The heads of cap screws are in five general types: hexagon (the most common), flat, button, fillister, and socket (or recessed).

Machine Screws

Machine screws - shown in Figure 8 - are similar to cap screws in shape and head type, but differ principally in the fact that they are smaller (usually in sizes from Nos. 0 to 12) and have threads of only the coarse series. As a rule, machine screws are threaded all the way from the head to the end.

Set Screws

Set screws (Figure 8) are fastening devices used to set a wheel, collar, or hub on its shaft. They are usually headless, although some come with square heads. The headless type is provided with slots or hexagon sockets for screwing them into the hub so that none of the screw projects on the outside. The diameter of the socket is, in nearly all cases, half the diameter of the screw.

The points of set screws are of several types: flat, cup, cone, oval, and dog. The same standard thread systems apply to set screws as those previously discussed.

Fastening Devices (Information Sheet continued)

Right and Left Hand Threads

All bolts, screws, and their nuts are right hand (RH) unless specified left hand (LH). Right hand means that the nut is turned in the right hand (clockwise) direction to tighten it.

Left hand screws are used only when required, as, for example, when the nut is in contact with a part turning in a counter-clockwise direction and the friction tends to loosen a right hand nut.

Self-Tapping Screws

Self-tapping screws, also called "Parker screws" and "Sheet metal screws," resemble ordinary wood screws except that they are shorter and have threads the entire length of the screw. They are used principally in fastening thin metal parts and sheet metal together, but are also used with plastics. The screws are of very hard metal, and the threads "form" rather than "tap" threads into the metal into which they are screwed. There is a type, however, which actually taps threads into a drilled hole. It resembles a machine screw with "interruptions" or slits along the end which present cutting edges at each thread, which tap the threads as the screw is tightened. (See Figure 9-B.)

Parker self-tapping screws are made in two types, "A" and "Z", and are available with six different types of heads, (See Figure 9), each of which may have the slotted or Phillips recessed head, as shown in Figure 9-C.

Drive Screws

Drive screws are a combination of screw and nail. They are used chiefly to fasten sheet metal, plastics, leather, and paper to wood by driving them nearly home with a hammer and tightening with a screwdriver a turn or two.

One type of drive screw, designed for metal work, is made of hardened steel and is used to fasten thin metal parts to brass, aluminum, and iron castings by driving the screw all the way home with a hammer after it has been started in a hole drilled to the proper size to receive it.

Fastening Devices (Information Sheet continued)

RIVETS

Use of Rivets

Rivets are used to fasten together two pieces of metal which will not likely require disassembling later. Riveting is the "upsetting" the end of the rivet shank which has been passed through punched or drilled holes in the metal pieces. "Upsetting" is the forming of a second head by shaping the end of the rivet in several different ways while the head is held firmly in place ("bucked") with a bucking bar or dolly which is usually held by another person.

Before the development of welding, riveting was practically the only method of fastening two pieces of heavy metal together permanently. Today, the use of large steel rivets is chiefly limited to structural steel and boiler work in which the steel rivets are driven red-hot. Only the "soft rivets," which are made of aluminum, copper, and other soft metals and which can be driven cold, will be discussed here. The ends of such rivets are "upset" by hammering or peining, with hammer and a rivet set, and with pneumatic hammers called rivet "guns."

Types of Rivet Heads

The most common types of rivet heads are shown in Figure 11. In general, each type is used for the following types of work:

1. Countersunk rivets are used where streamlining is necessary to prevent "drag" due to air or water flow, and for appearance. The principle of countersinking used with wood and metal screws is used with rivets, permitting the heads to be flush with the surface of the metal.
2. Brazier head rivets are used chiefly in aircraft assembling and repairing where countersinking is not practical and where "drag" must be kept as low as possible by making the rivet heads thin.
3. Round head rivets are used where maximum strength is important and "drag" and appearance are of little concern.

Fastening Devices (Information Sheet continued)

4. Flat head rivets are used for general purposes where both strength and compactness are important. Tinnings' rivets are of this type and are made of soft steel and are usually tinned to prevent rusting.

Special Rivets

One of the chief drawbacks to the use of ordinary rivets is the fact that both sides of the work must be accessible for driving and bucking. For places where only one side of the work can be reached, several patented "blind" rivets are available, most of which use a metal screw or plug inside the hollow rivet which compresses and upsets the end when the screw or plug is withdrawn. One type of "blind" rivet uses a small explosive charge in the hollow end which explodes when heat is applied to the head, thus upsetting the end of the rivet.

Size of Rivets

The size (diameter) of rivets is expressed in three manners:

1. Fractional inch sizes
2. Gauge
3. Weight

The size of aluminum rivets is given in fractional inch sizes, usually in 32nds, and the length of the shank is usually expressed in 16ths of an inch.

Tinnings' rivets have standard lengths for each size, which is expressed in weight. The weight, such as 6 ounces, 1 pound, and the like, represents the number of ounces or pounds that 1000 such rivets weigh. The smallest size is 6 ounces (1000 weigh 6 ounces), and the largest is 3 pounds.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Introduction

TOPIC: Transmission of Power

OBJECTIVE: To develop an understanding of the ways that power is transmitted from its origin to use.

INTRODUCTION: Power remaining at the source of production is of no value to the operator. To utilize this power it must be transferred by some method to a place of adjustment and use. Often times it is necessary to adjust power into several speeds to fully utilize it. In this assignment the methods of transmitting this power will be studied.

REFERENCES: Required:

1. Farm Machinery and Equipment, H. P. Smith.
Ch. 4.

Supplemental:

2. Modern Farm Power, pp. 182-187.
3. Farm Gas Engines and Tractors. pp. 404-445.
475-479.

QUESTIONS
or
ACTIVITIES:

1. What are the six methods of transmitting power in connection with farm equipment?
2. What is the advantage of a V-belt over flat belts?
3. When is a V-belt properly fitted?
4. How can belt lengths be determined?
 - a. V-belt
 - b. Flat belt
5. What formula may be used to calculate the speed or size of pulley?

UNIT: Introduction
TOPIC: Transmission of Power

6. Explain how the pitch of the sheave will vary speeds.
7. Explain the proper direction of travel when using a pressed-steel hook chain.
8. List the names of the types of gears that are shown in figures 4-17, page 34 in the Farm Machinery and Equipment, Smith.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Introduction

TOPIC: Tractor Design

OBJECTIVE: To develop an understanding of different types and sizes of farm tractors.

INTRODUCTION: The tractor is the farmers "power house". It is a moveable powerhouse. Most all farm machines can be operated by the tractor and many other attachments can also be used such as grader and ditcher blades, manure loaders, scoops, power shovels, post hole diggers, wood saws, load carriers and many others. Each implement attached must "match" the tractor in size and capacity.

Farmers are the principle users of tractors. In a recent ten (10) year period, the number of tractors used by farmers almost doubled which shows how rapidly our farming is being mechanized

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Internal Combustion Engines

TOPIC: Theory of Operation

OBJECTIVE: To develop an understanding of the process involved in transforming fuel to power in a two cycle and four cycle engine.

INTRODUCTION: Do all engines have spark plugs? Of course, the answer is no. Do all engines have valves? Again the answer is no. We would then say it is apparent that engines differ in physical characteristics. It should be just as evident that differences exist between different types of engines in the process of transforming fuel to power.

To be a good mechanic one must not only be able to recognize the different types of engines by the types of fuel and number of strokes per cycle but must have a good understanding of why and how each operate.

In this assignment we are concerned with understanding exactly what happens on each stroke for both the two and four cycle engines.

Information Sheet
on
TWO AND FOUR STROKE CYCLE ENGINES

The first successful four-stroke cycle internal combustion engine was developed by a German in 1876. An Englishman patented a two-stroke cycle engine in 1878. Experimentation on various systems of converting heat to power had been underway in various countries for at least 200 years prior to the successful development of an internal combustion engine. In some of the early experiments gun powder was used as fuel but did not prove practical.

Power which is used to move the tractor is created within the cylinders of the engine and transmitted through the crankshaft, transmission, differential, and final drive to the rear wheels. The way the power is utilized after it is produced by the engine is determined by the power transmitting systems attached to the engine. However, regardless of the kind of work which is done by the power, whether it is pumping water or powering a self-propelled combine, the origin of power is still the same--that is through the combustion of fuel and air within the cylinders of an engine. See Figure 6, page 4, reference 2, for an illustration of the conversion of compressed air-fuel mixture to power. Since the piston is attached to a connecting rod, which is attached to a crankshaft in an offset position from the center of the crankshaft, the force exerted on the piston by combustion drives the piston downward causing the crankshaft to turn. This represents rotary motion.

Internal combustion engines are of two types: two-stroke cycle and four-stroke cycle. A STROKE includes that movement of the piston from the top of the stroke (TDC--Top Dead Center) to the bottom of the stroke (CDC--Crank Dead Center) or from CDC to TDC. This means that with each complete revolution of the crankshaft the piston moves from a point back to that point, for example TDC to TDC, and has made two strokes.

A CYCLE is composed of the number of strokes required for a complete series of events from the point the cylinder is ready to receive the fuel-air mixture (carburetor engine) or the air only (diesel engine) to the point at which the spent gases are expelled from the cylinder and is ready to receive a new supply of fuel-air mixture or air. A two-stroke cycle engine requires two strokes for this process. A four-stroke cycle engine requires four strokes to complete a cycle. It is common terminology to refer to 2-cycle or 4-cycle engines; in this case the 2 and 4, respectively, refer to the number of strokes required for a complete cycle of events.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Internal Combustion Engines

TOPIC: Engine Types

OBJECTIVE: To develop an understanding as to engine types classified according to blocks, valves, cylinders and fuels, as well as basic engine parts.

INTRODUCTION: Successful farm machinery repairmen know that farmers today depend upon machinery to a very great extent. One of the basic elements of all farm power machinery is the engine. This may be a gasoline or diesel depending upon the owners choice. Basically both engines are constructed and operate similarly. To be able to better understand the operation of an engine a person needs to be familiar with its basic construction and parts.

In this topic we explore the basic engine parts, methods of classification and some materials used in the parts.

Information Sheet
on
POWER PLANT CONSTRUCTION AND TERMINOLOGY

Gasoline engines are composed of many small parts. Each part serves a specific function or, in many cases, several functions. The efficient tractor mechanic must have a thorough understanding of the many parts of a gasoline engine and the functions they perform.

Because of the peculiar function of each part, each falls into a natural group, referred to as an assembly or a system.

Gasoline engines may be grouped into the following systems:

1. Stationary parts
 - a. Cylinder block
 - b. Cylinder head
 - c. Crankcase
 - d. Oil pan
 - e. Cover
2. Moving parts
 - a. Pistons and rings
 - b. Connecting rods and wrist pins
 - c. Crankshaft
 - d. Main bearings
 - e. Flywheel
 - f. Camshaft and camshaft gear
 - g. Valves
 - h. Rocker arm assembly
 - i. Oil pump and accessories

Power Plant Construction and Terminology
(Information Sheet continued)

3. Electrical system

- a. Battery
- b. Generator and charging circuit
- c. Ignition circuit (distributor, coil, spark plugs, breaker points, condenser and magneto)
- d. Cranking motor (starter)

4. Fuel, air, and exhaust systems

- a. Air cleaner
- b. Fuel tank
- c. Fuel line, cut-off valve, strainer, and filter
- d. Fuel pump (only in tractors that do not have the fuel tank located above the engine)
- e. Carburetor
- f. Manifold, muffler, and exhaust pipe
- g. Governors

5. Cooling system

- a. Radiator, hose, and pressure cap
- b. Water pump
- c. Thermostat
- d. Fan

Tractor engines may be grouped into four basic classes, classed according to fuels. These are: (1) gasoline, (2) distillate, (3) LP gas and (4) diesel. Although these engine classes require different fuels basically the engine is constructed very similar.

Power Plant Construction and Terminology (Information Sheet continued)

The cylinder block is the basic frame of the engine. It supports all the components in relation to one another and maintains them in alignment. The most important requirement of the cylinder block is rigidity. In most cases, tractor engines are made of cast iron alloy.

Cylinder blocks may vary in design. They may be of the integral bore type; that is, the cylinder bore is machined directly into the material of the block. It may have separate and removable cylinder sleeves. The removable sleeve may be of the wet type (the coolant comes in direct contact with the outer surface of the sleeve), or it may be of the dry type (the sleeve or liner is inserted in the bore and is not in direct contact with the coolant).

Valve-in-block engines have the valve seats, ports, and guides in the block casting with their respective water jackets; whereas, the I-head engine block has only the cylinder bore water jackets.

If the block skirt extends only to the center line of the crankshaft main bearing, it is known as a "short skirt." If it extends below the center line of the crankshaft main bearing, it is known as a "deep skirt."

Many engine blocks may have oil galleries cored in. Others may have steel tubes inserted to act as galleries; whereas, others may have oil lines and fittings to carry oil to the various parts.

As a rule, the cylinder head is made of the same material as the cylinder block. It serves as a cap and is attached to the top of the engine block and covers the upper cylinder openings, thereby forming a combustion chamber.

The crankcase is the lower part of the cylinder block; it confines the lubricating oil near the engine's moving parts in the four-cycle engine. It also supports the crankshaft and camshaft bearings.

The oil pan serves as a reservoir to hold the crankcase lubricant and seals the lower part of the engine in the four-cycle engine.

Various types of covers are used on the timing train, the valve train, and sometimes on other components or inspection-holes. They are usually made of stamped steel.

Power Plant Construction and Terminology (Information Sheet continued)

The moving parts of the engine that receive the gaseous energy produced in the combustion chamber and deliver it to the output end of the engine in the form of useful power are referred to in this module as the moving parts.

1. Pistons and rings

Cylinders are sealed and the gaseous pressure transmitted to the connecting rod by the piston and its rings.

The top section of the piston is the crown, and the lower section is the skirt.

The upper set of rings, compression or power rings, are carried by the crown of the piston. The lower set of rings, oil control rings, are carried by the skirt of the piston.

2. Connecting rods and wrist pins

A connecting rod is a bar or strut with a bearing at each end. The purpose of the connecting rod is to transmit the piston thrust to the crankshaft.

The connecting link between the connecting rod and the piston is the wrist pin.

There may be three arrangements of wrist pins.

- a. The wrist pin is secured in the piston, and the bearing is held in the connecting rod end.
- b. The wrist pin is fastened to the connecting rod, and the bearing is part of the piston.
- c. The wrist pin is free and bears against bearings in both the piston and the connecting rod.

3. Crankshafts

Crankshafts deliver force to the transmission and power train as a result of the thrust from the connecting rod.

Some crankshafts are designed with counterweights opposite the crank pins. These relieve the load on the main bearing by offsetting the inertia forces.

Power Plant Construction and Terminology (Information Sheet continued)

4. Bearings

The purpose of bearings is to support rotating shafts and other moving parts that transmit power from one engine part to another.

Bearings reduce the friction between the moving surfaces by separating them with a film of lubricant and carry away the heat produced by unavoidable friction.

5. Flywheels

The flywheel is a heavy wheel or disk attached to the crankshaft. Through rotation, the flywheel acquires kinetic energy. It stores additional kinetic energy when it speeds up and gives back that energy when it slows down.

The main purpose of the flywheel is to reduce the speed fluctuations of the crankshaft, caused by the difference in the amount of energy exerted on the piston during the power stroke and during the compression stroke.

Single-cylinder engines require larger flywheels than multi-cylinder engines, because energy variations during a complete cycle are greater in single-cylinder engines.

6. Camshaft and gear

The camshaft is a lobed shaft which provides eccentric action for opening the valves. It is driven from the crankshaft by a timing gear or through a timing chain.

7. Valves

The purpose of valves is to open and close ports in the combustion chamber. Since there are two ports for each cylinder, there must be two valves. The intake valve allows the fuel-air mixture to enter the chamber when the valve is open. Exhaust valves open to allow burned gases to escape from the combustion chamber into the exhaust system. Both valves are closed on the compression and power strokes.

8. Rocker arm assembly

The purpose of the rocker arm assembly is to actuate the valves at

Power Plant Construction and Terminology
(Information Sheet continued)

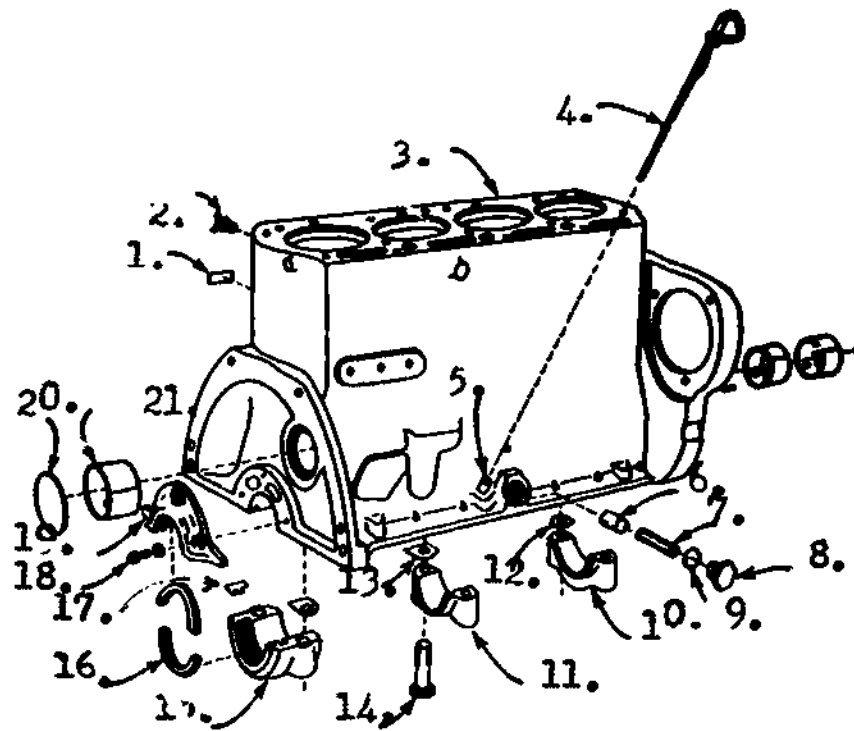

the proper time. The rocker arm assembly is actuated by the camshaft and consists of valve lifters, push rods, rocker arms, rocker arm shaft brackets, rocker arm shaft and accessory parts.

9 Oil pump and accessories

The oil pump is located in the oil pan. Its function is to provide engine lubrication. Pumps are of three types: vane, piston, and gear. Because of their long life and trouble-free operation, gear pumps are used in most engines.

In many engines, oil filters are located between the oil pump and the engine parts to remove abrasive particles.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

- UNIT: Internal Combustion Engines
- TOPIC: Power Plant Disassemble, Assemble and Repair
- OBJECTIVE: To develop an understanding of the procedure to follow in disassembling an engine, checking for items in need of repair and assembling the engine.
- INTRODUCTION: Do you know the proper sequence to follow in disassembling and assembling an engine? Often times labor is wasted because someone will try to disassemble an engine and not know the proper order to follow. They will try to remove a part which cannot be removed until something else is first removed. This assignment will cover a lot of territory however it is felt necessary to include this one lesson in order to give a complete logical sequence to follow in working on engines. As we study this lesson both carburetor and diesel engines will be considered. It must be kept in mind that no one procedure will fit every brand of engine therefore, when working on a specific brand always use the repair manual for that brand.

Information Sheet
on
POWER PLANT DISASSEMBLE, ASSEMBLE AND REPAIR

Thorough cleaning is the first step in preparing an engine for overhaul. The best method is steam cleaning; but if this is not possible, clean the engine with a mixture of one part "Gunk" concentrate (a cleaning compound made for dirty engines) with four parts kerosene. Paint the engine with this mixture and allow it to soak for 20 minutes; then wash it off with a spray of water.

After the engine has been thoroughly cleaned, follow these steps to prepare it for overhaul:

1. Remove engine accessories. These include the hood, shrouds, radiator shell and grill.
2. Drain the coolant from radiator and block into a clean container and inspect it for rust particles and other foreign particles.
3. Remove all radiator clamps and hoses, noting those that need to be replaced. Record this information on the reconditioning sheet.
4. Remove the radiator holding bolts and the radiator.
 - a. Check the radiator for bent fins, external leakage, and corrosion build up inside the radiator.
 - b. If the radiator needs repair, send it to a radiator shop.
5. Remove external engine parts.
 - a. Battery clamp and battery
 - (1) Remove battery cables removing the ground cable first.
 - (2) Inspect cables and note condition.
 - (3) Using a hydrometer and voltmeter, test the battery and recharge it, if necessary.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

b. Starter

c. Water manifold and thermostat

- (1) Check thermostat and note its condition.

d. Carburetor (gasoline engine only)

- (1) Remove linkage.
- (2) Turn valve on gas tank off and remove gas line.
- (3) Remove air cleaner base and note its condition.

e. Governor

Diesel engines do not have the same type of governor as gasoline engines. Omit this step on the diesel engine.

- (1) Disconnect linkage and oil line.
- (2) Remove bolts around the housing.
- (3) Slip governor unit from housing.
- (4) Check spring for tension.

f. Intake and exhaust manifold

g. Air cleaner

- (1) Check condition of air cleaner. An excessively dirty cleaner may suggest possible clues to causes of internal malfunctions.

h. Spark wires, spark plugs, and distributor

A diesel engine has a different type of fuel and ignition system. The following procedures should be followed when removing the injector and injector pump.

1. Injector

a. Turn fuel valve off at tank.

b. Remove fuel lines from injectors.

- (1) All fuel lines from pump to injectors must be removed at each end.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

- (2) Remove line bracket.
- (3) Be careful not to bend lines.

c. Remove injector

- (1) Remove hold-down nuts.
- (2) Use crowfoot bar to pry injector out.
- (3) Remove injector, being careful not to bump the nozzle tips.
- (4) Wrap injector in a soft cloth to avoid damage to the nozzle tips while they are out of the engine. Always remove the injector before removing the head.

2. Injection pump

- a. Locate marks used in timing pump.
- b. Rotate engine until marks are in proper position and the number one cylinder is on the compression stroke.
- c. Remove throttle and stop linkage attached to pump.
- d. Remove fuel lines.
- e. Remove primary fuel line from pump.
- f. Remove bolts holding the pump to the block.
- g. Remove oil line that runs from the pump to block.
- h. Remove pump.
- i. Any calibration of the pump must be made on a test stand. Most dealers do not do this job but send pumps to special diesel repair shops. Some pumps, however, may be calibrated on the engine, operating at maximum load and using a ball fuel meter or dynamometer to measure fuel consumption.
- j. Three types of injection pumps have been developed for use on diesel engines.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

- (1) Ro sa master
- (2) Boash
- (3) Simms

Manufacturer's specifications should be followed when overhauling these pumps.

- k. Clean injection pump screen which is located on head of pump.
 - (1) Remove plug.
 - (2) Remove screen and "o" ring.
 - (3) Wash in solvent and blow dry with compression.
 - (4) Install screen on plug and ring.
 - (5) Install injection pump in head.

After thorough testing and removal of all accessories and external parts, the engine is ready to be overhauled. A mechanic should learn well the following procedure, which outlines a complete engine overhaul, before he accepts employment and proceeds to overhaul a tractor engine in an agricultural machinery dealership.

Disassemble the engine in the following manner, and make observations of worn parts, and other faults.

- 1. Valve cover
 - a. Remove valve cover by taking out four attachment bolts. Make sure that the area around the cover is clean and dirt free before the cover is removed.
- 2. Rocker arm assembly
 - a. Oil must flow to the rocker arm assembly through an oil line or stud which retains this assembly. Locate the flow openings and check to see if they are plugged.
 - b. Remove the oil line.
- 3. Push rods
- 4. Head nuts or capscrews

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

These are special nuts or capscrews of high strength steel. Under no circumstances should nuts or capscrews of any other material be used for this purpose.

5. Remove head

a. Visually inspect the head, noting the following:

- (1) Condition of valves
- (2) Condition of headgasket
- (3) Condition of top of piston

- (a) Excessive carbon indicates bad rings.
- (b) Piston loose in cylinder

(4) Pitting in the piston top and cylinder wall

Pitting is caused by water entering the combustion chamber through the head gasket or a crack in the head or sleeve.

(5) Taper of the cylinder wall

The taper of the cylinder is checked by a dial indicator or inside micrometer. Measure the diameter of the cylinder where the top ring travels and above the piston when at bottom dead center. By subtracting the latter measurement from the former the amount of taper can be determined. Compare the taper with maximum taper given in the manufacturer's specifications for the tractor.

(6) Check cylinder for being out of round.

To check a cylinder for being "out of round," use the same tools as those used to check taper.

6. Remove valves from head and determine condition.

a. Place head on work lead.

b. Using suitable valve compressor, compress spring and cap

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

and remove the two locks located on the end of the valve stem.

- c. Release valve compressor.
- d. Remove spring and valve cap. Some engines may have rotating valve caps on the exhaust valves. These caps allow valves to rotate, thus keeping the seat clean and free of carbon. Also, some engines may be equipped with two valve springs on each valve, allowing more positive valve seating.
- e. Remove valves.
 - (1) Visually inspect each valve for excessive burning.
 - (2) Check valve stem for sticking in the guide, which is caused by carbon in the guide. The guide should be cleaned or replaced.
 - (3) Check the valve seat for burning or cracks.

At this point in the overhaul procedure, study all observations made to determine whether a complete overhaul is necessary or whether reconditioning of the valves would bring the compression back to within manufacturer's recommendations. If the tractor needs a complete overhaul, follow these procedures:

- 1. Remove the engine block from the tractor mounting.
 - a. Drain oil from the oil pan by removing the plug in the bottom of the pan.
 - b. If necessary, remove the front axle and axle support, which is bolted to the engine block.
 - (1) Disconnect the front axle wishbone supports and steering linkage.
 - (2) Place safety jack under the transmission to support the engine while removing the front axle and wheels.
 - (3) Remove bolts around the rear engine bell housing. Usually there are one or two line-up pins in the rear bell housing which often stick and need to be freed by prying the engine away from the transmission.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

- c. Attach engine lifting straps to the block so that when the engine is lifted from the mountings it will be balanced. Use short capscrews to replace the head studs or capscrews.
 - d. Hook sound chain falls on hydraulic lifting crane to engine strap and remove the engine block from its mountings.
2. Place engine on an engine stand and fasten it down tightly. If an engine stand is not available, lay the engine block on its side on a workbench.
 3. Remove oil pan.

Take off capscrews around the oil pan, and check it for sludge deposits in the bottom.

4. Remove oil pump.
 - a. Remove oil pump screen and pick-up tube. In some cases this tube may be a part of the pump.
 - b. Remove locks on safety wire from the capscrews or nuts which hold the oil pump in place.
 - c. Turn the pump housing back and forth until it comes free.
5. Remove fly wheel.
 - a. Remove pressure plate.
 - (1) Remove capscrews on the pressure plate evenly.
 - (2) Be prepared to catch the pressure plate and clutch disk, as they drop when the last capscrew is removed.
 - b. Remove flywheel nut locks and nuts
 - (1) It may be necessary to lay a 2" x 4" block of wood, 12" long, beside the crankshaft to keep the crankshaft from turning during removal of flywheel nuts.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

- (2) Tap flywheel off with a soft mallet hammer.
- (3) Because of the weight of the flywheel, be careful not to drop it while removing from the engine.

6. Check the flywheel starter ring gear for missing teeth and slippage on the flywheel, and record findings.
 - a. Remove ring gear from the flywheel, cutting halfway through the ring gear with a cutting torch and splitting the remainder with a chisel, or cutting halfway through with a 1/4" drill and splitting the remainder with a chisel.

Be extremely cautious to avoid cutting with the torch or drilling into the flywheel.

- b. Install new ring gear.
 - (1) Lay ring gear on flat fire bricks that completely support it.
 - (2) Use a torch to heat ring gear to 360° or until it turns a dark straw color.
 - (3) Quickly place ring gear on flywheel and let cool into place.

7. Remove pistons.
 - a. On engines with sleeves, install a short capscrew and large washer at the top of each sleeve to hold sleeve while removing piston.
 - b. Cut ridge frame cylinder with a suitable ridge removing tool. Follow manufacturer's instructions for using the tool to remove the cylinder ridge.
 - c. Rotate crankshaft until the number one piston is at the bottom of its stroke.
 - d. Remove lock nuts on cotter pins from connecting rod.
 - e. Mark rod cap with a center punch on both halves to make certain it is reinstalled in the same position it was before

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

disassembly. Also, notice whether mark is on the crankshaft side, and record observation.

- f. Remove connecting rod nuts.
 - g. Remove rod cap.
 - (1) Inspect insert for excessive wear, pitting, and corrosion.
 - (2) Remove upper insert bearing.
 - h. Push piston out of cylinder.
 - i. Throw inserts away and reinstall cap on rod.
 - j. Repeat steps a through i to remove the remaining pistons.
8. Inspect piston, pins, and connecting rods.
- a. Clean piston.
 - (1) Remove old rings.
 - (2) Remove carbon from the piston top with a scraper.
 - (3) Remove carbon from ring bands with a broken ring.
 - (4) Do not use a wire brush for cleaning these parts.
 - (5) Clean oil groove and oil return holes. The oil return holes should be cleaned with a drill bit of the same size as the oil return holes so as not to enlarge the holes.
 - (6) Using a micrometer, check the size of the pistons against manufacturer's specifications, and determine whether they are within limits. A micrometer check also reveals whether the pistons are standard or oversized.
 - (7) Compare the ring band of piston with that of a new ring and check it with a feeler gauge. Insert ring in groove. Check the distance between the ring edge and groove wall. Check size of gap with manufacturer's specifications for maximum allowance clearance. These measurements, along with visual inspection and piston size, indicate whether the piston should be replaced.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

b. Inspect connecting rod.

Put the connecting rod cap in place on the rod with punch marks lined up and rod nuts torqued to manufacturer's specifications. Using an inside micrometer, check whether the inside of the rod is out-of-round and the connecting rod opening is within manufacturer's specifications. If the measurements are not within specifications, install a new rod or recondition the old rod at a machine shop.

c. Check wrist pin.

(1) Remove wrist pin from rod.

- (a) Mark piston and rod with a center punch to make sure they are reinstalled in the same position they were before disassembly.
- (b) Remove snap rings on lock bolts that retain pin in the piston.
- (c) Using a brass punch, drive the pin out of the rod. Some pistons require that the wrist pin be pressed out. This is a job for a machinist who has a special piston holder and press.

(2) Using a micrometer, check pin to see whether it is within manufacturer's specifications.

(3) Check inside of the rod bushing with a telescopic gauge and outside micrometer to determine whether the opening is within manufacturer's specifications.

(4) Record all measurements in order to determine what parts should be replaced or reconditioned.

9. Check cylinder for taper and being out-of-round.

These checks are made with an inside micrometer or dial indicator. If the taper is not within specifications or the cylinder is out-of-round, install new sleeves or rebore the cylinders.

10. Remove crankshaft.

- a. Before removing crankshaft, check end play. One bearing,

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

usually the center or rear bearing, controls the end play with a thrust ring built on the insert or a separate ring. Locate the thrust bearing, and pry crankshaft forward. Insert feeler gauge in the opposite side and measure the gap. Record the gap and check it against manufacturer's specifications. If a new bearing is needed, it may be obtained in oversize thrust to take up for wear on the crankshaft flange.

b. Remove front crankshaft pulley.

- (1) Remove set screw, nut, or retaining bolt from the pulley.
- (2) Using a suitable puller, remove crankshaft pulley.
- (3) Be careful to fit puller jaws on the solid part of the pulley.
- (4) Check pulley for cracks and excessive wear on the sealed surface.

c. Remove timing cover.

- (1) Remove all capscrews and nuts on the retaining cover.
- (2) Pry cover off.
- (3) Notice if the crankshaft end-play adjusting setscrew is built into the retaining cover.

d. Check backlash between camshaft and crankshaft gear with dial indicator.

- (1) Mount dial indicator on front of engine with needle resting on camshaft gear teeth.
- (2) Rotate camshaft back and forth without moving the crankshaft. Take dial reading and compare with manufacturer's specifications listed as camshaft gear backlash. If backlash is excessive, new gears are needed.

e. Check timing marks on the camshaft and crankshaft gears. The marks must line up before disassembly and at reinstallation.

f. Mark main bearing cap in relation to block. Be care-

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

- fu to put caps back in the same position and place when reinstalling them.
- g. Remove main bearing capscrew or nuts. Some nuts or capscrews have locks, and others are self-locking.
 - h. Remove main bearing cap by tapping it with a soft mallet hammer. Inspect the insert bearing for pitting, grooving, and excessive wear. At this point it may be necessary to remove the rear main oil seal retainer and seal.
 - i. Remove crankshaft. Try to keep it standing on end to avoid possible warping.
 - j. Reinstall main caps on block and tighten them to prevent damage to the caps.
11. Check the crankshaft.
- a. Using a micrometer, check each journal for the following:
 - (1) Out-of-round condition
 - (2) Excessive wear
 - (3) Taper of journal

Micrometer readings should be recorded and compared with manufacturer's specifications.
 - b. Check rear oil seal surface.
 - c. Check straightness of crankshaft.
 - (1) Using two "V" blocks, rest the number one journal on one block and the rear main journal on the other block.
 - (2) Set dial indicator needle to ride against the center main bearing and rotate shaft. Record the dial reading. If the reading is excessively high, a new crankshaft or re-grinding of the old one, is needed. Compare the dial readings with the manufacturer's specifications to determine whether to replace, regrind, or reuse the crankshaft.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

12. Remove cylinder sleeves.
 - a. Use a suitable puller to pull sleeves out of the block. Sometimes wet sleeves may be driven out of the block with a hard wood block.
 - b. Remove the capscrews that hold the sleeve in place. If the engine does not have sleeves, have the cylinder rebored at a local machine shop.
13. Remove camshaft.
 - a. Remove retaining bolts behind cam gear.
 - b. Slip camshaft out of the block. It is not necessary to remove the gear from the camshaft unless the gear needs replacing, in which case it must be done in a press.
 - c. Be careful not to let the camshaft lobes scrape on the cam bushing when slipping it out of the block.
 - d. Check camshaft with a micrometer to determine the bearing journal and lobe sizes, and compare these measurements with the manufacturer's specifications.
14. Remove valve lifters and check them for excessive wear and pits in the flat surfaces.
15. Remove camshaft bushing.
 - a. Use a suitable driver plug fitted to the cam bushing and drive out all bushings.
 - b. Camshaft bushings, the heart of good oil pressure, should be replaced on all overhauls.
16. Clean engine block.
 - a. Soak block in cleaner tank and wash with hot water.

Blow out all oil passages with air. If steam cleaner is available, steam the block and force steam through the oil passages.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

- b. The block should be cleaned after the cylinders have been rebored.
- c. Using 80 grit sandpaper, sand the top of the block and the base where the sleeves are installed. Caution: the cylinder must be clean around the top flange and at the bottom where the "O" rings seal.
- d. Check block for cracks.

Up to this point in the overhaul procedure, disassembly of the engine and inspection of its parts, has been emphasized. The emphasis now turns to the installation of new parts and reassembly of the engine. The following procedure should be followed in reassembling the engine and installing parts:

- 1. Install camshaft bushings.
 - a. Coat the surface of the bushings with light number 10 oil and install them in the block with a driving plug.
 - b. Make sure that the oil holes in the bushing align with the oil holes in the block.
- 2. Install cylinder sleeves.
 - a. Before installing "O" rings on the sleeve or in the block, try each sleeve in the block to make sure it falls into place without having to be forced.
 - b. Install "O" rings on sleeve or in the block, using the lubricant recommended by the manufacturer.
 - c. Push sleeve into place with hand or a light tap of a soft mallet hammer.
 - d. Check protrusion of sleeve above block to make sure that it comes within the manufacturer's specifications. Shims may be added under sleeve flange to increase the protrusion.
- 3. Coat valve lifters with number 30-weight oil and install them in the block.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

4. Install camshaft.
 - a. Coat bearings with number 30-weight oil.
 - b. Slide the camshaft through each bearing. Do not let lobes slide on the bushings.
 - c. Check for free rotation of the camshaft. If it does not rotate freely, the bushings have been improperly installed.
 - d. Install camshaft retaining bolts, and check end play of shaft with dial indicator to compare with manufacturer's specifications.

5. Install crankshaft.
 - a. Remove main cap.
 - b. Install new bearing inserts in the block and cap. Make certain that the two bearing halves are installed opposite each other.
 - c. Coat bearing with 30-weight oil.
 - d. It may be necessary to install one-half of the rear main oil seal.
 - (1) Coat back of seal with aviation sealer.
 - (2) Soak inside with 30-weight oil.
 - (3) Push into channel.
 - e. Place crankshaft in the block. Make certain that the camshaft and crankshaft gear timing marks are in line.
 - f. Install main bearing caps.
 - (1) Place plastic gauge strip on the bearing and install the cap.
 - (2) Align marks on caps with marks on the block.
 - (3) Install main bearing bolts and locks.
 - (4) Torque bolts down, 20 pounds at a time, to manufacturer's specifications.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

- (5) Remove cap and read plastic gauge on the bearing. This indicates the bearing clearance. If too much clearance is read, oversized bearings are needed.
 - g. Check crankshaft end-play.
 6. Install front timing cover.
 - a. Install front crankshaft seal in cover.
 - (1) Coat outside of seal with aviation sealer.
 - (2) Coat inside with number 30-weight oil.
 - (3) Tighten all bolts uniformly.
 7. Install crankshaft pulley.
 - a. Coat pulley seal surface with 30-weight oil.
 - b. Make sure inside of pulley is clean. If it is not, use sandpaper to clean and clear it.
 - c. Use a block of wood and hammer to tap the pulley into the crankshaft and install retainer.
 8. Install pistons on connecting rod.
 - a. Read manufacturer's instructions for installing rings.
 - b. Check rings for size.
 - (1) Insert rings in cylinder and measure end gap with feeler gauge. All rings except the oil rings, must be checked.
 - (2) Check manufacturer's specifications to be within clearance limits. If ring end clearance is inadequate, it should be filed.
 - c. Check piston cylinder clearance.

Insert piston into cylinder and check side clearance to be within manufacturer's specifications.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

d. Assemble connecting rod and piston.

- (1) Have the pin and bushing fitted at a machine shop that has honing and aligning equipment.
- (2) Install piston and rod together, making sure the mark on top of the piston is toward the front of the engine and the mark on the rod is in proper relation to the camshaft.
- (3) Install locks on pins.
- (4) Caution: follow manufacturer's guide for locating piston to rod alignment.

9. Install piston and connecting rod in the sleeve.

a. Install rings on the piston with a recommended ring expander.

- (1) Carefully place each ring on the piston with the top marking up.
- (2) Make sure rings are in the right grooves.
- (3) Follow ring manufacturer's specifications for installing rings on piston.

Example: (a) Oil ring should be installed in the bottom groove with the level toward the top.

(b) The scraper ring must be installed in the second groove with the outside notch down.

(c) The compression ring must be installed in the top piston groove with the inside notch up.

b. Remove rod cap.

c. Cover piston and rings with number 30-weight oil.

d. Place ring compressor around piston and compress rings. Note: Follow the manufacturer's specifications for the type of compressing tool to use.

e. Slide skirt of piston into sleeve, making sure the notch or arrow is toward the front of the block.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

- f. Tap piston into sleeve with hammer handle. Only light pressure is needed to force the piston out of the ring compressor. Make sure the connecting rod aligns with the crankshaft as the piston is tapped into the cylinder. Be careful not to scratch the crankshaft journals.
 - g. Install rod bearing and check.
 - (1) Coat the upper half of the bearing insert with 30-weight oil and insert in the connecting rod.
 - (2) Push connecting rod with piston attached down onto crankshaft.
 - (3) Install lower half of bearing insert into the cap and cover with oil.
 - (4) Place a strip of plastic gauze on the insert in the cap.
 - (5) Install cap on connecting rod.
 - (6) Tighten rod bolts or nuts according to manufacturer's specifications.
 - (7) Remove rod bolts or nuts and read the plastic gauge. Compare these clearance readings with the manufacturer's specifications. If the clearance is greater than those prescribed by the manufacturer, use oversized bearings and repeat steps five and six.
 - (8) Install lock nuts and bend metal locks around nuts.
 - (9) This procedure should be used when installing all rod bearings.
10. Overhaul and install the oil pump.
- a. Disassemble oil pump.
 - (1) Remove gear from pump, using suitable puller.
 - (2) Remove all parts from pump and clean them thoroughly.
 - (3) One should install an oil pump overhaul kit, which includes new gears, shaft, gasket, and pressure regulating valve, when overhauling an oil pump.
 - (4) Install new pump parts.
 - (a) Check backlash between gears.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

- (b) Check gear-to-housing clearance.
 - (c) Check gear end clearance.
 - (d) Compare these findings with manufacturer's specifications. If the readings are higher than those set down in the manufacturer's specifications, replace the housing.
- (5) Install pump into the block, torque bolts to manufacturer's specifications, and lock with wire or metal locks.
- (6) Fill oil pump inlet tube with number 30-weight oil to aid in priming the pump.
11. Install oil pan.
- a. Coat block with aviation sealer and stick gasket to it.
 - b. Install pan and tighten bolts. Do not tighten bolts too tight, as they will break the gasket.
12. Recondition cylinder head.
- a. Clean head.
 - (1) Using a 1/4 hp. drill with a wire brush, remove carbon from the head.
 - (2) Use a carbon scraper to remove excess carbon that cannot be removed with a wire buffer.
 - (3) Clean around valve seats.
 - (4) Wash the head in a cleaning solution and then hot water.
 - b. Remove and replace valve guides.
 - (1) Drive guides out of head with a suitable guide driver and hammer.
 - (2) Using emery paper, clean hole in head where guides are inserted.
 - (3) Wipe guides and blow area around guide holes clean with compressed air.
 - (4) Coat guide with number 10-weight oil and drive in place with driver and hammer.

Power Plant Disassembly, Assembly and Repair
(Information Sheet continued)

- (5) Follow manufacturer's specifications for length of guide protrusion.

c. Grind valve seats.

- (1) Select valve guide pilot to fit guide.
- (2) Select a stone to fit the valve seat outside diameter and the degree of angle on the seat.
- (3) Set grinder on the seat and reface the seat.
 - (a) Make sure the seat is within allowable limits for width of seat.
 - (b) If the seat is too wide, use a 15° and 75° stone to narrow the seat.

d. Using a straight edge, check the head for warp.

e. Reface valves.

- (1) Clean valves with wire brush.
- (2) Using a micrometer, measure the valve stem for comparison with the manufacturer's specifications.
- (3) Set valve grinding machine for proper valve face angle.
- (4) Reface all valves.

Check valve head thickness after grinding to be certain it is within manufacturer's specifications.

- (5) Resurface valve stems on grinding machine.
- (6) Place valve in the head and check margin of seat on valve face with bluing. Grind seat to bring it within manufacturer's specifications, and allow proper valve seating.
- (7) Check valve springs.
 - (a) Using a valve spring tester, check spring length and the tension at a given length.
 - (b) Compare these measurements with the manufacturer's specifications and replace valve springs not within manufacturer's limits.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

- (8) Coat valves and stems with number 30-weight oil and place in the head.
- (9) Install valve spring and keeper.
 - (a) Check valve spring to see if there is any difference in the top and bottom by check-for coils being close together.
 - (b) Install valve seals on stem of valve if recommended by the manufacturer.

f. Clean and check energy cells.

Note: Some diesel engines use what is called an "energy cell" or "precombustion chamber" to increase combustion efficiency.

- (1) Remove cell from head.
 - (a) Remove bolts from cell.
 - (b) Remove bolts from cell hold-down bars.
 - (c) Remove bars and caps.
 - (d) Remove cell with the necessary special puller and slide hammer, and check for burnt tips and enlarged hole. Keep all cells and caps together.
 - (e) Soak cell in carbon remover, wash, and blow dry with compressed air.
 - (f) Lap the cap and cell on a special lapping tool.
 - (g) Clean hole in head and check for burnt places where cell may leak. If the cell has been leaking, replace the compression.
 - (h) Replace any burnt cell.
 - (i) Assemble and install in reverse order, following the procedure outlined by the manufacturer.
 - (j) Torque nuts and hold-down bar to manufacturer's specifications.

13. Install head on block.

- a. Install a new head gasket.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

- b. Coat gasket with a recommended gasket sealer.
 - c. Install all head bolts and snug them down.
 - d. Use torque wrench to finish tightening head bolts.
Follow manufacturer's sequence for torquing head bolts.
14. Install push rods.
- Make certain that each rod is set in the valve-lifter socket.
15. Recondition rocker arm assembly.
- a. Remove all arms from shaft.
 - (1) Remove cotter pin and washer.
 - (2) Note where oil holes are in respect to the shaft.
 - b. Resurface all rocker arms on valve refacing machine.
 - c. Check rocker arm shaft with micrometer for excessive wear and compare with manufacturer's specifications.
 - d. Clean shaft internally to keep sludge from plugging oil holes.
 - e. Assemble rocker arms and shaft.
16. Install rocker arm assembly on head.
- a. Fit all rocker arm balls into socket of push rod.
 - b. Make sure oil feed stud on line is in the proper place.
 - c. Back up adjusting screws.
 - d. Tighten rocker arm assembly to head.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

17. Adjust valves.

They should always be adjusted cold before starting engine.

18. Install valve cover.

Coat valve cover with sealer and stick gasket to it.
Do not coat the other side of the cover gasket.

19. Overhaul and install distributor (gasoling tractor only).

a. Remove distributor cap.

(1) Check for cracks, corrosion on points, and other signs of wear.

(2) Remove rotor and inspect.

b. Remove points.

Check conditions of points.

c. Remove condensor.

Test condensor on tester.

d. Remove point plate.

e. Check spark advance weights for sticking.

f. Check spark advance spring tension.

g. Check distributor shaft and bushing for excessive wear.

h. Assemble in reverse order.

i. Lubricate advance weights with number 10-weight oil.

j. Install new points and condensor.

k. Adjust the distributor to the manufacturer's specifications on high cam and lubricate cam with distributor cam grease.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

1. Install rotor and cap.
20. Install and time distributor.
21. Install spark plug wires.
 - a. Check spark plug wires for cracks and bad insulation.
 - b. Check terminals, making certain that they fit tight in the distributor cap and on the spark plug.
 - c. Check the spark plug firing order.
 - (1) Remove the spark plug in the number one cylinder
 - (2) Rotate crankshaft until the number one piston is almost at the top of the compression stroke.
 - (3) Insert spark plug.
 - (4) Install the wire on the spark plug and in the distributor cap wire plug opening which the rotor in the distributor points to.
 - (5) Install the remaining wires in rotation, running them to the plugs according to the firing order.
 - (6) The cylinders are numbered starting with the first cylinder, which is the closest to the radiator, and counting back.
22. Install injector pump (diesel tractor only).
 - a. Rotate engine to bring the number one cylinder to the top of its compression stroke.
 - b. Line up crankshaft pulley on flywheel timing marks.
 - c. Turn the injector pump to proper timing mark and slide it into the block, meshing the gear on the pump with the gears on the crankshaft.
 - d. Recheck alignment of all markings.
 - e. Reassemble all parts in the reverse order.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

23. Overhaul and install water pump.
 - a. Remove fan from the pump.
 - b. Remove fan hub and pulley with a pulley puller and mark the position of the hub on the shaft.
 - c. Remove rear pump cover.
 - d. Remove pump impeller from shaft.
 - e. Remove seal assembly.
 - f. Remove snap ring and then shaft and bearing from the pump housing.
 - g. Clean housing with a scraper and sand paper and blow clean with compressed air.
 - h. Install new water pump kit.
 - (1) Using soft hammer, tap shaft and bearing into housing, and install snap ring.
 - (2) Install new seal in the pump impeller.
 - (3) Press impeller into place on the shaft. Do not tap on the shaft or seal, as it will break the seal.
 - (4) Press fan hub onto shaft in its original position.
 - (5) Install gasket and rear pump cover.
 - (6) Install a new pump gasket.
 - (7) Install pump on engine.
24. Overhaul and install generator.
 - a. Overhaul generator.
 - (1) Remove and inspect generator cover.
 - (2) Remove terminal wire from armature brush holder
 - (3) Remove wire from field to armature brush.
 - (4) Remove long bolts from the commutator end-frame, and remove frame and generator brushes.
 - (5) Remove field housing from pulley end-frame, Remove the pulley by removing the attachment nut and pressing the shaft from the pulley.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

- (6) Remove pulley key and top armature shaft from the bearing.
 - (7) Remove bearing from frame and check, clean, and repack it with grease. Clean generator parts in cleaning solution, wash with water, and blow dry with air under low pressure.
 - (8) Check commutator end-frame bushing and armature shaft for excessive wear. Replace bushing, if necessary.
 - (9) Check armature
 - (a) Grawler test
 - (b) Induction test
 - (c) Light short test
 - (10) Check field coil.
 - (a) Light continuity test
 - (b) Light short test
 - (11) Turn commutator on metal turning lathe and undercut mica. Smooth commutator with fine sandpaper.
 - (12) Install new brushes and make certain they fit properly against the commutator.
 - (13) Assemble the generator, reversing the disassembly order outlined above.
- b. Install generator on engine.
- (1) Install new fan belt and tighten.
 - (2) Polarize generator.
25. Overhaul and install starter.
- a. Remove starter and inspect its parts.
 - b. Remove screws holding field wires to brush holders.
 - c. Remove end-frame bolts and frame. Center punch housing for use in aligning the frame and housing.

Power Plant Disassembly, Assembly and Repair
(Information Sheet continued)

- d. Remove bolts from drive-end frame and remove the frame.
 - e. Remove armature from field housing.
 - f. Remove and inspect drive mechanism.
 - (1) Check for broken spring.
 - (2) Check for sheared drive bolt.
 - (3) Check for untrue gear teeth.
 - (4) Check for sticking screw mechanism caused by heavy grease, oil, or rust.
 - (5) Clean parts, install new parts, as needed, and lubricate with 10-weight or a lighter oil.
 - g. Check field coils.
 - (1) Use light test for continuity.
 - (2) Use light test for detecting a short.
 - h. Check armature.
 - (1) Use gawler test.
 - (2) Use light test for shorts.
 - (3) Use gawler test for induction.
 - (4) Turn commutator on metal lathe. Do not undercut the mica on a starter commutator.
 - i. Check end-frame bushing for excessive wear, and replace if necessary.
 - j. Check armature lamination for wear, which would suggest worn bushings.
 - k. Seat new bushings on commutator.
 - l. Reassemble starter, and install on the engine.
26. Install water manifold.
- a. Check thermostat.
 - (1) Place the thermostat in a pan of water.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

- (2) Heat the water with a torch.
 - (3) Note the temperature of the water when the thermostat opens.
 - (4) Check this temperature reading with the manufacturer's specifications for temperature at which the thermostat should open. If the thermostat does not open within manufacturer's specifications, replace it with a new one.
- b. Install thermostat in the head, with coil toward the block.
 - c. Install water manifold gasket and water manifold on the head.
27. Install intake and exhaust manifold.
- a. Scrape and sand head and manifold gasket surfaces.
 - b. Install gasket on head.
 - c. Install manifold.
 - d. Torque bolts uniformly to meet manufacturer's specifications.
- 27A. On diesel engines the manifold heater must be cleaned and adjusted at this stage in the overhaul procedure.
- a. Remove heater from manifold.
 - b. Check for burnt insulator material that may be shorting heater element.
 - c. Check insulated bolts.
 - d. Check element for burnt spots.
 - e. Check element for proper ground.
 - f. Reassemble element and install in the manifold.
 - g. Test the heater element.
 - (1) Connect manifold to the positive post of a 1250 battery.
 - (2) Connect insulated terminal to negative post. Wait 60 seconds and check the element. It should be red hot.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

28. Overhaul and install fuel injectors (diesel only).

a. Remove injectors and attach to pump injector tester.

- (1) Note pressure build-up until the injector injects fuel.
- (2) Keep hands away from the injector nozzle, as the fuel is under high enough pressure to penetrate the skin .
- (3) Watch spray pattern.
- (4) Check injector to see if it will hold pressure to within 300 lbs. of pop-off without leaking at tip.

b. Clean injector.

- (1) The injector should be cleaned and reset according to the procedures outlined by the manufacturer.
- (2) Cleanliness is of utmost importance here because all parts are built with close tolerance.

c. Install injector after overhauling the engine.

d. Using a piece of dowl stick wrapped in a soft cloth, wipe the injector hole clean.

e. Place a new copper gasket on the injector and install the injector in the head.

f. Tighten the injector hold-down nuts uniformly, according to manufacturer's specifications.

g. Install fuel lines.

Note: The following procedure should be carried out after the fuel filters are cleaned.

h. Bleed injector.

- (1) Loosen all injector lines at the injector and set the throttle to start.
- (2) Crank engine until fuel leaks from lines.
- (3) Close all lines and start engine.
- (4) Loosening one line at a time, let all air out of the line.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

29. Overhaul and install governor (gasoline tractor only).
 - a. Clean governor.
 - b. Disassemble unit and check for the following:
 - (1) Worn linkage
 - (2) Worn weight pins
 - (3) Worn and flat spots on weight balls
 - (4) Worn bearing, bushing, and shaft
 - (5) Worn and broken thrust bearing
 - (6) Tension on governor spring
 - c. Reassemble entire unit.
 - d. Install new gasket, using aviation sealer to seal gasket to housing, and install the governor on the engine.

30. Overhaul and install carburetor.
 - a. Disassemble entire carburetor.
 - (1) Remove screw around the float, and split carburetor.
 - (2) Remove float by slipping pin out of bracket.
 - (a) Check float for dents.
 - (b) Shake float to see if there is fuel inside it.
 - (3) Remove float needle valve assembly, seat, and seat gasket.
 - (a) When installing the seat, make sure the new seat gasket is in place.
 - (b) Needle, seat, and gasket should always be replaced for good fuel regulation.
 - (4) Remove all jets.
 - (5) Soak all parts in a carburetor cleaning solution for one hour.
 - (6) Wash with hot water, and blow dry with compressed air.

Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)

- b. Assemble carburetor.
 - (1) Install carburetor overhaul kit.
 - (2) Install jets in the lower and upper carburetor housing
 - (3) Install float seat in upper carburetor housing.
 - (4) Install float and pin. Adjust float according to manufacturer's specifications.
 - (5) Reassemble remaining parts.
 - (6) Check choke butterfly to see that the anti-flooding valve is operating properly.
 - (7) Preset all outside adjustments to manufacturer's specifications.
 - c. Install new carburetor flange gasket.
 - d. Install carburetor on the engine.
 - e. Start engine and set the carburetor for maximum R. P. M. 's by adjusting the governor spring according to the manufacturer's specifications.
31. Set spark plug gap and install spark plugs.
- a. Measure the spark gap with a feeler gauge. Compare this gap with the manufacturer's specifications and adjust with a bending tool.
 - b. Attach spark plug wires.
32. Install oil filter.
- a. Install gasket on oil filter bracket, using aviation sealer and bolt ~~filter~~ to block.
 - b. Soak oil filter element in either number 10-or number 20-weight oil and install filter in bracket.
33. Remove, clean, and install fuel filters (Diesel tractors only).
- a. Remove primary fuel filter element. This is the filter closest to the tank.

**Power Plant Disassemble, Assemble and Repair
(Information Sheet continued)**

- (1) Turn fuel off at tank.
- (2) Remove cap screw from top of bracket.
- (3) Remove fuel filter cup.
- (4) Remove element from filter cup.
- (5) Wash filter cup in diesel fuel.
- (6) Install new elements in filter cup.
- (7) Fill filter cup with clean diesel fuel.
- (8) Install filter cup in bracket, and install on the engine.

b. Bleed filter.

- (1) Loosen bleed screw on the top of the filter. Turn fuel on and open bleed screw until air bubbles cease.
- (2) Tighten bleed screw.

c. Clean secondary filter.

- (1) Turn fuel valve off.
- (2) Disconnect fuel lines.
- (3) Remove filter from bracket.
- (4) Remove fuel line fittings from old filter.
- (5) Discard old filter.
- (6) Reinstall fuel line fittings in new filter, using aviation sealer on fittings.
- (7) Reassemble secondary filter.
- (8) Turn fuel valve on.
- (9) Loosen bleed screw in the top of the filter and let the air out of the filter cup.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

- UNIT:** Lubricants and Lubricating Systems
- TOPIC:** Lubricants (Engine oils and their functions)
- OBJECTIVE:** To develop an understanding of oils and their function in an internal combustion engine.
- INTRODUCTION:** How long can an engine be run without oil and not harm it? First let's say that it is possible to run an engine without oil for a short period of time however the resulting damage is usually beyond repair. Proper lubrication of a tractor engine is a major factor in its continued efficient operation at low maintenance costs. It is obvious that oil serves as a lubricant to prevent metal to metal contact. Oil also has other equally important functions which are not so obvious but should be equally as well understood by the tractor mechanic. It is generally agreed that crankcase oils perform five major functions in engine lubrication. These are:
1. Lubricate moving parts
 2. Assist in cooling
 3. Seal the combustion gases in the cylinders
 4. Aid in keeping the engine clean
 5. Protect against rust and corrosion
- In the remainder of this assignment we will attempt to determine what is required of a crankcase oil to perform these functions.
- REFERENCES:** Required:
1. Gulf Farm Tractor Guide
 2. Tractor Maintenance AAAE + VA, pp. 18-21

UNIT: Lubricants and Lubricating System
 TOPIC: Lubricants (Engine oils and their functions)
 (Assignment Sheet continued)

3. "Farm Tractors - Basic Principles, Operation, and Maintenance", Engineering Bulletin FT, pp. 63-64.

Supplemental:

4. Selecting and Storing Tractor Fuels and Lubricants, pp. 27-39.

QUESTIONS
 or
 ACTIVITIES:

1. To lubricate all parts of an engine properly, oil must possess the proper "body". What is meant by "body"?
2. How does body affect lubricating qualities of oil?
3. What is viscosity?
4. How does heat affect viscosity?
5. What causes thickening of oil after long continued use in LP - Gas engines?
6. Even though the same chemical reaction occurs (as in 5 above) in gasoline and diesel engines, why is the same result of thickened oil not apparent?
7. What are the major engine parts which depend almost entirely upon the circulation of oil for cooling?
8. What specifically happens when the circulation of oil through the bearings of an operating engine is interrupted?
9. What is the most important characteristic of an oil if it is to seal properly?
10. How do detergent - dispersant oils keep an engine clean?

UNIT: Lubricants and Lubricating Systems
TOPIC: Lubricants (Engine oils and their functions)
(Assignment Sheet continued)

11. Under what types of operating conditions are detergent - dispersant crankcase oils especially valuable in keeping engines clean?
12. Why does contamination of oil occur more readily under the conditions specified in number 11 above?
13. Why is it that all oils do not prevent rust and corrosion in engines?
14. What happens to oil additives as they perform their functions in an engine?
15. List five specific contaminants which make it more advisable to change oil because of oil contamination rather than because of oil deterioration.

VOCABULARY:

The following key words or terms have been used in this assignment and should now be a part of your vocabulary. Explain or define each:

Viscosity
Oxidation
Dilution

Oil contaminants
Detergent - dispersant
Additive

Texas Education Agency
Texas A&M University

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Lubricants and Lubricating Systems

TOPIC: Lubricants: Crankcase-Oil Viscosity (Grade) and
Crankcase-Oil Type (Service Clas-
sification)

OBJECTIVE: To develop the ability to select the proper oil for
a tractor engine.

INTRODUCTION: Just any oil is not good enough. The preceding
statement does not refer to brand names but to
actual viscosity and type of oil as have been
scientifically determined and stamped on the con-
tainer. On an oil container we will find designat-
ions of viscosity (grade), such as SAE 30, SAE
20W, SAE 10W-30 or some other SAE designation.
We will also find single or multiple designations of
API service classifications (type), for example ML
or MS, DG and others, all of which will be studied
in this assignment.

The operator's manual is the key to determining the
viscosity grade and the crankcase oil type to be used
for a specific engine. However, there are other
factors to consider which will require knowledge of
the grade and classification systems as well as good
judgment on the part of the mechanic who may ser-
vice the tractor or advise the operator as the the
characteristics to look for in an oil.

To illustrate this point study the attached table from
John Deere Operator's Manual, OM-R39699, 3020
Tractors.

By careful study of the table you will note that AIR
TEMPERATURE will determine the oil viscosity
(SAE Grade). The other factor, EXPECTED TYPE
OF ENGINE SERVICE, will determine the crankcase
oil type (API Service Classification) which should be used.

UNIT: Lubricants and Lubricating Systems
 TOPIC: Lubricants: Crankcase-Oil Viscosity (Grade) and
 Crankcase-Oil Type (Service Classification)
 (Assignment Sheet continued)

After studying the introduction to this assignment, by careful reading of the references and answering the following questions, you should have a working knowledge of the factors involved in selecting the proper oil for a tractor engine.

REFERENCES: Required:

1. Selecting and Storing Tractor Fuels and Lubricants, pp. 28-29, 34-36. Questions 1-9; pp. 28-29, 10-12; page 34.

Supplemental:

3. "Farm Tractors-Basic Principles, Operation, and Maintenance " Engineering Bulletin No. FT-53. pp. 64-65, 69.
4. "Gulf Farm Tractor Guide", pp. 16-18.

QUESTIONS
 or
 ACTIVITIES:

1. What does SAE mean when used preceding a viscosity grade?
2. A lower viscosity grade number indicates that the oil is more fluid or less fluid?
3. What does the "W" indicate which follows the SAE number of the lower viscosity numbers?
4. What single-viscosity grades are available at the present time?
5. Why do viscosity recommendations issued by a tractor company vary with different types, sizes and models of tractors. as well as for different temperature operating conditions?

Information Sheet
on
LUBRICANTS AND LUBRICATING SYSTEMS

Gear oils are primarily used in the transmissions and rear-axle housings of agricultural machinery. In many respects they are similar to heavy crankcase oils, but their functions are somewhat different. They are given different viscosity-grade numbers (SAE: 80, 90, and 140) and different API classifications to prevent their being confused with crankcase oils.

As tractor horsepower has increased, gears have been improved to meet increased pressure and greater work loads. Gears have become smaller and tooth pressure has increased. In addition to the rolling action which occurs between gear teeth, gears go through a wiping action that tends to wipe away the oil layer separating the two gear surfaces. Additives have been added to gear oils to meet the more severe operating conditions now encountered and to cut down on the wear of gears caused by these increasingly severe operating conditions.

Temperature affects the viscosity of gear oils in the same manner that it affects crankcase oils. Therefore, it is necessary to consider viscosity grade and type classification when selecting gear oils.

1. Gear oil of proper viscosity has enough body to hold moving surfaces apart.
2. If gear oil is too heavy, engine power is wasted; the oil may channel and provide little or no lubrication thus making gears very hard to shift.
3. If the gear oil is too light, the oil film becomes so thin that high points on the sliding surfaces contact and wear rapidly.

Gear oils, like crankcase oils, contain certain kinds of additives depending upon their service classification. These additives include:

1. Anti-oxidants
2. Rust preventatives
3. Foam inhibitors

Lubricants and Lubricating Systems
(Information Sheet continued)

Lubricating grease is basically a lubricating oil with a soap-type thickening agent added to give it consistency. Different types of grease are used on agricultural machinery as determined by the operating requirements of a particular piece of equipment.

1. Lime soap is used in chassis grease; this results in a water-resistant grease that can be used anywhere where high operating temperatures are not present.
2. Soda soap is used to form a semi-smooth grease and is often referred to as wheel-bearing grease.
3. Lithium soap combines the water resistance and heat resistance of the other greases to provide a multipurpose lubricant that is suitable for all-round use on farm machinery.

Material for this Information Sheet was taken from Agricultural Machinery Assembly and Lubrication, The Center for Research and Leadership Development in Vocational and Technical Education, The Ohio State University, Columbus, Ohio.

UNIT: Lubricants and Lubricating Systems
 TOPIC: Lubricants: Crankcase-Oil Viscosity (Grade) and
 Crankcase-Oil Type (Service Classification)
 (Assignment Sheet continued)

Table From John Deere 3020 Tractor Operator's Manual OM - R39665

ENGINE OR AIR CLEANER OIL VISCOSITY

Depending upon the prevailing air temperature, use the following weight of oil in the engine crankcase and air cleaner:

DIESEL

Air Temperature	Single-Viscosity Oil	Multi-Viscosity Oil
Above 32° F. - 10° F. to 32° F. Below - 10° f.	SAE 30 SAE 10W	SAE 20W-40 SAE 10W-30 SAE 5W-20*

GASOLINE OR LP-GAS

Air Temperature	Single-Viscosity Oil	Multi-Viscosity Oil
Above 90° F. 32° F. to 90° F. - 10° F. to 32° F. Below - 10° F.	SAE 30 SAE 20W SAE 10W SAE 5W*	SAE 20W-40 SAE 10W-30 SAE 10W-30 SAE 5W-20

*Use of SAE 5W or 5W-20 oil may cause some increase in oil consumption. Check oil level more often when using this oil.

Be sure to select the oil you will use both by viscosity and by expected type of engine service; for example - ASE 20W-40, Service DS, for diesel engines; or SAE 20W-40, Service MS, for gasoline or LP-Gas engines.

UNIT: Lubricants and Lubricating Systems
TOPIC: Lubricants: Crankcase-Oil Viscosity (Grade) and
Crankcase-Oil Type (Service Classification)
 (Assignment Sheet continued)

6. What results may be expected from using a lighter grade oil than is recommended?
7. What results may be expected from using a grade that is too heavy?
8. What are "multi-viscosity" oils?
9. How many grades of a single-grade oil may a multi-grade oil replace?
10. What do the letters API mean?
11. What do the following letters mean?
ML; MM; MS; DG; DM; Ds
12. Which API Service Classification is not recommended by any farm tractor manufacturer?
13. Using the table from the John Deere Operator's Manual and table IV, page 36, Reference 1, determine the SAE Grade and minimum API Class of oil to use for the following conditions:
Determine for both spark ignition and diesel.
 - a. Air temperature 80° F., mowing.
 - b. Air temperature during working hours 80°-110° F., mowing.

ADDITIONAL INFORMATION:

Under the current API Classifications disregard such terms as "Regular," "Premium," and "Heavy Duty," as they are not necessarily meaningful.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Lubricants and Lubricating Systems

TOPIC: Lubricants: Gear Oils, Hydraulic Oils, and
Lubricating Greases

OBJECTIVE: To develop an understanding of the requirements for oils and greases in tractor lubrication and to develop the ability to select oils and greases for tractor lubrication other than for the engine.

INTRODUCTION: A hunter must know the caliber of his weapon and the purpose for which it is to be used before he can select the proper ammunition. A tractor mechanic should be just as knowledgeable about a tractor before making recommendations or servicing a transmission, differential, power take-off, pulley housing, final drive, or hydraulic system. The Farm Tractor Tune-Up and Service Guide (see reference) and also individual operator's manuals are very specific as to recommendations for the lubrication of each part of the tractor. These recommendations not only vary between manufacturers but also may vary between models of the same make. For example, some tractors use the same lubricant for the transmission and hydraulic system, whereas others require specific gear oil for one and a hydraulic oil for the other. Lubrication is the best preventive maintenance that can be performed but the lubricant must be used which has been determined by the manufacturer to satisfy the requirements of a particular machine. Never guess - look it up!

In the remainder of this assignment a closer look will be taken at gear oils, hydraulic oils, and lubricating greases. Opportunity will also be provided to compare the oil requirements of different makes of tractors.

UNIT: Lubricants and Lubricating Systems

TOPIC: Lubricants: Gear Oils, Hydraulic Oils, and Lubricating Greases
(Assignment Sheet continued)

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Lubricants and Lubricating Systems

TOPIC: Lubricating Systems

OBJECTIVE: To develop an understanding of how oil lubricates an engine.

INTRODUCTION: The life of an engine depends to a great degree upon the type of lubrication it receives. Some engines require a special oil, some have special fitting devices, others have no filters, while still others have special devices to lubricate the engine.

In this study we will determine what is necessary to properly lubricate an engine.

QUESTIONS
or
ACTIVITIES:

1. A good lubrication system should be:
 - a.
 - b.
 - c.
 - d.

2. Although a lubricating system may have the above named features, it must also possess two additional factors to be completely satisfactory. These are:
 - a.
 - b.

3. The most important parts of a gasoline engine which require lubrications are:
 - a.
 - b.
 - c.
 - d.
 - e.
 - f.

4. Generally, engine lubrication systems may be classified in three groups. These are:
 - a.
 - b.
 - c.

5. What maintains the correct pressure and controls the quantity of oil circulating in the force feed oil system?

6. What is the most widely used type of oil pumps?

7. Any engine having an enclosed crankshaft must have two oil indicators. These are:
 - a.
 - b.

8. What are two types of oil indicators?
 - a.
 - b.

Information Sheet
on
FUELS AND PRINCIPLES OF COMBUSTION

Fuels for an internal combustion engine must be specific in nature for its operation to be successful. These fuels must have a reasonably high energy value, yet be of such nature that they can be handled and transported easily and safely. These fuels must vaporize at least partially at fairly low temperatures and the vapors must ignite and burn readily when mixed with oxygen in correct proportions. These fuels must also be relatively safe for use and not too harmful or dangerous to human health and life.

Fuels for internal combustion engines may be classified as either gaseous or liquid according to the physical state before entering the engine cylinder. These fuels are also classified according to their origin as natural or artificial. The most common gaseous fuels derived from a natural origin is natural gas and LP gas. Natural gas, due to its properties, is used very limited for internal combustion engines. LP gases are used more frequently and are by-products of petroleum refining process. LP gases are derived (1) from dry gas and gasoline as it is removed from crude oil, (2) from recycling plants from the wet gas drawn from natural gas wells, or (3) from the normal processing of crude oil into commercial gasolines and distillates.

The more common types of liquid fuels derived from petroleum are gasoline, kerosene, distillate and diesel. These fuels are more easily stored and transported than the gaseous fuels.

The above mentioned fuels are of a natural origin, originating from petroleum. There are many variations in character of crude oil depending somewhat upon the location where it was obtained. In the refining process of crude oil it is converted into hundreds of commercial products by various distillation and refining processes. One of these products is gasoline. Today we have four grades of gasoline available. These are white or fourth grade, regular, premium, and super premium. Premium grade gasolines have the best anti-knock characteristics and are usually somewhat higher quality fuels. Although a person may use the highest quality fuel possible, there are still some impurities that may cause trouble. The two main natural impurities are gum and sulphur.

Fuels and Principles of Combustion
(Information Sheet continued)

Today the tendency toward higher compression ratios have caused a need for some change in tractor and automotive fuels. This higher compression has resulted in a pronounced fuel knocking effect termed detonation. Often this is confused with preignition, however, there is a distinctive difference. Detonation occurs during the process of combustion, whereas preignition occurs when the fuel charge is fired too far ahead of the compression dead center position of the piston. Today anti-knock additives such as tetraethyl lead is being used in gasoline to assist in eliminating engine knocks.

TOPIC: Gasoline Systems

OBJECTIVE: To develop an understanding of the parts of a gasoline fuel system and their functions.

INTRODUCTION: We know that an engine utilizes air and fuel in its process of operation, but do you understand how these are utilized? Will an engine run on gasoline without air? Just how is the air and gasoline mixed?

In this topic we will study the function of the gasoline fuel system and its operation in relation to the whole engine.

REFERENCES: Required:

1. Modern Farm Power, Ch. 6
2. Machines for Power Farming, Stone and Gulvin, Ch. 4
3. "Farm Tractors, Basic Principles, Operation and Maintenance," Humble Engineering Bulletin No. FT-53, pp. 10-18

Supplemental:

4. Service manual for make of tractor being studied.

QUESTIONS

or

ACTIVITIES:

1. What is the function of the carburetor?
2. How do air-fuel mixtures differ in cold or hot engines?
3. What are the four systems of a carburetor?

UNIT: Fuel Systems
TOPIC: Gasoline Systems
(Assignment Sheet continued)

4. What are two types of carburetors classified according to the direction of air travel through them?
5. Explain the function of the manifold heat control.
6. What is a simple type test a person can use to check the float level of a carburetor?
7. Explain how to adjust the idle screws of a carburetor?
8. Explain the adjustment of the load system of a carburetor.
9. What is the venturi? Explain its function in the carburetor.
10. What is responsible for maintaining a constant fuel level in the carburetor and why is it important to maintain a constant level?

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel Systems

TOPIC: L. P. Gas Systems

OBJECTIVE: To develop an understanding of the operation, care, and utilization of liquefied petroleum gas on farm tractors.

INTRODUCTION: In what ways are LP Gas tractors like gasoline tractors? In what ways do they differ? Will they perform the same as a gasoline tractor? These questions and others will be studied in this unit and with careful reading and study you can make these comparisons.

REFERENCES: Required:

1. Tractor Maintenance Principles and Procedures, pp. 62-63.
2. Information Sheet, "Liquid Petroleum Systems"
3. Farm Tractors, Basic Principles, Operation and Maintenance, FT-53.
4. "Gulf Farm Tractor Guide".

Supplemental:

5. Modern Farm Power, Bishop and Promsberger.

QUESTIONS
or
ACTIVITIES:

1. Why is butane and propane mixed for tractor fuel purposes?
2. Why is butane and propane mixed for storage?
3. What are the primary differences between a gasoline and LP engine? Trace the LP gas through its fuel system.

UNIT: Fuel Systems
TOPIC: L. P. Gas Systems
(Assignment Sheet continued)

4. What are the advantages of LP gas over gasoline?
5. On a per gallon basis, which fuel, gasoline or LP gas, has the most power? Explain.
6. What are the disadvantages of LP gas?
7. Explain the differences in carburetors of gasoline and LP gas engines?

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel Systems

TOPIC: Governors

OBJECTIVE: To develop an understanding of the purpose of an engine governor and to determine how it operates.

INTRODUCTION: In farm work it is almost essential that stationary engines maintain a constant speed whether under load or not. To do this the engines are equipped with governing devices.

In this lesson we will study the governing device, its construction, its operation, and how it will effect engine operation.

REFERENCES: Required:

1. Modern Farm Power, Promersberger and Bishop, Ch 8.
2. Tractor Maintenance Principles and Procedures, AAAE-VA, pp. 126-128.

Supplemental:

3. 'Farm Tractors Basic Principles, Operation and Maintenance,' Engineering Bulletin No. FT-53, pp. 18-20

QUESTIONS
or
ACTIVITIES:

1. What are the two types of governing systems?
2. What is the primary purpose of a governing system?
3. What is a governor hunting?
4. What is the cause of governor hunting?

UNIT: Fuel Systems
TOPIC: Governors
(Assignment Sheet continued)

5. What type governors do motor vehicles use?
6. Explain the method of operation of the hit and miss system of governing.
7. Explain the governing method of the throttle system.
8. What type governing system do all tractors have?
9. What is the main use of the hit and miss system?
10. Explain the method of operation of the vacuum system of governing.
11. How are diesel engines governed?
12. On what type engines is the vane-type governor used? Explain its method of operation.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

- UNIT: Fuel Systems
- TOPIC: Diesel Fuel Systems - Principles of Operation,
Combustion Chambers, Air Systems and
Starting Aids
- OBJECTIVE: To develop an understanding of the principle
differences between the operation of a diesel
and that of a gasoline engine.
- INTRODUCTION: Basically we know that all internal combustion
engines operate similarly but we need to have
a working knowledge of the differences which
exist in a diesel.
- In this topic we will study some of these dif-
ferences of operation and construction of
combustion chambers and the air system.
- REFERENCES: Required:
1. Modern Farm Power, Promersberger and
Bishop, pp. 13, 29, 41-43.
 2. Tractor Maintenance Principles and Pro-
cedures, pp 93, AAAE & VA.
 3. Tractor Fuels and Lubricants, Selecting
and Storing, page 11. AAAE & VA.
- Supplemental:
4. Diesel and High Compression Gas Engines,
Kates.
- QUESTIONS
or
ACTIVITIES: 1. Review the principles of operation of a two and
four stroke diesel engine. (Unit II Topic 1)

UNIT: Fuel Systems

TOPIC: Diesel Fuel Systems - Principles of Operation, Combustion Chambers, Air Systems and Starting Aids

(Assignment Sheet continued)

2. What causes combustion in a diesel engine?
3. How does the intake stroke of a diesel differ to that of a carburetor type engine?
4. When and how is the fuel added in a diesel engine?
5. After the fuel is added, when does ignition take place?
6. Why is it extremely important to keep the diesel engine fuel system clean?
7. Why is it necessary for the cylinder of a diesel engine to be more strongly constructed than that of a carburetor type engine?
8. On the two stroke diesel engine how is air furnished to the cylinder?
9. Due to the fact that diesel have such high compression ratio, they may be difficult to start. What are some starting aids to help start them?

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

- UNIT: Fuel Systems
- TOPIC: Diesel Fuel Systems, Injection Pump and Fuel Injectors
- OBJECTIVE: To develop an understanding of the functions of the fuel system, injection pump and fuel injectors to the diesel engine.
- INTRODUCTION: If you were asked to service the fuel system of a diesel tractor, could you do so? To be able to do this you would need to be familiar with the operation of a diesel fuel system, its parts and their function.
- REFERENCES: Required:
1. Tractor Fuels and Lubricants, AAAE and VA, pp. 11-14
 2. Tractor Maintenance, Principles and Procedures, pp. 93-99, AAAE & VA.
 3. Modern Farm Power, Promersberger and Bishop, pp. 62-64
- Supplemental:
4. "Gulf Farm Tractor Guide"
 5. "Farm Tractors, Basic Principles, Operation and Maintenance", Engineering Bulletin No. FT-53
- QUESTIONS
or
ACTIVITIES:
1. What is the most important thing to do when changing fuel filters on diesel engines?
 2. What are the parts of a diesel fuel system?

UNIT: Fuel Systems

TOPIC: Diesel Fuel Systems, Injection Pump and Fuel Injectors
(Assignment Sheet continued)

3. What is the purpose of the injection pump on a diesel system?
4. What is the purpose of the extremely high pressure the injection pumps deliver?
5. For what purpose is the return fuel line?
6. What is the purpose of the first, second and third stage filter of the diesel fuel supply system?
7. What determines the number of filters used on an engine?
8. What other terminology is used for designating stages of filters?
9. What are the five kinds of filters that may be used on farm tractor diesel systems?
10. Why is it necessary to bleed fuel lines after changing a filter? What general procedure should be followed?

for
AGRICULTURAL MACHINERY MECHANICS

- UNIT: Fuel Systems
- TOPIC: Air Cleaners
- OBJECTIVE: To develop an understanding of the function, kinds and systems of air cleaners on fuel systems of modern tractors.
- INTRODUCTION: We would all agree that a tractor must "breathe". It is as true with a tractor as with a human that bad air opens the way for internal trouble.
- In this lesson we will study how "bad" air can be filtered to produce clean air for the operation of the engine.
- REFERENCES: Required:
1. Modern Farm Power, Ch. 9
 2. "Farm Tractors", Engineering Bulletin No. FT-53, pp. 26-29
- Supplemental:
3. Tractor Maintenance, page 16
 4. "Gulf Farm Tractor Guide", pp. 34-35
- QUESTIONS
or
ACTIVITIES:
1. What are the three common types of air cleaners?
 2. According to test, what location of the intake stack proved to be the most efficient?
 3. What are the four requirements of an air filter for it to be considered as a well designed unit?

UNIT: Fuel Systems
TOPIC: Air Cleaners
(Assignment Sheet continued)

4. Explain the principle of operation of a dry type air cleaner.
5. Explain the principle of operation of the oil bath unit.
6. Explain the principle of operation of the oil soaked unit.
7. What is the proper way to clean each type filter?
8. What other parts of the air intake system should be checked and cleaned regularly?
9. How often should an oil bath cleaner be serviced?
10. What are some places where dust can enter the engine other than through the normal air entries?

AGRICULTURAL MACHINERY MECHANICS

UNIT: Electrical Systems

TOPIC: Magneto System

OBJECTIVE: To develop an understanding of the operation, care, and required service of a magneto system on internal combustion engines.

INTRODUCTION: Do all tractors have starters? Generators? Batteries? To answer these questions we need to go back to our early tractor electrical system. The modern day tractor utilizes the battery ignition system, however, many of the smaller engines on balers, grain elevators, and such utilize the magneto system.

In this topic we will study the magneto system, its parts and method of operation.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Electrical Systems

TOPIC: Introduction to the Battery Ignition System

OBJECTIVE: To develop an understanding of the purpose of the ignition system, the major components and the function of each.

INTRODUCTION: From the word "ignition" we would expect that the ignition system is designed to provide spark which ignites the fuel mixture in the cylinders. Since the spark plug extends into the combustion chamber, we know that the spark plug is one part of the ignition system. A "system" is defined as a number of things adjusted as a connected whole. The ignition system of a tractor is composed of a number of parts adjusted as a connected whole. In this assignment we will find out what these parts are, what they do, and how they are connected to the other parts to make a complete, functioning ignition system. In later assignments we will study each part of the ignition system in detail so that we will have the knowledge necessary to perform the services required of a tractor mechanic in maintaining a tractor engine at peak performance.

for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Engine Testing and Tune Up

TOPIC: Timing the Ignition System

OBJECTIVE: To develop an understanding of the importance of a properly timed engine.

INTRODUCTION: Proper timing is essential to proper engine operation. All farmers are interested in the economy of their operation however many fail to realize how uneconomical a poorly timed engine is.

In this topic we will study the importance of proper timing and the method to follow in timing an engine.

REFERENCES: Required:

1. Farm Tractors Basic Principles, Operation and Maintenance, Engineering Bulletin No. FT-53, pp. 50-51.
2. Tractor Maintenance Principles and Procedures, pp. 86-89.

Supplemental:

3. Modern Farm Power, pp. 69-79, Promersberger & Bishop.
4. Machines for Power Farming, pp. 80-83, Stone & Gulvin.

QUESTIONS
or
ACTIVITIES:

1. What are the two methods of timing an engine?
2. What does timing actually mean?
3. Where may the timing marks of an engine normally be found?

UNIT: Engine Testing and Tune Up
TOPIC: Timing the Ignition System
(Assignment Sheet continued)

4. How is the two wire timing light attached?
5. How is the three wire timing light attached?
6. How can a person determine when the number one piston is up on the compression stroke?
7. Where should the timing light be held and why?
8. When timing an engine by the breaker point method what is the relative position of the breaker points and timing marks?
9. When timing an engine, what should a person always do regarding instructions, timing marks, and adjustments?
10. What is retarded and advanced timing?
11. How is the diesel engine timed?

for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Engine Testing and Tune-Up

TOPIC: Valve Clearance Adjustments

OBJECTIVE: To develop an understanding of the importance of valves and how to properly adjust them.

INTRODUCTION: Most people know that there are valves in an engine but few know their purpose or how to adjust them. If a valve is improperly adjusted the result is often serious trouble to the farmer.

In this study we will consider the valve adjustments and how they effect proper engine performance.

REFERENCES: Required:

1. Modern Farm Power, pp. 79-80, Promersberger & Bishop.
2. Tractor Maintenance, Principles and Procedures, pp. 34-42. AAAE - VA
3. Farm Tractors, Basic Principles, Operation, and Maintenance, Engineering Bulletin No. FT-53, pp. 31-38.

Supplemental:

4. Machines for Power Farming, pp. 28-35, Stone-Gulvin.

QUESTIONS
or
ACTIVITIES:

1. By what other names may valve clearance adjustments be called?
2. What is valve clearance adjustment?
3. What are the two kinds of valves?
4. Why should valves be properly adjusted?

UNIT: Engine Testing and Tune-Up
TOPIC: Valve Clearance Adjustments
(Assignment Sheet continued)

5. Is valve adjustment made while the engine is hot or cold?
6. What tools are used to adjust valves?
7. At what point is the actual adjustment checked?
8. What is the purpose of the third racker arm per cylinder on a diesel engine?
9. Although valves are adjusted between the rocked arm and the valve stem where is the critical area of the valve?
10. How can valve springs be tested without a special testing device?

(cooperating)

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Hydraulics

TOPIC: Introduction

OBJECTIVE: To develop an understanding of how and why hydraulic principles operate, also to understand hydraulic theory and the basic systems involved in hydraulics.

INTRODUCTION: Hydraulics may be defined, in a strict sense, as the science of fluid forces. In modern usage, hydraulics' has come to mean the use of fluid to transfer power, or to change a power source into useful force.

The use of hydraulic power on modern farm tractors and equipment is relatively new but the principle of hydraulic power dates back to early times. There are several branches of hydraulics, but the branch applicable to farm equipment deals with enclosed liquids under pressure.

REFERENCES: Required:

1. Tractor Hydraulics, American Association for Agricultural Engineering and Vocational Agriculture, pp. 1-8.
2. Farm Machinery and Equipment, Smith, Ch. 7, pp. 65-67.

Supplemental:

3. The Operation, Care, and Repair of Farm Machinery, Deere and Company, Ch. 6, pp. 56-66.

QUESTIONS
or
ACTIVITIES:

1. What is the definition of "hydraulics"?
2. Who discovered the fundamental law upon which modern machine hydraulics is based?

UNIT: Hydraulics
TOPIC: Introduction
(Assignment Sheet continued)

3. List the nine main features that make hydraulics so adaptable?
4. No mechanical device is perfect. What are two drawbacks of hydraulics?
5. Give the three basic theories of hydraulics?
6. Define: a. Hydrostatic Power
b. Hydrodynamic Power
7. List the parts of a basic hydraulic system as illustrated on page 8, Tractor Hydraulics, AAAE&VA.

2. Farm Machinery and Equipment, Smith, Ch. 7, pp. 67-69.

QUESTIONS
or
ACTIVITIES:

1. Give the two classifications of pumps.
2. Which type of pumps does most farm and industrial equipment use?
3. Name the various types of pumps available on hydraulic systems.
4. Study the illustrations of the ten different types of pumps, pp. 11-16, Tractor Hydraulics, AAAE&VA.

Texas Education Agency
Texas A&M University
(cooperating)

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Hydraulics

TOPIC: Hydraulic Valves

OBJECTIVE: It was mentioned earlier that hydraulic systems are basically simple and they are, if the presence of many valves, of several types, is not allowed to confuse understanding.

Until recently, valves were the only means of controlling fluids in a hydraulic system. With the advent of "variable delivery" pumps, certain valves in systems having this type of pump may be eliminated. However, valves are still the most important method of controlling fluid pressure and flow, and obtaining wide flexibility in hydraulic systems.

REFERENCES: Required:

1. Tractor Hydraulics, American Association for Agricultural Engineering and Vocational Agriculture, pp. 17-24.

QUESTIONS
or
ACTIVITIES:

1. Nearly all the valves used in hydraulic systems may be classified into three categories. Name these three categories.
2. What are the five ways in which valves can be controlled?
3. Name the eleven specific-types of valves available for hydraulic systems.
4. Study the illustrations on page 17-23 in Tractor Hydraulics.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Hydraulics

TOPIC: Hydraulic Cylinders

OBJECTIVE: To develop an understanding of the cylinder and how
it operates on hydraulic systems. Also to understand
the different categories of cylinders.

REFERENCES: Required:

1. Tractor Hydraulics, American Association for
Agricultural Engineering and Vocational Agriculture,
pp. 24-28.
2. Farm Machinery and Equipment, Smith, Ch. 7,
pp. 69-73.

QUESTIONS
or
ACTIVITIES:

1. Cylinders may be classified into two general cate-
gories. Name these two categories.
2. Name five refinements found in the hydraulic cylinder.
3. Give the purpose of the hydraulic cylinder.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

- UNIT:** Hydraulics
- TOPIC:** Hydraulic Seals and Packing
- OBJECTIVE:** To develop an understanding of the different types of seals and packing used in hydraulic systems; also, to understand their general classification, and their functions.
- INTRODUCTION:** None of the components of a hydraulic system so far discussed would operate without proper seals and packings to hold the fluid under pressure in the system.
- REFERENCES:** Required:

Tractor Hydraulics, AAAE and VA, pp. 28-30
- QUESTIONS
or
ACTIVITIES:**
1. Give the two classifications of seals and packings according to their use.
 2. List the ten different types of seals and packings according to their shape.
 3. Study pictures of the different types of seals and packings and be able to identify each.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

- UNIT: Hydraulics
- TOPIC: Hydraulic Lines and Fittings
- OBJECTIVE: To develop an understanding of the different types of lines and fittings used in hydraulic systems.
- INTRODUCTION: No hydraulic system can be expected to operate without proper connections for moving the fluid between the various units of the system. Hydraulic lines must be designed and installed with the same care applied to the other parts of the system. They should be leakproof and strong enough to stand the maximum pressure, temperature, and vibration of the system involved. They should not be constructed of materials, or designed in a way, that will cause restriction of flow and turbulence. They should be large enough to carry the maximum pump output without excessive friction losses or turbulence. They should be as short as possible and have as few bends as possible. Hydraulic lines may be off piping, tubing or flexible hose.
- REFERENCES: Required:

Tractor Hydraulics, AAAE and VA, pp. 30-31
- QUESTIONS
or
ACTIVITIES:
1. What are the different types of metals used in piping and tubing?
 2. Why should one never use galvanized pipe in a hydraulic system?
 3. Give the bending radius of piping and tubing and also flexible hose.
 4. List the five various types of hydraulic line fittings as illustrated on page 31, Tractor Hydraulics.

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

- UNIT:** Hydraulics
- TOPIC:** Hydraulic Systems
- OBJECTIVE:** To develop an understanding of the different types of hydraulic systems and how they operate. Also, to understand the application of these systems.
- INTRODUCTION:** In order to be able to fully understand the application of hydraulics to equipment, it is necessary to understand what is meant by the descriptive terms applied to various kinds of hydraulic systems.
- Four components are all that are necessary to have a workable hydraulic system--A reservoir, a pump, a valve, and a motor (cylinder).
- Descriptive titles for the various systems discussed in this topic are based on the type of valve used, or its operation.
- REFERENCES:** Required:
- Tractor Hydraulics, American Association for Agricultural Engineering and Vocational Agriculture, pp 35-38
- QUESTIONS
or
ACTIVITIES:**
1. Name the four components which are necessary to have a workable hydraulic system.
 2. List the five different hydraulic systems.
 3. Study the five different hydraulic systems on page 36-38, Tractor Hydraulics and be able to describe the action of each.
 - a. Follow the fluid through the block return line system naming the parts through which it goes, to raise the cylinder plunger in illustration 49.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Introduction

TOPIC: The Parts of Machines

1. The function and application of a cam is to produce intermittent motion. This is done by action of the lobe or nose as it turns by the shaft causing the tappet to raise and lower as the nose turns by it.
2. The difference between a friction and anti-friction bearing is that the the friction bearing is in direct contact with the shaft wheras the anti-friction bearing has rollers or balls placed between the shaft and the supporting bearing, thereby reducing the friction.
3. The function of a bearing is to hold the various power transmission parts in position.
4. Types of ball bearings:
 - a. Internally self-aligning bearings
 - b. Single row deep groove bearings
 - c. Loading groove bearings
 - d. Single row angular contact bearings
 - e. Double row deep groove bearings
 - f. Double row angular contact bearings
 - g. Ball thrust bearings
5. Types of roller bearings:
 - a. Spherical
 - b. Straight
 - c. Spherical thrust
 - d. Tapered
 - e. Needle
 - f. Thrust
6. Roller bearings differ from ball bearings in that small cylindrical rollers are substituted for the balls which gives a much larger bearing surface.

THE PARTS OF MACHINES

1. The function of bearings in farm equipment is to hold the various power transmission parts in position.
2. Factors determining proper bearing selection are:
 - a. Amount of wear
 - b. Speed of turning shaft
 - c. Load to be carried
 - d. Amount of end thrust
3. Proper lubrication is essential to long life and service.
4. Bushings may be made from:
 - a. Wood
 - b. Babbitt
 - c. Bronze
 - d. Chilled iron
5. Two types of bearing bushings are:
 - a. Straight bearings
 - b. Graphited oilless

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Introduction

TOPIC: Transmission of Power

1. Six methods of transmitting power of farm equipment are:
 - a. Direct drive
 - b. Pulleys and belts
 - c. Sprocket wheels and chain
 - d. Gears
 - e. Shafts and universal joints
 - f. Flexible shafting
2. The advantage of a V-belt over a flat belt is that the V-belt has less belt slippage due to greater tractional contact between the sides of the belt and sheave flanges.
3. To properly fit a V-belt it should run in the sheave groove with the top surface almost flush with the top of the groove and at least 1/8 inch clearance under the belt in the bottom of the groove.
4. Belt lengths can be determined in the case of a V-belt by using the formula $L = 2c + 1.57(D+d) + \frac{(D-d)^2}{4c}$ where
L = effective length of belt, inches
d = distance between centers of sheaves, inches
D = effective outside diameter of large sheave, inches
d = effective outside diameter of small sheave, inches
In the case of flat belts to find the length add the diameters of the two belts together, divide by 2 and multiply by 3. To this product add twice the distance between the centers of the two shafts.
5. To calculate this speed or size of the pulley use the formula $S \times D = 5 \times D$. Where three of the quantities are known the fourth can easily be found.
S = r.p.m. D = diameter.
6. The pitch of the sheave will vary the speed because as the pitch is widened the belt will be running on a smaller diameter there by causing the speed of the pulley being driven to slow down. The pitch of alternate sheaves should be changed to vary speeds.

UNIT: Introduction
TOPIC: Transmission of Power
(Answer Sheet continued)

7. When using pressed steel hook chains run the hook end forward and slot side out when the larger of the sprockets is the driver. When the smaller of the sprockets is the driver, the chain should run in reverse direction.

8.
 - a. Spur
 - b. Cluster
 - c. Internal spur
 - d. Herringbone
 - e. Helical
 - f. Worm and worm heel
 - g. Straight level
 - h. Straight level gear set
 - i. Spiral-level set used in tractors
 - j. Hypoid gear set
 - k. Spline-shaft gear

Answer Sheet for Test
on
TRANSMISSION OF POWER

PART I:

1. The six methods of transmitting power in farm equipment are:
 - a. Direct drive
 - b. Pulley and belts
 - c. Sprocket wheels and chains
 - d. Gears
 - e. Shafts and universal joints
 - f. Flexible shafting

2. To properly fit a V-belt it should ride about level with the top of the sheave flanges and clear the bottom of the pulley about 1/8.

3. The length would be calculated as follows:

$$L = 2C + 1.57 (D + d) + \frac{(D + d)^2}{4c}$$

$$L = 2(24) + 1.57 (8 + 4) + \frac{4^2}{4 (24)}$$

$$L = 48 + 1.57 (12) + \frac{16}{96}$$

$$L = 48 + 18.84 + .17$$

$$L = 67 \text{ inches}$$

4. The diameter would be calculated as follows:

$$S \times D = S \times D$$

$$1800 \times 6 = 2400 \times (X)$$

$$10800 = 2400X$$

$$2.5 = X$$

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Introduction

TOPIC: Tractor Design

1. a. Wheel types
 1. All-purpose, most all farm work especially row-crop work
 2. A standard for general farmwork (open field work) but not major row crops
 3. Orchard
 4. Utility
 - b. Crawler type or tracklayer
 - c. Garden tractors
2. The all-purpose type is most popular because of its diversity of use. About 92% of all tractors sold for farm use are all-purpose and utility types (wheel type), 5% standard and 3% crawlers or tracklayers.
3. Tractors are rated according to horsepower and capacity meaning the width and number of moldboard plows the tractor can use.
4. All tractors are alike in the following ways:
- a. An internal-combustion engine as a source of power
 - b. A clutch to connect and disconnect the engine power and the driven parts.
 - c. A transmission system for conveying power to the driving members or to other points where applied
5. The basic elements of all farm tractors are:
- a. An engine
 - b. A clutch
 - c. A transmission
 - d. A final drive

Answer Sheet for Topic Test
on
TRACTOR DESIGN

1. a. Wheel type
 1. All-purpose
 2. Standard
 3. Orchard
 4. Utility
- b. Tracklaying or crawler type
- c. Garden

2. Tractors are also classified according to their adaptability to certain kinds of farm work such as field work, tilling, harvesting, haying, and etc.

3. The all-purpose type tractor is more widely used because of its versatility.

4. a. Tricycle
- b. Wide front axle
- c. One row or auxiliary

5. Features of an orchard or grove tractor:
 - a. Narrow tread wheels and short wheel base
 - b. Steering wheel and operators seat are lowered and protected by a cowl.
 - c. Overall height of the tractor is reduced
 - d. Projecting parts are covered
 - e. Designed to give added stability and safety

Texas A&M University
(cooperating)

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Internal Combustion Engines

TOPIC: Theory of Operation

1. A four cycle engine is one having four strokes or movements of the piston to complete the action necessary to produce power. Such an engine requires two complete revolutions of the crankshaft for each full cycle of events.
2. A two cycle engine is one having only two strokes or movements of the piston to complete the action necessary to produce power.
3. The four cycle carburetor type engine operates with four decisive strokes of the piston. The first stroke, known as the intake stroke, takes in a mixture of air and fuel through the intake valve which is open. The intake valve then closes and the piston begins its upward stroke or compression stroke until it reaches T. D. C. (Top Dead Center) of the crankshaft. This stroke has compressed the fuel-air mixture into a very small space between the piston and cylinder head. The third stroke then takes place when the spark from the spark plug ignites the compressed fuel and air causing a downward movement of the piston. This stroke is the power stroke causing the crankshaft to turn 180° . The fourth stroke is the upward movement of the piston while the exhaust valve is open driving out the burned gases.
4. The operation of a two cycle carburetor type engine is much the same as that of a four cycle engine. The main differences are that with each stroke of the piston two events take place rather than one, and the crankshaft makes only one revolution. This engine makes use of an air tight crankcase for partially compressing the fuel and air mixture. As the piston travels down the mixture previously drawn into the crankcase is partially compressed. As the piston nears the bottom of the stroke it uncovers the exhaust and intake ports. The exhaust then flows out reducing the pressure in the cylinder. This reduces the pressure in the cylinder lower than that in the crankcase allowing the new fuel charge to flow into the cylinder through the port openings. The incoming mix-

UNIT: Internal Combustion Engines
TOPIC: Theory of Operation
(Answer Sheet continued)

ture is deflected upward by a baffle on the piston. As the piston travels upward it compresses the mixture above and draws a new air-fuel mixture into the crankcase. The engine then fires, driving the piston down and thereby beginning another stroke.

5. Lubrication in a two-cycle engine is provided for by mixing the oil and fuel.

Texas Education Agency
Texas A&M University
(cooperating)

Answer Sheet for Test
on
THEORY OF OPERATION

1. Intake: Air and fuel mixed in the carburetor are drawn into the cylinder through the open intake valve by the downward action of the piston.
Compression: Both valves are closed and the air-fuel mixture is compressed in the upper part of the cylinder by the upward motion of the piston.
Power: An electrical charge is produced by the spark plug igniting the compressed air-fuel mixture. The expansion of the fuel drives the piston down turning the crankshaft. Both valves are closed.
Exhaust: The exhaust valve opens and the burned fuel fumes are driven out by the upward movement of the piston.

2. Intake and Exhaust: At the bottom of the power stroke the piston travels below the port openings and allows the fuel previously partially compressed in the crankcase to flow into the cylinder. This drives the fumes of the burned fuel out the exhaust port on the opposite side of the cylinder. The fresh fuel is deflected upward by a baffle on the piston.
Compression and power: As the piston travels up, it closes the intake and exhaust ports and compresses the fuel-air mixture in the top of the cylinder. As the piston reaches the top of its travel, a spark is injected by the spark plug igniting the compressed fuel, thereby forcing the piston back down.

3. Equipment requiring small power requirements such as garden tractor power lawn mowers, outboard engines, etc.

4. Mixing oil with fuel

5. A stroke is the movement of the piston from top of the stroke or T. D. C. (Top Dead Center) to the bottom of the stroke or C. D. C. (Crank Dead Center).

Cylinder head
Piston Pin
Connecting rod
Crankshaft
Flywheel
Crankcase (block)
4. The block of a diesel must be designed to withstand more pressure per square inch and a higher operating temperature.
5. Engines are classified according to cylinders by numbers. An engine may have one, two, four, six or eight cylinders and up. They are also classified according to horizontal or vertical cylinders.
6. An engine is classified as a straight block meaning all pistons fall in a straight line. A vee (V) block indicating that the pistons are in two rows opposite each other.
7. In most engines each cylinder has two valves; one intake and one exhaust. In a two cycle engine the cylinder does not have any valves. The piston acts somewhat like a valve by passing over port holes in the cylinder wall allowing the movement of air and fuel.

UNIT: Internal Combustion Engines
 TOPIC: Engine Types
 (Answer Sheet continued)

8. Diesel engines differ from carburetor type engines in many ways and yet they are alike in many ways. In the carburetor type engine the air and fuel are mixed before they enter the cylinder on the intake stroke whereas in the diesel engine only air is taken in on the intake stroke. When the air has been compressed by the compression stroke it causes a rise in temperature. At just the right time for firing a fine mist of fuel is forced into this highly compressed air and ignition takes place. The air is so hot that it automatically ignites the fuel without a spark.

In a gasoline carburetor type engine compression ratios range between 5.5 to 1 to 8.5 to 1 while diesels range between 15 to 1 to 19 to 1.

The operating temperature of a diesel is much higher than that of a gasoline carburetor type engine.

- VOCABULARY:
1. Bore - the size of the cylinder
 2. Stroke - The distance traveled by the piston from its extreme upper position in the cylinder to its extreme lower position
 3. Piston displacement - is a measure of volume displaced by the piston during one complete stroke.
 4. Intake valve - the valve through which fresh air-fuel mixtures in four cycle carburetor type engines or fresh air in diesel engines enters the cylinder.
 5. Exhaust valve - the valve through which fuel gases are expelled in a four cycle engine
 6. Piston - the cylindrical vessel moving within the cylinder

UNIT: Internal Combustion Engines
TOPIC: Engine Types
(Answer Sheet continued)

7. Crankshaft - the longest shaft in the engine which transforms the reciprocating action of the pistons into a rotary motion.
8. Spark plug - a part fitting into the head of a cylinder which has two electrodes separated by an air gap across which the current from the ignition system discharges to form a spark thereby igniting the fuel present in the cylinder
9. Cylinder - often called the heart of the engine. With in the cylinder the process of combustion takes place.
10. Connecting rod - the rod which transmits the pressure of the piston to the crankshaft
11. Fuel injector - a pump-like device used to inject fuel under pressure into the cylinder of a diesel engine.

Answer Sheet for Test
on
ENGINE TYPES

1.
 - a. Cooling system
 - b. Fuel system
 - c. Lubrication system
 - d. Ignition and electric system

2.

a. Cylinders	f. Cylinder head
b. Pistons	g. Piston pin
c. Piston rings	h. Connecting rod
d. Valves	i. Crankshaft
e. Valve opening parts	j. Flywheel
k. Crankcase (block)	

3. Diesel and carburetor type engines differ in the following ways:
 - a. Block construction
 - b. Compression ratios
 - c. Method of igniting fuel
 - d. Method of fueling cylinder
 - e. Operating temperature or cooling system

4.
 - a. The size of the cylinder is known as the bore.
 - b. Piston stroke is the distance traveled by the piston moving from its extreme upper position to its extreme lower position as expressed in inches.
 - c. Piston displacement is a measure of the volume displaced by the pistons during one complete stroke, as expressed in cubic inches.
 - d. Fuel injector is a pump like device used to inject fuel under pressure into the cylinder of a diesel engine.
 - e. The crankshaft is the largest shaft in the engine which transforms the reciprocating action of the pistons into a rotary motion.

5. The advantage of a sleeve type cylinder is that when the cylinder walls become severely worn that sleeve may be removed and a new sleeve installed thereby giving new cylinder walls.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Internal Combustion Engines

TOPIC: Power Measurement

1. Horsepower is the rate of doing work equivalent to raising 33,000 lbs. one foot in one minute.
2. A btu is defined as a British thermal unit. To convert heat to power, tests have been conducted which show that 42.44 btu per minute is equivalent to one horsepower.
3. In itself, the tractor is of little good to the farmer because it does not put the horsepower to work. Until some source of outlet for power is attached to the tractor, the horsepower is confined in the tractor. The attachment of a plow or such supplies a source of outlet.
4.
 - a. Draw bar
 - b. P. T. O.
 - c. Driving members
 - d. Hydraulic system
5. Indicated horsepower differs to brake horsepower because it does not take into consideration friction or other mechanical loss.
6. Conditions affecting the calculation of draw-bar horsepower are:
 - a. Condition of ground
 - b. The adhesion of the driving wheels to the ground
 - c. The size of the driving wheels
 - d. The packing of the ground
7. Indicated horsepower

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Lubricants and Lubricating Systems

TOPIC: Lubricants (Engine oils and their functions)

1. Body or viscosity is the thickness or resistance to flow.
2. It must be heavy enough at operating temperature to prevent metal to metal contact. If it is too heavy, it cannot penetrate close clearances.
3. Viscosity is the body of an oil or its resistance to flow. It is expressed as the number of seconds required for a certain quantity (60ml.) of the oil to flow through a hole of a specified size in a special instrument known as a viscosity meter.
4. Viscosity decreases as the oil is heated.
5. Oxidation resulting from the exposure of the hot oil to air in the crankcase.
6. Thinning effect of fuel dilution.
7. Main and connecting rod bearings, and wrist pins and pistons.
8. The bearings will "burn out" or seize.
9. Viscosity.
10. Prevent deposits of oil contaminants as they are formed and by holding them in minute dispersion (suspension) in the oil so that they are eliminated when the crankcase is drained.
11. Short periods of operation, light loads, rich mixtures, or excessive idling.

UNIT: Lubricants and Lubricating Systems
TOPIC: Lubricants (Engine oils and their functions)
(Answer Sheet continued)

12. Low engine temperature and/or poor combustion.
13. Some oils do not have adequate quantities of properly selected additives having effective rust and corrosion preventing properties.
14. They are "used up."
15.
 - (1) Dust and dirt
 - (2) By-products of combustion such as soot, carbon, acidic by-products and condensed water vapor.
 - (3) Unburned fuel from blow-by or fuel leaks
 - (4) Wear metals and rust
 - (5) Water or antifreeze solution from internal leaks in the cooling system

VOCABULARY:

1. Viscosity - the body of an oil or its resistance to flow. It is expressed as the number of seconds required for a certain quantity (60ml.) of the oil to flow through a hole of a specified size in a special instrument known as a viscosity meter.
2. Oxidation - a chemical change in oil causing it to thicken. This is caused by hot oil being exposed to air in the crankcase.
3. Dilution - the thinning of an oil caused by the fuel mixing with the oil.
4. Oil contaminants - foreign matter in the oil solution.
5. Detergent - dispersant - additives to oil which keep foreign matter in suspension.
6. Additive - chemicals added to oils for various reasons.

AGRICULTURAL MACHINERY MECHANICS

UNIT: Lubricants and Lubricating Systems

TOPIC: Lubrication: Gear Oils, Hydraulic Oils, and Lubricating Greases

1. Some crankcase and gear oils are of the same viscosity, therefore it was necessary to number them differently to avoid confusion.
2. SAE 75, SAE 80, SAE 90, SAE 140, SAE 250.
3.
 - a. Regular Type Gear Lubricant
 - b. Warm Type Gear Lubricant
 - c. Mild Type Extreme Pressure (EP) Gear Lubricant
 - d. Multi-purpose Type Gear Lubricant (API Service GL4)
4. Regular type and multi-purpose type.
5. Tractor manufacturers sometimes provide a special oil that is different from those available under API Classification.
6.
 - a. Operating the hydraulic implement control system
 - b. Operating the hydraulic steering mechanism
7.
 - a. Single-grade and multi-grade crankcase oils of various types
 - b. Gear oils
 - c. Hydraulic oil
 - d. Special oils-supplied by tractor manufacturers for use with their particular tractors.
8.
 - a. Anti-oxidants that keep the oil from thickening
 - b. Rust and corrosion inhibitors
 - c. Prevent foaming
 - d. Mild extreme pressure (EP) additives prevent rapid wear and scoring of the hydraulic pump and gears.
9. Multi-purpose grease
10.
 - a. Rust inhibitors
 - b. Anti-oxidants

AGRICULTURAL MACHINERY MECHANICS

UNIT: Lubricants and Lubricating Systems

TOPIC: Lubricating Systems

1.
 - a. Efficient in operation
 - b. Reliable
 - c. Trouble-proof
 - d. Simple
2.
 - a. Good quality lubricant
 - b. Correct grade of lubricant
3.
 - a. Cylinder walls and piston
 - b. Piston pin
 - c. Crankshaft and connecting rod bearing
 - d. Valves and valve-operating mechanism
 - e. Other moving parts such as fan, water pump, ignition mechanism, etc.
4.
 - a. Simple circulating splash
 - b. Internal force feed and splash
 - c. Full internal force feed
5. A relief valve
6. Gear driven
7.
 - a. An oil level indicator
 - b. An oil pressure or circulation indicator
8.
 - a. Bayonet type-stick type
 - b. Test cocks, one for high level and one for low level
9.
 - a. Too thin oil
 - b. Lack of oil
 - c. Oil too cold or too heavy to flow
 - d. Broken pump parts or oil lines
 - e. Clogged oil screen or oil lines

UNIT: Lubricants and Lubricating Systems
TOPIC: Lubricating Systems
(Answer Sheet continued)

10. Piston pumping action creates an uneven pressure in the crankcase, therefore some means must be present to keep the oil from being forced out of the crankcase joints or past pistons and into the combustion chamber. The breather may also serve as the oil-filler opening.
11.
 - a. Poor carburetor settings
 - b. Excessive chocking
 - c. Loose, badly worn piston rings
12. Controls and eliminates trouble caused by water and fuel vapors.
13. Reduce engine wear by removing foreign particles from the oil.
14.
 - a. General operation
 - b. Filtering principle
 - c. Size
 - d. Direction of flow
 - e. Type of element

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel Systems

TOPIC: Fuels and Principles of Combustion

1.
 - a. Reasonably high energy value
 - b. Vaporize at comparatively low temperatures
 - c. Fuel vapor must ignite and burn readily when mixed in the proper proportions with oxygen.
 - d. Not unduly harmful or dangerout to human health or life
 - e. Can be handled and transported with comparative ease and safety.
2.
 - a. According to physical state before entering engine cylinder, either gaseous or liquid
 - b. According to origin of fuel either natural origin or artificial
3.
 - a. Gasoline
 - b. Diesel
 - c. Liquefied petroleum
4.
 - a. From dry gases and gasoline as it is removed from crude oil
 - b. From recycling plants from the wet gas
 - c. From the normal processing of crude oil into commercial gasoline and distillates
5.
 - a. Gasoline
 - b. Kerosene
 - c. Distillate
 - d. Diesel fuels
6. The ability of a liquid to change to a vapor
7.
 - a. White or fourth grade
 - b. Regular
 - c. Premium
 - d. Super-premium

UNIT: Fuel Systems
 TOPIC: Fuels and Principles of Combustion
 (Answer Sheet continued)

8. Detonation is the "knock" caused by higher compression pressures, whereas preignition is the firing of the fuel charge too far ahead of the compression dead center position of the piston.
9. Combustion is the chemical union of the fuel with oxygen. In an internal combustion engine this union gives off intensive heat and produces an oxide. These gases being confined in a very small place, produce high pressures and consequently exert a great force on the piston and thus generate power.
10. The ability of a gasoline to resist detonation.
11. Diesel fuels are graded by the American Society for testing materials into two grades. Number 1 Diesel Fuel (NO. 1-D) and number 2 Diesel Fuel (NO. 2-D). They are graded on the basis of the centane number, and the maximum limits of impurities such as water sulfur, sediment, etc.
12. Centane rating is a measure of the self ignition and burning qualities of diesel fuel of which anti-knock is one quality.
13. The two worst enemies of diesel fuel is sulphur and water.

Vocabulary:

Destillate = crude oil products greatly resembling kerosene but having a different color and odor.

LP gas = liquified petroleum so named because they turn to gas at atmospheric pressure and temperature. More or less a by-product of the petroleum refining process.

Detonation = the "knocking" effect caused by fuel in high compression engines after ignition has taken place.

Preignition = the noise made when fuel is ignited too far ahead of compression dead center of the piston.

Combustion = the chemical union of fuel and oxygen causing force to be applied to the piston thereby producing power.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel Systems

TOPIC: Gasoline Systems

1. Mix and deliver the proper air-fuel mixture to the engine.
2. In a cold engine the air-fuel ratio should be about 9 to 1, whereas the ratio in a hot engine should be about 15 to 1. In extremely cold engines the choke may provide a mixture as rich as 2 to 1.
3.
 - a. The fuel supply system
 - b. The idling system
 - c. The load system
 - d. The choke or starting system
4. Updraft and downdraft
5. To deflect hot exhaust gases around the intake manifold to assist in vaporizing the fuel droplets entering the engine
6. Place a small rubber and glass tube device to the bottom of the carburetor and then run it upright along the side of the carburetor float bowl. The liquid in the tube will then seek the same level as that in the float bowl. Engines having fuel pumps should be running when this test is made.
7. First, you would adjust the idle speed adjustment screw. This is done by closing the throttle until the engine runs at a fast idle. Then turn in the idle speed adjustment screw until the engine begins to increase speed. Close the throttle completely and re-adjust the needle turning it out until engine reaches the idle speed you want. (approximately 425 rpm).
8. First, bring the engine to normal operating temperature and then by turning the adjustment screw counterclockwise set the carburetor for the type work to be done--light or heavy. It is always best to consult the operator's manual for exact settings.

UNIT: Fuel Systems
TOPIC: Gasoline Systems
(Answer Sheet continued)

9. The venturi is a narrowing of the throat of the carburetor causing somewhat of a restriction. Its purpose is to increase the velocity of the air entering the carburetor. This is to create a partial vacuum at the discharge nozzle in order to get better fuel to air mixture
10. A float and needle valve is used to maintain a constant fuel level. This is important in order to obtain a uniform discharge of fuel.

Answer Sheet for Test
on
GASOLINE SYSTEMS

1. Updraft and downdraft refer to the direction of wind travel through the carburetor whether up or down.
2. A venturi is a narrowing of the carburetor throat causing somewhat of a restriction.
3.
 - a. Fuel supply system
 - b. Idling system
 - c. Load system
 - d. Choke or starting system
4. Bring the engine to normal operating temperature and then close the throttle to cause the engine to run at a slow idle. Turn the idle adjustment screw in until the engine begins to increase speed. Close the throttle completely, and then turn the idle adjustment screw out until the engine slows to the desired speed. (approximately 425 RPM)
5.
 - a. Quicker engine warm up
 - b. Increased fuel economy
 - c. Reduction of cylinder wall wear

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel Systems

TOPIC: LP Gas Systems

1. Because, propane has a lower boiling point than butane and thereby insures vaporization at extremely low temperatures.
2. In the winter straight butane will loose its pressure at 32° F. whereas propane will retain approximately 54 pounds pressure at 32° F. In the summer butane will have only 32 pounds pressure at 100° F. , whereas propane will have 195 pounds pressure at 100° F. For these reasons a mixture of the two fuels ranging from high propane concentration in winter to high butane concentration in summer is used to maintain a fairly constant pressure.
3. They are of the same general type and make-up, however, the LP may have a slightly higher compression ratio ranging up to 9:1. The big difference is in the handling and utilization of the fuel. In this type engine the fuel goes from the storage tank through a filter to the high pressure regulator. Here, the pressure is reduced to about 8 pounds per square inch and partial expansion and vaporization begins. The fuel then enters the vaporizer coils, which is surrounded by heated water from the engine cooling system, and further expansion and vaporization occur. This vapor then passes through the low pressure regulator which reduces the pressure slightly below atmospheric. From here the fuel goes to the carburetor where it is mixed with air before entering the cylinder. It also takes a different type carburetor.
4. Less wear due to burning clean, leaving no deposits
A high anti-knock characteristic
5. Gasoline has the greatest potential power having a heat value of 124,000 btu's per gallon compared to 91,500 to 103,500 btu's per gallon on propane and butane respectively. Assuming that the engine will have the same thermal efficiency when using either fuel, we will see that gasoline will have the greater horsepower hour out put.

UNIT: Fuel Systems
TOPIC: LP Gas Systems
(Answer Sheet continued)

6. Storage problems and costs
Lower btu rating

7.
 - a. The LP gas engine carburetor has no fuel float and storage chamber since the fuel enters the carburetor as a gas.
 - b. There is no venturi since LP gas and air mix readily
 - c. The choke on some models works opposite to that on the gasoline engine. Rather than shutting off the air, it shuts off fuel.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel Systems

TOPIC: Governors

1. a. Hit and miss system
b. Throttle system
2. To maintain constant engine speed whether under load or running free.
3. The fluctuating of engine speeds caused by the governor.
4. It is caused by incorrect carburetor settings or by the governor being too stiff or by striking or binding so that it fails to act freely.
5. A vacuum or automatic type
6. The hit and miss system is adapted only to slow speed engines. It keeps all explosions alike and at the maximum intensity, but varies the number per time interval depending upon the power out put required. This is achieved by weights on the flywheel which tend to spread apart as speed increases. This expansion slides a collar on the shaft which reacts on one end of the pivoted detent arm causing the opposite end to catch in a notch on the exhaust valve holding it open. This valve being held open will not allow a fuel charge to be drawn in, compressed and fired, thereby slowing the engine down.
7. The principle of the throttle system of governing is to permit the engine to fire the maximum number of times but to regulate the fuel charge per cycle thereby slowing the engine down. This is done by a set of weights on the shaft which are held together by springs. As the engine builds up RPM's the weights fly apart, moving a sliding collar and actuating a throttle connecting rod causing the throttle butterfly to partly close thereby cutting off the fuel mixture. As the fuel mixture is decreased the engine slows down.
8. The throttle governing system.
9. For slow speed single cylinder engines.

UNIT: Fuel Systems
TOPIC: Governors
(Answer Sheet continued)

10. The vacuum type governor is located between the carburetor and intake manifold. It consists of a housing and a throttle-butterfly valve mounted off center and connected to a spring controlled cam and lever mechanism. As the pressure of the gas being drawn into the engine increases the off center mounted butterfly tends to close, thereby maintaining a constant speed.
11. Diesel engines are governed by the weight or fly ball system. As the weights on the governor begin to change positions it moves a geared rack which rotates the scroll and supplies the correct amount of fuel.
12. On air cooled engines the vane-type method of governing is used. As the engine speed increases, the vane is forced by air toward a closed position. The throttle spring then takes over holding the valve at whatever position the throttle is set.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel System

TOPIC: Diesel Fuel Systems - Principles of Operation, Combustion Chamber, Air Systems, and Starting Aids

1. Review taken from required texts.
2. Combustion is caused by the rising temperature of the compressed air which reaches a temperature of 1000° F. to 1100° F.
3. On the intake stroke of a diesel only air is brought into the combustion chamber whereas both fuel and air is drawn into the carburetor type engine.
4. The fuel is injected under pressure by the fuel injector into the pre-compressed air.
5. Ignition takes place immediately upon injection due to the temperature of the air.
6. Cleanliness is extremely important due to the extremely precisioned machined parts in the injection system.
7. In the diesel engine the compression ratios range up to twice that of the gasoline or LP gas engines. Also, the heat range is much higher making it necessary to increase the amounts and materials of construction.
8. On a two stroke, diesel air is pumped into the cylinder by a blower mounted in line with the intake port.
9. A diesel may be started by the following ways:
 - a. A small auxiliary engine may be used
 - b. A dual fuel system may be used
 - c. Direct starting on diesel fuel by use of 24 volt electrical system to turn motor.

for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel Systems

TOPIC: Diesel Fuel Systems, Injection Pump and Fuel Injectors

1. Always work in extremely clean conditions and avoid getting any foreign material in a filter unit.
2.
 - a. Fuel tank
 - b. Low pressure line where filters are located
 - c. Injection pump
 - d. High pressure line (on some)
 - e. Injectors
 - f. Return fuel line (on some)
3. To apply very high pressure to the fuel from 2400 psi to as high as 20,000 psi.
4. This high pressure is used by the injector nozzles to make a fine mist of the fuel as it is sprayed into the cylinders. This provides for an immediate and even mixture with air in the cylinder for even burning.
5. The return fuel line returns excess fuel from the injectors or from the injection pump or both to the fuel tank depending upon the design of the injectors.
6. A filter is for the purpose of removing moisture and dirt particles from the fuel. The first stage filter removes most of the water and coarse material, the second stage filter removes the finer particles and a small amount of water. If a third stage is used, it is intended to remove any remaining smaller particles.
7. The number of filters used is a matter of judgement on the part of the manufacturer.
8. First stage may be called the primary or auxiliary filter, the second stage may be called the intermediate and the final stage is known as the final filter.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel Systems

TOPIC: Air Cleaners

1.
 - a. The dry type
 - b. The oil soaked element type
 - c. The oil bath type
2. One located 30" above the dash of the tractor
3.
 - a. It must effectively remove dust, but not restrict unduly the carburetor intake
 - b. Must work successfully in all climates
 - c. Require only minimum attention from the operator
 - d. Sturdily built
4. The dry type oil filter utilizes two principles; one being a rapid change in direction to cause large particles of air to fallout and another the swirling of the air to cause large particles to be thrown out by centrifugal force. After the air is cleaned in this manner, it then passes through a pleated paper filter designed to allow the air to pass through but stop dust particles. This paper is often chemically treated to aid in the filtering of the air. This system is 99% effective and is often used as a pre-cleaner.
5. The oil bath unit also utilizes the principle of reversing the direction of air travel. The air is drawn down a tube until it strikes oil held in a small reservoir at the bottom. As the air strikes the oil, the impact causes a mixture of oil spray and air to be carried upward into a separating element consisting of a system of baffels and metal mesh. The separating elements cause the dust laden air to be broken into fine air streams and change directions many times. Dust will be trapped by the oil film and gradually returned to the reservoir.

UNIT: Fuel Systems
TOPIC: Air Cleaners
(Answer Sheet continued)

6. The oil soaked element is very simple in operation. The element is placed in the path of travel of the air and as the air strikes it the oil on the filter element holds the dust and allows the clean air to continue its travel.
7.
 - a. The oil bath filter is cleaned by removing the bowl and washing it in a good solvent, replacing the oil with correct grade and amount according to the operator's manual directions.
 - b. The oil soaked element is cleaned by removing the element, wash it in tractor fuel, drying it and then dip it in fresh oil. Also, wipe all dust out of the filter itself.
 - c. The dry filter is cleaned by removing the element and tapping it gently to remove the remaining particles. In the case of a pre-cleaner, empty all loose dust particles and wipe the container clean with a clean rag.
8. The air intake tube, all pre-cleaners and screens and engine breather caps.
9. Daily or more often in extremely heavy dusty work.
10.
 - a. Around worn parts of the carburetor
 - b. Places where gaskets are missing
 - c. In drain holes in carburetors
 - d. Damaged filter elements
 - e. Loose connections

Answer Sheet for Test
on
AIR CLEANERS

1. A farm tractor requires about 9000 gallons of air for each gallon of fuel burned. If this air is not clean the engine will wear out in a very short time, approximately, a few hundred hours.
2. It is too flammable
3. No, because the engine may have some gaskets, connections or missing parts which will allow dust to enter.
4. The use of an air cleaner will lengthen the life of the engine as well as provide for better performance.
5. The service manual will give you information as to how often the filters should be changed, how specific brands should be cleaned and the replacement unit identification numbers.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Fuel Systems

TOPIC: Intake and Exhaust Manifold and Pipes

1. The purpose of the intake manifold is to conduct the fuel and air mixture from the carburetor to the engine cylinders.
2. Yes, copper-asbestos gaskets are necessary because of the extreme heat.
3. The intake manifold gasket seals out air impurities and seals in the fuel air mixture so that the engine will perform properly.
4. To help eliminate a fire hazard, cut down on noise and assist in removing exhaust fumes.
5. The intake manifold is designed to prevent the inertia of the mixture from loading up one cylinder and to give equal mixture in each cylinder.
6. Back pressure in the engine reduces performance and may cause valve trouble.
7. Replace mufflers with factory recommended units and be sure all connections are tight.
8. Inertia is the movement of the air-fuel mixture in a uniform motion in the same straight line going to the same cylinder unless acted upon by outside forces.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Cooling Systems

TOPIC: Liquid and Air Cooling Systems

1. 175°
2. From water jacket to radiator, down radiator to bottom and back up through the water jacket from bottom to top.
3. Thermo-siphon and forced circulation
4. As the water flows down through the radiator, the heat is transferred from the water to the metal in the radiator. The fan pulls air through the radiator thereby transferring the heat into the air stream.
5. The thermostat blocks the flow of water into the radiator thereby allowing the engine to heat up to normal operating temperature more rapidly. When the normal operating temperature is reached, the thermostat will open allowing the water to pass on through the opening and into the radiator.
6. No. The thermo-siphon system operates on the principle that as water is heated, it becomes lighter and as it moves up, cooler air from the radiator will take its place. This hot air will rise and finally enter the top of the radiator. As it does the air will cool, thereby becoming heavier and settle to the bottom of the radiator thereby completing a cycle.
7. The water pump is to speed up cooling by speeding up circulation.
8. Diesel 145°-165°
Tractor fuel 190°
9. With each pound of pressure the boiling point is increased 3° F.

UNIT: Cooling Systems
TOPIC: Liquid and Air Cooling Systems
(Answer Sheet continued)

10. This system forces air past the hottest part of the engine block and cylinder head. Sheet metal shrouds are often used to direct the flow of air. The air is usually forced through the system by a fan which is usually a part of the fly wheel.
11.
 - a. An accumulation of leaves or chaff on the radiator
 - b. An overload on the engine
 - c. Insufficient water in the cooling system
 - d. Excessive lime deposits in the cooling system
 - e. Carburetor out of adjustment (usually too lean)
 - f. Ignition out of time
 - g. Loose fan belt
 - h. Use of a fuel too low in anti-knock quality for the engine
12. Because, it does not have the heat carrying capacity that water has.
13. No
14. Near the outlet of the cylinder head.
15. 300 hours
16.
 - a. Excessive wear
 - b. Warpage and cracking of engine parts (particularly heads)
 - c. Burning of valves
17.
 - a. Increase fuel consumption
 - b. Excessive wear (due to inadequate oiling)
 - c. Lower horsepower

Texas Education Agency
Texas A&M University

Answer Sheet for Test
on
LIQUID AND AIR COOLING SYSTEMS

1. Air and liquid
2. Thermo-siphon and forced circulation
3.
 - a. Excessive wear
 - b. Excessive fuel utilization
 - c. Loss of power
 - d. Burning of valves
 - e. Warpage and possible cracking of engine parts
4. Gasoline - 175°
Diesel - 145° - 165°
Tractor fuel - 190°
5. Near the outlet of the cylinder head
6. The air is forced around the fins of the engine by use of a sheet metal shroud and a fan made on the flywheel. This air takes the heat from the hot engine parts, thereby cooling them.
7. The boiling point of water is raised 3° F for every pound of pressure.
8. It will cause bearings to wear out quicker causing the water pump to leak.
9. Every 300 hours
10. Remove it from the engine, place it in water 20° hotter than the temperature marked on the thermostat. The valve should open at this temperature. Then place it in water 10° cooler than the temperature marked on the thermostat and it should close. If it doesn't open or close properly, discard it and install a new one.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Electrical Systems

TOPIC: Magneto System

1. The rotation of the armature of the magneto
2. This construction simplifies design, reduces size, and lowers the cost.
3. Just before a reversal of the magnetic flux
4. Rotation of the magnetic rotor causes the magnetic flux to flow through the frame laminations and induces a flow of current in the primary windings.
5. To absorb the surging current when the points are opened and thus prevent arcing and burning of the points.
6. The storage action of the condenser is followed by a quick and complete collapse of the magnetic field then existing in the coil. This collapse induces a secondary current which is much higher voltage due to the more turns of a wire in the secondary circuit.
7. One and one-half times the engine speed.
8. A device used to give the magneto a quick flip to assist in starting. It consists of weighted pawls and a spring arrangement which wind up as the cranking begins. The spring gives the armature or rotor a quick flip which produces a hot spark.
9. On non-sealed units a very small amount of light machine oil may be used as recommended by the manufacturer or bearings or gears. If the impulse coupling becomes sluggish, it should be flushed with kerosene and reoiled. The distributor should be kept as clean as possible and the points should be regapped or replaced ever 200-300 hours.
10. One must be careful not to rotate the distributor arm because on many late models the gear case can be replaced with the distributor arm rotated one-half turn.

AGRICULTURAL MACHINERY MECHANICS

UNIT: Electrical Systems

TOPIC: Introduction to the Battery Ignition System

1. Provides a hot spark at the spark plug--the job of the ignition coil

Times the spark so that it occurs at the right instant to ignite the fuel in the cylinder--the job of the distributor
2. The opening and closing of the breaker points in the distributor
3. The rotating cam is powered by the engine cam shaft to which it is geared.
4. It flows from the battery through the primary winding of the ignition coil, to the distributor and to the ground connection where it returns to the battery.
5. A "ground" provides a path for the current to return to its source. In the case of the ground for the primary circuit the current is conducted through the metallic parts of the engine back to the battery ground connection.
6. Energizes the ignition coil
7. The cam lobe in the distributor turns enough to open the breaker points which breaks the primary circuit.
8. To jump the spark plug gap
9. Ignition coil through the distributor rotor, along the wire leading to the spark plug, where it jumps the gap and ignites the fuel in the cylinder. It then passes through the ground electrode of the spark plug, back through the shell of the engine to the ground connection of the ignition coil.
10. The condenser prevents sparking by providing a place where the current can flow until the points are safely separated. The condenser also helps collapse the flux lines more quickly, thus causing a higher secondary voltage.

UNIT: Electrical Systems
TOPIC: Introduction to the Battery Ignition System
(Answer Sheet continued)

11. Battery, ignition coil, distributor, spark plugs, along with necessary wiring.
12. Distributor cap, rotor, distributor shaft, cam, breaker points, and the condenser which is housed in the distributor

TOPIC: The Battery

1.
 - a. Positive plates
 - b. Negative plates
 - c. Separators
 - d. An electrolyte
 - e. Case or container
2. Hard rubber or bituminous composition
3. At 0° F. a charged battery will be about 40% efficient whereas the same battery at 80° F. will be about 100% efficient.
4. About 2 volts per cell
5. It is weak, very diluted, almost water
6. As the current is used, both the lead sponge and lead peroxide are covered with lead sulphate by chemical action.
7. A battery is charged by reversing the chemical action by passing a direct current of proper voltage through the battery. This current removes the sulphate from the plates returning it to the acid electrolyte.
8. Mix soda and water into a thick paste and spread on corroded parts. Let this solution stand on the parts for a few minutes, then wash with clear water.
9. When charging a battery, it will give off a highly explosive gas; therefore, it is necessary to keep all spark or open flames away from the battery.
10. The charge is checked by the use of an hydrometer which tells the specific gravity of the electrolyte. This specific gravity should be 1.285 for a full charged battery.

Answer Sheet
for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Electrical System

TOPIC: Generators, Alternators, and Accessories

1. To supply enough current to take care of all electrical equipment and to keep the battery fully charged.
2. The same as that of the generator.
3. To regulate the current entering the battery so that the battery will remain fully charged but will not overcharge.
4. To keep the battery from discharging back through the generator.
5.
 - a. Voltage regulator
 - b. Manual switch
 - c. Use of the third brush
6. The manual switch is used to insert or remove an electrical resistance in the generator field circuit. When the resistance is in the field, the rate of charging is reduced. When the switch is closed, the resistance is by-passed and the charging rate is increases.

The third brush is often used to regulate the generator output. As the third brush is moved toward the main brush in the direction of travel of the armature, the output is increased. As it moves toward the main brush against the direction of travel of the armature, the output is reduced.

The voltage regulator is used on most modern farm tractors today. It controls the generator output by automatically opening and closing the contact points within the regulator. As the current flows from the generator to the battery, the contact approaches full charge and the voltage increases causing the points of the regulator to open. This action causes the generator field current to flow to the ground through increased resistance, lowering its voltage.

UNIT: Electrical System
TOPIC: Generators, Alternators, and Accessories
(Answer Sheet continued)

7. A generator develops direct current where an alternator develops alternating current which is rectified or changed into direct current in the alternator by use of diodes.
8. The ammeter is used to indicate the flow of current from the generator to the battery on the flow side or the flow of current from the battery to lights and other electrical accessories on the discharge side. It also indicates whether or not the generator is functioning properly.
9. The bearings may need oiling with a light oil several times during the year; however, oil should be used sparingly because excessive amounts may get into the windings and cause damage. Also, the commutator may become corroded. To do this, No. 00 sandpaper may be held against it as the engine turns slowly.
10. It will serve as a conductor and might short the commutator segments.
11. Ground across the battery and generator terminal post on the voltage regulator momentarily.

AGRICULTURAL MACHINERY MECHANICS

UNIT: Engine Testing and Tune Up

TOPIC: Timing the Ignition System

1. a. The breaker point method
b. The timing light
2. Proper timing means that the ignition is set so the distributor will supply a spark to each cylinder at a time when the fuel will burn with the greatest efficiency.
3. On the flywheel or fan pulley
4. One lead goes to the number one plug wire while the other goes to a good ground.
5. One lead goes to the No. 1 spark plug wire while the other two go to the battery cables.
6. Loosen the plug pull the center wire out of the coil, and turn the engine over and listen for a hissing sound. This will indicate the compression stroke.
7. The timing light should be held directly over the timing marks because holding it at an angle can cause the timing to be off.
8. When the timing marks are on TDC (top dead center) the breaker points should be just beginning to open
9. Always go to the service manual of the make and model of that engine and get the correct information.
10. Retarded timing is the setting of the breaker points so that the spark reaches the spark plug after top dead center whereas advanced timing is the spark reaching the plug just ahead of top dead center.

UNIT: Engine Testing and Tune Up
TOPIC: Timing the Ignition System
(Answer Sheet continued)

11. A diesel is timed by adjusting the injection pump to start the injection at just the right time. In most cases this is so that the full pressure of the fuel charge exerts its pressure in the first 90° of crank travel.

UNIT: Engine Testing and Tune-Up

TOPIC: Valve Clearance Adjustments

1.
 - a. Tappet adjustment
 - b. Valve adjustment
 - c. Valve spacing
 - d. Valve lash
2. The provision for proper clearances between the ends of the rocker arms and the ends of the valve stems during the time that the valves are not being depressed.
3. Exhaust and manifold or intake
4.
 - a. To give longer service
 - b. Better engine efficiency
 - c. Easier starts
 - d. Maximum power
 - e. Cooler engine operation
 - f. Smooth engine operation
5. Some valves are adjusted with the engine hot while others are adjusted with the engine cold. Always check the operators manual to see how the engine should be adjusted.
6.
 - a. Proper sized hex end wrench
 - b. Proper sized open end wrench
 - c. Leaf tickness gage (feeler gage)
 - d. Screw driver
7. Between the rocker arm and the valve stem
8. This rocker arm is for fuel injection.
9. The critical area is between the valve seat and the face of the valve.

UNIT: Engine Testing and Tune-Up
TOPIC: Valve Clearance Adjustments
(Answer Sheet continued)

10. By turning them up on a smooth surface and checking the height of each. Those that are weak will be shorter.

for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Hydraulics

TOPIC: Introduction

1. Hydraulics may be defined, in a strict sense, as the science of fluid forces.
2. Pascal
3.
 - a. Simplicity in design
 - b. Extreme flexibility as regards to location of components
 - c. Complete automation of sequence is possible
 - d. Simplicity of speed control
 - e. Limitless variety of speeds, controls, and forces
 - f. Reduction of wear on moving parts by:
 1. Controlled acceleration and deceleration
 2. Automatic release of pressure at overload
 3. Absence of vibration
 4. Automatic lubrication
 - g. Efficient and economical to operate
 - h. Large forces can be controlled by much smaller ones
 - i. Power and friction losses are comparably small
4.
 - a. Pressures often are very high. Two or three thousand pounds per square inch is not uncommon. High pressures require heavy tubing, tight joints, and intelligent maintenance.
 - b. Operating efficiency can be severely reduced, or operation halted, by rust, corrosion, high temperatures, dirt, and the products of fluid deterioration. Cleanliness is all-important.
5.
 - a. The fluid is incompressible
 - b. Multiplication of forces
 - c. Hydrostatic and hydrodynamic power
6. Define:
 - a. Hydrostatic Power - is where the potential (static) energy of fluid under pressure is used to perform work.

UNIT: Hydraulics
TOPIC: Introduction
(Answer Sheet continued)

b. Hydrodynamic - where the Kinetic (dynamic) energy of fluid in motion is used to perform work.

7. a. Reservoir
- b. Pump
- c. Return line
- d. Pressure line
- e. Relief valve
- f. Directional control valve
- g. Cylinder

for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Hydraulics

TOPIC: Reservoirs

1. The size of the reservoir depends on the amount of fluid required to operate the system. An ideal size is two or three times the capacity per minute of the pump.
2.
 - a. So it can hold all the fluid that drains back into the reservoir by gravity flow.
 - b. So it can maintain the fluid level above the opening of the suction line at all times.
 - c. So it can dissipate excess heat generated during normal operation.
 - d. So it can allow air and foreign matter to separate from the fluid.
3.
 - a. Filter strainer
 - b. Return line
 - c. Air filter
 - d. Outlet to pump
 - e. Dipstick
 - f. Drain plug
 - g. Cleanout opening
 - h. Pump intake filter
 - i. Baffle

LUBRICANTS: CRANKCASE-OIL VISCOSITY (GRADE) AND
CRANKCASE-OIL TYPE (SERVICE CLASSIFICATION)

Student: _____ School: _____

Date: _____ Score: _____

PART I: Underline the most appropriate answer:

1. The type of oil not recommended by any farm tractor manufacturer for crankcase oil is (1) MS, (2) DS, (3) ML, (4) MM.
2. The results which may be expected from using a SAE grade that is too heavy is (1) hard cold weather starting, (2) extra power required for oil circulation, (3) poor lubrication of tight fitting bearings, (4) all of these.
3. A substance which prevents deposits of oil contaminants by holding them in suspension is called (1) viscosity, (2) oxidation, (3) dilution, (4) detergent-dispersants.
4. A higher SAE grade number indicates that the oil is (1) more fluid, (2) less fluid, or (3) has no effect as fluid.
5. The only way to be sure that you are using the proper oil in crankcase is to (1) use a multiple grade oil, (2) ask your neighbor what he used, (3) ask your dealer what to use, (4) look it up in the operator's manual.

PART II: Complete the following:

1. The _____ viscosity grade number indicates that the oil is more fluid.
2. What do the following letters mean?
 - a. ML
 - b. MM
 - c. MS
 - d. DG
 - e. DM
 - f. DS

PART I: True or False:

- _____ 1. All engines have oil filters.
- _____ 2. All oil must pass through the filter system.
- _____ 3. A breather is not necessary on an enclosed crankcase engine.
- _____ 4. There are two general classifications of engine lubricating systems.
- _____ 5. A good lubricating system is always complicated.

PART II: Fill in the following blanks:

1. Two types of oil indicators are _____ and _____.
2. The most used type oil pump is the _____ pump.
3. Engine oil systems are classified into three major groups. These are:
 - a. _____
 - b. _____
 - c. _____
4. Oil filters may be filled with _____,
or _____.
5. In order to maintain the correct pressure and control the quantity of oil circulated in an engine a _____ is used.

FUELS AND PRINCIPALS OF COMBUSTION

Student: _____ School: _____
Date: _____ Score: _____

Answer the following questions:

1. Name the four common liquid fuels:

- a. _____
- b. _____
- c. _____
- d. _____

2. What are the two chief impurities in gasoline that may cause trouble?

- a. _____
- b. _____

3. What is the range of fuel to air mixtures on which an engine will operate? _____

4. Often times it is necessary to lower the fuel to air ratio to ____ : ____ in order to start the engine in extremely cold weather.

5. What is the ideal ratio of fuel to air for an engine to operate with greatest efficiency and horsepower? ____:____.

GASOLINE SYSTEMS

Student: _____ School: _____

Date: _____ Score: _____

Answer the following questions:

1. Explain what is meant by updraft and downdraft systems. _____

2. What is a venturi? _____

3. What are the four systems of a carburetor?

a. _____

b. _____

c. _____

d. _____

4. Explain how to properly set the idle valve in a carburetor. _____

5. What are three reasons for servicing and maintaining the manifold heat control?

a. _____

b. _____

c. _____

L. P. GAS SYSTEM

Student: _____ School: _____

Date: _____ Score: _____

Place a T by the correct statements and F by the false:

- _____ 1. In all cases LP gas is cheaper to operate.
- _____ 2. Butane will "freeze" before propane.
- _____ 3. Gasoline has a higher btu rating than LP gas.
- _____ 4. LP gas leaves a carbon build up in engines.
- _____ 5. Butane has a greater btu rating per gallon than propane.
- _____ 6. LP gas is stored in a gaseous form.
- _____ 7. Gasoline and LP carburetors are very similar.
- _____ 8. LP gases are heavier than air.
- _____ 9. LP gases have a high octane rating.
- _____ 10. The boiling point of LP fuels is below the freezing point of water.

GOVERNORS

Student: _____ School: _____
Date: _____ Score: _____

Place a T by the true statement and F by the false statement.

- _____ 1. The vane-type governor can be used on tractors.
- _____ 2. The fly ball governor depends upon centrifugal force for its operation.
- _____ 3. An engine with no speed control mechanism would continue to increase in speed until it would fly apart.
- _____ 4. The most common way to control the speed of an engine is to regulate its fuel intake.
- _____ 5. LP gas engines require a different type governor than a gasoline engine.
- _____ 6. Governors will function only at higher engine speeds.
- _____ 7. The fly ball type governor requires special lubrication.
- _____ 8. The driver of a vehicle by adjustment of a hand lever may control the governors speed.
- _____ 9. The parts of a governor are: a shaft, weights, springs and sliding collar.
- _____ 10. The only purpose of a governor is to regulate engine speed to insure constant belt speed.

DIESEL FUEL SYSTEMS, INJECTION PUMP AND FUEL INJECTORS

Place a T by the true statements and an F by the false statements:

1. The injection pump may develop as much as 20,000 psi pressure in diesel fuel system.
2. If two or more filters are used, the second filter will not require attention as often as the first.
3. Some tractors have special gages connected to the fuel line which show when filters need to be changed.
4. If the injection pump consists of both pump and injector nozzle, there is no high pressure line.
5. On engines having no high pressure line each cylinder will have three rocker arms.
6. All diesel engines have a return fuel line for excess fuel to return to the storage tank.
7. The fuel filters are always located on the high pressure line.
8. The injection pump is responsible for timing the fuel injection, acting somewhat like a distributor on a spark-ignited engine.
9. When changing the filter elements, it is not always necessary to turn off the fuel supply.
10. If air enters the fuel system, it will automatically bleed back through the system into the fuel system.

MAGNETO SYSTEMS

Student: _____ School: _____
Date: _____ Score: _____

Place a T by the true statements and an F by the false statements:

- _____ 1. Magneto systems require little attention.
- _____ 2. Magneto systems are completely different to the battery system.
- _____ 3. All tractor magnetos use a novel device to give the armature or rotor a quick flip when cranking.
- _____ 4. When changing points on a magneto system, the condenser should also be replaced.
- _____ 5. Magneto points can be filed or honed to recondition them.
- _____ 6. Keeping the magneto clean and the points properly adjusted are two items essential to proper functioning of this unit.
- _____ 7. The magneto has some of the most finely finished and closely fitted bearings in the tractor.
- _____ 8. Points are always in need of repair after 200-300 hours of operation.
- _____ 9. The impulse coupling will only operate under 300 RPM.
- _____ 10. A magneto system has a coil, breaker points, condenser, distributor, rotor, wires, and spark plugs.

FOREWORD

The Curriculum Materials Laboratory is an instrument of the State Department of Vocational Education, Trade and Technical Section. Located in the Department of Industrial Education on the campus of Mississippi State University, the Laboratory maintains a working liaison with Mississippi industry and education. Activities of the Laboratory are focused on the development of curriculum materials with the purpose of encouraging statewide unity in the quality and scope of instruction in trade and technical education.

A workshop, sponsored by the Laboratory, was held on the campus of Mississippi State University on March 3, 4, and 5, 1965, to initiate development of curriculum materials in mechanical technology. Those participating in the workshop included instructors and directors of presently operating programs in mechanical technology. These men, who comprise the Curriculum Committee, and the institutions they represent are as follows:

Mr. Charles Ainsworth	Northwest Mississippi Junior College
Mr. Albert Campbell	Jones County Junior College
Mr. Luther Garrett	Copiah-Lincoln Junior College
Mr. Bob Laster	Hinds Junior College
Mr. Larry Otis	Itawamba Junior College
Mr. Hugh Statham	Copiah-Lincoln Junior College

During the workshop, major technical areas were identified, and courses indicated for training in these areas were planned. The curriculum that developed included courses in technology, courses in general education, and other courses necessary to support the technical program. The curriculum, as proposed, was approved by the group. A careful balance of semester hours for each of these areas was effected in accordance with recommendations of the engineering societies. Initial detailing of a topical outline of instruction for the technical and the supporting courses was begun.

After returning to their institutions, these instructors and directors continued to collaborate in the strengthening of course content and the development of laboratory activities. The Laboratory assembled, compiled, and edited these materials. Several of the men were called in for further conference; others were visited by a Laboratory staff member. All of the men and the institutions they represent are commended for their cooperation and their worthy contribution to the development of this curriculum.

On September 22 and 23, 1965, an Industrial Evaluation Committee convened on the campus of Mississippi State University. The content of each of the courses included in the curriculum was examined in detail, and the appropriateness of each course as it relates to the curriculum as a whole was determined. In the final editing, the recommendations of the Committee were weighed carefully and followed at every opportunity. A statement of authentication by the Committee and the membership are found on the second page following.

The Curriculum Materials Laboratory is indebted to Mr. E. P. Sylvester, Vocational-Technical Education, Junior Colleges, State Department of Education, for participating in the Industrial Evaluation Conference; to the State Department of Vocational Education, Trade and Technical Section, for its continuing support, which has been invaluable; to Mr. Ralph Caldwell, Assistant State Supervisor, for his contributions to the Curriculum Conference and to the Industrial Evaluation Conference; to Mr. Meade Eastland, Professor of Mechanical Engineering, Mississippi State University, for his assistance in reading the evaluation draft of this publication, and for his valuable comments while participating in the Industrial Evaluation Conference; to Mr. Eugene Earp, Mr. Art Wiselogel, and the members of the Mississippi Chapter, American Society of Safety Engineers, for their contribution in developing safety references for inclusion in this publication; and to Mr. Rex Deghuee, Product

Engineer, Rockwell Manufacturing Company, for construction of the sample problem in the appendix.

This publication incorporates the thinking and the contributions of all of the men listed above. It should be examined in light of this fact and should be used as a guide in the manner prescribed in the introductory chapter. It should not be inferred that this publication is a reflection of the practice of any given institution or that it is completely endorsed by any one institution, agency, or person.

AUTHENTICATION COMMITTEE

The material in this publication was reviewed and endorsed as being appropriate and adequate for the training of Mechanical Technicians by the following Industrial Committee:

- Mr. Rex Deghuee, Product Engineer, Rockwell Manufacturing Company, Tupelo, Mississippi.
- Mr. Robert V. Delcuze, Mechanical Engineer, General Electric Co., Mississippi Test Facility, Bay St. Louis, Mississippi.
- Mr. James A. Hutchison, Project Engineer, Tyrone Hydraulics, Corinth, Mississippi.
- Mr. Robert B. Jewell, General Machinery Coordinator, Ingalls Shipbuilding Corporation, Pascagoula, Mississippi.
- Mr. Stuart L. Jones, Supervisor, North American Aviation, Inc., Mississippi Test Facility, Bay St. Louis, Mississippi.
- Mr. Sam Manos, Works Inspector, Babcock & Wilcox Company, West Point, Mississippi.
- Mr. Roy R. Ross, Technical Supervisor, Olin Mathieson Corporation, Gulfport, Mississippi.
- Mr. John R. Ware, Education and Training Director, Taylor Machine Works, Louisville, Mississippi.

Endorsement by this committee in no way obligates the individual organizations that are represented by the committee membership.

The Curriculum Materials Laboratory wishes to commend these men for their efforts in the review of this publication and the constructive manner in which suggested changes were offered. We are further indebted to the companies represented for their interest in Mississippi education as evidenced by their cooperation and participation.

INTRODUCTION TO TECHNOLOGY

The growth of our nation's size and complexity has caused the creation of new concepts, products, and opportunities. A case in point is the growth of industry. As the research of the scientist and of the engineer has separated them even more from the craftsman with his high degree of manipulative skills, the broadened middle ground has created the technician. As he has evolved, the technician has accepted the responsibility for interpretation and application of design, for installation and maintenance of complex equipment, and for supervisory activities.

Educators have recognized their responsibility in this area and have developed technical curricula to meet the new needs. These curricula provide certain basic education for a wide variety of entry jobs in support of engineering and scientific personnel. These supporting technicians require an understanding of engineering principles basic to the field of technology. Graduates entering the field will become responsible members of a team--the scientist who is engaged in research at the fringe between theory and knowledge, the engineer who develops and designs practical applications of theory and knowledge, and the technician who may be involved in one or more activities, such as converting the design into a working model or testing and evaluating its effectiveness. With this done, the skilled craftsman converts raw materials into finished products. The technician re-enters the picture as he supervises production or directs installation and maintenance.

No description of the place of the technician would be complete without outlining his responsibilities in the area of safety. This responsibility may lie in his incorporating safety features as he develops the first working models.

In testing such models, he employs safe practices and studies operations for inherent features requiring special procedures, guarding, or protective clothing. Perhaps the most significant contribution to industrial safety comes as the technician supervises production. It is here that a working knowledge of safe practices assists him in analyzing habits of those under his direction and in promoting those practices designed to minimize job hazards.

It is obvious, then, that the training of the technician is not of a limited-or single-skill type. Rather, his training should equip him with basic qualifications and the ability to accept broad responsibilities that will prepare him for entry into multiple employment areas within a field.

Having accepted this training responsibility and having identified objectives, educators have established the technical program. Examination of successful programs reveals certain definite characteristics.

The caliber of the technical instructor is of major importance. While there is no guaranteed method of selection, there is general agreement that the level of formal training should be no less than that of a technical-school graduate. Broad job experience for all teachers has long been a basic requirement in occupational training. It is valid here. Therefore, a teacher must have sufficient industrial experience to be familiar with applications and processes. Additional study would include philosophy, methods, and procedures of technical teaching. In given instances, it has been found advantageous to use engineers as teachers in technical programs.

A second characteristic of the program involves physical facilities, equipment, and supplies. These items must simulate up-to-date industrial conditions. The emphasis here is on quality and variety rather than quantity.

Student admission policy and program flexibility, the third and fourth characteristics, must be considered together. Modern educational practice dictates a comprehensive guidance and testing program for the selection and/or admission of students. These potential technicians should be secondary-school graduates from the upper one third of the class or the equivalent, have an interest in technical work, and possess the necessary aptitudes for achievement in the program. For a variety of reasons, they may be unable to become involved in a longer, more expensive course of study. Ideally, the beginning technical student should have had two years of algebra, a year of geometry, a half year of trigonometry, and three years of science, preferably biology, chemistry, and physics. At this point, flexibility becomes important. Schools involved in technical training have found it necessary to make adjustments in their curriculum to take into account the deficiencies of those desiring such training. In some cases, it may be necessary to require students to take remedial or preparatory courses before entering the technical curriculum. Or the level of subject matter in beginning courses must be keyed to the mathematics-science background and the readiness of the students. Perhaps other ways can be found to prevent the closing of doors to likely prospects. The important consideration is the establishment of enrollment requirements which are high, yet realistic in their application. Realistic adjustment to local physical facilities, industrial requirements, staff competencies, and student capabilities should be considered carefully. Indiscriminate or seemingly endless compromise results in a collapse of standards. Such adjustments are best left to the judgment of state and local officials.

The content, variety, and timing of courses in the curriculum are essential. A strong technical program has breadth and depth in fundamentals, which will allow the graduate technician to qualify for and choose from multiple employment

alternatives, to advance professionally with occupational experience, and to keep abreast of new developments throughout his career. The acquisition of these fundamentals will require two years brimming with activities. Specialization in a given area can be gained only by relegating fundamentals in other areas to rapid, superficial treatment. For the graduate technician, therefore, specialization and specific job information come through experience, a company-training program, or the pursuit of higher education.

The most knowledgeable technicians are those involved in mathematical analysis, construction of design apparatus, and experimental testing and verification. The requirement here is a knowledge of the application of physical science principles and of mathematical formulas. These abilities are the distinguishing characteristics of the technician. In addition to strong general courses in physical sciences, the training of the technician goes into even greater depth in the given area of his specialty; for example, electricity and electronics for the electronics technician, properties of materials, heat, and mechanics for the mechanical technician, chemistry for the chemical technician, etc. Experience has shown that technical and supporting courses must be initiated immediately to successfully complete training in the allotted time. Inasmuch as technical and supporting courses comprise approximately two thirds of the total semester hours, they cannot be postponed until the second year or even the second semester.

Facility in the use of algebra and trigonometry is mandatory, and in no instance should the training of the technician require less than mastery in their use. An understanding of applicable sections of analytical geometry and calculus peculiar to the given technology will serve to enrich the student's background. Therefore, a minimum of six to nine semester hours of mathematics, which may be expanded to twelve semester hours in stronger programs, is recommended.

The technician must command a degree of manipulative skill. This degree is not nearly so high as that of the craftsman; and while it varies among technologies, in most instances it must be of sufficient height to assist him in the fabrication of design models. A comparison of training hours devoted to skill development in the curriculum verifies this assumption.

Sufficient general education must be included to assist in the development of a good citizen. The curriculum assumes an effective secondary-school program of general education. Building on this foundation, 17 to 22 additional semester hours in general education are scheduled.

Effective instruction is another essential in a technical program. Routine textbook teaching is entirely inadequate. The work of the technician, characterized earlier, is of a practical and applied nature. It follows that his training should be of this nature. The key words here are "practical" and "application", and the inference is that extensive periods of time would be spent in realistic experimentation in up-to-date, well-equipped laboratories. Careful coordination between lecture topics and laboratory experiments makes best use of both periods and promotes high-level learning. The most desirable situation is one in which the same instructor teaches principles in the lecture period, then supervises application in the laboratory. Experience has shown that this practice yields maximum motivation and learning. Failure to proceed in accordance with this practice means sacrificing time or retention in an already busy, demanding curriculum.

Studies of industrial procedures and effective technical training reveal many instances of report preparation. Information is gathered and organized, implications are drawn, and a report is submitted by the technician as the last step in his undertaking.

The selection of a text is of paramount importance to most instructors.

Realistically speaking, the content and presentation of many courses are influenced to a lesser or greater degree by the texts available. Rarely does a single volume contain all the essential technical information in a given area. For these reasons most instructors find it necessary to review available materials in their field and related fields and to select additional volumes as reference. In many technical programs, separate library facilities are developed apart from the main library. Here materials are gathered, catalogued, and placed in class or laboratory so as to be readily accessible to instructors and students. This approach is recommended by accrediting agencies.

The preceding statements briefly describe the most widely accepted characteristics of technical education namely, faculty background; student enrollment; the overall curriculum including a balance between technical and non-technical courses; plants and equipment; and library facilities. The institutions of which these technical programs are a part may look forward to the time when they will submit their programs for accreditation. If this is to be the case, careful consideration should be given, in the beginning, to the above criteria, which have been developed by the engineering societies.

The format of this publication is designed to lend itself to use in occupational training and in teaching by the "tell-show-do-check" method, a technique long used to good advantage. Briefly, this method requires that the instructor should present or explain the principle, show how it operates or applies, have the student put his learning to practical use, and check his newly acquired knowledge or skill. In support of this technique, two parallel columns have been developed. On the left will be an OUTLINE OF INSTRUCTION. This is the "tell" and "show" column. In it will be the theories and principles of the subject field. Some effort has been made to clearly identify the

mathematics and science involved in each unit. Conventional methods, such as question-answer periods, discussion, demonstrations, and audio-visual aids, are to be used. In the "do" column entitled LABORATORY ACTIVITIES, the spotlight is on student activities. Experiments are designed to involve the student in the practical application of principles set forth in the classroom. In most exercises, the student will set up the equipment, go through outlined procedure while taking measurements and making cogent observations, and record findings. In attempting to simulate industrial conditions, the technical program requires that data be obtained during laboratory activities. Outside the laboratory, data are organized, implications are drawn, and a report is submitted at some assigned date. No laboratory experiment is complete until a report is written and submitted. In many cases, a mathematical analysis and design will precede the experimental verification, and this practice is indicated by many references such as "mathematically compute...experimentally verify...and graphically represent...." This is the technical approach of the design technician and is one example of the scientific method employed by all.

The RECOMMENDED TEXT or texts listed, following each course, have been selected by the curriculum committee, partly on the basis of their experience, partly from additional volumes secured by the Curriculum Materials Laboratory. Although some of these books may be inadequate; they are--in the opinion of the committee and within the confines of their experience--the best available. Also listed are SUGGESTED REFERENCES which strengthen and broaden the instructional base. Many of these were strongly recommended by the industrial committee. Those desiring to build a library will find these books worthy of examination. It may be that one of these would serve as a text.

Formal education justifies its existence with the supposition that information imparted to students will increase their knowledge and skill and enable

them to make headway in new areas, either in the pursuit of a livelihood or in advanced study. It follows that future progress is dependent to some degree on the grasp of earlier courses. With this contingent in mind, each of the courses has a REVIEW scheduled as its last major division. At this time the instructor will review the key points and determine student command of the important knowledges and skills. Deficiencies in basics must be retaught until such time as the student, in the judgment of the instructor, has demonstrated a mastery of these essentials.

The Curriculum Materials Laboratory at Mississippi State University has been designed to serve as a means of promoting and assisting in the development and sharing of ideas and techniques in Mississippi junior colleges and secondary schools. Preparation of this publication is the first step. It is not an attempt at a "breakthrough" or "rediscovery" or "pioneering". Rather, major areas of the technology have been identified and subdivided into logical, teachable units. Suitable texts and references have been listed. The content has been agreed upon by Mississippi junior college technical instructors and a representative industrial committee as being those minimums deemed basic and essential to a technical program.

A second step must be taken by the technical instructor. He should give this publication his best efforts after carefully studying the ideas set forth in the first part of this chapter. Examination, evaluation, and recommendation during preparation of instructional materials and while teaching from them will assist in continued program development. Using this publication as a guide, the instructor should make lesson plans for lectures and demonstrations and should prepare laboratory experiments. In some instances, the instructor will likely find more information and greater detail than he is presently using.

There may be more than one laboratory experiment in the application of a principle. In other instances, the development of an idea may appear too shallow or laboratory application may be absent. It is at this time that the instructor can be most helpful in the following ways: (1) by suggesting which areas can be effectively covered in a shorter time, (2) by identifying areas requiring greater emphasis, which would involve additional detail and an extended-time allocation, (3) by extending the instructional content to reinforce or clarify ideas, (4) by preparing additional or alternate experiments in applying principles, (5) by listing references, texts, and instructional aids at appropriate places, and (6) by suggesting additions and deletions. Some of the suggestions listed above may require only marginal notes; others may call for development of completely new and more comprehensive materials. The result will be realistic evaluation of content, organization, and time allotment for each unit.

This initial effort on the part of the Curriculum Materials Laboratory is meant to encourage greater unity of offerings among the various programs. Two factors will dictate the revision of this publication--the dynamic state of industry and the development of improved teaching methods by technical instructors. The use and evaluation of this publication by people in the field will lay the necessary ground work for future editions.

In addition, recent vocational-technical legislation contains provision for follow-up and program evaluation. The day is coming when vocational-technical education will be held accountable for its actions in training youth and adults and for the millions of dollars it has spent. The Curriculum Materials Laboratory will, no doubt, be involved in developing suitable instruments and evaluative criteria at that time. This publication, representing the combined efforts of Mississippi education and industry and containing the material these groups feel is appropriate, may well serve as one basis for making such a study.

MECHANICAL TECHNOLOGY CURRICULUM

COURSE IDENTIFICATION

The coded symbols listed below are suggested as being applicable to all technical, supporting, and general education courses. Should the institutions involved adopt some mutually acceptable system, it would greatly aid in interpretation of course offerings, transcripts, and catalogs.

T - Technical Courses

- Au - Automotive
- Bc - Building and Construction
- Ch - Chemical
- Ci - Civil
- Dd - Drafting and Design
- El - Electricity
- Er - Electronics
- Me - Mechanical

S - Supporting Technical Courses

- Gr - Graphics (Art, Freehand and Mechanical Drawing, Blueprint Reading)
- Ma - Mathematics (Algebra, Trigonometry, Calculus, Analytical Geometry, Slide Rule)
- Pr - Shop Processes (Metal Processing, Materials and Methods)
- Sc - Science (Physics, Chemistry)

G - General Education Courses

- Bu - Business (Business Principles, Accounting, Bookkeeping)
- En - English (Composition, Technical Writing, Business Correspondence)

Mg - Management (Industrial Relations, Plant Layout and Materials Handling,
Time and Motion Study)

Or - Orientation

Ps - Psychology (General, Industrial, Social)

Pe - Physical Education (Health, Hygiene)

Ss - Social Studies (History, Sociology, Government)

The preceding letter coding of courses is further developed here by the addition of three-place numbering. The first-place number designates the semester in which the given course is normally offered. The second-place number designates the position of the course in sequence. The third-place number designates the semester hour(s) credit that the given course carries.

The following is a suggested curriculum with courses identified by letter and number and with a balance of courses in technical subjects, in related or supporting subjects, and in general education subjects.

PROPOSED
MECHANICAL TECHNOLOGY CURRICULUM

TMe 114

MANUFACTURING PROCESSES I

4 Semester Hours

INTRODUCTION

Manufacturing Processes I and II have as their objective the survey of modern methods of industrial materials formation and fabrication. Regardless of the teaching technique employed, instruction is designed to develop familiarity in setup and operation; tools and equipment; nomenclature; handbooks, charts, and tables; safety procedures and guarding methods; and calculations necessary to determine machine or process capabilities in production.

THE 114. Manufacturing Processes I. Two lectures. Four hours laboratory. (4 semester hours credit). Survey of modern industrial practices and procedures in the forming and fabricating of metals and non-metals.

MAJOR DIVISIONS

	Class Hours	Laboratory Hours
I. Introduction to Production Processes	2	2
II. Metals and Non-Metals	2	2
III. Simple Measuring Tools	1	2

Total Suggested Clock Hours 108

I. INTRODUCTION TO PRODUCTION PROCESSES

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Course objectives
2. General class procedure
3. Course requirements

B. LABORATORY ACTIVITIES Laboratory Hours 2

Laboratory orientation. Tour of facilities.

II. METALS AND NON-METALS

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Ferrous metals
 - a. Iron
 - b. Steel
 - c. Others
2. Non-ferrous metals
 - a. Aluminum
 - b. Copper
 - c. Alloys
 - d. Others
 - e. Fire and health hazards of non-ferrous metals¹
3. Plastics
 - a. Thermosetting
 - b. Thermoplastic

B. LABORATORY ACTIVITIES Laboratory Hours 2

Make laboratory inspections of samples of ferrous and non-ferrous metals and plastics. Note distinguishing characteristics of weight, color, hardness, etc. Use standard handbooks to examine different forming, fabricating, and machining rates.

III. SIMPLE MEASURING TOOLS

A. OUTLINE OF INSTRUCTION Class Hours 1

1. Types of instruments
 - a. Steel rule
 - b. Vernier

B. LABORATORY ACTIVITIES Laboratory Hours 2

Make basic measurements with tools indicated. The following should be involved:
reading of steel rule to 1/64";

¹Industrial Hygiene (Chicago: Kemper Insurance, n.d.), Bulletins 91 and 210. Accident Prevention Manual for Industrial Operations (Chicago: National Safety Council, 1964), Chapter 27, page 25; Chapter 40, page 39; Chapter 40, page 56; Chapter 40, page 59; Chapter 41, page 59.

- c. Micrometer
- d. Dial indicator
- e. Calipers--inside and outside
- f. Others

2. Care and calibration of instruments

outside micrometer to 1/1000"; inside and outside calipers to transfer measurements to micrometer; direct inside and outside measurements with vernier caliper; other measuring-tool practice aimed at practice in skill development in this area.

IV. METAL AND PLASTIC FORMING

A. OUTLINE OF INSTRUCTION Class Hours 3

1. Processes

- a. Hot
- b. Cold

2. Operations

- a. Stamping
- b. Upsetting
- c. Forging
- d. Bending
- e. Drawing
- f. Rolling
- g. Spinning
- h. Extruding

- (1) Hot
- (2) Impact

i. Explosive forming

3. Equipment

a. Types

- (1) Press
- (2) Rolling mills
- (3) Brakes
- (4) Drawing dies
- (5) Hotspin

b. Safety practices²

B. LABORATORY ACTIVITIES Laboratory Hours 5

NOTE: The nature of the following forming processes does not lend itself to student laboratory activities. It is recommended that extensive use be made of demonstrations, movie films, and field trips.

²Engineering Consultation Service (Chicago: Kemper Insurance, n.d.), Bulletins 400, 424, 802, 344, 534.

Accident Prevention Manual for Industrial Operations (Chicago: National Safety Council, 1964), Chapter 22, page 25 through Chapter 23, pages 36-44.

V. FOUNDRY PRACTICES

A. OUTLINE OF INSTRUCTION Class Hours 1

1. Melting methods
 - a. Historical
 - (1) Blast furnace
 - (2) Others
 - b. Modern
 - (1) Open hearth
 - (2) Bessemer
 - (3) Electric
 - (4) Induction
 - (5) Others
2. Casting methods
 - a. Sand
 - b. Investment
 - c. Sandless or permanent mold
 - d. Continuous
 - e. Die casting
 - f. Centrifugal
 - g. Injection
 - h. Precision
3. Basic foundry process
 - a. Prepare pattern
 - b. Prepare mold
 - c. Prepare metal
 - d. Pour
 - e. Remove pattern
 - f. Clean casting
4. Health hazards³

B. LABORATORY ACTIVITIES Laboratory Hours 2

NOTE: Make a field trip to an operating foundry in relation to all work included in the foundry sections.

SAFETY INSTRUCTION

While statistics indicate that the foundry accident rate is lower than other divisions, the nature and severity of occurring accidents dictate special attention. The conscientious instructor will explain, employ, and encourage these procedures at the appropriate times.

³Industrial Hygiene (Chicago: Kemper Insurance, n.d.), Bulletins 45, 129, 130, 131, 103.

Engineering Consultation Service (Chicago: Kemper Insurance, n.d.), Bulletins 509 and 711.

Accident Prevention Manual for Industrial Operations (Chicago: National Safety Council, 1964), Chapter 27, page 1 through Chapter 27, page 25, Chapter 28.

VI. FOUNDRY EQUIPMENT

A. OUTLINE OF INSTRUCTION Class Hours 1

1. Melting equipment
2. Molding equipment
 - a. Riddle
 - b. Rammer
 - c. Bellows
 - d. Trowel
 - e. Slick
3. Sand preparation equipment
 - a. Sand mixer
 - b. Shake out
 - c. Mullers
 - d. Conveyors
 - e. Storage hoppers
 - f. Testers
4. Casting equipment
5. Foundry accessories
6. Protective clothing⁴

B. LABORATORY ACTIVITIES Laboratory Hours 2

VII. PATTERNS

A. OUTLINE OF INSTRUCTION Class Hours 1

1. Introduction
2. Types with regular parting lines

B. LABORATORY ACTIVITIES Laboratory Hours 2

Make a laboratory examination of the most common types of patterns. Examine characteristics common to all and distinguishing characteristics of each including parting lines, draft, fillets, rounds, and colors. Practice measurements with various scales on shrinkage rule.

⁴Engineering Consultation Service (Chicago: Kemper Insurance, n.d.),
Bulletins 637, 629, 709.

3. Types with irregular parting lines

Prepare the mold and metal for a casting with an irregular parting line. Note characteristics which distinguish this technique from regular processes such as the need for and nature of mold repairs.

4. Core, core prints, core boxes

5. Draft and shrinkage

6. Fillets and rounds

7. Identifying colors

VIII. SANDS

A. OUTLINE OF INSTRUCTION Class Hours 1

B. LABORATORY ACTIVITIES Laboratory Hours 2

1. Types and characteristics

- a. Light
- b. Medium
- c. Heavy
- d. Core

Prepare several samples, using available sands, emphasizing distinguishing features such as weight, grain size, color, and molding characteristics. Add bonding compounds and cure to usable state.

2. Health hazards⁵

IX. MOLDS

A. OUTLINE OF INSTRUCTION Class Hours 1

B. LABORATORY ACTIVITIES Laboratory Hours 3

1. Types

- a. Bench
- b. Floor
- c. Pit
- d. Machine
- e. Green sand
- f. Skin dried
- g. Dry sand
- h. Loam
- i. Shell

Using regular mold sand, prepare a small bench-type or floor-type mold, following all described procedures.

⁵Industrial Hygiene (Chicago: Kemper Insurance, n.d.), Bulletin 103.
Accident Prevention Manual for Industrial Operations (Chicago: National Safety Council, 1964), Chapter 39, pages 6-8.

2. Permanent molds

3. Applications

X. CORES

A. OUTLINE OF INSTRUCTION Class Hours 1

1. Types

- a. Green sand
- b. Dry sand
- c. Drop
- d. Vertical
- e. Balanced
- f. Hanging

2. Mixtures and binders

3. Core finishing

B. LABORATORY ACTIVITIES Laboratory Hours 3

Prepare proper sand mixture using core box, then submit to baking heat to dry as determined by technical material. Make a simple casting of a pipe using a core and mold. Wear protective clothing, such as goggles or face shield, gloves, apron, safety shoes, etc.⁶

XI. POST-CASTING PROCESSES

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Cleaning

2. Seasoning

3. Annealing

4. Normalizing

5. Case hardening

6. Homogenizing

B. LABORATORY ACTIVITIES Laboratory Hours 4

Make comparative hardness tests of casting before and after artificial aging (seasoning) by holding at elevated temperature, but below critical temperature, for given periods. Wear protective clothing during quenching process.

⁶Engineering Consultation Service (Chicago: Kemper Insurance, n.d.),
Bulletins 637, 629, 709.

XII. WELDING PROCESSES

A. OUTLINE OF INSTRUCTION Class Hours 4

1. Processes

- a. Arc
- b. Gas
- c. Inert
- d. Brazing

- e. Carbon arc
- f. Submerged arc
- g. Forge
- h. Semi-automatic
- i. Automatic
- j. Resistance
 - (1) Spot
 - (2) Seam
- k. Others
 - (1) Laser
 - (2) Airchromatic
 - (3) Plastic
 - (4) Dry flux

2. Safety practices⁷

B. LABORATORY ACTIVITIES Laboratory Hours 2

Tour welding area. Make examination and inspection of all equipment. Especially note grounding of welding units.

Use standard equipment to make soft solder joints in sheet and tubing by brazing.

XIII. WELDED JOINT

A. OUTLINE OF INSTRUCTION Class Hours 2

B. LABORATORY ACTIVITIES Laboratory Hours 4

⁷Industrial Hygiene (Chicago: Kemper Insurance, n.d.), Bulletins 1^c and 540.
Accident Prevention Manual for Industrial Operations (Chicago: National Safety Council, 1964), Chapter 30.
Engineering Consultation Service (Chicago: Kemper Insurance, n.d.),
Bulletins 608 and 634.

1. Type

- a. Butt
- b. Lap
- c. Corner
- d. Pipe and tube
- e. Fillet
- f. Sheet metal

2. Application

- a. Vertical
- b. Flat
- c. Horizontal
- d. Overhead

Fabricate several joint types in different positions using oxy-acetylene welding equipment. Point out safe practices and importance of protective clothing.

3. Welding symbols

- a. Bead
- b. Fillet
- c. Square
- d. Bevel
- e. Weld all around
- f. Other special

Practice reading welding symbols from blueprints.

XIV. ARC WELDING MACHINES AND ACCESSORIES

A. OUTLINE OF INSTRUCTION

Class Hours 1

B. LABORATORY ACTIVITIES

Laboratory Hours 4

1. Welder's tools and accessories

- a. Electrode holders
- b. Ground lead
- c. Hammers and brushes
- d. Protective garments
- e. Others

Make careful examination of standard oxy-acetylene welding equipment. Give special attention to the safety practice in its use as well as proper care and maintenance. Take special note of protective garments for various parts of welder's anatomy such as eyes, hands, arms, legs, and feet.

2. Electrodes

- a. Mild steel
- b. Low hydrogen
- c. All position
- d. Alloy
- e. Iron powdered
- f. AWS numbering system
- g. NEMA color coding

Strike an arc and maintain the proper arc length. Run beads in several directions in a flat position using mild steel plate and small electrode.

3. Base metal

- a. Position
- b. Thickness

- c. Type of metal
- 4. Machine power--input-output
 - a. AC input, AC output
 - b. AC input, AC or DC output
 - c. Motor-generator
- 5. Drive systems
 - a. Mechanical
 - b. Electrical

XV. PROCEDURES IN ARC WELDING

A. OUTLINE OF INSTRUCTION Class Hours 2

- 1. Types (position)
 - a. Horizontal
 - b. Vertical
 - c. Flat
 - d. Overhead
- 2. Applications
 - a. Mild steel
 - b. Tool steel
 - c. Stainless steel
 - d. Hard surfacing
 - e. Build-up
 - f. Pipe welding
 - g. Pressure welding
 - h. Exotic metals⁸
 - i. Others
- 3. Standards for welder qualifications
 - a. Navy
 - b. AWS
 - c. ASME
 - d. U. S. Coast Guard
 - e. Others

B. LABORATORY ACTIVITIES Laboratory Hours 12

Make a butt joint by arc welding two horizontal plates.

Use specified rods for hard surfacing, build-up, etc.

⁸Accident Prevention Manual for Industrial Operations (Chicago: National Safety Council, 1964), Chapter 29, page 24.
Industrial Hygiene (Chicago: Kemper Insurance, n.d.), Bulletin 197.

XVI. OXY-ACETYLENE WELDING EQUIPMENT AND ACCESSORIES

A. OUTLINE OF INSTRUCTION

Class Hours 1

1. Welders tools and accessories

- a. Torches and tips
- b. Tanks
- c. Hoses
- d. Gages
- e. Protective garments
- f. Others

2. Gas rods

- a. Steel
- b. Bronze
- c. Aluminum
- d. Other

3. Base materials

- a. Cast iron
- b. Aluminum
- c. Stainless

B. LABORATORY ACTIVITIES

Laboratory Hours 4

Make careful examination of standard oxy-acetylene-welding equipment. Give special attention to the safety practice in its use as well as proper care and maintenance. Take special note of protection garments for various parts of welder's anatomy such as eyes, hands, arms, legs, and feet.

XVII. PROCEDURES IN OXY-ACETYLENE WELDING

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Welding positions

- a. Flat
- b. Vertical
- c. Horizontal
- d. Overhead

2. Applications

- a. Sheet metal

- b. Cast iron

B. LABORATORY ACTIVITIES

Laboratory Hours 6

Light and adjust torch; run a fusion bead in a straight line without filler rod.

Run beads on mild steel plate using a filler rod.

XVIII. OXY-ACETYLENE CUTTING

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Manual

a. Cutting

b. Beveling

c. Grooving

d. Flux cutting

2. Machine

a. Straight line

b. Shape

c. Circular

d. Precision

e. Pipe

f. Special

B. LABORATORY ACTIVITIES

Laboratory Hours 3

Follow proper techniques to light and adjust manual torch.

Cut specified shape, using a cutting torch after practice in selecting tip and adjusting torc for varying metal thicknesses.

Make straight cuts, curved cuts, beveled cuts, and grooves as assigned

Using manufacturer's chart, determine cutting tip, acetylene and oxygen pressures, and cutting rate for oxy-acetylene cutting of materials assigned by instructor.

XIX. SUBMERGED MELT AND INERT GAS SHIELDED

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Positions

a. Flat

b. Vertical

c. Horizontal

d. Overhead

2. Applications

a. Aluminum

b. Titanium

c. Stainless steel

d. Alloys

B. LABORATORY ACTIVITIES

Laboratory Hours 4

Use inert gas processes to weld typical joints of aluminum and of stainless steel in each position.

XX. METHODS OF INSPECTION

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Visual

B. LABORATORY ACTIVITIES

Laboratory Hours 4

Inspection Techniques:

Make visual inspections of all welds to identify defects such as flux trapping, spatter, poor penetration, gas pockets, protrusion, etc.

Use a welding micrometer to determine size, convexity, concavity, and reinforcement of various welds. Compare measurement with standard tables for given joints and plate thickness.

2. Pressure
3. Ultrasonic
4. Die penetrant
5. X-Ray
6. Magnaflux

NOTE: X-ray and Magnaflux inspection will be covered in detail in a later course.

XXI. WELDING ECONOMY

A. OUTLINE OF INSTRUCTION
Class Hours 2

1. Welding design
 - a. Freedom of design
 - b. Ease of change
2. Casting vs. welding
 - a. Strength
 - b. Weight
 - c. Uniformity
 - d. Ductility
 - e. Machinability
 - f. Cost
3. Manual vs. semi-automatic vs. automatic welding
 - a. Number of repetitive welds
 - b. Length of weld
 - c. Location
 - d. Duty cycle
 - e. Shape

B. LABORATORY ACTIVITIES
Laboratory Hours 0

NOTE: Instructor is to supply necessary details to set up problem solving sessions for students.

ACETYLENE CUTTING

Determine from a blueprint the joint types, metal thickness, and running feet to be cut. Assume a 100% duty factor and select tip size. Use a handbook to estimate oxygen and acetylene requirements, cutting speeds, gas-consumption rates, and job-time estimate.

SUBMERGED ARC

Use a blueprint to determine plate thickness and running feet of each weld in an estimate of welding time and material requirements for inert gas welding (TIG) of various ferrous and non-ferrous metals. Use a handbook to determine number of passes, current required, electrode diameter, gas volume and pressure, filler-wire diameter and length.

XXII. REVIEW

A. OUTLINE OF INSTRUCTION

Class Hours

1. Review key areas.
2. Evaluate student's command of material.
3. Give additional emphasis to weak areas.

3. LABORATORY ACTIVITIES

Laboratory Hours

Assign additional laboratory applications for reinforcement.

TMe 123
MATERIALS OF INDUSTRY
3 Semester Hours

INTRODUCTION

Materials of Industry concerns itself with elements, their compounds, and their properties, beginning with extraction and following through finishing. The teaching approach largely involves classroom presentation with outside reading assignments. Sufficient individual student examination of the materials is involved to develop the ability to recognize the materials in their raw form and during processes of manufacture. The use of handbooks is employed to assist in the identification of suitable processing techniques.

TMe 123. Materials of Industry. Three lectures. (3 semester hours credit). A study of the origin, extraction, processing, and application of modern industrial materials.

MAJOR DIVISIONS

	Class Hours
I. Ferrous Metals	18
II. Non-Ferrous Metals	15
III. Wood Products	6
IV. Plastics	12
V. Additional Materials	3
VI. Review	
	<hr/>
	Total
	Class
	Hours
	<u>54</u>

I. FERROUS METALS

A. OUTLINE OF INSTRUCTION

Class Hours 18

1. Extraction processes

- a. Mining
- b. Smelting

2. Major types

a. Cast iron and its properties

- (1) Ductile
- (2) Gray
- (3) Malleable

b. Steel and its properties

- (1) Cast
- (2) Low carbon
- (3) Low alloy
- (4) Tool

c. Stainless steel and its properties

- (1) Austenitic
- (2) Ferritic
- (3) Martensitic

3. Forming and fabricating characteristics

- a. Forgeability
- b. Machinability
- c. Weldability
- d. Castability

4. Special processes

II. NON-FERROUS METALS

A. OUTLINE OF INSTRUCTION

Class Hours 15

1. Elements and their properties

- a. Aluminum
- b. Lead
- c. Zinc

- d. Copper
 - e. Magnesium
 - f. Titanium
 - g. Exotic metals¹
 - h. Precious metals
 - i. Others
2. Extraction processes
 - a. Mining
 - b. Smelting
 3. Alloys and their properties
 4. Forming and fabrication characteristics
 - a. Forgeability
 - b. Castability
 - c. Weldability
 - d. Machinability
 5. Special processes

III. WOOD PRODUCTS

A. OUTLINE OF INSTRUCTION

Class Hours 6

1. Classification
 - a. Hard woods
 - b. Soft woods
2. Processes and products
 - a. Cutting and transporting
 - b. Milling
 - c. By-products
3. Applications
 - a. Structural
 - b. Packaging
4. Fabricating

¹Accident Prevention Manual for Industrial Operations, 4th ed. (Chicago: National Safety Council, 1964), Chapter 28, page 2; Chapter 29, page 24. Industrial Hygiene (Chicago: Kemper Insurance, n.d.), Bulletin 197.

- a. Permanent
- b. Temporary

IV. PLASTICS

A. OUTLINE OF INSTRUCTION

Class Hours 12

1. Types and composition

- a. Thermoplastic
- b. Thermosetting
- c. Others

2. Forming processes

- a. Compression
- b. Transfer
- c. Cold
- d. Injection
- e. Extrusion
- f. Blow
- g. Vacuum
- h. Others

3. Fabrication

- a. Sheeting
- b. Laminating
- c. Reinforcing
- d. Machining
- e. Welding

V. ADDITIONAL MATERIALS

A. OUTLINE OF INSTRUCTION

Class Hours 3

1. Bonding materials

- a. Properties
- b. Applications

2. Rubber products

- a. Properties
- b. Applications

3. Glass products

- a. Properties
- b. Applications

4. Others

VI. REVIEW

A. OUTLINE OF INSTRUCTION

TMe 234

MANUFACTURING PROCESSES II

4 Semester Hours

INTRODUCTION

The study of modern methods of manufacture is continued with major emphasis on machine-shop operations. Sufficient lecture and laboratory time is allotted to develop an understanding of equipment and operation potentials. Continued use of standard references is employed to develop the ability to estimate time and material requirements for various processes.

The instructor and the student should wear clothing appropriate to machine-shop work. Machining operations should be performed only when the operator is wearing appropriate safety equipment, such as safety glasses.

Modern industry places greater emphasis on safety equipment, clothing, procedures, and materials. Every instructor and technician should own and study the Accident Prevention Manual for Industrial Operations. Footnotes and references found in these outlines are to be fourth and fifth editions.

TMe 234. Manufacturing Processes II. Two lectures. Four hours laboratory. (4 semester hours credit). A survey of machine tool operations and finishing processes employed in modern operations using standard references to estimate job time and materials.

MAJOR DIVISIONS

	Class Hours	Laboratory Hours
I. Machining and Cutting Tools	4	6
II. Turning Lathes	3	14
III. Turret and Automatic Lathes	2	8
IV. Screw Threads	1	4
V. Drilling	2	4
VI. Boring	1	2
VII. Planing, Shaping, and Slotting	1	2
VIII. Milling	2	10
IX. Gears and Gearing	2	12
X. Broaching and Sawing	2	1
XI. Grinding and Finishing	2	3
XII. Automation	2	3
XIII. Numerical Control for Machine Tools	4	0
XIV. Transfer and Special Machines	4	0
XV. Metal Finishing	4	3
XVI. Review		
	-----	-----
	Total Class Hours 36	Total Laboratory Hours 72

Total Suggested Clock Hours 108

I. MACHINING AND CUTTING TOOLS

A. OUTLINE OF INSTRUCTION Class Hours 4

1. Principles of metal cutting

- a. Types of machines and tooling
- b. Machinability

(1) Methods of measuring and reporting machinability

(2) Ratings

(3) Uses of machinability ratings

- (a) Guide in selecting materials from cost standpoint
- (b) Standards for machining
- (c) Estimating machining time for new jobs

2. Cutting tool materials

3. Tool selection, preparation and maintenance

- a. Cutting angle
- b. Tool setting

4. Safety in metal cutting¹

B. LABORATORY ACTIVITIES Laboratory Hours 6

Make laboratory examination of standard handbook and tables. Make simple computations of feed, speed, depth of cut, and coolant for various types of metals and machines in relation to type of tool. Graphically represent the difference between machine time of various metals and tools.

These problems will be verified at a later date with actual use of machinery.

Compute cost difference using various machine methods.

Select proper cutting tool, determine proper sharpening procedure from handbook, and make cuts as specified by instructor.

Compute time to be allowed for machining new projects with standard tool with carbide tip.

¹Accident Prevention Manual for Industrial Operations (Chicago: National Safety Council, 1964), Chapter 24.
Engineering Consultation Service (Chicago: Kemper Insurance, n.d.),
Bulletins 149, 209, 508, 511, 527, 532, 705.

II. TURNING LATHES

A. OUTLINE OF INSTRUCTION Class Hours 3

1. Types
 - a. Engine
 - b. Turret lathes
 - c. Toolroom
2. Construction and design
 - a. Identification and function of parts
 - b. Drive mechanisms
 - c. Attachments
3. Operations
 - a. Turning
 - b. Boring
 - c. Threading
 - d. Facing
 - e. Knurling
 - f. Tapering
 - g. Safety²

B. LABORATORY ACTIVITIES Laboratory Hours 14

Study metal cutting lathes as to type and application in the manufacturing processes. Identify chief difference between types.

Identify parts of design and methods of construction which point up differences between lathe types.

Use proper inspection tools for measuring--micrometers, dial indicators, inside micrometers, etc.

Plan and make setup and perform indicated operations on selected projects. Use handbook tables for given metals to set feed, speed, depth of cut, and coolant for each operation.

III. TURRET AND AUTOMATIC LATHES

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Types
 - a. Hand operated, manual controls
 - b. Automatic
 - c. Vertical
 - d. Horizontal
 - e. Twin turret
 - f. Automatic screw
2. Construction and design
 - a. Identification of parts

B. LABORATORY ACTIVITIES Laboratory Hours 8

²Accident Prevention Manual for Industrial Operations (Chicago: National Safety Council, 1964), Chapter 25, pages 3-5.

- b. Drive mechanisms
- c. Attachments

3. Operation

- a. Safety
- b. Turning
- c. Cutoff
- d. Tapping
- e. Knurling
- f. Drilling
- g. Facing

4. Multiple tooling principles

- a. Speeds
- b. Feeds

Set up and perform boring, threading, turning, and cutoff operations on a turret lathe. Use blueprint or project sheet to determine proper sequence. Select proper stock for operation. Calculate speed, feed, depth of cut, and coolant on data in handbook. Select and set up proper attachments for turret head.

IV. SCREW THREADS

A. OUTLINE OF INSTRUCTION Class Hours 1

B. LABORATORY ACTIVITIES Laboratory Hours 4

1. Types

- a. Acme
- b. American national
- c. Square
- d. Whitworth
- e. International standard
- f. Pipe
- g. Unified
- h. Internal and external

2. Elements

- a. Crest
- b. Pitch
- c. Pitch line
- d. Root
- e. Lead angle
- f. Depth
- g. Radius
- h. Flats
- i. Thread angle
- j. Base of thread
- k. Major diameter
- l. Minor diameter

- m. Pitch diameter
- n. Helix angle
- o. Fits and specifications

3. Methods of producing

- a. Die
- b. Lathe
- c. Taps
- d. Automatic die
(turret lathe)
- e. Milling machine
- f. Threading machine
- g. Rolling
- h. Die casting
- i. Grinding
- j. Threaded inserts

Make short lengths of each type of thread as identified by the instructor. Make necessary computations for turning thread forms. Grind tools, set angles and depths. Make internal and external threads.

V. DRILLING

A. OUTLINE OF INSTRUCTION
Class Hours 2

B. LABORATORY ACTIVITIES
Laboratory Hours 4

1. Types

a. Machines

- (1) Radial
- (2) Pedestal
- (3) Bench

b. Drills

- (1) Taper shank
- (2) Straight shank

c. Drill classifications

- (1) Fractional
- (2) Numerical
- (3) Alphabetical

Sharpen drill bits on grinder. Use gauge to check for proper angles.

Examine each type drill, listing its particular applications.

2. Construction and design

- a. Multi-spindle
- b. Sensitive

3. Operations

- a. Drilling
- b. Boring
- c. Reaming

Calculate and set up drill speeds and feed for drilling and reaming. Select coolant, tool, and stock for ferrous and non-ferrous metals.

- d. Countersinking
- e. Counterboring
- f. Spot facing
- g. Tapping

Select drill bits and sharpen for 3 specified relief angles for special materials assigned by instructor.

4. Safety practices in drilling operations³

VI. BORING

A. OUTLINE OF INSTRUCTION

Class Hours 1

B. LABORATORY ACTIVITIES

Laboratory Hours 2

1. Types of machines

- a. Most common machines
- b. Special machines

2. Types of tools

- a. Common boring tools
- b. Special boring tools

Perform simple boring operation using measuring device for precision work.

3. Safety⁴

VII. PLANING, SHAPING, AND SLOTTING

A. OUTLINE OF INSTRUCTION

Class Hours 1

B. LABORATORY ACTIVITIES

Laboratory Hours 2

1. Types

- a. Planing
- b. Shaping
- c. Slotting

2. Construction and design

- a. Identification of parts
- b. Drive mechanism

3. Operations

- a. Capacity
- b. Procedure

Set up simple project. Perform shaping operation, using standard accessories such as parallels, etc.

³Accident Prevention Manual for Industrial Operations, 4th ed. (Chicago: National Safety Council, 1964), Chapter 25, page 6.
Engineering Consultation Service (Chicago: Kemper Insurance, n.d.), Bulletin 529.

⁴Accident Prevention Manual for Industrial Operations, 4th ed. (Chicago: National Safety Council, 1964), Chapter 25, pages 6-8.

Use handbook for calculating to determine length of stroke, feed of table, and depth of cut for given type of material.

4. Safety practices for shaping, planing, and slotting⁵

VIII. MILLING

A. OUTLINE OF INSTRUCTION
Class Hours 2

B. LABORATORY ACTIVITIES
Laboratory Hours 10

1. Types

a. Machines

- (1) Horizontal
- (2) Vertical
- (3) Chemical milling

Set up simple project for horizontal plane and horizontal universal. The same assignment should be extended to vertical plane. Study of each should be included on field trip.

b. Cutters

(1) Vertical milling cutters

- (a) End mill
- (b) Shell mill
- (c) Dovetail
- (d) T-slot
- (e) Woodruff key
- (f) Ball end

(2) Horizontal milling cutters

- (a) Gear cutters
- (b) Hobs cutters
- (c) Form cutter
- (d) Side cutter
- (e) Slitting saw
- (f) Staggered-tooth cutter

Set up 2 or 3 gear-cutting projects, one of which should be helical gear.

Make setup as specified by instructor for simple climb-cut straddle milling. Repeat for conventional or "upcut" milling.

2. Construction and design

⁵Engineering Consultation Service (Chicago: Kemper Insurance, n.d.),
Bulletins 530 and 531.

Accident Prevention Manual for Industrial Operations, 4th ed. (Chicago:
National Safety Council, 1964), Chapter 25, page 11.

- a. Vertical
- b. Horizontal

3. Operations

- a. Slotting
- b. Slab
- c. Key way
- d. Splining
- e. Gears
- f. Fly

Calculate the number of turns and select proper hole circle in index plate required for milling a given number of divisions. Calculate lead angle and gear ratio for milling a given helix.

4. Attachments and accessories

- a. Arbors
- b. Dividing head
- c. Rotor table
- d. Holding devices

Set up machine for slitting, using a 1/16" by 2" or 2½" saw with special emphasis on procedures and precautions in use of such cutters.

5. Safety practices in milling⁶

IX. GEARS AND GEARING

A. OUTLINE OF INSTRUCTION Class Hours 2

B. LABORATORY ACTIVITIES Laboratory Hours 12

1. Nomenclature

- a. Identification of parts and gears
- b. Identification of machines to produce gear

Examine gear assortment in identification practice. This should include appropriate cutter or selected gear.

2. Types

- a. Spur
- b. Pinion
- c. Helical
- d. Bevel
- e. Hypoid
- f. Spiral
- g. Miter bevel
- h. Worm
- i. Cone

⁶Engineering Consultation Service (Chicago: Kemper Insurance, n.d.),
Bulletin 150.

Accident Prevention Manual for Industrial Operations, 4th ed. (Chicago: National Safety Council, 1964), Chapter 25, pages 8-9.

3. Methods of fabrication

- a. Templet
- b. Shaper cutter
- c. Milling
- d. Gear-generating machine
- e. Hob cutter

Calculate outside diameter and depth of tooth of a 42-tooth, 6-diametral-pitch spur gear. Set up and cut on milling machine.

X. BROACHING AND SAWING

A. OUTLINE OF INSTRUCTION
Class Hours 2

B. LABORATORY ACTIVITIES
Laboratory Hours 1

1. Types

Calculate from data provided and plan setup for the type of machine to do the following:

a. Machines

- (1) Vertical single-side surface
- (2) Vertical double-side surface
- (3) Vertical push
- (4) Vertical pull down
- (5) Vertical pull up
- (6) Horizontal
- (7) Rotary
- (8) Continuous
- (9) Saws (power hack, continuous band)
- (10) Electrical discharge

- 1. Cut a key way and a gear.
- 2. Cut the cap on a connecting rod.

b. Cutters

- (1) Selected for machine
- (2) Selected for metal cut

Calculate the feed and speed of a continuous saw blade for various metals. Cut one hole requiring breaking of blade. Insert in drilled hole and reweld blade.

2. Methods

a. Operations

- (1) Purpose
- (2) Safety

b. Setups

3. Safety procedure⁷

⁷Accident Prevention Manual for Industrial Operations, 4th ed. (Chicago: National Safety Council, 1964), Chapter 25, pages 9 and 12.

XI. GRINDING AND FINISHING

A. OUTLINE OF INSTRUCTION Class Hours 2

B. LABORATORY ACTIVITIES Laboratory Hours 3

1. Types

a. Machines

- (1) Surface
- (2) Internal
- (3) Centerless
- (4) Tool and cutter
- (5) Tool post

Using magnetic chuck, set up surface grinding project, including specified material and appropriate wheel. Make practice passes to establish procedure in this type operation.

b. Grinding wheels

- (1) Aluminum oxide
- (2) Silicon carbide
- (3) Diamond

Determine wheel types, spindle speed, peripheral speed, and grinding time for a selected project. Operational r.p.m. must not exceed design r.p.m. Examine grinding wheels periodically for cracks.

2. Operations

- a. Snagging
- b. Surfacing
- c. Radiusing
- d. Cylindrical grinding
- e. Forming

Dress grinding wheel for desired operation.

3. Surface finishes

a. Classifications

- (1) Micro-inch
- (2) R.M.S.

b. Measurement

4. Safety practices in grinding and finishing⁸

⁸Engineering Consultation Service (Chicago: Kemper Insurance, n.d.),
Bulletins 533 and 711.
Accident Prevention Manual for Industrial Operations, 4th ed. (Chicago:
National Safety Council, 1964), Chapter 25, page 13.

XII. AUTOMATION

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Definition
2. Automatic controls
 - a. Types
 - b. Purposes
3. Area of use
 - a. Machining
 - b. Steel making
 - c. Materials handling
 - d. Metal casting
 - e. Press working
 - f. Heat treating

B. LABORATORY ACTIVITIES

Laboratory Hours 3

Give orientation on the processes, equipment, and controls to be observed on a field trip to an industry employing processes discussed in OUTLINE OF INSTRUCTION.

XIII. NUMERICAL CONTROL FOR MACHINE TOOLS

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Definition
2. Conventional vs. numerical control method
3. Computers
4. Application potential
5. Control concepts
6. Preparation for use
7. System details
8. Transfer line

B. LABORATORY ACTIVITIES

Laboratory Hours 0

Plan the programming of a tape (numerical) control machine. Select proper operations in proper sequence from blueprint or information supplied by instructor (such as drilling, boring, tapping, milling). Using coordinate system, determine exact X and Y axis points for each operation.

XIV. TRANSFER AND SPECIAL MACHINES

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Introductory definition
2. Transfer-type machines

B. LABORATORY ACTIVITIES

Laboratory Hours 0

- a. Operation
- b. Achievement
- 3. Process machines
- 4. Sectionized automation
- 5. Integrated-interlocked line
- 6. Case studies

XV. METAL FINISHING

A. OUTLINE OF INSTRUCTION
Class Hours 4

- 1. Methods
 - a. Polishing
 - b. Buffing
 - c. Grinding
 - d. Scraping
 - e. Filing
- 2. Surface preparation
 - a. Degreasing
 - b. Rust preventative
- 3. Surface protection
 - a. Anodizing
 - b. Bluing
 - c. Plating
 - d. Painting
 - e. Plastic coating
- 4. Safety practices in metal finishing⁹

B. LABORATORY ACTIVITIES
Laboratory Hours 3

Using project assigned by the instructor, grind, file, and polish one surface of a ferrous and a non-ferrous metal and a plastic.

Use the following protection methods which are suitable to materials assigned by instructor:

- 1) anodizing
- 2) bluing
- 3) plating

Adequate ventilation is required. Exhaust loads must be located over finishing tanks.

XVI. REVIEW

A. OUTLINE OF INSTRUCTION
Class Hours

- 1. Review key areas.
- 2. Evaluate student's command of material.
- 3. Give additional emphasis to weak areas.

B. LABORATORY ACTIVITIES
Laboratory Hours

Assign additional laboratory applications for reinforcement.

TMe 343

HYDRAULICS & PNEUMATICS

3 Semester Hours

INTRODUCTION

Modern industrial equipment is powered by a variety of methods. Among those occurring most frequently are hydraulics and pneumatics. The content of this course is intended to familiarize the technical student with the location and function of typical components within circuits. Lecture sections describe types and operational principles; laboratory sessions concern themselves with student problem solving and examination of components and circuits, including disassembly, inspection, reassembly, and testing.

TMe 343. Hydraulics and Pneumatics. Two lectures. Two hours laboratory. (3 semester hours credit). Lecture and laboratory examination of hydraulic and pneumatic components and circuits including typical applications and operations.

MAJOR DIVISIONS

	Class Hours	Laboratory Hours
I. Introduction to Hydraulics	2	1
II. Principles of Power Hydraulics	4	3
III. Hydraulic Fluids and Flow Measurement	2	4
IV. Hydraulic Pumps	4	4
V. Control Valves	4	4
VI. Hydraulic Motors	2	2
VII. Accessories	2	3
VIII. Hydraulic System Design	3	3
IX. Pneumatic Power Unit	2	2
X. Pneumatic Controls	2	2
XI. Air and Hydraulic Cylinders	2	2
XII. Pneumatic Circuitry	4	2
XIII. Combination Systems--Air & Oil	3	4
XIV. Review	—	—
	Total Class Hours	Total Laboratory Hours
	<u>36</u>	<u>36</u>
Total Suggested Clock Hours		<u>72</u>

I. INTRODUCTION TO HYDRAULICS

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. The scope of hydraulics

- a. Importance of hydraulics in engineering
- b. Importance of hydraulics to the technician.
- c. Importance of hydraulics in industry

- (1) The potential uses for hydraulics in industry
- (2) Reasons for use of hydraulic-operated equipment over other means

2. Assignments, term projects, notebook, problems, and tests

B. LABORATORY ACTIVITIES

Laboratory Hours 1

Tour laboratory facilities; identify hydraulic and pneumatic equipment, emphasizing nomenclature. Compare and contrast circuit operation principles and components.

II. PRINCIPLES OF POWER HYDRAULICS

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Physical laws and principles

- a. Power--its meaning, formula
 - (1) Force, pressure, p.s.i.
 - (2) Atmospheric pressure

- b. Work--its meaning, formula

- (1) Torque

- (2) Horsepower

2. Physical properties of liquids

- a. Differences between solids, liquids, and gases
- b. Pascal's law

B. LABORATORY ACTIVITIES

Laboratory Hours 3

Solve selective problems involving the pressure developed in the container when a given force is applied to a piston of a given area.

Calculate pressure resulting from levers of given length having given force supplied.

Solve problem in torque, force, pressure, and horsepower by determining the amount of work required (in horsepower) to develop given pressure.

- (1) Meaning
- (2) Applications

c. Mechanics of liquids

- (1) Forms of energy
 - (a) Potential
 - (b) Kinetic
 - (c) Heat
- (2) Liquids in force multipliers
- (3) Liquids and transfer of motion

d. Characteristics of flow

- (1) Static factors
 - (a) Static pressure vs. heat energy
 - (b) Potential energy vs. kinetic energy

- (2) Dynamic factors
 - (a) Bernoulli's principle and applications
 - (b) Kinetic energy-- applications

Calculate pressure variations at given points within a system having different cross sections at these points. Verify experimentally.

3. Safety hazards of hydraulic liquids

III. HYDRAULIC FLUIDS AND FLOW MEASUREMENT

A. OUTLINE OF INSTRUCTION
Class Hours 2

- 1. Reservoirs, strainers, and filters
 - a. Principles and characteristics of reservoirs
 - b. Types and principles of strainers and filters

B. LABORATORY ACTIVITIES
Laboratory Hours 4

Disassemble, inspect and reassemble reservoirs, strainers, and filters having common and contrasting features.

2. Hydraulic piping and fitting

- a. Classifications--JIC standards
- b. Selections (use of charts and layout)

Practice identification of components in hydraulics systems from industrial blueprints. Identify details such as pump capacity, degree of filtration, direction of flow, capacities.

- c. Installation

Inspect pipes, tubing, hose, and fittings; study sizes, shapes, and applications.

- d. Packing

Make a laboratory examination of packing and sealing devices.

- (1) Composition
- (2) O-rings

3. Hydraulic fluids

- a. Requirements of a hydraulic fluid
- b. Characteristics of hydraulic oils

Use a Saybolt Universal Viscosimeter to determine viscosity of several fluids. Compare with standard table ratings and typical on-the-job comparitors.

- (1) Initial suitability
- (2) Viscosity and viscosity index

- (3) Pour point
- (4) Oxidation stability
- (5) Rust prevention
- (6) Foaming

- c. Maintenance and storage of hydraulic oils

Use commercial flow meters to make basic flow measurements in closed pipe circuits. Employ meters incorporating principles of the simple pitot, combined pitot-static, venturi, orifice, etc. Using a monometer, calibrate each flow meter. Make measurements of flow at varying pressures, and compare with standard tables.

IV. HYDRAULIC PUMPS

A. OUTLINE OF INSTRUCTION Class Hours 4

B. LABORATORY ACTIVITIES Laboratory Hours 4

- 1. Purpose of hydraulic pumps
- 2. Performance ratings

3. Classification of hydraulic pumps

- a. Principles of operation of nonpositive displacement pumps
 - (1) Centrifugal pumps (volute and diffuser)
 - (2) Propeller pumps
 - (3) Mixed flow pumps
- b. Principles of operation of positive displacement pumps
 - (1) Rotary pumps--gear, lobe, vane, or piston-type rotary
 - (2) Reciprocating pumps

For each type of pump, calculate pressure in cylinder of given dimensions having known pressure applied or forces exerted on levers of given lengths. Calculate volume per stroke and output capacity; calculate capacity for various strokes per minute.¹

Construct hydraulic pump, using simple hydraulic cylinder and check valves. Using data available, calculate power requirements for various discharge pressures and volumes.

V. CONTROL VALVES

A. OUTLINE OF INSTRUCTION Class Hours 4

1. Introduction to valves
 - a. Types
 - b. Classification--ratings

2. Pressure-control valves

B. LABORATORY ACTIVITIES Laboratory Hours 4

Assemble hydraulic circuits containing control valves as directed.

¹ Accident Prevention Manual for Industrial Operations, 4th ed. (Chicago, Illinois: National Safety Council, 1964), Chapter 24, pages 31-32.

Make pressure and flow checks at assigned points to:

Describe action within efficiently operating system.

Diagnose problems arising with variety of control valves.

3. Directional-control valves

a. General classification

- (1) Spool types and rotary types
- (2) Two-, three-, and four-connection types
- (3) Flow paths

b. Specific types

- (1) Manual
- (2) Pilot-operated
- (3) Solenoid-controlled
- (4) Solenoid-controlled pilot-operated

c. Check valves

- (1) Simple or standard type
- (2) Prefill type
- (3) Foot valve
- (4) Pilot-operated

4. Flow-control valves

- a. Gate, plug, and needle valves
- b. Pressure-compensated flow-control valves

VI. HYDRAULIC MOTORS

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Rotary

- a. Classification
- b. Rating-torque-speed

B. LABORATORY ACTIVITIES Laboratory Hours 2

Calculate requirements of pressure, volume, speed, torque, and horsepower in various applications of hydraulic motors.

Set up circuits with available equipment and experimentally verify.

Plot horsepower and torque graphs for various speeds.

2. Rams

- a. Classifications
- b. Ratings

VII. ACCESSORIES

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Principles of operation

- a. Accumulators
- b. Heat exchangers
- c. Oil coolers

- d. Oil filters

2. Applications

VIII. HYDRAULIC SYSTEM DESIGN

A. OUTLINE OF INSTRUCTION Class Hours 3

1. Hydraulic circuits

B. LABORATORY ACTIVITIES Laboratory Hours 3

Make temperature tests at inlet and outlets of components such as motors, filters, heat exchangers, rams, etc.

Analyze the impurities and foreign matter present in an operating hydraulic system by extracting a sample and allowing to settle, by filtering, by passing over magnetic field, by litmus test, etc.

B. LABORATORY ACTIVITIES Laboratory Hours 3

Design an elementary system containing major components using specifications indicated by instructor. Calculate pressure losses, flow temperature, and motor speeds. Verify by setting up circuits using available equipment and apply power; make pressure and flow measurements.

IX. PNEUMATIC POWER UNIT

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Construction and principle of operation of the compressor
2. Cylinder arrangements
3. Air tank construction and dimensions
4. Pressure switch control
5. Coupling methods of motor to compressor
6. Power requirements
7. R.F.L. units (regulator, filter, lubricator)
8. Safety codes

B. LABORATORY ACTIVITIES

Laboratory Hours 2

Disassemble, inspect, and reassemble basic compressor types. Give special attention to nomenclature, purpose, and operation of component parts.

Solve problems involving power requirements for several types and capacities of compressors.

Examine construction, flow path, adjustments, and operational limits for regulator units.

X. PNEUMATIC CONTROLS

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Directional-control valves, construction and operation
 - a. Four-way valves, manual
 - b. Three-way valves, manual
 - c. Pilot-operated valves
 - d. Solenoid-operated valves
2. Flow-control valves, construction and operation
 - a. Manually-operated
 - b. Cam-operated
3. Sequence valves

B. LABORATORY ACTIVITIES

Laboratory Hours 2

Assemble pneumatic circuits containing control valves as directed. Make pressure and flow checks at assigned points to:

Describe action within efficiently operating system.

Diagnose problems arising with variety of control valves.

- a. Construction and principle of operation
- b. Location in circuit

XI. AIR AND HYDRAULIC CYLINDERS

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Types of air and hydraulic cylinders

- a. Light, medium, heavy
- b. Tandern
- c. Duplex
- d. Double-end

2. Cylinder parts

- a. Tube
- b. Cover
- c. Packing gland
- d. Cushion assembly
- e. Piston and piston seals

f. Rods

3. Installation, application, and maintenance

B. LABORATORY ACTIVITIES

Laboratory Hours 2

Examine internal construction and flow path through various types of cylinders.

Measure cylinder air consumption at various thrusts.

Measure piston's speed as it is affected by such variables as friction, volume, and restrictions.

XII. PNEUMATIC CIRCUITRY

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Power-operated holding devices

- a. Advantages and accuracy
- b. Power chucking applications
- c. Power-operated mandrels
- d. Clamping devices

2. Pneumatic safety circuits

- a. Protection when pressure drops
- b. Protection against overloads
- c. Interlock for machine protection

B. LABORATORY ACTIVITIES

Laboratory Hours 2

Set up an elementary pneumatic circuit containing safety devices. Calculate pressures and volumes of gases under proposed conditions. Verify calculations and operation of safety devices.

Set up an elementary pneumatic circuit containing safety devices. Calculate pressures and volumes of gases under proposed conditions. Verify calculations and operation of safety devices.

- d. Emergency reversal
 - e. Holding at two pressure levels
 - f. Safeguarding the operator's hands
3. Remote control of pneumatic systems
- a. Bleed-type, pilot-operated valves
 - b. Pressure-type, pilot-operated valves
 - c. Pilot-operated system
 - d. Solenoid-operated systems
 - e. Cam-operated limit switches

XIII. COMBINATION SYSTEMS--AIR & OIL

A. OUTLINE OF INSTRUCTION Class Hours 3

- 1. Application and advantages
- 2. Air-controlled, hydraulic valves
- 3. Oil-controlled, air valves
- 4. Air control of multiple hydraulic circuits
- 5. Air as a cushion for hydraulic systems
- 6. Air-hydraulic booster

B. LABORATORY ACTIVITIES Laboratory Hours 4

- Set up and operate circuits involving air and oil:
- Air-hydraulic rapid traverse circuit
- Air-loading, hydraulic performance circuit
- Dampening circuits

XIV. REVIEW

A. OUTLINE OF INSTRUCTION Class Hours

- 1. Review key areas.
- 2. Evaluate student's command of material.
- 3. Give additional emphasis to weak areas.

B. LABORATORY ACTIVITIES Laboratory Hours

- Assign additional laboratory applications for reinforcement.

METALLURGY

3 Semester Hours

INTRODUCTION

Personnel working at the technical level in forming and fabrication of metal must be familiar with industrial methods of metallurgical testing and analyzing. To comprehend the analytical process, interpret charts and graphs, prepare their own reports, and communicate with both engineering and production personnel, they must be familiar with fundamental procedures, testing equipment, and computation of results.

The instructor is responsible for the orientation of the students in the use of the majority of this equipment. However, some equipment may necessarily be used by the instructor only, and the student becomes familiar with these procedures only to the point of insight into higher skill and knowledgeable operation. The student takes readings from indicating instruments and makes mathematical computations.

TMe 353. Metallurgy. One lecture. Four hours laboratory. (3 semester hours credit). Lecture presentations of techniques of destructive and non-destructive testing and the analysis of ferrous and non-ferrous metals. Laboratory activities involve the testing and analysis of samples, and preparation of reports.

MAJOR DIVISIONS

	Class Hours	Laboratory Hours
I. Extractive Metallurgy	1	2
II. Physical Metallurgy	3	12
III. Casting	2	2
IV. Hot and Cold Working	2	6
V. Heat Treatment	3	12
VI. Surface Hardening	2	12
VII. Alloying	2	8
VIII. Testing	3	18
IX. Review		
	<hr/>	<hr/>
	Total Class Hours	Total Laboratory Hours
	18	72
	Total Suggested Clock Hours <u>90</u>	

I. EXTRACTIVE METALLURGY

A. OUTLINE OF INSTRUCTION

Class Hours 1

1. The production of iron and steel
 - a. Types of iron and steel, terminology
 - (1) Cast iron
 - (2) Steel
 - (3) Wrought iron
 - b. Preliminary treatment of iron ores
 - (1) Iron ore
 - (2) Treatment before refining
 - c. Principles of blast furnace smelting
 - (1) Furnace description
 - (2) Furnace charge
 - (3) Furnace operation
 - (4) Classification of pig irons
 - (5) Smelting under pressure
 - d. Production of steel
 - (1) Processes
 - (2) Tonnage and special steels
 - (3) Acid and basic steels
 - (4) Removal of impurities
 - (5) Ferroalloys
2. Additional widely used processes
 - a. The Bessemer process
 - (1) General
 - (2) The converter
 - (3) The process
 - b. The open-hearth process
 - (1) General

B. LABORATORY ACTIVITIES

Laboratory Hours 2

NOTE: Use laboratory section to orient students in practices in extractive metallurgy to assist their understanding of the following sections. Film strips and moving films would survey extractive processes.

- (2) The furnace
- (3) The process
- (4) Bessemer vs. open-hearth process

c. Other steel-making processes

- (1) General
- (2) Direct-arc electric furnace
- (3) Induction furnace
- (4) Duplex and triplex processes
- (5) Cementation and crucible processes

II. PHYSICAL METALLURGY

A. OUTLINE OF INSTRUCTION

Class Hours 3

1. Properties of metal

- a. Chemical
- b. Electrical
- c. Thermal

d. Mechanical

2. Metallurgical characteristics

- a. Metallic state
- b. Crystalline state

c. Grain structure

B. LABORATORY ACTIVITIES

Laboratory Hours 12

Find the critical temperature and identify content of steel sample supplied by instructor. Make thermal analysis by controlled heating, by plotting a temperature-time chart, and by comparing with iron-iron-carbon diagram (ASM).

Examine common table salt under a microscope at low to high power. After careful orientation, observe grain, crystal, and lattice structure. Compare observation with laboratory manual.

Examine the grain growth of a given type of steel; heat to specified temperatures below, in, and above the critical range; quench, break, and make microscopic (low power) examinations and hardness tests.

- d. Stress and strain
- e. Plastic deformation by slip
- f. Rupture by cleavage
- g. Recrystallization
- h. Cold crystallization
- i. Critical temperature

III. CASTING

A. OUTLINE OF INSTRUCTION Class Hours 2

- 1. Molding considerations
- 2. Freezing
- 3. Inclusion of gases
- 4. Normal and inverse segregation
- 5. Cooling contraction
- 6. Safety practices

B. LABORATORY ACTIVITIES Laboratory Hours 2

Make a macroscopic examination of cast and forged pieces by cutting, filing, polishing, and etching. Identify porosity, cracks, segregations, depth of carburization, etc., which are present.

IV. HOT AND COLD WORKING

A. OUTLINE OF INSTRUCTION Class Hours 2

- 1. Rolling
 - a. Critical temperature
 - b. Recrystallization
- 2. Forging
 - a. Critical temperature
 - b. Recrystallization
- 3. Extrusion
 - a. Critical temperature
 - b. Recrystallization

B. LABORATORY ACTIVITIES Laboratory Hours 6

Use the impact test to compare the relative hardness of hot rolled stock with that of quenched and drawn stock. Compare the relative resistance to impact in line with and transverse to the direction of rolling.

Determine the cost of a given forging and evaluate the economic advisability of buying as opposed to making.

4. Safety precautions¹

V. HEAT TREATMENT

A. OUTLINE OF INSTRUCTION

Class Hours 3

1. Hot working
2. Annealing
3. Quenching

4. Carburizing

5. Spheroidizing

6. Hardening

7. Tempering

8. Low-temperature working

9. Others

B. LABORATORY ACTIVITIES

Laboratory Hours 12

Make hardness tests before and after heating and quenching specimens of several types of steel, using water, brine, oil, and air as quenching media. Wear face shield while quenching.

Compare effect of tempering on hardness, brittleness, and toughness of steel by comparing selected specimens of those tempered and not tempered following hardening.

VI. SURFACE HARDENING

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Carburizing

- a. Pack
- b. Gas
- c. Liquid

B. LABORATORY ACTIVITIES

Laboratory Hours 12

Make microscopic inspections of carburized steels. Compare the structure of specimens taken from the hardened surface and the more ductile core.

¹Accident Prevention Manual for Industrial Operations (Chicago, Illinois: National Safety Council, 1964), Chapter 27, page 33, "Hammers"; page 45, "Upsetting"; page 47, "Presses".

2. Nitriding²
3. Cyaniding³
4. Flame and induction heating
5. Hardface welding

X-ray a steel plate which has been hardfaced by welding. Note variation in grain structure.⁴

II. ALLOYING

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Ferrous

- a. Iron base
- b. Carbon

- c. Vanadium
- d. Tungsten
- e. Molybdenum
- f. Manganese
- g. Silicone
- h. Titanium
- i. Others

- (1) hi-nickel
- (2) hi-chrome
- (3) hi-carbon

B. LABORATORY ACTIVITIES

Laboratory Hours 8

Prepare several samples of iron with known carbon content; identify each with number punch and make hardness test. Heat each to a given temperature to include a range below, above, and at Critical Temperature. Remove, quench, make micro-examination and hardness tests. Compare effects of heat and carbon content on hardness as shown when data are graphed.

²Accident Prevention Manual for Industrial Operations (Chicago, Illinois: National Safety Council, 1964), Chapter 40, page 44, "Nitric Dioxide".

³Accident Prevention Manual for Industrial Operations (Chicago, Illinois: National Safety Council, 1964), Chapter 40, page 52, "Cyanides".

⁴Accident Prevention Manual for Industrial Operations (Chicago, Illinois: National Safety Council, 1964), Chapter 42, page 3, "Ionizing Radiation"; page 38, "Regulations and Controls".

- (4) hi-yield
- (5) hi-tensile

2. Non-ferrous

- a. Copper
- b. Aluminum
- c. Manganese
- d. Lead
- e. Zinc

VIII. TESTING

A. OUTLINE OF INSTRUCTION
Class Hours 3

1. Microscopic sections

- a. Selecting representative sample
- b. Grinding and polishing
- c. Etching
- d. Examining with microscope

2. Photomicrography

3. Macroscopic etch

4. Magnaflux and Zyglo

5. Radiograph

B. LABORATORY ACTIVITIES
Laboratory Hours 18

Prepare a specimen by grinding, polishing, and etching. Make a microscopic examination noting characteristics as indicated by instructor.

Select 2-4 pieces of metal. Finish and polish one surface. Test each surface with an acid 1-3 minutes. Dip samples into neutralizing solution. Examine for degrees of corrosion--on finished surfaces, on unfinished surfaces.

Polish for surface smoothness and study under microscope. Compare types of material and finishes.

Use a photomicrograph to record the structure of metals prior to and following destructive testing.

Make a macroscopic examination of cast and forge pieces by cutting, filing, polishing, and etching. Identify porosity, cracks, segregations, depth of carburization, etc., which are present.

Determine the voltage, exposure time, and critical geometrical positioning to make X rays of ferrous metals; use a florescope for

light metals such as aluminum, magnesium, etc. Identify shrinkage cavities, gas cavities, cracks, etc. in castings; slag inclusion, cracks, and incomplete fusion in welds.

6. Tensile testing

- a. Tensile strength
- b. Elastic limit
- c. Yield point
- d. Ultimate strength

Prepare 1-3 ferrous specimens for testing, using Hydraulic Universal Testing Machine. Record data for calculation for stress, strain, elasticity, ultimate strength, and yield point.

7. Compression

Make compression tests on non-ferrous metals, using a Universal Testing Machine. Note typical fractures and compare instrument readings with standard tables.

8. Impact

Perform Izod and Charpy tests with pendulum-type impact testing machine to determine foot-pounds required to fracture brittle specimens.

9. Fatigue

Use tension-compression type, rotation under bending-load type, or flexion type, fatigue-testing machines to examine resistance to fatigue and character of failure of various metals.

10. Hardness

a. Brinell

Measure two diameters of the impression made, using a Brinell Hardness Tester. Calculate hardness number and compare with tables supplied with equipment.

Calculate tensile strength where applicable from Brinell scale, using formula: $T.S. (lb./in.^2) = 500 \times$ Brinell number.

b. Rockwell

Make (standard and superficial) penetration tests with a Rockwell Tester for tool steel and case hardened steel.

c. Scleroscope

Make several indentation tests for a given grade of metals using a scleroscope. Account for variation in reading and compare with standard tables.

d. Others

11. Spark

Practice identification of steels of varying hardness and carbon content by spark characteristics when grinding.

12. Ultrasonic testing

13. Die penetrant

IX. REVIEW

A. OUTLINE OF INSTRUCTION

Class Hours ____

1. Review key areas.
2. Evaluate student's command of material.
3. Give additional emphasis to weak areas.

B. LABORATORY ACTIVITIES

Laboratory Hours ____

Assign additional laboratory applications for reinforcement.

TMe 362
INSPECTION TECHNIQUE
2 Semester Hours

INTRODUCTION

The fact that an increasingly larger part of the production dollar now goes into inspection only emphasizes the need for a more intensive study of the use and care of precision and non-precision instruments, tools, and methods of industrial inspection.

In the classroom the study and understanding of theory and principle will be emphasized. The laboratory sessions will deal with the practical aspect of measuring devices, control limits, and optical and statistical methods of quality control and quality assurance. The care and calibration of all measuring instruments are emphasized inasmuch as this area is recognized as one of the specialties of the technician.

TMe 362. Inspection Technique. One lecture. Two hours laboratory. (2 semester hours credit). Classroom and laboratory examination of basic principles of modern industrial and aerospace inspection methods. Special emphasis is placed on calibration and care of all instruments.

MAJOR DIVISIONS

	Class Hours	Laboratory Hours
I. Basic Concepts of Inspection	1	2
II. Dimensional Control and Measurement	8	16
III. Testing for Physical and Mechanical Properties	6	12
IV. Statistical Methods of Quality Control	2	4
V. Inspection Organization	1	2
VI. Review	—	—
	Total Class Hours	Total Laboratory Hours
	18	36
	Total Suggested Clock Hours	54

I. BASIC CONCEPTS OF INSPECTION

A. OUTLINE OF INSTRUCTION

Class Hours 1

1. Understanding and appreciating industrial and aerospace inspection
2. Origin and need
 - a. Basic size limits
 - b. Clearance and allowance
 - c. Tolerance
 - d. Interference
 - e. Selective assembly
 - f. Specifications

- (1) AISC
- (2) ASM
- (3) MILS
- (4) Lloyds of London
- (5) Others

3. Classes of fits

- a. Selective
- b. Transition
- c. Zoning assembly

B. LABORATORY ACTIVITIES

Laboratory Hours 2

Compute basic size of parts, allowance, and the maximum permissible clearance with information furnished by the teacher.

II. DIMENSIONAL CONTROL AND MEASUREMENT

A. OUTLINE OF INSTRUCTION

Class Hours 8

1. Units of length
 - a. English system
 - b. Metric system
2. Sight and touch
3. Measurement
4. Specifications of dimensions
5. Non-precision measurement

B. LABORATORY ACTIVITIES

Laboratory Hours 16

Compute assigned problems dealing with decimals and fractions. Convert inches to millimeters and centimeters.

Inspect machine parts, using non-precision measuring devices.

- a. Tools of non-precision measurement
 - b. Care and use of tools
6. Precision measurement
- a. Micrometers
 - b. Vernier calipers, gages
 - c. Vernier micrometer
 - d. Care and adjustments of micrometers and vernier calipers, gages
 - e. Limits of precision measurement
7. Ring, plug, and snap gages
- a. Master gages
 - b. Care of gages
 - c. Gaging policy
 - (1) Tolerances for gage-makers
 - (2) Wear allowance
 - (3) Human error
8. Precision gage blocks
- a. Industrial function
 - b. Tolerance and classification
 - c. Care and use of gage blocks
9. Comparison measurement
- a. Uses of comparison measurement in inspection
 - (1) Advantages
 - (2) Limitations
 - b. Care and adjustment of dial indicator and dial gages
 - c. Mechanical and optical comparators
 - d. Electrical and electronic comparators
 - e. Air comparators
 - f. Multicheck comparators
 - g. Automatic gaging

Check the accuracy of micrometers and check measurements to the one thousandth of an inch. Compare two measurement methods.

Using go-no-go gages, snap, ring, and plug gages, inspect machine parts assigned by the instructor.

To show human error, graphically represent micrometer readings of the class on a large volume of parts.

Mathematically compute error by gage blocks due to heat and linear expansion problems to be selected by the instructor.

Verify the accuracy of micrometers and verniers, using gage blocks.

Verify measurement, using comparison and indicating methods. Industrial problems are to be set up by instructor for comparison measurement.

10. Optical instruments in industrial inspection

- a. Microscopes
- b. Optical comparators
- c. Light-wave interference

- (1) Equipment
- (2) Principles of light-wave measurement

Using gage blocks and optical flats, check size of ball bearings, size and parallelism of steel block.

11. Precision angle measurement

- a. Basic tools
- b. Sine bar
- c. Simple indexing
- d. Sine plates

Mathematically compute angular measurements, using the gage blocks, sine bar, and simple indexing.

12. Tool-room specialties

- a. Surface plate
- b. Angle irons
- c. Parallels
- d. Squares and straight edges
- e. Level
- f. Thread wires

13. Ultrasonic measurement

14. Supramicrometer and measuring machine

15. Calibration and care of all measuring devices

III. TESTING FOR PHYSICAL AND MECHANICAL PROPERTIES

A. OUTLINE OF INSTRUCTION

Class Hours 6

1. Destructive testing

- a. Typical destructive test
- b. Impact testing
- c. Equipment used

2. Hardness testing

- a. Simple test for hardness
- b. Brinell hardness test
- c. Rockwell hardness test

B. LABORATORY ACTIVITIES

Laboratory Hours 12

Perform destructive testing of selected ferrous and non-ferrous metals, oak and pine, thermoplastic and thermosetting plastics, and cermets, using Universal Testing Machine.

3. Magnetic particles inspection

- a. Basic concepts of magnetism
- b. Problems of magnetism
- c. Equipment used

Make magnetic particle inspection of ferrous metals, using magnaflux equipment.

4. Non-magnetic methods of non-destructive testing

- a. Zyglo
- b. Stratiflux
- c. Partek
- d. Struscoat
- e. Liquid penetrant

Use Zyglo process to make crack tests in non-magnetic materials.

5. Industrial radiography¹

- a. Radiographic process
- b. X-ray generation equipment
- c. Geometric principles in radiography
- d. Protection
- e. Application of industrial radiography

X-ray several welds and other mechanical parts, develop film, and analyze.¹

IV. STATISTICAL METHODS OF QUALITY CONTROL

A. OUTLINE OF INSTRUCTION

Class Hours 2

- 1. Basic theory of quality control
- 2. Quality control by attributes
 - a. Sampling method
 - b. Sample sizes
- 3. Quality control by variables
 - a. Frequency distribution curve
 - b. Range
 - c. Sampling procedures

B. LABORATORY ACTIVITIES

Laboratory Hours 4

Using statistical methods and random sampling, charting, tolerance, and analysis charts, set up a quality control problem.

¹ Accident Prevention Manual for Industrial Operations (Chicago, Illinois: National Safety Council, 1964), Chapter 42, "Ionizing Radiation".

- d. Using the work sheet
- e. Control limits and tolerances

V. INSPECTION ORGANIZATION

A. OUTLINE OF INSTRUCTION

Class Hours 1

1. The inspection problem of industry
2. Relationship of inspection to overall industrial organization
3. Internal organization

a. Receiving inspection

b. Shipping inspection

c. Process inspection

d. Other inspection

B. LABORATORY ACTIVITIES

Laboratory Hours 2

Set up receiving inspection situation. Determine method of sampling and inspection. Prepare report indicating quality or acceptability of incoming materials with justification.

COMPREHENSIVE PROBLEM

Plan a limited manufacturing process, indicating routing from beginning processes through to packaging. Determine the number of checkpoints needed and identify their locations. Indicate the features to be inspected on each part (overall length, hole spacing, etc.), the type of technique employed at each checkpoint (mechanical, electrical, etc.), and the necessary tools or equipment.

VI. REVIEW

A. OUTLINE OF INSTRUCTION

Class Hours

1. Review key areas.
2. Evaluate student's command of material.
3. Give additional emphasis to weak areas.

B. LABORATORY ACTIVITIES

Laboratory Hours

Assign additional laboratory applications for reinforcement.

TMe 473
STRENGTH OF MATERIALS
3 Semester Hours

INTRODUCTION

The objective of Strength of Materials is a study of the characteristics of industrial materials under work or load conditions and the nature of predictable change in external dimensions which result. Theory, explanation, and demonstration in class provide the student with sufficient background to make mathematical computations using standard references and to verify experimentally the nature and extent of changes under working conditions.

TME 473. Strength of Materials. Two lectures. Two hours laboratory. (3 semester hours credit). A lecture and laboratory study of the stressing and deformation of modern industrial materials.

MAJOR DIVISIONS

	Class Hours	Laboratory Hours
I. Strength of Materials as Related to Product Design	2	0
II. Properties of Materials	3	0
III. Introduction to Statics	4	2
IV. Stress and Strain	4	4
V. Welded Joints, Rivets, and Threaded Fasteners	4	4
VI. Beams	3	4
VII. Center of Gravity and Centroids	4	3
VIII. Columns	4	8
IX. Torsion--Shafts, Shaft Couplings, and Keys	4	8
X. Combined Stresses	4	4
XI. Review	—	—
	Total Class Hours	Total Laboratory Hours
	<u>36</u>	<u>36</u>

Total Suggested Clock Hours 72

I. STRENGTH OF MATERIALS AS RELATED TO PRODUCT DESIGN

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Strength
2. Weight
3. Sales appeal
4. Ease of manufacture
5. Availability and cost
6. Life of the product

B. LABORATORY ACTIVITIES Laboratory Hours 0

II. PROPERTIES OF MATERIALS

A. OUTLINE OF INSTRUCTION Class Hours 3

1. Strength
 - a. Tension
 - b. Compression
 - c. Shear
 - d. Bending
 - e. Twisting
2. Elasticity
3. Stiffness
4. Resilience
5. Ductility
6. Hardness
7. Malleability
8. Toughness
9. Machinability
10. Fatigue
11. Creep
12. Durability

B. LABORATORY ACTIVITIES Laboratory Hours 0

III. INTRODUCTION TO STATICS

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Composition and resolution of forces
2. Conditions of equilibrium
3. Inertia
4. Moments

B. LABORATORY ACTIVITIES

Laboratory Hours 2

Use data supplied by the instructor to review the principle of moments by solving problems involving various beam lengths, load weights, and points, and support or fulcrum.

IV. STRESS AND STRAIN

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Load and unit stress
2. Strain
3. Hooke's Law
4. Young's Modules

B. LABORATORY ACTIVITIES

Laboratory Hours 4

Determine the elastic limit, modulus of elasticity, and ultimate strength of a material supplied by the instructor. Verify experimentally with a strain gage by applying tension to the material and measuring strain for each unit of force; continue to add force to determine the elastic limit and ultimate strength.

5. Thermal stress

Using data supplied by the instructor, calculate the linear expansion and/or contraction of given materials for a 40-degree temperature change.

6. Pressure vessels

Calculate the change in the force on a given surface area of a cylinder with changes in internal pressure.

7. Factor of safety

Calculate the factor of safety for the above materials.

V. WELDED JOINTS, RIVETS, AND THREADED FASTNERS

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Welded joints
2. Riveted joints
3. Bolted joints
4. Typical problems

F. LABORATORY ACTIVITIES

Laboratory Hours 4

Prepare three joints using varying quality bolts. Calculate deformation of fastener and plate. Verify experimentally and represent graphically.

Using the three major fastening methods, prepare joints. Calculate the shear point of fastener, shear of plate or crushing of the plate. Use a universal tester to verify calculation. Graphically represent the comparative strengths of these methods. Examine cost and typical uses of each.

VI. BEAMS

A. OUTLINE OF INSTRUCTION

Class Hours 3

1. Types of beams
 - a. Simple
 - b. Cantilever
2. Shapes of beams
 - a. I beam
 - b. Tubular
 - (1) Round
 - (2) Square
3. Types of loads
 - a. Uniform
 - b. Concentrated
4. Application of moments
5. Reactions

B. LABORATORY ACTIVITIES

Laboratory Hours 4

6. Bending

Use a transverse testing machine to verify calculations on bending of beams of various materials as assigned by instructor.

7. Shear

Calculate the load or pressure requirements for shear point of the above-mentioned beams.

VII. CENTER OF GRAVITY AND CENTROIDS

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Definition of center of gravity
2. Distinction between center of gravity and centroid
3. Moment of inertia
4. Practical application

B. LABORATORY ACTIVITIES

Laboratory Hours 3

Experimentally determine the center of gravity of irregularly shaped objects using the intersecting center-line technique. Suspend the object from line; locate the center line; change the position of the object and locate a second center line. Continue this process until the converging point of all center lines is determined.

Using a suspended platform on which the object is mounted, make appropriate measurements of distance and period of swing. Mathematically compute the moment of inertia from experimentally determined data.

VIII. COLUMNS

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Length / area ratio
 - a. Short
 - b. Medium or intermediate
 - c. Long--Euler's formula
2. Materials
 - a. Steel
 - b. Wood
 - c. Concrete
 - d. Plastics
 - e. Aluminum and its alloys

B. LABORATORY ACTIVITIES

Laboratory Hours 8

3. Strength

- a. Inversely as length
- b. Directly as area
- c. Directly as moment of inertia

4. Loading

- a. Buckling
- b. Ultimate

Calculate the buckling load and the ultimate load for columns of various lengths/area ratios and materials.

5. Bracing

- a. Rotation
- b. Translation

Use a universal testing machine to verify experimentally the above calculations.

Make comparisons of the relative strengths, costs, weights, and other characteristics of the above materials.

6. Shape

- a. I beam
- b. Tubing

Use a transverse testing machine to load beams of various shapes.

Determine the bend moment and the vertical shear. Represent findings graphically.

IX. TORSION--SHAFTS, SHAFT COUPLINGS, AND KEYS

A. OUTLINE OF INSTRUCTION

Class Hours 4

B. LABORATORY ACTIVITIES

Laboratory Hours 8

1. Definitions

2. Torsional shearing stress

3. Angle of twist

4. Power of transmission

Use a torsion tester to test shafts of known diameter, length, and composition for torsional deformation and ultimate stress resulting from various tangential load conditions.

5. Types of couplings

Repeat the above experiment for shaft couplings.

6. Stress in couplings

7. Design of keys

Use a torsion tester to determine the shear points of keys of given sizes and metals.

Tabulate and plot findings. Compare with standard tables.

X. COMBINED STRESSES

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Principle of superposition
2. Combined axial and bending stresses
3. Eccentrically loaded, short-compression members
4. Eccentric loading of machine members
5. Combined shear stresses
6. Combined bending and tension

B. LABORATORY ACTIVITIES

Laboratory Hours 4

Use a universal testing machine to run complete tension and compression tests on ferrous and non-ferrous metals. Make computations and plot strain diagrams. Indicate elastic limit and ultimate strength of each material by calculation and experimental verification. Compare with standard tables.

XI. REVIEW

A. OUTLINE OF INSTRUCTION

Class Hours

1. Review of key areas.
2. Evaluate student's command of material.
3. Give additional emphasis to weak areas.

B. LABORATORY ACTIVITIES

Laboratory Hours

Assign additional laboratory applications for reinforcement.

MOTION AND TIME STUDY

3 Semester Hours

INTRODUCTION

Lecture sections of this course impart principles of industrial methods and procedures for analyzing the manipulative activities of the production worker. Application is of equal importance. The technical student engages in analyses using typical industrial materials and equipment.

Laboratory activities include the analysis of the fundamental physical motions, the construction of various charts, the practice of dividing operations into elements, and time-study observations. Additional experience is gained in recognizing and giving value to foreign elements, allowances, and performance rating, and in calculating average cycle time, minimum observations, and standard times.

IME 483. Motion and Time Study. Two lectures. Two hours laboratory. (3 semester hours credit). The systematic study of methods, materials, tools and equipment involved in motion and time studies. Laboratory practice centers around analysis of operational motions and time requirements as practiced in industry.

MAJOR DIVISIONS

	Class Hours	Laboratory Hours
I. History of Methods Engineering	2	1
II. Process Charts	4	4
III. Operations Analysis	2	2
IV. Motion Study	2	1

Total Suggested Clock Hours		<u>72</u>

I. HISTORY OF METHODS ENGINEERING

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Introduction
 - a. The production function
 - b. Scope of methods engineering and time study
 - c. Methods engineering
 - d. Time-study requirements
 - e. Wage payment
2. Development of motion and time study
 - a. Taylor and Gilbreth
 - b. Motion study
 - c. Early contemporaries
 - d. Organizations
 - e. Present trends

B. LABORATORY ACTIVITIES Laboratory Hours 1

Laboratory orientation involves equipment and general procedures.

II. PROCESS CHARTS

A. OUTLINE OF INSTRUCTION Class Hours 4

1. Introduction
2. Operation-process chart
3. Flow-process chart
4. Man-and-machine process chart
5. Gang-process chart
6. Operator-process chart

B. LABORATORY ACTIVITIES Laboratory Hours 4

Make an operation-process chart.

Make a flow-process chart.

Make a man-and-machine process chart.

Make a gang-process chart.

III. OPERATIONS ANALYSIS

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Introduction
2. Purpose of operation
3. Design of part

B. LABORATORY ACTIVITIES Laboratory Hours 2

Practice in motion analysis:

Determine method of doing a specific job. Establish a proposed method.

4. Tolerances and specifications

Determine best method of doing a particular job in terms of quantity and quality. Consider tooling and labor cost.

5. Material

6. Process of manufacture

7. Setup and tools

8. Working conditions

9. Material handling

10. Plant layout

11. Principles of motion economy

IV. MOTION STUDY

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Fundamental motions (Therbligs)
2. Principles of motion economy
3. Theory of motion economy
4. Motion analysis as applied in planning

B. LABORATORY ACTIVITIES

Laboratory Hours 1

Identify the fundamental motions in specific tasks and describe their function.

Construct an operations-instruction card.

V. MICROMOTION AND MEMOMOTION STUDY

A. OUTLINE OF INSTRUCTION

Class Hours 2

1. Introduction
 - a. Preparation for a micromotion study
 - b. Equipment
2. Motion pictures
 - a. Analyzing the film
 - b. Creating and improving method
 - c. Teaching and standardizing the new method

B. LABORATORY ACTIVITIES

Laboratory Hours 4

Prepare micromotion study of typical assembly operation, using movie camera with cyclographic and chromocyclographic study. Analyze operations to eliminate wasted motion.

3. Other motion-study, photographic techniques

- a. Monomotion study
- b. Cyclegraphic and chromo-cyclegraphic study

Construct a simo-chart (simultaneous motion) for a specific assembling operation.

VI. PREDETERMINED TIME SYSTEMS

A. OUTLINE OF INSTRUCTION
Class Hours 2

- 1. Introduction
- 2. Definition
- 3. Predetermined time systems
 - a. Work factor
 - b. Methods--time measurement
 - c. Basic motion-time study
 - d. Motion-time analysis
 - e. Dimensional-motion times

B. LABORATORY ACTIVITIES
Laboratory Hours 2

Analyze specific operations in terms of the basic division of accomplishment and calculate the total cycle time by applying synthetic basic motion-time values.

VII. FACTORY COST

A. OUTLINE OF INSTRUCTION
Class Hours 2

- 1. Introduction
- 2. Job analysis
- 3. Job evaluation
 - a. Ranging method
 - b. Classification method
 - c. Factor comparison method
 - d. Point system
- 4. Labor standards
- 5. Cost distribution

B. LABORATORY ACTIVITIES
Laboratory Hours 2

Make a tour of two or more production plants. Observe and compare the job evaluation methods employed in each. Evaluate the managerial policy for employing each.

6. Cost of accidents¹

VIII. TIME-STUDY EQUIPMENT

A. OUTLINE OF INSTRUCTION
Class Hours 2

1. Necessary equipment
2. Auxiliary equipment
3. Special equipment
4. Forms

B. LABORATORY ACTIVITIES
Laboratory Hours 1

Convert decimal minutes to decimal hours as used in timing equipment.

IX. ELEMENTS OF TIME STUDY

A. OUTLINE OF INSTRUCTION
Class Hours 2

1. Analysis of materials and methods
2. Elemental breakdown
3. Types of studies
4. Taking the study
5. Rating
6. Allowances
7. Calculations--average cycle time, minimum cycles

B. LABORATORY ACTIVITIES
Laboratory Hours 2

Practice dividing operations into elements based on time-study observations of operation cycles. Record the time consumed by each element and the difficulties encountered.

Calculate average cycle time and minimum number of cycle-study requirements for the above.

X. PERFORMANCE RATING

A. OUTLINE OF INSTRUCTION
Class Hours 4

1. Necessity of rating
2. Concept of normal
3. Principles of rating

B. LABORATORY ACTIVITIES
Laboratory Hours 4

Analyze time-study data resulting from observations of different individuals performing the same task; compute the systematic error mean deviation and the absolute error for each person and for the group.

¹Engineering Consultation Service (Chicago, Illinois: Kemper Insurance, n.d.), Bulletin 278, "Accident Costs".

Accident Prevention Manual for Industrial Operations (Chicago, Illinois: National Safety Council, 1964), Chapters 10 and 12, "Cost Estimating for Accidents".

4. Rating method
5. Analysis of rating
6. Training for rating

Analyze time-study data and apply the more common techniques of performance rating such as skill and effort rating, objective rating, and synthetic rating.

XI. ALLOWANCES

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Types
 - a. Personal
 - b. Fatigue
 - c. Delay
 - d. Machining
2. Application of allowances

B. LABORATORY ACTIVITIES Laboratory Hours 2

Using time-study data on an operation, calculate the standard time after determining and applying personal, fatigue, delay, and machining allowances as they apply to each element.

XII. STANDARD OR ALLOWED TIME

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Concept
2. Standard time
3. Types of standards
4. Maintenance of standards

B. LABORATORY ACTIVITIES Laboratory Hours 2

Using time study of an operation, evaluate the time study and then compare it with standard-time data. Convert to decimal hour per hundred pieces and calculate operator efficiency.

XIII. STANDARD DATA AND FORMULAS

A. OUTLINE OF INSTRUCTION Class Hours 4

1. Direct work standards
 - a. Observation sheet
 - b. Spread or comparison sheet
 - c. Manual and machine elements
 - d. Constants
 - e. Variables
 - f. Development of standard data
 - g. Application of data
2. Indirect work standards
 - a. Need

B. LABORATORY ACTIVITIES Laboratory Hours 4

Develop standard times of constant and variable elements of various types of work and machines.

Make graphs, tables, and monograms showing standard times for press working, foundry operations, and machining operations.

- b. Methods analysis
- c. Types

XIV. WORK SAMPLING

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Details
2. Application
3. Control chart
4. Technique

B. LABORATORY ACTIVITIES Laboratory Hours 3

Use the alignment chart to determine the number of observations required for a given degree of accuracy. Use the formula to check the accuracy of the alignment chart.

Conduct a simple work-sampling project.

XV. WAGE PAYMENT PLANS

A. OUTLINE OF INSTRUCTION Class Hours 2

1. Direct financial plans
2. Indirect financial plans
3. Nonfinancial plans

B. LABORATORY ACTIVITIES Laboratory Hours 2

Industrial field trip.

XVI. REVIEW

A. OUTLINE OF INSTRUCTION Class Hours

1. Review key areas.
2. Evaluate student's command of material.
3. Give additional emphasis to weak areas.

B. LABORATORY ACTIVITIES Laboratory Hours

Assign additional laboratory applications for reinforcement.

The techniques for making methods and operations analyses, as outlined in this course, are intended for use in methods engineering, operations analysis, production scheduling and process-flow chart preparation and not for the settling of jurisdictional matters or for the setting of wages or hours.

TMe 494

PRODUCTION PLANNING AND PROBLEMS

4 Semester Hours

INTRODUCTION

The objectives of this course are twofold: (1) to round out the production background of the student by presenting the factors involved in cost estimating, and (2) to point out the role of each segment of manufacturing production while emphasizing the planning and coordination required for effective operation.

Previous courses have concerned themselves with laboratory activities which were somewhat individual in nature. The comprehensive problem approach as set forth in the last major division of this course requires that the student combine these many separate knowledges and skills and apply them as a whole in analyzing and planning the manufacture of a given item.

A sample problem employing the comprehensive approach is found on page 197 of the appendix along with suggested steps of procedure in its solution. The technical instructor is encouraged to exercise his prerogative in assigning this problem or a similar one of greater or lesser difficulty and length in accord with the interests and abilities of his class. Regardless of the particular problem assigned, the procedure of production planning remains applicable.

Half of the contact time of this course has been allocated to the comprehensive problem. However, there is every indication that the number of hours necessary for completion is in excess of hours allotted. Outside work is encouraged. During scheduled laboratory periods, the instructor should guide and direct individual students in problem solving while encouraging use of laboratory and library facilities.

TMe 494. Production Planning and Problems. One lecture. Six hours laboratory. (4 semester hours credit). Examination of the factors involved in cost estimating. Identification of production problems and techniques of solution in lecture. Use of resource material in laboratory in application and problem solving.

MAJOR DIVISIONS

	Class Hours	Laboratory Hours
I. Cost Estimating Methods	3	3
II. Cost Estimating Elements	4	12
III. Production Activities	3	10
IV. Scientific Production Control	7	20
V. Comprehensive Problem	<u>1</u>	<u>63</u>
	Total Class Hours	Total Laboratory Hours
	<u>18</u>	<u>108</u>
	Total Suggested Clock Hours <u>126</u>	

I. COST ESTIMATING METHODS

A. OUTLINE OF INSTRUCTION

Class Hours 3

1. Introduction
2. Estimating requirements
3. General methods
 - a. Weights, sizes, and commercial shapes
 - b. Equipment costs and equipment life
4. The detail method
5. The basic time study method
6. The ratio method
7. Estimating forms

B. LABORATORY ACTIVITIES

Laboratory Hours 3

Determine shape weights of forgings and castings. Determine cut weights, bar weights, and combined weights of fabricated materials.

II. COST ESTIMATING ELEMENTS

A. OUTLINE OF INSTRUCTION

Class Hours 4

1. Use of graphs and tables
2. Preparation time (setup)
3. Tool maintenance
4. Performance time
5. Personal allowances
6. Process loss allowances
7. Number of operations and passes
8. Sequence of operations
9. Quality of requirements
10. Materials

B. LABORATORY ACTIVITIES

Laboratory Hours 12

Construct feed, speed, and rpm charts and graphs.

Determine machining times, setup times, and handling times for various specified jobs.

11. Labor and burden rates

12. Departmental costs

Calculate the total cost of manufacturing specified items in given quantities in terms of applicable factors.

13. Difficulty factors

III. PRODUCTION ACTIVITIES

A. OUTLINE OF INSTRUCTION

Class Hours 3

1. Scheduling
2. Machine loading
3. Design changes
4. Methods improvement
5. Inventory
6. Work areas
7. Work hazards
8. Scrap and salvage
9. Processing
10. Maintenance
11. Balancing production lines

B. LABORATORY ACTIVITIES

Laboratory Hours 10

Schedule for production specified jobs in quantity, having several component parts and given target dates. Consider material in stock, lead time, scrap ratio, processing techniques, machine loads, and possible change in design to reduce and simplify operations.

Solve problems in production-line balancing by equating time standards, number of personnel, combining and eliminating operations, reducing elemental times, changing feeds and speeds, and introducing special-purpose machines.

IV. SCIENTIFIC PRODUCTION CONTROL

A. OUTLINE OF INSTRUCTION

Class Hours 7

1. Linear programming

B. LABORATORY ACTIVITIES

Laboratory Hours 20

a. Index method

Solve order problems, using the index method in which several orders are programmed on a given number of machines, and have specified standard times for each piece and machine hours available.

b. The modified distribution method

Solve problems in linear programming, using the modified distribution method, with specific order loads, available machine times, standard pieces per hour, and cost per piece.

c. Simplex method
(introduction)

2. Economic order quantity

a. Computing standard-order quantity

b. Economic-order quantity formula

c. To make vs. to buy

Estimate engineering, founding, forging, stamping, machining, assembling, packaging, and shipping costs and set up production scheduling for a typical industrial product.

V. COMPREHENSIVE PROBLEM

A. OUTLINE OF INSTRUCTION
Class Hours 1

1. Problem assignment
2. Orientation
3. Procedure

B. LABORATORY ACTIVITIES
Laboratory Hours 63

Plan the production of an assigned item, following the steps of procedure as outlined in the sample problem found on page 197 in the appendix. Beginning with the acceptance of a design, prepare detailed assembly drawings; make cost estimates; determine required parts and raw materials; process and fabricate. Problem is completed with assembly employing a final inspection prior to packaging.

*Adapted, with permission, from outlines prepared by Curriculum Laboratory, Department of Community Colleges, State Board of Education, Raleigh, North Carolina.

INTRODUCTION

This beginning course is for those with little or no drafting experience. It assumes a background of plane geometry and arithmetic fundamentals.

The principal objective is to give the student a new communication tool--the language of industry. Additional objectives are to develop sketching-instrument drawing ability, to add greater depth in understanding of mechanical processes, and to introduce the area of tool design.

The course is developed as three two-hour laboratories to gain maximum contact time. Lecture-laboratory ratio is about 1-5. Lecture sessions are scheduled as needed for progress.

SGr 113. Mechanical Drafting I. Six hours laboratory. (3 semester hours credit). Theory and practice in sketching and instrument drafting. Orthographic projection and pictorial representation of mechanical objects.

MAJOR DIVISIONS

	Laboratory Hours
I. Fundamentals	2
II. Lettering	2
III. Sketching of Elementary Orthographics	12
IV. Isometric and Oblique Pictorial Sketching	12
V. Geometric Construction	10
VI. Multiview Projection and Dimensioning	16
VII. Scales	3
VIII. Sections and Conventions	15
IX. Fasteners	18
X. Auxiliary Views	18
XI. Review	
	<hr/>
Total Laboratory Hours	<u>108</u>

I. FUNDAMENTALS

A. OUTLINE OF INSTRUCTION

1. Function of drafting in design and production
2. Equipment and supplies
 - a. Standard drafting
 - b. Drafting media
 - c. Reproduction equipment
 - d. Reproduction media
3. Alphabet of lines
 - a. Widths of lines
 - b. Meaning of lines
 - c. Proper method of drawing
4. Sheet layout
 - a. Typical sheet sizes
 - b. Borders and title blocks
 - c. Arrangement of lettering

B. LABORATORY ACTIVITIES

Laboratory Hours 2

Examine drafting equipment, including: drafting machines, instruments, triangles, irregular curves, scales, templates, pencils, pens, ink, paper types, and cleaning equipment.

Practice line technique, including coding and width.

Lay out various borders and title blocks. Calculate placement of these for various paper sizes.

II. LETTERING

A. OUTLINE OF INSTRUCTION

1. Lettering styles
 - a. Gothic
 - b. Roman
 - c. Italic
 - d. Text
2. Composition
 - a. Uniformity
 - b. Stability
 - c. Condensed
 - d. Extended
3. Guide lines
 - a. Horizontal
 - b. Vertical
 - c. Inclined

B. LABORATORY ACTIVITIES

Laboratory Hours 2

Develop border system, title strip, and guide lines to be used in the exercises to be assigned in lettering practice.

Prepare lettering guide sheet for vertical upper case Gothic; space horizontal lines one-half inch apart down entire length of sheet.

4. Types

- a. Lightface
- b. Boldface
- c. Vertical

- (1) Upper case
- (2) Lower case

d. Inclined

- (1) Upper case
- (2) Lower case

5. Lettering instruments

- a. Ames lettering instrument
- b. Braddock and Rowe
- c. Leroy lettering device
- d. Wrico lettering device
- e. Grid back-up sheets

Exercise lettering techniques for:

- a. upper case vertical
- b. upper case inclined
- c. lower case vertical
- d. lower case inclined.

As skill develops, reduce spacing to $\frac{1}{2}$ ". Continue lettering practice with outside assignments.

Use drafting equipment to draw lettering guide lines as previously indicated. Practice lettering technique with assigned instruments.

III. SKETCHING OF ELEMENTARY ORTHOGRAPHICS

A. OUTLINE OF INSTRUCTION

1. Sketching

- a. Materials
- b. Line and arc technique
- c. Estimating size and proportion
- d. Choosing scale
- e. Two-dimension figures

2. Orthographic projection

- a. Definition
- b. Principal planes
- c. Principal views
- d. Projecting points
- e. Quality of finished sketches

B. LABORATORY ACTIVITIES

Laboratory Hours 12

Sketch straight line and arcs.

Sketch simple geometric solids to develop sense of proportion, ability to select and align views, and to recognize precedent of lines.

Sketch four plates involving objects having arcs, angles, holes, slots, grooves, etc.

IV. ISOMETRIC AND OBLIQUE PICTORIAL SKETCHING

A. OUTLINE OF INSTRUCTION

B. LABORATORY ACTIVITIES

Laboratory Hours 12

1. Isometric sketching

- a. Materials
- b. Principles
 - (1) Isometric projection
 - (2) Isometric drawing
- c. Techniques
 - (1) Blacking in
 - (2) Isometric and non-isometric lines
 - (3) Angles in isometric drawing
 - (4) Isometric ellipses
 - (5) Arcs and curves
 - (6) Sections
 - (7) Intersections

Sketch simple isometrics and obliques composed of straight lines only; sketch additional pictorials having curved surfaces. Emphasize technique of "blocking".

Assign additional pictorials, using instruments and dimensioning completely, as these areas are developed in lecture sessions.

2. Oblique sketching

- a. Cavalier drawing principles
- b. Cabinet drawing principles
- c. Positioning of object
- d. Steps in oblique drawing
- e. Offset measurements
- f. Ellipses
- g. Arcs and curves
- h. Angles
- i. Sections

V. GEOMETRIC CONSTRUCTION

A. OUTLINE OF INSTRUCTION

- 1. Bisecting arcs, lines, and angles
 - a. Compass and triangle
 - b. Triangle and T square
- 2. Parallel and perpendicular lines
 - a. Compass and straight edge
 - b. T square and triangle
 - c. Drafting machine

B. LABORATORY ACTIVITIES

Laboratory Hours 10

Use instruments and equipment in geometric-construction techniques as described in lecture outline. Assign one or more problems involving the proper procedure in the execution of methods listed in topics 1 through 5.

3. Dividing a line into equal parts
 - a. Conventional method
 - b. Method preferred by draftsmen
4. Constructing regular polygons
 - a. Conventional methods
 - b. Methods preferred by draftsmen
5. Tangents
 - a. Circle tangent to a line at a given point
 - b. Tangent to a circle through a point
 - c. Tangents to two circles
 - d. Line through a given point and tangent to an arc
 - e. Tangent arc to two lines at right angles
 - f. Tangent arc to two lines at acute or obtuse angles
 - g. Tangent arc to an arc and a straight line
 - h. An arc tangent to two arcs
 - i. An arc tangent to two and enclosing one or both
 - j. A series of tangent arcs conforming to a curve
 - k. Tangent arcs forming an ogee curve
 - l. A curve tangent to three intersecting lines
6. Constructing ellipses
 - a. Axes and foci method
 - b. Trammel method
 - c. Concentric-circle method
 - d. Ellipse on conjugate diameters
 - a. Parallelogram ellipse
 - f. Approximate ellipse
7. Parabola
 - a. Given focus and directrix

Construct six ellipses: one by each method listed at the left. Each student must make his own Trammel for use in constructing the ellipse by the Trammel method.

Construct parabolas using at least two of the four methods listed by which a parabola may be constructed.

- b. Given rise and span
- c. Given rectangle or parallelogram
- d. Given two points to join by a parabolic curve

8. Hyperbola

9. Involute

10. Spiral of Archimedes

11. Cycloid

12. Epicycloid

13. Hypocycloid

14. Helix

Construct one drawing of each geometric construction listed under topic 8 through 14.

Outside assignments may be made on the drawings listed above.

VI. MULTIVIEW PROJECTIONS AND DIMENSIONING

A. OUTLINE OF INSTRUCTION

1. Relationship of views to folding line
 - a. Conventional placement of views
 - b. Alternate positions of views
 - c. Partial-view location
 - d. Removed-views location
2. Angles of projection
 - a. First-angle projection
 - b. Third-angle projection
3. Lines
 - a. Visible lines
 - b. Invisible lines
 - c. Center lines
 - d. Lines produced by the intersection of two surfaces
 - e. Omission of line at the intersection of two surfaces

B. LABORATORY ACTIVITIES

Laboratory Hours 16

Use instruments and equipment to draw simple geometric solids. Emphasize relationship of views to each other and the placement of reference and miter lines.

Assign more complex geometric solids having covered surfaces, symmetrical holes, and hidden lines. Emphasize proper line techniques.

4. Surfaces
 - a. Normal surfaces
 - b. Inclined surfaces
 - c. Oblique surfaces
 - d. Curved surfaces
5. Curves
 - a. Fillets
 - b. Rounds
 - c. Runouts
6. Theory and technique of dimensioning
 - a. True-position dimensions
 - b. Maximum material condition
 - c. Lines
 - d. Arrowheads
 - e. Fractional and decimal dimensions
 - f. Leaders
 - g. Fillets and rounds
 - h. Finish marks
 - i. Notes
7. Dimensioning rules
8. Special dimensions
 - a. Mating dimensions
 - b. Machine pattern and forging dimensions
 - c. Notes in dimensioning
9. Preference in dimensioning
 - a. Function dimensions
 - b. Shop processes
10. Rules for dimensioning isometric and oblique drawings
11. Terms and definitions
 - a. Dimension line
 - b. Extension line
 - c. Arrowheads
 - d. Leaders
 - e. Notes
 - f. Finish marks

Assign various problems of some difficulty, requesting the projection of points among adjacent views to complete a third view. Emphasize use of projection lines and techniques. Dimension the preceding simple instrument drawings.

g. Dimension figures

12. Classes of fit

- a. Running and sliding fits
- b. Location fits
- c. Force fits
- d. Tolerances

Assign one or more plates that involve the proper execution of the designation of the various fits listed under "Classes of fit".

13. Surface-quality control

- a. Roughness
- b. Waviness
- c. Lay

Assign one plate to show the proper method of dimensioning tolerances.

Indicate properly the surface qualities listed in the lecture column on at least one drawing.

14. Machine finishes

- a. Ream
- b. Grind
- c. Hone
- d. Lap, polish, super-finish

Use correct method to indicate machine finishes: ream, grind, hone, lap, and polish on one or more drawings.

VII. SCALES

A. OUTLINE OF INSTRUCTION

- 1. Engineer's
- 2. Architect's
- 3. Metric

B. LABORATORY ACTIVITIES
Laboratory Hours 3

Use all scales in the measurement of and the drawing of line segments. Drawings hereafter will include those other than FULL SIZE.

VIII. SECTIONS AND CONVENTIONS

A. OUTLINE OF INSTRUCTION

- 1. Function of sectional views
- 2. Cutting plane
 - a. Representation on working drawing
 - b. Location of cutting plane line
 - c. Direction of sight
- 3. Classification of sections

B. LABORATORY ACTIVITIES
Laboratory Hours 15

Section selected problems to illustrate various types of sectioning and conventional practice.

At least one problem involving each type of section is recommended.

- a. Full sections
- b. Half sections
- c. Broken-out sections
- d. Revolved sections
- e. Aligned sections

4. Section lining

- a. Codes
- b. Spacing
- c. Angle and direction

5. Conventions

- a. Cutting plane lines
- b. Section lines (A.S.A.)
- c. Spokes, arms, ribs, and lugs in section
- d. Breaks

Execute properly the conventional practices listed under Conventions in lecture.

6. Dimensioning

Dimension the previously prepared sections and conventions.

IX. FASTENERS

A. OUTLINE OF INSTRUCTION

1. Types

- a. Removable
- b. Permanent

2. Screw threads

- a. Types and uses
- b. Terms and definitions
- c. Thread forms, series, and classes
- d. Tapped holes
- e. Detailed representations
- f. Semi-conventional representation
- g. Conventional representations (A.S.A. thread symbols)
- h. Thread notes and specifications

B. LABORATORY ACTIVITIES Laboratory Hours 18

Assign problem involving representation of the various forms of screw threads, classes of fit, and notes.

3. Threaded fasteners

- a. Types
- b. Proportions
- c. Detailed and conventional representations
- d. Notes and specifications

Represent fasteners listed in instructional column, using appropriate tables and formulas.

4. Keys and pins

- a. Types
- b. Detailed and conventional representations
- c. Notes and specifications

Represent the types and shapes covered in instruction column, following standard tables as to size, fit, and dimensions.

5. Rivets

- a. Types and uses
- b. Proportions
- c. Detailed and conventional representations
- d. Notes and specifications

6. Springs

- a. Types and uses
- b. Detailed and conventional representation
- c. Notes and specifications

Using tables and dimensions, assign problem involving extension, compression and torsion springs.

7. Welds

X. AUXILIARY VIEWS

A. OUTLINE OF INSTRUCTION

- 1. Function of auxiliary views
- 2. Classification of surfaces
- 3. Primary auxiliary views-- width, depth, height, auxiliaries
 - a. Direction of sight
 - b. Reference plane
 - c. Projection technique
 - d. Transfer of measurements
 - e. Auxiliary view from a principal view
 - f. Principal view from an auxiliary view

B. LABORATORY ACTIVITIES
Laboratory Hours 18

Develop a true shape and size primary auxiliary surface by projecting and transferring from principal views; assign a more complex problem and require development of complete object.

- g. Dihedral angles
- h. Plotted curves

4. Partial auxiliary views

5. Half auxiliary views

6. Auxiliary sections

7. Secondary auxiliary views

8. Descriptive geometry applied to true measurements of lines, angles, and surfaces

Develop a true shape and size secondary auxiliary surface from principal views; assign a more complex problem requiring development of the complete object.

XI. REVIEW

A. OUTLINE OF INSTRUCTION

1. Review key areas.
2. Evaluate student's command of material.
3. Give additional emphasis to weak areas.

B. LABORATORY ACTIVITIES

Laboratory Hours ____

Assign additional laboratory applications for reinforcement.

INTRODUCTION

This course complements SGr 113 and was constructed with the same objectives in mind. The fundamental areas of mechanical drafting are completed, and several special allied fields are introduced. This branching into special areas is justified because of the frequency of contact with other areas which the mechanical technician will experience.

SGr 223. Mechanical Drafting II. Six hours laboratory. (3 semester hours credit). A continuation of drafting fundamentals with an introduction to specialized areas such as architectural drafting, structural drafting, electrical drafting, and basic tool design.

MAJOR DIVISIONS

	Laboratory Hours
I. Working Drawings	12
II. Intersections & Developments	8
III. Gears	8
IV. Cams	8
V. Architectural Drawings	6
VI. Structural Drawings	6
VII. Electricity - Electronics Drawings	6
VIII. Pipe Drawings	6
IX. Welding Drawings	10
X. Charts, Graphs, Nomographs	4
XI. Basic Tool Design	34
XII. Review	—
	Total Laboratory Hours
	108

I. WORKING DRAWINGS

A. OUTLINE OF INSTRUCTION

1. Detail drawing
 - a. Layout and arrangement
 - b. Types
 - (1) Pattern-shop detail
 - (2) Forging details
 - (3) Machine details
 - (4) Welding details
 - (5) Stamping drawing
2. Assembly drawings
 - a. General-assembly drawing
 - (1) Views
 - (2) Dimensions
 - (3) Hidden lines
 - (4) Identification of part
 - b. Detail assembly
 - c. Diagram assembly
 - d. Working-drawing assembly
 - e. Installation assembly
 - f. Check assembly
3. Sectioning assembly drawings

II. INTERSECTIONS AND DEVELOPMENTS

A. OUTLINE OF INSTRUCTION

1. Intersections
 - a. Classification of surfaces
 - (1) Ruled surfaces
 - (2) Single-curved surfaces
 - (3) Warped surfaces

B. LABORATORY ACTIVITIES

Laboratory Hours 12

NOTE: The emphasis in applying dimensions to working drawings requires that the draftsman be aware of the shop processes. Remember that dimensions are for the craftsman who forms or fabricates the objects, not for the draftsman in preparing the layout.

Make detail drawings for the processes and uses listed at the left. Emphasize accuracy and retain plate for use in developing an assembly drawing.

Use previously made detail drawings in making assembly drawings of major types.

Design a simple machine, including in this machine permanent and removable fasteners and various machine processes; follow standard drafting-room practices.

Assign various drafting room practices (working orders, change orders, revisions, etc.)

B. LABORATORY ACTIVITIES

Laboratory Hours 8

- b. Common geometric solids
- c. Intersection of solids by planes

- (1) Plane surfaces
- (2) Curved surfaces

- d. Applications to design problems

2. Developments

- a. Types of surfaces

- (1) Developable
- (2) Nondevelopable or approximate

- b. Types of developments

- (1) Intersection of plane and prism
- (2) Intersection of plane and cylinder
- (3) Intersection of plane and oblique prism
- (4) Intersection of plane and oblique cylinder
- (5) Intersection of plane and pyramid
- (6) Intersection of plane and cone
- (7) Truncated oblique-rectangular prisms
- (8) Oblique cones (triangulation method)
- (9) Transition pieces
- (10) Intersecting prisms
- (11) Intersecting cylinders
- (12) Intersecting prisms and cones
- (13) Intersecting cylinders and cones
- (14) Intersecting cylinder and sphere

- c. Methods of development

- (1) Auxiliary views
- (2) Rotation
- (3) Triangulation
- (4) Gore method
- (5) Zone method

Draw two views of simple geometric solids intersected by planes; by other geometric solids.

Given necessary views, make developments of assigned surfaces of appropriate types as listed at the left.

III. GEARS

A. OUTLINE OF INSTRUCTION

1. Types of gears
 - a. Spur
 - b. Rack
 - c. Internal
 - d. Pinion
 - e. Bevel
 - f. Miter
 - g. Helical
 - h. Worm
 - i. Roller chain and sprockets
2. Standard spur-gear terms
3. Spur-gear tooth profile
4. Detail drawings of gears
5. Rack and pinion
6. Bevel and miter gears
7. Formulas
8. Splines
9. Serrations
10. Bearing
 - a. Types
 - b. Selection
 - c. Representing bearing on drawing
11. Notes for gears

B. LABORATORY ACTIVITIES

Laboratory Hours 8

Draw various elementary-gear types and parts, using standard formulas and tables.

Make a full-size drawing of pinion engaging a ring gear; show how teeth mesh; construct teeth exactly and note any interference.

IV. CAMS

A. OUTLINE OF INSTRUCTION

1. Followers--types
2. Cam motion--kinds

B. LABORATORY ACTIVITIES

Laboratory Hours 8

Assign problems involving selected cam representations and motion diagrams, using standard formulas and tables.

3. Motion diagrams--kinds

4. Profiles--types

V. ARCHITECTURAL DRAWING (INTRODUCTION)

A. OUTLINE OF INSTRUCTION

1. Architectural-drawing techniques

2. Architectural-drawing standards

- a. Symbols
- b. Units
- c. Handbooks

3. Classification

- a. Floor plans
- b. Elevations
- c. Special layouts
- d. Sections
- e. Details

B. LABORATORY ACTIVITIES Laboratory Hours 6

Draw a simple floor plan and elevation with representative details for a two-bedroom house.

VI. STRUCTURAL DRAWING (INTRODUCTION)

A. OUTLINE OF INSTRUCTION

1. Classification of structural drawings

2. Structural materials

- a. Shapes
- b. Connectors
- c. Floor and erection plans
- d. Riveting
- e. Welding
- f. Calculations
- g. Handbooks
- h. Working drawings and conventions
- i. Materials and corrosion factors

- (1) Ferrous
- (2) Non-ferrous

B. LABORATORY ACTIVITIES Laboratory Hours 6

Assign detail drawings from wood, steel, and concrete structural assemblies. Use standard texts, references, and tables.

j. Material expansion

- (1) Ferrous
- (2) Non-ferrous

3. Timber structures

- a. Materials
- b. Trusses
- c. Connectors
- d. Working drawings and conventions
- e. Material protection and preservation

4. Masonry structures

- a. Materials
 - (1) Brick
 - (2) Tile and terra cotta
 - (3) Stone
- b. Basic construction details
- c. Drafting conventions

5. Reinforced concrete

- a. Types of drawings
 - (1) Engineering
 - (2) Placing
- b. Manual of standard practice
- c. Drawings, sections, and conventions

6. Notes on structural drawing

VII. ELECTRICAL-ELECTRONICS DRAWINGS

A. OUTLINE OF INSTRUCTION

- 1. Diagrams
 - a. Single wire
 - b. Schematic
- 2. Electrical drafting techniques
- 3. Electrical symbols

B. LABORATORY ACTIVITIES

Laboratory Hours 6

Use electrical symbols to make a wiring diagram of a shop or small office building.

4. Typical electrical circuits

Use electronic symbols to draw a simple schematic of an electronic instrument.

5. Electrical charts

6. Notes on electrical drawings

VIII. PIPE DRAWINGS

A. OUTLINE OF INSTRUCTION

B. LABORATORY ACTIVITIES

Laboratory Hours 6

1. Types of pipes and tubes

- a. Steel and wrought iron
- b. Cast iron
- c. Copper
- d. Aluminum
- e. Stainless steel
- f. Plastics

2. Pipe joints and fittings

- a. Fittings
- b. Joints

Make one isometric or orthographic drawing, using selected pipe joints and/or fittings.

3. Valves

- a. Globe
- b. Check
- c. Gate

4. Pipe threads

5. Hangers and supports

- a. Rod
- b. Pipe

6. Pipe specifications and dimensions

7. American Standard code

8. Piping symbols

Make one schematic involving symbols in piping drafting.

9. Piping drawings

- a. Orthographic
- b. Isometric

10. Insulation materials and clearances

11. Notes for pipe drawings

IX. WELDING DRAWINGS

A. OUTLINE OF INSTRUCTION

1. Welding processes

- a. Oxyacetylene
- b. Metallic arc
- c. Carbon arc
- d. Stud Welding
- e. Atomic hydrogen
- f. Inert gas welding
- g. Automatic and semi-automatic
- h. Thermit welding
- i. Spot welding
- j. Pulsation welding
- k. Projection welding
- l. Seam welding
- m. Flash welding
- n. Forge welding

2. Bonding processes

- a. Brazing
- b. Soft soldering
- c. Plastics

3. Types of joints

- a. Butt joint
- b. Corner joint
- c. Tee joint
- d. Lap joint
- e. Edge joint

4. Types of welds

- a. Fillet
- b. Plug or slot
- c. Groove

5. Welding symbols

- a. General explanation of welding symbols
- b. Fillet-weld symbols

B. LABORATORY ACTIVITIES

Laboratory Hours 10

Make a prearranged visit to a welding shop to observe welding and bonding processes, types of joints, and types of welds.

Represent joint types, weld types, and welding methods, using standard symbols.

- c. Plug-weld symbols
- d. Slot-weld symbols
- e. Arc-spot weld symbols
- f. Arc-seam weld symbols
- g. Groove-weld symbols
- h. Flange-weld symbols
- i. Resistance-spot weld symbols
- j. Resistance-seam weld symbols
- k. Projection-weld symbols
- l. Flash-or upset-weld symbols

X. CHARTS, GRAPHS, AND NOMOGRAPHS

A. OUTLINE OF INSTRUCTION

- 1. Purpose
- 2. Terminology
 - a. Chart
 - b. Graph
 - c. Axis
 - d. Absissa
 - e. Ordinate
 - f. Origin
 - g. Coordinate
 - h. Plot
 - i. Fair
 - j. Scale
 - k. Independent variable
 - l. Dependent variable

3. Types

- a. Bar
- b. Pie
- c. Pictorials
- d. Trilinear
- e. Rectilinear

B. LABORATORY ACTIVITIES

Laboratory Hours 4

Draw the following charts and graphs:

A simple bar chart to show a comparison of two items.

A simple pie chart to show components adding to a total.

A simple trilinear chart to show the relationship among three items.

A simple rectilinear chart to demonstrate the continuity of relationship between two items.

f. Nomographs

A simple nomograph which simplifies the calculation of the value of a dependent variable when the value of an independent variable is known.

g. Others

XI. BASIC TOOL DESIGN

A. OUTLINE OF INSTRUCTION

B. LABORATORY ACTIVITIES

Laboratory Hours 34

1. Jigs and fixtures

- a. Classification of jigs
- b. Classification of fixtures
- c. Jig and fixture details
- d. Design procedure

Design a diameter drill jig for drilling a hole in a pin.

Design a milling fixture for either face milling or end milling. Provide set-up gages. State the kind and size of mill for which the fixture is designed.

Design a lathe fixture for turning, facing, boring, and tapping operations.

2. Punches and Dies

- a. Classification
- b. Presswork operations
- c. Punch and die details
- d. Special dies
- e. Punch and die design

Design a simple blanking and piercing die to punch out a specific workpiece.

XII. REVIEW

A. OUTLINE OF INSTRUCTION

B. LABORATORY ACTIVITIES

Laboratory Hours

1. Review key areas.
2. Evaluate student's command of material.
3. Give additional emphasis to weak areas.

Assign additional laboratory applications for reinforcement.

SMA 113. Technical Math I (Algebra). Three lectures. (3 semester hours credit). Broad coverage of the most widely accepted areas of college-level algebra with special applications for technicians.

MAJOR DIVISIONS

	Class Hours
I. Number Sets	4
II. Operations with Algebraic Expressions	8
III. Functions and Graphical Representation	5
IV. Linear and Quadratic Functions	8
V. Fractions	6
VI. Factoring	8
VII. Graphing	7
VIII. Exponents and Radicals	4
IX. Imaginary and Complex Numbers	<u>4</u>
	Total Class Hours
	<u>54</u>

I. NUMBER SETS

OUTLINE OF INSTRUCTION
Class Hours 4

- A. Basic operations on natural numbers
- B. Some properties of natural numbers
- C. Representation of natural numbers on a number line
- D. Basic operations of integers
- E. Some properties of integers
- F. Representation of integers on a number line

II. OPERATIONS WITH ALGEBRAIC EXPRESSIONS

OUTLINE OF INSTRUCTION
Class Hours 8

- A. Definitions
- B. Addition and subtraction with monomials

C. Addition and subtraction with polynomials

D. Use of exponents

E. Multiplication and division of monomials

F. Multiplication and division of polynomials

III. FUNCTIONS AND GRAPHICAL REPRESENTATION

OUTLINE OF INSTRUCTION

Class Hours 5

A. The coordinate system

B. The distance formula

C. Functions and relations

D. Graphical representation of functions and relations

E. Graphical representation of empirical data

IV. LINEAR AND QUADRATIC FUNCTIONS

OUTLINE OF INSTRUCTION

Class Hours 8

A. Equalities

B. Inequalities

C. Fractional equations

D. Linear equations and formula

E. Definition of quadratics

F. Methods of solution

G. Evaluating the discriminate

H. Radical equations

V. FRACTIONS

OUTLINE OF INSTRUCTION

Class Hours 6

A. Definition

B. Fundamental principles

C. Reduction to lowest terms

- D. Multiplication
- E. Division
- F. Signs
- G. Addition and subtraction
- H. Complex fractions

VI. FACTORING

OUTLINE OF INSTRUCTION
Class Hours 8

- A. Factoring monomials
- B. Prime factors
- C. Multiplication of a polynomial by a monomial
- D. Removing a common factor
- E. The difference between two squares
- F. The square of a binomial
- G. Perfect square trinomials
- H. Addition of a third term
- I. Factoring by grouping

VII. GRAPHING

OUTLINE OF INSTRUCTION
Class Hours 7

- A. Introduction
- B. The rectangular coordinate system
- C. Graphing an equation
- D. Solving simultaneous equations by graphs
- E. Graphing equations of higher degree

VIII. EXPONENTS AND RADICALS

OUTLINE OF INSTRUCTION
Class Hours 4

- A. Laws of exponents
- B. Radical and fractional exponents
- C. Multiplication and division of radical quantities
- D. Addition and subtraction of radical quantities
- E. Rationalizing
- F. The number j

IX. IMAGINARY AND COMPLEX NUMBERS

OUTLINE OF INSTRUCTION

Class Hours 4

- A. Imaginary numbers
- B. Simplifying imaginary numbers
- C. The imaginary unit
- D. Addition and subtraction
- E. Multiplication
- F. Complex numbers
- G. Conjugate-complex numbers
- H. Addition and subtraction of complex numbers
- I. Multiplication and division of complex numbers
- J. Equal complex numbers
- K. Graphing of complex numbers; addition and subtraction by graphing

NOTE: Modern mathematics is making significant inroads within modern industry. The increased frequency of its use will require that all engineers and technicians become knowledgeable in its use. It is recommended that the inclusion of its concepts and terminology be promoted in future mathematics courses.

SMa 223. Technical Math II (Trigonometry). Three lectures. (3 semester hours credit). Broad coverage of the most widely accepted areas of college-level trigonometry with special applications for the technician.

MAJOR DIVISIONS

	Class Hours
I. Radian Measure	4
II. Trigonometric Functions	4
III. Solution of Right Triangle	7
IV. Identities	8
V. Logarithms	8
VI. Vectors	7
VII. Oblique Triangles	6
VIII. Inverse Functions	5
IX. Complex Numbers	<u>5</u>
	Total Class Hours <u>54</u>

I. RADIAN MEASURE

OUTLINE OF INSTRUCTION

Class Hours 4

- A. Circumference of a circle
- B. The radian
- C. Arc length
- D. Changing from degrees to radians and from radians to degrees
- E. Linear and angular velocity

II. TRIGONOMETRIC FUNCTIONS

OUTLINE OF INSTRUCTION

Class Hours 4

- A. Introduction and definitions
- B. Positive and negative angles
- C. The rectangular Cartesian-coordinate system

D. Functions and variables

E. Algebraic signs of trigonometric functions

III. SOLUTION OF RIGHT TRIANGLES

OUTLINE OF INSTRUCTION

Class Hours 7

A. Definitions and nomenclature

B. Acute angles in a right triangle

C. Solving right triangles

IV. IDENTITIES

OUTLINE OF INSTRUCTION

Class Hours 8

A. Algebraic identities

B. Fundamental relations

C. Proofs

D. Variations of basic equations

V. LOGARITHMS

OUTLINE OF INSTRUCTION

Class Hours 8

A. Definitions

B. Logarithm bases

C. Theorems on logarithms

D. Multiplying, dividing, roots, and powers

VI. VECTORS

OUTLINE OF INSTRUCTION

Class Hours 7

A. Arithmetic additions

B. Algebraic addition

C. Representation by line segments

D. Geometric addition

- E. Resultants and components
- F. Use of the coordinate system
- G. Finding the resultant of two components
- H. Finding the components of a given vector

VII. OBLIQUE TRIANGLES

OUTLINE OF INSTRUCTION
Class Hours 6

- A. The distance formula
- B. Law of cosines
- C. Law of sines
- D. The ambiguous case
- E. Law of tangents
- F. Half-angle formulas

VIII. INVERSE FUNCTIONS

OUTLINE OF INSTRUCTION
Class Hours 5

- A. Definitions
- B. Inverse trigonometric functions
- C. Graphical representation
- D. Principle values
- E. Transformations

IX. COMPLEX NUMBERS

OUTLINE OF INSTRUCTION
Class Hours 5

- A. Definitions
- B. Cartesian form
- C. Graphical representation
- D. DeMoivre's theorem
- E. Roots of complex numbers

SMa 333. Technical Math III (Analytical Geometry & Calculus). Three lectures. (3 semester hours credit). Basic analytical geometry and calculus, including limits, derivations, and integrations; mechanics of La Place operational calculus as related to the study of control circuits; problem assignments illustrating application of oscilloscope demonstrations showing mathematical interpretations of electric waveforms; differentiation and integration to provide an understanding of expressions frequently encountered in technical literature.

MAJOR DIVISIONS

	Class Hours
I. Graphical Methods of Calculus	3
II. The Functions	2
III. Differentiation	17
IV. Differentiation of Higher Order	2
V. Integration	17
VI. Additional Trigonometric Functions in Calculus	10
VII. Logarithmic and Exponential Functions	<u>3</u>
	Total Class Hours <u>54</u>

I. GRAPHICAL METHODS OF CALCULUS

OUTLINE OF INSTRUCTION
Class Hours 3

- A. Slopes and rate of change
- B. Increments--work-force diagrams
- C. Nonlinear equations--slopes
- D. The derivative, graphically
- E. Maxima and minima
- F. Inflection points
- G. Areas, graphically

II. THE FUNCTIONS

OUTLINE OF INSTRUCTION
Class Hours 2

- A. Variables and constants
- B. Dependent and independent variables
- C. Continuous functions
- D. Single value
- E. Explicit and implicit

III. DIFFERENTIATION

OUTLINE OF INSTRUCTION
Class Hours 17

- A. Algebraic methods
- B. Limits
- C. General rules
- D. Where $X = f(y)$
- E. Where $X = f(y)^n$
- F. Sum or difference
- G. Maximum and minimum values
- H. Basic trigonometric functions
- I. $Y = e^u$ where $u = f(x)$
- J. Repeated differentiation

IV. DIFFERENTIATION OF HIGHER ORDER

OUTLINE OF INSTRUCTION
Class Hours 2

- A. Second derivative
- B. Application to falling bodies

V. INTEGRATION

OUTLINE OF INSTRUCTION
Class Hours 17

- A. Introduction of integration
- B. The integration constant

- C. The mechanics of the indefinite integral
- D. Evaluation of the constant of integration
- E. Integrals
- F. The integral applied to acceleration
- G. Area determination with integrations
- H. Average values by integration
- I. Integration of basic trigonometric functions
- J. Volumes by integration

VI. ADDITIONAL TRIGONOMETRIC FUNCTIONS IN CALCULUS

OUTLINE OF INSTRUCTION

Class Hours 10

- A. Inverse functions
- B. Electrical application of waves to differentiation and integration circuits

VII. LOGARITHMIC AND EXPONENTIAL FUNCTIONS

OUTLINE OF INSTRUCTION

Class Hours 3

- A. Exponential function
- B. Exponential functions in calculus
- C. Electrical transients

Ssc 213. Physics I (Properties of Matter and Mechanics). Two lectures. Two hours laboratory. (3 semester hours credit). A fundamental course covering several basic principles of physics such as the nature of scientific measurement and the most widely used systems, properties of matter including elementary atomic structure and the states of matter, mechanics and basic machines, and the solution of problems related to these areas. Laboratory periods will be used for demonstration and student experiments.

I. INTRODUCTION

OUTLINE OF INSTRUCTION

Class Hours 2

A. Physics: a study of matter and energy

1. Matter

- a. Solid
- b. Liquid
- c. Gas

2. Energy

- a. Forms

(1) Potential

- (a) Chemical
- (b) Position
- (c) Nuclear

(2) Kinetic

- (a) Motion (Momentum)
- (b) Heat
- (c) Light
- (d) Sound
- (e) Electrical

b. Conversion

B. Mathematics for physics

1. Decimals

2. Exponents

3. Trigonometric functions

- a. Sin alpha
- b. Cos alpha
- c. Tan alpha

4. Design and interpretation of graphs

5. The slide rule--a, b, c, d, k, and l scale

- a. Multiplication
- b. Division
- c. Squares and cubes
- d. Square root and cube roots
- e. Logarithms

C. Symbols and terms

D. Problem solving

1. Drawing of simple diagram

2. Listing of known and sought-after quantities

3. Type of problem and equation(s) needed

4. Substitution of letters for numbers

5. Cancelling and solving algebraically

6. Determining and giving unit for each number solved

7. Consideration of reasonableness of values obtained

II. MEASUREMENT

OUTLINE OF INSTRUCTION

Class Hours 4

A. Fundamental units of measurement

1. Length

a. English

- (1) Inch
- (2) Foot
- (3) Yard, 3600/3937 meter
- (4) Rod
- (5) Mile

b. Metric

- (1) Angstrom
- (2) Micron
- (3) Millimeter
- (4) Centimeter
- (5) Decimeter
- (6) Meter, standard unit of length for world

- (a) Old standard
- (b) New standard

(7) Kilometer

c. Conversion factors

- (1) 1 inch = 2.54×10^{-2} meter
- (2) 1 meter = 39.37 inches

2. Mass

a. English

- (1) Pound
- (2) Slug
- (3) Conversion

b. Metric

- (1) Milligram
- (2) Gram
- (3) Kilogram
- (4) Metric ton

c. Conversion factors

- (1) 1 Kilogram = 2.205 pounds (mass)
- (2) 1 slug = 14.6 Kilograms

3. Time - second

B. Secondary units of measure

1. Area

a. English

- (1) Square inch
- (2) Square foot
- (3) Acre

b. Metric

- (1) Square centimeter
- (2) Square meter

2. Volume

a. English

- (1) Fluid ounce
- (2) Quart
- (3) Gallon
- (4) Cubic foot

b. Metric

- (1) Milliliter
- (2) Liter

C. Systems of units

1. English

- a. Foot-pound-second (F.P.S.)
- b. Foot-slug-second (F.S.S. or British Engineering)

2. Metric

- a. Centimeter-gram-second (C.G.S.)
- b. Meter-kilogram-second (M.K.S.)

3. Table of corresponding units

D. The art of measurement

1. Closeness of measurement

2. The doubtful figure: tolerance
 3. Significant figure
 4. One part in so many
 5. Accuracy of measurement
 6. Percentage of error
 7. Percentage deviation from the mean
- E. Measuring devices
1. Length
 - a. Scaled-straight edge
 - b. Calipers and dividers
 - c. Micrometer caliper
 - (1) Least count
 - (2) Reading
 - d. Vernier caliper
 - (1) Least count (vernier)
 - (2) Reading
 - e. Gage blocks
 - f. Optical flats
 2. Area: compensating polar planimeter
 3. Volume: specific-gravity bottles--pyknometers
 4. Mass
 - a. Trip balance
 - b. Beam balance
 - c. Analytical balance
 - d. Inertia balance
 5. Force--spring balance
 6. Time
 - a. Stop clock
 - b. Stop watch
 - c. Atomic-decay measurement
 7. Direction
 - a. Units

- (1) Degree
- (2) Radian

b. Measurement

- (1) Protractor
- (2) Theodolite

c. Scales

- (1) Navigator's
- (2) Mathematician's and scientist's

III. ATOMS AND MOLECULES, SOME OF THEIR INTERACTIONS

OUTLINE OF INSTRUCTION

Class Hours 2

A. Structure of matter

1. Atoms

- a. Electron--orbits
- b. Nucleus

- (1) Protons
- (2) Neutrons

2. Molecules

3. Compounds

4. Mixtures

B. Phases of matter

1. Solid

2. Liquid

3. Gas

C. Forces among molecules

1. Cohesion

2. Adhesion

3. Capillary action

D. Molecules in motion

1. Brownian movement

2. Diffusion

3. Osmosis

4. Kinetic theory

IV. PROPERTIES AND PHENOMENA OF SOLIDS

OUTLINE OF INSTRUCTION

Class Hours 3

A. Density

1. Mass

2. Weight

B. Elasticity

1. Tensional

2. Compressional

3. Torsional

4. Shearing

5. Bending

C. Stress

D. Strain

E. Hooke's law

F. Young's modulus

1. Ratio of stress to strain

2. Elastic limit

G. Hardness, malleability, ductility, and tensile strength

H. The effect of heat

1. Linear expansion

2. Area expansion

3. Volumetric expansion

V. PROPERTIES AND PHENOMENA OF LIQUIDS

OUTLINE OF INSTRUCTION

Class Hours 3

A. Pressure

1. Measurement
2. Calculation
3. Pascal's vases
4. Head

B. Forces in fluids

1. Archimedes' principle
2. Bernoulli's principle

C. Physical

1. Viscosity
2. Volatility
3. Specific gravity: hydrometer
4. Density

D. Hydraulics

1. Hydraulic press
2. Pumps
 - a. Centrifugal
 - b. Lift
 - c. Force
 - d. Gear
3. Motors (hydraulic driven)

VI. PROPERTIES AND PHENOMENA OF GASES

OUTLINE OF INSTRUCTION

Class Hours 4

A. Elasticity and compressibility

1. Boyle's law

U
OF
ED
333

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1563

2nd. Charles' law

3. Ideal gas law

B. Pressure

1. Vacuum

2. Atmospheric

3. Absolute

C. Pressure gage

1. Barometer

a. Mercury

b. Aneroid: altimeter

2. Bourdon gage

VII. VECTORS AND GRAPHIC SOLUTIONS

OUTLINE OF INSTRUCTION

Class Hours 2

A. Vectors

1. Quantity representation

2. Parallelogram of forces

3. Equilibrium of forces

4. The vector triangle

5. Vector polygon

6. Vectors applied to structural problems

a. Condition I (translational)

b. Condition II (rotational)

7. Equilibrium due to concurrent forces

a. Tension

b. Compression

VIII. FORCE AND MOTION

OUTLINE OF INSTRUCTION

Class Hours 3

33

A. Force

1. Definition

2. The force of gravitation

- a. Sir Issac Newton--universal law of gravitation
- b. Gravit's relation to weight
- c. Means of measuring

B. Concept of motion

1. Velocity--the time rate of displacement

2. Acceleration

- a. Positive
- b. Negative

3. Velocity and acceleration

4. Distance and acceleration

5. Acceleration due to the force of gravity

- a. Free-fall motion
- b. Ballistic problems

C. Newton's laws of motion

1. First law--inertia

2. Second law--acceleration

3. Third law--action and reaction

IX. WORK, ENERGY, AND POWER

OUTLINE OF INSTRUCTION

Class Hours 4

A. Work

1. Definition

2. Units of work

- a. Metric
- b. English

B. Energy

1. Classification

a. Kinetic energy

- (1) Electrical
- (2) Heat
- (3) Sound
- (4) Light
- (5) Mechanical

b. Potential energy

- (1) Chemical
- (2) Positional
- (3) Nuclear

2. Measurement of energy

- a. Metric
- b. English

3. Energy and its transformations

a. Original sources

- (1) Sun
- (2) Atom

b. Conversion to other forms

4. Law of conservation of energy

C. Momentum

1. Impulse

2. Impact of moving fluids

3. Momentum and Newton's third law

- a. The law of conservation of momentum
- b. Rockets and jets

D. Power

1. Definition

2. Units of power

3. Efficiency

4. Measuring horsepower

- a. Brake horsepower: the Prony brake

b. The dynamometer

X. ANALYSIS OF BASIC MACHINES AND FRICTION

OUTLINE OF INSTRUCTION

Class Hours 6

A. Basic machines

1. The lever

a. Mechanical advantage

- (1) Actual
- (2) Theoretical

b. Examples and types

2. The inclined plane

- a. Vectorial analysis
- b. Applications

B. Friction

1. Nature of friction

2. Analyzing frictional forces

3. Coefficient of friction

- a. Starting
- b. Sliding
- c. Rolling

4. Effect of friction of machines

5. Mechanical advantage and efficiency of machines

C. Modification of the basic machines

1. The wedge

- a. Types
- b. Theoretical mechanical advantage

2. Screws

- a. Terminology
- b. Applications
- c. Mechanical advantage
- d. Efficiency

3. Wheel and axle

- a. Theoretical mechanical advantage
- b. Actual mechanical advantage
- c. Applications

4. Pulleys

- a. Simple
- b. Compound
- c. Chain fall
- d. Power transmitting--variable pitch

5. Gears

- a. Types
- b. Ratios

D. Compound machines

XI. ROTATION, TORQUE, AND POWER TRANSMISSION

OUTLINE OF INSTRUCTION

Class Hours 3

A. Rotary motion

- 1. Rotation as opposed to translation
- 2. Angular measurements
 - a. Displacement
 - b. Velocity
 - c. Acceleration

B. Torque

- 1. Units of torque
- 2. Contrast to work
- 3. Applications

C. Power transmission

- 1. Work and power in rotary motion
- 2. Drive shafts

D. Centripetal force

- 1. Uniform circular velocity

2. Circular acceleration

3. Relationship of Newton's first law of motion

4. Relationship of Newton's second law of motion

5. Applications

E. Centrifugal force

1. Relationship of Newton's third law of motion

2. Industrial applications

B. Producing electrical currents

1. Chemical means--voltaic cells

a. The dry cell

(1) Polarization

(2) Local action

b. The storage cell

(1) Lead-acid cells

(2) Alkaline cells

(3) Nickel-cadmium cell

2. Electromagnetic generators

3. Photoelectricity

4. Thermoelectricity

C. The effects of electric currents

1. Chemical

2. Magnetic

3. Heating

D. Electrical power and energy

1. Definitions

2. Units

- a. Watt and Kilowatt
- b. Watt-hour and Kilowatt-hour

3. Electrical energy equivalent to heat energy

IV. ELECTROMAGNETISM

OUTLINE OF INSTRUCTION

Class Hours 5

A. Magnetic fields

- 1. Around a straight conductor
- 2. Around a loop
- 3. Left-hand rule

B. Electromagnets

- 1. Iron core
- 2. Residual magnetism
- 3. Commercial uses

C. Electrical measuring instruments

- 1. Measuring effects
 - a. Chemical
 - b. Heating
 - c. Magnetic
- 2. Motor rule
- 3. Galvanometers
- 4. Ammeters
- 5. Voltmeters
- 6. Alternating-current instruments

V. ELECTROMAGNETIC INDUCTION

OUTLINE OF INSTRUCTION

Class Hours 5

A. Michael Faraday's contribution

1. Mechanical energy to electrical energy
 2. Importance of his discovery
- B. Magnetic induction terminology
1. Magnetic flux
 2. Flux density
 3. Permeability
 4. Field strength
- C. Induced-electromotive forces
1. Lenz's law
 2. Mutual inductance
 3. Self-induction

VI. ALTERNATING CURRENT

OUTLINE OF INSTRUCTION

Class Hours 5

- A. Introduction to alternating current
1. Nature of alternating current
 2. Alternating current compared with direct current
 3. Cycles--frequency
 4. Effective current and voltage
- B. Properties of alternating-current circuits
1. Pure-resistive circuits
 2. Inductive circuits
 3. Resistance and inductance--impedance
 4. Capacitive reactance circuits
 5. Resistive, capacitive, and inductive circuits
 6. Power factor
- C. Transformers

1. Structure

- a. Primary coil
- b. Secondary coils
- c. Cores

2. Theory

- a. Formation of magnetic field
- b. Induced electromotive force

3. Types of transformers

- a. Step-up voltages
- b. Step-down voltages

4. Uses of transformers

- a. Power transmission over long distances
- b. Low-voltage, heavy-current supply
- c. Low-voltage control circuits

5. Losses

- a. Eddy currents
- b. Hysterisis

VII. GENERATORS AND MOTORS

OUTLINE OF INSTRUCTION

Class Hours 3

A. Direct-current generators

1. Components

- a. Field
- b. Brushes
- c. Commutator

2. Principle of operation

B. Direct-current motors

1. Construction

2. Theory of operation

3. Counter-electromotive force

C. Alternating-current generators

1. Construction

- a. Rotor
- b. Stator

2. Phase

- a. Single
- b. Three

- (1) Delta
- (2) Y (wye)

D. Types of alternating-current motors

- 1. Series
- 2. Shunt
- 3. Compound
- 4. Induction
- 5. Synchronous

E. Measurement of a-c energy consumption

VIII. PRODUCTION AND DISTRIBUTION OF ELECTRIC POWER

OUTLINE OF INSTRUCTION

Class Hours 3

A. Terminology

- 1. Coulomb
- 2. Electron power
- 3. Kilovolt-ampere

B. Production of electric power

- 1. Steam plants
- 2. Internal-combustion-engine plants
- 3. Hydro-electric plants
- 4. Atomic energy plants

C. Design and operation of alternators

- 1. Advantages and disadvantages of three-phase alternators
- 2. General construction

- a. Armature
- b. Stator
- 3. Field excitation
- 4. Connecting alternators to the line
- D. Transmission of electric power
 - 1. Types of transmission
 - 2. Principal losses
 - a. Line
 - b. Leakage
 - c. Transformer
 - 3. Transformers for power transmission
 - 4. Substations

IX. INDUSTRIAL ELECTRONICS

OUTLINE OF INSTRUCTION

Class Hours 3

- A. Vacuum tube
 - 1. History of discovery
 - 2. Thermionic emission
 - 3. Diodes
 - 4. Triodes
 - a. Voltage amplifiers
 - b. Power amplifiers
 - 5. Rectification
 - 6. Audio-frequency amplifiers
- B. Semi-conductors
- C. Applied electronics
 - 1. Frequency controls
 - 2. Radio and television
 - 3. X rays

APPENDIX A
SAMPLE PROBLEM

PRODUCTION PLANNING
of a
BELT SANDER

The purpose of the following sample problem is to simulate a typical production assignment. The planning and procedure for production is equally valid for a simple forging with little required machining and for a highly complex piece of equipment composed of many sub-assemblies. In this instance the analysis of a machine of a medium degree of complexity is employed as a teaching device. A simpler or more complex problem could be undertaken without greatly modifying the format or procedure. It remains for the instructor to develop an assignment in accord with the time, material, and equipment limitations that will meet the needs of the class at a given time.

OBJECTIVE

To cause the application of all knowledges and skills acquired by the student during his technical training.

To point out the role of each segment of manufacturing production while emphasizing the planning and coordination required for effective operation.

INTRODUCTION

Company market research predicts strong sales potential for a small belt sander, competitively priced, similar to the one pictured. Surveys indicate that the market will support an initial output of 3,000 units and 2,000 units each month thereafter.

After reviewing the matter carefully, management has given the "go-ahead" for the first 25,000 units, which are to be similar in quality and design as well as in size and capacity.

The responsibility for planning and producing this machine lies with the production manager. Factors to be considered, in a review of company capabilities, are plant, materials, equipment, and labor.

Although the plant is small, it contains adequate floor and working space to house the equipment listed during a recent inventory.

A further review of the inventory, which follows, indicates that although there is no special tooling in stock, there is a sufficient supply of standard-size drills, cutters, reamers, etc.

EQUIPMENT INVENTORY

- 1 - 35-ton press brake
- 1 - 3/16" capacity x 6' shear
- 2 - turret lathe
- 1 - 100-ton punch press

- 2 - 17" drill press
- 1 - horizontal milling machine
- 1 - vertical milling machine
- 1 - Blanchard surface grinder 24" wheel size
- 1 - engine lathe 14" swing
- 1 - air compressor

- 1 - welder, arc
- 1 - welder, acetylene
- 1 - welder, electric spot
- Assorted hand tools

The Personnel Department states that the local labor market contains a source of skilled and semi-skilled machinists and assemblers.

After this estimate of company position has been made, production planning gets underway according to the following procedure.

PROCEDURE

Analyze available information to develop an over-all idea of the makeup of the item to be produced. Read through the following steps of procedure to determine what is to be done and what is wanted.

1. Develop a set of working drawings.
 - a. Use available information (a pilot model, sketches, pictures, pictorials, etc.)
 - b. Prepare details, assemblies, etc., as necessary.
2. Develop a production bill of materials.
 - a. List each part as identified by number.
 - b. Specify quantity of each part required.
 - c. Determine the most likely method of forming (stamping, forging, casting, etc.)
3. FOR EACH PART, make recommendations on whether to BUY or BUILD.
 - a. Determine the manufacturing cost by making a cost analysis.

- (1) Materials--determine material requirements, economical stock sizes and lot quantities; calculate salvageable scrap and waste.
 - (2) Labor--determine basic operations required to manufacture to specifications; combine into a likely sequence; estimate time.
 - (3) Add the material costs and labor costs; apply burden or overhead costs.
- b. Determine likely sources for purchased parts; advertise for bids; specify delivery time.
 - c. Compare cost of manufacture with cost of purchase; make recommendation.
4. Plan the overall manufacturing process.
 - a. Develop a master routing sheet.
 - b. Specify tooling required.
 - c. Lay out floor plan, showing placement of tooling and flow of work.
 - d. Develop a routing sheet of each part and each sub-assembly, outlining the processing of each.
 - (1) Use previously made operation analyses to plan sequential operations and handling.
 - (2) Take from delivery or storage, route through applicable process, place in temporary storage where necessary, and/or deliver to assembly point in proper quantity at appropriate time.
5. Plan an assembly line.
 - a. Indicate points where each part and each sub-assembly are to be delivered.
 - b. Specify transportation requirements from storage through processing to assembly.
 - c. Determine number of assembly workers required to meet production schedule.
6. Plan a quality-control program for incoming raw materials and purchased parts; for inspection stations during processing stages and on the assembly line; and for final inspection.
 - a. Specify techniques and tooling.
 - b. Outline in detail the application of techniques and tooling.
 - c. Develop tolerancing charts.

7. Develop production schedule, working backwards.
 - a. Set target date for finished packaged machine.
 - b. Set target dates for finished parts to be delivered to assembly department.
 - c. Determine the time required for manufactured parts.
 - d. Set target date for beginning manufacture..
 - e. Set target dates for delivery of raw materials.
 - f. Set target dates for delivery of purchased parts.
 - g. Set target dates for cartons ordered (delivered).
 - h. Set target dates for printed material ordered (delivered).

The above pictorial and the drawing on the second page following are reproduced with the permission of the Rockwell Manufacturing Company.

37	5/16-18 x 5/16" Soc. Set Screw	71	1/4"-20 Hex. Nut

APPENDIX B

TOOLS AND EQUIPMENT LIST FOR MECHANICAL TECHNOLOGY LABORATORY

The following tools and equipment have been recommended as being the minimum number and capacity to effectively carry out the necessary instruction, demonstration, and experimentation required in the area of Mechanical Technology.

<u>Quantity</u>	<u>Description</u>
1	Hacksaw, power cutoff, with coolant system. Min. 4" stroke.
1	Drill press; min. size 20"; variable speed; with pedestal.
1	Radial drill, ram-type; min. 6" column, 31" arm; 115 to 5400 RPM; 1/2 HP motor and controls.
1	Grinder, pedestal; floor mounted; wheel dia. min. 8".
1	Grinder, pedestal; min. 3 HP; 1725 RPM, with 12" dia., 2 1/4" wide wheels, for 1" arbor.
1	Surface grinder, min. 6" x 18"; with magnetic chuck, hydraulic operated.
1	Band saw, metal cutting; 20"; with blade welding attachment.
2	Engine lathes; min. swing 13"; to include accessories and extras.
2	Engine lathes; min. swing 16"; to include tooling and accessories.
1	Turret lathe; min. swing 13"; 2 speed; to include tooling and accessories.
1	Automatic screw machine for turning, boring, tapering, reaming, polishing, cutoff.
1	Milling machine, horizontal; table; with vertical shaping attachment; to include accessories; min. 32".
1	Milling machine, horizontal, universal; min. table dimensions 8" x 30"; to include cutters and power driven indexing unit.
1	Numerical control machine for drilling, boring, tapping, and milling.
1	Key-seating machine (broaching).

<u>Quantity</u>	<u>Description</u>
1 set	Sockets, 1/4" square-drive.
1 set	Sockets, 3/8" square-drive.
1 set	Sockets, 1/2" square-drive.
1 set	Sockets, 3/4" square-drive.
1	Grease gun, hand-type; high-pressure utility lever.
3	#2 Morse taper lathe center.
3	#3 Morse taper lathe center.
2 sets	Trammel points; complete with caliper legs and ball points.
6	Punches, prick; 5/16" x 4".
6	Punches, center; 1/2" x 5".
3	Combination sets, 2 with 12" scale, 1 with 18" scale.
6	Scribes, high-speed steel.
3	Rules, hook, spring-steel, tempered 6".
6	Rules, spring-steel, tempered 12".
1	Rule, nickel-plated, tape; 10'.
1	Ripping bar; weight approximately 40 lbs.; 30" long.
2	Hammers, ball-pein; 1/4 lb.
2	Hammers, ball-pein; 3/8 lb.
2	Hammers, ball-pein; 1/2 lb.
2	Hammers, ball-pein; 3/4 lb.
2	Hammers, ball-pein; 1 lb.
2	Hammers, blacksmith, hand; 3 lbs.
1	Square, hardened steel; 6".
3 pair	Dividers, with quick-spring nut; 3".
3 pair	Dividers, with quick-spring nut; 4".
3 pair	Dividers, with quick-spring nut; 6".

<u>Quantity</u>	<u>Description</u>
2 pair	Dividers, with quick-spring nut; 8".
2 pair	Dividers, with quick-spring nut; 10".
2 pair	Dividers, with quick-spring nut; 12".
	Lathe dogs: assorted types
3	1/2"
3	3/4"
3	1"
3	1 1/4"
3	1 1/2"
3	1 3/4"
3	2"
	Knurling tools
2	No. 1, single knurl
2	No. 2, single knurl
	Parting tools, engine lathe:
3	1/2" x 1 1/8" straight.
3	1/2" x 1 1/8" left-hand.
3	1/2" x 1 1/8" right-hand.
1	5/8" x 1 3/8" straight.
1	5/8" x 1 3/8" left-hand.
1	5/8" x 1 3/8" right-hand.
3	Lathe centers, live: #2 Morse taper.
	Boring bars, lathe:
1	Size 5/8" x 1 3/8" x 7 7/16".
1	Size 1/2" x 1 1/8" x 6 1/8".
1	Size 3/8" x 7/8" x 5 3/8".
1	Size 5/16" x 3/4" x 4 1/8".
2	Calipers, inside; with quick nut; 3".
2	Calipers, outside; with quick nut; 3".
2	Calipers, inside; with quick nut; 4".
2	Calipers, outside; with quick nut; 4".
2	Calipers, inside; with quick nut; 6".
2	Calipers, outside; with quick nut; 6".

<u>Quantity</u>	<u>Description</u>
2	Calipers, outside with screw adjusting (firm joint); 8".
2	Calipers, firm-joint hermaphrodite; 4".
2	Calipers, firm-joint hermaphrodite; 6".
2	Calipers, firm-joint hermaphrodite; 8".
3 sets	Chisels; 1/4" - 1".
3 sets	Punches; 1/4" - 1".
4	Sleeves, steel drill; size 1-2.
4	Drill sleeves; steel, size 2-3.
2 each	Chucking reamers; high-speed steel; straight flute, straight shank; 3/16", 1/4", 5/16", 3/8", 7/16", 1/2".
2 each	Reamers hand; high-speed steel; straight flute, 1/4", 5/16", 3/8", 7/16", 1/2", 9/16", 5/8", 11/16", 3/4", 7/8", 1".
2	Micrometers, outside; heavy-duty; 0"-1".
2	Micrometers, outside; heavy-duty; 1"-2".
2	Micrometers, outside; heavy-duty; 2"-3".
2	Micrometers, outside; heavy-duty; 3"-4".
1	Micrometer, inside; to measure 2" to 12".
1	Gage, micrometer depth; 0 to 6" range, with 3" base.
1	Caliper, vernier; 6".
1	Gage, vernier height; 12".
2	Gages, combination depth and angle; 6".
1 set	Gages, small hole; range of sizes .125 to .500 inch.
1 set (6)	Gages, telescoping; sizes 5/16" to 6".
1 set	Gage blocks, class BB; consists of 81 pieces, in box, with accessories.
1 set (5)	Rules, tempered steel; with holder and case; rule lengths-1/4", 3/8", 1/2", 3/4", 1"; graduated in 32nds and 64ths.
1 set	Clamps, key seat.

<u>Quantity</u>	<u>Description</u>
1 set	Parallels; to consist of 4 pair in container, size 6" long. 1/8" thick, 1" wide.
1	Protractor, universal bevel; 7" blade.
2	Gages, drill point.
2	Gages, tap and drill.
2	Gages, drill and wire.
2	Gages, 29-degree screw-thread (hardened).
6	Gages, center.
3	Gages, screw pitch; range of threads, 4 to 42 threads per inch.
1 set (16)	Gages, radius; size 1/64" to 1/2" with holder.
2 sets	Gages, thickness with 26 leaves, size range .0015 to .025.
2	Gages, toolmaker's surface; 7" spindle, 2 1/8" x 1 9/16" base.
2	Clamps, toolmaker's parallel; 4".
3 pair	V-blocks and clamps, to hold 1 1/4" round stock.
1	Level, precision ground; graduated vial.; 12".
1	Dial indicator, complete with attachments.
1	Straight edge; steel; 24".
3 pair	Goggles, safety.
2 pair	Gloves, welding.
1	Drill, portable electric; heavy-duty, size 1/4".
1	Drill, portable electric; heavy-duty; size 1/2".
1	Grinder, portable electric; capacity 6" x 1" wheel.
2	Pliers, combination; 6".
2	Pliers, combination; 10".
2	Pliers, chain nose; 4 1/2".

QuantityDescription

1	Anvil, 150-200 lbs.
1	Shaper, min. 12"
1	Air compressor with tank and hoses. 1½ hp, 7 cu. ft. min. displacement.
1	Press, hydraulic; 50-ton.
1	Press, arbor; min. 3-ton.
1	Punch press, deep-throat; min. 10-ton; floor model.
1	Grinder, standard, electric, (lathe) tool-posts; with internal grinding attachment; tool rest for indexing when grinding attachment; tool rest for indexing when grinding cutters, reamers, end mills.
6	Vises, machinist swivel base; 4" jaw.
1	Vise, machinist swivel base; 6" jaw.
1	Welder, electric; motor-generator type; min. size 250 amp., 220 v, 3 hp.; with necessary accessories.
1	Welder, electric; transformer-rectifier type, min. 250 ampere cap. with accessories.
2 sets	Torch, welding; with cutting attachment to include a hand truck and accessories.
1	Jack, hydraulic; ram-type; min. 5-ton
1	Hoist, lifting; min. 1-ton ratchet-type.
6	Hammers, chipping.
12	C-clamps (assorted size).
2	Tongs, blacksmith; straight lip; min. size 3/4" x 22".
2	Shields, hand-held welding; to include lens.
2	Helmets, welder's; to include lens.
2	Goggles, chipping.

QuantityDescription

2	Pliers, heavy-duty diagonal-cutting; 7".																								
2	Pliers, wrench; 10".																								
2	Shears, metal cutting; right hand.																								
2	Shears, metal cutting; left hand.																								
2	Tap wrench, T-handle; capacity 1/16" - 1/2".																								
2	Tap wrench, T-handle; capacity 1/16" - 1/4".

21/32	7/8	2"																							

<u>Quantity</u>	<u>Description</u>
2	Grinding wheel dresser.
2	Hack-saw frame; pistol grip; adjustable.
2	Machine countersinks; high-speed steel; 1/2"; 60 degrees.
2	Machine countersinks; high-speed steel; 1/2"; 82 degrees.
2	Machine countersinks; high-speed steel; 3/4"; 60 degrees.
2	Machine countersinks; high-speed steel; 3/4"; 82 degrees.
2 sets	Wrenches, hex-key, size .050 to 3/8".
1 set	Combination wrenches (box end--open end); sizes 3/8" through 1 1/4" by 16ths; with carrying case.
2	Wrenches, adjustable, open-end; 6".
2	Wrenches, adjustable, open-end; 12".
2	Wrenches, pipe; maximum pipe size 2" capacity; 14" long.
1	Demagnetizer.
1 set	Punches, transfer; 1/8" - 1/2" dia.
1 set	Screws, transfer; 1/4" - 5/16" - 3/8" dia.
1	Furnace, gas-fired; with blower; torch lighter, and pyrometer; Range 0-2400 degrees Fahrenheit.
1	Salt pots, with pyrometer; range 0-2000 degrees Fahrenheit.
1	Furnace, blast; gas-fired; with pyrometer; range 0-3000 degrees Fahrenheit.
1	Furnace, heavy-duty electric; with recording potentiometer; range 0-3000 degrees Fahrenheit.
1	Furnace, electric tempering; with electric controls; range 0-1000 degrees Fahrenheit.
1	Furnace, electric with pyrometer; range 0-2600 degrees Fahrenheit.
1	Furnace, heat-treating, electric, with pyrometer.

QuantityDescription

1	Hydraulic training unit for student and instructor use; to include typical hydraulic components, such as cylinders, pumps, filters, coolers, control valves, motors, seals, connections, complete with all lines, gages, controls (including master-control valve), table.
1	Pneumatic training unit for student and instructor use; to include typical pneumatic components, such as cylinders, pumps, compressors, filters, lubricators, coolers, control valves, seals, connection; complete with all lines, gages, controls (including master-relief valve), table.
1	9" Abrasive cutoff machine with bonded wheel.
1	Comparator, optical.
1	Hot plate, electric; 12" x 18".
1	Grinder, pedestal; 1" x 8" x 1".
1	Grinder, bench; with diamond wheels; 6" dia.
2	Tanks, quenching; portable.
1	Hardness Testing Machine; Rockwell.
1	Hardness Testing Machine; Brinell.
1	Scleroscope, shore.
1	Impact machine.
1	Magnaflux unit.
1	Torsion Tester.
1	Testing machine; bench-type.
1	X-ray machine; industrial-type.
1	Universal tester with selected attachments.
1	Grinder, belt; horizontal.
1	Press, simplemet; 1 1/4" capacity.
1	Polisher, electro.

<u>Quantity</u>	<u>Description</u>
1	Table, two-stage specimen-polishing.
1	Microscope, metallurgical.
1 set	Optical flats; with granite stage and monolight.
1	Sinebar, horizontal; 5".
1	Melting furnace, aluminum and brass; with pilot light, one crucible, and pyrometer.
2	Crucibles, carbon; #10.
1 set	Tongs, crucible; for operation by one person.
1	Poring ring; to fit above crucibles and operated by one person.
1	Sand box (for casting aluminum and brass); metal lined; with tight fitting lids and provision for building of molds inside box.
1 lot	Sand, molders.
1 each	Riddles: #4, #6, and #8 mesh.
1	Bench rammer; with one flat end and one wedge end.
1 each	Sprue cutter, brass construction: 1" diameter, 1 1/2" diameter.
1	Cutter, vent spike, stainless steel construction.
2 sets	Bellows.
1	Strike-off bar.
1	Spoon and gate cutter.
1	Slick and square.
1	Lifter, casting.
1	Blub sponge, with brush.
8 pair	Flasks (assorted sizes).
	Bottom boards; assortment; plywood construction.

QuantityDescription

2	Dust bags (for parting compounds).
2 pair	Gloves, asbestos.
2	Aprons, asbestos.
2 pair	Sleeves, asbestos.
2 pair	Leggins, asbestos.
	Ingot mold, to match crucibles used.
8	Watches, stop.
1	Camera, motion-picture; 8 mm; silent, with tripod.
1	Projector; with remote control; stopping, and reversing action, 8 mm motion-picture.
1	Screen, projection; 5' x 8'.
1	Cyclograph, with tripod.
1	Chronocyclograph with tripod.

FOREWORD

This unit was developed by Robert Eby, Larry Hazen and Howard Nowels in Agricultural Education 701 during the Winter Quarter of 1965. The unit was edited by Dr. Ralph J. Woodin, Professor of Agricultural Education, The Ohio State University.

The following factors have been instrumental in bringing about the need for a unit of this type:

1. Agricultural instructors have been teaching the management of lawns as an improvement project for some time, but no organized resource material has been available.
2. Some employment opportunities in turf management are available for students with adequate background training in agriculture.

This unit has been prepared specifically as a guide to teachers and should be used as such. It is not a lesson plan, but it is designed in such a way that it can be used to prepare lesson plans. Teachers need not use all of the material contained herein but may select those problem areas which apply to their specific situations.

Ohio Vocational Agriculture
Curriculum Materials Service

ESTABLISHMENT OF NEW LAWNS

PROBLEM I:

TIME OF SEEDING

Items to Consider:

1. Competition of grass by weeds.
2. Survival of grass seeded.
3. Resisting winter-kill.

Related Information:

1. Competition of grass by weeds.

Seventy-five per cent of the lawns in this country are planted at the wrong time. Most gardeners in northern regions assume that spring is the ideal time to sow grass seed, but nothing is farther from the truth. Summer annual weeds (crabgrass, foxtail, ragweed, pigweed, and many others) are always a problem with spring and winter seedings. Summer weeds are usually avoided with early fall seedings made properly, since a good sod develops before the weed seeds germinate.

2. Survival of grass seeded.

The best time to seed a lawn in Northern Ohio is between August 15 and September 15. In Central and Southern Ohio the entire month of September is good. Lawns seeded later in the fall may fail because the young grass does not get enough growth to survive the winter.

The early fall seeded lawn will throw out small stools almost at once and by the time freezing weather arrives, should be able to withstand sub-zero weather.

There is only one short period during the year when northern turf grasses cannot successfully be sown. This is the deceptive spell of warm weather that comes almost every fall just before the first killing frost strikes down tender vegetation. Not enough time is left for seeds to germinate and grass to grow sufficiently to be mowed once or twice to produce a crown for winter survival.

3. Resisting winter-kill.

If seeding cannot be done by October 1 in Northern Ohio or before October 15 in Southern Ohio postpone the job until winter or spring. The earlier in the spring a seeding can be made (preferably March) the better the chances for success.

Winter seedings made after November 15 in Northern Ohio and after December 1 in Southern Ohio will not germinate until spring. Lawns seeded during the winter usually start earlier than spring seedings can be made.

Suggested Student Activities:

1. Sow grass seeds in plots and determine germination time at various dates of seeding. Check germination time of weeds.
2. Consult home builders to determine time they seed and the problems with other than fall seedings.

Teaching Materials:

1. Samples of seeds of various grasses and seeds of common weeds.
2. Photographs and slides of good and poor lawns.

PROBLEM II:

SELECTION OF SEED

Items to Consider:

1. Characteristics of recommended species:
 - Rate of establishment
 - Texture
 - Disease tolerance
 - Wear resistance
 - Shade tolerance
 - Tolerance to close clipping
 - Drought tolerance
 - Nitrogen fertility requirement
2. Varietal characteristics.
3. Lawn grass mixtures.
4. Amount to seed.

Related Information:

2. Varietal characteristics.

The broad leaved grasses grow more rapidly than the fine leaved grasses and "stand out" in the lawn. Also, these coarse grasses often fail because they are not adapted to standard lawn maintenance practices such as close cutting.

Kentucky bluegrass is a hardy, long-lived, sod-forming grass that spreads by underground rootstocks. It is one of the most widely used lawn grasses in the United States. It is the basic lawn grass in cool, humid regions and in cool, dry regions where adequate irrigation water is available.

At present, Merion is the only variety which has shown important advantages over common Kentucky bluegrass or other varieties. Merion, however... is more susceptible to rust and stripe smut diseases than most of the other bluegrasses. It is also much more likely to develop a thatch problem.

Colonial bentgrass is a fine-textured turfed -type grass with few creeping stems and rhizomes. It forms a dense turf when heavily seeded and closely mowed. It is used chiefly in high-quality lawns and putting greens.

Creeping bentgrass is not often used in home lawns, but it is used extensively in golf course putting greens throughout the United States.

Clover in a lawn is a matter of personal taste.

Tall fescue is a tall-growing perennial bunch grass. Because of their wear-resistant qualities, two improved strains of tall fescue, Kentucky 31 fescue and Alta fescue, are used often on play areas, athletic fields, air fields, service yards and other areas where a heavy, tough turf is needed rather than a fine-textured turf.

Next to ryegrass, redtop is probably the most overrated species in commerce, creating more problems than it solves. It is highly touted as a "nurse" grass in lawn seed mixtures. For a year or two, far from nursing the new sod, it competes aggressively with it for light, air, food and water.

Red fescue and Chewings fescue rate next to Kentucky bluegrass as the most popular lawn grasses in the cool humid regions of the United States. They grow well in shaded areas, and they tolerate high acidity. They require good drainage but will grow in poor, droughty soils.

3. Lawn grass mixtures.

A straight seeding of Kentucky bluegrass often gives the best results. Red fescue should be used with bluegrass for shaded areas. No grass can be expected to persist under dense shade.

Never use a mixture containing bentgrass unless you want a bentgrass lawn. A small amount of bentgrass will crowd out the other grasses. Bentgrass can make an excellent lawn if it gets the extreme amount of care it needs.

Many commercial lawn seed mixtures contain too much ryegrass; the ryegrass competes with the permanent grass seedlings for moisture and nutrients. On sloping areas, it is sometimes advisable to include a small amount of ryegrass in the lawn seed mixture to help prevent soil erosion. The use of perennial ryegrass in lawn seed mixtures often results in ragged appearing lawns that are difficult to mow.

4. Amount to seed.
(see next page)

SELECTED LAWN GRASSES

Grass or Mixture		Potential Quality of Lawn	Sun or Shade	Amount of Care and Cost of Upkeep	Seed per 1000 Sq. Ft.
Common Kentucky bluegrass or blends of adapted varieties	100%	good to excellent	sun	average	1 - 3 lb.
Merion* Kentucky bluegrass	100%	excellent	sun	above average	1 - 3 lb.
Common Kentucky bluegrass Red Fescue	40-50% 50-60%	good	light shade	average	1 1/2-4 lb.
Merion* Kentucky bluegrass Creeping Red Fescue	40-50% 50-60%	excellent	sun or light shade	above average	1 1/2-4 lb.
Red Fescue	100%	fair	shade	below average	3 - 5 lb.
Tall Fescue** Common Kentucky bluegrass	90% 10%	poor	sun or light shade	below average	5 - 7 lb.
Bentgrass	100%	excellent	sun or light shade	much above average	1 1/2-2 lb.

Establishment of New Lawns

*Merion bluegrass had not been adequately tested by the Experiment Station in Southern Ohio.

**Use only where coarse grass is not objectionable.

Suggested Student Activities:

1. Identify varieties of grasses and weeds in local lawns.
2. Secure prices of various grasses and mixtures from local seed houses, nurseries, elevators, etc.
3. Study labels on seed tags for purity, mixtures contained, germination, variety, etc.

Teaching Materials:

1. Magnifying lens for examining seeds.
2. Samples of various grass and weed seeds.
3. Slides showing ideal and poor lawns.
4. Photos of local lawns.

References:

"Your Lawn," O.S.U. Bulletin 271, pp. 6-7.

"Better Lawns," United States Department of Agriculture, Home and Garden Bulletin No. 51, 1962, pp. 25, 27-30.

PROBLEM III:**FERTILIZING A NEW LAWN****Items to Consider:**

1. The plant food elements.
2. Fertilizer grades.
3. Amount of fertilizer to apply.
4. Method of application.
5. Fertilizer forms.

Related Information:

1. The plant food elements.

All new lawns should have fertilizer applied before seeding. A good weed free lawn needs plenty of plant food in the soil.

Nitrogen is the plant food that grass needs most because it stimulates rapid growth and dark green leaves. Although it is generally present in small amounts, it leaches out of the soil fairly easy and needs to be replaced.

Phosphorus promotes root growth. Grass needs a well developed root system to support a luxuriant top growth. A deep root system increases the ability of desirable grasses to survive midsummer conditions better without frequent watering than will poorly rooted grasses that have to be watered frequently.

Potassium helps to increase vigor, hardiness and disease resistance of lawns. Of the three major plant food elements, potassium is least likely to be lacking.

2. Fertilizer grades.

On every bag of fertilizer sold there appears a grade, which is the minimum guaranteed analysis of the major plant nutrients contained in that material. Such a grade might be 5-20-20, which means that the fertilizer contains by weight 5% nitrogen, 20% phosphorus, as P_2O_5 , and 20% potassium, expressed as K_2O .

3. Amount of fertilizer to apply.

When a soil test is made, use the amount and analysis suggested for the specific location. In the absence of a soil test, the following amounts should be adequate:

For common Kentucky bluegrass or a bluegrass mixture apply 40 to 50 pounds per 1000 square feet of a high phosphate analysis fertilizer, such as 6-24-12, 8-16-16; 6-10-4, 4-12-4, 5-10-5 or similar analysis.

For Merion Kentucky bluegrass use the same amount of 15-15-15, 12-12-12, 10-10-10 or similar analysis.

4. Method of application.

The needed fertilizer may be raked into the soil surface for most new lawns. Where soil test shows extreme lack of phosphorus, work the soil deeper.

5. Fertilizer forms.

Some farm granulated or pelleted fertilizers are hard to get through some lawn spreaders; they may work better in the spinner types of spreaders.

Many brands are formulas of liquid fertilizers and soluble powders are available. These produce no better results than the same quantities of plant nutrients supplied from dry fertilizers. Liquids may be more convenient for you to apply; however, they may be more expensive than dry fertilizer.

Suggested Student Activities:

1. Test soil.
2. Measure lawns and compute fertilizer requirements.
3. Apply fertilizers to lawns with different types of applicators.

Teaching Materials:

1. Soil sampling tube.
2. Lawn fertilizer spreader.
3. Samples of fertilizer and fertilizer forms.
4. Sample of soil test sheet.
5. Charts.

PROBLEM IV:**LIMING****Items to Consider:**

1. Soil testing.
2. pH level of soil.
3. Need for lime.
4. Type of lime suitable.
5. Time and placement of lime.

Related Information:

1. Soil testing.

Where needed, applications of lime greatly improve the growth and appearance of lawn grasses. The only way to be sure whether or not your lawn needs lime is to have the soil tested. Soil tests every 3 to 5 years determine the lime needs and serve as a check on liming programs.

2. pH level of soil.

Apply enough lime to bring the soil reaction to a pH of 6.0 to 6.5, where a soil pH test indicates that lime is needed.

3. Need for lime.

For every 1# of nitrogen applied as ammonia sulfate, 5# of lime are required to maintain the soil reaction at a given level.

Example: If your fertilizer program includes 3# of nitrogen from ammonia sulfate per 1000 square feet every year, you should apply 30# of lime per 1000 square feet every two years.

4. Type of lime suitable.

Finely ground or pulverized limestone is easily applied, is effective, and does not irritate the skin as does hydrated lime.

5. Time and placement of lime.

Lime may be applied at anytime; however, the best times are late fall or early spring. Work the lime into your soil to a depth of 3 to 6 inches.

Suggested Student Activities:

1. Take soil samples for testing.
2. Calculate the lime requirement according to soil test and to fertilizer applied.
3. Apply lime to a lawn.

Teaching Materials:

1. Soil sampling tube.
2. Soil test report sheet.
3. Samples of different forms of lime.
4. Chart on nutrient availability at different pH levels.

Effect of Soil Reaction (pH) on the Relative Availability of Plant Nutrients

PROBLEM V:**PREPARATION OF SEED BED****Items to Consider:**

1. Top soil.
2. Adding sand.
3. Adding organic matter.
4. Grading and draining the lawn.
5. Fitting the soil.

Related Information:

1. Top soil.

Every house-building contract should provide for all topsoil to be piled separately for the final grading and for debris to be removed (not buried on the site.)

How much topsoil is needed? The more the better - from 3 to 4 up to 6 to 8 inches.

Buy topsoil? This is expensive, and much so-called topsoil is little better than the soil you have. Insist on good loamy texture or don't buy it.

2. Adding sand.

Add sand? A small amount of sand may do more harm than good. Enough coarse sand to make up 50 to 80% of the resulting mixture will improve the physical condition of clay soil if uniformly mixed.

3. Adding organic matter.

Add organic matter? In starting a new lawn, add peat to fine textured basement soil. This will greatly improve its physical makeup if you use enough peat. Get fibrous peat (baled sphagnum is best) rather than muck which contains a large amount of clay. Mix the peat with the upper 3 or 4 inches of soil or with less soil if you use only a small amount of peat. Apply at least a one inch layer of peat or compost and work it into the soil.

4. Grading and draining the lawn.

Good surface drainage, so that water does not stand on the lawn is essential. It is doubtful that tiling adds enough to the average lawn to justify the expense as long as good surface drainage is provided.

When grading, slope the subsoil away from the house. A slope of one foot drop in fifty linear feet is adequate. Steep slopes should be avoided if possible. They are not attractive, are difficult to maintain and watering is a problem.

Grading operations should be so planned that the graded subsoil area and fill will have ample time to settle before topsoil is added and final grading is complete. Allow for several heavy rains to penetrate the soil, or heavy watering will aid the settling process.

5. Fitting the soil.

Plow, rototill, disc or spade the soil 3 to 6 inches deep. Work the soil only when moisture conditions are normal. Do not work soil when it is saturated with moisture.

Plowing or spading followed by disking and hand raking are the best methods of preparing the soil for planting.

Suggested Student Activities:

1. Lay off a grade line.
2. Observe soils on a lawn before preparation for seeding.
3. Prepare a seed bed for a new lawn.

Teaching Materials:

1. Transit.
2. Samples of light, medium and heavy soils.
3. Samples of different organic matter forms.
4. Slides showing a grading operation.

References:

"Your Lawn," O.S.U. Bulletin 271, pp. 3-5.

Norman K. Hoover, Approved Practices in Beautifying the Home Grounds, pp. 74, 76, 77.

"Better Lawns," U.S.D.A., Home and Garden Bulletin No. 51, pp. 3, 6.

PROBLEM VI:**SEEDING AND MULCHING****Items to Consider:**

1. Securing even distribution of seed.
2. Getting seeds covered the proper depth.
3. Mulching and mulches to use.
4. Securing quick growth.
5. How to protect seedlings on slopes.

Related Information:

1. Securing even distribution of seed.

Sow the seed evenly with a spreader. Plan to go over the area to be seeded twice, preferably in a different direction each time. With a low seeding rate it is easier to get good distribution if something is added to the seed to make more bulk.

2. Getting seeds covered the proper depth.

Rake the seed lightly into the soil. If you can still see some seed after raking you have not covered the seed too deeply.

Cover the seed lightly by hand raking or by dragging with a brush or mat. Cover large seeds $1/4$ to $3/8$ inch deep and small seeds $1/8$ to $1/4$ inch deep. Firm the seeded area by rolling with a light roller or cultipacker.

3. Mulching and mulches to use.

Apply a mulch at once after seeding. Perhaps the best mulch is an eighth of an inch of ground sphagnum peat. Straw applied in a thin layer is also satisfactory. When the job is finished you should see half soil and half straw when looking directly down on it.

It is not necessary or desirable to remove a mulch when you have spread the proper amount evenly. Piles of mulch caused by wind should be respread or removed to prevent smothering the young grass.

4. Securing a quick growth.

Pre-soaking the seed of bluegrass in water speeds up germination. The purpose of pre-soaking of all species of Poa is to remove an inhibiting chemical which prevents rapid germination. Soaked seed of Merion will germinate in

six days in late August, 7 to 10 days in early September and in less than two weeks in late September. Without this treatment it may not sprout for 20 to 40 days.

5. How to protect seedlings on slopes.

On terraced areas or on sloping banks cheesecloth open-mesh sacking or commercial mulching cloth will help hold the moisture and seeds in place. Grass will grow through the mulching material which may be left to rot.

Suggested Student Activities:

1. Set up sloping and level seed plots. Seed and water.
2. Use mechanical seeder with various lawn seeds in farm shop to check evenness of seeding.
3. Price mulches a local nurseries.
4. Use fan to show separation of light seeds.
5. Seed small area in school lawn.

Teaching Materials:

1. Seeders.
2. Various lawn seed mixtures.
3. Fan
4. Seeding tools, such as rakes, shovels, etc.

References:

"Your Lawn," O.S.U. Bulletin 271, p. 8.

"Better Lawns," U.S.D.A., Home and Garden Bulletin No. 51, p. 9.

R. Milton Carleton, Your Lawn: How to Make It and Keep It, pp. 77-78.

PROBLEM VII:**IRRIGATING A NEW LAWN****Items to Consider:**

1. Time to irrigate.
2. Type of soil.
3. Amount of water to apply.
4. Sprinkling systems.

Related Information:**1. Time to irrigate.**

Water the surface and keep it moist until the seedlings are established. This usually means that you will need to sprinkle the new seedlings lightly at least twice a day, sometimes more often, depending on how hot the weather is and how often it rains.

As the plant develops and roots become deeper intervals between waterings should be lengthened and the quantity of water used in each application increased.

In general, a program of proper watering to assure a successful lawn seeding means that each morning, if rain does not fall the night before, you should turn on the sprinklers for thirty minutes. If the sun is shining and the temperature is 80 degrees or above turn them on again thirty minutes at noon. Repeat for twenty minutes in late afternoon or evening.

2. Types of soil.

Sands require irrigation more often than silt and silts more often than clay provided other factors are equal.

3. Amount of water to apply.

In new seedlings it is necessary only to keep the top one inch of the soil wet. Water must be applied slowly so that the surface will not puddle or crust. Frequent waterings, often two or more times a day, may be necessary.

Avoid watering the lawn lightly at frequent intervals; this causes shallow growth of grass roots and stimulates growth of weeds. The deeper rooted the grass the less often it is necessary to water.

4. Sprinkling systems.

To prevent damage to a newly seeded lawn make provisions beforehand for a lawn watering setup.

For the great majority of cases, a simple arrangement of hose lines and sprinklers will be excellent. Whether you buy or borrow them, the big thing is to be sure you have enough so that every inch of the surface can be covered - with overlapping sprinkler patterns - without shifting the individual units.

Suggested Student Activity:

1. Visit a newly planted lawn.
2. Observe different types of sprinklers.
3. Lay out a sprinkling system to get an even distribution.
4. Experiment with different amounts and frequencies of water on grass seed to determine difference in depth of root growth.

Teaching Materials:

1. Sprinklers.
2. Soil samples.
3. Grass seed.
4. Small boxes to test plant growth.

References:

"Your Lawn," O.S.U. Bulletin 271, p. 8.

Robert W. Miller, "Irrigation of Turf Grass," Mimeo, Department of Agronomy, Ohio Agricultural Experiment Station, Wooster, Ohio.

"Better Lawns," U.S.D.A., Home and Garden Bulletin No. 51, p. 13.

R. Milton Carleton, Your Lawn: How to Make It and Keep It, pp. 75-76.

PROBLEM I:**CULTURAL PRACTICES FOR LAWN MAINTENANCE****Items to Consider:**

1. Raking.
2. Rolling.
3. Aeration.
4. Mowing.

Related Information:**1. Raking the lawn.**

Rake the lawn about a week before the time for the first mowing in the spring to remove twigs, leaves and dead grass. Rake easy to avoid pulling out the grass by the roots, especially that which may have heaved during the winter. Avoid excessive raking during the growing season except when leaves are falling from the trees. Do not allow leaves to remain on the lawn for any extended period of time. The leaves will reduce the amount of air and light to the grass blades which will slow the growth of the plants.

2. Rolling the lawn.

Rolling will not make an uneven lawn smooth, but it will bring the surface of a thin lawn to its original level by pushing down bunches of grass which were heaved during the freezing and thawing. If rolling is needed it should be done just after the frost has left the soil but not while it is muddy. A water-weighted roller without the water has sufficient weight. Too much weight may cause excessive compaction which can retard growth and water infiltration.

3. Aeration of the lawn soil.

Aerating may improve water infiltration on some lawns, especially areas with tight soils. Mechanical aerators are of particular benefit on steep slopes or on paths that receive a great deal of traffic. If an aerator is used it should be the type that removes a plug of soil, and it should be operated when the soil is moist.

If an aerator is properly operated it will not harm the turf surface or injure the grass. It will permit better penetration of water and fertilizer.

4. Mowing the lawn.

Lawns of Kentucky bluegrass should be cut about 2 inches high and as often as necessary so that no more than an inch of leaf is removed at each mowing. The food for the plant is produced in the leaf through the action of sunlight, so the more of the leaf that is left the more food that is produced and thus the stronger the plant. The depth and strength of the grass roots are proportional to the top growth. Close mowing, especially in hot weather, will weaken or may kill most of the cool season grasses.

The Merion variety of bluegrass can be cut from 1 to 1/2 inches without danger of killing the plants. This variety can withstand the closer mowing in regards to weed infiltration as can be seen in the data below. Mowing height can play an important role in weed control. The following results are from work that was conducted at The Ohio State University:

<u>Bluegrass Variety</u>	<u>Number of weeds per sq. /ft.</u>	
	<u>3/4" mowing</u>	<u>2" mowing</u>
Merion	3	0
Delta	23	3
Park	25	3
Common Kentucky	21	6

Frequent mowing will reduce to a minimum any problems created from clippings since the short pieces of leaf that are cut off can disappear among the grass blades. Allowing the clippings to remain on the lawn will benefit thin stands by conserving moisture, keeping the soil cooler and permitting the reuse of the fertilizing materials in the grass blades that are cut off. With heavy fertilization it may be necessary to remove the clippings early in the spring to prevent a rapid build up of "thatch" which can mar the appearance and increase disease problems.

Suggested Student Activities:

1. Adjust mowers to the proper height.
2. Adjust reel mower for clean cutting.
3. Observe a commercial aerator in operation.

Teaching Materials:

1. Reel type mower.
2. Rotary mower.
3. Commercial aerator.
4. Assorted colored slides showing height of cut and weed control.
5. Chart on height of cut and weed control.

References:

PROBLEM II:**FERTILIZING AN ESTABLISHED LAWN****Items to Consider:**

1. Time of application.
2. Analysis and rate of application.
3. Methods of applying.
4. Fertilizer burning.

Related Information:**1. Time of application.**

Unless a soil test indicates otherwise, a complete fertilizer should be applied in September for best results. If spring applications are to be made they should be applied before the green growth has started. Additional nitrogen can be supplied about July 15.

Time of application of nitrogen on Merion bluegrass should be between March 15 to April 15, June 1 to the 15th, and July 15 to August 15.

2. Analysis and rate of application.

Any complete fertilizer, such as 10-10-10, 12-12-12 or an equivalent, can be used for the fall or early spring application. The rate should not exceed two pounds of actual nitrogen per 1000 square feet. (To determine the rate needed divide the per cent nitrogen, which is the first number in the fertilizer analysis, into pounds of nitrogen to be applied per application.)

Example: 20-10-5 analysis, 2# N wanted per 1000 square feet
 $2 \text{ lbs.} \div .20 = 10\# \text{ of } 20-10-5 \text{ to give } 2\# \text{ of actual nitrogen}$

The additional nitrogen applied during the growing season should be at the rate of one pound nitrogen per 1000 square feet and in the form of soluble inorganic or soluble organic fertilizer. (Care must be used to prevent burning with these materials.)

Common Kentucky bluegrass should receive a total of three to four pounds of nitrogen per 1000 square feet per year. Merion bluegrass lawns should receive a total of five to seven pounds of nitrogen per 1000 square feet per year.

3. Method of application.

It is safe to broadcast all types of fertilizer on lawns at recommended rates early in the spring if you apply them before green growth has started.

4. Fertilizer burning.

All soluble nitrogen fertilizer materials if not properly applied can cause a light burning of the grass leaves which can be unsightly for a week or more. The following precautions should be taken to avoid these fertilizer burns:

- a. Do not apply more than two pounds nitrogen per 1000 square feet at one time.
- b. Always spread evenly. Do not overlap or spill materials.
- c. Apply fertilizer only when foliage is dry to prevent sticking to the foliage.
- d. Use granulated or pelleted material instead of pulverized material to prevent sticking to foliage.
- e. Water immediately after application to remove fertilizer material from the leaves and put into the soil solution.

Suggested Student Activities:

1. Determine amounts of different analysis of fertilizers needed to apply the recommended amounts of nitrogen.
2. Fertilize a lawn.

Teaching Materials:

1. Lawn fertilizer applicator.
2. Samples of fertilizer and fertilizer forms.
3. Charts.

References:

- "Your Lawn," O.S. U. Bulletin 271, pp. 9-11.
- "Better Lawns," U.S. D. A., Home and Garden Bulletin No. 51, p. 15.

SOME FORMS OF LAWN NITROGEN FERTILIZERS

Type of Fertilizer	Common Name	Approximate Nitrogen Content	Pounds Needed To Supply One Pound Nitrogen
1. Soluble, inorganic	Ammonia Sulfate	20%	5
	Ammonia Nitrate	33%	3
	Nitrogen Solutions	24-32 %	4-3
2. Soluble organic forms	Urea	45%	2.2
3. Insoluble organic forms	Urea form	38%	2.6
	Soybean Meal	5-10 %	10-20
4. Activated sewage sludge		5%	20

EXAMPLES OF LAWN FERTILIZER GRADES

	10-5-5				5-5-0 Activated Sewage Sludge
	10-6-4				

PROBLEM III:**WEED CONTROL IN ESTABLISHED LAWNS****Items to Consider:**

1. Using management practices to control weeds.
2. Chemicals for controlling annual grass weeds.
3. Chemicals for controlling perennial grass weeds.
4. Chemicals for controlling broadleaf weeds.

Related Information:

1. Management practices to control weeds.

Weeds in lawns are usually the result of poor management practices. This might be in soil preparation before seeding, fertilization, improper mowing or impurity in the grass seed. Producing a dense, healthy stand of turf grass is the most satisfactory method of controlling lawn weeds. This can be produced by (a) fertilizing at the proper time with the right materials, and (b) mowing at the recommended height.

Since perfect maintenance is seldom achieved on all lawns in the neighborhood and since weeds can spread from one lawn to another, it is sometimes necessary to use herbicides to control certain weeds.

2. Chemicals for controlling annual grass weeds.

Annual grasses are those which grow from seeds each year. Some of the annual grasses that are found in Ohio lawns are: crabgrass, foxtail, barnyard grass and goosegrass. Of these, the crabgrass is the most common and the herbicides that control it will usually give some control of the other annual grass weeds.

There are two basic ways of controlling crabgrass with herbicides: (a) the pre-emergence sprays and (b) the post-emergence sprays. The pre-emergence application should be made in the late winter or early spring before the crabgrass seeds germinate. This will be before April 1 in southern Ohio and April 15 in the northern part of the state. Materials containing Dacthal or Zytron have resulted in excellent control in several years of tests at the Ohio Agricultural Experiment Station. Bandane at the rate of one pound per 1000 square feet has also given good crabgrass control without injury to the established lawn grasses. Combinations of these materials are available commercially and should be used as directed on the label of the container.

Post-emergence herbicides should be used as soon as the crabgrass is seen in the turf. Make applications about a week apart until the crabgrass is killed. The two most effective and widely used post-emergence herbicides are DMA (disodium methylarsonate) and AMA (octyl-doedcyl ammoniummethyl-arsenate). Kentucky bluegrass may be slightly discolored with these materials, but no serious injury should result.

3. Chemicals for controlling perennial grass weeds.

Perennial grasses are those that come back from roots or stems each year. Most lawn grasses are perennials, but there are several which may be objectionable in lawns. Two of the most common of these are quackgrass and orchardgrass with timothy and tall fescue causing trouble in some localities. These grasses can be killed by dissolving 1/4 pound of Dalapon in a gallon of water and applying this solution to the individual plants or infested areas. (Lawn grasses are also killed by this spray, so care must be used to hit only the spots desired.) The Dalapon will disappear from warm moist soil within three to six weeks and slightly slower in cool or dry soils. These areas can then be reseeded or resodded after this waiting period.

A summer grass, nimblewill, can usually be controlled by using liquid Zytron at the rate of 15 pounds per acre. This material, when mixed with water, should be applied in May and again in June. In some tests at Columbus in 1962 and 1963 this treatment resulted in good control with little injury to Kentucky bluegrass.

4. Chemicals for controlling broadleaf weeds.

Most common broadleaf weeds can be eliminated with one or more applications of 2,4-D. Fall is the best time for general treatment with 2,4-D. When the weeds are killed the lawn grass has a chance to fill the vacant space before crabgrass germinates in the spring. The amine formulations should be used since they are less volatile and will not drift as much as the ester formulations. Spraying should be done only when the wind is quiet, and direct contact with all flowers, vegetables, trees and shrubs should be avoided.

A standard lawn solution of 2,4-D is one tablespoon of four pounds per gallon amine formulation in one gallon of water. Apply to wet the weeds to the point of run-off. On an acre basis, this is one pound per acre. On lawns containing bentgrass the rate should be reduced by 50%.

Not all broadleaf weeds commonly found in some lawns will be killed with 2,4-D. Silvex is suggested for trial use for any broadleaf weed that is not killed by the 2,4-D. Use the rate suggested on the label which is about 1 1/2 pounds per acre. Do NOT use on bentgrass lawns.

(See chart on following page.)

SOME COMMON LAWN WEEDS AND CHEMICAL CONTROLS

Weeds	Chemical to Use	Time of Application
Black medic	Silvex	early spring
Carpetweed	2, 4-D	spring
Carrot, wild	2, 4-D	spring
Chickweed	Silvex	spring or fall
Chicory	2, 4-D	spring
Dandelion	2, 4-D	fall or spring
Dock, curly	2, 4-D	fall or spring
Garlic or onion	2, 4-D (ester	late fall or early spring
Ground ivy	Silvex	summer or fall
Knotweed	2, 4-D or Dicamba*	spring or early fall
Pigweed	2, 4-D	summer
Plantain, buckhorn	2, 4-D	fall or spring
Plantain, common	2, 4-D	fall or spring
Poison ivy	2, 4, 5-T or Silvex	spring or summer
Red sorrel	Silvex or Dicamba*	spring, summer or fall
Spurge, spotted	Silvex	spring
Thistle	2, 4-D	spring and fall
White clover	Silvex	spring or fall
Wood sorrel	Silvex	spring
Yarrow	Silvex	spring

*Available only to professional turf men.

----"Your Lawn," O.S.U. Bulletin 271, p. 17.

Suggested Student Activities:

1. Identification of broadleaf and grass weeds found in lawns.
2. Demonstrate the proper use of spraying equipment.
3. Practice calculation on how to mix herbicides for proper application.
4. Practice calibration of granular spreaders.

Teaching Materials:

1. Mounted weed specimens or live specimens.
2. Knapsack sprayer and granular spreader.
3. Colored slides of common weeds.

References:

"Your Lawn," O.S.U. Bulletin 271, pp. 13-17.

"Better Lawns," U.S.D.A., Home and Garden Bulletin No. 51, p. 15.

PROBLEM IV:**DISEASE CONTROL IN LAWNS****Items to Consider:**

1. Cause of lawn diseases.
2. Prevention of common lawn diseases.
3. Chemicals for controlling lawn diseases.
4. Identification of common lawn diseases.

Related Information:

1. Causes of lawn diseases.

Fungi cause most of the serious diseases in lawns. These organisms usually produce seeds (technically called spores) that are spread by wind, water, mowers, infected grass clippings and numerous other ways. These fungus "seeds" need moisture and proper air temperature before they can cause infection. Diseases of lawns are therefore most common and harmful during warm, humid seasons. Although the temperature is virtually impossible to control, diseases may be started by too frequent watering during dry summer months.

Most of the fungi that attack lawn grasses occur in the form of microscopically small filaments or threads. This mass of threads, which sometimes has a cobwebby appearance, are called mycelium. Only those fungi that get their nutrients from a living host are true disease organisms. Such organisms cause Helminthosporium leafspot, fading-out, brown patch, rust, grease-spot, dollar spot and snow mold.

Mushrooms and slime mold in lawns are other examples of fungi, but they are not true disease organisms. They do not attack the lawn grasses directly, but they are a common lawn problem.

2. Prevention of common lawn diseases.

Proper lawn maintenance practices can help prevent many of the common diseases by eliminating the ideal conditions for their establishment. Practically all parasitic fungi of grasses can become established in the damp mulch from clippings. Here they flourish and attack healthy grass growing through the mulch. To guard against this, do not allow the clippings to accumulate more than 1/4 inch.

Since moisture is also necessary for fungi to become established, it is best to irrigate early in the day so the plants and clippings have a chance to dry before night. It is desirable to irrigate to a greater depth of penetration and less frequently rather than a little water at close intervals.

3. Chemicals for controlling lawn diseases.

The use of fungicides on lawn diseases is very expensive and time consuming due to the number of times they must be applied during the growing season. Some of the materials are poisonous and must be handled with extreme care, even to the extent of keeping children and pets off the grass until after a rain or irrigation.

When spraying fungicides use pressures as high as possible (up to 300 psi) to insure good penetration and distribution of materials. Using a wetting agent will also help to give a better coverage of all plants. Some of the materials containing mercury should not be used during hot weather.

Some of the common lawn diseases and the chemicals to use are:

- a. Helminthosporium Leaf Spot (Melting-out, Fade-out, Dying-out) --- Spray every two to three weeks with Captan 50%, Dyrene 50%, Kromad or Zineb 75%.
- b. Brown Patch --- Spray weekly with Cal-lor, Tersan OM or Kromad plus Calocure.
- c. Rust --- Spray with Acti-dione Ferrated (40 to 60 ppm in two gallons of water), Acti-dione + Thiram or Zineb.
- d. Snow Mold --- Spray with Tersan OM, Calocure or Cal-clor before the first heavy snow; spray during the growing season as for Melting-out.

4. Identification of common lawn diseases.

- a. Helminthosporium Leaf Spot --- Thinning out of the grass in scattered areas with a brownish undercast caused by the dead grass leaves. Close examination reveals spots on the leaves. These spots are usually brown, purple or brown with a purple border.
- b. Brown Patch --- This disease appears as somewhat circular brown patches up to several feet in diameter. The grass leaves first appear watersoaked and dark, but they soon dry, wither and turn light brown.
- c. Rust --- Reddish-brown or orange spots on the grass blades with this rusty colored material easily rubbing off onto fingers or shoes. It is most likely to become a problem in August or September following extended hot and dry periods. Severely rusted lawns may winterkill more easily. Merion bluegrass and ryegrass are particularly susceptible.
- d. Snow Mold --- Common systems are patches of whitish, bleached, dead areas of grass which may be as large as several feet in diameter. In the spring a whitish pink or dirty gray to black mold growth may be present.
- e. Dog Injury --- A lawn discoloration which may sometimes be mistaken for a disease is dog injury. These are normally small spots about three inches in diameter, straw colored and often within a short distance of the house or in certain areas of the lawn.

TROUBLE SHOOTING FOR LAWN DISEASES

<u>Condition</u>	<u>Problem</u>
1. Small, oblong purplish to brown spots on leaves. Turf appears thin with reddish-brown undercast in the summer.	Helminthosporium Leaf Spot
2. Small yellow to orange or reddish-brown pustules on leaves. Rust color.	Rust
3. A fine, gray-white, flour-like deposit on the grass blades.	Powdery Mildew
4. A gray to black, soot-like mold or white or yellow masses on the leaves.	Slime Mold
5. Long, yellow-green streaks or gray to black color in the leaf tissue. Mainly on Merion bluegrass.	Stripe Smut
6. Dark green grass in a circular pattern.	Fairy Ring.
7. Patches of whitish, dead, bleached areas of grass. May be several feet in diameter. Whitish pink or dirty gray to black mold growth often present in spring.	Snow Mold
8. Small spots - 3 inches in diameter, straw color, often within 30 to 40 feet of the house or in certain areas of the lawn.	Dog Injury

---"Your Lawn," O.S.U. Bulletin 271, p. 21.

Suggested Student Activities:

1. Demonstration on use of wetting agents.
2. Identification of common lawn diseases.

Teaching Materials:

1. Knapsack type tank sprayer.
2. Wetting agents for fungicide application.
3. Colored slides showing common diseases.
4. Chart "Trouble Shooting for Diseases."

- "Your Lawn," O.S.U. Bulletin 271, p. 21.

PROBLEM V:**INSECT AND PEST CONTROL IN LAWNS****Items to Consider:**

1. Damage caused by lawn insects and pests.
2. Chemicals to control insects and pests.
3. Safety measures when using insecticides.

Related Information:

1. Damage caused by lawn insects and pests.

Many insects and insect like pests damage lawns and other turf areas. They may cause the grass to turn brown and die or they may build many unsightly mounds that may smother the grass. Some of the pests infest the soil and attack the plant roots; some feed on the plant leaves and stems; others suck juice from the plants.

White Grubs --- These are usually thick, sluggish, white-bodies "worms" with yellowish-brown heads and legs. When full grown the grubs are 3/4 to 1 1/2 inches long. They are the larval stage of Japanese, May or June beetles. The grubs feed on the roots of the grass just below the soil surface, causing areas of dead grass.

Cutworms --- These are the larval stages of night-flying moths called "Owlet Moths." The caterpillars are smooth, nearly naked, dull colored and marked with spots and stripes. They vary in length from one to two inches when fully grown. Cutworms feed mostly at night and are present in the lawn from spring until late summer. Cutworms damage the grass by chewing off the leaves and sometimes the entire stem. The injury appears as tunnels of dead grass, which may be six inches in length.

Sod Webworms --- These are usually short, rather thickbodies, spotted, coarsely haired and active worms from 1/2 to 3/4 inch long. In early morning when the dew is present, white webs are easily seen in the lawn. They cut circular or irregular areas around their holes.

Ants --- These insects will build nests in the ground and usually form mounds around the openings. These anthills may smother the surrounding areas. Roots of the grass may also be destroyed.

2. Chemicals to control lawn insects and pests.

All insects and insect like pests can be controlled with insecticides such as chlordane, DDT, aldrin, dieldrin, heptachlor and malathion. These can be

purchased in various types of formulations and concentrations. Dusts and granules are ready-to-use formulations that can be applied with a dusted or fertilizer spreader. Wettable powders and emulsifiable concentrates must be mixed with water to make a spray. These sprays can be applied with a tank type garden sprayer.

Ground moles can be controlled by spraying the lawn to kill the white grubs. If the white grubs are killed, the moles are usually not a problem since the grubs are the source of food for the moles.

3. Safety measures when using insecticides.

Most insecticides or pesticides are poisonous and should be handled with extreme care. Do not apply any insecticide to a lawn when people or animals are on it; do not allow the material to drift to an area where it might injure people or pets. After an insecticide has been applied to a lawn the grass should be sprinkled before allowing children or pets to be on it.

USE PESTICIDES CAUTIOUSLY

Always read the label before using a pesticide. Note warnings and cautions each time before opening the container. Read and follow directions for use.

Keep pesticides away from children, pets, and irresponsible people.

Store pesticides in a secure place in their original labeled containers.

Do not smoke while using insecticides.

Do not breathe spray mist or dust.

Do not get pesticides in eyes, or on skin or clothing. If spilled on skin or clothing, wash thoroughly with soap and water and change clothes.

Wash hands and face thoroughly before partaking of food.

Dispose of empty containers so they pose no hazard to humans, animals or valuable plants.

Sweep dusts or granules from sidewalks and driveways.

Use a hose to thoroughly water-in any insecticide application so that residues do not remain on the grass blades or the granules or dusts remain on the surface of the soil. However, certain herbicides and fungicides should remain on the foliage for effectiveness. **FOLLOW ALL DIRECTIONS ON THE LABEL.**

Suggested Student Activities:

1. Inspect a lawn or other turf for insect damage.
2. Inspect for white grubs by peeling back a strip of sod.
3. Demonstrate the application of dusts and granules.

Teaching Materials:

1. A dust applicator.
2. Specimens of lawn insects.
3. Colored slides showing damage from insects.

PROBLEM VI:

MAINTENANCE IRRIGATION

Items to Consider:

1. Water importance to growth.
2. Water requirements.
3. Drought tolerance of different grasses.
4. Frequency and amount of irrigation.

Related Information:

1. Water importance to growth.

Water is important to plant growth because:

- a. A large percentage of the plant protoplasm is water.
- b. Water is essential to photosynthesis and hydrolytic processes, such as digestion of sugar to starch.
- c. Water is the solvent which carries nutrients from soil to plant cells.
- d. Water maintains turgidity which stimulates opening of stomata (minute openings in leaves) and movement of flower parts and leaves. Lack of turgidity slows growth.

--- Only about 5% of water taken in is used for physiological process; 95% goes out through transpiration and must be replaced as it is lost.

2. Water requirements.

The daily consumption of water by turf varies widely, owing to differences in climatic and other conditions. Estimated quantities range from ten to sixty gallons per thousand square feet. From five hundred to six hundred pounds of water or more is needed for each pound of dry matter produced by grass, thus fast growing turfgrass species require more water than the slower growing ones.

3. Drought tolerance of different grasses.

	Drought Tolerance
High	
↑	
↓	
Low	
	Tall Fescue Red Fescue Kentucky Bluegrass Perennial Ryegrass Colonial Bentgrass Creeping Bentgrass

4. Frequency and amount of irrigation.

During periods of the growing seasons when light showers occur soils should be examined following a rain to check on penetration. If moisture has moved down to less than a three inch depth and the soil is dry below water should be applied.

You may water whenever the lawn needs it, whether the sun is shining or not. Wet the soil to a depth of six to eight inches. This may require that the sprinkler remain in one place for several hours. Do not apply water faster than the soil will absorb it. During rainless periods you should expect to water your lawn every week to ten days.

One inch of rain in 24 hours is considered heavy rain. Most lawn sprinklers apply water at the rate of at least one inch an hour; very few soils can absorb water this quickly. Penetration can be satisfactory without mechanical means by repeated light sprinkling. Let the sprinklers operate until water begins to run off, then turn them off for a while and repeat the process several times.

Suggested Student Activities:

1. Observe the water holding capacity of different types of soil.
2. Check different mechanical sprinklers for amount of water put on in one hour.

Teaching Materials:

1. Soil samples.
2. Different types of water sprinklers.

PROBLEM VII:**RENOVATION****Items to Consider:**

1. When to renovate.
2. Mechanical procedures to use.
3. Chemicals to use.

Related Information:

1. When to renovate.

Early fall is the best time to renovate a lawn. If less than 50 per cent of the lawn consists of desirable grasses it is usually best to get rid of all grasses, prepare a new seedbed and plant new grasses.

2. Mechanical procedures to use.

Here are the steps in lawn renovation:

- a. Get rid of all weeds, leaves and undesirable grasses. Mow closely, rake to remove the clippings, leaves and other debris and then apply chemical weed killers to eliminate undesirable species.
 - b. Rake the lawn vigorously or cultivate it in such a way that the surface of the soil is loosened. This forms a rough seedbed for planting.
 - c. Fertilize, lime and plant in the same manner prescribed for establishing a new lawn.
3. Chemicals to use.

Experience has shown that the combination of a chemical and a tiller will give better kill of the unwanted plants than either used alone.

Some of the chemicals used in lawn renewing experiments are: Methyl bromide, SMDC (Vapam), Amitrol or Amitrol-T plus dalapon, Amitrol-T, Paraquat and Cacodylic acid.

New chemicals are being developed annually. For the most recent recommendation consult the latest information from the Ohio Agricultural Experiment Station, Wooster, Ohio.

Suggested Student Activities:

1. Make a count of desirable grasses in a lawn to determine if a lawn should be renovated.
2. Renovate a portion of school or other locally available lawn.

A Test for Students of Vocational Agriculture On Lawns

Name _____ School _____ Grade _____

General Instructions: This test includes 50 items of various types regarding the above topic. Directions are included at the beginning of each section.

SECTION I: True and False

Answer the following questions true or false. Place the symbol (+) in front of the true statements and the symbol (0) in front of the false statement.

- 0 1. The best time to seed a lawn is usually in the month of April.
- 0 2. Weeds such as ragweed and pigweed are a severe problem with fall seedings.
- + 3. Kentucky bluegrass is the basic lawn grass in Ohio.
- + 4. Bentgrass in a lawn will tend to crowd out Kentucky bluegrass.
- + 5. Ryegrass will establish itself much faster than Kentucky bluegrass.
- + 6. Tall fescue is one of the most wear-resistant grasses used in Ohio.
- 0 7. Most lawns in Ohio would benefit from a higher percentage of ryegrass in the seeding.
- 0 8. The plant food element needed most by lawns is potassium.
- 0 9. Liquid fertilizers will produce much better results than the same plant nutrients applied in dry form.
- + 10. Lime is needed on a lawn if the pH is 6.5 or below.
- + 11. Small lawn seeds should be covered with not over 1/4" of soil.
- 0 12. Mulch should always be removed after the lawn has become established.
- 0 13. Rolling a lawn in the spring is an excellent practice to help smooth uneven lawns.
- + 14. Merion bluegrass should be cut to a height of 1 to 1 1/2".
- + 15. Clipping should be done slightly higher with a rotary than with a reel type mower.
- + 16. Weeds will not usually be a serious problem if good lawn management practices are followed.
- + 17. 2, 4-D will control most broadleaved weeds.
- 0 18. Management practices on lawns have little effect on fungus growths in the lawns.
- + 19. An insecticide which destroys white grubs will also rid a lawn of moles.
- + 20. No more than 2 pounds of Nitrogen per 1,000 square feet should be applied on a lawn at one time.

SECTION II: Multiple Choice

Select the answer which best completes the statement. Place the letter in the blank at the beginning of the statement.

- c 21. The most drought tolerant of the following listed grasses is:
a. Kentucky bluegrass.
b. Creeping bentgrass.
c. Tall fescue.
d. Perennial ryegrass.
- a 22. The grass which should be mowed the highest is:
a. Kentucky bluegrass.
b. Merion bluegrass.
c. Creeping bentgrass.
d. Tall fescue.
- c 23. In seeding new lawns use all of the following practices except:
a. Seed in both directions.
b. Rake the seed into the soil.
c. Mulch deep enough so no soil is visible.
d. Cover small seeds 1/8 to 1/4 inch deep and large seeds 1/4 to 3/8 inch deep.
- a 24. In preparing the seedbed for a new lawn a practice which is not desirable is:
a. Add a small amount of sand to the soil.
b. Add organic matter to the soil.
c. Slope the soil away from the house.
d. Allow subsoil to settle before adding topsoil.
- c 25. The fertilizing element most needed to stimulate root growth is:
a. Potassium.
b. Nitrogen.
c. Phosphorus.
d. None of these.
- a 26. The fertilizing element least likely to be lacking in lawns is:
a. Potassium.
b. Nitrogen.
c. Phosphorus.
d. None of these
- d 27. The grass most likely to grow well in shade is:
a. Tall fescue.
b. Kentucky bluegrass.
c. Perennial ryegrass.
d. Red fescue.

- b 28. The grass most likely to survive and grow well under close clipping is:
- Red fescue.
 - Bentgrasses.
 - Perennial ryegrass.
 - Kentucky bluegrass.
- a 29. The grass most likely to survive under heavy wear is:
- Tall fescue.
 - Red fescue.
 - Bentgrasses.
 - Kentucky bluegrass.
- b -30. A time of seeding in Central Ohio which would give the best chance of success is:
- March 15 - April 15.
 - September 1 - 30.
 - October 15 - November 15.
 - December 1 - 30.
- c 31. Of the following statements the one which does not apply to good lawn watering practices is:
- Sands require irrigation more often than silts.
 - The deeper rooted the grass the less often you should water.
 - Water the lawn lightly at frequent intervals.
 - Silts require irrigation more often than clay.
- b 32. The amount of Kentucky bluegrass seed needed to seed 1,000 square feet:
- 1/2 to 2 pounds.
 - 1 to 3 pounds.
 - 3 to 5 pounds.
 - 5 to 7 pounds.
- a 33. Which of the following lawn weeds is an annual?
- Crabgrass.
 - Nimblewill.
 - Quackgrass.
 - Timothy.
- c 34. A fertilizer practice which will not help avoid plant burn is:
- Water immediately after fertilizing.
 - Do not apply over 2 pounds Nitrogen per 1,000 square feet.
 - Use ammonium sulfate.
 - Use granulated rather than pulverized fertilizer.
- c 35. All of the following practices should be considered in lawn irrigation except:
- Depth of water in the soil.
 - Amount of water runoff.
 - Whether or not the sun is shining at the time of irrigation.
 - Type of soil to be irrigated.

- c 36. Lawns should be renovated if the per cent of lawn in desirable grasses is:
- 25 - 40 per cent.
 - 10 - 25 per cent.
 - Less than 50 per cent.
 - Less than 75 per cent.
- b 37. When killing weeds in lawns with 2,4-D the formulation should be:
- Ester.
 - Amine
 - Either ester or amine.
 - Neither ester nor amine.
- c 38. Grass leaves affected with reddish-brown or orange spots on the blades have:
- Leaf spot.
 - Brown patch.
 - Rust.
 - Fade-out.
- c 39. A tool which removes a plug of soil from the lawn is used to:
- Cool the soil.
 - Irrigate the soil.
 - Aerate the soil.
 - Compact the soil.

SECTION III: Matching

Place the letter that best describes the term in front of the number at the left.

- | | |
|--------------------------|---|
| <u>d</u> 40. Phosphorus. | a. Promotes hardiness and disease resistance. |
| <u>b</u> 41. Nitrogen. | b. Stimulates rapid growth. |
| <u>a</u> 42. Potash. | c. Supplied by manganese sulfate. |
| <u>e</u> 43. Lime | d. Promotes root growth. |
| | e. Raises soil pH test. |

SECTION IV:

Complete the following mathematical problems. Show your work under the problem.

44. A lawn measures 90' x 100'. At a rate of 1 1/2 pound of bluegrass per 1000 square feet how much would the seed cost for this lawn if bluegrass seed costs \$.56 per pound?

Answer \$ 7.56

45. A lawn is 60' wide and 120' deep. How many gallons of water are placed on this lawn when 3" of water are applied? (One cubic foot of water equals 7.5 gallons.)

Answer 13,500

SECTION V: Interpretation of Data

Place an **A** in front of each statement that is true and can be proven by the data below. Place an **O** in front of each statement that may or may not be true but cannot be answered sufficiently from the data below. Place an **I** in front of each statement that is incorrect according to the data below.

Height of Mower Cut --- Merion Bluegrass

Mower type and height of cut	Per cent bare spots	Density*	Color**	Overall appearance ***
Reel 1"	2	9.5	4.8	8.2
Rotary				
Rotary 1"	6	8.0	2.2	5.0
Reel 2"	1	10.0	3.5	8.0
Rotary 2"	1	9.8	2.5	7.2

*Scale 1-10.....10 = very dense.....1 = bare soil

**Scale 1-5.....5 = dark green.....1 = light green to brown

***Scale 1-10.....10 = good appearance....1 = unsatisfactory appearance

- A 46. The density of the lawn is greatest where a reel mower is used at a height of 2".
- I 47. The overall appearance of the lawns mowed with a rotary mower is better than those mowed with a reel type.
- O 48. Using a rotary mower on a bentgrass lawn hurts the color.
- A 49. Fewer bare spots are found with a 2" height of cut than with a " height.
- A 50. A reel type mower leaves the lawn with a better color than the rotary type mower.

FOREWORD

This course of study is designed to provide direct assistance to industrial arts teachers of Applied Electricity concerned with the teaching of the basic principles of electricity and their application to electrical devices.

This publication was made possible by a special grant from the Missouri Farm Electric Utilization Council. Credit is due Dr. H. Pat Wardlaw, Assistant Commissioner of Education, and Mr. Merton Wheeler, Director of Industrial Education, and other staff members of the State Department of Education for their efforts in working with the Council toward the development of this publication.

We also wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for his participation in promoting this publication and for directing and administering the Curriculum Materials Laboratory in which this publication was prepared, and to Mr. James B. Karnes, Instructor in Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. The content of this course of study was developed by an advisory committee representing power producers, the electrical industry, and industrial arts education. Credit is due to Mr. Robert J. Spinti, Research Assistant in Industrial Education at the University of Missouri, who compiled this material and prepared the assignment sheets.

HUBERT WHEELER

Commissioner of Education
State Department of Education

MEMORANDUM

TO: The ERIC Clearinghouse on Vocational and Technical Education
The Ohio State University
980 Kinnear Road
Columbus, Ohio 43212

FROM: (Person) James B. Karnes (Agency) University of Missouri at Columbia
(Address) 103 Industrial Education Bldg., Columbia, Missouri

DATE: August 5, 1967

RE: (Author, Title, Publisher, Date) Industrial Education Dept., Univ. of Mo. at Columbia.
APPLIED ELECTRICITY, cooperatively with Industrial Education Dept., (Univ. of Mo. at Columbia) and Missouri State Dept. of Education (1

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:

Agency Industrial Education Dept., Univ. of Missouri at Columbia
Address 103 Industrial Education Bldg.

Limitation on Available Copies quantity Price/Unit \$2.00 outside of Mo.
(quantity prices) same

(No Key)

(2) Means Used to Develop Material:

Development Group Advisory committee; subject matter specialists and
Level of Group Regional. teacher educators.

Method of Design, Testing, and Trial Consultation committee, industry
specialists, subject matter specialists, teacher educators. Revised
by selected teachers in the field and refined.

(3) Utilization of Material:

Appropriate School Setting High school or Post-secondary basic course

Type of Program Preparatory in-service trade & industrial. setti

Occupational Focus job cluster

Geographic Adaptability United States

Uses of Material Comprehensive course of study (including assignment

Users of Material Instructor. sheets, testing & supplementar
aid

(4) Requirements for Using Material:

Teacher Competency Qualified teacher of basic electricity

Student Selection Criteria 8th or 9th grade level minimum; suitable for
initial instruction at post-secondary level.

Time Allotment 360 hours related instruction and laboratory experienc

Supplemental Media --

PREFACE

In a publication of this type there are numerous individuals and organizations that make contributions which are significant and it is difficult to give appropriate credit. In the development and publication of this course of study for Applied Electricity, the activities of the Missouri Farm Electric Utilization Council merit unusual and special recognition, for without their financial help this publication would have been impossible. For a number of years the education committee of this Council has been engaged in various activities concerned with improving the knowledge of electricity and its application.

An appraisal by the Industrial Education staff of the State Department of Education indicated that the lack of a well-organized course of study in Applied Electricity was a factor limiting the expansion of instruction in this area. Members of the Industrial Education staff of the State Department of Education and the Industrial Education Department at the University of Missouri met with the education committee of the Missouri Farm Electric Utilization Council and a means of producing such a publication was discussed. The activities culminated in an approval by the Council of a plan whereby a grant of \$2500 would be made to pay a part-time graduate student at the University of Missouri to prepare the course of study.

This course of study was prepared under the direction of an advisory committee representing the Council and professionally trained and experienced high school and college industrial arts teachers as well as representatives from the State Department of Education, all of whom played an important part in providing technical and professional direction to the work. The committee was composed of the following:

- Mr. Paul Henson, Manager, Boone Electric Cooperative, Columbia, Missouri.
- Mr. James B. Karnes, Instructor in Industrial Education, University of Missouri, Columbia, Missouri.
- Mr. Harold F. Klaus, Power Use Advisor, Black River Electric Cooperative, Fredericktown, Missouri.
- Dr. H. H. London, Professor of Industrial Education, University of Missouri, Columbia, Missouri.
- Mr. Ken McFate, Associate Professor of Agricultural Engineering, University of Missouri, Columbia, Missouri.
- Mr. Carl Shubert, Sales Representative, Kansas City Power and Light Company, Brunswick, Missouri.
- Mr. W. J. Spinabella, Power Use Specialist, Sho-Me Power Corporation, Marshfield, Missouri.
- Mr. Robert J. Spinti, Research Assistant in Industrial Education, University of Missouri, Columbia, Missouri.
- Mr. Maurice L. Stewart, Supervisor of Industrial Education, State Department of Education, Jefferson City, Missouri.
- Mr. William J. Streib, Instructor in Industrial Education, University of Missouri, Columbia, Missouri.
- Mr. Merton Wheeler, Director of Industrial Education, State Department of Education, Jefferson City, Missouri.
- Mr. Ray Wheeler, Rural Specialist, Missouri Power and Light Company, Jefferson City, Missouri.

Appreciation is expressed to Mr. Jarrel Hofer, Industrial Arts Instructor at Hickman High School, Columbia, Missouri, for the availability of teacher-made instructional aids which are illustrated in this publication.

The members of the committee drew upon the experiences and best practices of up-to-date programs in the teaching of electricity to decide upon the approach around which this course of study is organized rather than use the type of "take home" project which is traditionally found in such a course as an instructional vehicle. Research and best practices indicate that instruction which consists of experiments or activities presenting the principles and their application is the most effective instruction. Therefore, the nature of the activities assigned in this course has been designed to provide these concepts in the manner research indicates is the most effective presentation.

A wide variety of available books, laboratory manuals, and other instructional materials were examined and many which seemed to be most applicable were included either as basic or supplementary references.

The study of electricity is a broad and comprehensive undertaking and an attempt has been made in this course of study to provide enough detail by which the conscientious teacher can do a successful job of presenting the material.

TABLE OF CONTENTS

Foreword	2
Preface	3
Introduction	7
Section I - Content and Method	
A. Textbooks and References	8
B. Analysis of Applied Electricity	10
C. Suggested Teaching Plan	18
D. Job Assignment Sheets and Student Activities	24
E. List of Job Assignment Sheets	27
F. Job Assignment Sheets	28
G. Preparation and Use of Informational Assignment Sheets	80
H. List of Informational Assignment Sheets	80
I. Informational Assignment Sheets	81
J. Organizing Testing and Evaluation Materials	112
Section II - Instructional Aids	
A. Booklets, Pamphlets, Charts, Magazines, Etc.	117
B. Films	118
C. Organizing Instructional Aids for Applied Electricity	121
D. Three-Dimensional Instructional Aids	126
E. Free and Inexpensive Instructional Material	130
Section III - The Shop, Equipment and Supplies	
A. The Shop Plan	132
B. Suggested Equipment, Tools and Supplies for Applied Electricity	133
C. Sources of Electrical Equipment and Supplies	141
Section IV - Appendices	
A. Utilization of Old and Surplus Meters	143
B. Exam -- Unit I	145
C. Comprehensive Final Examination	151
D. Resistance of Soft Annealed Copper Wire	158

TAUM SAUK, Pumped Storage Hydro plant near Lesterville, Missouri, was developed by Unicom Electric Company at a cost of \$50,000,000. Low-cost, off-peak steam generated electricity pumps water 300 feet "up hill" at night and on weekends to the large storage reservoir on top of Proffit Mountain (up per left). When consumer's demand for electricity is greater during daytime hours, the water in the reservoir is released and comes back "down the hill" to drive the reverse pump turbine (shown in cut away) which economically generates electricity used to meet these peak demands. (Courtesy of Allis-Chalmers, Milwaukee, Wisc., mfr. of pump turbines.)

INTRODUCTION

Many factors have contributed to the technological developments which are continually shaping modern industrial America. However, one of the prime influences in America's technological progress has been the harnessing of the natural phenomenon known as electricity. An understanding of electrical principles is fundamental to the advancements being made in the fields of communication, heat, light and power. From space exploration to microbiology, from the automatic washer to the automatically controlled machine tool, from the electrically controlled home workshop to the automated industrial production line, electricity and the principles which control its use are assuming increasing significance. There are few places where one could go and not find usable electricity made available by one of America's many electrical power distributors.

All of the people in your community are consumers of electricity and electrical products; the students in your school are affected by electricity each day. Many of them will someday be employed in occupations which are directly dependent upon electricity and most all of them will work in buildings that are lighted and climate controlled by electricity. Certainly all of them will be consumers of electricity and electrical products. Therefore, it is apparent that they should have sufficient knowledge and understanding of the field of electricity to permit safe and effective use of this valuable natural resource.

In view of the influence which electricity exerts, and will continue to exert, on the lives of all youth, no secondary school program can be considered adequate that does not provide for a systematic study of electricity and its uses.

OBJECTIVES OF APPLIED ELECTRICITY

The objectives or aims of a course should serve three purposes: as goals or end points to be attained, as guides in the selection and teaching of content, and as standards for evaluation of achievement.

It is believed that the following objectives conform to the generally accepted objectives of secondary education and to those of industrial arts education.

This course has been planned and organized to provide the student with opportunities to:

1. Develop interest in and an understanding of the role which electricity plays in his home, his community and in his industrial-technical world.
2. Acquire consumer knowledge which will permit effective selection, care, and use of various electrical products and testing devices.
3. Develop safe and efficient work habits and techniques relating to electricity and electrically powered equipment.
4. Acquire information and have exploratory experiences with various aspects of the electrical industry in order to gain a better understanding of occupational opportunities in the broad field of electricity.
5. Develop a depth of understanding of electrical principles and the competencies necessary to perform a wide variety of fundamental tasks in the electricity field.

SCOPE AND CONTENT OF COURSE

It is the purpose of this comprehensive course of study to provide direct assistance to the industrial arts teacher as he establishes or revises a course designed to teach the basic principles, their application to electrical devices, and the associated competencies essential to the safe use of electricity in the home, on the farm, as well as in business and industry.

This course is designed to provide instruction for the eleventh or twelfth grade except where local variations must be considered. The class should meet one hour a day five days a week for thirty-six weeks, and should carry one unit of credit. The sequence of the course is presented in the following major divisions:

Fundamentals of Electricity	Electrical Conductors and Heat	Controls
Magnetism and Electromagnetism	Light from Electricity	Appliances
Sources and Distribution of Electrical Energy:	Residential Wiring	Automotive Electricity
Electro-chemistry	Motors	Electronics
Mechanical		
Other		

TEXTBOOKS AND REFERENCES

Textbooks:

It is difficult to select a single textbook for a course such as Applied Electricity which encompasses all of the planned content in the proportion and scope desired. There are several publications available that might serve equally well; however, most assuredly any one of them would have to be supplemented to a certain degree. It is also realized that teachers with varying backgrounds will be teaching Applied Electricity in courses with varying time allotments to students with varying abilities; therefore, recommendations were not limited to a single text in the hope that the teacher will select instructional materials which are most appropriate for the instructional situation at hand.

For implementing the content selected for this course, three books, any one of which could serve as a text, are suggested as basic references. Each of these books is preceded by a code letter which is used throughout this course of study to designate the book.

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, McGraw-Hill Book Company, New York, N. Y., 1962.
- B. Marcus, Abraham, Basic Electricity, Prentice-Hall, Inc., Englewood Cliffs, N. J., 1958.
- C. Steinberg, William B., and Ford, Walter B., Electricity and Electronics - Basic, American Technical Society, Chicago, Ill., 1961.

The teacher should not feel confined to one of the above books as there are several others listed below as supplementary references which provide good sources of information and are coded as such on the various job and information assignment sheets designed for the course.

ANALYSIS OF APPLIED ELECTRICITY

MANIPULATIVE OPERATIONS: What the Student Should Be Able to Do	Assign. No.	INFORMATIONAL TOPICS: What the Student Should Know
<u>Fundamentals of Electricity</u>		
	1	1. The variety of uses of electrical energy
	1	2. The relative cost per kilowatt hour of electrical energy
	1	3. The nuclear structure of matter
	1	4. The electron theory of electricity
	1	5. Principles involved in electric circuits
	1	6. Applications of Ohm's Law in D. C. circuits
7. Wire a series circuit	2	7. Characteristics of a D. C. series circuit
8. Connect and read an ammeter	2	8. Applications of and precautions to observe with ammeters
9. Connect and read a voltmeter	2	9. Applications of and precautions to observe with voltmeters
10. Connect and read an ohmmeter	2	10. Applications of and precautions to observe with ohmmeters
11. Read scales on a volt-ohm-milliammeter	2	11. Principles of volt-ohm-milliammeters
12. Wire a parallel circuit	2	12. Characteristics of a D.C. parallel circuit
13. Calculate power from volt and ammeter readings	3	13. Relationship of Watt's Law to D.C. circuits
14. Read a kilowatt-hour meter	3	14. Rate structure used by power distributors
15. Calculate an electric bill		
16. Convert horsepower to kilowatts	3	16. Principles of conversion power measurement
17. Convert kilowatts to horsepower		
18. Calculate the efficiency of an electrical device	3	18. Factors involved in efficiency of electrical equipment
19. Replace a cartridge fuse link	4	19. Function and operating principles of fuses
20. Place a fuse in a circuit	4	20. Types and uses of fuses
21. Place a circuit breaker in a circuit	4	21. Operating principles of circuit breakers
	4	22. Types and applications of circuit breakers

MANIPULATIVE OPERATIONS: What the Student Should Be Able to Do	Assign. No.	INFORMATIONAL TOPICS: What the Student Should Know
23. Identify an open circuit	4	23. Characteristics of an open circuit
24. Ground a circuit	4	24. Types of electrical grounds
25. Identify a grounded circuit	4	25. Characteristics of a grounded circuit
	4	26. Effects of electricity on the human body
27. Mouth-to-mouth artificial respiration	4	27. First aid for electrical shock
28. Read electrical wiring diagrams	5	28. Interpretation of symbols used in wiring diagrams
29. Draw electrical symbols		
30. Read electronic schematic symbols		
31. Draw electronic schematic symbols (make electronic schematic drawing)	5	31. Interpretations of electronic schematic symbols
32. Connect a potentiometer in a circuit	6	32. Principle of voltage dividers
33. Connect a potentiometer in a circuit as a rheostat	6	33. Operating principles of a rheostat

Magnetism and Electromagnetism

	7	34. Types of natural magnets
35. Trace magnetic fields for like and unlike fields	7	35. Artificial magnets and their applications
36. Construct an electromagnet	7	36. Factors influencing the strength of electromagnets
37. Connect and operate a relay	7	37. Applications of electromagnets
	7	38. Basic principles of induction in D.C. circuits

Sources and Distribution of Electrical Energy

A. Electrochemistry

	8	39. Operation, application, and limitations of primary cells
40. Test a cell with a hydrometer	8	40. Operation, application, and limitation of secondary cells
41. Test cell voltage under load		
42. Connect cells in series		
43. Connect cells in parallel		
44. Connect cells in a combination circuit	8	44. Types of cell connections
	8	45. Principles of electroplating
	8	46. Principles of electroforming

MANIPULATIVE OPERATIONS: What the Student Should Be Able to Do	Assign. No.	INFORMATIONAL TOPICS: What the Student Should Know
	8	47. Principles of electrorefining
	8	48. Principles of electrochemical cleaning
B. <u>Mechanical</u>		
	9	49. Principles of an induced current and voltage
	9	50. Principles of A.C. generators
	9	51. Principles of D.C. generators
	9	52. Methods of driving generators
	9	53. Characteristics of alternating current
	9	54. Basic principles of poly-phase power
	10	55. Principles of transformer operation
	10	56. Sizes, ratings and applications of transformers (include current)
	10	57. Power distribution from generators to transmission lines
	10	58. Power tools and interconnections (include metering)
	10	59. Reasons for using high voltage and safety precautions
	10	60. Power distribution from transmission lines to residences
C. <u>Other Sources</u>		
61. Measure current and voltage from a solar cell	11	61. Principles and applications of solar batteries
62. Measure current from a thermocouple	11	62. Principles and applications of thermocouples
	11	63. Problems with and applications of static electricity
	11	64. Principles and applications of piezoelectricity (spark pump)
	11	65. Principles and applications of nuclear power
<u>Electrical Conductors and Heat</u>		
66. Gage a conductor with a gage	12	66. Gage system for nonferrous metals and wire
67. Gage a conductor with a micrometer	12	68. Purpose and characteristics of stranded conductors

MANIPULATIVE OPERATIONS: What the Student Should Be Able to Do	Assign. No.	INFORMATIONAL TOPICS: What the Student Should Know
69. Solder a wire to a tie point	12	69. Factors influencing resistance
70. Make and insulate a rat rail splice	12	70. Types and characteristics of insulation material used on current carrying conductors
71. Measure IR drop in a cord	12	71. Factors influencing voltage drop in a conductor
72. Calculate power loss in a cord	12	72. Factors influencing power loss in a conductor
	12	73. Principles of electrical heat production and control
	12	74. Types of residential electric heating
	12	75. Factors to be considered when applying electric heat to residential buildings

Light from Electricity

	13	76. Principles of incandescent lamps
77. Wire a fluorescent lamp	13	77. Principles of fluorescent lamps
	13	78. Principles of vapor lamps
	13	79. Principles of electroluminescence
	13	80. Types of special lamps and their uses
81. Replace a lamp cord	13	81. Lamp basing, sizes, coatings, and shapes and applications
82. Take light measurements	13	82. Selection and location of light sources
83. Operate a photo-electric device	13	83. Photo-electric principles

Residential Wiring

	14	84. Services of Underwriter's Laboratories
85. Replace a grounding type duplex convenience receptacle	14	85. Basic wiring devices
86. Replace a flush single pole switch		
87. Replace a flush 3-way switch		
88. Replace a flush 4-way switch		
	14	89. Safety considerations in residential wiring
90. Install a switch box		

MANIPULATIVE OPERATIONS: What the Student Should Be Able to Do	Assign. No.	INFORMATIONAL TOPICS: What the Student Should Know
91. Wire an outlet from an existing outlet	14	91. Electrical codes and regulations governing wiring
	14	92. Advantages and limitations of different wiring media
	14	93. Types of service entrances and basic considerations in their use
	14	94. Grounding procedures for residential wiring systems
	14	95. Factors affecting, number, location and grounding of convenience receptacles
	14	96. Circuit design and load capacity for appliance installation
	14	97. Selection and location of fixtures
	14	98. Factors affecting the use of outdoor wiring and other decorative lighting
	14	99. Conditions and considerations governing the use of temporary wiring
	14	100. Factors to consider in locating switches
102. Wire two point control with low voltage activator	15	101. Principles and application of low voltage wiring
	15	103. Principles of operation and location of telephones
104. Wire a door bell (or chime) for front and rear door control	15	105. Principles of intercommunication, signal and alarm systems
<u>Motors</u>		
106. Assemble and operate an electric motor	16	106. Principles of operation of a series or universal motor
	16	107. Principles of operation of induction motors
	16	108. Principles of operation of repulsion motors
109. Reverse a split-phase induction motor	16	109. Principles involved in reversing motors
110. Reverse a three-phase motor		
111. Reverse a repulsion-start induction-run motor		

MANIPULATIVE OPERATIONS: What the Student Should Be Able to Do	Assign. No.	INFORMATIONAL TOPICS: What the Student Should Know
	16	112. Principles of wiring dual voltage motors
	16	113. Typical applications of split-phase induction motors
	16	114. Typical applications of capacitance-start induction motors
	16	115. Typical applications of repulsion-start induction-run motors
	16	116. Typical applications of shaded pole motors
117. Select a motor for a given application	16	117. Typical applications of universal motors
118. Wire a 120 volt motor for 240 volts or vice versa	16	118. Typical applications of three-phase motors
119. Determine the conductor size for a given motor a specified distance from a power source	16	119. Necessity of "over current" protection for motors
	16	120. Types and application of common motor controllers
	16	121. Common motor speeds
122. Mount and adjust a motor to a belt driven load	16	122. Speed adjustment and drive mechanisms
123. Record name plate data from a motor	16	123. The meaning of name plate data
124. Identify a motor with a faulty bearing	16	124. Main causes of motor trouble and maintenance procedures
125. Identify a motor with an open starter winding		
126. Identify a motor with a faulty starter switch		
127. Identify a motor with a grounded winding		
128. Identify a motor with a shorted capacitor		
129. Identify a motor connected for the wrong voltage		
130. Replace brushes in a universal motor		
	16	131. Safety considerations with motors
<u>Controls</u>		
132. Wire a thermostat	17	132. Principles of heat controls
	17	133. Principles of limit controls
	17	134. Principles of pressure controls
135. Wire a time control	17	135. Principles of time controls

MANIPULATIVE OPERATIONS: What the Student Should Be Able to Do	Assign. No.	INFORMATIONAL TOPICS: What the Student Should Know
	17	136. Principles of velocity controls
	17	137. Principles of humidity controls
	17	138. Principles of photoelectric controls
<u>Appliances</u>		
139. Replace an insulated cord on a heat producing appliance	18	139. Principles of operation and care for heating appliances
140. Ground an electric washing machine	18	140. Principles of operation and care of electric washing machines
141. Replace rollers on a conventional washer		
142. Clean out pump on an automatic washing machine		
143. Clean condenser coils on a compressor	18	143. Principles of operation and care of cooling appliances
144. Replace an air conditioner filter		
145. Level a major appliance	18	145. Principles of operation and care of motor operated appliances
	18	146. Typical causes of operating difficulties with electric appliances
	18	147. Factors to consider in determining whether or not an appliance is repairable
	18	148. Factors to be considered in selecting appliances for purchase
	18	149. Methods of venting clothes dryers
	18	150. Types and uses of power cords
151. Wire an extension cord including a feed-through switch	18	151. Types and uses of cord ends and caps
	18	152. Electrical shock hazards with appliances
	18	153. Characteristics of grounded and shorted circuits
154. Test a heating element for continuity	18	154. Principles of continuity testing
<u>Automotive Electricity</u>		
	19	155. Principles of a common return conductor
	19	156. Components and principles involved in the automobile lighting system

MANIPULATIVE OPERATIONS: What the Student Should Be Able to Do	Assign. No.	INFORMATIONAL TOPICS: What the Student Should Know
	19	157. Principles involved in the starting motor
158. Replace the brushes on a generator	19	158. Operating principles and components of the battery recharging system
159. Identify and locate faults in an ignition system	19	159. Operating principles and components of the ignition system
	19	160. Characteristics and uses of special automotive circuits
Electronics		
	20	161. Electronic principles involved in vacuum tube operation

	20	164. Principles of semiconductor
	20	165. Essentials of a radio receiver
166. Block diagram a radio receiver		
167. Block diagram a home music system		
168. Block diagram a public address system		
	20	169. Factors to consider in public address installations
170. Block diagram a T-V receiver		
	20	171. Shock hazards with T-V receivers
	20	172. Principles of F.M. transmission and reception
173. Diagram an antenna installation	20	173. Factors influencing the installation of an effective antenna system
	20	174. Principles of capacitance
	20	175. Principles and applications of ultra-sonics
	20	176. Avocational applications of electronics
	21	177. Occupational opportunities in the electrical industries

SUGGESTED TEACHING PLAN

Suggested Activities	Demonstrations	Topics for Class Discussion	Informational Assignments	Other Instructional Aids
FUNDAMENTALS OF ELECTRICITY				
1. Wire a series circuit.	Solve problems with Ohm's Law. Read an ammeter. Read a voltmeter. Read an ohmmeter. Read a VOM. Wire meters in circuits.	Increased use and decreasing cost of electricity. Nuclear structure and electron theory. Ohm's Law. Construction, use, and precautions with meters. Characteristics of D.C. series circuits.	1	Film: "What is Electricity"
2. Construct a voltage tester. 3. Wire a parallel circuit. 4. Calculate electric power.	Measure power with wattmeter, voltmeter, and ammeter.	Characteristics of D.C. parallel circuits. Electric power in D.C. circuits.	2	Film: "Series and Parallel Circuits"
5. Operate overcurrent protective devices.	Overload a fuse.	Rate structures. Power unit conversion efficiency calculation. Overcurrent protective devices. Safety precautions with electricity, first aid. Grounding considerations. Open and closed circuits.	3	Rate cards from power distributors.
		Electrical and electronic schematic symbols.	4	Start a file on newspaper clippings dealing with electric shock. Make a demonstration board with the various sizes and types of fuses. Films: "Electrical Safety in the Home" "How to do Rescue Breathing?" Chart of symbols: available from Eico. Architectural plans with wiring diagrams and schematic circuit drawings.
			5	

SUGGESTED TEACHING PLAN - continued

Suggested Activities	Demonstrations	Topics for Class Discussion	Informational Assignments	Other Instructional Aids
6. Wire variable resistors.	Limit current with a rheostat. Divide voltage with a potentiometer.	Limiting current with resistance. Voltage dividing principles.	6	Mock-up or parts of equipment showing use of rheostats and potentiometers.

MAGNETISM AND ELECTROMAGNETISM

7. Study effects of permanent magnets.	Make a dipping needle. Magnetize a bar held in earth's field. Demagnetize by holding East-West and striking.	Natural magnets. Earth's magnetic field. Materials used for permanent magnets. Magnetic field properties. Magnetic induction. Diamagnetic materials. Magnetic shielding.	7	Slide film: "Magnetism, or Permanent Magnets"
8. Make an electromagnet.	Magnetic field around a conductor Field around a coil. Change in flux with a core, change in amount of core. Change in flux with a change in ampere turns.	Magnetic field around a current carrying conductor. Factors influencing the strength of an electromagnet. Applications of electromagnets.		
9. Wire a relay.		Principles of operation of relays. Type of relays. Applications of relays.		

SOURCES AND DISTRIBUTION OF ELECTRICAL ENERGY

10. Connect and check batteries.	Make a primary cell with zinc and copper in mouth or citrus fruit deflecting a galvanometer.	A. ELECTROCHEMISTRY Factor influencing current and voltage of a cell. Construction of primary cells.	8	Cut-away of primary cell. Old lead-acid cell with removable plates.
----------------------------------	--	--	---	--

SUGGESTED TEACHING PLAN - continued

-20-

Suggested Activities	Demonstrations	Topics for Class Discussion	Informational Assignments	Other Instructional Aids
11. Measure solar cell output. 12. Make a thermocouple.	<p>Induce a current by passing magnet through a coil (show influence of speed, angle, number of turns, strength of field.)</p> <p>Change voltage with a step-up and step-down transformer.</p> <p>Produce a current and voltage with a solar cell.</p> <p>Produce a current and voltage with a thermocouple.</p> <p>Produce a voltage with a "spark pump."</p>	<p>Construction of secondary cells. Safety with lead acid cells. Types of cells commonly used include mercury, Edison, nickel-cadmium, advantages and limitations of each. Electroplating. Electroforming. Electrorefining. Electrochemical cleaning.</p> <p style="text-align: center;">B. MECHANICAL</p> <p>Principles of induced currents and voltages. A. C. & D. C. generator principles. A. C. characteristics Transformer principles. Power distribution practices.</p> <p style="text-align: center;">C. OTHER SOURCES</p> <p>Solar cells and their uses. Principles of thermocouples and typical uses. Static electricity problems and uses. Lightning protection. Piezoelectricity and applications.</p>	9 10 11	<p>Film: "The Primary Cell"</p> <p>Show induced current on oscilloscope.</p> <p>Materials -- coil, magnets, galvanometer. Field trip: Power generating station. Film: "My Pop's A Lineman" Demonstration transformer.</p> <p>Film: "Bell Solar Battery"</p> <p>Film: "Electrostatics"</p>
ELECTRICAL CONDUCTORS AND HEAT				
13. Gage wire	<p>Read a micrometer. Find wire size with gage.</p>	<p>Gaging systems. Factors that influence resistance. Types of insulation.</p>	12	<p>Film: "Wire Size and Voltage Drop" Your local power supplier may be able to obtain films on electric heat.</p>

SUGGESTED TEACHING PLAN - continued

Suggested Activities	Demonstrations	Topics for Class Discussion	Informational Assignments	Other Instructional Aids
14. Make an electrical splice. 15. Determine voltage drop and power loss.	Effect of current through a conductor. Solder a terminal. Make a splice.	Essentials of a good splice. Joining wires in electronic circuits.		Make a demonstration board with several common types of conductors and insulations. Include types S, SJ, SP, HPD, HPN, Cords; TW, R, VF, WP building wires; SCE, DCE, enameled formvar magnet wires; nichrome, aluminum and copper conductors.
LIGHT FROM ELECTRICITY				
16. Wire a fluorescent lamp. 17. Repair a lamp. 18. Wire a photoelectric cell.	Wire and operate lamp out of envelope. Wire and operate a fluorescent lamp. Wire a lamp cord. Photo conductive tube operating a device through a relay.	Operation of incandescent lamps. Types of lamp bases and uses. Lamp coatings. Selection and location of light sources. Principles of operation of fluorescent lamps. Operation and use of vapor lamps. Present status of electroluminescence. Considerations in repairing lamps. Principles of photo tubes. Variations in color sensitivity.	13	Demonstration board with several types of lamps using different bases.
WIRING				
19. Replace an outlet.	Replace an outlet. Replace a switch.	Underwriter's Laboratories. Electrical codes & purposes. Necessity of proper grounding of system. Types of wiring systems, conduit, armored cable, etc. Considerations in locating outlets and types that should be used.	14	Samples of different types of electrical boxes. Catalogs from which students may become familiar with nomenclature. Sample 60 or 100 amp. cabinet. Demonstration board with SPDT Knife switches to show how 3-way switches operate.

SUGGESTED TEACHING PLAN - continued

Suggested Activities	Demonstrations	Topics for Class Discussion	Informational Assignments	Other Instructional Aids
20. Wire a switch.	Wire and operate 3-way and 4-way switches.	Decorative lighting. Locating switches.	15	Wiring panel with low voltage relay mounted with a medium base cleat receptacle.
21. Install a switch box.	Wire and operate a low voltage switch.	Considerations with low voltage wiring.		
22. Wire low voltage circuits.	Wire and operate a door chime.	Door bells, buzzers and chimes.		
MOTORS				
23. Make an electric motor.	Motor principle with a compass and magnet.	Principles of operation of a series motor.	16	Induction motor with starter switch removed and leads brought out so the starters can be switched in by the instructor, also capacitor leads brought out so different sized capacitors can be used. (See pictures.) Field Trip: Examine motors around the school for type, speed, drive mechanisms, etc. Samples of several motor driven devices.
24. "Trouble shoot" a motor.	Show effect of the starter windings on starting torque. Show effect of capacitor site on starting torque. Reverse a repulsion start-induction run motor. Adjust a motor to line up with a load. Reverse a motor with two control stations.	Operation and application of induction and repulsion motors. Reversing inotors. Motor speeds and drive mechanisms. Preventative maintenance of motors. Motor control devices.		
CONTROLS				
25. Wire electrical controls.	Wire and operate a limit control. Wire and operate time sequence control.	Principles of the various types of electrically operated controls.	17	Mock-up of a complete furnace control with thermostat.
APPLIANCES				
26. Perform minor appliance maintenance.	Disassemble an electric iron. Disassemble a conventional washer. Test for continuity. Properly ground an appliance.	Principles of operation and proper care for appliances. Typical troubles with appliances that can be repaired at home. Considerations to be given in purchasing appliances. Concept of continuity testing. Necessity for properly grounding appliances.	18	

SUGGESTED TEACHING PLAN - continued

Suggested Activities	Demonstrations	Topics for Class Discussion	Informational Assignments	Other Instructional Aids
AUTOMOTIVE ELECTRICITY				
27. Locate automotive electric troubles.	Analyze and connect components of an automobile ignition system.	The automotive lighting system. The battery recharging system including alternator systems. The ignition system including transistorized systems. Other special electrical systems.	19	Mock-up of automotive electrical system.
ELECTRONICS				
28. Make a crystal set.	Test a vacuum tube with a tube tester. Set up a public address system. (Include feed back and means of reduction.)	Vacuum tube and semiconductor principles. Principles of radio transmission and reception. Audio amplifier installations. Microphone impedance.	20	Oscilloscope to show half and full wave rectifier. Films: "Sending Radio Messages," "Receiving Radio Messages" Field trip: Radio and/or TV broadcasting station. Catalogs which students may examine to become familiar with electronic components and nomenclature. Field trip: Amateur radio station if none in school.
29. Make a code oscillator.		Principles of TV antenna systems. Hobbies in electronics. Occupations in the electrical industry.	21	Obtain local electrical contractor or electronic technician to give talk to the class.

JOB ASSIGNMENT SHEETS AND STUDENT ACTIVITIES

The curricular area of electricity differs from most other phases of industrial arts in that the majority of the instructional content is informational rather than manipulative in nature. This difference suggests some variation in the teaching approaches when one teaches a course in the area of electricity.

Traditionally, the constructional "take home" project has been the instructional vehicle in industrial arts classes; however, logic, experience and research* indicate that a broader interpretation of the term "project" will be needed if instruction in the area of electricity is to be most effective. Since most of the content in industrial arts electricity consists of principles and their application, there is some question as to the value of spending any significant amount of time building motors and fabricating similar devices or components. In addition to these factors, it must be borne in mind that the electricity-electronics industry is of a component assembly nature and that a realistic interpretation of this phase of industry cannot be gained through fabrication with metals, wood, and plastic.

In consideration of these things, most of the student activities for this course have been planned as experiments and independent exercises. The familiar job assignment sheet style has been modified to serve as the organizational guide to the student activities. Since there are several manufacturers of electrical equipment and circuit boards which would serve as a suitable medium for the planned activities, the circuits and other schematics drawn on the job assignment sheets are general and adaptable to any number of systems. The components and sizes specified are meant to be suggestive and will need to be varied in order to be compatible with the system being used. If the teacher desires to establish his own system of circuit boards, he may want to consult: Zbar, Paul B. and Schildkraut, Sid, Instructor's Guide for Basic Electricity, Basic Electronics, and Basic Radio and Radio Receiver Servicing.

Most industrial arts teachers can establish system circuit boards for a given course in applied electricity at less cost than those commercially available. However, it does take a considerable amount of time to develop these materials, and it may not be practical to construct circuit boards especially considering the pressures of time as the teacher initiates a new program.

The commercially available materials offer the advantages of being immediately usable with a minimum of instructor time involved, and some of these materials come with well-written laboratory manuals. The disadvantages of some may be their lack of flexibility, incompatibility with existing equipment and future expansion of the program as well as high cost.

It is suggested the following might be criteria to use in selecting the system to be adopted:

1. Initial cost.
2. Cost per student over a period of several years.
3. Probable life of the parts--how "boy proof" are they?
4. Ability to expand with intended development of the electricity-electronics program in the school.
5. Will they be usable in a second course?
6. Suitability of published material that is supplied or available and how well it is written.
7. The experience of others who have used the equipment.

Few projects, as such, have been included in this guide. The intention of these job assignment sheets is to provide an organized approach to activities that will increase understanding of certain basic concepts. The method of implementation is left to the instructor; therefore, it is quite conceivable that some instructors and students may use all of the job assignments while others may begin planning and solving supplementary problems after some initial experiences with the job assignments. Of course, if some of these exercises have been covered in previous courses, they should be omitted at the teacher's discretion. Many of the supplementary references have good project suggestions that are suitable to convey the information and develop the skill desired. Wherever feasible, the instructor should use completed projects, or those in the process of construction, when performing experiments. However, care should be exercised in selecting projects that involve a minimum of operations that are non-electrical. A list of projects which typify this suggested approach will be found below.

In some cases the instructor may want to use kits for projects. This is an acceptable practice since many kits enable a person to get excellent equipment at comparatively small cost. However, when kits are used, the instructor must be certain that the students understand the principles involved and the operation of the circuits. Currently available kits with step by step instructions can be assembled without a thorough understanding of the operational procedures involved. One method of avoiding this pitfall is to require a written or oral report, by the student, on the operation of the equipment.

*Johnston, J. L., Teacher-Demonstrations Versus Shop Activities In The Teaching of Electricity: An Experimental Comparison, Unpublished Doctor's Dissertation, University of Missouri, 1956.

SUGGESTED PROJECTS

The following projects are typical of what may be used in a course of this nature. Projects should be carefully examined for shock hazards before being approved for use.

"Shock coil." Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 123-124.

"Ignition tester." Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 176-177.

"Combination continuity tester and flashlight." Arnold, Joseph P. and Schank, Kenneth L., Exploratory Electricity, pp. 41-42.

"Model railroad signal." Gerrish, Howard H., Electricity, pp. 86-87. or Tustison, F. E., and Ruehl, P. W., Electrical Essentials, Appendix B.

"Circuit breaker." Gerrish, Howard H., Electricity, pp. 91-92, or Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 179-180.

"Code Oscillator." Gerrish, Howard H., Electronics, pp. 101-103.

"Rheostat." Tustison, F. E., and Ruehl, P. W., Electrical Essentials, Appendix D; or Jones, E. W., Fundamentals of Applied Electricity, p. 320.

"Continuity Tester," Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 400-401.

"T-V Antenna," Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, p. 407.

"Compass, Magnetic." Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 28-29, 390.

"Motors," Many of the books suggested in the list of references contain motors that are suitable for use as projects. There are also several kits available.

"Soldering Gun" or "Copper" - One of several kits available, such as Instruct-A-Kit S-1.

"Radio Receiver." such as Instruct-A-Kit No. 17, 5-tube Superheterodyne, AC/OC Radio Receiver.

Students setting up experiment with Electronic equipment.

LIST OF JOB ASSIGNMENT SHEETS

Assignment Number	Title	Units Covered in Analysis
1	Wire a Series Circuit	7, 8, 9, 10, 11
2	Construct a Voltage Tester	7
3	Wire a Parallel Circuit	8, 9, 10, 11, 12
4	Calculate Electric Power	13
5	Operate Overcurrent Protective Device	19, 20, 21, 23, 24, 25
6	Wire Variable Resistors	32, 33
7	Investigate Permanent Magnets	35
8	Make an Electromagnet	36
9	Wire a Relay	37
10	Connect and Check Batteries	40, 41, 42, 43, 44
11	Measure Solar Cell Output	61
12	Make a Thermocouple	62
13	Gage Wire	66, 67
14	Make an Electrical Splice	70
15	Determine Voltage Drop and Power Loss	71, 72
16	Wire a Fluorescent Lamp	77
17	Repair a Lamp	81
18	Wire a Photo-electric Cell	82, 83
19	Replace an Outlet	85
20	Wire a Switch	86, 87, 88
21	Install a Switch Box	90, 91
22	Wire Low Voltage Circuits	101, 102
23	Construct an Electric Motor	106
24	"Trouble Shoot" a Motor	109-130
25	Wire Electrical Controls	131-133
26	Perform Minor Appliance Maintenance	139, 140, 141, 142, 143, 144, 145, 146, 149, 150
27	Locate Automotive Electrical Troubles	158, 159
28	Construct a Crystal Set	164, 173
29	Construct a Code Oscillator	165

APPLIED ELECTRICITY

Job Assignment 1
Covering Units 7-11

Name _____
Due _____

WIRE A SERIES CIRCUIT

Any electrical circuit has certain elements that operate according to series circuit principles. Therefore, one should develop an understanding of the operation of a series circuit. In this assignment you are to connect and study a series circuit.

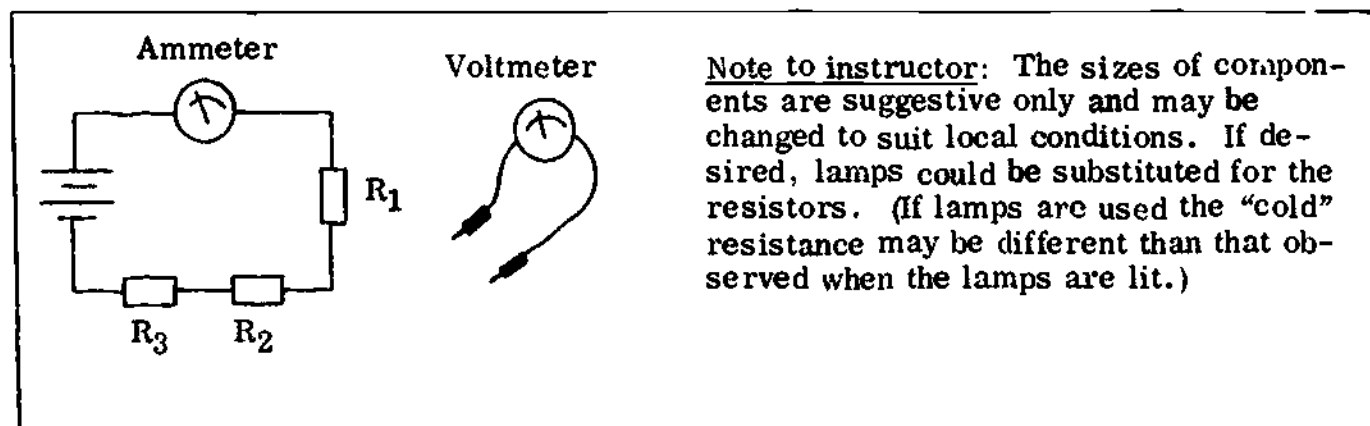

Objective: To develop an understanding of the operation of a series circuit.

Directions: Read this entire assignment sheet. Read the reference(s) assigned and work out the problem by following the steps of procedure.

References:

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 146-147, 238-244.
- B. Marcus, Abraham, Basic Electricity, pp. 40-42, 85-91, 95-98.
- C. Steinberg, William B., and Ford, Walter B., Electricity and Electronics - Basic, pp. 60-62, 65-66, 95-96, 99-101.

Specifications:

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Ohmmeter
1	0-1 amp. D.C. Ammeter
1	0-15 volt D.C. Voltmeter
1	R ₁ Resistor 40" of # 24 nichrome
1	R ₂ Resistor 20" of # 24 nichrome
1	R ₃ Resistor 56" of # 24 nichrome
2	Dry Cells

Steps of Procedure:

- _____ 1. Obtain the components, meters, and other equipment needed as listed in the bill of material.
- _____ 2. Using the ohmmeter measure the resistance of each resistor and record in the appropriate place in the chart below. (A-243-244, B-97-98)

MICROCOPY RESOLUTION TEST CHART
 NATIONAL BUREAU OF STANDARDS - 1963

Comp.	Meas. Res.	Meas. Volt Drop	Cur.	Calc. Res.	Volt w/R ₂ Disc.
R ₁			**		
R ₂			*		
R ₃			*

Circuit Checked _____

Readings Approved _____

*DO NOT MOVE THE AMMETER TO MAKE THESE MEASUREMENTS. Ascertain them from your knowledge of series circuits.

- _____ 3. Connect the resistors in series with each other. Measure and record the total resistance with an ohmmeter.
- _____ 4. Connect the ammeter and power source into the circuit. DO NOT TURN ON POWER! (A-239-240)
- _____ 5. Have your instructor check your circuit.
- _____ 6. Take and record the voltage readings called for in the chart above. Your hand should only be touching one meter lead at a time. (A-241-142)
- _____ 7. Record the total current flow. (A-240)
- _____ 8. Remove one lead of R₂ from the circuit.
- _____ 9. Have your instructor check your readings.
- _____ 10. Disassemble your circuit and return all parts to their proper places.
- _____ 11. Calculate the resistances and voltages as called for on your chart.
- _____ 12. Answer the questions below.

Checking Understanding:

1. Suggest reasons why the nominal resistance and measured resistance were not the same.
2. Why wasn't there any voltage drop across R₁ when R₂ caused an open circuit?

53

APPLIED ELECTRICITY

Job Assignment 2
Covering Unit 7

Name _____
Due _____

CONSTRUCT A VOLTAGE TESTER

A very useful and quite inexpensive voltage tester can be made by connecting a 200,000 ohm resistor in series with a small neon lamp. The neon lamp can then be used to test for direct and alternating current volts from about 65 to 500.

Objective: To develop an understanding of current and voltage in a series circuit and ionization of a gas.

Directions: Read the entire assignment sheet. Consult the reference listed below and follow the steps of procedure. Perform the suggested activities.

Reference:

A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, p. 400.

Specifications: Use the components listed on the bill of material and assemble as indicated on the drawing.

Bill of Material:

<u>Quantity</u>	<u>Description</u>
2	Phono tips
8 inches	Wire, stranded rubber covered, Belden #8200 or equal
1	Resistor, fixed carbon 200K $\frac{1}{2}W \pm 20\%$
1	Lamp, Ne-2 Neon
$\frac{1}{4}$ inch	Insulating sleeving for #18 wire
2 inch	Tape, Plastic Elect.
1	Test Tube 12mm x 75mm
1 tsp.	Cold setting liquid plastic and hardener (may be obtained from the Castolite Co., Woodstock, Ill.)

Steps of Procedure:

- _____ 1. Secure tools and materials.
- _____ 2. Strip insulation from both ends of leads (wire).
- _____ 3. Cut component leads to length.
- _____ 4. Place piece of insulating sleeving over longer lead of lamp.
- _____ 5. Tin leads of conductors and quickly sweat solder the joints. Caution: Prolonged heat will expand and crack the resistor.
- _____ 6. Sweat solder the phono tips to each lead.
- _____ 7. Place a piece of plastic tape around the larger part of each phono tip to remove the shock hazard.
- _____ 8. Try tester in an outlet.
- _____ 9. Mix casting plastic and hardener in a paper cup (follow the directions on the can). (Some use the outside casing from Type S heavy duty cord or fiber tubing rather than the plastic.)
- _____ 10. Pour casting plastic in test tube with tester.
- _____ 11. Set aside for a day or two for hardening.
- _____ 12. Remove test tube. Caution: In cracking test tube do not apply pressure at the end where the Ne-2 lamp is, as it will crack.
- _____ 13. Perform the suggested activities.

Suggested Activities:

1. Identify the "hot" (ungrounded conductor) of a 115 volt outlet.
2. Test the continuity of a lamp filament.
3. Test for an A.C. and D.C. voltage.

Hot lead will light lamp
Neutral (grounded)
no light

Complete circuit Ne-2 lamp lights
Open circuit (broken filament) no light

A.C. both electrodes light
D.C. only one electrode lights

Test of Workmanship:

1. Does the tester work as shown under suggested activities?
2. Are the solder joints smooth?
3. Is the resistor cracked?
4. Are both leads the same length?

APPLIED ELECTRICITY

Job Assignment 3
Covering Units 8-12

Name _____
Due _____

WIRE A PARALLEL CIRCUIT

The parallel circuit is quite commonly used, in fact, this is the way our homes are wired. If we were able to see the household circuits from the point where the power enters the home we would find that the radio, lights, motors, and various other electrical appliances are all connected in parallel with each other. Some of the concepts of a parallel circuit may seem a bit difficult at first; however, after working with a parallel circuit and observing the basic principles, you will find them to be quite easy to understand.

Since parallel circuits are used so frequently, a clear understanding of their operation is essential to further work in electricity. In this assignment you will construct and take measurements in a parallel circuit.

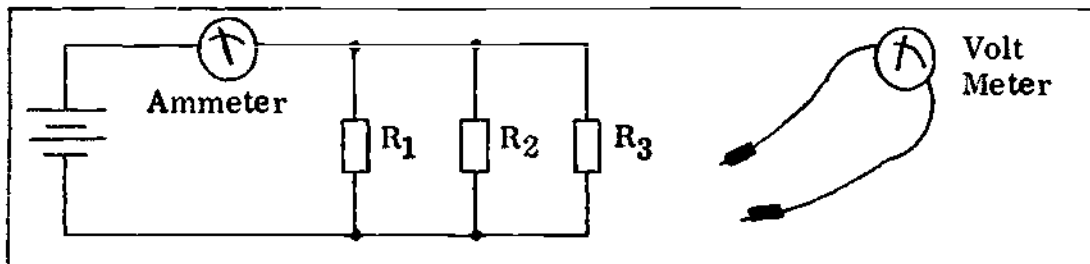

Objective: To develop an understanding of the operation and characteristics of a parallel circuit.

Directions: Read this entire assignment sheet. Read the reference(s) assigned and follow the steps of procedure.

References:

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 147-149.
- B. Marcus, Abraham, Basic Electricity, pp. 43-44.
- C. Steinberg, William B., and Ford, Walter B., Electricity and Electronics - Basic, pp. 96-99.

Specifications:

Note to the instructor: The size of the components are suggestive only and may be changed to suit local conditions. If desired, lamps could be substituted for the resistors. (If lamps are used the "cold" resistance will be different than that observed when the lamps are lit.)

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Ohmmeter
1	0-1.5 amp. Ammeter, D.C.
1	0-150 v. Voltmeter, D.C.
1	R ₁ Resistor 46" of #24 nichrome
1	R ₂ Resistor 20" of #24 nichrome
1	R ₃ Resistor 56" of #24 nichrome
2	Dry Cells

Steps of Procedure:

- _____ 1. Obtain components, meters, and other equipment needed as listed in the bill of material.
- _____ 2. Connect the circuit as specified in the diagram except do not complete the connections of R₂ and R₃.
- _____ 3. Have the circuit checked by your instructor.
- _____ 4. Record the current through R₁ and the voltage across it. (A-240-242)
- _____ 5. Disconnect R₁ and connect R₂.
- _____ 6. Record the current through R₂ and the voltage across it. (A-240-242)

- _____ 7. Disconnect R_2 and connect R_3 .
- _____ 8. Record the current through R_3 and the voltage across it. (A-240-242)
- _____ 9. Connect R_1 , R_2 , and R_3 in the circuit and record the total current and voltage.

Component	Nominal Ohmmeter Resistance	Measured Voltage Drop	Measured Current	Calculated Resistance
R_1				
R_2				
R_3				
R_T	Measured		$I_1+I_2+I_3$	

Circuit Checked _____
 Readings Checked _____

- _____ 10. Have your instructor check your readings.
- _____ 11. Disassemble your circuit and return parts to their proper places.
- _____ 12. Calculate the current and resistances as called for above.
- _____ 13. Answer the questions below.

Checking Understanding:

1. What would be the total resistance of a circuit with only R_1 and R_2 ? How does this compare with the resistance of the circuit with R_1 , R_2 , and R_3 ?
2. What would happen to the total resistance if another resistance were added in parallel?

APPLIED ELECTRICITY

Job Assignment 4
Covering Unit 13

Name _____
Due _____

CALCULATE ELECTRIC POWER

Any time current flows through a device, heat is generated. The energy thus transformed is called power and in electricity the unit of measurement is the watt. In this assignment you will make some computations with Watt's Law.

Objective: To develop an understanding of Watt's Law as applied to series and parallel circuits.

Directions: Read this entire assignment sheet. Read the reference(s) assigned and follow the steps of procedure.

References:

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 153-155.
- B. Marcus, Abraham, Basic Electricity, pp. 29-31.
- C. Steinberg, William B., and Ford, Walter B., Electricity and Electronics - Basic, pp. 89-91.

Specifications: Use the data obtained from Job Assignments 1 and 2.

Bill of Material: None.

Steps of Procedure:

1. Enter the data from Job Assignments 1 and 2 in the proper spaces in the chart below.

Component	Measured Voltage	Measured Current	Calculated Resistance	Calculated Power
R ₁ series				
R ₂ series				
R ₃ series				
R _{Tot.} series				
Power Total P ₁ + P ₂ + P ₃				
R ₁ parallel				
R ₂ parallel				
R ₃ parallel				
R _{Tot.} parallel				
Power Total P ₁ + P ₂ + P ₃				

2. Calculate the power consumed by each resistance and the total in each case. (A-154, B-30, C-90)
3. Determine the total power in series, and in parallel by adding the individual power consumptions.
4. Answer the questions below.

Checking Understanding:

1. What two things must be known about a resistor before it can be used in a circuit?
2. With a given voltage two resistors of equal value are connected in series. Would the power consumption be more, less, or the same than if either resistor were used alone. Support your answer with a sample computation.
3. Referring to the problem presented in question 2, what would be the situation if the two were connected in parallel? Support your answer with sample computations.

APPLIED ELECTRICITY

Job Assignment 5
Covering Units 19-25

Name _____

OPERATE OVERCURRENT PROTECTIVE DEVICES

To help reduce the danger of fire or damage to electrical equipment, various methods are used to limit the amount of current that can flow in a circuit. One method is to use a piece of metal with a low melting temperature in the form of a fuse. Often a form of circuit breaker is used; one type of which is operated on a thermal principle, the other on an electromagnetic principle. In this assignment you will experiment with the principles involved in these two types of circuit breakers.

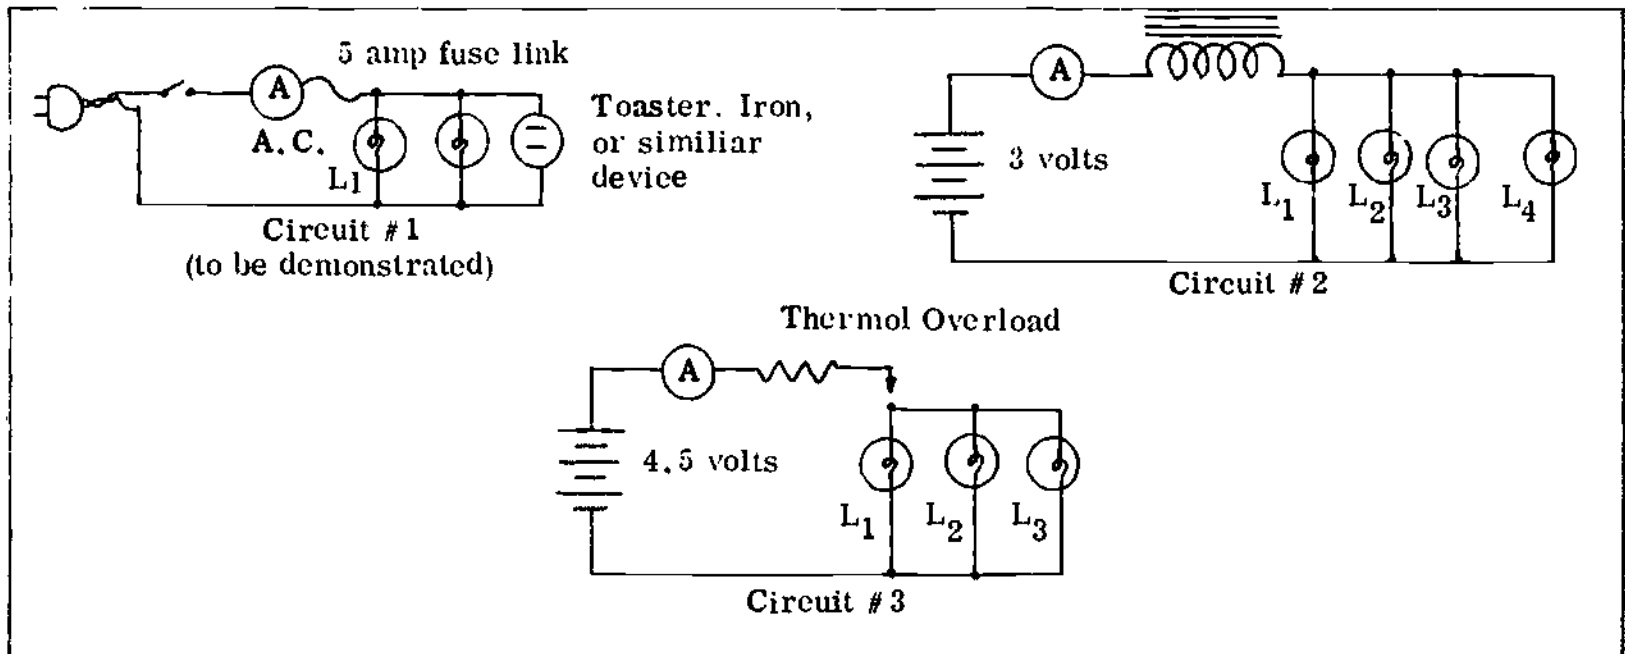

Objective: To develop an understanding of the operation of fuses and circuit breakers.

Directions: Read this entire assignment sheet. Read the reference(s) assigned and complete the assignment by following the steps of procedure.

References:

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 179-180.
- C. Steinberg and Ford, Electricity and Electronics - Basic, pp. 130-132.
- P. Manual with SE-2 kit.

Specifications:

Bill of Material:

Quantity	Description
3	Dry Cells
1	Ammeter, 0-.5 amp. D.C.
5	Lamps, # 222 or similar pilot lamps
1	Thermostat, Bimetalic strip with several turns of nichrome wire wrapped around it (Brodhead-Garrett SE-2 Kit)
1	Coil with removable core--This may be the coil in the SE-2 Kit or one that is made by wrapping 56 feet of # 24 formvar on a 1/4" I.D. x 1 1/4" coil form. Use a 1/4" x 1 1/4" soft iron rod for the core. The coil may be used as part of a project such as the model railroad signal given in supplementary reference (J) or (V). In this case it should be designed around specifications contained therein.
	Lamp receptacles and assorted leads

For Demonstration Only:

1	Fuse link, 5 ampere
1	Toaster, iron or other device that draws more than 4 amperes
2	Lamps, 150 watt

Steps of Procedure:

- _____ 1. Your instructor will demonstrate circuit #1 to the class. Record the current flowing through lamp 1 in the proper blank. Do the same with lamps 1 and 2 in parallel. Record the current flowing with all three devices connected.

	L 1	L 2 (calculate)	L 1 & 2	Total	High Wattage Load (calculate)
Current					

- _____ 2. Obtain materials listed in the bill of material
 _____ 3. Wind coil (if it is to be wound by the student). (A-p. 179)
 _____ 4. Connect components as in circuit #2.
 _____ 5. Have your instructor check your circuit.
 _____ 6. Place the core in the coil with half of it sticking out.
 _____ 7. Screw in the lamps, one at a time.
 _____ 8. Record the current as each lamp is screwed in.
 _____ 9. Record the current flow at which the core is pulled into the coil.

	1. 1	L 1 & 2	L 1, 2, & 3	L 1, 2, 3, & 4	Core Pulled In
Current					

Circuit Checked _____

- _____ 10. Disconnect circuit 2 and connect circuit 3.
 _____ 11. Have your instructor check your circuit.
 _____ 12. Screw in the lamps, one at a time.
 _____ 13. Record the current as each lamp is screwed in. Allow time between screwing in lamps for the thermostat to heat up.
 _____ 14. Record the current at which the bimetallic contacts open.

	L 1	L 1 & 2	L 1, 2 & 3	Contacts Open
Current				

Circuit Checked _____

- _____ 15. Replace all components in proper storage place.
 _____ 16. Answer the questions below.

Checking Understanding:

1. List the steps of procedure in replacing a fuse link in a renewable cartridge fuse. Start with unscrewing the two ends. Why shouldn't one put more than one fuse link in a fuse holder?
2. How could the solenoid used in the experiment be adapted for use as a circuit breaker?
3. What change would have to be made in the thermostat used to adapt it as a circuit breaker?
4. Which of the two types of breakers would you expect to be the faster acting?

WIRE VARIABLE RESISTORS

There are many applications of the principles of variable resistance in the devices we use every day. Whenever you change the intensity of the dash lights on your car or change the volume level on your radio or TV, you use a variable resistor.

Important electrical principles are involved in the use of variable resistors so one should be familiar with them. In this assignment you will connect a rheostat as well as a potentiometer and experiment with the effects they can have in a circuit.

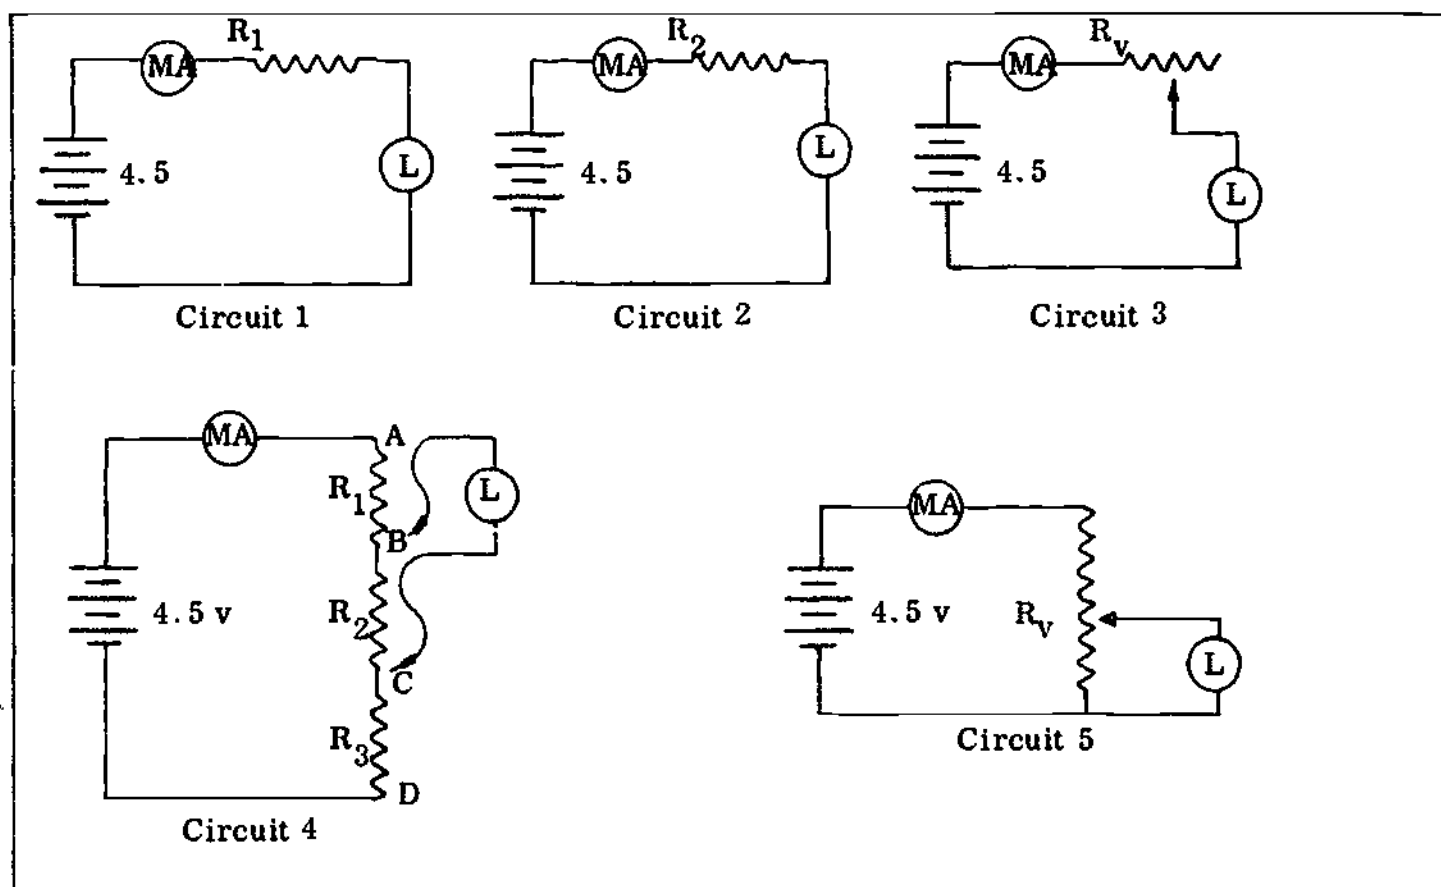

Objective: To develop an understanding of current limiting and voltage dividing with resistance.

Directions: Read this entire assignment sheet and the reference(s) assigned below and follow the steps of procedure.

References:

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 133-134, 250.
- V. Turner, Rufus P., Basic Electricity, pp. 44-45, 58-60.

Specifications:

Bill of Material:

Quantity	Description
1	Power source
1	R ₁ resistor 56" of #24 nichrome
1	R ₂ resistor 40" of #24 nichrome

- 1 R₃ resistor 20" of # 24 nichrome
- 1 Lamp, 222 or similar pilot lamp
- 1 Ammeter 0-1 amp.
- 1 Voltmeter 0-15 volts
- 1 R_v Potentiometer 500 ohms 2 watt
- 3 Dry Cells

Steps of Procedure:

- _____ 1. Obtain the components needed.
- _____ 2. Connect circuit number 1.
- _____ 3. Record the current flow and the potential across R₁ and the lamp in the chart below.
- _____ 4. Remove R₁ and replace it with R₂ as in circuit # 2.
- _____ 5. Record the current flow and the potential across R₂ and the lamp in the chart below.
- _____ 6. Remove R₂ and replace it with R_v using one outside terminal and the center terminal.
- _____ 7. Adjust the rheostat so that the current readings in the chart are obtained. Record the voltage across the lamp for each setting.

	Circuit #1	Circuit #2	Circuit #3		
Current			200 ma.	150 ma.	100 ma.
Voltage across R ₁					
Voltage across R ₂					
Voltage across lamp					
Total voltage					
Total circuit resistance I X E					

- _____ 8. Disassemble circuit and connect circuit # 4.
- _____ 9. Record the voltage and current as called for in the chart below.
- _____ 10. Connect the lamp across R₃ (Points A and B) and record the voltage across it in the chart below.
- _____ 11. Remove R₃, R₄, and R₅ and replace them with R_v connecting one outside terminal to the milliammeter and the other to the power source. Connect the lamp to the center terminal and one of the outside terminals as in Circuit # 5.
Caution: Have the potentiometer $\frac{1}{2}$ way between the two extremes. Do not exceed the voltage rating of the lamp.
- _____ 12. Adjust the potentiometer to obtain the voltage readings called for in the chart below and indicate the current in each case.

	Current	Voltage R ₃	Voltage R ₄	Voltage R ₅	Lamp
Circuit # 4					
Circuit # 5					
Lamp voltage		.5	1.0	1.5	
Current

INVESTIGATE PERMANENT MAGNETS

Permanent magnets are important in everyday life. We find many uses for them. The speakers in your radio and/or television receivers have them. Many types of meters use them. The principles involved are fundamental to the use and understanding of electricity.

Objective: To develop an understanding of the principles of magnetic fields.

Directions: Read this entire assignment sheet. Read the reference assigned and complete the activity by following the steps of procedure.

Reference:

V. Tustison, F. E., and Ruehl, P. W., Electrical Essentials, Instruction Sheet # 8.

Specifications: None.

Bill of Material:

<u>Quantity</u>	<u>Description</u>
2	Bar Magnets
1	Horseshoe Magnet
1 piece	Steel for making a permanent magnet
1 assortment	Assorted pieces of aluminum, copper, brass, iron, plastic
1 container	Iron Filings
1 box	Steel Tacks, carpet
1 sheet	Plastic or paper (to keep filings off magnets)
1	Compass
1	Source of heat

Steps of Procedure:

- _____ 1. Obtain the components needed.
- _____ 2. Magnetize the steel rod or needle by stroking it with one of the permanent magnets.
- _____ 3. Pick up some tacks with the magnetized rod. Note the number of tacks.
- _____ 4. Remove the tacks from the rod and suspend the rod on a piece of thread. Note the position it assumes.
- _____ 5. Take the compass and compare its direction with that of the steel rod.
- _____ 6. Bring a permanent magnet close to the suspended rod. What happens?
- _____ 7. Heat the steel rod until it is red hot.
- _____ 8. Try to pick up tacks with it now. What position does it take when suspended in air?
- _____ 9. Place the two bar magnets with two poles that attract each other far enough apart so they will not pull together.
- _____ 10. Place a piece of paper or plastic over the magnets and sprinkle the iron filings on the paper or plastic. Note the pattern.
- _____ 11. Pull the paper or plastic off the magnets so the filings cannot come in contact with the magnets.
- _____ 12. Turn one of the magnets 180 degrees and replace the paper or plastic over the magnets.
- _____ 13. Tap the paper gently and note the pattern of the filings.
- _____ 14. Remove the paper or plastic with the filings and place over the horseshoe magnet. Note the pattern when the paper or plastic is tapped gently.
- _____ 15. Using one of the permanent magnets, determine which of the pieces of metal are attracted to the magnet.
- _____ 16. Return all of the items to their proper storage place.
- _____ 17. Answer the questions below.

Checking Understanding:

1. How many tacks could you pick up with a magnetized rod? How many after it was heated?

2. What position did the rod assume when it was suspended? How did it compare with the compass? Why wasn't the rod horizontal?
3. What happened when a magnet was brought close to the suspended rod?
4. How do the magnetic fields of a bar magnet compare with those of a horseshoe magnet? Which is stronger?
5. Which pieces of metal were attracted to the magnet?
6. How should one store a horseshoe magnet? Bar magnet?

MAKE AN ELECTROMAGNET

The principles of electromagnetism have many applications in the field of electricity. They are used in generating electricity and in operating many electrical devices. In this assignment you will experiment with several electromagnetic effects.

Objective: To establish an understanding of some of the magnetic effects of an electric current flowing through a conductor.

Directions: Read this entire assignment sheet. Read the references assigned and complete the activity by following the steps of procedure.

References:

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 170-181.
- C. Steinberg and Ford, Electricity and Electronics - Basic, pp. 25-31.

Specifications:

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Compass, Magnetic
3	Dry cells
2	Coils and cores same as used in Job Assignment 4
	Ammeter 0-1.5 amps.
1	Assorted carpet tacks

Steps of Procedure:

- _____ 1. Obtain the materials listed in the bill of material.
- _____ 2. Place the compass under a piece of wire and use the conductor to "short" one cell momentarily. Note what happens to the compass needle.
- _____ 3. Connect the circuit as shown in the specifications.
- _____ 4. Without the core try picking up some tacks.
- _____ 5. Bring the compass near the conductor and note the effect.
- _____ 6. Place the core in the coil and note how many tacks can be picked up. Open the circuit and note the effect.
- _____ 7. Connect a second cell in series with the first. Note the current. How many tacks can be picked up now?
- _____ 8. Connect a second coil in series with the first coil and place them so the two ends are together with the cores inside. How many tacks can be picked up now? What happened to the current?
- _____ 9. Turn one coil 180 degrees. How many tacks can be picked up now?
- _____ 10. Connect another cell in series with the two in use. How many tacks can be picked up now? What happened to the current?
- _____ 11. Replace the components to their storage place.
- _____ 12. Answer the questions below.

Checking Understanding:

1. Make a generalized statement concerning the number of turns with a given current flow and the strength of the magnetic field.
2. Make a generalized statement concerning the current with a given number of turns of wire and the strength of the magnetic field.
3. What effect did the core have on the strength of the magnetic field.
4. What is meant by ampere-turns?
5. What is meant by coils connected in series aiding? Series opposing?
6. What factors other than the ampere-turns and amount of core will influence the strength of the electromagnetic field?

WIRE A RELAY

One of the important applications of electromagnetic principles is in relay systems. Such systems are the means by which one can control one voltage or current by a separate or different voltage and/or current.

Objective: To understand the principles of operation of a relay.

Directions: Read this entire assignment sheet. Read the reference assigned and complete the activity by following the steps of procedure.

Reference:

U. Turner, Rufus, Basic Electricity, First Edition, pp. 80-83.

Specifications:

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Relay (similar to the one in Broadhead-Garrett SE-4 Kit or Science Electronics IA300)
4	Dry Cells
1	Switch
1	Lamp and base
	Assorted leads

Steps of Procedure:

- _____ 1. Obtain components listed in bill of material.
- _____ 2. Connect the circuit as shown in the diagram.
- _____ 3. Operate the relay by closing the switch.
- _____ 4. Replace the components to their proper storage places.
- _____ 5. Answer the questions below.

Checking Understanding:

1. Is the relay connected so that it is normally open or normally closed?
2. How could this relay be connected so it would operate in the opposite manner?
3. What limitations would be placed on the current and voltage that the contacts of the relay can safely control?

CONNECT AND CHECK BATTERIES

The electric cell is an important source of electricity in many situations. Portable radios, space exploration, and the automobile all depend on this source for some of their power.

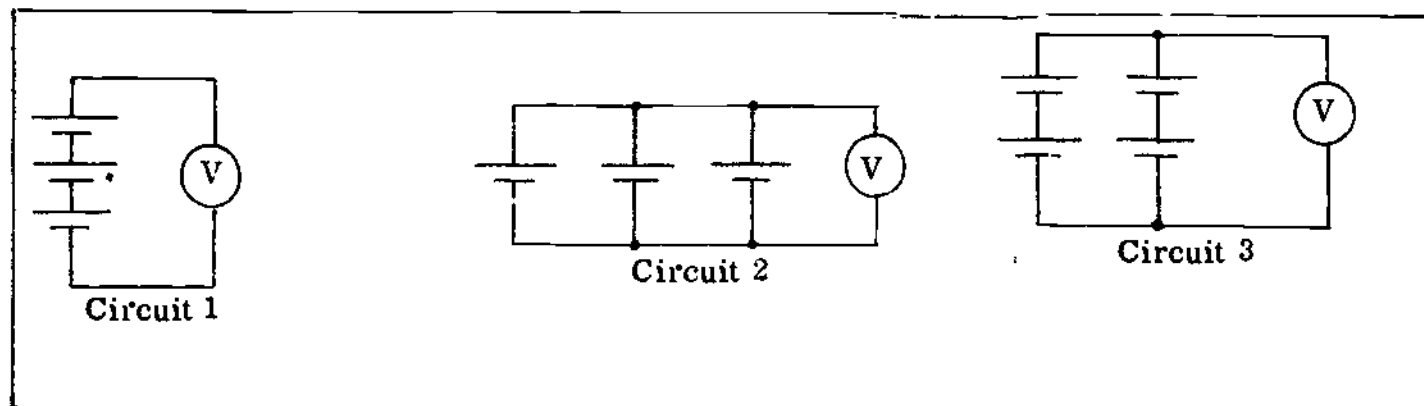

Objective: To test cells to determine if they should be recharged or replaced, and to connect cells in parallel, series and combination.

Directions: Read this entire assignment sheet. Read the reference assigned and complete the assignment by following the steps of procedure.

Reference:

A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 203-218.

Specifications:

Bill of Material:

Quantity	Description
4	Dry cells
1	Dry cell, #6 (if not used above)
1	Voltmeter 0-8 volts D.C.
1	Hydrometer
1	Cell tester
1	Voltmeter for load testing cells
1	Lead acid battery
1	Battery tester (similar to Simpson Model 379)
	Assorted leads

Steps of Procedure: (The steps may be done in any order as equipment is available.)

- _____ 1. Obtain needed components.
- _____ 2. Using the hydrometer determine the specific gravity of the cells of the lead-acid battery. (A-214)

	Cell 1	Cell 2	Cell 3
Specific gravity			
Voltage			
Condition of cell			

- _____ 3. Using the load testing voltmeter, record the voltage of each cell. Caution: Do not touch the shorting bar of the meter. Do not short the cell any longer than needed to take your reading.
- _____ 4. Test the #6 dry cell with the cell tester. It reads _____ amperes. If a #6 reads less than 17 amperes on a short circuit it is to be replaced. A new cell can deliver between 30 and 35 amperes. (A-216)
- _____ 5. Connect circuit 1 and record the voltage below.
- _____ 6. Reconnect the cells as in circuit 2 and record the voltage below.
- _____ 7. Reconnect the cells as in circuit 3 and record the voltage below.

	Circuit 1	Circuit 2	Circuit 3
Voltage			

- _____ 8. If time permits make a coin cell by using a penny and a nickel or dime separated by a piece of blotting paper. Wet the piece of blotting paper with a salt water solution. What is the voltage? Connect several cells in series and measure the voltage. (A-217)
- _____ 9. Return components to their proper storage place.
- _____ 10. Answer the questions below.

Checking Understanding:

1. Indicate in the appropriate blank what you think the condition of each cell is in step 2.
2. Must the temperature of the electrolyte be considered when taking the specific gravity of a cell? Why?
3. Suggest a reason why a #6 cell is replaced when the short circuit current drops to approximately 17 amperes.
4. What is "galvanic action"? Where might one find this a problem? How can it be reduced?
5. What kind of current is needed for charging a battery?
6. Which leads from a battery charger are connected to which terminals on the battery?
7. What precaution must be observed when disconnecting a battery charger from a battery?
8. List some rules to follow in order to receive maximum life from a storage battery.
9. What could happen if a battery were charged at too rapid a rate?

MEASURE SOLAR CELL OUTPUT

One source of electrical energy is light. This source has increasing applications in space exploration, as well as in more common place applications such as a photographer's light meter. In this assignment you will have an opportunity to measure the current and voltage from a "sun battery".

Objective: To obtain a knowledge of the influence of varying light intensities on a solar cell.

Directions: Read this entire assignment sheet. Read the reference assigned and solve the problem by following the steps of procedure.

Reference:

- A. Buban. Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 228-230.

Specifications:

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Solar Cell (B2M or similar style)
1	Volt-Ohm Milliammeter

Steps of Procedure:

1. Obtain the components listed in the bill of material.
2. Connect the solar cell across the VOM with the meter on the 1 milliamp scale. **Caution:** This scale is very sensitive so do not connect the leads to anything other than the solar cell. Note the change in current as the cell is moved around and varying light intensities strike it. Record the amperage when the cell is on the bench. _____ ma.
3. Change the VOM to the voltage scale (2.5 v. or less) and note the change in voltage as the cell is moved around. Record the voltage when the cell is in the same position as in step 1. _____ volts.
4. Replace the components to their proper storage place.
5. Answer the questions below.

Checking Understanding:

1. What power would the cell deliver with the above readings? Assume no load other than the meter.
2. How could one obtain more power from solar cells?
3. If the current from this cell were to be used to operate some other device, how could it be done?

MAKE A THERMOCOUPLE

The thermocouple is a source of energy very often used to measure temperature. You will have an opportunity to use several of similar metals and see the effects of heat on the coupling.

Objective: To obtain an understanding of the principle of a thermocouple.

Directions: Read this entire assignment sheet. Read the references assigned and complete the assignment by following the steps of procedure.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, p. 235.
C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 53-54.

Specifications:

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Volt-Ohm Milliammeter
1	Assorted pieces of wire: nichrome, copper, iron, brass, aluminum
1	Bunsen burner or candle

Steps of Procedure:

1. Obtain needed components.
2. Twist about 1½ inch of two wires together. (A-235)
3. Using the 80 microampere or lower scale measure the current flow as the coupling is heated.
4. Try the same procedure with each of the possible wire combinations. Record the maximum current for each coupling.
5. Return the items to their proper storage place.
6. Answer the questions below.

Checking Understanding:

1. Which combination gave the highest current?
2. What is the relationship between the current and the temperature of the thermocouple?

APPLIED ELECTRICITY

GAGE WIRE

If one is going to work with electricity, one should have a familiarity with wire sizes and methods of determining wire size.

Objective: To develop an ability to determine wire size.

Directions: Read this entire assignment sheet. Read the reference assigned and complete the assignment by following the steps of procedure.

Reference:

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 43-48.

Specifications: None.

Bill of Material:

<u>Quantity</u>	<u>Description</u>
4 pieces	Assorted conductor sizes and insulations

Steps of Procedure:

- _____ 1. Obtain several pieces of wire from your instructor.
- _____ 2. Determine the insulation on each sample.
- _____ 3. Gage each piece with a micrometer caliper. On those conductors with insulation do not remove the insulation at this time.
- _____ 4. Gage the size of each conductor with a wire gage. Remove any insulation. (A-44)

	Sample 1	Sample 2	Sample 3	Sample 4
Type of insulation				
Diameter with insulation				
Gage number				

- _____ 5. Replace the micrometer and gage to their proper storage place.
- _____ 6. Answer the questions below.

Checking Understanding:

1. Why must one remove the insulation before gaging the conductor?
2. In some wire tables the diameters will be listed as nominal diameter in inches. What is meant by the term nominal as used here? Why might the diameter of two conductors of the same gage vary slightly?
3. Look at a wire table. Number 24 wire has a circular mil area of 404 CM. What size wire could you use if you wanted to double the circular mil area? Try this with several other sizes and note it always comes out approximately the same.
4. In the original wiring of a motor #22 wire was used. If a person wanted to rewire this motor but didn't have any #22, but did have some #23, 24, 25, 26 and 28, can he rewire this motor from his stock? How?

APPLIED ELECTRICITY

Job Assignment 14
Covering Units 69-70

Name _____
Due _____

MAKE AN ELECTRICAL SPLICE

Many times in electrical work it is necessary to join wires together. Any electrical joint has to meet two requirements. It must first of all be mechanically secure and secondly it must be electrically secure. In the case of splices, the wires are twisted together to make the joint mechanically secure. To meet the second requirement, the wires are often soldered or spliced through the use of approved solderless connectors. On some new equipment special wrapping machines are being used that wrap the conductors around the terminals in a manner that makes soldering unnecessary. In cases where the wire is fastened to terminals, it is twisted around the terminal to meet the first requirement.

When wiring electronic circuits it is necessary that all joining of conductors be done on objects that are securely fastened to the chassis. This is often done by using tie points.

Objective: To familiarize the student with the proper method of making a splice and fastening a conductor to a tie point.

Directions: Read this entire assignment sheet. Read the reference assigned and complete the assignment by following the steps of procedure.

Reference:

C. Steinberg, William B., and Ford, Walter B., Electricity and Electronics - Basic, pp. 83-85.

Specifications: None.

Bill of Material:

<u>Quantity</u>	<u>Description</u>
2 pieces	# 14 TW Wire 6" long
	Rubber Electrical Tape
	Friction Tape
1 piece	# 20 solid hook-up wire 4" long
1	Tie point
	Solder, rosin core
1	Soldering Copper - electric
1	Side cutting pliers
1	Needle nose pliers

Steps of Procedure:

1. Obtain the needed equipment and supplies.
2. Strip $1\frac{1}{2}$ inches of insulation from one end of each piece of #14 wire. (C-83)
3. Twist the two stripped conductors together tightly. (C-83)
4. Cut off the ends of the two conductors (about $\frac{1}{4}$ inch). (C-83)
5. Solder the joint making sure the joint is heated hot enough to permit the solder to flow completely through the joint. (C-83)
6. Tape the joint with the rubber splicing compound (tape). Be sure to stretch the tape as it is applied.
7. Wrap the joint with friction tape.
8. Strip about $\frac{1}{4}$ " from one end of the hook-up wire.
9. Wrap the stripped conductor around the tie point through the hole. Use a complete wrap to provide mechanical strength.
10. Solder the joint making sure there is sufficient heat to permit the solder to flow through the complete joint.
11. Return components to their proper place and turn in your two joints. Make sure your name is attached to them.

DETERMINE VOLTAGE DROP AND POWER LOSS

Any time current flows through resistance there will be a voltage drop. This is a simple application of Ohm's law. Every conductor has some resistance and the smaller its diameter the greater is its resistance. If the current is great enough and the conductor long enough, the voltage drop could be sufficient to affect the operation of an electrical device.

Another reason to be concerned about conductor size and length, is that there is also power being consumed as the current flows through the conductor. The power thus consumed is wasted, but it must be paid for, nevertheless.

Objective: To become familiar with the problem of voltage drop and power loss when using extension cords.

Directions: Read this entire assignment sheet. Read the reference assigned and solve the problems by following the steps of procedure.

Reference:

M. Jones, E. W., Fundamentals of Applied Electricity, pp. 28-29, 95.

Specifications:

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	AC Ammeter 0-25 amperes
1	AC Voltmeter (use VOM) 0-150 volts
1	Extension cord 18-2 SP-1 100 ft. long
1	Extension cord 14/2 S 100 ft. long
1	Electric iron or other device that consumes about 1000 watts.

Steps of Procedure:

1. Obtain needed components.
2. Connect the circuit according to the specifications using the #18 wire. Do not plug the device in at this time.
3. Record the voltage at the source and at the end of the extension cord in the proper blank below.
4. Plug in the load and again record both voltages and the current. Note: SP-1 cord should not carry more than seven amperes, but disregard this limitation for this exercise.
5. Replace the extension cord with the #14 cord.
6. Repeat the same procedures as for the #18 wire.
7. Return the materials to their storage places.
8. Complete the chart below.
9. Answer the questions.

	18/2 no load	18/2 with load	14/2 no load	14/2 with load
voltage at source				
voltage at load				
voltage drop in line				
amperage (load)	X		X	
wattage at source (IXE)	X		X	
wattage of device (IXE)	X		X	
power loss	X		X	

Checking Understanding:

1. How many feet of conductor were in each of the extension cords?
2. What would happen to the voltage drop if the length of the cords were doubled? The power loss?
3. A three per cent voltage drop is usually considered maximum. Which of these two cords would satisfy this requirement?

WIRE A FLUORESCENT LAMP

A popular form of lighting in the modern home is fluorescent lighting. This form of lighting gives a good quality of light, and it also gives more light per watt than a normal incandescent lamp.

Objective: To wire and examine the operation of a fluorescent lamp.

Directions: Read this entire assignment sheet. Read the reference assigned and work out the problem by following the steps of procedure.

Reference:

Z. Wellman, William R., Elementary Electricity, pp. 273-281.

Specifications:

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	SPST switch
1	Fluorescent lamp 15 watt
1 pair	Lamp holders (one with starter and holder). (Note to instructor: Remove the metal cover from the starters.)
1	Voltmeter 0-150 Volts A.C. (use VOM)
1	Ballast
1 set	Leads

Steps of Procedure:

- _____ 1. Obtain needed materials.
- _____ 2. Wire the circuit as given in the specifications. Connect a voltmeter across points A and B on the 0-150 volt scale.
- _____ 3. Have your instructor check the circuit before plugging in.
- _____ 4. Operate the lamp several times. Note the voltage as the lamp goes through the starting cycle. Also observe the starter.
- _____ 5. Return the components to their proper storage place.
- _____ 6. Answer the questions below.

Checking Understanding:

1. What two purposes does the ballast serve?
2. The line voltage was about 120 volts, but the voltage across the lamp was less. What happened to the remainder of the voltage?

REPAIR A LAMP

A common repair job around the home is replacing a lamp cord. At the first sign of a lamp cord fraying or the rubber insulation cracking it should be replaced. Fires have started from shorted lamp cords.

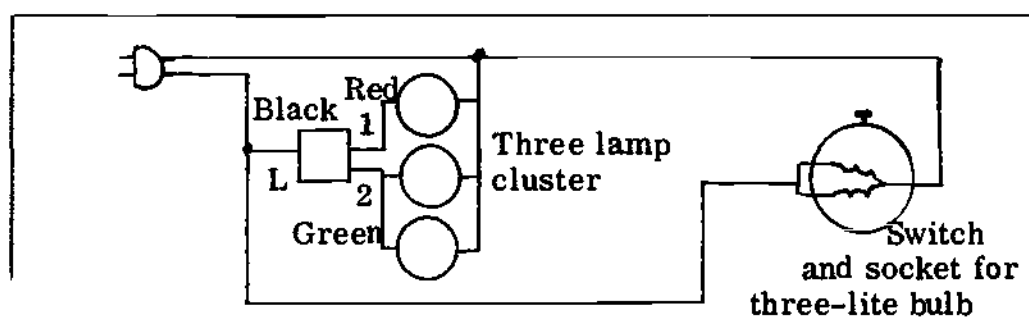

Objective: To understand how to wire and repair a lamp.

Directions: Read this entire assignment sheet. Read the reference assigned and complete the assignment by following the steps of procedure.

References:

- U. Turner, Rufus P., Basic Electricity, pp. 238-239.
V. Tustison, F. E. and Ruehl, Phillip W., Electrical Essentials, Instruction Sheet 23.

Specifications:

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Plug lead
1 piece	SP-1 cord
1	Cap (plug)
1	Key socket with nonconducting bushing
1	Switch for three lamp cluster
3	Lamps, 25-50 watt
1	Three-lite lamp base with switch (mogul or medium base)
1	Three-lite lamp, wattages to fit the above base.

Steps of Procedure:

1. Obtain needed components.
2. Wire as given in the specifications. (V Instruction Sheet 23)
3. Operate the lamps. The three lamp cluster should go on in the following order: one lamp, two lamps (not the one that went on alone), and then all three. If they do not operate in this order, rewire the switch.
4. Have your instructor observe the operation of the lamps.
5. Take the lamp assembly apart.
6. Wire the plug and socket as an extension cord. Use an underwriter's knot in the socket. (V - 238)
7. Attach your name to the cord and turn in. (Note to Instructor: Examine the cord assembly by taking apart and returning components to storage.)
8. Return equipment to proper storage.
9. Answer the questions below.

Checking Understanding:

1. What is the purpose of the underwriter's knot?
2. What is the reason for using the non-conducting bushing where the cord enters the socket?
3. Why should a conductor always be put under a screw in a clock-wise direction?

WIRE A PHOTO-ELECTRIC CELL

There are many applications of photo-electric devices which have become commonplace in the lives of all of us. In many places lights are turned on, doors are opened, objects are counted, sorted, and otherwise identified through photo-electric devices.

Objective: To gain an understanding of how a photo-electric tube operates and to use a light meter to determine the light intensity on a work station.

Directions: Read this entire assignment sheet. Read the reference assigned and solve the problem by following the steps of procedure.

Reference:

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, p. 233.

Specifications:

Bill of Material:

Quantity	Description
1	Phototube, Type 930, 918 or similar tube and socket
1	Resistor 1 megohm $\frac{1}{2}$ watt
1	Volt-Ohm Milliammeter
1	Power Supply, 90 v. D.C.
1	Light Meter
1	Flashlight

Steps of Procedure:

- _____ 1. Obtain needed components.
- _____ 2. Using a light meter record the light intensity at your work station as called for in the chart below. (A-233-234)

	On bench	1 ft. above bench	2 ft. above bench
Light intensity (ft. candles)			

- _____ 3. Connect the circuit as shown in the specifications.
- _____ 4. Note and record the current flow in the circuit with room light. _____ ma.
- _____ 5. Turn the flash light on and aim the light beam on the cathode (curved electrode) and record the current flow. _____ ma. Measure the voltage drop across the resistor. _____ volts. (A-233)
- _____ 6. Turn off the flash light and using a box or your hands cover the photo tube. Note the current flow. _____ ma. What is the voltage across the resistor? _____ volts (A-233).
- _____ 7. Return the equipment to their proper storage places.
- _____ 8. Answer the questions below.

Checking Understanding:

1. What statement can be made concerning the light intensity as you get further from the source?
2. What happened to the current when the photo tube was in semidarkness?
3. What additional equipment would be needed to have the photo tube operate a light?

APPLIED ELECTRICITY

REPLACE AN OUTLET

Replacing an outlet is relatively simple, but there are a few precautions that must be observed. In this assignment you will replace a duplex convenience outlet.

Objective: To understand how to wire a duplex convenience outlet.

Directions: Read this entire assignment sheet. Read the reference assigned and work out the problem by following the steps of procedure.

Reference:

- S. Richter, H. P., Wiring Simplified, pp. 63-67.
I. Information Sheet No. 1 (page 57)

Specifications: None

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Duplex convenience receptacle, grounding type
1	Screwdriver
1	Voltmeter or test light
1	Needle nose pliers

Steps of Procedure:

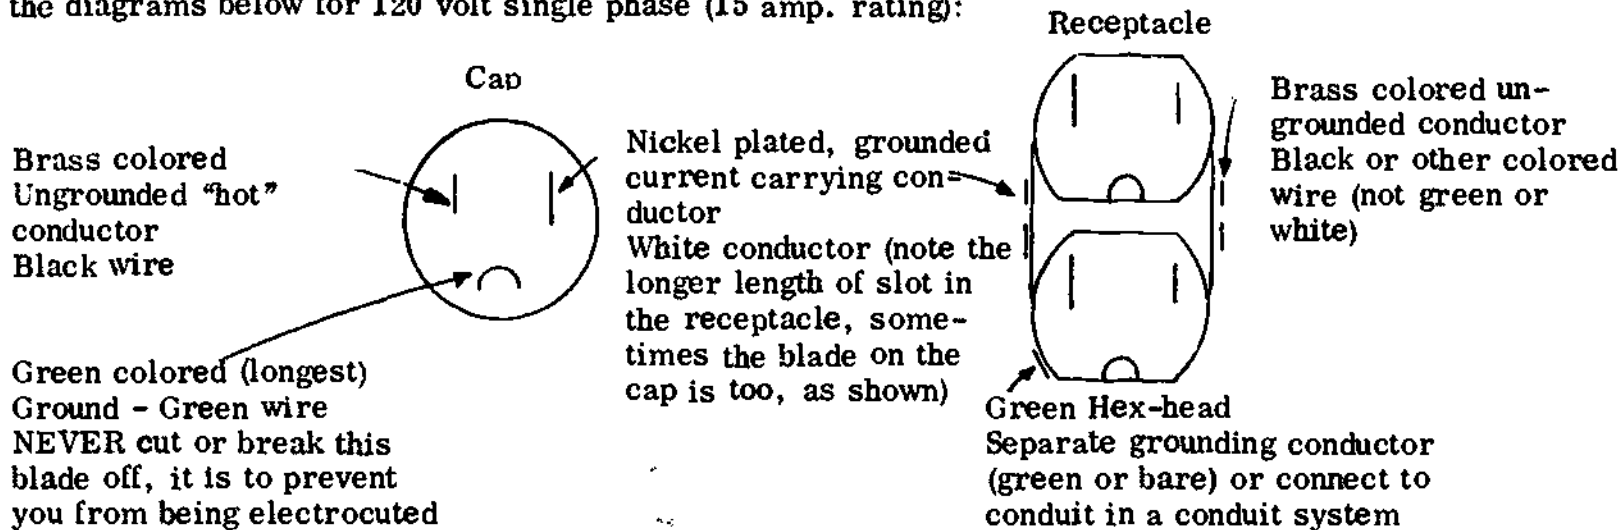

- _____ 1. Obtain needed materials.
- _____ 2. Turn off the power to the outlet to be replaced.
- _____ 3. Check the outlet with a voltmeter or test light to make sure the power is off.
- _____ 4. Remove the cover from the outlet. Do not lose the machine screw.
- _____ 5. Remove the receptacle from the box.
- _____ 6. Note the wiring. A white conductor is wired to the nickel plated screw, a green or bare conductor is connected to the hex head green grounding screw and another colored wire is connected to the remaining or "hot" terminal. Note also the size of the slots connected to the nickel plated screw and those of the "hot" lead.
- _____ 7. Remove the receptacle from the wiring by unscrewing the terminals.
- _____ 8. Wire the new receptacle. (Richter -65)
- _____ 9. Push the receptacle back into the box being careful with the placement of the wires.
- _____ 10. Replace the cover plate.
- _____ 11. Return the old outlet and tools to their proper places.

APPLIED ELECTRICITY

Information Sheet No. 1

PROPER WIRING FOR CAPS AND RECEPTACLES

The National Electrical Code specifies that non-current-carrying parts of portable equipment **MUST** be grounded (NEC 250-59). This regulation is normally implemented by using a three conductor cord containing white, black, and green conductors. The green conductor must be connected to the frame of the piece of equipment. The black conductor should be connected to the switch, and the white conductor to the other current carrying conductor of the device. The cap (plug) and receptacle should be wired as in the diagrams below for 120 volt single phase (15 amp. rating):

The common 240 volt single phase caps should be wired as shown below: (NEVER use any of these for three phase)

Three phase devices should use either of the caps below, when not permanently wired:

Ungrounded current carrying conductors, order unimportant

Grounded conductor (longest blade and key on twist-lock type) - Green wire

GREEN must never be used for anything except **GROUNDING** with any system. White is normally the grounded current carrying conductor.

WIRE A SWITCH

One of the more confusing things in residential wiring is working with three- and four-way switches. The purpose of these switches is to wire a lamp so that it may be controlled from two or more places.

Objective: To understand how a lamp or other device can be controlled from more than one point.

Directions: Read this entire assignment sheet. Read the references assigned and solve the problem by following the steps of procedure.

References:

- A. Buban, Peter, and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 273-274.
- O. Lush, Clifford R., and Engle, Glen E., Industrial Arts Electricity, p. 97.

Specifications:

Bill of Material:

Quantity	Description
2	3 way switches
1	4 way switch
1	Lamp and receptacle
	Plug leads
	Assorted leads

Steps of Procedure:

- _____ 1. Obtain needed components.
- _____ 2. Wire the two three-way switches to control the lamp. The switch terminal that is a different color from the other two is the common terminal and is connected either to the source (ungrounded conductor) or the lamp, depending upon which switch it is; (A-273-274)
- _____ 3. Plug in and try operating the lamp. You should be able to turn the lamp off or on from either switch.
- _____ 4. When you have it operating properly, demonstrate it to your instructor.
- _____ 5. Place a four-way switch between the two three-way switches. One can determine the switch terminal arrangement by using an ohmmeter. The two terminals that do not have continuity between them with the switch in either position should be connected to the two "dummy" leads from one three-way. The other two terminals are then connected to the leads from the other three-way. (A-273-274)
- _____ 6. Operate the lamp. You should have complete control of the lamp from any of the three switches. If not, you wired it incorrectly. Correct it.
- _____ 7. Demonstrate the proper operation to your instructor.
- _____ 8. Disconnect and return all equipment to the proper storage place.

APPLIED ELECTRICITY

Job Assignment 21
Covering Units 90-91

Due _____

INSTALL A SWITCH BOX

Often one wishes to have an additional outlet around the home. This can often be done quite easily by extending a cable from an existing outlet, installing a switch box and wiring the new outlet in this box. One should be sure the local building codes permit this practice. In some communities you must have a permit before doing such wiring; other places may require that it be done by a licensed electrician.

Objective: To gain an understanding of some of the considerations in wiring an outlet.

Directions: Read this entire assignment sheet. Read the reference assigned and complete the assignment by following the steps of procedure.

Reference:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 272-273.

Specifications:

Bill of Material:

<u>Quantity</u>	<u>Description</u>
2	Cable straps
1 piece	12/2 non-metallic sheathed cable with ground. (May use armored cable if local codes require.)
1	Switch box without cable clamps
1	Romex connector 3/8" (fit 1/2" conduit knockout)
1	Duplex convenience outlet
1	Duplex cover plate
1	Pliers, side cutting
1	Screwdriver
1	Knife
1	Voltmeter or test light

Steps of Procedure:

1. Obtain needed items.
2. Turn off power to the outlet that will be extended.
3. Check with a voltmeter or test lamp to make sure power is off.
4. Locate box for new receptacle and mount. The front edge of the box should be flush with the finished wall.
5. Remove cover and duplex receptacle from the existing box.
6. Remove 8" of sheathing from one end of the cable. (Do not strip insulation from conductors)
7. Install end of cable in either box keeping the 8" of cable that has been stripped extending through the box with the cable clamp compressed against the sheathing. Do not tighten so tight as to damage the conductor insulation.

- _____ 8. Within 12" of the box fasten the cable with a strap.
- _____ 9. Run the cable to the second box and cut allowing at least 8" of conductor in the box. Remember it is easier to cut one or two inches extra off than to try and add it on later.
- _____ 10. Strip 8" of sheathing off the free end of the cable and install in the box.
- _____ 11. Fasten the cable within 12" of the box with a strap.
- _____ 12. Strip the conductors and install the new receptacle. Be sure the white conductor is fastened to the nickel plated screw.
- _____ 13. Mount the outlet in the box and put on the cover plate.
- _____ 14. Attach the wires to the existing outlet making sure to observe polarity.
- _____ 15. Replace the outlet and cover plate.
- _____ 16. Turn on power and test new outlet.
- _____ 17. Return tools to proper storage.

WIRE LOW VOLTAGE CIRCUITS

Because there is less fire hazard and shock hazard with wiring systems requiring less than 30 volts, different rules govern this wiring. The transformers used for door bells and chimes, remote control wiring and other control systems are designed to limit the current to safe values.

In this assignment you will wire a door bell-buzzer and a low voltage two point lamp control.

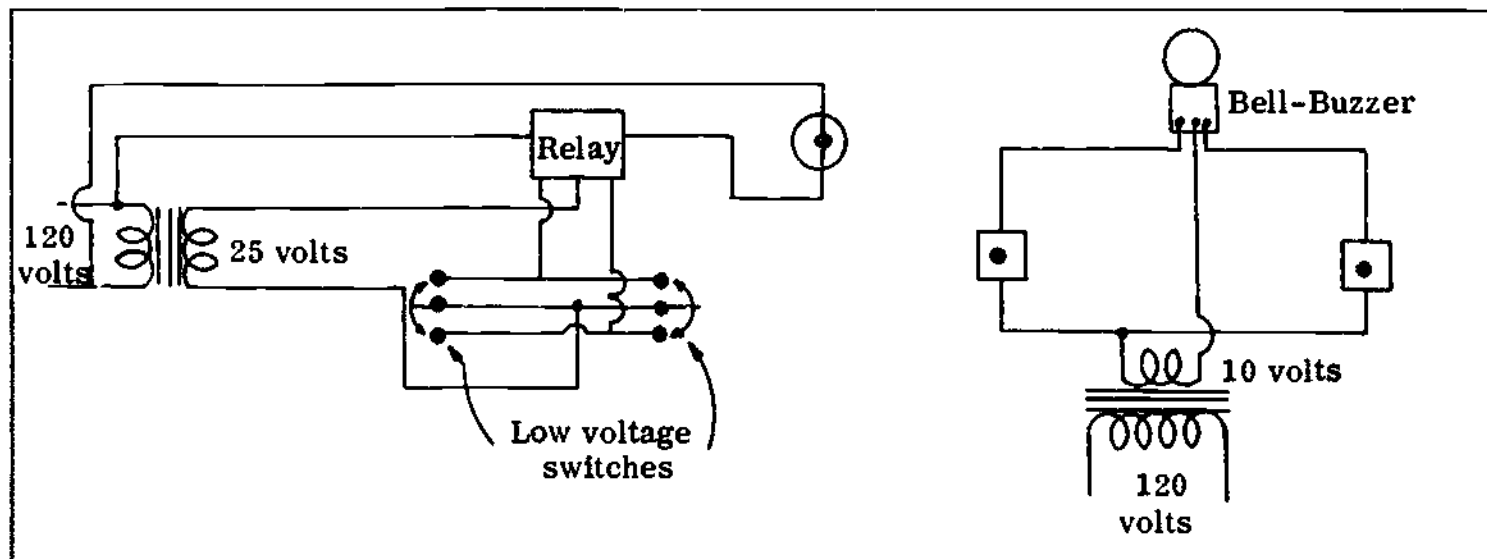

Objective: To familiarize the student with the principles of low voltage wiring.

Directions: Read this entire assignment sheet. Read the reference assigned and complete the assignment by following the steps of procedure.

Reference:

S. Richter, H. P., Wiring Simplified, pp. 79-82.

Specifications:

Bill of Material:

Quantity	Description
1	Transformer 120 v: 25 volt
2	Low voltage switches
1	Lamp and receptacle
1	Low voltage relay
	Assorted leads
1	Transformer door bell 120 v.: 10 v.
2	Push button switches
1	Door bell-buzzer combination

Steps of Procedure:

- _____ 1. Obtain needed components.
- _____ 2. Wire the low voltage lamp control as in the diagram. Be sure you do not have the high and low voltage leads mixed. (S - 81)
- _____ 3. Have your instructor check your circuit before turning on any power.
- _____ 4. Operate the lamp several times from the two switches.
- _____ 5. Disassemble the circuit.
- _____ 6. Wire the bell-buzzer as in the diagram. (Note to the instructor: Have the door bell transformer primary leads wired directly to a 120 volt plug so the students will not be able to wire the high voltage to the bell-buzzer.) (S - 79-80)
- _____ 7. Operate the circuits several times.
- _____ 8. Disassemble the circuit and return all materials to their proper storage places.

CONSTRUCT AN ELECTRIC MOTOR*

One method of developing an understanding of the operation of an electric motor is to construct one. There are many types of motors that can be built, but all operate on the same basic principles.

Objective: To develop an understanding of the operation of an electric motor.

Directions: Read this entire assignment sheet. Read the reference assigned and follow the steps of procedure to complete the project.

Reference:

M. Jones, E. W., Fundamentals of Applied Electricity, pp. 309-311.

Specifications: (see attached diagram)

Bill of Material:

Quantity	Description	Kind of Material	Size	Cost

Estimated time to do job _____ hrs;
Actual time required _____ hrs.

Steps of Procedure:

- _____ 1. Make out the bill of material. (Jones -309-311)
- _____ 2. Obtain materials required.
- _____ 3. Cut rotor stock to size and smooth rough edges. (Jones-310)
- _____ 4. Make commutator. (Jones- 310)
- _____ 5. Assemble the rotor and commutator on the shaft. (Jones-310-311)
- _____ 6. Wind the rotor coils. (Jones-310)
- _____ 7. Construct the field core. (Jones-310)
- _____ 8. Wind the field coil. (Jones-310)
- _____ 9. Construct the rotor bearing supports and brushes. (Jones-311)
- _____ 10. Make the base for the motor. (Jones-309)
- _____ 11. Assemble the motor. (Jones-311)
- _____ 12. Apply the test of workmanship.
- _____ 13. Submit to your instructor for a grade.

Test of Workmanship:

1. Are all dimensions the same as on the drawing?
2. Are your coils wound smoothly and neatly?

*Adapted from: Jones, E. W., Fundamentals of Applied Electricity, Bruce Publishing Company, Milwaukee, Wisconsin, 1956.

3. Are solder joints smooth and electrically sound?
4. Is the rotor symmetrical and balanced?
5. Is clearance between rotor and stator proper?
6. Does the motor run?
7. What changes would you make if you were to do it again?

-64-

Adapted from: Jones, E. W. Fundamentals of Applied Electricity. Milwaukee: Bruce Publishing Co., 1956, p. 309.

"TROUBLE SHOOT" A MOTOR

With proper maintenance an electric motor will give years of trouble free service. However, since it is a mechanical device there are parts that can eventually wear out. There are a number of routine things that can be done with a motor to increase its productive life.

Objective: To learn to identify common troubles with electric motors, how to reverse the direction of rotation of a motor, change voltage and make minor repairs.

Directions: Read this entire assignment sheet. Read the reference assigned and solve the problems by following the steps of procedure.

Reference:

1. Information sheet No. 2 (following this assignment)

Specifications: None

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Voltmeter (use VOM)
1	Screwdriver
1	Wrench, adjustable or nutdriver
1	AC ammeter 0-25 amp.
6	Motors as follows: 1 with a shorted capacitor 1 with a bad starter winding 1 with a bad starter switch 1 with a bad bearing 1 dual voltage motor to change voltage and reverse direction of rotation 1 with a grounded winding

Since you can only work on one motor at a time,
take only one at a time.

Steps of Procedure:

1. Obtain tools, a motor and other needed items.
2. Record the nameplate data for the motor on the attached form.
3. Examine the motor and note its construction.
4. Determine the type of motor.
5. Read the complaint against the motor.
6. Determine if the rotor is free to turn.
7. If the rotor can be turned by hand, plug the motor in to see if it operates.
8. Determine what the probable cause of the trouble is by consulting the information sheet attached.
9. Write a description of the fault, and indicate what should be done to remedy the fault.
10. On the motor to be reversed and voltage changed steps 6-9 are omitted. On this motor change the voltage connections and reverse the motor rotation.
11. Return the motor and obtain another with a different type of fault.
12. Repeat the above procedures until all types of trouble have been investigated.
13. Mount the motor with the shorted capacitor to a load with a V-belt. Line it up and tighten the motor mounting. Have your instructor check it.
14. Turn the motor on. Can it start the load?
15. Return all materials to their proper storage places.
16. Answer the questions below.

Checking Understanding:

1. What voltage was used when using the ohmmeter scales on the VOM? Would all breakdowns of insulations at 120 volts show up at this voltage?
2. A one horsepower motor operating on 120 volts requires 14 amperes. It is going to operate 500 feet from the power source. If the voltage drop of the line is not to exceed 3% or 3.6 volts for the line, what size wire should be used? Remember that the 500 foot length includes 2 conductors. Use a wire table to determine the resistance per foot and use Ohm's Law.
3. Why should a motor be lined up with its load when using a V-belt drive?

ELECTRIC MOTOR TROUBLESHOOTING

There are many possible troubles that can develop in a motor. Some of these can be repaired by the owner; others should only be done by an experienced motor repairman. Occasionally the trouble will be such that it is best to replace the motor with a new one.

In order to determine the extent of the repair needed, a logical procedure should be followed. One can not make a generalized procedure to follow in all types of motor analysis, but the one below will be adequate for most situations you will come in contact with.

- A. Perform a visual inspection of the motor. This may require some cleaning of the motor.
 1. Record all name plate data of the motor for future reference. This information may be needed to order parts.
 2. Read the complaint against the motor. Often this will give a good indication of what the trouble may be.
 3. Examine the motor carefully for:
 - a. Cracked bell housing. If this is the case, it often is best to get a new motor on smaller motors. On larger ones it should be welded or replaced.
 - b. Worn bearings. This can be done by checking for "play" in plane at a right angle to the axis of the shaft. Repair: replacement of bearings should be done by a repair shop so the bearings can be carefully reamed.
 - c. Excessive end play of shaft. Normally there should not be more than 1/16 of an inch. If it is excessive, additional washers should be added.
 - d. Bent shaft. Usually means replacement of rotor or complete motor.
 - e. Binding of rotor. Several things can cause this. It may be badly worn bearings, bell housing not properly tightened, bell housing not replaced properly, starter switch or windings in the way and several other causes that would have to be investigated in each case. It is difficult to predict the repair needed. It may be new bearings, proper placement and tightening of the bell housing, repair of switch, or rewinding. In some cases the best solution may be a new motor.
Do not plug in a motor if the rotor is not free to turn.
 - f. Poor electrical connections. Check the condition of the plug, cord and connections in the motor. Often this is the only repair needed. If the cord is to be replaced, it is highly recommended that you use a three conductor cord for replacement and a grounding type plug. Inform the users of the motor why this is done and the importance of the grounding conductor. When rewiring the motor, the green conductor is fastened to the frame of the motor.
 - g. Size of the motor too small for the load.
- B. If the rotor is free to turn, operation test the motor.
 1. Plug in the motor and turn on the power.
 - a. If it does not operate or start, check for:
 - (1) An open line cord.
 - (2) A defective switch on the motor.
 - (3) A defective overload device.
 - (4) Open main and starter leads.
 - (5) Improper wiring on the terminal block.
 - b. If it does not operate, but hums, particularly when under load, and will operate when started by hand, check for:
 - (1) Defective starter switch. The contacts may be burned, bent, or otherwise damaged, necessitating replacement.
 - (2) Open or burned out starter winding. Rewind the starter windings.
 - (3) Open or shorted capacitor on capacitor start motors. Check with a capacitor checker or replace with a new one. A quick way to check for a shorted capacitor is to connect it across a 120 volt A.C. line protected by a circuit breaker. If the breaker trips, the capacitor is shorted and should be replaced. One

should be careful when handling electrolytic capacitors as the electrolyte can be dangerous. They can make a mess if they blow.

- (4) Spacing washers may all be on one end of shaft so starter switch can't operate.
 - (5) Overloaded motor. A motor may be overloaded by having drive belt tension too tight as well as too much of a load.
 - (6) Check the following if the motor is a repulsion or repulsion start-induction run type:
 - (a) defective brush mechanism. Check to see that the brush mechanism is free to operate.
 - (b) brushes stuck in brush holders.
 - (c) worn brushes.
 - (d) brushes in wrong position.
- c. If the motor starts but overheats, check:
- (1) Motor is too small for the load.
 - (2) Starter windings shorted to the mains.
 - (3) Main windings shorted to each other.
 - (4) Improper ventilation of motor. Vent holes plugged or motor mounted where air can not properly circulate.
- d. If the motor blows a fuse, check for:
- (1) A shorted plug, line cord, or connections on terminal block.
 - (2) Shorted windings - main and/or starter.
 - (3) Grounded windings.
 - (4) A shorted capacitor on capacitor start motors.
 - (5) Badly worn bearings.
 - (6) Motor wired for wrong voltage.
- e. If the motor smokes while operating, check for:
- (1) Shorted windings - starter and/or mains.
 - (2) Starter switch does not open after starting which may be caused by (3).
 - (3) Overloaded motor.
 - (4) A grounded winding.
- f. If the motor loses speed and power, check the following:
- (1) A shorted running winding.
 - (2) The starter windings remain in the circuit.
 - (3) The motor is wired for the wrong voltage.
 - (4) If the motor has just been rewound one winding may have the wrong polarity.
 - (5) If a repulsion type motor, the brush mechanism may need repair or cleaning.

This list is not intended to be complete but covers some of the more common difficulties that will be encountered.

WIRE ELECTRICAL CONTROLS

Electricity is used to control the flow of gases and liquids. It is also used to control and regulate devices on the basis of time, temperature, humidity, light and other factors.

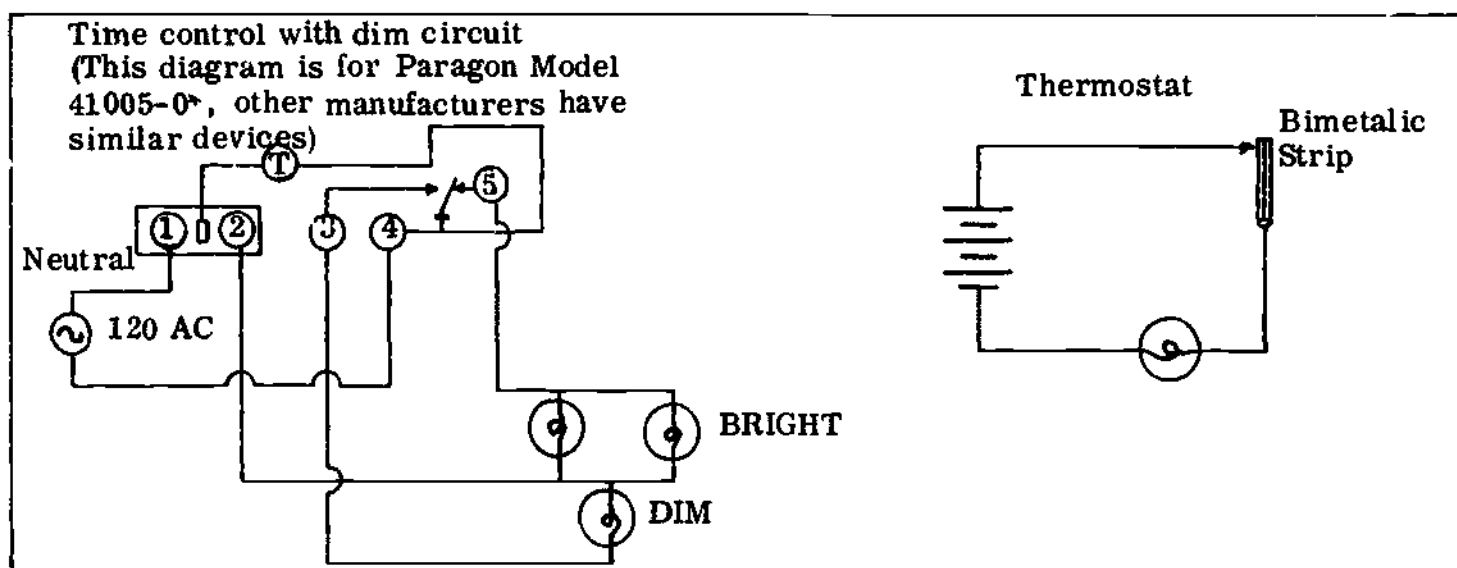

Objective: To obtain an understanding of how certain electrical controls operate and some of their limitations.

Directions: Read this entire assignment sheet. Read the references assigned and solve the problems by following the steps of procedure.

Reference:

L. Graham, Kennard C., Interior Electric Wiring-Part I-Residential, pp. 190-199.

Specifications:

Bill of Material:

Quantity	Description
1	Time control
3	Light bulbs and bases
1	Single phase magnetic motor control
1	Start-stop station for above control
1	Motor to operate with controller
1	Thermostat
2	Drycells
1	Lamp and receptacle to control with thermostat (represents load)
	Assorted leads

Steps of Procedure:

Note: These three circuits may be completed in any order.

A. Motor Control

- _____ 1. Obtain materials for the motor controller.
- _____ 2. Wire the motor controller to the motor and power source (make sure the power is off!).
Wire the start-stop station as given on the diagram inside the cover of the motor controller.
- _____ 3. Check the name plate current on the motor.

*Used with permission of Paragon Electric Company, Inc., Subsidiary of American Machine & Foundry Company.

- _____ 4. Check the number on the heater in the controller and the current for this number inside the cover of the controller. If they are not the proper size, obtain the proper size and install them.
- _____ 5. Have your instructor check the circuit.
- _____ 6. Replace the covers on all of the equipment.
- _____ 7. Turn the power on and operate the motor several times.
- _____ 8. Turn the motor on from the start-stop station. While the motor is running turn off the power source (not the start-stop station).
- _____ 9. Turn the power back on (do not touch the start-stop station). Does the motor start?
- _____ 10. Disassemble the circuit and return the components to their proper storage place. Make sure you turn the power off before you start disassembly.

B. Thermostat Control

- _____ 1. Obtain a thermostat and other materials needed for the thermostat.
- _____ 2. Wire the circuit as given in the specifications.
- _____ 3. Adjust the thermostat so it will just operate the lamp at room temperature.
- _____ 4. Heat the bimetallic strip with a match or other method. Note the bimetallic strip and the light.
- _____ 5. Remove the heat and allow the thermostat to cool. Note what happens.
- _____ 6. Repeat several times.
- _____ 7. Disassemble and return parts to their proper storage.

C. Time Control

- _____ 1. Obtain parts needed for the time control.
- _____ 2. Wire the time control as given in the specifications or the diagram furnished with the controller.
- _____ 3. Have your instructor check the circuit.
- _____ 4. Set the timer so it reads the proper time and adjust the time stops so the lights will be on when you plug the unit in and will go on the dim circuit within a few minutes after plugging in.
- _____ 5. Plug in the unit and watch the operating sequence. During the dim sequence you can be answering the questions below.
- _____ 6. After the clock has run through the dim sequence and is off, turn off the power and disassemble. Return all equipment to its proper storage place.
- _____ 7. Answer the questions below.

Checking Understanding:

1. What happened to the motor when the power was turned off at the source? What happened when the power was turned on? Why didn't the motor start again? Why might this feature be an advantage?
2. For what reason are the heaters located in the controller? What would happen if they were too small for the motor? What might happen if they were too large?
3. How would you add another start-stop station so the motor could be controlled from two locations?
4. How could you wire the thermostat so it would operate a machine for cooling?
5. Suggest some places where a time switch might be used. List at least four.

PERFORM MINOR APPLIANCE MAINTENANCE

There are many minor appliance repairs that can easily be done at home. There are also certain minor maintenance procedures that can be done by the appliance owner that will increase the life and efficiency of appliances.

Objective: To familiarize the student with some of the minor maintenance procedures that can be used with electrical appliances.

Directions: Read this entire assignment sheet. Read the references assigned and complete the assignment by following the steps of procedure.

References:

- D. Arnold, Joseph P., and Schank, Kenneth L., Exploratory Electricity, pp. 41-42.
- G. Gabbert, William L., Electrical Appliance Service Manual, pp. 58-76, 251-296.
- O. Lush, Clifford K., and Engle, Glenn E., Industrial Arts Electricity, pp. 87-89.

Specifications: None

Bill of Material:

<u>Quantity</u>	<u>Description</u>
1	Electric iron in need of new cord (obtain one from home or a neighbor)
1	Cord assembly for an electric iron
1	Washing machine (conventional)
1	Refrigeration compressor (air conditioner)
1	Vacuum cleaner
1	Screwdriver
1	Wrench, adjustable
1	Level, 2 foot
1	Volt-Ohm-Milliammeter
1	Side cutting pliers
1	Cap (plug)
1	Cord end
1	Feed through switch
1	Length of SP-1 cord
1	Thin wall conduit (E. M. T.) $\frac{1}{2}$ " x 5"
1 piece	Sheet brass or steel $\frac{1}{2}$ " diameter (gage)
2	Pen light cells
6 inches	Test Lead #18 rubber covered
1	No. 1 rubber stopper, 1 hole
1	Alligator clip (Mueller #70)
1	Nail 10 d
1	Lamp, 2.5 volt, screw base
2 inches	Stove wire

Steps of Procedure:

- _____ 1. Construct a combination continuity tester and flashlight. (Arnold & Schank, pp. 41-42)
- _____ 2. Obtain an electric iron that needs a new cord and a replacement cord.
- _____ 3. Using an ohmmeter determine if there is a continuous circuit through the iron heating element. If the cord is broken this can be done at the terminals where the cord is attached to the iron (do after step 5). Make sure the iron thermostat is in an on position.
- _____ 4. Examine the iron and determine how to take it apart to get at the cord terminals.
- _____ 5. Remove the necessary parts to get at the terminals.
- _____ 6. Remove the screws holding the cord conductors. Caution: Hold the iron so the screws will not fall into the iron, where they can be difficult to get out and may cause short circuits.
- _____ 7. Install the new cord, again being careful to keep the screws from falling into the iron.

- _____ 8. Replace the iron handle and/or other parts that were removed.
- _____ 9. Test the iron for operation.
- _____ 10. Obtain a conventional washing machine.
- _____ 11. Examine the wringer arrangement and remove the cover.
- _____ 12. Remove the top wringer roll and note the bearing arrangement as it is removed.
- _____ 13. Examine the condition of the rolls and the bearings.
- _____ 14. Replace the wringer rolls, bearings and cover.
- _____ 15. Examine the water pump on the machine and determine how it might be removed for cleaning.
- _____ 16. Remove the pump cover or pump from the machine as the case may be. (Note to the instructor: Try to use a machine from which the pump can be easily removed.)
- _____ 17. Examine the pump to see that it is not clogged.
- _____ 18. Replace the pump.
- _____ 19. Determine the best way to ground the machine and ground it.
- _____ 20. Obtain an air conditioner or other refrigeration unit.
- _____ 21. Examine the unit and determine the best way to get to the condenser coils.
- _____ 22. Make sure no power is on and remove any necessary covers. Be careful not to damage any of the coils or other tubing.
- _____ 23. Using a vacuum cleaner, clean the dirt from the condenser coils. Note the location of the fan and other components.
- _____ 24. Replace all guards and covers.
- _____ 25. Remove the air filter and determine its condition.
- _____ 26. Replace the filter if it is still effective. If not replace it with a new one.
- _____ 27. Level the piece of equipment your instructor has assigned you.
- _____ 28. Determine the best places to place the level.
- _____ 29. Test the piece of equipment and determine the approximate amount of material needed to level it.
- _____ 30. Place the leveling blocks under the legs and check.
- _____ 31. Use shingles or other material to finish leveling.
- _____ 32. Obtain the parts needed for making the extension cord.
- _____ 33. Strip 3/8" of insulation from each conductor on one end of the cord.
- _____ 34. Attach the cap to the cord. Be sure the leads come around the plug blades and under the screw in a clockwise direction as shown in your reference.
- _____ 35. Strip 3/8" of insulation from each conductor on the other end of the cord.
- _____ 36. Attach the cord end, again making sure the conductor goes under the screw in the proper direction.
- _____ 37. Assemble the cord end.
- _____ 38. Close to one end of the cord cut one conductor and separate the conductors 2 3/8" (1 3/16" on each side of the cut).
- _____ 39. Strip each end of the cut conductor.
- _____ 40. Disassemble the feed-through switch.
- _____ 41. Fasten the conductors under the terminal screws making sure they are in the proper direction.
- _____ 42. Locate the conductors in the switch so they follow the proper path and assemble the switch.
- _____ 43. Test the cord assembly.
- _____ 44. Turn in with your name attached. (The instructor should check the cord by taking it apart and returning the components to storage.)
- _____ 45. Return all equipment to their proper storage places.
- _____ 46. Answer the questions below.

Checking Understanding:

1. Why should special types of cords be used with heating appliances?
2. Why are wooden bearings used on wringers?
3. How can one keep wringer rolls from getting a soap film on them?
4. What is the purpose of the fan on the refrigeration compressor?

LOCATE AUTOMOTIVE ELECTRICAL TROUBLES

There are many troubles in the automotive electrical system that can be repaired with very little equipment. In this assignment you will have an opportunity to test and repair parts of the automotive electrical system.

Objective: To enable the student to analyze and correct some of the troubles that commonly develop in the automobile electrical system.

Directions: Read this entire assignment sheet. Read the references assigned and solve the problems by following the steps of procedure.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 292-301.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 167-176.

Specifications: None

Bill of Materials:

<u>Quantity</u>	<u>Description</u>
1	Automobile generator
1	Automobile ignition coil
1	Automobile distributor
1	Set of generator brushes
1	Capacitor checker
1	Volt-Ohm-Milliammeter

Steps of Procedure:

- _____ 1. Obtain a generator, screwdriver, and set of brushes.
- _____ 2. Examine the condition of the commutator. (A-296, C-170)
- _____ 3. Remove the brushes.
- _____ 4. If the commutator is dirty, it can be cleaned with carbon tetrachloride. If it is badly worn and pitted, the armature should be removed and the commutator cut down on a lathe.
- _____ 5. Replace the brushes in the generator.
- _____ 6. Return the generator and extra brushes to their proper storage places.
- _____ 7. Obtain an ignition coil.
- _____ 8. Ascertain the primary and secondary leads of the coil. (A-298, C-173)
- _____ 9. Check the primary for continuity with an ohmmeter.
- _____ 10. Check the secondary for continuity with an ohmmeter.
- _____ 11. Return the coil to the proper storage place.
- _____ 12. Obtain a distributor and capacitor checker.
- _____ 13. Remove the distributor cap and note the placement of parts and their function. (A-298, C-173)
- _____ 14. Look at the points. Are they badly pitted?
- _____ 15. Remove the capacitor and check it for capacitance and voltage break down.
- _____ 16. Replace the capacitor.
- _____ 17. Replace the distributor cap.
- _____ 18. Return all equipment to the proper storage places.

CONSTRUCT A CRYSTAL SET

A radio receiver that requires no external power and is easily made is a crystal set. The parts of this simple receiver contain the essentials for any radio receiver: antenna-ground system, tuner, detector, and reproducer.

For this assignment you will design and construct your own crystal set.

Objective: To develop an understanding of the function of the basic essentials of a radio receiver.

Directions: Read this entire assignment sheet. Read the reference assigned. Design a crystal set and make a bill of material for the set. Make an outline of the procedure you will follow. Have your instructor approve your design and then build it.

Reference:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 312-325.

Specifications: Drawn by student.

Bill of Material: Developed by student.

Steps of Procedure: Determined by student.

Test of Workmanship:

1. Does the crystal set work?
2. Are all solder joints smooth and heated through?
3. Are leads adequately insulated from the chassis?
4. Are all electrical connections made on tie points or firmly mounted components?

APPLIED ELECTRICITY

Job Assignment 29
Covering Unit 164

Name _____
Due _____

MAKE A CODE OSCILLATOR*

Morse code is a widely used method of communication. Any amateur radio operator must have a thorough knowledge of this code before receiving an operating license. Also, knowledge of this code is a requirement for advancement in Boy Scouts. The best way to learn the code is by listening to it. This project is a device that can be used for this purpose.

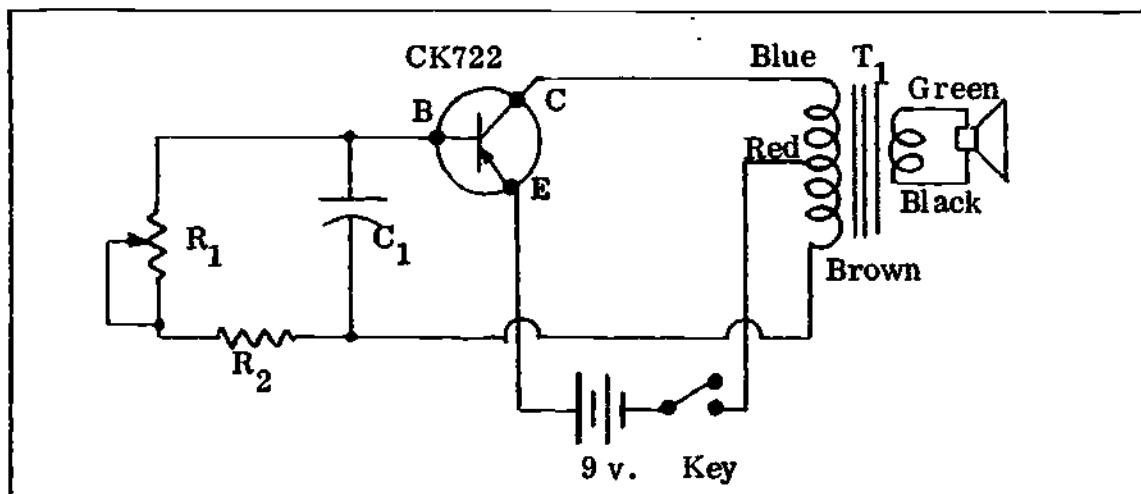

Objective: To develop a familiarity with transistors and to gain experience in wiring an electronic circuit.

Directions: Read this entire assignment sheet. Read the reference assigned and construct the project by following the steps of procedure.

Reference:

J. Gerrish, Howard H., Electricity and Electronics, pp. 211-216, 227.

Specifications:

Bill of Material:

Quantity	Description
1	R ₁ - Potentiometer, 25,000 ohms
1	R ₂ - Resistor, fixed carbon 6800 ohms $\frac{1}{2}$ watt
1	C ₁ - Capacitor, paper, .5 mf. 200 volts
1	T ₁ - Transformer, output, (AR 119 or Thordarson TR 27)
1	Transistor CK 722
1	Speaker, PM 1 $\frac{1}{2}$ inch
1 piece	Grill cloth
1	Battery 9 volt
1	Terminal strip or plug jack for key
1	Knob (for potentiometer)
1	Tie point, 4 lug
1	Box, 4 x 2 x 2 $\frac{1}{4}$

Steps of Procedure:

- _____ 1. Obtain needed components.
- _____ 2. Layout the components on the chassis so as to utilize the space to best advantage. Keep lead lengths as short as practicable. (J - 102-103)
- _____ 3. Center punch and drill all mounting holes.

*This project is adapted from Gerrish, Howard H., Electricity and Electronics, Goodhart-Wilcox, Chicago, Illinois, 1964, p. 227.

- _____ 4. Mount all components. Note the mounting of the capacitor and transistor in figure 17-32 on page 102 in the reference. It is essential that the transistor be connected properly. The marked lead is the collector. (J - 102-103)
- _____ 5. Check your wiring with the schematic diagram.
- _____ 6. Solder all connections. Caution: Heat can damage transistors. Use a "heat sink" by grasping the transistor lead to be soldered with a needle-nose pliers between the joint and the transistor before soldering. The pliers will conduct the heat away from the transistor.
- _____ 7. Connect the battery in the circuit and a key.
- _____ 8. Close the key and adjust the potentiometer for a pleasing tone.
- _____ 9. Disconnect the key and put the bottom on the chassis.
- _____ 10. Apply the test of workmanship.
- _____ 11. Put all tools away.
- _____ 12. Place your name on your project and turn into your instructor.
- _____ 13. Answer the questions on page 103 in Gerrish, Electronics.

Test of Workmanship:

1. Does the oscillator work?
2. Are all solder joints smooth and heated through?
3. Are leads adequately insulated from the chassis?
4. Are all electrical connections made on tie points or on firmly mounted components?

Osage Hydro-Electric Power Plant, Bagnell Dam

The Osage hydro-electric power plant has been in operation since 1931. Average yearly output is 440,000,000 Kilowatt hours. There are eight generators, each with a capacity of 21,500 Kilowatts. (Courtesy of Union Electric Co., St. Louis, Mo.)

PREPARATION AND USE OF INFORMATIONAL ASSIGNMENT SHEETS

The study of electricity involves a considerable amount of technical information. An effective way of developing a student's competency with this knowledge is through the use of demonstrations and other visual aids reinforced through the use of informational assignment sheets. The primary purpose of informational assignment sheets is to place the responsibility for learning upon the student.

The informational assignment sheets which follow have been prepared as guides by focusing attention on the more important course content. They are offered as sample guides for the teacher to use in preparing others which will provide additional coverage.

These informational assignment sheets should serve three purposes. First, they should serve to guide the student in his reading of the selected reference (s). Second, it is suggested that the student write out the answers to the questions so that he may organize his thoughts concerning the questions. Third, they serve as a guide to class discussion.

Several books have been listed as possible texts. The instructor should select one of these, or one of the others listed as related references, for use in the class. The teacher should only list those references on his informational assignment sheet that he will be having the students use. On several assignment sheets other references are offered since they contain equivalent content; however, the teacher may or may not want the student to use these. The instructor will find these suggested references to be an excellent resource for the topic under discussion. Some of these references should be made available to the students, particularly the bulletins and pamphlets. For example, on informational assignment sheet number 4 the U.S. Department of Labor Bulletin should be made available to the students.

NOTE: In preparing the informational assignment sheets it is suggested that the teacher allow space between each question providing room for the student to write his answer and make notes.

Assignment Number	LIST OF INFORMATIONAL ASSIGNMENT SHEETS Title	Instruction Units Covered From Analysis
1	Basic Electrical Concepts	1-6
2	Series and Parallel Circuits	7-12
3	Electric Power	13-18
4	Overcurrent Protection and Safety	19-27
5	Electrical-Electronic Symbols	28-31
6	Potentiometers and Rheostats	32-33
7	Magnetism and Electro Magnetism	34-38
8	Electrochemistry	39-48
9	Generators	49-54
10	Transformers	55-60
11	Electricity from Light, Heat, Friction, Pressure, and Nuclear Energy	61-65
12	Conductors, Insulators, and Heat	66-75
13	Light from Electricity	76-83
14	Home Wiring	84-100
15	Low Voltage Wiring	101-105
16	Electric Motors	106-131
17	Electrical Control Systems	132-138
18	Electrical Appliances	139-154
19	Automotive Electricity	155-160
20	Electronics	161-176
21	Occupations in the Electrical Industries (assigned earlier in the year)	177

APPLIED ELECTRICITY

Informational Assignment 1
Covering Units 1-6

BASIC ELECTRICAL CONCEPTS

Name _____
Due _____

Probably the most basic and widely used commodity in this country is electrical energy. In a modern home, farm, or business almost anything one attempts to do involves the use of some electrically powered device.

The demand for electrical service has increased the production of electricity from 95,287,390,000 kilowatt-hours in 1935 to 753,350,271,000 kilowatt-hours in 1960, in the United States. During this same period, in which utilization of electricity has increased, the average cost of 250 KWH decreased from \$8.91 in 1935 to \$7.48 in 1962. (The instructor should obtain and have available this information for the local area from the local power distributor.)

The study of electricity is fascinating, partly due to the fact that its nature is not completely understood. We do know it will do certain things under given conditions, and we do have theories regarding the nature of electricity.

In this unit you will explore these theories and study the basic law of all electricity - Ohm's Law.

Assignment:

1. Read the reference (s) assigned below.
2. Study the questions and problems listed below and write you answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 1-13, 18-20, 121-124, 144-145.
- B. Marcus, Abraham, Basic Electricity, pp. 1-11, 22-29, 31-40.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 1-10, 32-34, 58-77, 86-89, 242.

Problems and Questions:

1. Make a list of all of the electrical appliances and other electrically operated devices in and around your home. How many of these were not in your home five years ago? Is it likely that new electrical equipment will be added to your home this year?
2. Suggest some reasons why the average cost of electrical energy has gone down while the consumption has gone up. Do you think the cost of electricity will continue to decrease? Why?
3. What was the power consumption in your area last year? Ten years ago? What has been the change in cost?
4. What are the essentials of any electrical circuit?
5. What is meant by an open circuit? A closed circuit?
6. What is the basic unit used to measure electro-motive-force? What unit is used to measure current or intensity? What is the unit of resistance?
7. Give Ohm's Law in its three symbolic forms.
8. What is an electric current, as explained by the electron theory of electricity?
9. What does the prefix milli mean? Kilo?
10. What electrical charge do electrons have?
11. How much current will flow through a lamp that has a resistance of 240 ohms when it is connected across 120 volts? What would happen to the current flow if this lamp were connected across 240 volts by mistake?
12. What voltage would be impressed across a 1000 ohm resistor having 0.1 ampere flowing?
13. What is the resistance of a heating element that permits 10 amperes to flow when connected across 120 volts?
(The teacher may want to add more problems on Ohm's Law.)

APPLIED ELECTRICITY

Informational Assignment 2
Covering Units 7-12

Name _____
Due _____

SERIES AND PARALLEL CIRCUITS

There are two basic types of electrical circuits, series and parallel. All other circuits are variations of these. It is important that one understands the characteristic of each of these types of circuits.

Anyone who works with electricity must understand the basic units of electrical measurement and how these are calculated if he is to work intelligently.

In this assignment you will become familiar with these basic electrical circuits and the basic units -- ohms, volts, and amperes.

Assignment:

1. Read the reference (s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 146-153, 237-247.
- B. Marcus, Abraham, Basic Electricity, pp. 40-50, 77-91, 95-99.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 60-62, 65-66, 95-101, 242.

Questions and Problems:

1. What statement can be made about current flow in a series circuit? How many paths can the current take?
2. What general statement can be made about the total voltage in a series circuit with respect to the voltage drop across the individual components?
3. What is meant by the term voltage drop?
4. Make a general statement about the total resistance of a series circuit.
5. In a few sentences explain how a permanent magnet moving coil meter operates?
6. What should one do if the needle on a meter goes the wrong direction?
7. Why must an ammeter always be connected in series in a circuit?
8. How does a permanent magnet moving coil ammeter differ from a voltmeter with the same type of movement?
9. What does the word shunt mean? If you were to shunt a meter what would you do?
10. If one had a voltmeter in a circuit where the meter read 150 volts, what would be the potential difference between the two meter leads? Suggest a reason why a person should only touch one lead at a time.
11. List two things that should be done when a person is going to use an ohmmeter to measure the resistance of a device.
12. What type of meter does the abbreviation VOM identify? VTVM? How do the two meters differ?
13. What is the value of each division on each scale of the meter illustrated below?

What are the readings:

- A. (15 volt scale) _____
- B. (1.5 volt scale) _____
- C. (150 volt scale) _____

What is the maximum voltage that should be impressed across this meter?

- 14. What statement can be made about the voltage across the branches of a parallel circuit?
- 15. What statement can be made about the total current in a parallel circuit?
- 16. Suggest a reason why the total resistance in a parallel circuit must be less than the smallest resistance in the circuit.
(The instructor may want to add some problems to be solved using series and parallel laws.)

APPLIED ELECTRICITY

Informational Assignment 3
Covering Units 13-18

Name _____
Due _____

ELECTRIC POWER

One of the basic values of electricity is its power potential. Since we use electricity to do work, we should understand the unit that expresses the rate at which work is done. The unit used to indicate electrical power is the watt. In the United States mechanical power is generally designated by a unit called horsepower. One should be able to convert from mechanical to electrical and from electrical to mechanical power.

As a consumer of electrical energy you should be familiar with the rate structure and cost of electric power.

In this unit you will become acquainted with Watt's law, conversion of power units, determination of efficiency, and the calculation of the cost of electric power.

Assignment:

1. Read the reference (s) assigned below.
2. Study the problems and questions listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 153-155, 252-255.
- B. Marcus, Abraham, Basic Electricity, pp. 29-31, 92-95.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 89-94.
Electrical rates from local power distributor.

Questions and Problems:

1. What is energy? What is electric power? What is the relationship between watts and watt-hours?
2. List the nine symbolic forms of the power formula.
3. Are any changes necessary in applying Watt's law to parallel circuits? Explain.
4. What is input power? Output power? What is the relationship of these two to electrical efficiency?
5. What is the horsepower equivalent of three kilowatts?
6. How much power will be dissipated when 120 volts are impressed across a circuit causing 10 amperes to flow?
7. Read the kilowatt-hour meter below.

8. Using the rates supplied by your instructor calculate the bill for the month of June from the following readings: June 1 7943 KWH, July 1 8219 KWH. (The instructor should use rates obtained from the local power distributor).
(The instructor may want to add some more problems dealing with variations of the power formula.)

APPLIED ELECTRICITY

Informational Assignment 4
Covering Units 19-27

Name _____
Due _____

OVERCURRENT PROTECTION AND SAFETY

There are certain safety precautions that must be observed with electricity to avoid danger to persons and property. If too much current is permitted to flow through a conductor, it can create enough heat to cause a fire.

For the above reason, among others, it is necessary to place in electrical circuits some device to control or limit the current to a safe level.

There are some simple safety precautions that must also be observed to avoid electrical shock which could cause death.

In this assignment you learn about the operation and applications of overcurrent protective devices, safe work habits with electricity, and first aid for electric shock.

Assignment:

1. Read the reference (s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 33-41, 247-252.
- B. Marcus, Abraham, Basic Electricity, pp. 261-264.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 127-130, 151.
- Y. U. S. Department of Labor, Control of Electric Shock Hazards, Bulletin 216.

Questions and Problems:

1. What is the principle by which a fuse operates?
2. What two principles are used in operating circuit breakers?
3. What advantage does a dual element fuse have over an ordinary fuse?
4. Since January, 1961, the National Electrical Code has required that all plug fuses of 30 amperes or less shall be type S (Fusestats). Suggest some reasons why this regulation was enacted.
5. What procedures should be followed when a fuse has blown?
6. What types of cartridge fuses are available?
7. What design differences are there which prevent the substitution of improper size fuses?
8. What is an open circuit? A closed circuit?
9. What is meant by a grounded circuit? Is there more than one meaning to the term? Explain.
10. What types of fire extinguishers should be used on electrical fires?
11. If you were driving along a highway and came upon an accident where a car had rammed a power pole and one power cable was resting on the car, what would you do?
12. Approximately how much current is necessary to be fatal? Why is high voltage more dangerous than low voltage?
13. Why is there increased danger if one works on electrical circuits while standing on the ground or a concrete floor?
14. What procedure should be followed if you came upon a person who appears to have touched a "live" wire?

APPLIED ELECTRICITY

Informational Assignment 5
Covering Units 28-31

Name _____

ELECTRICAL-ELECTRONIC SYMBOLS

As in many other areas of work, there have been developed certain symbols to be used when representing particular electrical devices. One may call it an electrical shorthand.

Most of these symbols have been standardized within the industry and are recognized by the American Standards Association. One should use these symbols when making a drawing which represents electrical circuits and devices.

It is necessary for any person working in electricity to be familiar with these symbols and to be able to recognize what they represent.

In this assignment you will be introduced to schematic diagrams and symbols as well as to some of the practices adopted in their use.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 14-17, 20-26.
- B. Marcus, Abraham, Basic Electricity, pp. inside back cover.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, p. 244.
- K. Graham, Kennard C., Fundamentals of Electricity, pp. 275-284.
- W. U. S. Defense Department, Graphical Symbols for Electrical and Electronic Diagrams, Part I.
- X. U. S. Defense Department, Electrical Wiring Symbols for Architectural and Electrical Layout Drawings, Part III.

Questions and Problems:

1. What is the difference between a schematic and a pictorial drawing?
2. Draw the architectural symbols for the following:
 - a. recessed ceiling lighting fixture
 - b. clock outlet
 - c. duplex convenience outlet grounding type
 - d. range outlet
 - e. three way switch
 - f. push button
 - g. door chime
 - h. telephone
3. Draw the following schematic symbols:
 - a. motor
 - b. antenna
 - c. potentiometer
 - d. coil with an iron core
 - e. ground
 - f. alternating current power source
4. Draw a simple circuit including a battery power source, a fuse, switch, ammeter, and a voltmeter connected across a resistor load. Indicate polarity of the power source.
5. Do schematic diagrams show the physical location of components in a circuit?

APPLIED ELECTRICITY

Informational Assignment 6
Covering Units 32-33

Name _____
Due _____

POTENTIOMETERS AND RHEOSTATS

There are two ways in which variable resistors are frequently used in electrical-electronic circuits. One application is for dividing voltage, and the other is for limiting current.

For voltage dividing a potentiometer is used. An example of this process is the volume control of a radio or television receiver.

For current limiting a rheostat is used. An example of the application of this device is the dash-light dimming in an automobile.

It is important that one be familiar with the principles involved in each process as they have many applications.

In this assignment you will learn of current limiting and voltage dividing principles.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 133-134, 250.
- B. Marcus, Abraham, Basic Electricity, pp. 27-28.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 72-75.
- T. Turner, Rufus P., Basic Electricity, pp. 40-41, 44-45, 58-60.

Questions and Problems:

1. What will be the total current flowing in the following circuits? Through the lamp?

A.

B.

C.

2. If the resistance of one resistor in a series circuit is increased, what will happen to the current flow? If the size of this resistor is decreased?
3. How many terminals are required for a rheostat?
4. Draw the schematic diagram for a rheostat. Identify the rotor and stator terminals.
5. What will be the voltage between terminals A and B in each of the drawings?

A.

B.

C.

D.

6. Draw the schematic diagram for a potentiometer. Identify the rotor and stator terminals.

7. How many terminals are required for a potentiometer? May a potentiometer be used as a rheostat? If so, which terminals would be used?

8. How can one determine the power rating for a potentiometer or rheostat to be used in a particular circuit?

APPLIED ELECTRICITY

Informational Assignment 7
Covering Units 34-38

Name _____

MAGNETISM AND ELECTROMAGNETISM

Magnetism and electricity are closely related to each other. Although we do not know as much about this relationship as we would like, we do know that we can produce electrical energy with a magnetic field. Also, we know that anytime there is an electrical current, it is surrounded by a magnetic field. This type of magnetism is called electromagnetism.

This inter-relationship of magnetism and electromagnetism is an interesting and important phase of electricity. Most electrically operated machines use magnetic principles.

In this assignment you are expected to develop some elementary concepts regarding the relationship of magnetism and electricity.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 163-188.
- B. Marcus, Abraham, Basic Electricity, pp. 55-72.
- C. Steinberg, William B., and Ford, Walter B., Electricity and Electronics - Basic, pp. 16-31.
- F. Crow, Leonard R., Learning Electricity Fundamentals, pp. 127-171.

Questions and Problems:

1. Why aren't natural magnets used very much?
2. What is the difference between a permanent and an electromagnet?
3. What is the law of magnetic attraction and repulsion?
4. Explain what is meant by magnetic induction.
5. List two ways to magnetize an object.
6. List three ways one may demagnetize an object.
7. List at least three uses for permanent magnets.
8. What is a solenoid?
9. What factors determine the strength of an electromagnet?
10. List at least four applications of electromagnets.
11. What is a relay? Explain how one operates. Give several examples of relays in common use.
12. Explain the operation of a door bell.

ELECTROCHEMISTRY

Early studies in electricity were done with single cells connected to form batteries. Electro-chemistry is still an important source of electrical energy.

Batteries are used every day in automobiles, flashlights, missiles and portable radios. There currently is a considerable amount of research being done on the electro-chemical make up of the human body. As one can see this is an important area of electricity, an area that is expanding rapidly.

In this unit you will learn of several types of cells, how they may be inter-connected as well as other applications of electro-electricity.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 203-218.
- B. Marcus, Abraham, Basic Electricity, pp. 35-36, 216-240, 302-310.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 34-40, 67.

Questions and Problems:

1. What is meant by the term electrolysis? Electroplating?
2. List some materials that are refined or extracted through the use of electricity. Where are some of these plants located? Suggest reasons why they are located where they are? Example: Anaconda Copper at Great Falls, Montana, fertilizer plants in the Tennessee Valley.
3. Explain how electroplating is done. List some things that are electroplated. How would you classify the process of making electrotype?
4. Diagram the construction of a zinc-carbon cell.
5. May a wet cell be a primary cell? Explain.
6. What differences are there between a No. 6 cell and a penlight cell? What feature is the same?
7. Compare the voltages of a zinc-carbon cell, mercury cell, lead-acid cell, Edison (nickel-iron-alkali) cell, nickel-cadmium cell. What are the cathodes (negative terminals) in each? The anodes (positive terminals) in each? The electrolytes? List some advantages and disadvantages of each.
8. How may we test the condition of a zinc-carbon cell or battery? A lead-acid cell?
9. What is meant by "shelf life"? How may this problem be reduced?
10. What is meant by polarization?

APPLIED ELECTRICITY

Informational Assignment 9
Covering Units 49-54

GENERATORS

Name _____
Due _____

The most important and widespread source of electrical energy for commercial purposes is the generator. This is the source of power for your home, and it provides energy for your automobile electrical system while the motor is running.

Since the principles involved in electrical generators are basic to an understanding of electricity, it is important that the student of electricity gain knowledge of the characteristics of this source.

In this assignment you will explore the operation of an electrical generator, and the process of obtaining either alternating or direct current from them.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 219-226.
- B. Marcus, Abraham, Basic Electricity, pp. 101-126, 178-213.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 41-49, 108-111.

Questions and Problems:

1. Is a generator a machine? What is a machine?
2. What is the purpose of a generator?
3. What are the essentials of a generator?
4. What determines the direction of electron flow in a conductor passing through a magnetic field?
5. What determines the value of a voltage from conductors passing through a magnetic field.
6. What condition is necessary with respect to a conductor and a magnetic field to have an induced voltage?
7. What kind of voltage (and/or current) is generated in any armature rotating through a magnetic field?
8. How does a direct-current generator differ from an alternating current generator?
9. What sources of energy are used to drive generators?
10. How does a magneto differ from other types of generators?
11. What is the purpose of an exciter generator?
12. What is the stator of a machine? The rotor? The armature? Does an armature always rotate?
13. What determines the frequency of an alternating current?
14. Explain how three phase current differs from single phase current.
15. Take a field trip to an electric power generating station. Answer the following questions on the field trip:
 - a. What was the speed of rotation of the rotor on the alternator?
 - b. What excitation voltage and current were used?
 - c. Where was the exciter generator located?
 - d. What was the alternator output voltage?
 - e. What was the alternator KVA or wattage?
 - f. What protection is given (electrically) to the plant equipment for both lightning and overcurrent?
 - g. How are the generators synchronized with the line when they are turned on?
 - h. What voltages are distributed from the plant?
 - i. How is the power leaving the plant metered?

APPLIED ELECTRICITY

Informational Assignment 10

TRANSFORMERS

Transformers are important electrical devices that have applications which range from ringing door bells to transmitting and varying power supplies over thousands of miles.

Because of the many uses of this efficient device and the basic electrical principles involved in its operations, it is important that it be included in any study of electricity.

In this assignment you will study the principles underlying the operation of a transformer as well as their application to power transmission and distribution.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.
4. Take a field trip to a power generating station noting the generators and the manner in which power gets from the generator to the ultimate consumer.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 181-186.
- B. Marcus, Abraham, Basic Electricity, pp. 327-344.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 111-120.

Questions and Problems:

1. Define induce with reference to electricity.
2. Define a step-down transformer. A step-up transformer.
3. Which winding is the primary winding of a transformer? The secondary winding?
4. What is meant by the term laminations?
5. What is necessary, with reference to the magnetic field (or the current causing it), to have a voltage and current induced in the secondary of a transformer?
6. May there be more than one secondary winding on a transformer?
7. Can a steady D.C. such as one obtains from a dry cell operate a transformer? Why?
8. What is the difference between self induction and mutal induction?
9. What is the unit of inductance?
10. Can a transformer be used with D.C.? Under what conditions? Suggest some applications.
11. List places where you have seen transformers used.
12. Make a diagram indicating the way power passes from the power plant to your home. Indicate the voltages used at various stages.
13. What is a power pool? What are its advantages? How many interconnections are there with your power distributor?
14. Why are high voltages used for transmitting power long distances?
15. What is the relationship between the number of turns and the voltage in a transformer? The number of turns and the current capacity?

ELECTRICITY FROM HEAT, LIGHT, FRICTION, PRESSURE AND NUCLEAR ENERGY

Practically all of our commercial electrical energy comes from mechanical generators, and much of the other electrical energy used comes from chemical sources. There are, however, other sources of electricity that are important today, and indications are that these may be more important in future years.

Since we can expect increasing use of these other sources of electrical energy it is essential that you have some understanding of sources other than mechanically generated and chemically produced electricity.

In this assignment you will become acquainted with heat, light, friction, pressure, and nuclear energy as sources of electricity.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 228-232.

- K. Graham, Kennard C., Fundamentals of Electricity, pp. 5-11, 95-97.
- N. Lightning Facts and Figures, Lightning Protection Institute.

Questions and Problems:

1. What term is used for electricity produced through light?
2. List some present applications of solar cells.
3. What is bio-electricity?
4. Suggest some applications of static electricity which benefit man.
5. List some places where static electricity is an undesirable problem.
6. What is a pyrometer?
7. Explain the operating principle of a thermocouple.
8. List some places where thermocouples are used.
9. What is piezoelectricity?
10. List some applications of piezoelectric effects.
11. Lightning is an example of what form of electricity?
12. List some safety precautions that should be followed during a lightning storm.
13. In what ways is nuclear energy being used to produce electrical energy? What are the present limitations for direct conversion of nuclear energy to electricity?

APPLIED ELECTRICITY

CONDUCTORS, INSULATORS, AND HEAT

One of the important applications of electricity is the production of heat. We find this application in small portable heaters, ranges, and in many places heating entire buildings. In some cases the heat produced is undesirable. All of these applications involve the principle that a current flowing through resistance creates heat.

There are certain things a person working with electricity should know about conductors, insulators, and the heating effects that result from their use.

In this assignment you will learn about the gaging, insulation used, and the composition of conductors. You will also be expected to learn some of the principles involved in the production and control of heat that is obtained from electricity.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 43-52, 72-83, 95-104, 127-135, 188-192.
- B. Marcus, Abraham, Basic Electricity, pp. 51-52, 254-274.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 77-85, 148-152.
- Q. National Electrical Manufacturers Association, Manual for Electric House Heating.

Questions and Problems:

1. What gage system is used in the United States for non-ferrous metals? What is non-ferrous?
2. Which conductor has the larger diameter, a #12 wire or a #13?
3. What two methods may be used to determine the size of a conductor?
4. Explain the procedure for gaging a conductor with insulation.
5. Why is some wire stranded? How can one determine its gage?
6. List the three best conductors in order.
7. List at least five insulating materials and places where they are used.
8. What three types of tape are commonly used for electrical splices? How are they used?
9. What tools may be used for cutting wire?
10. What precautions must be observed when stripping wire?
11. What are the three basic types of electrical splices?
12. List some methods of terminating or joining wires.
13. What is "tinning"? What is a "cold" solder joint?
14. What causes a conductor to become hot? What factors determine the resistance of a given conductor?
15. How is the cross section area of a conductor often stated?
16. What is meant by safe current carrying capacity? What factors will influence this figure?
17. What is the safe current carrying capacity of ordinary lamp cord (rubber covered 18/2 code designated is SP-1)? What would be the maximum wattage of a lamp(s) used with such a cord? If this cord were 100 feet long what would be the voltage drop of the cord at maximum current and 120 volts (remember there are two conductors)?

18. What would be the power loss if the cord in question number 17 were changed to #16 conductors? Use the same current and voltage.
19. List the devices in your home that use electricity for heating. Suggest some industrial applications with which you are familiar.
20. What principles are used in electric arc welding?
21. What safety precautions must be observed around arc welding? What is the normal voltage across an arc used for standard arc welding?
22. What principle of heating is involved in an electronic oven?
23. List some applications of inductive and dielectric heating.
24. What types of units are available for heating in homes?
25. What special considerations should be given when contemplating the use of electricity for home heating?
26. List the advantages and the disadvantages of electric home heating.

LIGHT FROM ELECTRICITY

One of the primary uses of electricity is to provide light. There are many different types of lamps and lighting systems, each having certain unique characteristics and applications. Some of these lighting devices use an arc, some are gas discharge while others simply heat a conductor to incandescence. In the near future electroluminescence will probably find considerable use.

As a consumer you should have a knowledge of the operating principles and applications of this use of electricity.

In this assignment you will study the operating principles of the several types of lighting devices and some typical applications.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buhan, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 195-199.

- D. Wellman, William R., Elementary Electricity, pp. 255-284.

Questions and Problems:

1. What is an incandescent lamp. Why are these lamps in an evacuated envelope (bulb)?
2. What types of bases are available on lamps? Give a typical application of each.
3. What sizes of screw bases are used? Give a typical application of each.
4. Make a diagram of a three-light lamp and explain how it operates.
5. Give some application of infrared lamps.
6. How does a photo flash lamp work?
7. What are the essentials in a circuit for a fluorescent lamp? Explain the purpose of each.
8. Explain how the fluorescent tube produces visible light.
9. Why have fluorescent lamps become so popular?
10. What types of fluorescent lamps are there? What color tubes are commonly used?
11. Explain the operation of a neon lamp. What color light does it produce?
12. List some applications of mercury lamps. What is "black light"?
13. What color light does a sodium vapor lamp produce?
14. What is electroluminescence?
15. What units of measurement are used when measuring light?
16. What factors should be considered when determining proper light for reading?
17. Where might one find arc lamps used?
18. What is L A S E R?
19. List some applications of photo-electric devices and explain how they operate.

- T. Sears, Roebuck and Company, Simplified Electric Wiring Handbook, pp. 2-63.

Questions and Problems:

1. Is Underwriter's Laboratories a government agency? What is its purpose? Why should one look for the UL label on electrical goods? Who makes use of the services of the Underwriter's Laboratories?
2. Why must an electrical installation in most places be inspected by an electrical inspector?
3. Electrical codes have what primary purpose?
4. List some common electric wiring devices, and indicate where they would be used in an installation.
5. What methods are used to fasten cables in boxes?
6. What types of cable are commonly used for wiring homes? What restrictions are applied to the use of each?
7. How must conductors be protected from the armor on armored cable?
8. What is EMT? What advantages are there in a conduit system of wiring?
9. What are the main parts of a house wiring system?
10. What color wires are in a three conductor cable? What is the white conductor called? What is its voltage to ground?
11. What voltages are supplied to your house? Is it necessarily the exact voltage specified?
12. What equipment is generally considered the service entrance? What should its capacity be (in amperes) for your community in a new installation? What size is in your home?
13. What is the total current that may be drawn from each ungrounded conductor in a 100 ampere service? What is the total for the whole service then? How much current flows through the neutral conductor if the load is balanced on the two ungrounded conductors?
14. What is a load center? What advantages does it offer over having all branch circuits fused at the main panel?
15. What purpose does a ground on a service entrance serve? How is this ground connection made in a home served by a municipal water system? How is this done if there is no water system? How long should a ground rod be?

16. Where are grounding type outlets to be located? Which terminal on the receptacle is connected to ground? What is the purpose of using a grounding type receptacle?
17. How far apart should outlets be located along a living room wall?
18. What is the minimum size wire that may be used for wiring electrical circuits? What is the maximum current it can carry safely? Why do many authorities recommend the use of a #12 conductor for most circuits?
19. What special provisions are required for appliances in the kitchen? What size wire should be used?
20. What three general types of circuits are used in a home?
21. What considerations should be given in locating lighting fixtures? Where should a light fixture be located in a closet? What factors should be considered when selecting a fixture for a particular room?
22. How deep should conduit or cable be buried in the ground? What material may be used for underground wiring? What type of outlets should be used for outside wiring? List several reasons for locating outlets outside. What advantages are there to underground wiring as opposed to overhead wiring? What limitations can you suggest?
23. Suggest reasons why temporary wiring should be done in such a manner as it would be acceptable as permanent wiring. What should be the primary consideration in any temporary wiring?
24. Where should a light switch be located?
25. When should multiple point control be used?
26. If one does not use a center ceiling fixture in a room, what light switching arrangement should be used?

LOW VOLTAGE WIRING

There are several devices around the home that are ordinarily wired with low voltage - less than 50 volts. Wiring procedures are a bit different for these devices than for regular outlets. Items falling in this classification are door bells or chimes, thermostats and communication circuits.

Since most modern homes use most of these systems, one should have some knowledge of them.

In this assignment you will study some of the rules governing low voltage wiring and location of telephones and thermostats.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 307-312.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 178-182.
- F. Crow, Leonard R., Learning Electricity Fundamentals, pp. 335-367.

Questions and Problems:

1. List several advantages of low voltage wiring over the wiring that would be used for 120 volt devices.
2. What voltages are commonly used for door bell transformers? Where are the transformers usually located?
3. What type of staples should be used for attaching bell wiring?
4. What considerations should be given in locating door bells or chimes?
5. What considerations should be given in locating a thermostat for the heating system?
6. List some advantages of low voltage remote control wiring for switching lights.
7. What principle is involved in switching with low voltage remote control wiring?
8. How are the switches connected to each other in low voltage remote control wiring?
9. Explain the operation of a door bell.
10. Explain the operation of a door chime.
11. Explain the operating principle of the receiver in a telephone.
12. What happens electrically in a telephone system when you dial a number? What happens at the exchange?
13. Explain the operation of a telephone transmitter.
14. At what voltage do telephones operate?
15. What considerations should be given in locating telephones? Why might one wish to locate telephone outlets on a plan before the building is built?
16. What are annunciators? Where might they be used?
17. Devise a signal system you might use from a house to a garage or barn. Make a diagram of your proposal and explain how it would work.

ELECTRIC MOTORS

One of the most widespread uses of electrical energy is to supply the power to produce mechanical energy. We do this with a motor. The basic principle of an electric motor is relatively simple the attraction and repulsion of magnetic fields. This is done in several different ways with different types of motors. Each have their advantages and limitations.

There are many applications of electric motors both in the home and industry; therefore, you as a student of electricity should have some knowledge of these applications and the principles involved.

In this assignment you will learn of the operating principles of several types of electric motors, the procedures involved in reversing their direction of rotation and their common applications.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 274-281.
- B. Marcus, Abraham, Basic Electricity, pp. 346-391.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 157-163.
- F. Crow, Leonard W., Learning Electricity Fundamentals, pp. 280-283, 294-333.

Questions and Problems:

1. What is the "field" of a motor? The "armature?"
2. How is the field connected to the armature in a universal motor? What type of D.C. motor is it?
3. Are D.C. motors still used in industry? Why?
4. Explain how a series motor operates.
5. How can one reverse a series motor?
6. What are some advantages of a universal motor? Where are they used?
7. What is meant by the term inductor?
8. Is there an electrical connection between the rotor and stator of an induction motor?
9. Describe the construction of the rotor in an induction motor.
10. Describe how an induction motor operates. How long are the starter windings used? What would happen if they were not turned off? How are they turned off?
11. What advantages does a capacitor start induction run motor have over a regular split-phase induction motor? List some typical applications of each type.
12. How does one reverse a split-phase induction motor?
13. Does a repulsion start-induction run motor have a wound armature?
14. Is there any electrical connection between the rotor windings and the stator windings on a repulsion start-induction run motor? On what principle does this type of motor operate?
15. In a repulsion start-induction run motor, what electrical difference exists in the rotor after it reaches rated speed? Explain. What advantages does this type of motor offer over a regular induction motor? What are some disadvantages?
16. How does one reverse a repulsion start-induction run motor?

17. What type of rotor does a shaded pole motor have? Where might one find this type of motor used?
18. If one has 120 and 240 volts available and wants to operate a motor with a name plate voltage of 120/240 which voltage should be used? How can the operating voltage of the motor be changed?
19. Three phase induction motors are commonly used where this type of power is available. What construction similarities are there between this type motor and a split-phase induction motor? What differences? What advantages does a three phase motor offer?
20. The frame of an electric motor should always be grounded. Why?
21. What type of guards should be used around motors and the equipment they are operating? Why?
22. Why are many motors equipped with "thermoguards," and similar circuit breakers or fuses? What do they protect? If a motor stops operating because of a thermal overload, what do you do?
23. Controllers are used in many motor installations. List several reasons for using these devices. Where have you seen them used? Suggest reasons why they were used in these particular situations.
24. What are the common speeds for induction motors?
25. What methods may one use to change the operating speed of a device driven by a motor?
26. List several types of drive mechanisms that may be used. List some examples of the application of drive mechanisms.
27. What information does one find on the name plate of a motor?
28. What routine maintenance should one perform on a motor?
29. List some advantages of magnetic starters when compared with manual starters.

ELECTRICAL CONTROL SYSTEMS

Electricity is used to regulate a variety of mechanical processes and to control the flow of certain liquid and gases. In the home these control devices are usually associated with the heating and cooling system. In industry they are used in all types of industrial processes from relatively simple machine operations to complex computer programmed processes.

This is a rapidly expanding area of electricity with which you should become familiar.

In this assignment you will gain some knowledge of the principles underlying the operation of these controls and a few of their typical applications.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

Questions and Problems:

1. List some applications of thermocouples used to control mechanical devices.
2. List some places where photoelectric devices are used to control operations or devices.
3. What principles are involved in humidity controls?
4. Why do many control devices incorporate relay arrangements?
5. What is a selsyn?
6. What does the term transducer mean?
7. Furnace controls provide examples of several types of controls. List the various controls that are on your furnace at home. Explain the purpose of each.
8. What is the purpose of a limit control?
9. Suggest some applications of time controls.

Covering Units 139-154

Name _____
Due _____

ELECTRICAL APPLIANCES

An important use of electricity in the home is for the operation of appliances. These appliances take many forms. Some are used for heating, some for cooling, and others are designed to provide rotary power.

Often appliances operate for many years with little attention other than periodic cleaning and lubrication; however, there are occasions when an appliance needs repair.

There are certain minor repairs of appliances that the homeowner can undertake and others which only trained personnel should handle; of course, in some cases replacement rather than repair is the answer. As a consumer of appliances you should have some familiarity with the operation of appliances and some understanding of the common problems, their cause and correction.

In this unit you learn of the principles of operation of the several types of appliances and typical troubles that can easily be repaired.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 282-292.
- B. Marcus, Abraham, Basic Electricity, pp. 255-261.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 148-152.
- G. Gabbert, William L., Electrical Appliance Service Manual.

Questions and Problems:

1. What principle is used for heat control (thermostat) on most heating appliances?
2. What are the principle parts of a toaster?
3. If a toaster does not operate, what parts of it should be checked? What preventative maintenance should be observed with a toaster?
4. How are thermostats connected in the heating circuit with relation to the heating element?
5. What are the principle parts of an electric clothes iron?
6. What types of cords must be used on heating appliances?
7. The downtown sections of many of our larger cities in the United States still use D.C. Most automatic irons are designed for use on A.C. only. What will happen if one of these automatic irons is used on D.C.?
8. Why should one only use distilled water in a steam iron?
9. How are the different degrees of heat obtained on an electric range? (application of series and parallel circuits) What voltages are used in electric ranges?
10. What precaution should be observed before working on any electrical appliance?
11. Most modern electric ranges have convenience receptacles on them which are fused in the range. Where are these fuses usually located? If you have one of this type at home, find it.
12. Why must the frame of an electric range be grounded?
13. How does an electric water heater operate?

14. Why shouldn't an electric coffee maker be immersed in water? Why shouldn't an electric coffee maker be operated without water in it?
15. Why should any washing machine be grounded by a separate conductor used only for grounding?
16. What type of motor is usually used on a conventional washing machine.
17. Why shouldn't the water level in the tub be permitted to get above the height of the agitator?
18. Why should the wringer rolls be washed off after each laundry? Why should the pressure on the wringer rolls be released when not in use?
19. What are probable causes of trouble in an automatic washer?
20. What is the principle of operation of refrigerants as used in refrigerators and air conditioners?
21. What parts of a refrigerator are operated electrically? What purpose does each serve?
22. What differences are there between refrigerators and air conditioners?
23. If a particular air conditioner is rated as being a 3/4 Ton unit, what does it mean?
24. What protective maintenance should be performed on a refrigerator? A freezer? An air conditioner?
25. What type motor is normally used on household vacuum cleaners?
26. What things would you check if a vacuum cleaner did not operate?
27. If a fan operates with more than a reasonable amount of noise, what might you expect is wrong?
28. What factors should be considered in determining if an appliance should be repaired or discarded?
29. What factors should be considered in selecting an appliance for purchase?
30. Are grounded and short circuits necessarily the same? Explain.
31. What is meant by checking a device for continuity? What pieces of equipment might be used for this? What are the voltage considerations with each of these testing devices?
32. The National Electrical Code requires that current carrying metal parts of portable equipment must be grounded. Why was this regulation enacted? How can it be carried out?
33. What limitations are there in the use of extension cords? Where can parallel rubber lamp cord (SP-1) be used? Are there places where it may not? List some. Types S, SJ, and SO cords can be used for hard usage. How does the construction of these cords differ from type SP?
34. What types of caps (plugs) and cord ends may be used on extension cords? Where may they be used?
35. Most manufacturers of electric dryers recommend that their dryers be vented. How is this normally done?

APPLIED ELECTRICITY

Informational Assignment 19
Covering Units 155-160

Name _____
Due _____

AUTOMOTIVE ELECTRICITY

The modern automobile contains nearly every application of electricity. In it we use electricity for heat (igniting the fuel), light, mechanical motion (there are many electric motors in the modern car), chemical effects (battery) and mechanical generation. There are several electrical principles involved in the distribution of the electrical energy too.

Since the automobile is familiar to everyone and contains so many electrical devices, it makes a good machine to see many of the applications of electrical energy.

In this assignment you will study some of the electrical devices that permit the modern automobile to operate as it does.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 292-301.
- B. Marcus, Abraham, Basic Electricity, pp. 209-213, 341-344.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 167-176.

Questions and Problems:

1. If you examine the wiring to most electrical devices in an automobile, you discover there is only one conductor going to the device. Where is the return conductor?
2. List the electric motors in your family car.
3. Why is a relay used on the starting motor?
4. What type motor is used for the starting motor?
5. Approximately how much current does a starting motor use?
6. What is the purpose of the voltage regulator?
7. How can an alternator be used as it is on some cars, to charge the battery?
8. What is the purpose of the cut out relay? The current regulator?
9. What electrical principle is used in the ignition coil? How does it work?
10. What causes the pulsating voltage in the coil primary?
11. Make a diagram of the automobile ignition system and explain the purpose of each part.
12. Approximately what voltage is used at the spark plugs?
13. Why doesn't this high voltage kill a person?
14. What is the purpose of the capacitor across the points?
15. How are the two light intensities obtained in the automobile headlight?
16. How are automotive lighting circuits protected?
17. How do the directional signal lights operate?
18. Is there danger of fire with the low voltages used in the automobile? Explain.
19. How can battery terminals be kept clean? Why should they?
20. What gas is given off when a battery is being charged?

21. Why must one turn off a battery charger before disconnecting it from the battery?
22. Why should one use distilled water when adding water to the battery?
23. How does a horn operate?
24. What safety features are incorporated in the design of the sizes of fuses?
25. How do most fuel and temperature gages in automobiles operate?

APPLIED ELECTRICITY

Informational Assignment 20
Covering Units 161-176

Name _____
Due _____

ELECTRONICS

One of the most rapidly growing aspects of the electrical industry are those areas that make use of vacuum and gas tubes and semi-conductor devices. We generally refer to this phase of the industry as electronics.

These devices have many applications for communications systems such as telephone, radio, TV and telegraph and for a variety of industrial applications where communication is not involved. This later classification would include automatic controls for machines (automation), dielectric heating, photo-electric devices, computers, and many others.

In this unit you will become acquainted with some of the fundamental concepts of these electronic circuits and some of the safety precautions that should be observed in their use.

Assignment:

1. Read the reference(s) assigned below.
2. Study the questions and problems listed below and write your answers. Use complete sentences.
3. Be prepared to discuss these problems and questions in class.

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 312-358.
- B. Marcus, Abraham, Basic Electricity, pp. 394-464.
- C. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 185-201, 206-212, 214-221, 222-228, 232-239.

Questions and Problems:

1. What property of selenium, germanium and silicon is used in electronics?
2. How does a vacuum tube diode work?
3. What is the difference between a half wave and a full wave rectifier?
4. What is the principle of operation of a triode vacuum tube?
5. What things about a tube can be tested with a tube tester? Does a tube tester necessarily test all aspects of a particular tube's operation? Is the statement "the best test for a tube is the circuit in which it is to operate" valid? Why?
6. What is a semi-conductor? How does a transistor differ from a diode?
7. What advantages do transistors have when compared to vacuum tubes? What precautions must be observed with transistors?
8. What are the operating principles of transistors?
9. What are the basic parts of a crystal set? What function does each serve?
10. Make a block diagram of a superhetrodyne radio receiver. Explain the purpose of each part.
11. How does a radio speaker operate?
12. Make a block diagram of a stereo hi-fi including a tape input, radio input, turntable input, pre-amplifier, power amplifier, two speaker enclosures. Explain the purpose of each.
13. Make a block diagram of a public address system.
14. What precautions should be observed when working with microphones? What procedure should be followed if a microphone cable is going to be longer than 50 feet? (use low impedance microphones and cables)
15. What is feed back? What should be done if feed back occurs? Why should a microphone be located behind the speakers?

16. Make a block diagram of a television receiver and briefly describe the purpose of each section.
17. What is an implosion? Why does this hazard exist with a TV set?
18. What shock hazard exists with most table model radios and TV sets? How can this hazard be reduced?
19. What voltages are used in TV set circuits?
20. How does a TV picture tube function?
21. What is the basic difference between A.M. and F.M.?
22. What methods of modulation are used in TV?
23. What are some of the advantages of F.M. as compared with A.M.?
24. Who licenses and allocates frequencies to radio stations in the United States?
25. What precautions must be observed in grounding antenna systems? What size grounding conductor should be used for the mast? Why shouldn't one run an antenna over a power line? How far must antennas and lead-ins be from power lines? What is the purpose and how does a lightning arrester work?
26. What is a capacitor? What effect does a capacitor have in a D.C. circuit? What effect does it have in an A.C. circuit?
27. What are ultra-sonics? What are some applications of the principles of ultra-sonics?
28. What are some hobbies that can develop from an interest in electronics?
29. List some things that may cause interference in a radio or TV. How may these be eliminated or reduced?
30. What are the requirements for a Citizen's Band license? What are the limitations in the use of these frequencies?
31. What are the classes of license for amateur radio? How long are the licenses valid for each class? What limitations are placed on each?

APPLIED ELECTRICITY

Informational Assignment 21
Covering Unit 177

Name _____
Due _____

OCCUPATIONS IN THE ELECTRICAL INDUSTRIES

The electrical industries provide many opportunities for employment in a wide range of jobs. The jobs vary greatly in their requirements, duties, qualifications, training required, and wages paid. These jobs vary from unskilled, requiring a few hours of training, to engineering and other professional levels that may require five or more years training at a college or university. People with a knowledge of electricity are needed in such diverse areas as: medicine, technical writing, servicing occupations, construction, teaching, data processing, sales, refrigeration, electrochemistry, power and light utilities, maintenance, telephone, radio and TV, research, product design and others.

To illustrate the demand, it is estimated that by 1970 the United States will be short two and a quarter million electronic technicians (1963 data). The electrical field is so broad that there are few areas of employment that are not influenced by electricity.

The purpose of this assignment is to acquaint you with some of these career opportunities and the training necessary to enter and progress within them. Information of this type will help you in the process of selecting and preparing for your occupational future.

Assignment:

1. Read the reference(s) assigned below.
2. Select an occupation in a field of electricity that interests you and answer the questions listed below concerning that occupation. (The teacher may wish to use this as a written report or as an oral report to the class.)

References:

- A. Buban, Peter and Schmitt, Marshall L., Understanding Electricity and Electronics, pp. 360-388.
- B. Steinberg, William B. and Ford, Walter B., Electricity and Electronics - Basic, pp. 1-15.
- R. Panel of Consultants on Vocational Education, Education for A Changing World of Work. U. S. Department of Labor, Occupational Outlook Handbook.

People in the occupations in the community.
College and technical school bulletins and catalogs.

Questions:

1. Training required to enter the occupation:
 - a. What type of training is required? Any other entrance requirements?
 - b. Where might this training be obtained?
 - c. How long does this training take?
 - d. What financial resources are needed to undertake the training?
2. Job opportunities:
 - a. Approximately how many people are employed in this field?
 - b. Where might one in this field be employed?
 - c. What is the nature of opportunities for advancement?
 - d. What are the trends in employment in this field?
3. Working Conditions:
 - a. What is the nature of the work required in this occupation?
 - b. Where is the work generally located? Inside? Outside? Seasonal? Traveling required? Particular parts of the country? May the job require moving?
 - c. Are there any special physical requirements for a worker?
 - d. What are the job hazards?
 - e. Are any special personal-social traits desirable?
 - f. What are the normal working hours?
 - g. What are the normal starting salaries? After 5 years?
 - h. Is union or other organizational membership required or desirable?
 - i. Does the occupation offer an opportunity to perform a desirable service to your fellow citizens?

- j. List the advantages of this occupation.
- k. List the disadvantages of this occupation.

Optional Addition:

- 4. Consult the want-ad sections of several metropolitan newspapers and list job opportunities of the type you are interested in.
- 5. Compose a dummy letter of application (the teacher may want to do this in cooperation with the English Department).

System Dispatchers in the Kansas City central dispatching room, Kansas City Power & Light Company. In the background is a mock-up of the distribution network. (Courtesy of Kansas City Power and Light Company.)

ORGANIZING TESTING AND EVALUATION MATERIALS

Achievement in teaching is tested for several reasons and by several methods. Testing can be used to diagnose learning difficulties, motivate learning, evaluate teaching, evaluate learning or ascertain progress, establish a basis for marks, guide in teaching, and as a comparison between schools, classes, and students.

There has been some confusion in the past between evaluation and measurement. Evaluation involves value judgements while measurement is a more objective means of assessing the magnitude of a property. They are different processes, but there is no conflict between the two as both are essential in ascertaining student growth. In teaching industrial subjects, it becomes necessary to measure skill and the speed with which that skill can be performed, to measure factual information learned by the student, to evaluate attitude and work habits of students, interest, problem solving ability, progress of achievement, consumer knowledge, and the appreciation of design as well as other related aesthetic values. As indicated, these topics are either objective, qualitative or a combination of both.

In any type of testing it is imperative that we have an aim or goal to be reached. In the case of teaching, those ultimate goals are the objectives. These objectives provide standards by which the measurement can be made and thus evaluated. In the case of measuring skill, we are interested in observing the performance and examining the finished product. Speed, accuracy, and efficiency can also be checked, thus enabling the teacher to give helpful suggestions to the student for improving performance. The most common type of measurement is the testing for mastery of informational content or factual knowledge. This is usually done by written or oral examinations carefully prepared in advance. Progress is usually measured by the day-to-day advancement of student achievement and from the student's constructional efforts in the shop. Effort, attitude, and personality traits are impossible to measure and are usually evaluated through observation.

Test Construction (See Appendix for sample unit test and sample final exam).

Teachers of industrial subjects may use one or more of the many types of evaluative, checking, and testing devices very effectively. Observation, in and out of class, examination of the finished product or job plan, and oral test, performance test, procedure test, vocabulary test, progress chart, self evaluation, and rating scales (for interest, aptitude, etc.) are some of the most common types of testing devices. Some of the more common types of test items that lend themselves well to industrial education subjects are: (1) true-false, (2) listing or inventory, (3) multiple-choice, (4) completion, (5) best answer, (6) matching, (7) identification, (8) procedure, (9) problem solving, and (10) essay.

What constitutes a good test? Listed below are questions that should be answered in determining the quality of a test.

1. Validity -- does the test measure what it purports to measure?
2. Reliability -- does it measure with any degree of consistency?
3. Objectivity -- can the test be scored without bias so that two or more persons scoring the same test will arrive at the same score?
4. Discriminating -- does it differentiate between those students who know the material and those who do not?
5. Comprehensive -- does the test have sufficient breadth in sampling to cover the course or area thoroughly and fairly uniformly?
6. Administration -- is the test easily administered and scored?
7. Variety -- are the questions and total composition of the test arranged in a manner that will decrease boredom and fatigue?
8. Ambiguity -- is the test free from trick questions and statements that are not clear?

If these items are checked and satisfactorily considered, the result will be a test that is well constructed and one which can be of much use to the teacher, as well as a learning device for the student.

The method or procedure for the construction of good tests is relatively simple, providing certain steps are followed in its construction. Itemized below are the steps found to be helpful in building good tests.

1. List the major objectives for which an appraisal is desired.

2. Examine the course content for additional objectives.
3. Analyze and define each objective in terms of expected student outcomes.
4. Establish a table of specifications or format for the various type of questions.
5. Construct one or more test items of the various types of questions for each objective listed.
6. Assemble the items for the test, keeping in mind the format for easy scoring.
7. Write clear and concise directions for each type of question.
8. Study every aspect of the assembled test for the following:
 - a. Does each item really measure the student's attainment of the objective?
 - b. If not, how could it be revised to do so?
 - c. Is each set of instructions clear? Do they apply to every item in the group, or do some items require specific directions?
 - d. Is there plenty of space to write the responses to the questions?
9. Construct the key.
10. Have other instructors criticize, and if possible, take the test.
11. Make any necessary revision.
12. After the test has been administered to one or two groups of students, analyze, revise, and improve it.
13. Continually revise the tests to keep them current with latest developments in the field. The construction of a good test is never completed.

The following information deals with the wording of directions for various types of common test questions. It should be considered only as a guide and may be changed by the individual instructors to better meet their needs.

TRUE-FALSE

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. The total resistance in a series circuit is equal to the sum of component resistances.

COMPLETION

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. An ammeter is connected in _____ with the device being measured.

MULTIPLE-CHOICE

Directions: In the space at the left of each statement write the letter of the item which will make the statement both complete and true.

- _____ 1. Resistance wires used in electrical heating devices are made from (A) silver; (B) copper; (C) aluminum; (D) nichrome.

LISTING

Directions: List the items called for in each of the following. Select your answers carefully.

1. List the three most commonly used splices:

(A) _____ (C) _____
 (B) _____

MATCHING

Directions: In the left hand column is a list of electrical devices. The right hand column contains symbols used to represent these devices. Match the symbols to the terms by placing the letter of the symbol in the blank at the left of the appropriate device.

_____ 1. Antenna

_____ 2. Fuse

PROCEDURE

Directions: List in order of sequence, the operation of a glow switch start fluorescent lamp.

- | | |
|----------|--------------------------------------|
| _____ 1. | A. Ionization of neon gas |
| _____ 2. | B. Ionization of mercury vapor |
| _____ 3. | C. High induced voltage from ballast |
| _____ 4. | D. Heating of bimetallic strip |
| _____ 5. | E. Cooling of bimetallic strip |

BEST ANSWER

Directions: Each of the statements listed below is followed by several possible answers. Choose the answer that best completes the statement and place the letter in the space provided at the left.

- _____ 1. The recommended gage for wiring a home duplex receptacle would be (A) #16; (B) #14; (C) #12; (D) #10.

PROBLEM

Directions: Read the problems carefully and work each one carefully showing all work performed to arrive at your answer. Label each answer.

1. How much current will flow in the circuit below?

100 volts

$R = 50 \text{ ohms}$

ESSAY

Essay questions can be worded to suit the objective to be measured. It should be kept in mind, however, that the question should require the student to compare, explain why, describe, or tell how certain things occur. Care should be taken to avoid asking the student to list or enumerate in this type of question.

No attempt has been made here to discuss the standardized tests that are available or the method of marking, scoring, or tabulating scores on the different types of tests.

PROGRESS CHARTS

Methods for posting or keeping records of the students' progress can be done by means of progress charts. These charts are designed to be used for both broad and general tabulation or observation and are not constructed to be highly objective. Progress charts usually are of two types, those for manipulative content and those for informational content. This type of chart is designed to quickly indicate which instruction units have been experienced by the student. Some variations of the progress chart have been made so that different degrees of performance can be entered and thus serve an evaluative function. The chart itself, however, is a qualitative device and can be used only for arriving at generalizations of the student's ability.

BOOKLETS, PAMPHLETS, CHARTS, MAGAZINES, ETC.

There are many materials other than books that can be used to advantage as reference material in presenting information. Some of these are listed below. Those with an asterisk should be obtained as the information in them is of definite value to this course. Most instructors will also want to obtain many of the other materials. New material of this nature is being produced at irregular intervals and it is recommended that the instructor watch for announcements of new material in current issues of Industrial Arts and Vocational Education, School Shop, and The Industrial Arts Teacher.

FILMS

There are many 16mm motion picture films and 35mm slide films available which deal with the area of electricity. Many of these are quite valuable in presenting electrical concepts to the student. Those of this category known to us at the time of writing were included.

The abbreviations used are:

MU - University of Missouri, Audio-Visual Department, Whittier Hall, Columbia, Missouri.

USOE - U. S. Office of Education sponsored films that were available from the International Film Bureau. These may only be available from rental agencies now.

EBF - Encyclopedia Britannica Films, Inc., 1150 Wilmette Avenue, Wilmette, Illinois.

Westinghouse - Westinghouse Electric Corp. These films are not available from Westinghouse for use in secondary schools. However, they may be available from rental agencies.

Jam Handy - Jam Handy Organization.

SVE - Society for Visual Education, Inc., 1345 Diversey Parkway, Chicago 14, Illinois.

Modern Talking Pictures - Swank Motion Pictures, Inc., 621 N. Skinker Blvd., St. Louis 30, Missouri, or 3718 Broadway, Kansas City 11, Missouri.

Association Films, Inc., 561 Hillgrove Avenue, La Grange, Illinois.

U. of Minn. - University of Minnesota, Audio-Visual Extension Service, 115 T.S.M.A., Minneapolis 14, Minnesota.

International Film Bureau, Inc., 332 South Michigan Avenue, Chicago 4, Illinois.

Coronet Films, Coronet Building, Chicago 1, Illinois.

Some films of value may be available from local armed forces recruiting offices.

ORGANIZING INSTRUCTIONAL AIDS FOR APPLIED ELECTRICITY*

Introduction

Educators have long agreed that the best type of learning experiences are the direct, purposeful experiences which students encounter in their daily living. It is not always possible in the classroom to provide situations which let the pupils have this type of experience. It becomes necessary to develop what is called a contrived experience which will explain the principles involved in a manner that can be easily understood. Some of the most common contrived experiences or instructional aids are working models, cut-away models, mock-ups, scaled miniatures, demonstrations, chalk-board drawings, charts and nomographs, field trips, still pictures, motion pictures, television, tape recordings, specimens, and objects.

A good instructional aid is the result of an attempt to vitalize the instruction by broadening the sensory experience of the learner. Good instructional aids can be characterized as being: 1. large enough to be seen by the whole class, 2. readily stored, 3. durable, 4. made to scale, 5. in keeping with recognized technical standards, 6. designed for a specific purpose, 7. designed to emphasize important parts and only include essentials. For the most effective use, the material should be unobtrusive and ready to go at class time. Everyone should be able to see the material, the room should be at a comfortable temperature and well ventilated. Due to the uniqueness of these different types of experiences some lend themselves best to specific situations. The following paragraphs explain the advantages of each of the common contrived experiences and indicate how each can be used most effectively in classroom instruction.

Models

Next to direct contact with the actual object, a model is probably the next best thing, and in some cases, a model may serve as a better instructional aid than the real thing. It is usually made of wood, metal or plastic and is a different size than the actual object. Though it may or may not be workable, the model is similar to or identical with the original in every respect except size. Due to this fact, models are used in instances where the object being studied is too large to study in detail or is not readily accessible to the class. There are several types of models, each with a specific purpose. The cut-away model is very good for seeing the actual working parts of an apparatus with sections or portions removed for clarity. For example, the walls of a steam turbine can be removed to show the inner workings of the turbine blades or other components, without completely separating the original piece.

Mock-Up

A mock-up is slightly different from the model in that it is used mainly to show only a portion of the entire object. A good example of a mock-up is the cooling system of an automobile or section of an electrical circuit which has been laid out on a "bread board" for purposes of studying connections or circuit arrangements. Fuel systems, hydraulic systems or other parts of the whole object can be studied in detail when the mock-up is enlarged or rearranged so that every part is placed on the board. You can produce a different mock-up of the same machine by making only a few parts of it workable while ignoring other parts for the time being. The essential difference, then, between a model and a mock-up, is that a model is a recognizable imitation of the original (whether workable or not), whereas a mock-up alters the essential elements that are being studied in the original and concentrates on specific sections or elements.

Size, time, physical inaccessibility, and processes can be shown with the use of models or mock-ups in a relatively satisfactory manner. Another help in using models or mock-ups is color-coding or cross-hatching certain items of interest for definition. Every model or mock-up is, in a figure of speech, a simile or metaphor of the real thing; hence, the ever-present need for directing attention from the model to the reality for which it stands is a necessity. The differences as well as the likenesses should be pointed out when using contrived experiences in teaching.

Specimens and Objects

It is not possible for students to take a tour of the world, but we can bring fragments of the physical world into the classroom in the form of objects carefully presented in their realistic backgrounds. Such specimens are by no means an ideal solution, but since we cannot possibly experience the direct reality, they are good substitutes. Specimens enable us to learn many things that would

*Adapted from Drafting and Design Technology, published jointly by the Missouri Department of Education and the University of Missouri.

otherwise be unobtainable. The advantages and limitations are true of objects--pieces of leather, asbestos, porcelain, plastic, glass, copper, minerals, metals and alloys--that become necessary in teaching. These fragments are useful because they are the "real things" but they are limited by being torn from their context. Objects and specimens enable us to build generalizations that would otherwise cost prohibitive amounts of time and effort. The largest task of the teacher is choosing the proper aid for specific situations and this becomes an individual problem. Never show or substitute the sign for the real thing, if it is possible to show the real thing.

Demonstrations

In teaching, the term demonstration is used in its broad meaning to include the teaching of ideas, skills, attitudes, processes and other intangibles. We are interested here in the demonstration method and its possibilities. There are several facts about demonstrations that should be considered. We are not limited to material objects or to ideas immediately connected with them. In teaching a skill, a demonstration through guided performance is virtually indispensable. An effective demonstration requires more than a demonstrator and an audience. It requires materials with which to demonstrate and a knowledge of how to use the materials effectively. Films and television constitute an excellent media for demonstration in that the demonstrator can stop and ask if the step has been clearly understood before proceeding to the next step. This direct communication between the teacher and the student is a vital part of the demonstration as are answering student questions at the close of the performance.

Preparing a demonstration by the individual teacher is as arduous a task as performing it. A demonstration is a dramatic performance and as such needs practice and planning. The steps in preparing a demonstration are planning, rehearsing, execution, and timing. It should be kept in mind that the instructor should have decided in advance what the students are to learn, what they already know, how they can be motivated to learn more, and what experiences are likely to develop such learning. For clarification and understanding, certain steps should be followed in giving a demonstration. The teacher should establish rapport with the students, he should know the subject thoroughly, point out the key points and discuss them as the demonstration progresses, and evaluate at the completion of the demonstration. The teacher should also keep the demonstration as simple as possible, and should see that questions and discussions during the demonstration do not digress from the main ideas. He should constantly check to see that the demonstration is being understood and care should be taken not to hurry the presentation or to make it too lengthy. Any materials that are to be handed out to the students should be given to them at the end of the presentation to prevent the students from reading it during the demonstration. In evaluating the demonstration you will want to know what the students have learned and gauge your success in using the demonstration method.

The same principles as discussed above about the demonstration are used in chalkboard drawing. The chief advantage of the chalkboard is its availability and ease of use. Care should be taken, however, to be neat and not to block the students' line of vision to the example you are drawing. Charts and graphs can be used as variations of the chalkboard but cannot be altered as easily, and in time certain information may become outdated. The flannel board is another derivation of the chalkboard demonstration and is in wide use in schools and businesses. The chief advantage of the flannel board is its capability of being changed and the absence of messy chalk dust during use. Storage of materials, however, becomes a problem if the flannel board is used to any great degree.

Field Trips

The field trip is classed as an observation of a direct purposeful experience. You can discover what it means by seeing it in operation. A field trip differs from a demonstration in that it is usually not followed by participation or activity by the students. The richer the experience with the ideas presented in observation, the more meaningful that situation will be. The more meaning we bring into our experience, the more meaning we can get out of it. Field trips offer experiences rich with meaning. It becomes necessary to teach the students to be critical and selective in their observations, and to look for specific items or situations that may be overlooked in casual observation. The field trip is especially rich in providing a total experience. It can influence one's ideas, emotions, and values. The field trip promotes school and community relations and problems of the community or industry can be brought back to the classroom.

The over-all procedure for planning a field trip is fairly simple. Advance decisions relating to the purposes of the trip, the responsibility for planning or pointing out what to look for, the frequency of taking field trips, and the evaluation of experiences gained on the trip are essential. Because the field trip takes considerable class time, it must always be justified in terms of educational gains. Planning for field trips involves a direct relationship with the goals or objectives of the school, objectives of the subject area, and the organization of experience with which one is working. One basic technique of the

field trip is to make each student directly responsible for specific information that can be gained by observation on the trip. This advanced planning gives the student direction and makes him responsible for his own learning.

After the instructor is convinced that a field trip is warranted, he should make a preliminary survey and prepare a list of situations, points of interest, and other information about the place to be visited. To obtain consent from the school administration for the trip, to obtain parental consent where necessary, and to make an estimate of the length of time involved, and the round trip schedule should be included in the over-all planning. It should be decided whether or not the entire class or just a selected group will make the trip. Final arrangements with the authorities at the destination point and with school authorities should then be conducted. The last step is then to plan the transportation route in detail and arrange financing.

Having discussed the administrative arrangements, the teacher should make the following preparations with the students prior to the excursion:

1. Arouse student interest in the trip (class discussion, photographs, bulletin board, and other similar material).
2. Discuss with the students the problems that the trip can help solve.
3. Make clear to students the purpose of the trip.
4. Develop background by consulting reference materials.
5. Work out with the students the specific points to observe during the trip or questions that the trip will answer.
6. Establish with the students the standards for safety and behavior.
7. Prepare and distribute to students any materials that can be used profitably in the course.

The pleasure and much of the value of a field trip depends on the quality of the teacher-student preparation. The evaluation of the field trip should be a joint enterprise between student and teacher. Such questions as the following should be asked:

1. Did the trip serve our purpose?
2. What factors accounted for its success?
3. Was there sufficient time?
4. Were the route and means of transportation satisfactory?
5. If we took the trip again, what changes would we make?

In evaluating the results of the trip in line with the growth of the students, the following questions might be asked:

1. Did the class see what they wanted to see?
2. What things did they like best?
3. What things did they like least?
4. Were any students disappointed? If so, why?
5. Were attention and interest consistently maintained?
6. Were the guide services adequate or deficient?
7. Were there discipline problems that need to be considered?
8. Did the trip accomplish what it was supposed to in the light of the preparation of the students and the objectives of the trip?

An objective test covering specific details of the trip should be developed and administered. Also an attempt should be made to measure the concepts and generalizations that were developed or changed as a result of the trip.

Motion Pictures

Through basic motion-picture techniques, such as direct photography, changing speed photography, photomicrography, and animation, great areas of desirable, but heretofore inaccessible, in-

structional experiences and visualized explanations can now be brought into any classroom. Two broad types of sound motion-picture films are being used in classroom work: the direct teaching film and the supplementary teaching film. The latter, which is produced for purposes other than teaching, is often useful in instructional situations.

The classroom use of teaching films has been found to: increase pupil interest in the subject, increase learning, increase retention as well as to stimulate greater interest in reading.

The teacher who uses films in the classroom must accept new and increased responsibility if they are to be used with greatest effectiveness.

It is the teacher's responsibility to choose wisely from large numbers of teaching films those which will make the greatest contribution to the instructional program. In selecting, he must consider such characteristics as authenticity, grade level, curriculum purpose, quality of photography and sound, organization, and study helps.

The greatest responsibility is incurred when the teacher actually prepares to use the film in the classroom. The film should never be accepted as a mechanical substitute for good teaching. Rather, a carefully selected teaching film is a tool of instruction which, wisely used, can bring results in terms of interest, learning, and pupil activity far beyond those previously accomplished with traditional learning materials.

Other teacher responsibilities for using films in the classroom include awakening pupil interest and stimulating the desire to learn, conducting vocabulary study before the film is shown, clarifying with pupils the purpose in viewing the film, providing good classroom conditions for film viewing, providing for individual and group evaluation as well as appropriate follow-up activities. In the hands of an intelligent, well-trained, and understanding teacher, the teaching film can be a vivid, interesting, dynamic and socially useful instrument of instruction.

The following items are offered as a more direct guide to the use of motion pictures in the classroom:

1. Select the film on the basis of the purposes, needs and interests of the class in question.
2. Plan the lesson so as to make maximum use of the material contained in the film.
3. Make use of other materials such as reference reading, objects, reports, and similar items, dealing with the general area covered by the film.
4. Tell the class about the film, such as the film title, the running time, where the picture takes place, characters--if any, the vocabulary involved and its general context.
5. Discuss the film before showing to the class to prepare them on what to look for, problems arising, new concepts brought out, and for other intangibles.
6. Show the film (twice if technical and rather complicated and you feel that the material will be more easily learned).
7. Discuss the film after showing, answering questions raised by the pupils, discussing the content of the film as it relates to the present classroom situation and the new learnings that the students should have obtained.
8. Engage in follow-up activities by continuing study in related readings, written reports, field trips, other films, and by giving tests over the information covered.

Television

The use of television in the classroom is still not too widely accepted because of the expense involved and the experimental nature of much of its use. It is, however, one of the many good ways of improving demonstrations and probably will find increasing use as better techniques are developed. If the equipment is available you may want to consult: Barnard, David P., "Audio-Visuals," Industrial Arts and Vocational Education, 52:10, 12, 44, January 1963; and Diamond, Robert, "Single Room Television," Audio Visual Instruction Magazine, pp. 526-527, December, 1961.

Overhead Projectors

Transparency projectors offer a practical method of presenting certain material, now that rather low cost reproduction methods are available. This system has several advantages, existing drawings

and diagrams may be reproduced or the teacher may prepare his own and they may be reproduced on transparent film. These transparencies are then projected on a screen which may be viewed with the room fully lighted. The teacher may also mark and sketch directly on the transparent film to provide emphasis.

Opaque projectors can be used effectively in projecting pictures, diagrams, and other illustrations directly from the printed page. However, with this type of projector a reasonably dark room is needed.

Slides and Film Strips

Slides and film strips are very effective when used following the procedure as outlined for motion pictures. Many commercially available film strips may be purchased or borrowed, some of which may have a record or tape narration to accompany them. Slides may be borrowed, purchased or made by the teacher to suit his own purposes in improving the presentation.

Bulletin Boards and Displays

An effective method of constantly keeping materials in front of the students is to plan for effective and well-arranged bulletin boards and displays. The teacher should use care in planning to see that a central theme is carried through and, of course, the material should be frequently changed.

APPLIED ELECTRICITY SHOP LAYOUT

SUGGESTED EQUIPMENT, TOOLS AND SUPPLIES FOR APPLIED ELECTRICITY

Listed in this section are the items of physical equipment and tools as well as expendable supplies which are essential to providing the student experience outlined in this course of study. In addition to providing the essentials for Applied Electricity, these items will be basic to advanced work in electricity and electronics when advanced courses are added to the program.

It is strongly urged that test equipment be purchased pre-wired rather than in kit form. The instructor will not have time to adequately supervise the construction of kits as a new program is being organized.

It is assumed that the maximum class size will be 24 students. Adjustments in quantity of equipment and supplies should be made if variation from this maximum is anticipated. The equipment is planned so that experiments will be performed by students working in pairs.

Immediately following many of the items in the list will be found suggested manufacturers and model numbers that will indicate the appropriate quality and cost. This list of manufacturers is intended to be suggestive not exhaustive. If the equipment is purchased on a bid basis, lower prices may be obtained. A statement indicating that the material will be used for educational purposes should accompany all requisitions in order to receive educational discounts.

12	Volt-Ohm-Milliammeter (20,000 ohms/volt D.C./5,000 ohms/volt A.C.) \$50 each (B&K Model 360, \$58.75; Triplet #630 or #630PL, \$49.50; Eico #555, \$34.95; Weston #980, \$53.50; Precision #120, \$44.05; Simpson #260, \$48.95; Paco #M-40W, \$37.50) One meter for each work station	\$ 600.00
1	Vacuum Tube Voltmeter (11 megohm input) (RCA #WV-77E, \$43.95; Triplet #631, \$69.50; Eico #222, \$42.95; #221, \$39.95; #232, \$49.95; Knight, \$39.95; Simpson #311, \$69.95; Heathkit #1MW-11, \$46.75; Paco #V-70, \$47.50; Precision #68, \$54.50)	50.00
1	Oscilloscope, 5 inch (Eico #460, \$129.50; Precision #ES-150, \$146.95; Simpson #466, \$149.95; Paco #5-55W, \$139.50)	140.00
1	Tube Tester (It is recommended the tube checker include more than just emission tests. The checker should include mutual or transconductance. Emission testers are available at less cost, but they are not as satisfactory. Since one checker is all that will be purchased in the foreseeable future the slight additional cost is more than justified. It is further recommended that a transistor testing attachment be purchased if not part of the instrument.) (Precision #10-40, \$149.50; B&K #700, \$166.55; Hickok #800, \$179.50; Seco #107A, \$149.50)	180.00
1	Voltage Regulated Power Supply (0-400 volts D.C.) (Kit) (Heathkit #PS-4, \$56.95; Paco #B-12, \$69.95)	70.00
5	A.C. Ammeter (0-25 amperes) (Simpson #370, \$22.95)	115.00
10	D.C. Ammeter (0-1.5 amperes) panel type, mount in cases (often suitable meters are available in surplus material, see appendix to make them usable)	150.00
1	Volt-ammeter (dry cell type) (Sterling #35)	3.75
1	Battery Tester (Eico #584, \$12.95; RCA #WV-37B, \$24.95; Simpson #379, \$29.95)	30.00
1	Audio Generator (Eico #377, \$49.95; (kit) \$31.95; Heathkit (kit) #AG-9A, \$39.95)	50.00

1	Wattmeter (Simpson #390, \$48.95; #391, \$43.95; Triplett #660, \$40.00)	45.00
1	Resistance-Capacitance Substitution Box (Eico #1140, \$19.95)	20.00
1	A.C. Ammeter (clamp-on style) (Pyramid-Amprobe #RS-3, \$52.50; Weston #749, \$51.50)	50.00
1	Tachometer (direct reading style)	13.00
1	Transformer, Variable 7.5 ampere (Powerstat #116, \$24.00; Ohmite #VT8FC, \$26.50)	25.00
1	Megger (for measuring insulation resistance of motors)	75.00
1	Growler	40.00
1	Capacitor substitution (for electric motors)	30.00
1	Radio Frequency Signal Generator (Eico #320, \$29.95; Paco #G-30, \$39.95; Knight #516, \$29.95)	40.00
1	Grid-dip meter (Eico #710, \$49.95)	50.00
12	Headphones, single	13.00
1	Battery Eliminator, 6 and 12 volt (Eico #1060, \$47.95; Paco #B-10, \$39.50)	50.00
1	Capacity Checker (Eico #955, \$39.95; Paco #C-20W, \$31.50; Precision #1C-60, \$32.95; C-D #BF-90, \$40.91; Knight #503, \$29.95)	40.00
1	Signal Tracer (Paco #Z-80W, \$42.50; Eico #147, \$39.95)	40.00
1	Cell Tester (Load testing Voltmeter for lead-acid cells)	5.50
1	Hydrometer	1.80

Equipment will be needed for student experiments and demonstrations. There are many commercially developed systems available which provide the instructor with a ready-to-use instructional system. Some of the systems that have been developed and would be suitable for the course are listed below. (Sources: B - Brodhead-Garrett; P - Paxton Equipment and Supply; N - Noname, Inc.)

<u>Source</u>	<u>Description</u>	
B	SE Kit series (10 kits)	\$ 104.00
B, N	Science Electronics (Electronic System) I A 300 Package	395.00
P	Electronic Aids, Inc. Construction Skill Kits (each)	39.95
	Electronic Aids, Inc. Block System	152.00
B, P	Electronic Kits Supply, KS Series of Demonstration Boards, set of 20 -	375.00
	Electromatic System	721.00
	(May be purchased as complete layout for \$5250.00. Includes many of the tools, test Equipment and other items included other places on this list.)	
	Helio Productions, Series of Panels	133.55
	Universal Scientific Co. Crow Model 30 Series	762.00
	Universal Scientific Co. Crow Model 100G & 110G Demon- strations	560.00
B	Brodhead-Garrett Model 1000 Demonstrations	260.00

It should be remembered that some of this equipment is for demonstration purposes and would provide only one work station.

To provide the student with experiences outlined in this course, it is recommended that a system similar to the Brodhead-Garrett, SE series be obtained. One complete set for demonstration and certain kits in the series for those experiments that the students will perform should be obtained.

1	Series SE kits including 1 complete set 10 additional SE-1 10 additional SE-2 10 additional SE-4 10 additional SE-5	462.00
---	--	--------

It might be desirable to have additional demonstration equipment such as provided by the:

1	Electronic IA-300 or similar package and/or	395.00
1	Brodhead-Garrett Model 1000 (Similar to Crow Models 100G & 110G)	260.00

Total Major Items \$6,549.55

Minimum Tools and Machines:

12	Needle or Long Nose Pliers, 6"	30.00
12	Diagonal Cutting Pliers, 5 "	26.00
6	Side Cutting Pliers, 6" or 7"	17.00
6	Slip-Joint Pliers 6"	5.00
1	Slip-Joint Pliers (channel-lock type) 10"	3.00
1	Wire Stripper, #10-#22 Wire (G C model 766A or equal)	6.00
12	Pocket Knives, Electrical	18.00
6	Soldering Coppers, Electric 100 watt	48.00
12	Soldering Aids (GC #9088)	12.00
6	Soldering Guns, 100 watt	30.00
1	Soldering Pencil (Ungar complete with #113 Chisel tip or equal,	4.00
1	Nut Driver Set (Xcelite #127 or equal)	7.00
12	Screwdriver, straight brade 1/8 x 4"	5.00
6	Screwdriver, straight blade 3/16 x 4"	5.00
2	Screwdriver, straight blade 3/32 x 2"	.54
1	Screwdriver, straight blade 1/4 x 6"	.85
1	Screwdriver, straight blade stubby	.50
1	Screwdriver, straight blade 5/16 x 8"	1.20
1	Screwdriver, Phillips #1 x 3"	.70
1	Screwdriver, Phillips #2 x 4"	.90
1	Screwdriver, Phillips #1 stubby	.60
1	Screwdriver, Phillips offset	.50
1	Screwdriver, Straight blade offset	.50
1 set	Hex or Allen Wrench set	.90
6	Rules, Steel 8ths, 16ths, 32nds, 64ths (B&S #300, Starrett #604R, or equal)	11.00
1	Gage, American Wire (B&S)	6.50
1	Micrometer Calipers 1"	15.00
2	Awls (Stanley #6A or equal)	2.00
1	Fuse Puller	.80

2	Bench Rules (Lufkin or Stanley #34 or equal)	3.00
1	Rule, Circumference 36"	7.00
2	Dividers, 6"	7.00
2	Square, combination 12"	4.00
1	Marking gage (Stanley #90G or equal)	1.75
1	Gage, Fractional Drill	6.50
12	Brushes, Bench 8"	16.80
1 set	Drills, twist fractional sizes 1/16 - 1/2 by 64ths, High Speed Steel	29.00
1 set	Taps and Dies (Ace #614 or equal)	25.00
1	Reamer, Center 3/8 x 1/2	2.00
1	Reamer, Burring 1 1/4" pipe capacity	5.00
1	Reamer, Hand Held (Hansen #120 or equal)	1.20
1 set	Wood bits, 3/8" to 1" by 16ths (power type)	4.00
1	Hand drill 1/4" capacity	4.00
1 set	Chisels and Punches, 2 chisels, pin, solid and center (Stanley #486K or equal)	3.50
1 set	Chisels, wood (1/4, 1/2, 3/4, 1")	5.50
1	Tin snips, aviation type	3.75
1	Scissors 5"	1.80
1	Nibbling tool (Adel)	3.80
1 doz.	Handles, file 3-6" (Disston #1 or equal)	1.80
1 doz.	Handles, file 6-10" (Disston #2 or equal)	2.20
1	Saw, Back 12"	5.60
1	Saw, Coping	.75
2	Hacksaw frame, 10" and 12" blades	6.00
1	First Aid Kit	8.00
1	Fire Extinguisher, Dry Chemical Type 10 lb.	40.00
1	Furnace, Gas	25.00
1	Spark lighter and extra flints	.90
1 pr.	Soldering Coppers (2 lb. pair)	2.75
1	Tube Pin Straightener, 7 & 9 pin (G C #8655)	1.50
1	Vise, Drill Press	10.00
2	Vises, Machinist 3"	48.00
2	Hammers, Ball pein	5.00
2	Hammers, Claw 13 oz.	6.00
2	Mallets, Soft Face 8 oz. Medium tips	5.50
6	C-Clamps 3"	6.00
1	Combination Oilstone	2.50
1	Wrench, 6" adjustable	2.30
1	Wrench, 8" adjustable	2.65
1	Wrench, 10" adjustable	3.40
1	Grinding Wheel Dresser	1.50

1 pr. for each student	Glasses, Safety It is recommended that an eye protection program be practiced whereby all students wear eye protection when working in the shop.	50.00
1	Vise-grip Pliers	1.70
1	End Nippers	4.50
1	Handy Seamer	5.25
1	Framing Square	4.50
1	Brace, Hand 10"	12.00
1 set	Auger Bits #4-16	32.00
1	Expansion bit (to 3")	3.00
1	Bit Extension 18"	4.00
1	Hold-it type Screwdriver	1.00
1	Forceps ("Seizer")	4.25
1	Tweezers 6-1/2"	.75
1 set	Screwdriver, Jewlers	2.90
1	Stock Cart 30"	25.00
1	EMT Bender 1/2" (with handle)	5.00
1	Hole Saw	20.00
1	Jack Plane	8.00
1	Block Plane	4.00
1	Drill Grinding Attachment	34.00
1	Inspection Mirror (G C # 5090)	.50
1	Flashlight with Magnifier	5.00
5	Flashlights	6.00
1 set	Chassis Punches, round (including 5/8, 3/4, 7/8, 1, 1-1/8, 1-5/32, 1-1/4 inches)	26.00
1	Nut Driver, Hollow shaft type (Xcelite HS 14)	1.00
1	Nut Driver, Hollow shaft type (Xcelite HS 16)	1.00
1	Nut Driver, Hollow shaft type (Xcelite HS 18)	1.20
1	Nut Driver, Hollow shaft type (Xcelite HS 20)	1.25
1	Bench Grinder 7"	180.00
1	Bench Drillpress 15" incl. motor	230.00
1	Electric Drill 1/4"	17.00

The following items would be needed if they are not available in other areas of the industrial arts department.

1	Squaring Shear, 24" (Di-Acro, \$440.00; Pexto #132, \$376.00)	376.00
1	Box and Pan Brake 24" (Di-Acro, \$297.00; Pexto #PX24, \$297.00; Berkroy B-90, \$293.00)	297.00
1	Arbor Press, 1 ton	35.00

1	Shop Vacuum Cleaner	50.00
1	Dymo Labeling Machine M22 with tape	45.00
1 set	Number and Letter Stamps 1/8"	7.00
1	"Pop" Rivet set	25.00
1	Square Stake and Plate	40.00

Tools and machines total \$2146.24

Supplies:

The following are typical of the type items that should be purchased to support the activities planned for Applied Electricity.

10 lb.	Solder, 50/50 rosin core, .0625 dia. 1 lb. spools	12.00
5 cans	Soldering Paste	.75
2 dz.	Coping Saw Blades	.75
20	Hacksaw Blades, 24 teeth/inch, 10"	2.90
1 dz.	Mill Files, Bastard cut, 10"	9.00
1/2 dz.	Half Round Files, Bastard Cut, 10"	9.00
1/2 dz.	Round File, Bastard Cut, 10"	6.00
2	Combination File Card and brushes	2.50
1500 ft.	Lamp Cord, SP-1 18/2, Black or Brown	30.00
250 ft.	Non-Metallic Sheathed Cable, 14/2	6.50
250 ft.	Cord, type S 16/3	25.00
1000 ft.	Cord, type S 14/2	84.00
15	Feed-through Switches	4.00
25	Caps (Eagle # 912 or equivalent type)	2.00
20	Caps, Grounding type (Eagle # 203 or equal)	9.00
25	Socket, key with pendant bushing	10.00
15	Cord ends	4.50
15	Cord ends, grounding type (Eagle # 222 or equal)	13.50
5	2 wire to 3 wire adapter (Eagle # 832 or equal)	1.25
1	Magnetic Motor Control, 1 phase with a start-stop station, size 0	7.50
1	Time clock switch with dim circuit (Paragon # 41005-0 or similar style)	12.00
20	Crystal diodes 1N34 or similar type for crystal sets	2.00
20	Capacitors, variable, 365 picofarads	14.00
1	Coil winding calculator	.50
12	Doorbell transformers	24.00
24	Push buttons, doorbell type	24.00
12	Bell-buzzer combinations	24.00
12	3 lite bases	48.00
12	3 lamp cluster switches	12.00
24	Remote control switches	12.00
12	Remote control relays	24.00

1	Remote control transformer 24 volt	4.00
1	Lead Acid Battery	17.00
5	Cube Taps	.75
5	Bases (Eagle #6-B or equal)	.35
500 ft.	Wire, Building #14 TW	6.00
100 ft.	Hook-up wire	1.00
24	Dry Cells #6	23.00
6	Motors for troubleshooting and reversing (Motors in need of repair can often be obtained from local repair shops for \$2-3 each)	18.00
3 lb.	# 24 nichrome wire	15.00
10 lb.	# 24 heavy Formvar	2.00
100	Terminal strip, 1 terminal	2.00
20	Duplex convenience outlets grounding type	10.00
20	Switches, 3-way	8.80
10	Switches, 4-way	6.00
20	Cleat Receptacles, medium base	4.00
20	Cleat Receptacles, miniature base	2.80
30	Switch boxes	7.50
15	Switch, SPST toggle, bat handle	15.30
20	Compasses, 25 mm	5.00
20 pr.	Bar magnets	10.00
18	Magnets, horseshoe, 1"	11.85
1 lb.	Iron filings	2.00
15	500 ohm, 2 watt potentiometer	13.95
20	1 megohm, 1/2 watt, fixed resistor 20%	1.80
20	Lampholder sockets for fluorescent lamp	6.80
20	Lampholder and starter socket for fluorescent lamp	9.40
20	FS 2 starters	3.60
12	Ballast for 15 watt fluorescent lamp	3.00
15	Fluorescent lamps, 15 watt	10.00
12	Solar cells, B2M	18.00
5	918 or 930 photo tube	13.95
30	Pilot lamps, #41, 222 or 233 (or assortment)	3.00

Assorted machine screws, wood screws, tape (plastic, friction, and rubber), spade lugs, metal and fiber washers, oil and oil cans, tacks, assorted types of wire (brass, aluminum, iron), and similar electrical hardware

The following items can probably be picked up at little or no cost as they need not be in working condition.

1	Air Conditioner (to replace filter and clear condenser coils)
1	Generator, automobile, with extra brushes
1	Ignition coil
1	Distributor

Furnishings and Storage Facilities

1	Display Cabinet (Instrument Storage) (Brodhead-Garrett SC14 or equal)	375.00
2	Storage Cabinets 18" deep (small parts drawers)	123.00
1	Tool Storage Cabinet (Brodhead-Garrett TSE13 or equal, no tools)	510.00
1	Hardware Storage Cabinet (Brodhead-Garrett T34 or equal)	190.00
1	Paint Storage Cabinet (Brodhead Garrett T37 or equal)	103.00
6	Benches, Locker bases, including Power Channel (Brodhead-Garrett ET160 or equal)	1134.00
1	Instructor's Demonstration Desk (Brodhead-Garrett ET631)	420.00
1	Machinist Bench (Brodhead-Garrett W45 or equal)	300.00
1	Sheetmetal Bench with 1 stakeplate (Brodhead-Garrett SM99S or equal)	290.00
1	Electrical Test Bench (Brodhead-Garrett ET5C or equal)	330.00
1	Woodworking vise with 4 vises (Brodhead-Garrett L13 or equal)	215.00
1	File Cabinet with lock	40.00
1	Instructor's Desk	88.00
2	Chairs	40.00
1	Bookcase 7' long	120.00
1	Wall Bench (Brodhead-Garrett WC10 or equal)	228.00
1	Soldering Bench (Brodhead-Garrett 6122TR or equal)	79.00
1	Bench, wall Locker base (Brodhead-Garrett W12L)	235.00
1	Bench 6' x 24" x 1 1/2" Drawer base and Cabinet base	95.00
26	Stools, 22"	145.00
	Furnishings Total	\$5,749.50
	Grand Total	\$14,445.29

SOURCES OF ELECTRICAL EQUIPMENT AND SUPPLIES

Most of the recommended equipment and supplies for this course can be obtained from local hardware, electrical, and electronic distributors. If there are electrical and/or electronic manufacturers in the area, one can often obtain some equipment and supplies from them at low cost. Do not overlook the possibility of obtaining some items from the state surplus property office.

In some cases, where the possibility of annoying back-orders exist, one might be better off ordering from some of the larger supply houses. Some of the better known are listed below:

- Allied Radio Corp., 100 North Western Avenue, Chicago 80, Illinois - general electronic tools, equipment, and supplies, Knight kits.
- Arrow Sales, Inc., 2534 South Michigan Avenue, Chicago, Illinois - electronic supplies, surplus equipment.
- Barry Electronics, 512 Broadway, New York 12, New York - surplus equipment and supplies.
- Brodhead-Garrett Company, 4560 East 71st Street, Cleveland 5, Ohio - general industrial arts equipment and supplies.
- Buck Engineering Company, Inc., Box 151, Freehold, New Jersey - power panels.
- Burstein-Applebee Company, 1012 McGee Street, Kansas City, Missouri - electronic equipment, tools, and supplies.
- Central Scientific Company, 1700 Irving Park Road, Chicago 13, Illinois - magnetic supplies, scientific apparatus.
- Electromatic Manufacturing Company, Inc., Box 183, McMinnville, Tennessee - demonstration equipment.
- Electronic Instrument Company (EICO), 330 Northern Blvd., Long Island City 1, New York - test equipment wired and kit.
- Electronic Kits Supply Company, 1727 Glendale Blvd., Los Angeles 26, California - demonstration equipment.
- Electronic Teaching Laboratories, 5034 Wisconsin Avenue, N.W., Washington 16, D. C. - demonstration equipment.
- Equipto, Aurora, Illinois - benches, storage cabinets.
- Fair Radio Sales Company, 2133 Elida Road, Lima, Ohio - surplus equipment and supplies.
- Fay-Bill Distributing Company, 79 White Street, Department C-21 New York 13, New York - surplus equipment and supplies.
- Graybar Electric Company,
1644 Baltimore Avenue, Kansas City, Missouri
2642 Washington Street, St. Louis, Missouri
electrical tools, equipment and supplies.
- H. A. Holden, Inc., 1208 Harmon Place, Minneapolis 3, Minnesota - electric motor supplies and parts.
- Hampden Engineering Corporation, East Longmeadow, Massachusetts - power distribution equipment.
- Heath Company, Benton Harbor 35, Michigan - test equipment wired and kit.
- Helio Productions, 414 East 7th, Mt. Carmel, Illinois, Electronic training aid system.
- Industrial Arts Supply Co., 3002 Hennepin Avenue, Minneapolis 8, Minnesota, Teaching Aids, Supplies, Instruct-a-Kits, St. Cloud, Minnesota - kits.
- Lafayette Electronics, 111 Jericho Turnpike, Syosset, Long Island, New York - electronic supplies.
- National Kits, Inc., 140 Tenth Avenue, New York 11, New York - electronic kits.
- Newark Electronics, Inc., 223 West Madison Street, Chicago 6, Illinois - electronic tools, equipment and supplies.
- Olson Electronics, Inc., 260 South Forge Street, Akron, Ohio - electronic supplies.

Parent Metal Products, 6801 State Road, Philadelphia 35, Pennsylvania - benches and storage cabinets.

Patterson Brothers, 45 Samworth Road, Clifton, New Jersey - equipment and supplies.

Paxton Equipment and Supply, 7401 South Pulaski Road, Chicago 29, Illinois - tools, equipment and supplies.

Philco Technological Center, P.O. Box 4730, Philadelphia 34, Pennsylvania - demonstration and laboratory equipment.

Precision Apparatus Company, Inc., 70-31 84th Street, Glendale 27, Long Island, New York - test equipment, PACO test equipment wired and kit.

Radio Corporation of America, Audio Products, Meadow Lands, Pennsylvania - demonstration and laboratory equipment. test instruments.

Science Electronics, Inc., 195 Massachusetts Avenue, Cambridge 39, Massachusetts - demonstration and lab equipment (Electronic system).

Shop-Bilt, Inc.. 315 South First Street, Effingham, Illinois - benches, cabinets.

Standard Electric Time, 89 Logan Street, Springfield 2, Massachusetts - power distribution equipment.

Standard Pressed Steel Company, Jenkintown, Pennsylvania - benches, storage cabinets.

Systems Analyzer Corporation, Nokomis, Illinois - add-a-phase power conversion equipment.

The Tolerton Company, 265 N. Freedom Avenue, Alliance, Ohio - benches, storage cabinets.

Thornton Associates, Room 38, 680 Main Street, Waltham 54, Massachusetts - Mini-lab circuit system.

Universal Scientific Company, Inc., 1102 Shelby Street, Vincennes, Indiana - demonstration equipment.

Vector Electronic Company, Inc., 1100 Flower Street, Glendale 1, California - Vector circuit system.

Appendix A

APPLIED ELECTRICITY

Utilization of Old and Surplus Meters (Do not use as a student exercise)

Many good meters are available through the state surplus property office. These meters may have incorrect scales or have characteristics which make them unusable in their present condition. It is not very difficult to make new shunts or new multiplying resistors for these meters if the resistance of the meter movement and the full scale current are known. One method of determining this for a permanent magnet or Weston type movement is as follows:

1. Take the meter apart in as dust free atmosphere as possible.
2. Remove any shunts and external resistances from the meter.
3. Connect the meter in a circuit as below.

Caution: Make sure you start with the voltage divider at the low voltage end of the potentiometer or you could burn out the meter movement.

4. Adjust the slider (rotor) on the potentiometer slowly until full scale deflection is obtained on the unknown meter.
5. Record the current flow on the known meter. Since the two meters are in series with each other this will be the full scale current for the unknown meter.
6. Obtain a resistance decade box that will go down to 0 ohms in at least 1 ohm steps (Example: Eico Model 1171).
7. Place this resistance decade across the unknown meter in the circuit above with maximum resistance.
8. Remove the resistance in steps until $\frac{1}{2}$ scale deflection is obtained on the unknown meter, making sure that the current of step 5 is maintained on the known meter by adjusting the potentiometer.
9. The resistance on the decade box is the resistance of the meter. Theory: Current divides equally in the branches of two equal resistances - $\frac{1}{2}$ through meter, $\frac{1}{2}$ through the decade box.
10. If the meter is to be used as an ammeter (D.C.) the resistance of the shunt can be calculated by the following formula:

$$R_{\text{shunt}} = \frac{I_{\text{meter}}}{I_{\text{shunt}} \times R_{\text{meter}}}$$

Example: A meter has a full scale current of 1 ma and a resistance of 50 ohms. It is desired to have the meter calibrated for 1 ampere, full scale deflection. Since only 1 milliamp can flow through the meter movement the remaining 999 ma must flow through the shunt. Substituting: $1/999 \times 50 = .05005$ ohms for the shunt resistance. Resistances this small are difficult to measure in the shop so try to get it close and do final calibration with the meter in series with a known meter at the desired current. The wire used for the calibrating shunt should be a wire having a low (very small) temperature coefficient. Actually it should be slightly negative. Constantan wire can be used if regular meter shunt wire is not readily available. This wire can often be obtained surplus as one of the conductors in thermocouple wire.

11. Be sure the shunt wire is wound so that it can not short against itself or anything else. If there is room, put it inside the meter and close the meter. If not, put it externally and mount the meter in a cabinet.

12. If the meter is to be used as a voltmeter, it is necessary to connect a multiplier resistor in series with the meter movement. The total resistance of the meter and multiplier has to be such as to allow the full scale current to flow at the desired full scale voltage. Example: Using the 1 ma movement of the example above, it is desired to have a meter that will have a 500 volt range. The meter sensitivity for a 1 ma movement is 1000 ohms/volt ($1 \text{ v} / .001 \text{ a} = 1000 \text{ ohms/volt}$). Therefore, the total resistance needed is 100×500 or 500,000 ohms. Since the meter resistance is 50 ohms the multiplier must be 499,950 ohms ($500,000 - 50$). This resistance is then added in series with the meter and it is enclosed in a case.
13. In the case of the voltmeter and the ammeter it probably will be necessary to remark the values for the scale on the meter, or make a new scale.

Appendix B

APPLIED ELECTRICITY

EXAM -- UNIT I
Fundamentals of Electricity

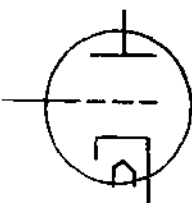

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. The nucleus of the atom is made up of electrons and protons.
- T F 2. An Ohmmeter contains a source of electrical energy.
- T F 3. An open circuit is a circuit that has a complete electrical path.
- T F 4. A rheostat can be used as a potentiometer.
- T F 5. The rotor of a potentiometer is the center terminal of the three in this diagram. 
- T F 6. It is likely that the consumption of electrical energy will decrease in the next five years.
- T F 7. A kilowatt is equal to 10,000 watts.
- T F 8. The current flow is the same in any part of a series circuit.
- T F 9. If a D.C. voltmeter reads in the wrong direction, reverse the two leads.
- T F 10. The word shunt means series.
- T F 11. A schematic diagram shows the actual physical location of components.
- T F 12. Dry chemical type fire extinguishers are one of the best type for electrical fires.
- T F 13. An ammeter is always connected in series in a circuit.
- T F 14. The prefix milli means 1/1,000.
- T F 15. Electrons have a positive electrical charge.
- T F 16. Circuit breakers work on thermal principles, electro-magnetic principles or a combination of the two.
- T F 17. The abbreviation VOM stands for Volt-Ohm-Milliammeter.
- T F 18. The voltage across each of the components in a parallel circuit is the same.

Identification

Directions: Identify the following symbols by placing the name of the device in the blank beside the symbol.

- 19.  _____
- 20.  _____
- 21.  _____
- 22.  _____

23.  _____

24.  _____

25.  _____

26.  _____

27.  _____

28.  _____

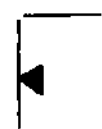

29.  _____

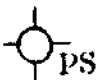

30.  _____

31.  _____

32.  _____

33.  _____

34.  _____

35.  _____

36.  _____

37. \ominus WP _____

38. S_3 _____

39. $\square \bigcirc$ _____

Problems

Directions: Read each of the problems below carefully and solve. Show all work performed to arrive at your answer in the space provided. Label your solution (Ans.).

40. What is the voltage drop across a 250 ohm resistance with 2 amperes flowing through it?
41. How much current flows through a 15,000 ohm resistor connected across 150 volts?
42. What is the resistance of an appliance operating on 120 volts and drawing 6 amperes?
43. What is the power rating of an appliance drawing 10 amperes on 240 volts?
44. What voltage is impressed across a 1600 watt device drawing 8 amperes?
45. What is the maximum current flow through a 10,000 ohm, one watt resistor?
46. What is the voltage drop across R_1 in the circuit to the right?

47. What is the resistance of R_3 in the circuit at the right?

48. What is the current flow through R_2 in the circuit at the right?

49. What is the total resistance of the following three resistors in parallel? $R_1 = 100$ ohms, $R_2 = 200$ ohms, $R_3 = 400$ ohms.

50. What is the kilowatt-hour reading for the meter below?

_____ K.W.H.

51. Using the rates below, calculate the monthly bill for 261 KWH of electrical energy.

- 4¢ per KWH for the first 50 KWH/mo.
- 3.3¢ per KWH for the next 50 KWH/mo.
- 3¢ per KWH for the next 50 KWH/mo.
- 2.25¢ for any excess KWH/mo.
- 60¢ service charge /mo.

52. What should be the power rating of a 15,000 ohm resistor with .01 amperes flowing through it?

53. What is the rated efficiency of a device that consumes 2,200 watts and delivers 2,000 watts of power?

54. Assuming a $\frac{1}{2}$ horsepower motor were 100% efficient, what would be the power input in kilowatts?

55. What is the power consumption of a 100 ohm heating element connected across 120 volts?

56. What is the reading on the meter below?

_____ volts D.C.

Problems

40. $E = I \times R = 2 \times 250 = \underline{500 \text{ volts}}$ A-144
41. $I = \frac{E}{R} = \frac{150}{15,000} = \underline{.01 \text{ amperes or } 10 \text{ ma.}}$ A-144
42. $R = \frac{E}{I} = \frac{120}{6} = \underline{20 \text{ ohms}}$ A-144
43. $P = I \times E = 10 \times 240 = \underline{2400 \text{ watts}}$ A-154
44. $E = \frac{P}{I} = \frac{1600}{8} = \underline{200 \text{ volts}}$ A-154
45. $I = \sqrt{\frac{P}{R}} = \sqrt{\frac{1}{10,000}} = \frac{1}{100} = \underline{.01 \text{ amperes or } 10 \text{ ma.}}$ A-154
46. $I = \frac{E}{R} = \frac{45}{45} = 1 \text{ amp.}$
 $E = I \times R = 1 \times 45 = \underline{45 \text{ volts}}$ A-147
47. $R_T = \frac{E}{I} = \frac{500}{5} = 100$

- $R_3 = R_T - (R_1 + R_2) = 100 - (10 + 30) = \underline{60 \text{ ohms}}$ A-147
48. $I_3 = I_T - (I_1 + I_2) = 10 - (5 + 1) = \underline{4 \text{ amperes}}$ A-147
49. $\frac{1}{R_T} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} = \frac{1}{100} + \frac{1}{200} + \frac{1}{400} = \frac{4 + 2 + 1}{400} = \frac{7}{400}$
 $R_T = \underline{57 \text{ ohms}}$ A-149
50. 8651 K.W.H. A-254
51. $50 \times .04 = \$2.00$
 $50 \times .033 = 1.65$
 $50 \times .03 = 1.50$
 $111 \times .0225 = 2.4975$
 fixed = .60
\$8.2475 or \$8.25 A-255
52. $P = I^2 R = (.01)^2 \times 15,000 = .0001 \times 15,000 = \underline{1.5 \text{ watts}}$ A-154
53. $\text{eff} = \frac{\text{output}}{\text{input}} = \frac{2,000}{2,200} = \underline{90.9\%}$ B-391
54. $\frac{1}{2} \times .746 = \underline{.373 \text{ KW}}$ B-391
55. $P = \frac{E^2}{R} = \frac{120^2}{100} = \frac{14400}{100} = \underline{144 \text{ watts}}$ A-154
56. 27.5 volts D.C. A-244

Appendix C

APPLIED ELECTRICITY
COMPREHENSIVE FINAL EXAMINATION

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. Electrons go from minus to plus in the external circuit of a battery.
- T F 2. A voltmeter is ordinarily connected in parallel with the device being measured.
- T F 3. An ohmmeter should never be connected in a circuit with the power turned on.
- T F 4. Permanent magnets should be stored with like poles together.
- T F 5. The total resistance of a series circuit is equal to the sum of the individual resistances.
- T F 6. Brass makes a good permanent magnet.
- T F 7. The total voltage in a series circuit is the same as the sum of the voltage drops across the components.
- T F 8. The magnetic north pole and the geographic north pole are at the same location.
- T F 9. A fuse is a device that operates on the principle that current flowing through resistance creates heat.
- T F 10. The total power in either a series or parallel circuit is equal to the sum of the component power consumptions.

Multiple-Choice

Directions: Select the best answer to complete each of the following statements and place the letter of it in the blank at the left.

- _____ 11. A person went to the store to buy 50 feet of #14 AWG conductor. No wire gage was available. It was known the stock contained four sizes of wire--numbers 10, 12, 14, and 18. Which of the following diagrams represents the correct selection?
A. B. C. D.
- _____ 12. While on an automobile trip, your car is forced off the road into a power pole which breaks. It appears a wire may be resting on the roof of the car. You and your passengers should:
A. Jump out of the car and get help.
B. Take a piece of wire or other metal and place it between the car and the ground and step out.
C. From the information given it should be safe to step out of the car.
D. Remain in the car until help from the power company arrives.
- _____ 13. The visible light emitted by a fluorescent lamp is obtained:
A. Directly from the ultra-violet rays within the lamp.
B. From the glow of the lamp filaments.
C. From the ultra-violet rays striking the phosphor coating.
D. From the chemical action as the neon lights up.
- _____ 14. Which of the following are most permeable?
A. Air C. Copper
B. Brass D. Steel
- _____ 15. The property of a device or circuit to store electricity is called:
A. Impedance C. Capacitance
B. Reactance D. Inductance

- _____ 16. To control a ceiling light from two places one should use:
- Two three-way switches.
 - Two four-way switches.
 - One three-way and one four-way switch
 - Two two-way switches.
- _____ 17. Resistance wires used in electric heating devices are often made from:
- | | |
|-----------|-------------|
| A. Silver | C. Aluminum |
| B. Copper | D. Nichrome |
- _____ 18. Copper wire is measured by the:
- American wire gage
 - Birmingham wire gage
 - United States standard gage
 - Music wire gage.
- _____ 19. What type(s) of modulation is (are) used for television?
- Amplitude modulation
 - Frequency modulation
 - Pulse modulation
 - Amplitude and frequency modulation
- _____ 20. If coil "A" has 500 turns and .1 amperes flowing through it and coil "B" has 250 turns with .2 amperes flowing through it, the relative field strength of coil "A" will be:
- Twice the strength of coil "B".
 - The same strength of coil "B".
 - One half the strength of coil "B".
 - Three tenths the strength of coil "B".

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

- An ammeter is always connected in _____ with the device being measured.
- As a result of the electrons and ions striking the electrodes in a neon lamp, with enough force to free electrons, the current strength is _____.
- Conductance is measured in _____.
- An example of a (an) _____ circuit would be a lamp with a broken filament.
- The prefix _____ signifies the value 1/1000.
- When transmitting power over long distances, high voltage is used to reduce _____.
- When a circuit is complete, it is called a _____ circuit.
- If one shunts a device, he connects something in _____ with it.
- A VOM is a _____.
- The total current in a _____ circuit is the sum of the individual currents.

Identification

Directions: Identify the following symbols by placing the name of the device in the blank beside the symbol.

- | | | |
|-----|--|-------|
| 31. | | _____ |
| 32. | | _____ |
| 33. | | _____ |
| 34. | | _____ |
| 35. | | _____ |
| 36. | | _____ |
| 37. | | _____ |
| 38. | | _____ |
| 39. | | _____ |
| 40. | | _____ |

Matching

Directions: The left column lists several electronic devices. The right column shows the schematic symbols for several electronic devices. Place the letter of the correct symbol in the blank beside the named device.

- | | | | | |
|-------------------------------|----|--|----|--|
| _____ 41. Transformer | A. | | L. | |
| _____ 42. Coil with air core | B. | | | |
| _____ 43. Capacitor, fixed | C. | | | |
| _____ 44. Capacitor, variable | D. | | | |
| _____ 45. Potentiometer | E. | | | |
| _____ 46. Resistor, fixed | F. | | | |
| _____ 47. Crystal diode | G. | | | |
| _____ 48. Voltmeter | H. | | | |
| _____ 49. Electron tube | I. | | | |
| _____ 50. Ballast | J. | | | |
| | K. | | | |

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

Three sources of electrical energy are piezoelectricity, friction and direct nuclear conversion. List four other sources.

51. _____

52. _____

53. _____

54. _____

List the three most commonly used electrical splices.

55. _____

56. _____

57. _____

There are four essential parts to any radio receiver. One of these is a reproducer. What are the other three?

58. _____

59. _____

60. _____

Performance

Directions: Read each of the following meter scales and record the value in the appropriate blank. Use the mark nearest the pointer.

61. _____ volts

62. _____ amperes

63. _____ ohms

A person complained of getting a shock from an electric motor. What would you suspect is the trouble

64. _____

What would you use to test your theory stated above?

65. _____

Procedure

Directions: List in order of sequence the operation of a glow switch start fluorescent lamp. Place the proper letter beside the number.

- | | | |
|-----------|-----|--------------------------------------|
| _____ 66. | (1) | A. Ionization of neon gas |
| _____ 67. | (2) | B. Ionization of mercury vapor |
| _____ 68. | (3) | C. High induced voltage from ballast |
| _____ 69. | (4) | D. Heating of bimetallic strip |
| _____ 70. | (5) | E. Cooling of bimetallic strip |

Problems

Directions: Read each of the problems below carefully and solve. Show all work performed to arrive at your answer in the space provided. Label your solution (Ans.).

71. What is the resistance of a device that has a current flow of 5 amperes when connected across 120 volts?
72. What power is consumed by a device drawing 10 amperes when the e.m.f. is 50 volts?
73. What is the total resistance of three 90 ohm resistors connected in parallel?
74. How much current flows through a 5,000 ohm resistance connected across 100 volts?
75. What would be the voltage drop across a 600 ohm resistor connected in series with two other 600 ohm resistors? The total voltage is 30 volts.

FOREWORD

This course of study contains an analysis of **MERCHANDISING** together with assignment sheets designed for group instruction covering the related information taught in preparatory distributive education programs.

The assignment sheets were prepared by Mr. Robert F. Johnson while a graduate student in Industrial Education. The original analysis along with the completed format and the compilation of materials were prepared by Mr. Roy P. Roberson, Research Assistant in Industrial Education, University of Missouri.

Credit is also due Mr. Lester B. Kesterson, Director of Cooperative Industrial and Distributive Education, State Department of Education, for guidance and assistance in preparing the distributive education series, of which this is a part.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, for the direction and administration of the Curriculum Materials Laboratory in which this material was prepared, and to Mr. James B. Karnes, Instructor in Industrial Education at the University of Missouri, who supervised the preparation of the material and edited the manuscript. Credit is due to Mr. B. W. Robinson, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and to other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

Training Plan and Progress Record

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning.

1. Mastery of the practical Job Skills and Procedures performed by the worker in the occupation.
2. Comprehension of the Technical and Related Information basic to an intelligent understanding and practice of the occupation.
3. Development of those Personal-Social Traits which are essential for the successful worker.

The first group of these "units for learning"--the job skills and procedures--has been arranged in the analysis section under the heading of "Job Training." The second group of learning units--the technical and related information--has been arranged under the heading of "Related Information." The third group--personal-social traits-- has been listed under "Personal Qualifications" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies, the school and the employer, to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker should master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

The last section of this course of study contains three copies of a TRAINING PLAN and PROGRESS RECORD for RETAIL MERCHANDISING. One copy is marked "Student" in the upper right corner. With this copy, in the space marked Time in Hours, the student will keep a tally of the hours he spends on his job performing operations in each of his training areas. The next copy marked "Employer" should be given to the employer for recording the student's job performance in each area. The third copy may be used by the coordinator for his record.

Skills and information related to the student's job can be taught through direct instruction. But personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility

for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success in life and on the job.

Since a coordinator's class is usually made up of fifteen or more students, each differing from the other significantly, and possibly studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for a coordinator to teach, through the group method, the occupational information which relates to the specific job of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workman's compensation, wage-hour laws, fair labor standards, unemployment compensation, and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. However, if a coordinator is to make an optimum contribution to the in-service vocational education of his students, he must devote a large portion of his classroom instruction to content which deals specifically with the occupation of each boy and girl in his program.

Obviously, it is desirable to teach related information in school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets in this study guide well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work the student is doing on the job. With this arrangement, the coordinator will be able to serve, during a major portion of his classroom time, as a supervising study and helping teacher for a variety of occupations.

Your attention should be called to the fact that there are two types of retail merchandising study guides available. Both types cover the identical material, but each is designed for a different purpose. Although both types require the same reference materials, one is designed for individual study, while the other is designed for group discussion as their titles indicate. This study guide, Merchandising Group Instruction, has been developed with essay type questions which lend themselves well to group instruction. The other study guide, Merchandising Individual Study, utilizes objective type questions and is designed for guiding a student's study on an individual basis.

A coordinator who has students in distributive occupations, as well as trade, industrial, or service occupations represented in his class, might choose to utilize the study guide with objective type questions for directing the related study of D.E. students. In a class consisting solely of students in distributive occupations, a coordinator might elect to use the study guide with discussion type questions for group teaching purposes. EACH STUDY GUIDE HAS THE SAME CONTENT COVERING THE SAME READING ASSIGNMENTS DIFFERING ONLY IN THE DESIGN OF THE QUESTIONS AND THE PURPOSE FOR WHICH THEY ARE INTENDED.

Each of the two study guides contains certain record data such as; numbers and range of units covered by each assignment; introductory paragraphs designed to develop interest and explain the importance of the assignment, and to convey to the student what he is expected to learn; specific reference readings; activity assignments; and a series of questions designed to check student attainment. If a coordinator uses the discussion type study guide for his students, he will find that the study guide with objective questions serve as excellent objective type test material for the corresponding discussion material covered.

In selecting books for this course of study, an effort was made to restrict their number, yet adequately cover the subject of retail merchandising. Only those references with the most recent publication date were selected so that current information and practices can be consistently presented. Possibly, older copies of the references could be used. However, both the study guides are written for use with, and are keyed to, the particular editions listed on the reference page.

Keys for the study guide assignments are available in a separate manual. They have been prepared to enable the coordinator to score quickly the questions included in each assignment. The key gives the correct answers to the questions, as well as the reference and the page on which each answer can be found. The key manual is bound under cover separate from each study guide so the coordinator may keep it apart from student use.

TO THE STUDENT-WORKER

In past years many workers, especially youth, have entered the retail trades largely by chance. Few have chosen the vocation as a result of definite investigation and planning. Now, however, retail merchandising has progressed as a field of employment to the point where it is advantageous to make systematic preparation if one wishes to enter and advance in these occupations. By far, a greater number of employment opportunities are open to younger people in the various phases of retail business; therefore, to help them become more able to make a wise occupational choice, it is important that certain high school students have an opportunity to learn something while in school about the kind of work they would like to do.

The primary purpose of this course of study is to provide a guide for instruction through which students may gain certain basic knowledge and training in the field of retail merchandising. This material is designed to help the Distributive Education student acquire knowledge about retail merchandising that will help him, if properly applied to the job, get off to a good, solid, successful start in the field. Students who have had considerable work experience should also find this course interesting and helpful since it covers several phases of retail merchandising such as locating and purchasing merchandise, preparing goods for display, and selling to the consumer.

In just about any occupation it is impossible to do a good job unless one has the proper physical and mental tools needed and unless scientific methods are used in performing the tasks of that occupation or profession. Retailers, as well as people in the professions, have specific tools to be used and definite methods of using them to achieve a profitable store operation.

The attainment of occupational competency in any type of work involves three different, yet closely related, types of learning:

1. Mastery of the practical job-skills and procedures performed by the worker in the occupation.
2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.
3. Development of those personal-social traits which are essential for successful workers.

Job-skills and procedures will mostly be taught by your employer on the job. Some of the fundamental principles and procedures of your occupation can be acquired from class instruction. Specific technical and related information required in your occupation will be taught both by group methods and individual study. The assignments

U
F
E
D
3
3
3

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963

in this study guide are directed to the related information fundamental to successful performance of duties in retail merchandising. Therefore, this material is broad and basic to the particular field.

Personal-social traits may be developed as a result of your classroom instruction and your employer's teaching. Desirable personality traits are of extreme importance for success in life. They are the factors by which one primarily is judged when meeting people and when attempting to obtain a job. They are vitally important in holding a job. In fact, studies reveal that the chief cause of ninety per cent of the persons being discharged from their jobs is due to a lack of desirable personal-social traits, while only ten per cent of the discharges are the result of a lack of skills. It should be noted, however, that without job skills it is exceedingly difficult to find employment.

The following are some of the more important personal-social traits that a retail merchandising student should possess:

Personal Cleanliness. Dirty hands or clothing repel customers.

Good Health. Retail merchandise work requires abundant energy, and the ability to stand on one's feet for long hours. A student-worker must have no health problems that are offensive to customers.

Pleasing Personality. People employed in retail merchandising must be pleasant to meet, approachable, emotionally stable, and have a sense of humor.

Courtesy. The practice of being polite, considerate, and sympathetic to others will pay dividends in any business, especially in the field of retailing.

Attentiveness. The ability to pay close attention, to respond quickly and to concentrate on his work is essential to the student in retailing.

Cooperation. The ability and disposition to work harmoniously with others, to be helpful, and to do one's share are necessities.

Honesty. A salesman must give full value for every cent he receives from his customers--workers in all phases of retail activity must be accurate in giving merchandise information at all times.

Initiative. The ability to see things that need to be done and to keep busy doing them without constant supervision is one of the most marketable traits of a retail employee.

As indicated by the frequency of use numbers above (numbers in parentheses) all three references are important as reference material for use with this particular study guide. Reference A, Retail Merchandising, is the priority text to be used when working the assignments. Where B and C references are recommended, they are essential if a student is to be able to adequately cover the assigned material and answer the study guide questions. To prevent gaps in student progress through this study guide, use of all three texts is necessary.

Both reference B and C, same editions, are used with the Salesmanship Group Instruction and Salesmanship Individual Study Study Guides, other publications in the Preparatory Distributive Education Series published by the Department of Industrial Education at the University of Missouri.

91. Identify the various steps involved in making a sale	8	91. Basic types of sales transactions
92. Check the cash register for proper change level	8	92. Check change in the cash register
93. Identify customers and have checks approved for cashing	8	93. Store policies on accepting checks

Advertising and Displaying Merchandise

94. Interpret store advertising	9	94. Purposes of retail advertising
95. Plan store advertising		
96. Determine goods that should be advertised		
97. Choose appropriate advertising media		
98. Write advertising headlines and copy	9	98. Rules for writing headlines and copy
99. Build and tie in store displays with the overall store promotion theme	9	99. Objectives of store display
100. Build an appropriate window display	9	100. Principles of window display
101. Build interior displays	9	101. Factors involved in setting up interior displays
	9	102. Effective use of colors in display work
103. Analyze promotional advertising	9	103. Forms of promotional advertising

Keeping Records and Controlling Stock

104. Analyze and utilize store records for the buying and merchandising process	10	104. Phases of retail record keeping
105. Assist in taking a full store inventory		
106. Analyze stock control methods	10	106. Advantages and disadvantages of various stock control methods

JOB TRAINING: What the Worker Should Be Able to Do		Assign. No.	RELATED INFORMATION: What The Worker Should Know	
107.	Identify causes for stock shortages	10	107.	Reasons for stock shortages
108.	Interpret a balance sheet and a profit and loss statement	10	108.	Uses of a balance sheet and a profit and loss statement
109.	Forecast the needed type, style, and amount of stock	10	109.	Importance of stock planning, forecast and control
110.	Compute stock turn for various departments			
111.	Plan for greater stock turn results	10	111.	Effect of stock turn on profits
112.	Suggest needed price changes on merchandise			
113.	Identify slow-moving stock	10	113.	Methods of moving slow-selling merchandise
114.	Draw a store organizational chart	10	115.	Management uses of store capital
116.	Interpret store financial information	10	116.	Management's need and use for store financial information
117.	Bill customers	10	117.	Methods of billing customers
118.	Interpret the various phases of bookkeeping	10	118.	Requirements of a good bookkeeping system

Observing Government Regulations

119.	Identify imposed government regulations	11	119.	Government regulations in the distribution of goods
		11	120.	Reasons for increased government regulation
121.	Interpret employee benefits derived from government regulations	11	121.	Government regulations of working conditions
		11	122.	Government regulations on prices
		11	123.	Advantages and disadvantages of resale price maintenance laws
		11	124.	Regulations on merchandising
		11	125.	Regulations on advertising and selling
		11	126.	Tax regulations for business

FUNDAMENTALS OF RETAILING

Retailing is the function of selling goods to the consumer profitably, of maintaining the most advantageous proportion between sales, stocks and profits, and of controlling the relations between purchases and estimated future sales. It is the last link in the process of distributing the producer's goods to the consumer and is one of the most important fields of work in the United States today. Retailing is the third largest industry in our country. One out of every seven persons gainfully employed works in some phase of retailing. In this important, vital field, there are unlimited opportunities for advancement and success for the person who desires to succeed and has a willingness to work and learn.

Wants and needs are much different today for Americans as compared to those of thirty to forty years ago. Modern retail stores reflect these changes and will continue to meet new needs with stocking new products, developing new merchandising techniques and providing the necessary customer services. Whether a store is large or small, retailing functions are basically similar. Retail businesses must effectively merchandise their goods if they are to meet customer demands and operate successfully.

In this assignment you will study the importance of retailing in the economy, types of retail stores, and the methods of selling used for different kinds of merchandise.

Assignment:

1. Read the references listed below.
2. List the nine types of small scale retail concerns and the five large scale retailing concerns given in your text, and select a local business in your community as an example of each.
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate and Weiner, Retail Merchandising, Sixth Edition, 1963, pp. 2-66.
- B. Richert, Meyer and Haines, Retailing Principles and Practices, Fourth Edition, 1962, pp. 7-14.

Questions:

1. What are the major differences between the consumer of today and the consumer of the past?
2. Discuss the different classes of customers the retailer must seek to please.

3. What are the different age groups of consumers that the retailer must consider?
4. Explain why even now consumers must continue to receive consumer education.
5. How is it possible for small retailers to hold their own in this increasingly mass production-mass distribution economy with increasingly selective consumers?
6. How has competition in retailing promoted a "profit squeeze"?
7. Compared to business today, what major changes are expected to come about in retailing within the next few decades?
8. Explain the three weapons that small retailers may use to combat their domination by large-scale retailers...
 - a. specialization
 - b. personal service
 - c. convenience of location
9. Discuss how downtown department stores are attempting to maintain their portion of the buying public in the face of the suburban movement and the success of discount houses.
10. What are the advantages of mail-order type retailing?
11. What effect has self-service had on food stores and other retail establishments?
12. What are the two main types of shopping centers and why are they becoming more and more popular?
13. Which type of retailing is best, and what size store is most desirable?
14. What are the reasons for the rapid growth of discount houses in recent years?
15. In what fields do independent stores do the major share of business? Why?
16. What effect has the increase in mobility of our population had on the operation of retail stores?
17. How do consumer cooperatives distribute their earnings to their members?
18. It has been predicted that small retailers will eventually disappear. Do you believe this to be true? Defend your answer.
19. What are the features that have characterized the growth of the supermarket during the years since the great depression of the 30's?

20. What are the features of the discount store operation that have resulted in its phenomenal growth in the 1950's and 60's?
21. Discuss the advantages and disadvantages of an individual proprietorship in relation to: a partnership, a corporation.
22. Name the basic retailing activities and discuss the advantages of setting up a detailed organization of these activities in the case of a: a small scale retailer; large scale retailer.
23. In recent years many customers have become increasingly price conscious. Discuss what changes, if any, this has brought about in the operation of retail stores.
24. Nearly everyone is familiar with the two largest mail order houses--Sears, Roebuck & Co. and Montgomery Ward & Co. Discuss the extensive changes in the methods of operation these companies have undergone in the past 25 years.
25. Discuss the meaning of the following terms: (A) the specialty shop; (B) voluntary chain; (C) corporate chain; (D) consumer co-operative; (E) direct selling.

Assignment
Sheet No. 2

Covering
Units 22-36

BUYING FOR CONSUMER DEMAND

Many merchants have difficulty in buying correctly. There can be no such thing as an ideal stock because each one store has its own individual problems. A stock which in one store may be adequate to meet the varying demands of customers might be inadequate for another.

A careful study of market offerings, stock on hand, fashion desires of customers, and money available for purchases will provide the buyer with needed information for purchasing the adequate stock for his store.

This assignment presents many of the factors that a buyer must consider when purchases are to be made for his store.

Assignment:

1. Read the references listed below.
2. In a paper not exceeding three pages describe methods used to study customer demand and why it is important to consider customer demand in purchasing.
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate and Weiner, Retail Merchandising, Sixth Edition, 1963, pp. 163-189.
- B. Richert, Meyer and Haines, Retailing Principles and Practices, Fourth Edition, 1962, pp. 343-348.
- C. Wingate and Nolan, Fundamentals of Selling, Eighth Edition, 1964, pp. 70-76.

Questions:

1. Briefly compare and contrast staple goods to fashion goods, convenience goods, and shopping goods.
2. Discuss the characteristics of staple goods and the factors a buyer should consider in drawing up a staple list.
3. What are the major advantages of having private brands?
4. What are the disadvantages of stocking private brands?
5. Discuss the problems that discount houses have in deciding whether to use private or national brands.
6. What are the sources of information a buyer might use when formulating a written buying plan?

7. Discuss why it is usually necessary to have an assortment of various prices within each classification of fashion goods.
8. What were the typical merchandise classifications given in your text?
9. How do chain stores such as J. C. Penny Co. and Sears, Roebuck and Co. go about setting up specifications for merchandise they buy?
10. Discuss the major ways to get information to determine what your customers want.
11. Name and discuss the ways different fashion cycles vary as to time.
12. Explain the different methods a retail buyer may use to determine the style preferences of his store's clientele.
13. Discuss how the model stock plan used in planning fashion assortments is organized.
14. Explain how a study of past sale records can aid in determining future customer demand.
15. Name and explain the different ways a retail store might conduct customer surveys.
16. What are the advantages to be gained by the study of trade papers and magazines?
17. How do substitution sales by the sales force affect the buyer's job?
18. Discuss how scientific developments and labor saving devices create new fashions.

Assignment
Sheet No. 3

Covering
Units 37-47

RESPONSIBILITIES OF A STORE BUYER

Basically, there are three main channels of purchasing open to buyers of retail stores. They are (1) display markets, (2) manufacture and wholesale salesmen, and (3) buying offices.

Due to economic conditions or to location of natural resources, various industries and markets have become centralized in different parts of the country. Many manufacturers and wholesalers display their goods in these centrally located display markets to which retail merchants can conveniently come to inspect and purchase goods. Some retailers find it most convenient to do a part of their purchasing from manufacturers who have a policy of dealing directly with the retailer through manufacture and wholesale salesmen. Large department stores do a large part of their purchasing through buying offices located in principal key cities. Smaller stores, to meet chain store competition, have been forced to associate themselves with such offices.

The first step in profitable merchandising is wise buying. This assignment will explore the functions of the channels of purchasing available to the retail store.

Assignment:

1. Read the references listed below.
2. Select a type of retail store, then list the factors to consider in deciding on suitable suppliers of merchandise.
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate and Weiner, Retail Merchandising, Sixth Edition, 1963, pp. 193-220.
- B. Richert, Meyer and Haines, Retailing Principles and Practices, Fourth Edition, 1962, pp. 408-422.

Questions:

1. What factors determine the frequency of retail buying trips to a central market?
2. Discuss the various reasons a buyer might select certain sources of supply.
3. Give the factors a buyer should have in mind as he views a manufacturer's line of merchandise.
4. Give several of the major unethical practices a buyer should avoid.

5. The policy of group buying that is sometimes practiced by resident buying offices consists generally of what type procedure?
6. Discuss the following terms in relation to the aid that may be given a buyer in a retail store in making new market contacts: (a) trade papers, (b) trade directories, (c) comparison shopping, (d) trade shows, (e) market trips.
7. What are the advantages and the disadvantages of depending largely on traveling salesmen as the primary market contact?
8. Discuss the differences in the two distinct kinds of resident buying offices: (a) independent office, (b) store-owned office.
9. Since World War II, consumers have shown increasing interest in imported merchandise--discuss how a retail store buyer may use this to an advantage for his store.
10. Discuss the requirements a buyer should look for in considering a new item for his store.
11. Discuss the "don'ts" a buyer should avoid in selecting and purchasing goods for his store.
12. Name and explain the desirable qualifications of a retail buyer.
13. What are the factors a buyer must consider when buying in advance?
14. What is a merchandise plan?
15. What factors influence a merchandise plan?
16. Describe the aspects involved in controlling the merchandise plan.
17. Name and briefly describe the five items to be used as a guide in selecting merchandise.
18. Describe the services the buying office performs for a buyer in the market and his home store.

Assignment
Sheet No. 4

Covering
Units 48-53

NEGOTIATING FOR PRICE

When the buyer has decided that certain merchandise best fulfills his customers' needs, he must negotiate on a number of factors before a purchase agreement is made. A major element is the price of the merchandise. What the retailer actually pays for his merchandise, however, depends not only on the seller's list price but also upon the various discounts which may be secured.

The retailer is also interested in the period of time allowed for the taking of discounts and the date when the bill finally becomes payable, that is, the dating that may be obtained. These two elements--discounts and dating--are known as the "terms of sale".

Finally, negotiations may also take place over transportation charges. In this assignment we turn our attention to these various aspects of negotiations.

Assignment:

1. Read the reference listed below.
2. Answer the following, explain fully, and hand in by _____
 - a) Assume that merchandise shipped on May 15 was billed at \$1,950 with terms of 2/10-30 extra, F.O.B. destination, and that the bill was paid on the day the cash discount expired. On what date was the bill paid and what was the amount of the check?
 - b) Assuming the same terms and figures given in (a) above, plus the fact that anticipation was allowed, what amount should be remitted to the seller if the bill was paid on June 1?
3. Answer the questions below and turn in this assignment by _____.

Reference:

- A. Wingate & Weiner, Retail Merchandising, sixth edition, pp. 225-252.

Questions:

1. Discuss why you think a capable buyer should or should not guess at prices; memorize prices; estimate prices.
2. List and discuss when, or over what points the buyer should bargain to gain price concession.
3. Discuss the advantages which may result from a group of stores banding together to place group orders.

4. There are basically four kinds of discounts available to the retailer. List these and explain the purpose of each.
5. Explain the protection given the small retailer by the Robinson-Patman Act.
6. Discuss the term E.O.M., explaining when and why it is used, and what the letters stand for.
7. Discuss the term R. O. G., explaining when and why it is used, and what the letters stand for.
8. List and discuss what is meant by the several variations of the F.O.B. shipping terms.
9. Discuss the meanings of the shipping methods called "piggyback" and "fishyback".
10. Give an example of extra dating. Give an example of post dating. Explain the meaning of each.
11. Discuss what is meant by purchasing on consignment terms.
12. Discuss and give your reasons why you think the cash discount is a reward for prompt payment, or a penalty for late payment.
13. Explain other forms of price adjustments that may be given a buyer that are not in the form of invoice discounts.
14. List and explain special buying arrangements that result in a reduced cost of merchandise to a retailer.
15. List and discuss all information that should be contained on a written purchase order.

Assignment
Sheet No. 5

Covering
Units 54-65

HANDLING INCOMING MERCHANDISE

A moment's reflection will readily reveal that after goods are purchased they must be delivered to the store and made available for inspection by customers. This process is necessary in stores of all kinds and sizes and involves the performance of several closely related activities including Receiving, Checking, Marking, Storing, and Arranging.

Receiving refers to the activities necessary in taking physical possession of merchandise at the store and its movement to the area where it is opened and checked. Checking includes a matching of the order against the invoice, the opening of containers, the removal and sorting of the goods, and a comparison of the quantity and quality of the goods with the specifications of the order. Marking consists of placing certain types of information on the merchandise or on price tickets attached to or placed near the goods. This aids the customer and the salesperson in making selections and provides information for certain aspects of control. Storing and Arranging refers to the activities involved in moving merchandise from the marking room to the stock room, if one is used, or otherwise to the sales floor.

In this assignment we will study Receiving, Checking, Marking, Storing and Arranging in detail, emphasizing the importance of the proper performance of each to the successful operation of a large or small retailing business.

Assignment:

1. Read the references listed below.
2. Using both the information in your text and visits to local retail stores, summarize the following:
In what ways do the receiving, checking and marking activities of chain stores differ from those of single-unit retail establishments?
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate and Weiner, Retail Merchandising, Sixth Edition, 1963, pp. 253-282.
- B. Richert, Meyer and Haines, Retailing Principles and Practices, 1962, pp. 123-141.

Questions:

1. Describe the four major types of floor layouts used in receiving rooms giving the advantages and disadvantages of each.
2. In relation to checking the quantities of merchandise received, discuss and explain the following terms: direct check; apron; blind check; dummy invoice.
3. Discuss the advantages of the newer concepts in receiving goods.
4. Describe the plan of a receiving room that is equipped with stationary tables; with portable tables; with mechanical conveyors.
5. List and discuss what the checker may find wrong in a careful check on quality of incoming shipments.
6. List and discuss several kinds of price tickets used in marking goods. Give the advantages and disadvantages of each.
7. Describe the various methods used to code cost price on price tags. Which is best?
8. List each type of information commonly found on price tickets. Tell why it is important to include each.
9. Discuss the advantages of machine marking over hand marking.
10. Describe the advantages of the newest development in price tickets, that of using punched-card marking.
11. Discuss the procedures and the reasons for control systems set up for remarking merchandise.
12. How does the proper layout of reserve stock help the retailer obtain more volume?
13. What are the ways that supermarkets and discount stores attempt to reduce their reserve stock areas? What are the advantages of reduced reserve stock areas?
14. List types of merchandise that it is important to have where the customer can easily handle and inspect. Why is it necessary that this merchandise be so placed?
15. Why is arrangement of stock important to the salesperson and to the merchandise stock control people?
16. Trace the wholesaler's invoice as it travels through the retail store from the receiving point to the office for payment.
17. List and discuss the seven steps of invoice control.

18. What has mechanization done to the procedures at the points of: receiving; checking; marking; and storing the goods?
19. Trace the steps of the flow of goods from the time they are received at the retail store until they are delivered to the customer. Explain the process of each step.
20. What are the advantages of maintaining an adequate assortment of goods?
21. List and discuss the merchandising operations with which personnel assigned to receiving incoming goods should be familiar.
22. When should a store use and what are the advantages of: the open check; the blind check; the spot check?
23. In relation to the function of receiving merchandise, explain the meaning of the following terms: LCL shipment; log; receiving apron.
24. What information besides the retail price is often included on price tickets? Why is this information important?
25. What type of price ticket would you expect to use when marking: rayon hose; crew socks; men's belts; women's handbags; pajamas?
26. Explain the concept of stock turnover. Why is turnover important to the retail store?
27. What basic merchandise information might a retailer derive from using a dollar control and/or a unit control type of stock-control system?
28. What information is needed to make a dollar or unit control system function? Where can this information be obtained?
29. In what ways do retail stores benefit from a good stock control system?
30. List and discuss the ways a salesperson can assist the stock record department to increase the accuracy of the control system.

PRICING FOR PROFITS

No retailer can stay in business very long unless his store yields a profit. Successful pricing is often put forth as the means of maximizing profits, actually it is only one of several steps the store must take to secure such profits. Yet pricing is an important step and needs to be given careful consideration.

"Retail markup" means the amount that is added to the merchandise cost price to determine the retail price. Since prices are constantly on trial, quite often it becomes desirable to alter those originally placed on various items. The changes usually represent decreases in prices and are referred to as "markdowns".

In this assignment we will study various retail policies on taking markups and markdowns. We will also take a look at the use of price leaders and the practice of offering premiums in relation to their effect on the profits of a retail store.

Assignment:

1. Read the references listed below.
2. Talk with three or four local retailers about their policies on taking markdowns. Analyze and write up each one's policy, noting any disagreement among them as to just when and how much markdown should be taken.
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate & Weiner, Retail Merchandising, Sixth Edition, 1963, pp. 285-310.
- B. Richert, Meyer & Haines, Retailing Principles and Practices, 1962, pp. 430-445.

Questions:

1. Discuss the ways to use markdown to further boost a store's sales promotion policies.
2. List and discuss the variations in markup according to the kind of merchandise and the type of store.
3. List and discuss the use of loss leaders and leaders. Point out why they have received much criticism.
4. What is bait advertising and how is it used by retailers of today?
5. Discuss the various methods used by chain-stores to purchase their merchandise and tell how they are different from the methods used by small retailers.

6. What are the duties and responsibilities of the merchandise manager?
7. Explain the attitude of the Better Business Bureau regarding the use of false leaders in retail advertising.
8. What are some of the actions a retailer may take when competition is threatening to reduce his profit on an item?
9. Define and explain the following terms: markup per cent, markon, initial markup, maintained markup, and markup formula.
10. List and discuss the formulas for finding: markup per cent, cost price, retail price, dollar markup.
11. What are the reasons for markups on the same or similar merchandise being different in different stores?
12. List and discuss conditions which may exist that will justify a high markup or a low markup.
13. What are the basic premium merchandising policies being used in retailing today and how do these affect initial markup?
14. Discuss merchants' attitudes and objections toward the use of premium devices.
15. Draw and discuss a typical organization chart for a merchandising division of a department store.
16. Explain how competition affects the final decision of the amount of profit margin a store will try to obtain.
17. Discuss the psychological affect that pricing in odd numbers has on customers.
18. When setting prices on merchandise, how would a merchant take into consideration the following: desirability of the article, habits and customs of the consumer, service policies, and depreciation.
19. How do minimum price laws in your state affect the practice of using loss leaders, promotional pricing in general, and manufacturer list prices.
20. List and discuss the usual operating expenses the average store in your community may encounter. In what way will tight control of these expenses affect pricing and markup?

SELLING TO CUSTOMERS

One of the very important activities in our economy--one that differentiates the American way-of-life from a large part of the world --is salesmanship. It did not "just happen" that Americans are the best-fed, best-housed, and best-clothed people on earth. It is not an accident that we are making, exchanging, and consuming goods (and services) at a rate which is unique only to this country. American salesmen are the agents who have, in large measure, brought this favorable economic condition into being. Not only has salesmanship made substantial contributions to the American way-of-life, salesmanship is a way-of-life.

Salesmen are rewarded on the job in relation to the results they produce. High level earnings, economic security, recognition, and promotions are among the forms of compensation for successful salesmen. Salesmanship can be learned through study and practice--much the same as typing, sewing, or piano playing. Salesmen can become as proficient as doctors, engineers, or educators. There is much knowledge to be mastered. There are skills to be perfected.

In this assignment, we shall consider the techniques a successful salesman must develop if he is to make a contribution to his customers, his company, and to society.

Assignment:

1. Read the references listed below.
2. The next time you shop in a retail store for any type of merchandise make written notes on the following:
 - a. The success qualities that the salesman exhibited.
 - b. How he exhibited them.
 - c. What success qualities were lacking.
 - d. How you knew that they were lacking.
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate and Weiner, Retail Merchandising, Sixth Edition, 1963, pp. 314-345.
- B. Richert, Meyer and Haines, Retailing Principles and Practices, 1962, pp. 196-223.
- C. Wingate and Nolan, Fundamentals of Selling, Eighth Edition, 1964, pp. 28-32.

Questions:

1. To what extent does non-personal selling assist personal selling? Discuss.
2. Discuss personal selling at the wholesale level and the retail level.

3. Contrast internal and external personal selling methods.
4. Name and discuss the methods of the different types of external non-personal selling retail stores engage in.
5. Explain how and to what extent informative labeling of merchandise can act as a non-personal selling media.
6. Discuss what you consider the future of the automatic vending machine. Give your reasons.
7. Name and discuss the meaning of the five points of the star salesman.
8. Explain the importances of stockkeeping as a duty of salespeople.
9. Discuss the important points for a salesperson to follow when giving directions to customers.
10. Discuss some of the ways a salesperson may help keep store expenses down and help prevent waste and losses.
11. Formulate several situations that normally may be points of customer complaints. Discuss how you would handle each.
12. Explain the points of a good pre-approach as the first step of a sale.
13. Name and discuss several objectionable traits a salesperson can exhibit that are irritating to the average customer.
14. Contrast and discuss the service greeting and the merchandise approach. When should each be used?
15. By what means might a salesperson determine a customer's wants?
16. A salesperson must have specialized knowledge to present effective selling conversation. Discuss these important points.
17. Explain why the salesperson must answer objections. Give a brief example of the four types of valid customer objections.
18. When is the "best time" for the salesperson to start to close a sale? Explain.
19. Discuss the activities performed during the mechanics of closing a sale.
20. Discuss what phrases may be employed by the salesperson as the customer departs that will build goodwill for the store.
21. Name and discuss the psychological wants of human beings as they relate to selling.

22. Discuss how a customer's buying motives may differ, and how the salesperson may utilize these motives in getting the customer to buy.
23. What type of open remarks would you use in using a merchandise approach if you suspect the customer is a shopper? Why?
24. What are the major reasons stores encourage salespersons to use the merchandise approach? Why?
25. Name and discuss the rules a salesperson should keep in mind when making suggestions to his customer for additional merchandise.
26. Name and discuss the four "keys" to use when "trading up." Give the reasons you believe these keys could be of help to a salesperson.

Assignment
Sheet No. 8

Covering
Units 84-93

PERSONAL AND NONPERSONAL SELLING

All retail stores, regardless of type or size, perform a number of activities related to the actual sale of merchandise to the customer, such as presenting the customer with a sales check or a cash register receipt, receiving and safeguarding money, and recording sales transactions. To insure proper performance, the procedures or routines must be planned carefully, carried out smoothly, and revised as business conditions change.

In addition to advertising and display, which will be studied in the next assignment, a variety of other nonpersonal methods of retail sales promotion is used by retailers. Nonpersonal selling methods that seem to be of greatest importance today are telephone and mail-order selling, packaging, and consumer premiums, including trading stamps.

This assignment presents an introduction to the broad fields of nonpersonal retailing such as selling by telephone and mail-order. This unit also covers sales recording, making change, packaging, and wrapping customer purchases. The student will find that this unit provides valuable tips and information on closing sales and handling money that could very well serve to help prevent him from making costly errors.

Assignment:

1. Read the references listed below.
2. Assume that you are the proprietor of a retail drug store. In a paper not to exceed two pages, tell how you would proceed, and what types of items you would feature in setting up a program of telephone selling in your drug store.
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate and Weiner, Retail Merchandising, Sixth Edition, pp. 352-379.
- B. Richert, Meyer and Haines, Retailing Principles and Practices, pp. 93-115.
- C. Wingate and Nolan, Fundamentals of Selling, Eighth Edition, pp. 422-435.

Questions:

1. Name and explain the various types of devices used in retailing today for recording sales.
2. Discuss differences in the duties of a floor cashier and a check-out cashier.

3. What are the advantages of the tube system for recording sales?
4. List and explain the "musts" in making change.
5. Discuss the major types or methods of credit authorization.
6. Explain the system developed to handle and record sales called Uni-Tote.
7. List and discuss the retail objectives in wrapping customer packages.
8. What are the differences between wrapping and packing?
9. Discuss the advances that have taken place in recent years in preparing packages for delivery and mailing.
10. Is the use of telephone selling increasing or decreasing in retail stores? Why?
11. Discuss the problems a telephone salesperson will encounter that are different from those of selling on the sales floor.
12. List and discuss the special pointers a salesperson should observe when selling by telephone.
13. What are the duties that are associated with the job referred to as "order filler"?
14. What kinds of goods are best suited for telephone selling?
15. Discuss the system of team selling in small stores; in self-service stores; in departmentalized stores.
16. Briefly explain several factors that contribute to informal teams in store organizations and how they should be dealt with.
17. Explain the term "sales grabbing", and three major solutions for solving the problem.
18. Define the following terms: cash-take; cash-send; charge-take; charge-send; C.O.D.; and will-call or lay-away.
19. In what ways will accuracy in filling out the sales slip help in store operations and control?
20. Describe the procedure used in many stores as explained in your text, for exchanges, will-calls, and discounts of various kinds.
21. Describe the procedure outlined in your text concerning how to check your change fund.
22. List and discuss the eight steps or basic rules of how to make change.

23. Briefly explain the importance of the following parts of checks: date, payee, maker, amount, signature, and endorsement.
24. Explain and discuss the marked-bill trick and the split-bill trick often used by short-change artists.
25. Discuss the concepts of appropriateness, durability, appearance, economy, and speed, in the wrapping of packages.

ADVERTISING AND DISPLAYING MERCHANDISE

The primary purposes of retail advertising are (1) to build a reputation for the store and (2) to increase the customer traffic and the sales volume of the store. The successful accomplishment of these two aims results in the achievement of the retailer's third purpose: (3) to increase the net profit of the store.

Since the very beginnings of trade merchants have recognized that they must show their wares under the most favorable conditions, if passers-by are to be enticed to purchase. From the rude display of the early merchant, with his commodities spread out on the street, have sprung the massive show windows of the modern retailer, with lavishly prepared displays, brilliantly lighted, all with the same purpose in mind--to interest passers-by and to induce them to purchase

In this assignment you will explore the psychology of advertising, study the methods of singling out which merchandise to promote, evaluate the media best to use, and learn the procedures in preparing an advertisement. In addition, this assignment is designed to acquaint you with some of the essentials necessary in the preparation of a good display which will bring forth the most satisfactory sales results.

Assignment:

1. Read the references listed below.
2. Make a newspaper advertisement layout, following the directions given in the job assignment sheet included with this assignment.
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate and Weiner, Retail Merchandising, Sixth Edition, 1963, pp. 383-434.
- B. Richert, Meyer and Haines, Retailing Principles and Practices, Fourth Edition, 1962, pp. 280-311.
- C. Wingate and Nolan, Fundamentals of Selling, Eighth Edition, 1964, pp. 381-396.

Questions:

1. Discuss the major factors that various types of stores should study in deciding which goods to advertise.
2. What types of goods usually should not be advertised and why?
3. Explain the principle of timeliness in regard to window displays.

4. Discuss the use of backgrounds and lights to attract attention and accent a window display.
5. Explain the factors that determine how often window displays are changed.
6. How do signs and labels increase emphasis on open displays?
7. What are the advantages of direct-mail advertising?
8. What factors must be considered in selecting a newspaper in which to advertise?
9. Name several forms of outdoor advertising used by retail stores.
10. Name as many media of advertising as you can that are used by retail stores.
11. What three functions must a headline accomplish in an advertisement?
12. Explain the difference in factual appeal and emotional appeal in advertising copy writing.
13. Discuss the steps in the preparation of an advertisement.
14. All states now have "Printers' Ink" statutes. What purpose do these laws serve?
15. Where might a beginning retailer secure help with his advertising problems?
16. What are the objectives of merchandise displays?
17. Display has several advantages that advertising does not possess; what are they?
18. Name and explain the major purposes of retail advertising.
19. What are the major factors to consider in determining when to advertise?
20. Discuss the three major considerations related to selection of a medium of advertising.
21. Explain the five factors that determine the competitive strength of a layout.
22. Discuss the advantages and disadvantages of advertising.
23. Compare the three types of promotional advertising with each other.
24. Discuss the advantages of effective store display.

KEEPING RECORDS AND CONTROLLING STOCK

There are numerous important merchandising functions, and the performance of each in an efficient manner is as essential in a small store as in a large department store.

Advantageous turnover, or the carrying of stocks just sufficient to meet public demand, is the secret of success in retailing. Records of sales, stocks and purchases should be carefully analyzed. On the basis of previous experience and current business developments, the volume of future purchases that will give the turnover desired should be planned. The merchandise division should be able to analyze business barometers for the purpose of forecasting business conditions.

In this assignment, we will study merchandise records and control relative to their importance to effective business operation and future planning.

Assignment:

1. Read the references listed below.
2. Take your stand, pro or con, and prepare a debate outline on the following topics:
 - a. The large retail department store has a greater need for using automatic data processing than small shopping district stores.
 - b. A store's success is more dependent on outside general business conditions than it is on inside management abilities.
 Be prepared to orally defend your point of view.
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate and Weiner, Retail Merchandising, Sixth Edition, 1963, pp. 446-504.
- B. Richert, Meyer and Haines, Retailing Principles and Practices, 1962, pp. 448-474.

Questions:

1. What methods of keeping records for cash receipts seem best for a large retail business? A small retail business?
2. Under what conditions would it be wise for a store to establish a petty cash fund? Discuss the different expenses that should be paid from this fund.
3. List several expenses that most businesses incur regularly. Classify these expenses under fixed and variable.

4. Discuss the effects that a decrease in normal sales volume may have upon the five most important records in a retail business: cash, expenses, sales, purchases, and inventories.
5. Discuss the advantages and disadvantages of using automatic data processing methods in keeping business records.
6. Select a business in your community and discuss methods and procedures for taking a physical inventory for it.
7. Discuss the advantages and disadvantages of the perpetual inventory method of stock record control.
8. Discuss the use of a unit control system. Will the mechanization of unit control systems decrease the need for clerks to keep records? Explain.
9. Discuss why you do or do not agree with this statement: The chief value of the income statement is in showing how to increase net income.
10. Name the three main divisions of a balance sheet. Discuss what accounts would be placed under each. Why?
11. Discuss the pro and con of the following statement: A small retail store does not have as great a need for financial records as the large department store.
12. Discuss the pro and con of the following statement: Planning, forecasting, and control are of greater importance to the large retailer than the small retailer.
13. Name and discuss the four phases of merchandise planning.
14. Discuss the three stock turn equations. Which equation would probably be preferred by stores in your community?
15. Discuss the advantages of increasing a store's stock turn. How would increasing stock turn affect profits?
16. How does open-to-buy control affect a store's inventories and profits?
17. Name and discuss some of the better methods of moving slow-selling merchandise.
18. Discuss what you consider to be the duties and responsibilities of the controller.
19. What are sources of capital for starting and operating a business? How does the wise selection of these sources affect future profits?
20. Discuss the personal characteristics or traits a store owner should consider about a customer before granting him credit.

OBSERVING GOVERNMENT REGULATIONS

Since 1933 there has been a growing trend toward increased government regulation over business. The main reason for this trend is that the public has expressed a need for protection from unfair business prices and practices, the sale of harmful food, misrepresentation in advertising, and conspiracies among sellers.

One should have a clear understanding of the fact that business operates under laws that both aid and control, thus the American business enterprise must not be classed as a completely free enterprise system. It is important to learn some of the regulations under which business must operate.

The purpose of this assignment is to present to you the governmental regulations covering wages, hours of work, insurance, working conditions, competition, prices and retail credit.

Assignment:

1. Read the references listed below.
2. Write a paper listing some of the businesses in your area which are affected by the regulations presented in this assignment. State how these businesses are affected and whether they are aided or controlled.
3. Answer the questions below and turn in this assignment by _____.

References:

- A. Wingate and Weiner, Retail Merchandising, Sixth Edition, 1963, pp. 507-532.
- B. Wingate and Nolan, Fundamentals of Selling, Eighth Edition, 1964, pp. 477-494.

Questions:

1. If you publish a magazine in which false advertising is published, are you subject to any liability under the regulations of the Federal Trade Commission?
2. What is the role of better business bureaus in establishing ethical practices in advertising and selling?
3. What is the significance of the nonsigner clause of the fair-trade laws?
4. Name at least three different kinds of acts that are prohibited under the laws administered by the Federal Trade Commission.
5. What is the essence of the Robinson-Patman Act, and why is this act important?

6. Explain whether you think that it is legal under the Robinson-Patman Act for a firm to sell goods to an independent retailer for 50¢ a dozen in 10 dozen lots and sell the same item to a chain store for 30¢ a dozen in lots of 10,000 cases.
7. What are the basic reasons for most of the taxes imposed by the government on business firms?
8. What are the chief types of taxes and/or licenses that a business needs to consider in estimating expenses?
9. In what way does the government regulate or control monopolies?
10. Discuss the laws that regulate business selling methods.
11. Are retailers free to sell any type of product their customers are willing to buy? Give examples supporting your answer.
12. Is the trend for government regulation today toward or away from a laissez-faire attitude?
13. Develop a list of reasons why the trend today is toward increased government regulation of business.
14. Why have the reasons you developed in question 13 become more noticeable during the last quarter of this century than they were before?
15. Discuss the chief reasons for the increase in government regulation of working conditions that are designed to protect the welfare of employees during recession years.
16. What essential information should be found on an informative label? A descriptive label?
17. What are the chief requisites for labeling foods?
18. Summarize the section of the Federal Food, Drug, and Cosmetic Act that affects the labeling of drugs.
19. What are the chief rules set up by the Federal Trade Commission to enforce advertising standards of textiles?
20. The Federal Trade Commission has the power to take action against various unfair advertising practices. What are these practices?

FOREWORD

This course of study, consisting of an analysis of **FOOD SERVICE**, together with assignment sheets covering the related (occupational) information to be taught by the school, has been prepared for teaching food service workers on an individual basis in a cooperative part-time program.

The original analysis was prepared by Miss Virginia Griffith while a graduate student in Industrial Education at the University of Missouri. Subsequent revisions of the analysis were made by a few COE coordinators in Missouri with later revisions being made in 1952 by Mr. Marion P. Stevens and in 1958 by Dr. Thomas W. Miller, both formerly Research Assistants in Industrial Education at the University of Missouri. Special credit is due Mr. Nevin E. Andre, Research Assistant in Industrial Education at the University of Missouri, who prepared the present revision of the analysis and the assignment sheets.

We wish to acknowledge our indebtedness to Dr. H. H. London, Professor of Industrial Education at the University of Missouri, who supervised the preparation of the material, and to Mr. James B. Karnes, Instructor in Industrial Education at the University of Missouri, who edited the manuscript. Credit is due Dr. H. Pat Wardlaw, Assistant Commissioner of Education, Mr. Merton Wheeler, Director of Industrial Education, and other staff members of the State Department of Education for their efforts in the development of the Industrial Education Curriculum Series of which this course of study is a part.

Training Plan and Progress Record

INTRODUCTION

In preparing this course of study, it has been assumed that the attainment of occupational competency in any type of work involves three different, yet closely related, types of learning. They are:

1. Mastery of the practical job skills and procedures performed by the worker in the occupation.
2. Comprehension of the technical and related information basic to an intelligent understanding and practice of the occupation.
3. Development of those personal-social traits which are essential for the successful worker.

The first group of the "learning units"--the job skills and procedures -- has been arranged in the analysis under the heading of "Job Training." The second group of learning units -- the technical and related information -- has been arranged under the heading of "Related Information." And the third group -- the personal-social traits -- has been listed under "Personal-Social Traits Essential for the "Food Service Worker" in the introductory section addressed to the student.

In a cooperative educational program it is necessary for both cooperating agencies -- the school and the employer -- to understand clearly just what each is to be responsible for in the training of the student-worker. Experience has shown that most of the practical job skills and procedures of an occupation can best be learned through supervised work on the job. Experience has shown also that the school can best teach most of the technical and related occupational information needed by young student-workers. This division of responsibility has been made in the arrangement of the course of study; that is, it is expected that the student-worker will master the job skills and procedures through practical work on the job under the immediate supervision of the employer, and that he will receive instruction in related occupational information in the school under the direction of the coordinator.

Skills and related information are matters for direct instruction, but personal-social traits are acquired only through practicing them during the process of acquiring skills and information and in one's daily conduct. Therefore, both the employer and the school, as well as the home, must assume responsibility for developing in the student-worker those habits, attitudes and character traits which are essential for success in his occupation and in life. Both the employer and the school should be constantly on the alert to see that the student-worker places desirable interpretations on his experiences and that he does not practice habits and exhibit character traits detrimental to his success.

Since the coordinator's class will be made up of fifteen or more students, each differing from the other significantly, studying a dozen or more occupations which differ markedly in their requirements, it follows that it will be impossible for him to teach, through the group method, the occupational information which relates to the specific job

of each student-worker. In order to be effective, this type of instruction must be individualized. There is, of course, some related information, such as occupational health and safety, workmen's compensation, wage-hour laws, fair labor standards, unemployment compensation and the like, which is of common interest and concern to all student-workers, and may be effectively taught by the group method. But if the coordinator is to make a real contribution to the in-service vocational education of his students, he must devote a major portion of his classroom instruction to content which deals specifically with the work of each boy and girl enrolled.

With this requirement in mind, and in order to facilitate individual instruction, these assignment sheets have been prepared. Each contains certain record data as to number and range of units covered, introductory paragraphs designed to develop interest, explain the importance of the assignment, and to convey to the student what he is expected to learn, specific assignments including reading, learn activities and a series of new-type questions designed to check his attainment.

Obviously, it is desirable to teach the related information in the school at the time it will be used most advantageously on the job. This means that the two phases of the student-worker's training should parallel each other in a progressive manner. The coordinator will find the assignment sheets well adapted to this end. He can select from day to day the assignment which covers the informational units related to the work being done on the job. With this arrangement, the coordinator will become, during a major portion of his classroom time, a supervising study and helping teacher.

In selecting books for the course, an effort has been made to restrict the number to an adequate coverage of the material, and to select those of recent publication so that current practices can be consistently presented. It is recommended that copies of these books be secured and kept in the coordinator's classroom for ready use by the student.

The key sheets available in a separate manual, have been prepared to enable the coordinator to score quickly the objective tests which are a part of each assignment sheet. These key sheets give the correct answers to the questions, as well as the reference and the page on which each answer can be found. The key sheets should be kept in the coordinator's possession.

TO THE STUDENT WORKER

The beginning of the food service trade dates back to the early inns of England and France. As men found it necessary to travel for long distances by horseback and stagecoach, the need for places to lodge overnight grew. Many people earned additional income by hanging out signs advertising an extra room or two in their homes to be rented for the night. Some inns set aside a downstairs room as a place where weary travelers could secure family meals at a slight cost in addition to their night's lodging. Thus was the beginning of establishments, later to be known as restaurants, in the early days of trade and commerce.

Even though the restaurant business is a very old one, only in comparatively recent years has its growth been striking. Prior to 1910 restaurants were patronized primarily by members of the upper middle class and the wealthy. In following years factors such as the changing business pattern, development of the automobile and the increased work force resulted in an increased sales volume by eating and drinking places of 171 per cent from 1939 to 1945. In 1954, the sales of eating establishments amounted to 8.7 billion dollars, while in 1961, the sales reached a record of 16.5 billion dollars.

Opportunities in Food Service

The food service business is one of the greatest industries of this country, ranking as the fifth largest in terms of retail sales. It has been estimated that combining all the sources of prepared meals, exclusive of the home, an average of 78,000,000 meals are served each day in the 344,740 restaurants.

The health and well-being of the millions of people who eat in restaurants every day is affected by the food served them. Also, much of the social life is centered in dining out. The industry is, therefore, a great public enterprise and has serious obligations to those communities in which restaurants are established.

Reliable publications indicate that the outlook for food service workers is good. From all indications the American public will continue to travel in great numbers and more food will probably be required to meet their needs. This increased demand can be met only through development of more restaurant facilities. Thus, the demand for well-trained food service workers will most likely increase in the next few years.

The usual work week for food service workers ranges from 40 to 48 hours and, in many instances, the working day may consist of two shifts in order to cover the rush hours.

Opportunity for advancement exists in most restaurants and with advancement comes greater responsibility and higher pay.

Requirements for Entry into Food Service

Entry into food service work is usually obtained through on-the-job training. Ordinarily, no previous experience is required; however, experience may be a requisite to employment in some of the larger establishments. Union membership usually is a requirement in only the large restaurants located in cities.

High school courses, in addition to the COE class, which will be helpful to food service workers are home economics, mathematics, and English.

Personal Qualifications for the Food Service Worker

Desirable personality traits are of extreme importance for success in life. They are the factors on which one is usually judged when meeting people and when attempting to secure a job; they also are vitally important in holding a job. Various studies have revealed that about 90 per cent of the discharges are due to lack of desirable personal-social traits with only about 10 per cent due to lack of job skills. However, it must be noted that without job skills it would be exceedingly difficult to find employment. Personal-social traits can be improved, but only through conscientious and continued effort. The following are among the personal-social traits of chief importance to the food service worker:

Carefulness - conservation of foods, equipment, and materials.

Cleanliness - observation of high standards of working conditions and of personal grooming.

Cooperativeness - ability to work harmoniously with others.

Courtesy - respect for the opinions, interests, and desires of others.

Dependability - in performance of work and loyalty to establishment.

Health - observation of habits which promote vitality and vigor.

Initiative - ability to see what needs to be done and to do it without constant supervision or prodding.

Promptness - seldom tardy or absent from responsibilities.

Self-Control - maintenance of a pleasant disposition and temper under control at all times.

Voice - good English usage and a pleasant manner of speaking.

THE RESTAURANT BUSINESS

The food service industry is "big business." Some idea of the size of this industry can be obtained from the fact that its annual dollar volume exceeds the total amount of money spent on new and used cars. There are about 533,000 commercial and institutional food service establishments, of which more than 200,000 are commercial restaurants, cafeterias, hotels, lunch counters, caterers, and refreshment stands. In some localities the demand for workers may be seasonal; however, over the entire nation the demand is relatively steady. Many people must eat out regardless of the season, resulting in fairly steady employment for food service workers.

Food service workers who are adequately trained and endeavor to improve themselves on the job are more in demand, have less fear of dismissal, have better working conditions and receive more pay than those workers who are less well prepared. For these reasons, it will be of value to the student to have a thorough knowledge of the nature of the work and the opportunities in this field.

In this assignment you will have an opportunity to learn the extent of the restaurant business, the opportunities, and advantages of adequate training in this field.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in by _____.

REQUIREMENTS OF FOOD SERVICE WORKERS

The requirements of food service workers are numerous and varied. Their chief responsibility is that of caring for the orders of customers and to make a sincere effort to satisfy them. This in itself is not as simple as it may seem, and is further complicated by the various types of service required in different establishments.

It is extremely important that food service workers be fully aware of the responsibilities they will assume upon the acceptance of a position dealing with the public. Not only will their success depend upon the way they accept their responsibilities, but their remuneration will correspond accordingly.

In this assignment you will have an opportunity to learn what requirements are commonly encountered by food service workers and the importance of these for success in the restaurant business.

Assignment:

1. Read the references listed below.
2. In a one page paper list the responsibilities you have on your job which are directly or indirectly concerned with being a successful salesperson.
3. Answer the questions below, and turn in by _____.

References:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 42-43, 46-50, 58-62.

(B) _____ (F) _____

(C) _____ (G) _____

(D) _____ (H) _____

Assignment
Sheet No. 3

Covering
Units 19-32

CARE OF EQUIPMENT, SANITATION, AND SAFETY

Cleanliness is a factor of extreme importance in the restaurant business. Public officials believe sanitary conditions are so vital in food service that most cities have ordinances governing this. Equipment must be safe as well as clean in all successful restaurants. The health of all the patrons of a restaurant will depend upon the way equipment is cleaned and how sanitary it is.

There are two sources of danger which must be guarded against--spoiled food and foreign substances. The usual precautions of preparing and handling food in a sanitary manner will generally prevent the danger of spoiled food.

In this assignment you will have the opportunity to learn various methods of cleaning equipment and the value of sanitary and safe procedures which are followed in the food service industry.

Assignment:

1. Read the references listed below.
2. Over a period of one week, make a written list of all the unsafe acts you see performed at the establishment where you work, then indicate after each your suggestion as to how the situation may be corrected or avoided.
3. Answer the questions below, and turn in by _____.

References:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 18-19, 25, 162-163, 165.
- B. Sealtest Foods, Know Your Job, pp. 5, 13-15.
- C. Dietz, The Correct Waitress, pp. 27, 52-53.
- I. Information Sheet #1, this manual.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. The food service worker should never touch the food in a patron's order with her fingers.
- T F 2. Glasses should always be carried by grasping them by their rims.
- T F 3. A guest should never be made to feel that it is necessary to wipe silver or dishes with his napkin.

- T F 4. Failure to pass through designated doorways is a frequent cause of accidents.
- T F 5. Broken glass should be picked up with the bare fingers.
- T F 6. Ankles are easily twisted in high heels and heels that are run down.
- T F 7. The physical arrangement of the restaurant is up to the management but the day-to-day cleanliness is the responsibility of the food service worker.
- T F 8. Turning dishware upside down will eliminate the chance for dust and foreign matter to fall into them.
- T F 9. Drying eating and drinking utensils with a towel is a good practice.
- T F 10. It is recommended that the rinsing water used for hand-washing glasses be only clear water.
- T F 11. Ice-chilled glasses should be allowed to warm a little before they are thrust into hot water.
- T F 12. Bread drawers and storage compartments should be washed daily with soap and water.
- T F 13. Polish should never be used on the tops of syrup jars, as it might seep into the tanks and spoil the contents.
- T F 14. To prevent clogging of sink drain pipes pour a solution of boiling hot water and sal soda into pipes once a week.
- T F 15. Refrigerators should be cleaned and regularly defrosted at least weekly.
- T F 16. A good metal polish or abrasive cleaning powder should be used to clean chrome plated surfaces.
- T F 17. Stainless steel surfaces with burned-on food spots should be removed with a gritless cleaning powder or fine steel wool.
- T F 18. Toasters should be cleaned at weekly intervals.
- T F 19. Sanitation is a public trust shared by every person associated with the food service.
- T F 20. One of the most important functions in the food service business is sanitation.
- T F 21. It is important for the salesperson to return the soiled dishes promptly to the washing department.
- T F 22. In some establishments salespersons are expected to sort, scrape, and soak soiled dishes.

- T F 23. Hands should always be washed after touching the hair or face, and before leaving the washroom.
- T F 24. When food has fallen from a plate onto a tray, replace it on the plate and serve it.
- T F 25. Tops of milk bottles should be wiped with a clean cloth before removing the caps.
- T F 26. Side towels should always be carried over the shoulder or under the arm.
- T F 27. It is not important to rinse ice cream dippers before re-using.
- T F 28. Individual spoons for dishing food are not used in restaurants.
- T F 29. Silver spoons should be removed from bowls of mayonnaise, chopped eggs, or other dressings before putting them away.
- T F 30. The outside and rims of jars and mouths of pitchers should never be wiped before they are replaced in the ice box.
- T F 31. The failure to clean up spilled food immediately may cause an accident.
- T F 32. It is a good practice to leave cupboard doors ajar.
- T F 33. To prevent accidents it is important to watch the movement of other employees in the vicinity.
- T F 34. China and glassware must be handled carefully to avoid breakage.
- T F 35. If a public health inspector finds a situation in a restaurant very bad, there is very little he can do about it.
- T F 36. Inspections of food service establishments are not made as frequently as is desirable.
- T F 37. Soft water has more effective cleaning properties than hard water.
- T F 38. Of all the restaurant accidents, falls and strains cause the greatest loss of time.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In a restaurant most accidents are due to _____.
2. The U. S. Public Health Service recommends that eating and drinking utensils should be immersed _____ minutes in _____ F water or _____ minute in _____ water.

4. A reputation for being a clean place in which to eat can be maintained by a restaurant if each worker will _____ the _____ for upholding high standards of cleanliness.
5. In handling silverware, it is proper to touch the handles, but do not touch _____, _____ or _____ with fingers.
6. Moist food should never be handled with the fingers but always with a _____ or _____.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

- _____ 1. Butter should be handled with (A) the fingers; (B) a fork; (C) ice tongs; (D) pliers.
- _____ 2. Most accidents are due to (A) fate; (B) faulty equipment; (C) bad luck; (D) carelessness.
- _____ 3. Brushes in an electric brush scrubber should be removed and washed (A) once a week; (B) every other day; (C) every day; (D) never.
- _____ 4. The public attempts to protect itself against bad food by (A) refusing to patronize establishments that serve bad food; (B) having all establishments inspected by departments of health; (C) making all owners responsible for the food they serve; (D) telling their friends not to go to certain restaurants.
- _____ 5. Most cleaning in a restaurant is done by using water with the addition of any substance having cleansing quality which is known as (A) detergent; (B) solvent; (C) emulsion; (D) evaporative.
- _____ 6. In order for water to clean most efficiently, it should be at a temperature of (A) at least 220°; (B) about 135°; (C) not more than 100°; (D) approximately 180° F.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The board of health in all states will demand clean and sanitary:
 (A) _____ (B) _____ (C) _____

U
F
E
D
3
3
3

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963

2. Three methods of washing glassware used in restaurants are:

- (A) _____ (C) _____
 (B) _____

3. The three major areas concerning sanitation are:

- (A) _____ (C) _____
 (B) _____

4. Members of the food sanitation operations are:

- (A) _____ (C) _____
 (B) _____

5. The three major areas of responsibilities for the food salesperson to assist in the development of standards of cleanliness are:

- (A) _____ (C) _____
 (B) _____

6. Three factors that are extremely important in achieving success in the restaurant business are:

- (A) _____ (C) _____
 (B) _____

7. Four liquids which are ideal for removing chewing gum, grease, or oil are:

- (A) _____ (C) _____
 (B) _____ (D) _____

8. The six types of accidents which occur most frequently in restaurant work are:

- (A) _____ (C) _____ (E) _____
 (B) _____ (D) _____ (F) _____

Information Sheet #1*

SANITATION, CLEANING MATERIALS, CARE OF EQUIPMENT AND SAFETY

Three points in restaurant work are vitally important to keeping a successful business--sanitation, care of equipment and safety.

Sanitation

Food and drink which are carelessly handled and prepared become sources of diseases and even death. Diseases may be spread to customers through food and drink or through utensils contaminated by diseased food handlers, by pests, or by careless handling.

The public is protected by means of inspection by the department of health. If the situation in a restaurant is very bad, the health department will close the establishment permanently or until such time as the condition is remedied. Inspection staffs are inadequate at times and inspection cannot be made as frequently as would be desirable. For daily protection, the public must depend on the efficiency of restaurant managers and employees.

Many excellent suggestions for sanitation are available from the United States Public Health Service, Washington, D. C.

Cleaning Materials

Dirt of several types must be removed in cleaning the restaurant and its equipment.

1. Loose dirt on the floors should be removed by brush or vacuum cleaner.

2. Chewing gum, grease or oil are removed with turpentine, gasoline, benzine or kerosene. Make sure there are no open flames when using these fluids.

3. Most other types of cleaning use water alone or with the addition of a detergent or an abrasive or both. The cleaning process consists of four steps:

- a. Wetting the soiled surface
- b. Removing the soil with water containing the detergent
- c. Thorough rinsing
- d. Drying (in most cases)

Some important facts about water are:

1. Soft water cleans more efficiently than hard. The hardness of the water may be reduced by the use of softening agents.

*Adapted from Establishing and Operating a Restaurant, U. S. Department of Commerce, U. S. Government Printing Office, Washington, 1957, pp. 144-172.

2. Hot water cleans more efficiently than cold. Hot water (180°F) melts grease and dissolves detergents readily.

Care of Equipment

One of the most important responsibilities of the manager and employees is the care of equipment. Good care is facilitated by proper installation and followed by periodical cleaning, careful operation and proper maintenance. Instructions for operation of machines and cooking equipment are usually furnished by the manufacturers. It is essential for the manager to see that all employees thoroughly understand the use of the equipment and its proper operation and periodical cleaning and maintenance.

Safety

Accidents in a restaurant usually occur during the busy rush periods. Steps should be taken by the manager in cooperation with employees to remove hazards and educate all to be safety-minded.

The most prevalent type of accidents are cuts, falls, strains, bumps, infections, and burns. Falls and strains cause the greatest loss of time and money.

Special attention should be given to the hazards involved in the handling of machines and other electrical equipment, hazards to the public, and fire hazards.

RELATION WITH THE PUBLIC

A food service worker must remember that some patrons are not quick in deciding what they want and must be dealt with patiently. Friction with customers must be avoided. In the restaurant business, as in all businesses, remembering the Golden Rule of Business, "The CUSTOMER is always right," may save the employee many embarrassing experiences.

The efficient food service worker must learn to understand the needs of the customers and to serve them in a friendly but dignified manner. It is also important to cultivate an understanding of people, both customers and your fellow workers. Harmony and efficiency are possible only when an understanding of people is at your command.

In this assignment you will have an opportunity to learn the importance of an alert, cooperative, friendly attitude toward your customers and fellow employees. Many people fail in their chosen occupation, not because they cannot do the work but because they cannot get along with other persons.

Assignment:

1. Read the references listed below.
2. Prepare a one-page paper on your understanding of the phrase, "The salesperson is the representative of management."
3. Answer the questions below, and turn in by _____.

References:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 27-31.
- C. Dietz, The Correct Waitress, pp. 54-56.
- D. Dahl, The Efficient Waitress Manual, pp. 49-51.

Questions:True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. Most parents do not hesitate to take their youngsters to restaurants.
- T F 2. It is the responsibility of the food service worker to remove any bits of paper, rags, food, or other objects on a stairway that may cause someone to slip.

- T F 3. Many restaurants do not have provisions for serving children.
- T F 4. Food service workers should secure a high stool or put an extension chair on a regular chair when guests with small children arrive.
- T F 5. Some restaurants provide children's portions or a child's menu for their small guests.
- T F 6. No distinction should be made between adults and children when filling cups and glasses.
- T F 7. It is unwise for the waitress to help the mother remove a child from the high chair and put on wraps when the party leaves.
- T F 8. A harmonious atmosphere can exist only when the employer and his staff are loyal to each other.
- T F 9. The food service worker should avoid showing confidence in his own ability as this is a sign of conceit.
- T F 10. The average behind-the-counter salesgirl must work in closer harmony with customers than most waitresses.
- T F 11. There are two sets of rules governing habits and personality traits--one for social life and one for business life.
- T F 12. One of the most important functions performed in the restaurant is giving comfort to persons away from home.
- T F 13. The customer's good will may be obtained by the quality of food and appreciation of the excellence of the service.
- T F 14. The food service operation should use every reasonable means to please the customer.
- T F 15. The first step in gaining a favorable customer "image" is that of providing a well-balanced meal at a reasonable price.
- T F 16. Physical aspects will help win the customer's good will and make him want to return.
- T F 17. Cleanliness doesn't play a part in creating a favorable customer image.
- T F 18. The food service worker has an important selling job to do.
- T F 19. The satisfaction of a customer depends upon the way in which each member of the sales staff performs his duties.
- T F 20. The customer is an absolute essential in the operation of a business.

- T F 21. Good food alone can win the good will of most customers.
- T F 22. The business life of a food service operation depends upon building a clientele of satisfied customers.
- T F 23. Salespersons should act on the assumption that most customers are unreasonable.
- T F 24. The waitress should assist women with packages, handbags, and wraps.
- T F 25. Newspapers should never be given to customers when seated at a table.
- T F 26. Most customers like to be seated promptly and have their orders taken as soon as they are ready to make a selection.
- T F 27. As a general rule, customers may be served faster at a counter than when seated at a table.
- T F 28. When children's service is available, it should be brought to the attention of the mother.
- T F 29. The salesperson should be thoroughly familiar with the menu and be able to explain it to customers with difficulties.
- T F 30. The salesperson should not be concerned with methods of preparing the items that he serves.
- T F 31. Customers usually ask very few questions about the food products served in restaurants.
- T F 32. The preparing time for cooked-to-order foods is no concern of the salesperson.
- T F 33. If a customer is courteously told how long it will take to prepare an order, he usually will wait much more patiently.
- T F 34. First courses may often be suggested and served while a customer is waiting for cooked-to-order food.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Friendliness consists of the quality of _____ and the desire to express _____.
2. The ability to see what needs to be done, and do it, is known as _____.
3. The success of your occupation as a waitress lies, not with your _____ or _____, it lies with _____.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Physical elements of a restaurant that help establish a favorable customer "image" are:

(A) _____	(C) _____
(B) _____	(D) _____

2. The salesperson's role in fulfilling the objective of the food service unit requires a willingness to aid management in:

(A) _____
(B) _____
(C) _____

3. What essential items must be displayed in customer-employee relations to build a clientele of satisfied customers?

(A) _____	(E) _____
(B) _____	(F) _____
(C) _____	(G) _____
(D) _____	(H) _____

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the terms by placing the letter of the description in the blank at the left of the appropriate term.

- | | |
|--------------------------------|--|
| _____ 1. friendliness | A. willingness to hear or observe |
| _____ 2. cheerfulness | B. to see without being told what needs to be done |
| _____ 3. tolerance | C. believe in yourself |
| _____ 4. dependability | D. desire to express good will |
| _____ 5. "stick-to-it-iveness" | E. ability to finish what you start |
| _____ 6. open-mindedness | F. vigor and glowing animation |
| _____ 7. resourcefulness | G. "To live and let live" |
| _____ 8. initiative | H. finding a way to get things done under difficulty |
| _____ 9. enthusiasm | I. expression of good will |
| _____ 10. confidence | J. punctuality and willingness, honestly and effectively |

DINING ROOM REGULATIONS

There are numerous regulations which apply to the operation of the restaurant business. Food service workers should have a knowledge of the health laws governing them and their place of employment. They should have a thorough knowledge of the "unwritten" regulations which govern their personal actions such as alertness, loyalty, poise, promptness, and other traits.

Some business places are stricter than others in the following of food service regulations. It is important that you as a young food service worker develop your own high standards without being forced to do so by the rules of your manager. Only by adopting and practicing these generally established rules and regulations will you be able to become a successful food service worker.

In this assignment you will have an opportunity to study the statutory and "unwritten" regulations which govern food service workers.

Assignment:

1. Read the references listed below.
2. Check with your local Board of Health to ascertain the nature of the ordinances regulating eating establishments. In a paper not to exceed two pages, make a list of the ordinances which you consider essential to the welfare of the public.
3. Answer the questions below and turn in by _____.

References:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 154-166.
- C. Dietz, The Correct Waitress, pp. 49-51.
- D. Dahl, The Efficient Waitress Manual, pp. 54-60.

Questions:True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. Food service workers should not visit with fellow workers during service hours.
- T F 2. It is a poor policy to tell your troubles to either fellow employees or patrons.
- T F 3. Patrons who are old friends or who especially appeal to you should be given better service or extra helpings.

- T F 4. As a rule, women patrons tip less than men.
- T F 5. If a patron's request is unreasonable, you should try to argue him into seeing the right side.
- T F 6. If silver is dropped on the floor, the food service worker should very calmly pick it up, wipe it off, and replace it in the silver box.
- T F 7. China or dishes should always be wiped so patrons can see that they are clean.
- T F 8. Food service workers should never hint or indicate in any way that they desire a tip.
- T F 9. Food service workers should always work quietly and quickly, but regardless of how rushed they may be, should never run.
- T F 10. A hurried atmosphere in a restaurant does not encourage hearty dining by patrons.
- T F 11. Ash trays, sugar bowls and salt and pepper shakers should be cleaned at the tables when they are empty.
- T F 12. If a patron accidentally spoils some food and asks for another portion, he should not be charged for the portion spoiled.
- T F 13. When cleaning the table, linen and silver should be gathered together into one bundle.
- T F 14. Food service workers should never pass in front of guests unless it is absolutely necessary.
- T F 15. Banquet service entails many accident possibilities that are not encountered in regular service.
- T F 16. If a food service worker accepts a guest's wrap or bag for checking or hanging up, the restaurant becomes responsible for it if stolen or damaged.
- T F 17. Drunken patrons should be reported to the manager at once so they may be assisted out of the restaurant quietly and quickly.
- T F 18. If a mistake is made on a guest's check, it should be erased and the correction made.
- T F 19. A very common error when making change for a customer is to return both the change and the original bill the customer gave you.
- T F 20. English service is such that guests make their own choice and serve themselves from the main table.

- T F 21. When French service is used, the headwaiter places the food on the plates and the food service workers place the plates in front of the guests.
- T F 22. Regular guests should be given more cordial treatment than is accorded to new guests.
- T F 23. If a friend or relative asks, you should serve him his meal at a reduced price.
- T F 24. The food service worker should never ask his employer for advice relative to personal matters.
- T F 25. A person obsessed by fears and worries is not likely to achieve success.
- T F 26. Much of the responsibility for the way foods look and taste rests with the food service worker.
- T F 27. Foods which have proper color give the guest the impression that the food is of a superior quality.
- T F 28. Soups should be served in pre-heated bowls and should be covered to keep them hot.
- T F 29. Hot foods should be picked up first when filling a customer's order in the kitchen.
- T F 30. A food service worker should be well versed on the substitutions he is allowed to make in a meal.
- T F 31. Efficient food service workers try to plan their work and dovetail duties connected with the serving of several guests.
- T F 32. It is very important to plan the work in advance; however, the sequence in which it is performed is not so important.
- T F 33. Supplies should be arranged on the side table in an orderly manner so they will look neat to the guests seated at near-by tables.
- T F 34. Dishes should be placed gently on the edge of the table and then slid quietly into place.
- T F 35. Ice cold beverages should not be poured directly into hot glasses.
- T F 36. Napkins should not be used for cleaning as they might become permanently stained.
- T F 37. Guests should be warned when plates, containers, or handles are very hot.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Great care must be exercised to make sure that the food service worker's hands or _____ never touch the top of a plate.
2. One important point for food service workers to remember in regard to the temperature of food is that hot foods should be served on a _____ plate and cold foods served on a _____ plate.
3. If a large party dines at your restaurant, and you know which person is the hostess for the party, she should be served _____.
4. Service which is very elegant and includes burning alcohol lamps and rolling tables is called _____ service.
5. When the food service worker holds the plate in one hand and serves the food to the guest's plate with the other, it is known as _____ service.
6. To show a guest _____, you must receive and entertain him kindly and graciously.
7. Hospitality should be extended to your _____ as well as to your customers.
8. The appealing appearance of foods served to patrons depends upon judgment by sight which is sometimes called _____.
9. When speaking of the "form" of food, we are usually referring to its _____ and _____.
10. Restaurant work can be made much easier for the worker and more economical to the restaurant if it is well _____ in advance.
11. When the fewest number of motions is used to accomplish a task, the work may be performed more efficiently and with less _____ to the workers.
12. When it is necessary to pass a fellow worker, he should be passed on the _____ if at all possible.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Five types of table service as found in restaurants are:

(A) _____ (C) _____ (E) _____
 (B) _____ (D) _____

2. Most authorities agree that fine quality in foods may be determined by the following four factors:
- (A) _____ (C) _____
(B) _____ (D) _____
3. A guest's judgment, by sight, of foods is based upon the reaction to the following five essentials of quality food:
- (A) _____ (D) _____
(B) _____ (E) _____
(C) _____
4. Careful planning of work will save and reduce three important elements in efficient restaurant work. They are:
- (A) _____ (B) _____ (C) _____

Assignment
Sheet No. 6

Covering
Units 48-56

PREPARING THE SERVICE STATION AND SIDE WORK DUTIES

Food service workers have many duties other than waiting on customers. In some of the larger restaurants a person known as a bus boy is employed to help the food service worker; however, in most establishments it is the duty of the food service worker to see that the service station is clean and ready for new customers at all times. Sugar bowls, salt and pepper shakers, syrup jugs, and various other items should be cleaned and filled during slack periods.

It is important for the efficient food service worker to note and then perform the many small duties which are so necessary in restaurant work. Employers appreciate employees who can do this work without being constantly told what needs to be done.

In this assignment you will have an opportunity to learn what duties are expected of the food service worker other than the actual serving of customers.

Assignment:

1. Read the references listed below.
2. In a one-page paper list all of the duties you perform at your serving station that are not directly related to the servicing of customers.
3. Answer the questions below and turn in by _____.

References:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 85-87.
- B. Sealtest Foods, Know Your Job, p. 12.
- D. Dahl, The Efficient Waitress Manual, pp. 38-47.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. Bus boys usually are employed in hotel dining rooms to keep the waitress's side stand supplied.
- T F 2. Trays are stacked to eliminate breakage and facilitate unloading.
- T F 3. Salt and pepper shakers, sugar bowls and catsup and mustard jars must be filled each day.
- T F 4. White pepper has a tendency to make the containers in which it is kept appear cloudy.

- T F 5. Black pepper is stronger in flavor and more attractive in the container than white pepper.
- T F 6. The best way to polish salt and pepper shaker tops is by hand, with silver polish.
- T F 7. Table linen should be changed quickly and neatly after each guest leaves.
- T F 8. Silver sugar bowl lids should be washed after polishing to remove all excess polish.
- T F 9. When original catsup bottles are used, they should be wiped with a damp cloth to prevent caking around the top.
- T F 10. Metal ash trays should be polished in soapy water once a day.
- T F 11. Food service workers should promptly report all wet or greasy spots on floors or stairs.
- T F 12. A heavy breakage report will focus unfavorable attention on a careless food service worker.
- T F 13. When carrying a loaded tray, be sure to have a heavy plate above the arm and others evenly distributed.
- T F 14. Glasses of water should be carried on the edge of the tray.
- T F 15. Side work, when well done, takes very little time, and usually only one person is responsible for it.
- T F 16. Sugar bowls should be emptied and cleaned only once a day.
- T F 17. Care should be taken to keep the sugar free from lumps and foreign material.
- T F 18. A stiff brush should be used to clean the holes in the lids of salt and pepper shakers before they are washed.
- T F 19. The outside of syrup jugs should be washed with soap and water after filling.
- T F 20. Torn menu folders should be mended with scotch tape.
- T F 21. Flowers should be arranged in large and fancy containers.
- T F 22. Individual creamers should be washed and thoroughly cooled before refilling.

- T F 23. The top of the serving tray should be wiped clean before it is loaded to prevent the bottoms of the dishes from being soiled.
- T F 24. Fingers, if they are clean, may be used to place ice cubes in glasses.
- T F 25. Silver should be cleaned according to the special directions of the restaurant.
- T F 26. Food service workers should clear and reset the unoccupied tables in their serving stations just prior to going off duty, if the serving period is not ended.
- T F 27. Before any food service workers leave their stations, everything should be in order in accordance with the instructions of the restaurant.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Salt and pepper shakers should be emptied and washed in soapy water at least once a _____.
2. Silver will be bright and sparkling if it is dropped in a pan of very hot water with _____ and allowed to stand for a while.
3. Oakite is a good silver polish, but must be used only in _____ pans.
4. To avoid breaking dishes, the efficient food service worker will train himself to become _____.
5. Butter should be sliced beforehand, and a good way to prevent it from becoming soft is to have a _____ ready to lay the chips on.
6. Duties assigned daily to the food service worker other than those related to actual serving of food are commonly called _____.
7. Sugar bowls should be emptied, washed, thoroughly dried, and refilled _____.
8. The inside of salt and pepper shakers should be washed with a _____.
9. Salt and pepper shakers should not be filled after washing until they are _____.
10. When folding napkins, the fold should be made _____ and the edges should meet _____.

11. The edges and bottoms of serving trays should be kept clean and dry to protect both the _____ and the serving table surface.
12. After using silver cream to clean silver, all traces of the cleaner should be removed from the silver by thoroughly washing, rinsing, and polishing with a _____.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

- _____ 1. As salt and pepper shakers are too small to be washed inside, the easiest way to remove clotting is to use a
(A) soft rag; (B) few grains of rice in the water;
(C) little shot and soapy water; (D) toothpick.
- _____ 2. A few grains of rice added to each salt shaker will
(A) keep the salt clean; (B) look very nice; (C) absorb moisture; (D) allow less salt to flow from the shaker.
- _____ 3. Silver cleaned by a solution of hot water and sal soda should be removed from the container by (A) using a ladle or rubber gloves; (B) emptying the solution out; (C) cooling the solution with cold water and then lifting the silver out with the fingers; (D) use of a strong magnet.
- _____ 4. After washing and polishing the tops of salt and pepper shakers, they should be dried by (A) waving them through the air; (B) wiping them with a dry clean cloth; (C) leaving them in the rinsing sink; (D) placing them in a heated oven.
- _____ 5. Discolored marks inside cups and pots caused by coffee or tea may be removed by (A) polishing with steel wool; (B) use of a wet cloth that has been rubbed on a cake of sal soda; (C) soaking in hot water; (D) use of a wet cloth that has been rubbed on a cake of Sapolio.
- _____ 6. As a rule, "side work" is done (A) during serving periods; (B) after closing time; (C) in the early morning; (D) during slack periods.
- _____ 7. When the serving period is over, the tables should be (A) reset; (B) turned upside down; (C) grouped together; (D) stripped.
- _____ 8. Holes in the lids of salt and pepper shakers should be unclogged by using (A) a stiff wire brush; (B) a high pressure water stream; (C) a clean toothpick; (D) a broom straw.

Listing

Directions: List the items called for in each of the following.
Select your answers carefully.

1. What items are included in a side work schedule?

- (A) _____
- (B) _____
- (C) _____
- (D) _____
- (E) _____
- (F) _____
- (G) _____

SETTING THE TABLE

Good will has been defined as "the disposition of the pleased customer to return to a place where he has been well treated." This definition includes fine food, pleasant atmosphere, and efficient service. One of the requirements for efficient service is that the food service worker be capable of correctly and neatly setting the table.

Have you ever been in a restaurant when the person waiting on you brought you a plate and the necessary silverware and just "piled" them in front of you for you to untangle? Did you consider that restaurant and salesperson efficient? The answer is obvious. Just as you resent poor service, so do other people who eat in restaurants. It takes very little effort to be neat and correct, yet it pays big dividends in good will and efficiency.

In this assignment you will have an opportunity to learn the correct way of setting a table, thereby giving customers the feeling that you are competent and courteous.

Assignment:

1. Read the references listed below.
2. Make a careful study of various ways of setting tables (Ref. D. pp. 18-23) then list the differences, if any, that exist in table service items used between:
 - a. breakfast service and luncheon service
 - b. breakfast service and dinner service
 - c. luncheon service and dinner service
3. Answer the questions below and turn in by _____.

References:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 80-85.
- C. Dietz, The Correct Waitress, pp. 41-48.
- D. Dahl, The Efficient Waitress Manual, pp. 18-23.

Questions:True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. When breakfast is served "club" style, fruits, juices, toast and coffee should always be served at separate times.
- T F 2. Individual packages of cereal should be cut through the middle so that it will be easy for the guest to empty the contents into a bowl.

- T F 3. Butter is seldom served on the same plate with the bread.
- T F 4. Guests should never be required to ask for their check.
- T F 5. Orders for "cooked to order" foods should be placed with the kitchen personnel last.
- T F 6. Salads should be placed to the right of the guest.
- T F 7. To pour coffee or tea, the waitress should lift the cup and saucer from the table with her left hand and pour with her right hand.
- T F 8. Beverages should always be served with the main course.
- T F 9. The guest's check should be placed to his right, face up.
- T F 10. One prerequisite to good service is that the waitress know what is on the menu.
- T F 11. Although all restaurants do not use the same type of service, certain fundamental duties that pertain to the serving of food are common to all.
- T F 12. Keeping the tables attractive is a definite responsibility of the food service salesperson.
- T F 13. When bus boys are used to help the waitress, it is the duty of the bus boy to see that adequate preliminary preparations have been made for serving the guests.
- T F 14. The waiter should provide tables that are properly set before service is given.
- T F 15. A cover includes the space at the table within which one place is set.
- T F 16. When doily service is used, the doilies or place mats should be laid in the center of the cover about one inch back from the edge of the table.
- T F 17. Silverware should never be placed on the doily.
- T F 18. When silence pads are used, they should be placed on the table so that the edges do not hang below the tablecloth.
- T F 19. The tablecloth should be arranged so that the longest edges are toward the guest.
- T F 20. The folded napkins are placed at the left of the forks with the open corners about five inches from the front edge of the table.
- T F 21. At formal dinners it is permissible to place the folded napkin on the service plate.

- T F 22. Knives and forks should be placed about nine inches apart so that a plate may be easily placed between them.
- T F 23. Knives are placed at the right side of the cover with the cutting edge of the blade turned away from the plate.
- T F 24. Spoons are laid, bowls up, at the left of the knives.
- T F 25. Silver for dessert service is placed just before the respective course at the right side of the cover.
- T F 26. A dessert fork should be placed to the right of the cover next to the plate just before serving the dessert.
- T F 27. If knives are not used in the cover set-up, the forks and spoons are placed to the right of the cover.
- T F 28. The bread and butter plate is placed to the left of the dinner plate directly above the tines of the meat fork.
- T F 29. The water glass should be placed at the base of the knife handle.
- T F 30. Wine, liquor and beer glasses are placed to the left of the water glass.
- T F 31. Sugar bowls and salt and pepper shakers are generally placed on the side nearest the wall when small tables are located in the center of the room.
- T F 32. On large tables only one set of sugars and creamers is needed.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Many restaurants serve dry toast in _____ and buttered toast under a _____.
2. Restaurants which do not use tablecloths as standard equipment often place _____ under the service plate
3. Water glasses should be filled approximately _____ full.
4. Vegetable dishes should be placed at the _____ of the main dish or meat plate.

Covering
Units 64-70

RECEIVING GUESTS AND TAKING THE ORDER

Many details should be observed when greeting guests and taking their orders. Questions such as, "How should I greet a guest?", and "How and where do I stand when taking the order?", "How long after the guest is seated should I wait before asking for the order?", are frequently confusing to food service workers.

The essential elements necessary to acquire any skill are speed, accuracy, and confidence. This applies to the food service worker just as it does to workers in any other occupation. To be an efficient food service worker, confidence in your ability to meet guests is necessary. It is highly important that you learn the correct way of approaching guests and taking their orders.

In this assignment you will have an opportunity to become familiar with the proper techniques used in greeting guests. Observe and practice them diligently, because not only will they make your employer and guests regard you more highly, they also are applicable to good manners in any situation.

Assignment:

1. Read the references listed below.
2. Answer the following questions and turn in by _____.

References:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 27-34.
- B. Sealtest Foods, Know Your Job, pp. 6, 8-9.
- C. Dietz, The Correct Waitress, pp. 20-26.
- D. Dahl, The Efficient Waitress Manual, pp. 10-17.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. The waitress should present herself to take an order as soon as the guest is seated.
- T F 2. The food service worker always writes in the prices of the various items on each order.
- T F 3. All a la carte dishes produce about the same amount of profit.

- T F 4. As soon as customers have been seated, hand the menu to the gentleman.
- T F 5. Customers are less inclined to order a good meal if they have a long wait while food service workers visit.
- T F 6. A good saleswoman will suggest a salad with a la carte meal.
- T F 7. It is a good practice to feed a guest's vanity as well as his appetite.
- T F 8. Good service is quite common in our restaurants of today.
- T F 9. An efficient food service worker should not be concerned with the length of time it takes to prepare a meal.
- T F 10. The waitress does not necessarily need to know the merchandise and prices of her restaurant.
- T F 11. Baked Virginia ham is a good "ready-to-serve" food suitable for suggestion to the guest who is in a hurry.
- T F 12. Apple sauce is a suitable food accompaniment for fish.
- T F 13. The efficient waitress will organize a daily cleaning and sidework schedule and adhere to it.
- T F 14. One item of sidework is that of dusting daily the furnishings in your service station.
- T F 15. Efficient planning is the keynote to smooth, uninterrupted service and also to higher tips.
- T F 16. A good salesperson refills water glasses, serves sugar, condiments, butter, and other services required without being reminded.
- T F 17. Food service workers should help and assist persons who need special care, such as elderly people or small children.
- T F 18. It is a great asset to the waitress if she can remember the names of regular patrons.
- T F 19. A prompt approach to the customer is just as important as a friendly greeting.
- T F 20. Customers are more willing to wait patiently if a glass of water, napkin, and a clean menu are placed before him.
- T F 21. It is part of the food service worker's job to offer assistance in finding the desired items and tactfully indicating featured offerings to the customer.
- T F 22. Customers should be given enough time to study the menu before being asked for their order.

- T F 23. To avoid errors, all orders should be repeated to the customers.
- T F 24. Generally speaking, selling requires no other talents than those you put to work in everyday living.
- T F 25. The customer likes to be seated promptly and that his order be taken as soon as he is ready to make a selection.
- T F 26. Suggestive selling is defined as any method of selling goods other than those asked for by the customer.
- T F 27. The most satisfactory type of suggestive selling is based on a knowledge of the customer's likes and dislikes.
- T F 28. Foods typical of a geographical region should not be suggested to customers, as they may not care for that kind of food.
- T F 29. No consideration need be given to the amount of money the customer wishes to spend for a meal.
- T F 30. The food service worker should make no attempt to help a customer meet his nutritional requirements when ordering.
- T F 31. Food suggestions should always be made in a positive manner.
- T F 32. The use of such terms as "hot" rolls, "chilled" watermelon, and "old-fashioned" strawberry shortcake helps to create a favorable mental impression.

Multiple-Choice

Directions: Listed below are some commonly ordered foods that are served with various accompaniments to suit the varied tastes of customers. Indicate which accompaniment(s) you would suggest, or serve, to the guest for each order, by placing in the space at the left of each item, the letter of your suggestion.

- _____ 1. Baked beans: (A) salad dressing; (B) grated cheese; (C) chili or catsup; (D) lemon or cream.
- _____ 2. Bananas: (A) crackers; (B) grated cheese; (C) cream or lemon juice; (D) butter.
- _____ 3. Berries: (A) cup or demi-tasse; (B) crackers; (C) lemon or sauce; (D) cream, powdered sugar.
- _____ 4. Clams: (A) sliced lemon; (B) horseradish and cocktail sauce; (C) honey, jam, or jelly; (D) knife or fork.
- _____ 5. Fried fish: (A) jelly; (B) maple syrup; (C) tartar sauce; (D) mustard.

- _____ 6. Ham: (A) mustard, catsup; (B) butter; (C) lemon; (D) powdered sugar.
- _____ 7. Hot cakes: (A) lemon or cream; (B) powdered sugar; (C) bread or crackers; (D) honey, jam, or jelly.
- _____ 8. Iced coffee: (A) cream and powdered sugar; (B) cherry served in center; (C) tartar sauce; (D) sliced lemon.
- _____ 9. Iced tea: (A) cheese; (B) cream; (C) crackers; (D) lemon section.
- _____ 10. Meat pies: (A) cream; (B) meat sauce; (C) serving spoon, knife, and fork; (D) lemon juice.
- _____ 11. Milk toast: (A) cup or demi-tasse; (B) extra hot water; (C) sugar; extra butter; (D) syrup.
- _____ 12. Pie: (A) sugar and extra butter; (B) cheese or ice cream; (C) crackers; (D) whipped cream.
- _____ 13. Roast lamb: (A) slice of lemon; (B) bread or crackers; (C) meat sauce; (D) tartar sauce.
- _____ 14. Salads: (A) honey; (B) grated cheese; (C) butter; (D) salad dressing.
- _____ 15. Soup: (A) milk or cream; (B) bread or crackers; (C) long-handled spoon; (D) soup fork.
- _____ 16. Watermelon: (A) salt, knife, fork; (B) lemon or cream; (C) bread or crackers; (D) toast and butter.
- _____ 17. Toast: (A) cream; (B) sugar; (C) jelly or marmalade; (D) maple syrup.
- _____ 18. Sandwiches: (A) pickle or olive; (B) cheese; (C) butter; (D) jelly.
- _____ 19. Coffee: (A) extra hot water; (B) melted butter; (C) cream; (D) lemon.
- _____ 20. Tea: (A) extra tea bag; (B) lemon or cream; (C) powdered sugar; (D) crackers.

Identification

Directions: Listed below are some commonly requested a la carte foods that the food service worker should know approximately how long it takes to prepare. In the blank to the left of each order, indicate the approximate number of minutes (rounded off to nearest five minutes) required to prepare each.

- | | | | |
|-------|-------------------------|-------|--------------------------------|
| _____ | 1. veal chops | _____ | 9. spring chicken en casserole |
| _____ | 2. roast saddle of lamb | _____ | 10. sirloin, for two |
| _____ | 3. broiled chicken | _____ | 11. porterhouse steak for two |
| _____ | 4. pork chops | _____ | 12. extra sirloin |
| _____ | 5. hash, browned | _____ | 13. tenderloin for two |
| _____ | 6. oyster stew | _____ | 14. small sirloin for one |
| _____ | 7. ham, broiled | _____ | 15. mutton chops |
| _____ | 8. fish, broiled | | |

GIVING AND ASSEMBLING THE ORDER

Have you ever given an order for a hamburger without onions and then had it served to you with onions? Whose fault would it be--the customer's, the chef's, or the food service worker's? We can certainly say that it was not the fault of the customer and probably not that of the chef. The only other person involved is the food service worker.

From the foregoing, you can see the importance of getting the order from the customer correctly and of giving the order to the chef correctly. Customers want just what they order and are resentful if the order is changed in any way. For this reason, it is imperative that food service workers be very careful when giving the order and when assembling it to serve to the guest.

In this assignment you will have an opportunity to learn the importance of correctly giving and assembling an order. Remember, you are the chief representative of your restaurant in the eyes of the public, and the customer will judge it by the service you render.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in by _____.

References:

- A. U. S. Department of Health, Education and Welfare, Food Service Industry, pp. 80-90.
- B. Sealtest Foods, Know Your Job, p. 7.
- C. Dietz, The Correct Waitress, pp. 37-38.
- D. Dahl, The Efficient Waitress Manual, pp. 48-49.

Questions:True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. Workers should be just as orderly and well behaved in the serving room as in the dining room.
- T F 2. The new waitress should make it a point to study the layout of the serving room during slack periods.
- T F 3. Hot foods should be picked up after cold foods have been assembled.

- T F 4. Standing hot foods do not deteriorate as quickly as cold foods.
- T F 5. The efficient food service worker must know every station in the kitchen or serving room.
- T F 6. Orders should be called out in a loud clear voice.
- T F 7. Cooked-to-order foods should be called for last.
- T F 8. The chef usually is not interested in getting orders out promptly.
- T F 9. In assembling the order, all silverware and accompaniments needed should be collected.
- T F 10. Before an order is served it should be rechecked to see that all silverware is clean, and that dishes and glassware are spotless and unchipped.
- T F 11. The kitchen layout and number of service stations will determine the route the salesperson must follow in assembling her order.
- T F 12. In giving an order, the correct names for foods should be used rather than slang phrases.
- T F 13. One reason for making a distinction between an order on the dinner menu and the one on the a la carte menu is that there may be a difference in the size of the servings.
- T F 14. A food service worker is never justified in asking to be served rapidly or out of turn.
- T F 15. Soups should be covered in order to help retain the heat.
- T F 16. When hot bread is to be served, it should be picked up first.
- T F 17. Tea and coffee pots should be rinsed with cold water before they are filled with hot beverages.
- T F 18. The tray should be loaded with heavy plates and saucers close to the edges in order to make it easier to carry.
- T F 19. When loading the tray, cups should be placed on saucers.
- T F 20. Hot and cold dishes of food should be placed on the tray so that they do not touch each other.
- T F 21. Pot spouts should be turned away from plates of food.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. In the serving room, the dish table is usually situated next to the _____ door so that a full tray may be quickly unloaded.
2. Unless protected by being in a pot, _____ will cool quicker than any other hot food.
3. The waitress must know the proper _____ in which to order and pick up foods in the kitchen.
4. Orders should be given at the correct _____ and in the most efficient _____.
5. The procedures used for giving and collecting orders in the kitchen vary somewhat with the _____ and _____ of the kitchen.
6. The waitress who is _____ and _____ in giving and assembling orders will help to maintain harmonious relations between the kitchen and the dining-room personnel.

8. When written orders are used, the waitress usually signs either her _____ or her _____ to the order slips.
9. The verbal order should be given in a _____ and _____ a loud voice.
10. When giving the order, the food service worker should notify the kitchen whether it is on the dinner or on the _____ menu.
11. The waitress should not make a practice of saying that is " _____ " for her order.
12. The food service worker should know the approximate amount of _____ it will take to prepare an order so that she will know when to return for it.
13. Those foods which require the _____ time to prepare should be ordered first.
14. The waitress should learn to assemble her order so that she can pick up each food as soon as possible after it has been _____ .

Listing

Directions: List the items called for in each of the following.
Select your answers carefully.

1. The waitress gives her order in one of three ways. They are:
 - (A) _____
 - (B) _____
 - (C) _____

2. While the order is being filled, the waitress should collect all the serving equipment that she will need and the cold food accompaniments such as:

(A) _____	(D) _____
(B) _____	(E) _____
(C) _____	

3. The following precautions should be observed in checking the order and loading the tray:
 - (A) _____
 - (B) _____
 - (C) _____
 - (D) _____
 - (E) _____
 - (F) _____

SERVING THE ORDER

Orders may be served in various ways depending upon the custom of the individual restaurant. The more elaborate the restaurant, the more elaborate the method of serving is likely to be. Each food service worker should acquaint himself with the method of serving used in his place of employment.

It is important that those in the restaurant business know the methods of serving which may be encountered in specific situations. However, several rules for service are approved by social custom for use in all restaurants and these should be thoroughly understood by all food service workers.

In this assignment you will have an opportunity to learn the various methods of serving the order and the general rules that apply to all situations.

Assignment:

1. Read the references listed below.
2. For this assignment you are to itemize the procedures in serving an order. With these procedures in mind, serve an order to a guest. After serving the order, note your procedural errors and report these, together with suggestions for improvement, to your coordinator.
3. Answer the questions below and turn in this assignment by _____ .

References:

- A. U. S. Department of Health, Education and Welfare, Food Service Industry, pp. 90-98.
- B. Sealtest Foods, Know Your Job, p. 7.
- C. Dietz, The Correct Waitress, pp. 28-33.
- D. Dahl, The Efficient Waitress Manual, pp. 28-40.

Questions:True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. All food is placed from the left in order to reduce the danger of spill.
- T F 2. When removing food or empty dishes, it is best to remove them from the same side on which they were served.

- T F 3. If you see a guest accidentally drop a napkin, you should immediately pick it up and hand it back to him.
- T F 4. At a large table, the waitress should always move the sugar bowl within reach of the guest when serving coffee.
- T F 5. The efficient food service worker will ask guests when they prefer their beverage to be served at the time she takes the order.
- T F 6. Guests should not receive the check with the face turned down as this gives the appearance of trying to hide the amount shown on the check.
- T F 7. Guests are very apt to eat more leisurely at night, thus requiring more time for each service.
- T F 8. If a patron orders a chop or steak, the food service worker should turn the order in immediately so that it will be ready when the first course is finished.
- T F 9. When stacking a tray from a table that has been used, the cups should not be removed from the saucers.
- T F 10. Any paper napkins that may have been used at a table should be rolled into a ball and placed in one of the empty glasses.
- T F 11. It is safer to carry loads on the shoulder than below the waist.
- T F 12. Liquids are poured from the left of the guest.
- T F 13. If milk is brought to the table in half pint bottles, the serving glass should be placed upside down over the bottle top.
- T F 14. Should a guest need extra silver after starting his meal, it should be placed at his right.
- T F 15. When serving another course, the soiled dish is removed with the right hand the next course is placed with the left hand.
- T F 16. The hand closest to the guest should be used for serving when guests are seated at booths or wall tables.
- T F 17. Hot or cold dishes should be handed directly to the customer.
- T F 18. If an establishment has a policy of "pay when served" the worker should courteously call the customer's attention to this fact.
- T F 19. Tomato and fruit juices are best served on small plates.

- T F 20. Cold water should be poured in finger bowls if they are used.
- T F 21. Soup service should be removed when the guest has completed the soup course.
- T F 22. When bread is served on trays, it should be placed at the right of the salad plate.
- T F 23. Hot beverages served with the main course should be placed to the right of the cup and saucer.
- T F 24. Glasses containing an iced drink should be placed to the right and a little below the water glass.
- T F 25. A dessert service should be placed in the center of the cover.
- T F 26. When plate service is used, place the dinner plate in the center of the cover.
- T F 27. The salad should be placed at the right of the forks when it is served with the main course.
- T F 28. The proper procedure is to serve extra butter without asking the guest if he desires it.
- T F 29. The beverage should be placed to the right of the teaspoons.
- T F 30. Platters and other serving dishes should be removed first when clearing the table.
- T F 31. The salad plate is removed last when clearing the table.
- T F 32. After the main course has been completed, the empty milk glass is removed from the left side.
- T F 33. Water glasses should remain on the table and be kept filled as long as the guest is seated.
- T F 34. Soiled linen can be changed very skillfully and will not disturb the guest if properly done.
- T F 35. When a man and woman are dining together, the check should be presented to the man unless separate orders have been written.
- T F 36. The waitress should always mention the amount of the sales check and the denomination of the bill when she accepts payment for a check.
- T F 37. The food service worker should return some of the change from a bill in small silver.
- T F 38. Disappointment should never be shown when the size of a tip is less than that customarily received.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. All food except beverages should be served from the _____.
2. The reason for using the right hand for removal and the left hand for placement of serving is to minimize the danger of a _____.
3. An easy way to learn the rule that dictates which hand to serve food with is by saying, "Serve with the hand _____ the customer."
4. As a general rule, speedy service depends chiefly on the space and the _____ used in the serving room.
5. If the amount of space and serving system are up to standard, it should be possible to serve a guest on a la carte luncheon in _____ minutes.
6. Coffee is usually served from a coffee pot at the table when _____ service is used.
7. When serving banquets or formal groups, the _____ or the guest of _____ should be served first.
8. Forks should be placed to the _____ of the service plate.
9. One very important rule to be observed is to always say a cheerful _____ at the close of each order.
10. The most elaborate form of table service is the _____ service.
11. The English style of service is sometimes referred to as _____.
12. Most banquet meals are served using the _____ type of table service.
13. A form of buffet service used in many Swedish restaurants is the _____.
14. A cheerful attitude on the part of the salesperson at the breakfast service will help to _____ for customers.
15. Fruit dishes, fruit juice glasses, and cereal bowls should always be placed on _____ before serving.

18. When clearing the table, the _____ plate should be removed first.
19. The _____ and _____ plate is removed from the table last.
20. Hot tea and coffee service should be left on the table until after the completion of the _____.
21. The guest should not be _____ for the check.
22. The check should be presented either immediately after the last course has been served or as soon as the guest has _____.
23. The check should be accurately totaled and laid _____ on the table to the _____ of the cover or placed on a small change tray.
24. It is courteous to ask if any other _____ is desired before presenting the check.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Trays used for bringing food from the kitchen to the dining room should be loaded with the following three factors in mind:

(A) _____ (C) _____

(B) _____
2. When trays are loaded for the removal of dishes from the dining room to the kitchen, the three factors to consider are:

(A) _____ (C) _____

(B) _____
3. One of the rules to be observed when delivering table orders is to avoid piling dishes upon each other. Three things which may happen if this rule is not observed are:

(A) _____ (C) _____

(B) _____

4. Most restaurant operators strive to give satisfactory service to their guests, and this is achieved only by adhering to these three standards:

(A) _____

(B) _____

(C) _____

5. Five types of table service used in various restaurants throughout this nation are:

(A) _____ (D) _____

(B) _____ (E) _____

(C) _____

6. The three traditional forms of table service most commonly used in catering to the public are:

(A) _____ (B) _____ (C) _____

7. As a rule, luncheon customers may be classified into two groups, which are:

(A) _____ (B) _____

CAFETERIA SELF-SERVICE UNITS

Food service units are classified by the type of service rendered. The cafeteria self-service unit differs from the service unit by eliminating the extensive menus and elaborate table service.

Cafeteria customers are able to make their food selections from foods displayed at a service counter and assemble the kinds and quantity of food desired. A cafeteria offers quick and economical service for those desiring such types of service.

Cafeterias meet the needs of shoppers and business workers who are in a hurry.

In this assignment you will have an opportunity to learn counter serving techniques and the many different procedures of operation found in self-service cafeteria units.

Assignment:

1. Read the reference listed below.
2. In a short one-page paper, list the main differences, as you see them, between cafeteria service and table service.
3. Answer the questions below and turn in this assignment by _____.

Reference:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 34-37; 41-42; 54-58; 127-143.

Questions:True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. Many customers will experience difficulty in making a quick decision when confronted by several appealing foods.
- T F 2. A good counter salesperson will suggest foods to hesitant customers.
- T F 3. A counter salesperson need not know the prices of the food as this is the checker's job.
- T F 4. Counter displays are one of the least important types of advertising in which salespersonnel take part.

- T F 5. It is the menu planner's job to group the foods on the counter in regard to kind and form.
- T F 6. Color has no role in the displaying of food at a counter.
- T F 7. A yellow and brown color harmony may be used to advertise waffles.
- T F 8. The service-counter salesperson should possess the same characteristics as the dining room salesperson.
- T F 9. Careless counter workers can cause a lot of waste and lower profit to the business.
- T F 10. Cafeterias may employ floor girls to supply extra servings to customers.
- T F 11. The work of floor girl is the beginning job in a food cafeteria.
- T F 12. A cafeteria checker must have poise and composure in order that he or she be undisturbed by challenging customers.
- T F 13. The last person on the food service staff that has contact with the customer is the food checker.
- T F 14. If a counter worker on a cafeteria line is inefficient and slow, it will interfere with the efficiency of the entire line.
- T F 15. A well-arranged counter will reflect the creative ability, ingenuity, and individuality of the management.
- T F 16. Broccoli looks more appetizing and stays hot longer when placed in deep pans at the serving counter.
- T F 17. Garnishes have no purpose except to add to the attractiveness of the food.
- T F 18. The salad counter is packed with a bed of cracked ice.
- T F 19. Colored vegetables, such as tomatoes and beets, should be placed in rows side by side.
- T F 20. Large and small plates should be placed in the same rows at the dessert counter.
- T F 21. Low and tall dishes may be arranged neatly in the same row at the dessert counter.
- T F 22. Broccoli, asparagus spears, glazed carrots and fingers of eggplant should be served in sauce dishes.
- T F 23. When replenishing the contents of a serving pan, it is best to pour the fresh material into the soiled container already in the steam table.

- T F 24. Dishes on the cafeteria counter should be kept moving from back to front so that no one dessert will stand on the counter for a long time.
- T F 25. Freshly made coffee should be ready just after the meal service begins.
- T F 26. For the sake of economy, coffee making utensils should be used for making tea also.
- T F 27. Water which has not quite reached the boiling point should be used for making tea.
- T F 28. Customers who ordered a second cup of coffee should receive their order in a clean cup.
- T F 29. Sanitary standards maintain that regular and consistent cleaning routines after each meal are necessary.
- T F 30. A stiff brush should be used to wash the walls of the steam table.
- T F 31. Bread storage spaces should be washed every two weeks with a hot detergent solution.
- T F 32. The inside of coffee urns should be washed with detergent solution and rinsed with clean water once a week.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The counter salesperson delivers the order at the _____ and has no further responsibility for the guest.
2. The selling task of the counter salesperson is simplified by the food display which gives " _____ " and stimulus to the _____ of the customer.
3. It is hard for a customer to resist the dual appeal of food that is attractively arranged and has an appetizing _____.
4. Food service workers on a cafeteria counter have an individual responsibility for operating their unit _____.
5. Salads should be arranged in such a way to provide color _____ and contrast.
6. An attractively arranged salad counter will display the salads as " _____ " of pleasingly colored food.
7. A reserve supply of creamers should be kept in the _____.
8. The person responsible for supplying the serving counter is called a _____.

9. The number of portions of food sold may be counted on a small machine called a _____.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Twelve characteristics used as criteria for determining the efficiency of a cafeteria counter salesperson are:

- (A) _____ (E) _____ (I) _____
- (B) _____ (F) _____ (J) _____
- (C) _____ (G) _____ (K) _____
- (D) _____ (H) _____ (L) _____

2. The work of operating a cafeteria serving counter falls into three parts, which are:

- (A) _____
- (B) _____
- (C) _____

3. Places where self-service units are found are:

- (A) _____ (D) _____
- (B) _____ (E) _____
- (C) _____

PANTRY AND COUNTER SERVICE

Food service workers occasionally are required to help in the kitchen during slack periods in some restaurants. Regardless of the policy of the establishment where you work, you should be acquainted with duties performed in the kitchen with regard to this type of work.

Many food service units have a counter to provide rapid service for the hurried person. Food service workers should realize that most people who want service at the counter are in a hurry. This does not mean that they expect inferior food or service, but they do expect prompt service.

In this assignment you will have an opportunity to learn the special techniques to give efficient counter service. Also, you will have an opportunity to learn what duties may be expected of a food service worker in regard to pantry service in the kitchen.

Assignment:

1. Read the references listed below.
2. Answer the following questions and turn in by _____.

References:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 121-122.
- I. Information Sheet #2, Pantry Service for Restaurants.

Questions:True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- | | | |
|---|---|--|
| T | F | 1. If a dining room has both counter and table service, different menus should be used for each service. |
| T | F | 2. The area beneath the counter is carefully planned to provide storage space. |
| T | F | 3. Food preparation and dish washing for a counter is done in the kitchen. |
| T | F | 4. The counter salesperson has the same responsibilities to the customer as the table-service waiter. |
| T | F | 5. Counter appointments should be grouped so as to be used by 6-8 persons. |

- T F 6. It is a poor practice at counters to place the check as soon as the order is completed.
- T F 7. Pantry service for restaurants should be under the supervision of a mature worker.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The counter salesperson's position with the customer requires the service to be from the _____.
2. Customers are to be served in the order they are _____.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Two main distinguishing characteristics of counter service are:

(A) _____	(B) _____
-----------	-----------
2. The principal classifications of menu items are:

(A) _____	(C) _____
(B) _____	
3. The two basic designs for the shape of counters are:

(A) _____	(B) _____
-----------	-----------
4. Foods prepared at the pantry are:

(A) _____	(E) _____
(B) _____	(F) _____
(C) _____	(G) _____
(D) _____	(H) _____
5. Five duties involved in cleaning the pantry are:

(A) _____	(D) _____
(B) _____	(E) _____
(C) _____	

PANTRY SERVICE FOR RESTAURANTS*

This service requires a mature worker. She has a great deal of responsibility for the preparation of dainty as well as substantial dishes. The food materials she handles in her work are both perishable and expensive.

How to Prepare for Service

1. Chill all dishes used for salads or cold desserts.
2. Warm all dishes used for hot food.
3. Prepare sandwich fillings before serving.
4. Prepare, celery, radishes, scallions, salad greens, etc.
5. Prepare salad mixtures and garnishes.
6. Prepare material for fruit cup and appetizers.
7. Prepare sauces and whipped creams.
8. Place hot breads in roll warmer.
9. Prepare individual creamers and milk bottles.
10. Prepare salad dressings.
11. Prepare individual jelly and marmalade.
12. Prepare enough butter servings for the meal. Stack the trays of prepared butter in the refrigerator.
13. Collect serving utensils, spoons, ladles, dippers, etc., of the correct size.

Foods prepared and served at the pantry are:

1. Salads
2. Desserts
3. Relishes
4. Cereals
5. Sandwiches
6. Cream, milk and butter
7. Bread, rolls, and other hot breads
8. Beverages

How to Clean the Pantry

1. Clean the mixer.
2. Wash the utensils.
3. Clean the work tables.
4. Clean the refrigerator.
5. Clean the sink.

Assignment
Sheet No. 13

Covering
Units 101-109

PREPARATION OF SALADS AND SANDWICHES

Various studies have shown that approximately two-thirds of all people who stop at a restaurant for a cup of coffee will also order their favorite sandwich. In some restaurants the food service worker may be required to prepare sandwiches or any special plates which guests may order.

For these reasons it is important that the food service worker be familiar with the techniques of preparing various sandwiches and salads. An attractive salad can add much to the meal served a guest.

In this assignment you will have an opportunity to learn the various techniques used in making sandwiches and salads. Sandwich and salad preparation is an art -- master it well.

Assignment:

1. Read the references listed below.
2. During the next four days you are to take special note and keep a list of the different kinds of sandwiches and salads ordered. In a short paper summarize all the sandwiches and salads ordered and rank them in order of frequency of demand.
3. Answer the questions below and turn in by _____.

References:

- B. Sealtest Foods, Know Your Job, pp. 36-39.
- I. Information Sheet #3, How to Prepare Salads.
Information Sheet #4, How to Prepare Sandwiches.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- | | | | |
|---|---|----|---|
| T | F | 1. | Salad dressings should be chosen to blend appropriately with the salad ingredients. |
| T | F | 2. | The salad is always served as a course with the meal. |
| T | F | 3. | Soft foods, such as chicken, fish, and eggs, used in salads should be combined with a crisp vegetable to make them more palatable and attractive. |
| T | F | 4. | French dressing and mayonnaise are examples of cooked dressings. |

- T F 5. Roquefort dressing is a variation of French dressing.
- T F 6. All ingredients for mayonnaise must be kept under refrigeration.
- T F 7. Thousand Island dressing is a variation of Russian dressing.
- T F 8. All sandwich fillings are made in the exact way.
- T F 9. A garnish should be served with a sandwich to add flavor and eye appeal to the sandwich.
- T F 10. Lettuce or other crisp greens should be added just before a sandwich is to be toasted.
- T F 11. The filling in a sandwich should not be spread to the very edge of the bread.
- T F 12. Sandwiches should not be so moist that fillings drip when the sandwich is eaten.
- T F 13. A small sized work space is all that is needed for efficient sandwich service.
- T F 14. A special board should be used on which all chopping, slicing, and spreading of bread is done.
- T F 15. A separate spreader should be used for each different sandwich spread mixture.
- T F 16. All ingredients for sandwiches should be prepared well in advance.
- T F 17. Pickles, olives, and onions may be kept in the same container.
- T F 18. Wax paper should be placed between each slice of meat in order to prevent drying out.
- T F 19. It is most practical to use cheaper grades of mayonnaise for making sandwiches.
- T F 20. All sliced bread and sandwich materials should be handled with tongs or knives.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. The salad green which is most often used is _____.

2. The simplest and most generally used salad dressing is _____ dressing.
3. Approximately _____ per cent of all customers who order food at a fountain will ask for a sandwich.
4. An instrument which is useful for dipping sandwich fillings is the _____.
5. Foods such as chicken, greens, and cheese are easily cut with _____.
6. Butter may be softened so that it will spread easily by adding a small amount of _____.
7. The thickness of bread used for double-decker sandwiches should be approximately _____ inch.
8. Sliced meats should be approximately _____ inch in thickness.
9. The bread used for single sandwiches should be about _____ inch(es) thick.
10. The seasoning of sandwiches should be tested by a common method which is known as the _____.
11. A two-pound loaf of sandwich bread will yield about _____ medium slices.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. Three reasons why salads are so popular with guests are:

(A) _____	(C) _____
(B) _____	
2. The basic parts of a salad are:

(A) _____	(C) _____
(B) _____	(D) _____
3. Garnishes for salads are:

(A) _____	(E) _____
(B) _____	(F) _____
(C) _____	(G) _____
(D) _____	

4. The two types of salad dressings are:
 (A) _____ (B) _____
5. French dressing is a mixture of the following principal ingredients:
 (A) _____ (B) _____ (C) _____
6. The essential ingredients of mayonnaise are:
 (A) _____ (C) _____
 (B) _____ (D) _____
7. The three ways in which fillings are prepared for most simple sandwiches are:
 (A) _____ (B) _____ (C) _____
8. Seven ways in which sandwiches may be served are:
 (A) _____ (E) _____
 (B) _____ (F) _____
 (C) _____ (G) _____
 (D) _____
9. Five methods of cutting bread for sandwiches are:
 (A) _____ (D) _____
 (B) _____ (E) _____
 (C) _____
10. Six types of bread often used for making sandwiches are:
 (A) _____ (D) _____
 (B) _____ (E) _____
 (C) _____ (F) _____

HOW TO PREPARE SALADS*

Salads are a great addition to the menu. They are popular because they add variety, introduce attractive colors and refreshing flavors to the meal.

A salad is made of a foundational material, a green salad, a salad dressing, and a garnish. The salad green is selected from those available, lettuce is the most often used. The foundation material is made from either meat, seafood, vegetables, cheese, eggs, or combinations of various types. The salad dressing is chosen to blend appropriately with the ingredients.

The size and kind of salad served varies with the place it takes in the menu. It is served as a course with the meal, as the main dish of the meal or as a dessert.

The place in the menu plus the taste of the guest dictates the form and combinations used in making salads.

Salad Garnishes

Salads are garnished with greens, chopped nuts, cheese balls, preserved fruit, olives, pickles, pimento strips, etc.

All soft food materials used for salads, such as chicken, fish, eggs, potato, etc., are combined with a crisp vegetable to render them more palatable and attractive.

Salad Dressings

There are two types of salad dressings--cooked and uncooked. The uncooked are French dressing and mayonnaise. The cooked dressings include those made with oil and those made without oil.

French dressing is the simplest and most generally used salad dressing. It is a mixture of oil, acid and seasoning. Vinegar or lemon juice or both are used as the acid; any edible salad oil is used; salt, paprika, pepper and sugar are the seasonings most widely used.

By the addition of special seasonings and food materials and by varying the chief ingredients, many variations of French dressing are possible. Variations of French dressing are cream dressing, tomato, Roquefort, Chiffonade, and Parisian dressing.

The essential ingredients of mayonnaise are salad oil, acid, egg or egg yolk and seasonings. The preparation depends upon the proportion of acid, oil, and egg. All ingredients should be kept at room temperature, Variations of mayonnaise dressing are cream dressing, club dressing, Russian dressing and Thousand Island dressing.

Information
Sheet #4

HOW TO PREPARE SANDWICHES**

Simple Sandwiches

Fillings for simple sandwiches are sliced, chopped or finely ground. Sliced fillings should be cut to an even thickness. Use an ice cream dipper to measure the amount of chopped or ground filling. All fillings should cover the slice of bread exactly.

1. Cream the butter until it spreads easily.
2. Prepare the filling and garnish.
3. Place the slices of bread in two rows on a work table.
4. Spread all the bread with butter, using a spatula. Spread all the back row of slices first.
5. Place a portion of the filling on each slice in the front row. Keep the fillings uniform.
6. Cover the front row of slices with the slices in the back row.
7. Stack two or three sandwiches together. While holding in position with the finger-tips of one hand, cut through the sandwiches with a sharp knife.
8. Sandwiches are wrapped with a slightly dampened towel or wax paper, or placed in glassine bags until serving time.
9. The garnish is placed on the plate with the sandwich when served.

Grilled Sandwiches

1. Assemble the sandwich.
2. Brush the outside top and bottom slice with melted butter.
3. Toast on both sides in the broiling oven or on an electric sandwich toaster. Caution: Lettuce or other crisp greens are added after toasting.

*Adapted with permission from Food Service by Helen Livingstone, McKnight and McKnight Publishing Company, Bloomington, Illinois, 1950.

PREPARATION OF BEVERAGES

Which is correct, "Do you care for anything to drink?" or "Do you care for coffee or tea?" From a previous assignment you should know that the latter question is the most effective way of asking guests for their orders. Now, after the guest decides to have coffee or tea, will it be good coffee or tea? Many people are very particular about their drink. Have you ever heard someone say, "This coffee tastes like mud." Do you think this customer will come back for more "mud"?

It is important that all food service workers know how to prepare and serve good coffee and tea. From early breakfast until closing time, there will be a constant demand for coffee--good coffee.

In this assignment you will have an opportunity to learn the techniques of making coffee and tea and the various methods of serving each.

Assignment:

1. Read the references listed below.
2. Make a chart with each hour that you work represented. During the next four days keep a record of the number of cups of coffee and tea you serve each hour. At which period is the most coffee served? At which hour is the most tea served?
3. Answer the questions below and turn in by _____.

References:

- B. Sealtest Foods, Know Your Job, p. 18.
- I. Information Sheet #5--Beverages.

Questions:True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. The terms Mocha or Java are trade names indicating a typical flavor rather than the place where the coffee was grown.
- T F 2. Most coffees are blends of several varieties.
- T F 3. Coffee beans are cured after they have been roasted and ground.
- T F 4. Most restaurants use a "regular" grind of coffee.

- T F 5. Coffee will lose its flavor if it is stored too long.
- T F 6. The kinds of tea differ according to the variety of plant from which the leaves are taken.
- T F 7. Green tea is fermented and kiln-dried.
- T F 8. Black tea is first fermented and then kiln-dried.
- T F 9. When tea is allowed to stand on the leaves too long, tannic acid will develop.
- T F 10. Tea is classified according to the size of the leaf.
- T F 11. The more tender leaves of tea grow near the root or trunk of the tea bush where the hot sun cannot bleach them.
- T F 12. The quality of tea varies according to the country in which it is grown.
- T F 13. Tea deteriorates more rapidly in storage than does roasted coffee.
- T F 14. The product obtained by grinding roasted cacao bean is known as cocoa.
- T F 15. Cocoa contains more fat than chocolate and consequently is richer.
- T F 16. Chocolate is usually pressed into a cake and cocoa is usually sold as a powder.
- T F 17. Cocoa and chocolate should be stored in a cool dry place.
- T F 18. All beverages except water are considered to be either stimulating or nutritive.
- T F 19. When coffee is made in an urn, the water should be heated to the boiling point.
- T F 20. The hot water from the water urn should be poured over the coffee bag two or three times before it is ready to be served.
- T F 21. Coffee which has already been brewed should be maintained at a temperature between 110° and 115° Fahrenheit.
- T F 22. The coffee urn should be cleaned with steel wool.
- T F 23. If coffee is made in a silex, the heat should be turned off when about half the water has risen into the top part.
- T F 24. Although tea is the simplest of all beverages to make, it also is the one which is most often poorly made.

- T F 25. Two tea bags should be used for each individual cup of tea made.
- T F 26. The best way to serve tea is to serve the teapot and the tea bag at the side so that the customer can make his own cup of tea.
- T F 27. When making ice tea, the teabag should steep for over 10 minutes in the boiling water.
- T F 28. Whipped cream is sometimes added to a cup of hot chocolate.
- T F 29. Urns and brewers for making coffee should be thoroughly washed and rinsed with hot water once a week.
- T F 30. Coffee sacks should be washed in cold water.
- T F 31. The tops of coffee urns should be tightly closed immediately after the urns have been washed.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

- _____ 1. Coffee is made from the berry seeds of the (A) caffeine bush; (B) coffee tree; (C) Java tree; (D) carrie tree.
- _____ 2. The country which is the largest supplier of coffee is (A) Brazil; (B) Mexico; (C) Java; (D) Arabia.
- _____ 3. Green coffee beans are roasted to (A) make them more attractive; (B) help preserve them; (C) kill all harmful fungus growth; (D) develop flavor.
- _____ 4. Coffee should not be cooked overly long because the (A) grounds will burn; (B) caffeine will not harden; (C) caffeine will be extracted; (D) water will boil away.
- _____ 5. Tea that has stood on the leaves too long should not be used because it (A) becomes bitter; (B) is unsafe; (C) is unsanitary; (D) becomes tasteless.
- _____ 6. Black tea yields a beverage which is darker in color than green tea and which (A) contains less tannin; (B) is richer; (C) contains more tannin; (D) is more expensive.
- _____ 7. Both cocoa and chocolate contains (A) tannic acid; (B) caffeine; (C) starch; (D) oil of vitriol.

- _____ 8. The most important of all beverages is (A) milk; (B) coffee; (C) tea; (D) water.
- _____ 9. When making large quantities of coffee, the correct proportion of coffee to water is one pound of coffee to each (A) 1/2; (B) one; (C) two; (D) three gallons of water.
- _____ 10. An excellent cleansing agent to use for scrubbing the lining of coffee urns is (A) laundry soap; (B) soda; (C) pumice stone; (D) steel wool.
- _____ 11. Coffee sacks should be rinsed in (A) hot water; (B) energine; (C) lemon juice; (D) cold water.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The three kinds of Brazilian coffee are:
 (A) _____ (B) _____ (C) _____
2. The roasts of green coffee, according to color classification are:
 (A) _____ (B) _____ (C) _____
3. The three kinds of tea, according to methods used in drying and curing are:
 (A) _____ (B) _____ (C) _____
4. Three trade names for blended black tea are:
 (A) _____ (B) _____ (C) _____

BEVERAGES*

Coffee

Coffee is made from the seeds from the berry of the coffee tree, these are usually twin seeds.

Ordinarily, coffee is imported from about 35 sources, but at the present time, most of the coffee imported into the United States comes from South America, principally from Brazil. The Brazilian coffees include Rio, Santos, and Bourbon Santos. What are known as "milds" come from Colombia. Another South American coffee is Bogota, the better grades of which have an excellent flavor. The trade name Mocha or Java signifies a typical flavor, rather than the place where the coffee was grown.

Coffee beans from different sources contribute different qualities to the brew. Most coffee, as purchased by the restaurant, is a blend of several to fifteen varieties.

The seeds or beans are dried by artificial heat. The coffee beans, after curing, are roasted and ground. Green coffees are roasted to develop flavor. The roasts are classified according to color: (a) light, a cinnamon brown color; (b) medium, a deep chestnut, the roast most used in the United States; and (c) dark, popular in the South.

Coffee is bought in the beans or ground. A few restaurants purchase coffee in the bean and grind it fresh as required.

Coffee is steel-cut to the degree of fineness or grind best suited to the method of preparation. Restaurants use an "urn grind", which is finer than the drip designed for home use.

The flavor quality of coffee begins to deteriorate immediately after roasting and the change is significantly noticeable after a few days. The change takes place even more rapidly after the roasted beans have been ground. Coffee should be used as soon after roasting and grinding as possible.

Coffee must not be cooked for an indefinite time because the caffeine will be extracted.

Tea

Tea consists of the dried leaves of the tea bush. The kinds of teas are green, black, or oolong; they differ according to the methods used in drying and curing rather than the variety of plants.

*Adapted with permission from Food Service by Helen Livingstone, McKnight and McKnight Publishing Company, Bloomington, Illinois, 1950, and Establishing and Operating a Restaurant, U. S. Department of Commerce, U. S. Government Printing Office, Washington, 1957.

Green tea is unfermented and is steam dried. Black tea leaves are withered and completely fermented, then rolled and kiln dried. Oolong tea leaves are only partially fermented.

Tea that has stood on the leaves for any length of time is not used because it becomes bitter and unpalatable and develops an undesirable substance called tannic acid. The beverage made from black tea is darker in color and contains less tannic than the beverage made from green tea. The principal type of tea now available in the United States is black tea.

Tea is classified according to the size of the leaf used. The more tender leaves are at the tip of the branches and have a delicate flavor. They are used in the higher grades. The quality of the tea varies with the country in which it grows, the tenderness of the leaf, the degree of fermentation and other details of its preparation for the trade.

Pekoe, Orange Pekoe, and English Breakfast are trade names for blended teas.

Tea deteriorates on storage but not nearly as rapidly as roasted coffee. Tea also tends to pick up flavors and odors from substances stored near it. Tea should be stored in air-tight containers and never opened or allowed to remain open in the presence of odoriferous substances.

Chocolate and Cocoa

Chocolate and cocoa are made from the cacao bean. The product obtained by grinding the roasted cacao bean is known as chocolate. Chocolate contains more than 50 per cent of a high quality fat called cacao butter and is pressed into a cake. When an appreciable quantity of fat is removed from chocolate the remaining product is known as cocoa and is sold in a powder.

Cocoa and chocolate contain starch and are cooked until the mixture thickens and is thus rendered more palatable and digestible. Chocolate contains more fat than cocoa and consequently is richer.

Both cocoa and chocolate should be stored in a dry, cool place. Cocoa tends to lump if stored in a moist atmosphere or at high temperature. When chocolate is stored at high temperature, some of the cacao butter softens and forms a grayish film on the outside of the chocolate; this makes the product appear stale but the flavor may not be impaired.

The Preparation of Beverages

Water, the beverage provided by nature to relieve thirst, is the most important of the beverages.

All other beverages are considered as either stimulating beverages or nutritive beverages.

How to Prepare Coffee

Probably no single item has built or ruined more restaurant reputations and business than coffee. The reputation of many a famous restaurant is due largely to its excellent coffee.

Everyone should know how to brew coffee properly. Following are instructions for brewing coffee in a variety of coffee-makers.

Urn-Brewing Methods:

1. Flush stale water from boiler and water pipe. (Open boiler faucet and water supply valve.)
2. Fill the hot water urn and bring to a boil, lighting the gas or turning on the steam.
3. Fill the coffee bag. Two gallons of water per pound of coffee is a good allowance.
4. Place the coffee bag on the rim inside the coffee urn.
5. Draw the hot water from the water urn into the measure and pour it over the coffee bag. Repeat this 2 or 3 times.
6. Remove the coffee bag when the liquid has drained through it. Water should drip through within six minutes.
7. After removing coffee bag, mix brewed coffee by drawing off one gallon and pouring into top of urn.
8. Cover the urn.
9. Taste the coffee. Check heat to make sure brew will stay at 185° - 190° F.
10. Remove grounds from urn bag. Rinse thoroughly and place in container of cold water. Urn bags should always be kept submerged in cold water when not in use to keep them clean and sweet.

Urn baskets and filters must be kept scrupulously clean. Clean urn between each use with stiff scrubbing brush. Never use steel wool.

The foregoing directions are specifically for battery urns, but basically they apply to any type of urn.

Making coffee with a silex:

1. Place water in the lower flask.
2. Place it on the heating element.
3. Place the filter in the top and add the coffee.

4. Insert the top part in the flask after the water begins to boil.
5. Turn off the heat when the water has all risen to the top part.
6. After the coffee has run back into the lower flask, remove the top with the coffee grounds.
7. Serve immediately . . . place on warming unit. (Never allow coffee to boil.)
8. Empty the coffee grounds immediately--clean the top. Discard the filter.

How to prepare hot tea:

Hot tea is the simplest of all beverages to make, but the one that is the most frequently poorly made. If the following simple rules are followed, a good cup of hot tea will result.

1. Rinse out the tea pot with boiling water.
2. Place a tea bag in the pot and fill it with boiling water. Allow one tea bag for each individual cup of tea.
3. Serve the tea pot on a small plate.

Milk for tea use, instead of cream, will produce a better cup of tea, flavor-wise.

Many restaurants serve the hot water in a teapot or cup and the tea bag at the side so that the customer can make his own cup of tea. This is an unwise procedure as only a mediocre cup of tea can result. The boiling water must be poured directly on the tea.

How to prepare iced tea:

1. Pour one gallon of boiling water over one 2-ounce tea bag (or two 1-ounce tea bags) in a crock or stainless steel container.
2. Let steep for 6 to 10 minutes (no longer) stir and remove bags, pressing them against the container's side to squeeze out the liquid.
3. Serve in ice filled glasses with lemon slices.

How to serve milk:

1. Use a clean polished glass.
2. Clean the milk bottle.
3. Remove the top at the table and pour it into the glass.
4. Serve the glass on a small plate.

How to prepare hot chocolate:

1. Open the regulation package and turn the contents into a cup or an individual pot.
2. Add the hot water and stir.
3. Whipped cream is often added to the single cup of chocolate.

Assignment
Sheet No. 15

Covering
Units 118-130

FOUNTAIN SERVICE

Fountain service is similar to regular restaurant table and counter service in that all customers expect prompt, efficient, and courteous service. Just as on regular counter service, the food service worker on a fountain must be fast and capable of handling many orders at one time.

Many restaurants have a small fountain for the purpose of serving special requests for desserts and between-meal snacks. When such fountain service exists, it is usually the duty of the food service worker to assemble the order. It is therefore important that all food service workers have some knowledge of the techniques and methods of preparing fountain orders.

In this assignment you will have an opportunity to learn the various fountain orders and how to fill them. You will also gain a thorough knowledge of the importance of correct fountain procedures.

Assignment:

1. Read the reference listed below.
2. Answer the following questions and turn in this assignment by _____.

Reference:

B. Sealtest Foods, Know Your Job, pp. 10-12; 16-35.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. A few minutes should be spent in reviewing the day's happenings with the person who relieves you before going off duty.
- T F 2. Each day's menu should be memorized in order that you may be able to answer questions quickly and correctly.
- T F 3. Your lunch period should be so arranged that it will not conflict with rush hours.
- T F 4. Non-essential, personal phone calls should be very limited while on duty.

- T F 5. When a food service worker is having lunch, he should sit in an end booth or at the end of the counter.
- T F 6. The apron not only protects clothing, but also may be used to wipe the hands.
- T F 7. If pots and pans appear to be clean, it is not necessary to rinse them before they are used.
- T F 8. Several glasses of carbonated water should be drawn off and discarded each morning before any is used.
- T F 9. Chocolate and cream pumps should be scalded and dried thoroughly each day.
- T F 10. Newly received merchandise should be inspected for quality and short weight.
- T F 11. Menus should be changed first thing in the morning.
- T F 12. Mirrors should be washed and polished once every three or four weeks.
- T F 13. Metal spoons and straw holders should be washed and polished each day.
- T F 14. Soda fountain equipment represents a fairly small investment by the employer.
- T F 15. Excess frost in ice cream sleeves retards cooling efficiency.
- T F 16. Ice cream containers or cans should be dropped into the ice cream sleeves.
- T F 17. Bakelite covers and syrup pump tops should be cleaned with hot water and soap.
- T F 18. An ice pick should never be used to remove ice from the syrup rail.
- T F 19. Hot water should not be used to thaw either soda or plain water cooling coils.
- T F 20. Condenser fins on an air cooled refrigeration machine should be cleaned yearly with a stiff wire brush.
- T F 21. If dust collects on a condenser, the machine will have to operate longer to accomplish the same amount of work.
- T F 22. The outside of the electric drink mixer should be cleaned with a good silver polish.

- T F 23. All broken china or glassware should be disposed of immediately.
- T F 24. The care you exercise in controlling waste and breakage determine your personal efficiency in the eyes of your employer.
- T F 25. Extreme temperatures of either heat or cold will cause wax coated paper cartons to warp.
- T F 26. Wooden utensils should be stored at rather warm temperatures.
- T F 27. Improperly packed bulk ice cream will cause a financial loss to the employer.
- T F 28. The delicate and perishable nature of ice cream necessitates careful handling.
- T F 29. All mixed milk drinks should be whipped for about five minutes to insure proper blending.
- T F 30. Price should be the determining factor in buying commercially prepared syrup.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Bar mops should be discarded before they become _____ and _____.
2. Dipper wells should be free of refuse and kept full of water that is _____ and _____.
3. Stools, booths, tables, and chairs should be washed each _____ with hot, soapy water.
4. Leather-covered counter stool seats should be washed with _____.
5. Freshly received merchandise should immediately be placed at the _____ of the refrigerator.
6. As a general rule, carbonated water should be between _____ and _____ degrees F at the draft arms.
7. A solution of _____ of _____ may be used when cleaning refrigerators in order to help avoid objectionable odors.
8. The temperature in the salad compartment should not exceed _____ degrees Fahrenheit.

9. Ice which has accumulated on refrigerator coils should be removed by melting it off with _____.
10. Most present-day refrigeration systems are charged with _____ refrigerant.
11. A good safety practice at a fountain is to keep a _____ on the ends of ice picks when they are not in use.
12. When starting to dip from a new container of ice cream, it is best to start at the _____ of the container.
13. The ice cream dipper should never be dipped more than _____ inch(es) into the surface of the ice cream.
14. The first requirement of a good ice cream sundae is _____.
15. It takes approximately _____ minute(s) on the mixer to blend a milk drink smoothly.
16. Chocolate syrup is demanded in approximately _____ to _____ per cent of all fountain items ordered.
17. Whipped cream should be kept in a cool place as it has a tendency to _____ as it becomes warm.
18. One way to cause whipped cream to "hold up" in warm weather is to add a little _____ to the cream before it is whipped.

Multiple-Choice

Directions: In the space at the left of each statement, write the letter of the item which will provide the correct answer to complete the statement.

- _____ 1. All articles left by customers should be (A) turned over to the police; (B) taken home; (C) turned over to the management; (D) left where they are.
- _____ 2. Food stuffs should always be picked up or handled with (A) your fingers; (B) the proper utensil; (C) a napkin; (D) an ice pick.
- _____ 3. The best way to describe the odor of sulphur dioxide refrigerant is that it smells like (A) soap; (B) gasoline; (C) apples; (D) rotten eggs.
- _____ 4. The smell of sulphur dioxide may be eliminated by sprinkling the soiled spot with (A) soap powder; (B) vinegar; (C) salt; (D) household ammonia.
- _____ 5. The long gear and the pinion gear of a hand type juicer should be lubricated with (A) petroleum jelly; (B) motor oil; (C) lard; (D) salad oil.

- _____ 6. If food should catch fire in a pan, the safest thing to do is (A) pour water on it; (B) call the manager; (C) smother flame with salt; (D) smother flame with flour.
- _____ 7. If a dripping dipper is placed in ice cream, the drops of water will (A) melt the ice cream; (B) not affect the ice cream; (C) freeze into ice crystals and ruin the ice cream; (D) improve the quality of the ice cream.
- _____ 8. A good preservative to use in syrups is (A) sulphur dioxide solution; (B) powdered benzoate of soda solution; (C) ammonia solution; (D) bicarbonate of soda solution.
- _____ 9. In order for cream to whip efficiently, it should be (A) fresh; (B) sweet; (C) diluted with water; (D) at least 24 hours old.
- _____ 10. When chilled to the freezing point, sweet cream will (A) yield more "swell" when whipped; (B) not whip; (C) turn to butterfat; (D) whip only slightly.

WRITING AND PLANNING THE MENU

What is the difference between a table d'hote meal and an a la carte meal? If a guest asked you what is meant by "chicken fricassee" could you answer correctly? Many such terms are found on our menus in today's modern restaurants. Food service workers should be able to answer questions about the menu and tell how certain dishes are prepared.

In previous assignments you have learned the importance of efficient food preparation and service. You will now discover that the food service worker must, in many instances, be an interpreter as well. Many people would like to try new and different dishes but are hesitant because they do not know exactly what the dish is.

In this assignment you will have an opportunity to learn some of the common terms used on menus. Remember, the more information you have about the menu, the better you can serve your guests.

Assignment:

1. Read the references listed below.
2. Answer the questions below and turn in by _____.

References:

- A. U. S. Department of Health, Education, and Welfare, Food Service Industry, pp. 145-150.
- B. Sealtest Foods, Know Your Job, pp. 9, 44.
- I. Information Sheet #6, Additional Information on Menu Planning.

Questions:True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- | | | |
|---|---|--|
| T | F | 1. Menu making in a small restaurant is a complicated procedure. |
| T | F | 2. The appearance of a menu determines the customer's introduction to the restaurant. |
| T | F | 3. Statistical surveys indicate that very few people order the first dish which is listed on a menu. |
| T | F | 4. The best practice is to arrange all items on the menu according to price. |

- T F 5. The chef should have the responsibility for planning menus.
- T F 6. A restaurateur must consider food values and the basic principles of good nutrition when planning menus.
- T F 7. Persons who plan menus for the public must guard against letting personal preferences become the guiding factor.
- T F 8. When writing menus, a planner may disregard the correct meaning of foreign terms and use them just to give the menu an atmosphere of class.
- T F 9. The method of computing the selling price of restaurant foods is very complicated.
- T F 10. The food cost percentage is the same for all types of restaurants.
- T F 11. When a customer chooses an article which has been "sold out", it should be suggested that he go to another restaurant in order to get what he wants.
- T F 12. It is the responsibility of the food service worker to provide the customer with information about the food he eats.
- T F 13. The customer who is obviously in a hurry should be informed that counter service is quickest.
- T F 14. The talents needed in selling are, generally speaking, about the same as those required in everyday living.
- T F 15. The information on a well-arranged menu should be so headed and classified that the reader can readily find it.
- T F 16. The type used for "specials" on menus is often heavier than that on the rest of the menu.
- T F 17. The appearance of the menu is a factor in the early impressions which customers form of a restaurant.
- T F 18. The sole value of a menu is as a sales medium.
- T F 19. The menu of the day describes the foods which are available at all times.
- T F 20. Menu arrangements are always standardized.
- T F 21. "Club" breakfast menus list the different food items which may be ordered individually.
- T F 22. When presenting breakfast menus to the customer the salesperson should point out special or featured breakfasts.
- T F 23. The arrangement of the a la carte dinner menu is similar to that of luncheon menus.

- T F 24. It is important for everyone selling food to be familiar with certain foreign terms adopted by Americans in menu writing.
- T F 25. Overhead expense will usually equal and may sometimes exceed the cost of food purchases.
- T F 26. Table flowers, menu folders, etc., should not be considered as a part of the cost of serving a meal.
- T F 27. Customers usually underestimate the percentage of profit which is made on restaurant food sales.
- T F 28. The profit on food sales exceeds 10 per cent in a well-managed restaurant.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. Before new menus are distributed to customers, they should be carefully checked for correct _____, _____, and _____.
2. One of the most important functions in the restaurant is that of _____.
3. In order to control food costs, it is essential that recipes and food portions be _____.
4. To maintain a 40 per cent food cost, the selling price of an item or meal should, on the average, be _____ times the cost of the food.
5. Dishes priced separately on the menu are known as _____ dishes.
6. A meal served in several courses at a set price is known as a _____ meal.
7. Because it tells the initial story about food to the customer, the menu is sometimes called the _____ of the restaurant.
8. Another name for the menu of the day is the _____.
9. The luncheon menu is composed of lists of _____ dishes and several _____ meals.
10. In the case of selective choice menu the main dishes usually are listed under _____.
11. Meat or chicken stewed and served in a rich sauce is _____.
12. A small cup of coffee is sometimes known as a _____.

Matching

Directions: In the left hand column is a list of items. The right hand column contains descriptive phrases or synonymous terms. Match the descriptions to the items by placing the letter of the description in the left blank at the left of the appropriate item.

- | | | |
|-------|-------------------|---|
| _____ | 1. a la carte | A. savory foods served as appetizers |
| _____ | 2. au jus | B. the main dish of a meal |
| _____ | 3. brochette | C. French for Perfect |
| _____ | 4. a la king | D. any colorful or attractive decoration |
| _____ | 5. consomme | E. on the bill of fare, or prepared as ordered |
| _____ | 6. rissole | F. a mixture of garden vegetables |
| _____ | 7. hors d-oeuvres | G. meat broiled on a skewer |
| _____ | 8. condiment | H. the bill of fare or fountain newspaper |
| _____ | 9. entree | I. browned |
| _____ | 10. fizzes | J. served in a cream sauce |
| _____ | 11. garnish | K. cut in thin strips |
| _____ | 12. menu | L. clear meat stock served hot or jellied |
| _____ | 13. marinate | M. menu of the day |
| _____ | 14. parfait | N. after the style or fashion |
| _____ | 15. carte du jour | O. served in its natural juice |
| _____ | 16. jardiniere | P. a carbonated fruit flavored drink |
| _____ | 17. julienne | Q. a spicy seasoning |
| | | R. to pickle or salt and preserve in oil or vinegar |

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. The menu must be planned to do three things. They are:

(A) _____ (C) _____

(B) _____

2. Three types of information customers get from the menu are:

(A) _____ (C) _____

(B) _____

3. In order to help guests make a satisfactory food selection, the food service worker should know:

(A) _____ (C) _____

(B) _____ (D) _____

4. Two types of menus used in most restaurants today are:

(A) _____ (B) _____

5. The three kinds of menus are:

(A) _____ (B) _____ (C) _____

6. Under what headings are featured luncheons listed:

(A) _____ (C) _____

(B) _____

ADDITIONAL INFORMATION ON MENU PLANNING*

Menu-making for small restaurants can be a relatively simple process. Many establishments specialize in two or three items regularly. Others build their reputation on one dish only. A number of restaurants have a simple but well-rounded menu.

The appearance of the menu is the first point to consider in menu designing. The menu is the customer's introduction to the restaurant. It informs him of the dishes available, manner in which they are prepared, and the cost. It is planned to sell the food, to conform to the atmosphere, and to advertise the restaurant.

The menu card should be simple, handy in size, easy to read and understand. Many small restaurants use a duplicating machine of some kind for preparing the menu. Enough are usually made to permit the discarding of soiled or torn menus. Before using, it should be carefully checked for correct spelling, phrasing, and pricing.

A prominent place on the menu for "special" dishes is at the top of the list for that course. Statistics show that more people order the first dish on that list than any other.

It is not a good practice to arrange items according to price. If the lower priced items are listed first, the customer's attention will be focused on these and the higher priced dishes may be neglected.

Menu-Maker

Menu planning is one of the most important functions in the restaurant. It requires knowledge, thought, study, investigation, and ingenuity.

Menus should be made when you are fresh, alert and full of enthusiasm. The best menu will be made by the resourceful person who is on the lookout for the new dish, the new recipe, the new idea, the new phrase, or the new way.

While the chef may be an excellent cook and be consulted when planning menus, he should not be left with the entire responsibility. The menu maker must first have a considerable amount of specific information and also, he must keep the customer's point of view. Basic factors that the menu-maker should have are:

- A. Must know food values and the basic principles of good nutrition.
- B. Must know the capacity of all departments and plan menus of ease of production.

*Adapted from Establishing and Operating A Restaurant, U. S. Department of Commerce, U. S. Government Printing Office, Washington, D.C., 1957.

- C. Must obtain full value from all purchases and plan the menu to take care of all food purchased.
- D. Must keep in touch with market conditions.
- E. Must follow the day's sales and know your customer's preference.
- F. Must know how far ahead to plan menus.
- G. Must insure variety.
- H. Must know food costs.

In planning a menu, the customer's point of view must be considered. Items that are important to note are:

- A. Menus must not be misleading.
- B. Foreign terms must be used correctly.
- C. Customers look for seasonal foods.
- D. Selections should suit women as well as men.
- E. Menus should be planned at different price levels.
- F. Customers like to be surprised to find new dishes and new names on the menu.

Controlling Food Costs

The menu-maker should know the approximate cost of every item on the menu, and the approximate yield from every food ordered.

It is essential to standardize recipes and food portions. Yields must be the same each time the recipe is prepared and the sales, based on a certain number of portions of definite size, can be calculated with a fair degree of accuracy.

The general method of calculating selling prices is a simple one. If the restaurant operates on a 40 per cent food cost, this means that the cost of food as purchased by the restaurant is 40 per cent of sales. The meal or item that sells for a dollar has an average raw food cost of 40 cents. To maintain a 40 per cent food cost, the selling price of an item or a meal should average $2\frac{1}{2}$ times the cost of the food. If the restaurant operates on a 50 per cent food cost, the selling price should be twice the cost prices.

The food-cost percentage varies in different restaurants, of course, depending on the menu and the type of operation; luxury restaurants operate on lower food-cost percentage than eating places which sell food at moderate prices (that is, the mark-up on food cost is greater in the higher-price restaurants).

Units 135-146

RESTAURANT MANAGEMENT

Many factors contribute to success in the restaurant business. One of the most important of these factors is efficient management. The manager must know how to buy and prepare food material, how to buy equipment, how to negotiate contracts, how to keep accurate and adequate records, etc. Many restaurants have failed because the manager did not have a thorough knowledge of the fundamentals of good management.

The importance of good restaurant management can not be overstressed. The food service worker who progresses on the job may very well move into the management phase of the business some day. For this reason, all food service workers should become acquainted with the techniques involved in good management.

In this assignment you will have an opportunity to learn the value and technique of good restaurant management.

Assignment:

1. Read the reference listed below.
2. Consult with the manager of your restaurant as to what factors he considers to be the most important in good management. In a brief paper, summarize what you consider the most important factors in successful management as based on your own experience and the discussion with your manager.
3. Answer questions below and turn in by _____.

Reference:

- I. Information Sheet No. 7, Restaurant Management.

Questions:

True-False

Directions: The following statements are either true or false. If the statement is true, draw a circle around the letter "T." If it is false, draw a circle around the letter "F."

- T F 1. There are practically no disadvantages to buying a restaurant business which is already a "going concern."
- T F 2. An established business can never be bought at a bargain price.
- T F 3. In purchasing a business, one will be battling the prejudices and habits of the customers against the former owner.

- T F 4. Business will suffer until changes are made and the public learns about the changes.
- T F 5. There is no value to investigate the assets and liabilities of a business when purchasing a restaurant.
- T F 6. Operators of small restaurants often make the mistake of buying fixtures which are larger and more expensive than necessary for their volume of business.
- T F 7. As a general rule, sellers will not tend to exaggerate the good features of a business which they are trying to sell.
- T F 8. A lawyer should draw up the purchase agreement to protect both parties.
- T F 9. Most restaurants are started and owned by corporations.
- T F 10. An individual proprietorship is usually operated by two or more persons.
- T F 11. A partnership is the association of two or more persons in the conduct of an enterprise.
- T F 12. One big advantage to a partnership is that the money and experience of two or more persons is combined to start a business.
- T F 13. All corporations have a large number of stockholders.
- T F 14. Corporations must be legally chartered and filed with the appropriate state authority.
- T F 15. Adequate records, by their very nature, must be quite complicated.
- T F 16. It cannot be expected that a record system will furnish any information as to how your restaurant compares with others of the same type.
- T F 17. Some types of records will help to guard against loss of cash receipts.
- T F 18. Many types of restaurant businesses should not use a cash register.
- T F 19. The best policy is to pay the purchases by check.
- T F 20. Tax laws and regulations require that certain records be kept by operators of restaurants.
- T F 21. The employer and employee each pay 50 per cent of the Federal Unemployment Tax.

- T F 22. Assets are the amounts owed by the business.
- T F 23. The balance sheet gives a picture in dollars and cents of the financial status of a business at a given time.

Completion

Directions: Fill in the blank(s) in each statement with the word(s) required to complete the sentence correctly.

1. You become the owner of a restaurant by _____ restaurant or _____.
2. When buying a restaurant, a (an) _____ should be obtained from the seller stating that the fixtures and equipment have been paid for and are free from mortgage.
3. Before any transaction for the purchase of a restaurant is complete, you should seek _____.
4. Business success and good _____ seem to go hand in hand.
5. _____ are used when paying for purchases from the cash register.
6. The guest check is sometimes referred to as a guest _____.
7. Guest check books should be _____ numbered so that all checks may be accounted for.
8. A _____ provides a simple and easy method of keeping a record of every sale dollar.
9. Every businessman who pays wages to _____ or _____ employees must deduct and withhold specified amounts from their wages for federal income taxes.
10. The _____ statement is a summary in dollars and cents of the business operations of the restaurant during a given period.
11. Sales, minus the cost of food sold, will equal the _____.
12. The gross margin, minus total operating expenses, will equal _____.

Listing

Directions: List the items called for in each of the following. Select your answers carefully.

1. What are two basic questions to ask when purchasing a restaurant:

- (A) _____
- (B) _____

2. Records are important as they give the proprietor the following information:

- (A) _____
- (B) _____
- (C) _____
- (D) _____
- (E) _____
- (F) _____
- (G) _____
- (H) _____
- (I) _____

3. Cash registers are used in business places for:

- (A) _____ (C) _____
- (B) _____ (D) _____

4. Guest checks provide two types of records:

- (A) _____
- (B) _____

5. Records to be kept in accordance with tax laws are:

- (A) _____ (C) _____
- (B) _____ (D) _____

6. Two financial statements which must be prepared for any type of business are:

- (A) _____ (B) _____

Information
Sheet No. 7

RESTAURANT MANAGEMENT*

To become the owner of a restaurant you can either buy an established business or start a new one.

The advantages and disadvantages of buying an established business are:

Advantages:

1. The business sometimes can be bought at a bargain price.
2. You pick up the existing goodwill, when acquiring an established patronage.
3. By eliminating that initial period of waiting for business to build up, your income starts quicker, with less drain on your resources.

Disadvantages:

1. The owner may have a bad reputation, in which case you will be battling customers' prejudices.
2. You must face the fact that many potential customers have formed the habit of not patronizing the restaurant.
3. If the former owner has made a bad choice of equipment, arranged the restaurant badly, or been unwise in his menu selection, you will suffer from these mistakes until you remedy them and the public learns about the change in management.

If you decide to purchase a restaurant, first demand why the owner wishes to sell; and second, what are your chances of continuing the operation successfully. Each purchase must be judged carefully on its own merits.

Certain things should be investigated carefully to determine the value of a going business. The chief assets and liabilities of the seller should be separately evaluated.

When buying a going business, be sure that the owner did not over extend himself on the value of fixtures and equipment. Many small restaurant owners make the mistake of buying fixtures too big and too expensive for his volume of business, and in doing so ties up precious capital.

Find out if there is a mortgage on the equipment.

An affidavit should be obtained from the seller stating that the fixtures have been fully paid for and are free from mortgage.

*Adapted from Establishing and Operating a Restaurant, U. S. Department of Commerce, U. S. Government Printing Office, Washington, D. C., 1957, pp. 14-26; 173-182; 188-204.

The profits claimed by the owner should be tested carefully for authenticity. The seller tends to exaggerate the good features of the business he is selling.

Legal advice should be sought before the transaction is closed. Both buyer and seller will want a lawyer to draw up the agreement in order to protect both parties fully.

Forms of Business Organizations

Most small restaurants are started by a single individual and operated as sole proprietorship, but some are initially organized as partnerships and corporations.

The individual proprietorship is owned and operated by one person, who supplies all the capital, takes all the risks and enjoys all the profits.

The partnership is the association of two or more persons in the conduct of an enterprise. The rights and duties of the partners toward each other and toward the public are regulated by the partnership agreement and by the State partnership laws.

An advantage of a partnership is that it permits pooling the capital, skill, experience, and business contacts of two or more co-owners, thereby increasing the scope of the business and enhancing its credit standing.

The corporation is an investment for the ownership and management of an enterprise that enables a person to invest a given sum in an enterprise without becoming personally liable for its indebtedness beyond the amount invested. Incorporation is not limited to large enterprises. There are thousands of corporations with only three or four stockholders and a small scope of activity. A corporation comes into existence when a certificate of incorporation or a charter is accepted and filed with the appropriate State authority.

Record Keeping

It is important that all restaurants, to be successful, should keep adequate records of the business. They can be simple and easy to keep, so that a minimum amount of time need be devoted to records. Good record keeping and success in business go hand in hand. They inform the proprietor how the business is doing, net profit earned, food costs, payroll costs, trends in sales, stock inventory, money owed, money in the bank, and a comparison on how well his restaurant is doing compared with others of the same type.

Safeguarding Cash

Some records help to guard against loss of cash receipts through thefts, errors in making change, or failure of a guest to pay his check.

A cash register is recommended for every restaurant. Besides being a safe place to keep money during the day, it records each sale and totals the sales as well as the number of checks rung up. Many registers accumulate separate totals for food, cigars and cigarettes, paid-outs, and the like.

Cash payment vouchers should be used in paying for some purchases from the cash register, a receipt is placed in the register for each amount of cash removed.

A guest check, sometimes called a guest order, provides the record for the service of food and collection of cash. The check contains space for the order and correct amount to be paid by the customer. Order books should be serially numbered so that all checks may be accounted for.

It is essential that all payments be made by check. A canceled check, marked paid, and carrying the creditor's name on the back of it serves as a receipt.

A large part of the operator's dollar is paid out for food, most of the remainder goes for expenses, and only a small part of it becomes net profit. The cashbook provides a simple and easy method of keeping a record of every sales dollar. This cashbook, should be kept according to good business practices, and any simple bookkeeping book will provide information for keeping a good cashbook.

Tax Records

It is necessary for the restaurant operator, or any business place, to keep certain records to comply with tax laws and regulations. Records must be kept in connection with Federal income, social security and unemployment, and, in a number of states and cities, income and sales taxes. For the operator who keeps records, only a few additional records or changes are necessary for tax purposes.

Since it is impractical to discuss at this time the many problems and regulations concerning taxes, the restaurant operator who keeps good records will have no problems. Every business man who pays wages to one or more employees is required to deduct and withhold specific amounts from the wages of his employees for Federal income taxes. The Federal unemployment tax is imposed upon employers and not deducted from the wages of employees. The operator should acquaint himself with all the regulations of State and Federal taxes.

Financial Statements

In the restaurant business, as in any other business, there are two financial statements which you must prepare. These are the profit and loss statement and the balance sheet.

The profit and loss statement is a summary, in dollars and cents, of the business operations of the restaurant during a given period.

It is a comparison of income and expenses to determine the net profit during that period. The profit and loss statement summarizes the business operation thus:

Sales minus cost of food sold equals gross margin.

Sales minus total operating expenses equals Net Profit.

The balance sheet is a statement of the assets (things owned by the business), the liabilities (amounts owned by the business), with the differences equaling the net worth, or capital, of the business enterprise.

ASSETS - LIABILITIES = NET WORTH OR CAPITAL

It is a picture, of dollars and cents, of the financial status of the business at a given time, usually at the close of the fiscal year.

In the operation and preparation of these business practices, training should be received or expert advice consulted in the operation of these important records.

FOREWORD

There have been many improvements in our corn growing practices in the past 20 years such as better hybrids, more fertilizer, improved tillage methods, drainage, weed, and insect control. If farmers are to receive the full benefits of these improvements they must have adequate plant population to take full advantage of them.

Mr. Clarence Fridline, Vo-Ag Teacher, Mt. Vernon, Ohio, used the laboratory exercise described in this outline to demonstrate the effect of planter seed plate selection and the rotating speed of the seed plate on the accuracy of seed drop. Mr. Fridline found this exercise to be very effective for both adult farmers and high school students.

The exercise first develops the importance of maintaining a high rate of planting. Dr. Gordon Ryder, Extension Agronomist, The Ohio State University, and Drs. H. J. Mederski and E. J. Dollinger of the Ohio Agricultural Experiment Station, have technical advice in developing this section.

The remainder of the exercise deals with the laboratory work and the operation and calibration of the corn planter planting assembly unit. Mr. S. G. Huber of the Agricultural Engineering Department and Mr. Richard Carr, John Deere Engineer, gave assistance with this part of the outline.

 - A. Causes of inaccuracy in seed drop.**
 - B. Speed of planting and seed plate cell size.**

- IV. Corn Planter Calibration.**

I. Determining the proper rate of planting for most profitable corn yields.

A. Soil fertility level.

1. Small increases in plant population can result in sizable increases in yield when recommended fertilizer practices are followed. (Chart 1) "Well fertilized Soil Requires Adequate Stand for Best Results." Summary of results - Soil Fertility Demonstration Plots Conducted by H. S. Vo. Ag. Depts., Agronomy Mimeo 155, O. A. E. S., Wooster, Ohio.

a. The average stand on all plots was 14,500 plants/A with a yield of 78 bu/A on no fertilizer plots and 94 bu/A. on fully treated plots.

b. Increasing the stand above the average 14,500 plants/A to 18,000 plants/A only increased the yield 3 to 4 bu/A on the no fertilizer plots.

c. Increasing the stand above the average of 14,500 plants per A. to 18,000 plants/A increased the yield 18 bu/A on fertilized plots.

d. Increasing the stand from 14,500 to 18,000 plants per A. and following recommended fertility practices increased the yield 36 bu/A.

"Agronomists agree that a minimum of 16 to 18 thousand plants per Acre are needed to make the best use of applied fertilizer."

2. Different types of soil give similar response to high plant populations.

(Chart 2) "Two soil types give similar response to increased rates of planting." Agronomy Journal Vol. 52, 1960 Hoffand Mederski, O A E S.

With each soil type the maximum yield was obtained at about 18,000 plants per acre. In each case the top yield was above 140 bu/A.

3. When rate of planting matches the productivity of the soil ears should average about one half pound each. If ears average more than one half pound under planting is indicated.

(Chart 3) "Thickness of stand affects ear size." Crops and Soils, May 1959.

(Chart 4) "It's the bushels per acre - not the size of the ears - that bring the profits." Gordon Ryder, Know your Limiting Factors in Crop Production, American Potash Institute.

The weight per corn ear declined as the plant population and bushel yield increased. The average ear weight decreased from .6 pounds at 9000 plants per acre to .4 pound per ear at 19,000 plant population. Results of a survey conducted by Gordon Ryder, Department of Agronomy, O. S. U. using 8 hybrids with 4 rates of fertility on 55 fields.

B. Relationship of plant populations to stalk breakage and barrenness.

"Efficient use of available fertility and soil moisture in stand is prevented by two main factors - stalk breakage and barrenness."

1. "The ideal stand for commercial corn is the one that makes the best comparison between maximum yield and minimum stalk breakage."

(Chart 5) Yield and Stalk Breakage from Corn Planted at various rates," Crops and Soils, May 1959, G. H. Stringfield, OAES dept. of Agronomy.

High plant populations favor development of stalk rots which bring on stalk breakage.

2. As the plant population increases the number of barren stalks may increase. (Chart 6) "The Number of Barren Stalks Increases as Plant Populations Increase." Agronomy Journal, Vol. 52, 1960 Hoff and Mederski, OAES.

Dr. E. J. Dollinger, Dept. of Agronomy, OAES, states that research in corn breeding has made progress in developing hybrids that are resistant to barrenness (no ears) and resistant to stalk rot which brings on stalk breakage. When high plant populations are to be used care must be taken to select hybrids that are tolerant to heavy stands.

A balance of plant nutrients (Nitrogen, Phosphate, and Potash), is important if healthy corn is to be raised. Nitrogen stimulates vegetative growth and an excess of nitrogen will cause weak stalks. Phosphorus helps bring about early maturity while Potash produces stronger and stiffer stalks.

C. Plant populations and season.

The production of high corn yields depends largely on an adequate supply of moisture, other factors being equal.

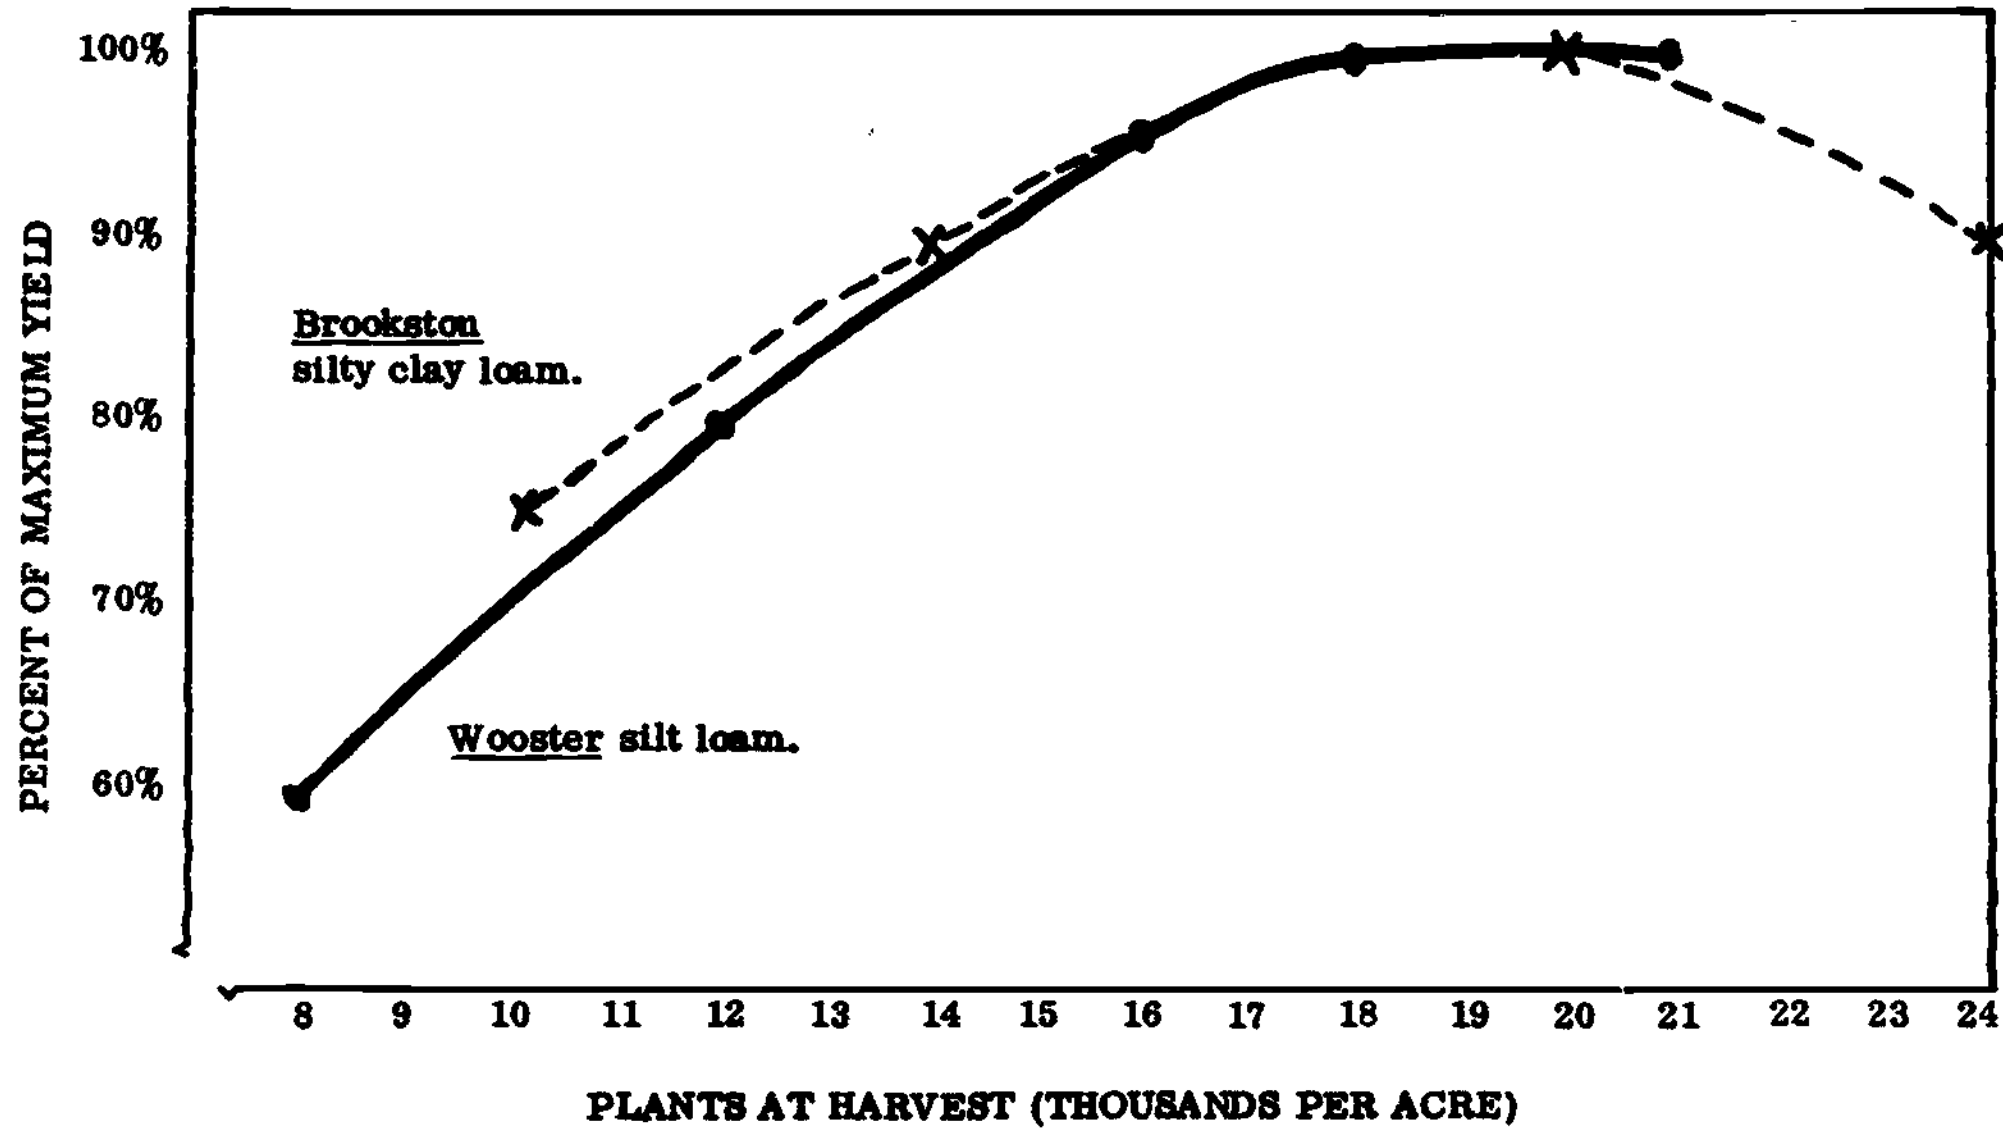

**WELL FERTILIZED SOIL REQUIRES ADEQUATE

Agronomy Journal, volume 52, 295-297.

CHART 6

(Chart 7) "Stands Best Suited to Favorable Seasons Pay Best in Longrun," Handbook of Ohio Experiments in Agronomy, Item 73, OAES

Heavy stands during dry seasons will produce low yields but stands adequate for full production in good seasons will produce more in good and average seasons than the loss during dry seasons. These tests also indicated that silking date was delayed one day for each 4000 plants in the stand. Tillering (suckers) and weed growth were also reduced as stand increased. At optimum stands ears averaged about one half pound each.

D. Determining the rate of planting corn.

Farmers are maintaining a fairly high rate of fertility on their corn land and the moisture supply has usually been adequate for high yields. If full benefit of the fertility and moisture supply is to be received, farmers need to have a plant population of 17,000 to 18,000 stands per acre at harvest. There is an average loss of about 15% from the amount of seed planted to the number of plants harvested. The following table may be used in determining rate of planting.

Table 1. Corn Planting Rates and Row Spacing

Rates of Planting Kernels per acre	Estimated Stand Allowing 15% Stand Loss	Spacing in Row (inches)			
		Row Widths			
		36"	38"	40"	42"
20,000	17,000	8.7	8.2	7.8	7.5
21,000	17,850	8.3	7.8	7.4	7.1
22,000	18,700	7.9	7.5	7.1	6.8
23,000	19,550	7.5	7.2	6.8	6.5
24,000	20,400	7.2	6.8	6.5	6.2
25,000	21,250	6.9	6.6	6.3	5.9

Fig. 1

SIZES OF SEED CORN

Corn is sized according to its width, thickness, and length. The dimensions are recorded in 64ths. inch. Seed corn companies do not take the time or go to the added expense of close grading, so there will be considerable variation in size of kernel within a grade.

EXAMPLES OF SIZE, DIMENSIONS, AND KERNELS PER POUND

Size	Dimensions	Kernels per pound
Small flat	13 x 18-17	1794
Medium flat	13 1/2 x 21-18	1542
Large flat	13 1/2 x 24-21	1336
Extra large flat	13 1/2 x 28-24	1096
Thick flat	15 x 24-21	1150
Medium round	21-28	1280
Large round	24-21	1106

NOTE: First number is the thickness in 64ths.

Second number is the width of screen which kernel passed through.

Third number is the width of screen which kernel carried over.

Rounds will plant fewer acres per bushel due to the larger seed size. More food is stored in the rounds giving a healthier plant during the early stages of growth.

To determine the amount of seed corn to buy, divide the planting rate per acre by the number of kernels per pound of seed.

$$\frac{\text{Planting rate per acre}}{\text{Kernels per pound}} = \text{Pounds of seed per acre}$$

EXAMPLE: Plant 20 acres at rate of 18,000 kernels/acre with medium flat seed.

$$\frac{\text{Planting rate } 18,000/\text{A.}}{\text{Medium Flat } 1542 \text{ Kernels/lb.}} = 11.67 \text{ pounds seed per acre planted}$$

$$20 \text{ acres} \times 11.67 \text{ lbs./A.} = 233.4 \text{ pounds of seed}$$

$$\frac{\text{Lb. seed for total As. planted } 233.4}{\text{Lbs. seed per bushel } 56} = 4.167 \text{ bu. of seed needed}$$

WHERE DIFFERENT SEED SIZES OCCUR

 5. "Planting Corn in the Sixties" pp. 11 - 14 Educational Department, De Kalb Agricultural Association, Incorporated De Kalb, Illinois, (price 25¢)

A. Equipment and Materials Needed.

1. A corn planter "planting assembly unit" may be borrowed from a local machinery or seed corn dealer. This unit includes only the hopper plate holder, seed plates, cut off tongue, knocker roller, plate gear, and clutch parts of the corn planter and is used by dealers in helping farmers select seed plates of the proper size. Most John Deere Dealers will have such a seed plate selector stand available. This planting unit is operated by an electric motor.

If such a unit is not available a corn planter could be used in the shop by raising a wheel and operating the planting unit, at the desired speed, by means of an electric motor.

2. Obtain a set of seed plates for the planting unit. Have both 16 cell and 24 cell plates available. Obtain some plastic plates so they can be compared with metal plates. See attached sheet "Plastic Planter Plates" to determine available plastic plates.

Students may bring planter plates from home for checking.

3. Obtain several different grades of seed corn from seed dealers. See Figure 1, "Sizes of Seed Corn."

B. Procedure to follow:

1. Have the class determine the desirable rate of planting for a field of corn. (See section I this outline).
2. Have the class select a grade of seed corn to use in this exercise.
3. Have the class select the seed plate with the cell size and number of cells they think is best adapted to the grade of corn being used.

Reference: Agronomic Tips C - 2, and Agronomic Tips C - 3 Table II.

4. Have the class select the rate of forward travel to be simulated in this exercise.
 - a. Determine whether to use 16 cell or 24 cell plates.
 - b. Set the clutch so that the desired seed plate r. p. m. is obtained to simulate the m. p. h. given in Agronomic Tips C-3, Table I.

Note: At this point the information may be obtained in one of two ways.

- (1) Use the tables provided in this exercise and in the operator's manual you are using, and check the seed plate r. p. m. with a speed indicator. Compare with Table I, Agronomic Tips C-3 for accuracy of setting.
- (2) This provides an opportunity to teach the principles of mathematics involved in relating the speed of forward travel m. p. h. to the r. p. m. of the seed plate.

Optional Suggested Problems:

- (1) If the planter forward travel speed is 5 m. p. h., what is the r. p. m. of the drive wheel?

Circumference of drive wheel = diameter x pi

$5280/C = \text{revolutions per mile}$

revolutions per mile x speed (m.p.h.) = revolutions in 60 min.

revolutions in 60 min. / 60 = r. p. m. of drive wheel

- (2) The speed at which the various units of the planter are driven may be calculated by comparing the relationship between the size of the driving pulley, sprocket, or gear with the size of the driven pulley, sprocket, or gear. The following formula is used:

$$\begin{aligned} \text{r. p. m. of driver} \times \text{diameter or no. of teeth in driver} &= \\ \text{r. p. m. of driven} \times \text{diameter or no. of teeth in driven} & \end{aligned}$$

If any three of these items are known the fourth can be calculated. By applying this formula and following the flow of power from the drive wheel to the seed plate the r. p. m. of the seed plate may be determined.

(The work may be checked by using a speed indicator and comparing with Table I, Agronomic Tips C - 3 for accuracy.)

5. Have the class determine the number of kernels that theoretically should be dropped in one minutes time. (The r. p. m. of the seed plate will be determined by one of the methods outlined in item four above.)

Example: If the planter is set for 20,000 kernels per acre in 40 inch rows using a 16 cell plate and foward travel is 5 m. p. h., the seed plate r. p. m. should be 42.3. Each of the 16 cells will pass the cut off 42.3 times per minute.

$$16 \text{ cells} \times 42.3 \text{ r. p. m.} = 678.8 \text{ kernels in one minute.}$$

Optional: If desired the number of kernels dropped per acre can be figured mathematically. The above example is figured as follows:

$$\text{Row width in ft. } 3.33 \times 5280 \text{ ft.} = 17,582.4 \text{ sq. ft. per ml.} \\ \text{(traveled in 12 minutes at 5 m. p. h.)}$$

$$43,560 / 17,582.4 = 2.48 \text{ miles traveled per A planted}$$

$$12 \text{ min. per mile} \times 2.48 \text{ miles} = 29.76 \text{ minutes per A}$$

$$29.76 \text{ min./A} : 678.8 \text{ kernels per minute} =$$

$$20,201.08 \text{ kernels per A (checks closely} \\ \text{with } 20,000)$$

6. Using the seed corn plate, seed corn grade, and speed selected by the class operate the unit for one minute. Count the kernels dropped and compare with the theoretical number determined in item 5 above.

How many kernels per acre would this represent? (See example in item 5 above.)

7. Demonstrate the effect of seed plate speed (r. p. m.) on accuracy of seed drop.

For this demonstration select the seed plate with the "correct" size seed cells (Part III section 4 this outline) and vary the seed plate speed (r. p. m.) in the trials for an assimulated ground speeds of 3, 5, 7, and 10 m. p. h.

Table 2

Record of the effect of seed plant speed (r. p. m.) on accuracy of seed drop.

Grade of seed corn used _____
 Seed plate cell size _____
 No. cells in seed plate _____

Assimulated Ground Speed m. p. h.	Seed Plate r. p. m.	Theoretical Seed Drop in one minute	Actual Seed Drop in one minute	Percent Theoretical Drop	No. Cracked Kernels	% Cracked Kernels
3						
5						
7						
10						

Note: Data in Table 2 may be plotted similar to charts 8 and 9.

a. Demonstrate how seed plate r. p. m. increases as speed of forward travel increases.

b. Demonstrate how seed plate r. p. m. may be reduced for a given rate of planting by changing from a 16 to a 24 cell plate.

8. Demonstrate the effect of seed plate cell size on the accuracy of seed drop.

For this demonstration select the rate of forward travel to be used (suggested speed 7 m. p. h.) and vary the seed plate cell size from a close fit upward in size (Part III section 4 this outline).

The effect of seed plate cell size on accuracy of drop at different rates of speed can be illustrated by repeating this demonstration at different speeds.

Table 3

Record of the effect of seed plate cell size on accuracy of seed drop

Ground speed m. p. h. _____
 Seed plate r. p. m. _____
 Grade of seed corn _____

Seed Plate Cell Size	Theoretical Seed Drop in one minute	Actual Seed Drop in one minute	No. Cracked Kernels	% Cracked Kernels

Note: Data in Table 3 may be plotted on a graph.

9. Compare accuracy of plastic and cast plates.

10. Demonstrate seed box grading.

a. When cells are too short for grade being used.

b. When kernels are too wide for cell use extra wide kernels for this demonstration such as large flat $13\frac{1}{2} \times 24 \times 21$ or extra large flat $13\frac{1}{2} \times 28 \times 24$. (Turn the seed plate holder groove up to correct this.)

11. Demonstrate the effect of worn parts on accuracy of seed drop by inserting worn cut off tongue and knocker roller.

Planter Plate Selection and Its Effect on Seed Drop Accuracy

Uniform stands and higher plant populations are more certain by selection of the correct planter plate. The seed plate size should be checked for each lot of seed corn, particularly when changing hybrids. Most seed corn has a recommended plate number for each bag of seed. The shape and sizes of the corn kernels vary because of differences in hybrid, fertility levels in the seed field, moisture conditions. The sizes of graded seed corn vary due to the grading procedures of the seed producers.

Kernel length in flat grades of corn is probably the most critical dimension in the selection of a seed plate for proper cell size. Uniformly sized round grades will plant more accurately than flat grades because they have only one general dimension which is the diameter of the kernel.

The edge drop seed plates in Fig. 1 shows three plates each with different cell lengths and the way kernels of the same length fit into the cells. In the top seed plate, the cells are too short for the kernels shown. Many of these kernels will be wedged in the cell and will not be ejected from the cell by the knock-out roller. Some kernels may be cracked or damaged; others will be pushed out of the cell as it passes under the knock-out housing. Each cell failing to drop a viable kernel, or each cell ejecting a cracked kernel, will reduce the stand $6\frac{1}{4}\%$ on each revolution of a 16-cell plate.

The center plate in Fig. 1 shows the proper clearance. The seed cells are $\frac{1}{16}$ " longer than the longest kernels in a seed lot. This will give ample room for the kernels to drop into the cells as the seed plate rotates at a high speed.

The bottom seed plate in Fig. 1 shows what will happen if the seed cells are too long for the kernels to be planted. Often times, a cell can pick up two kernels standing end-wise in the cell. As these pass under the knock-out housing, they may be broken, cracked or pushed out of the cell completely. Extensive testing has shown that as high as 18 to 20% of the kernels are cracked and damaged when excessively large plates are used.

Seed corn is sized for width, thickness, and length of kernels. The width and thickness are very uniform and relatively easy to size with the

GOOD FIT = $\frac{1}{16}$ " CLEARANCE

Cell Too Short

Cell Right Size

Cell Too Long

Fig. 1

Kernel Too Wide Cell Right Length

Fig. 2

present equipment available. The sizing for kernel length is more difficult and time consuming. The variations in kernel length are greater than for either the width or thickness. Most of the seed plates for flat kernels are 20/64" thick to accommodate the kernel width. The cells are from 11/64" to 13/64" wide corresponding to the kernel thickness. The cell lengths range from usually 32/64" to 44/64" long, and each size is usually listed by plate numbers.

The large flat kernels in Fig. 2 are 23/64" wide. In most corn planters these kernels are too wide to pass under the knock-out housing without many of them being cracked or pushed out of the cells. To eliminate this problem, the grooved side of the seed plate holder or false plate should be up or next to the seed plate, allowing these wide kernels to drop into the groove. The depth of the groove varies from 2/64" to 4/64" depending upon the make of planter. The extra clearance in the plate holder groove allows the wide kernels to pass under the knock-out housing with less damage to the kernels.

Matching uniformly sized round grades with the proper seed plate in relatively easy ample clearance can be allowed for accurate cell fill without two kernels fitting into a cell causing excessive cracking. When planting large rounds the plate holder groove may need to be next to the seed plate.

The rotating speed or rpm of the seed plate is a critical factor in a cell fill accuracy of the seed corn plates. The use of 24-cell plates instead of 16-cell plates will reduce the rpm of the seed plate by 33%. The top plate in Fig. 1 has 24 cells. Compare the distance between cells with the 16-cell plates below it. When the rotating speed of the seed plate is reduced, it allows more time for the kernels to drop into the cells and gives greater cell fill accuracy.

Seed box grading occurs when the plate holder groove is in the wrong position or when the cell length is too short, particularly if the seed corn has much more than 4/64" variation in kernel lengths. The smaller kernels are sorted out of the corn in the box, thus permitting a layer of the longer and/or wider kernels to build up in the bottom of the seed box. Repeated refilling of the seed boxes increases the thickness of this layer which causes a reduction in cell fill. This causes a poorer seed drop than anticipated. Seed box grading can be reduced by emptying the boxes after each second or third refill. Save this seed until the seed lot is planted, then select a different plate, if needed, for these larger kernels.

The steps in choosing the proper seed plate for flat grades are:

- 1) Select the seed plate recommended for the seed corn bag
- 2) Pick out several of the longest kernels from a handful of corn
- 3) Fit these long kernels in the seed cell of the recommended plate
- 4) Allow 1/16" clearance for length
- 5) If clearance is greater or less, try another plate
- 6) Adjust plate holder or false plate for proper kernel width
- 7) Check seed drop in prepared seedbed at usual planting speed

Many factors are involved in causing the harvest stands to be lower than planned. Careful selection of the seed plates and using 24-cell plates at reasonable speeds can lead to greater planting accuracy and higher profits.

High Speed Planting Can Reduce Kernel Drop

High-speed corn planting causes reduced seed drop and lower stands even though proper plates are used. Combinations of high planting speed, thick planting rates, and incorrect seed plates frequently decrease the seed drop to below 60% of the planter manual setting. Farmers can accurately determine whether the stand losses are occurring before or after the corn emerges.

On 100 plot locations in the Miami County demonstration program during 1959 and 1960, farmers had a harvest stand of about 25% below the planter setting. The farmers set their corn planters for a 7" seed spacing in 40" rows, driving at about 5 mph or less, using the seed plates recommended for the seed lot planted. The planter setting for this spacing was 22,400 kernels per acre. Stand counts in these plots shortly after emergence showed an average stand of 18,600 plants per acre or 17% less than the planter setting. The harvest stands averaged 16,800 plants or 25% less than the planter setting. Most of the 17% loss is due to the failure of the kernels to drop and only a small portion due to germination.

The rotating speed of the seed corn plate is a most important factor in the accuracy of the seed cell fill. High rpm of the seed plate doesn't allow sufficient time for the kernels to properly fit into the cells. Two factors affect the rpm of the seed plates. Increasing the planting speed and/or increasing the planting rate will increase the rpm of the seed plate. This is shown in Table I.

TABLE I PLANTER PLATE SPEED

MPH	16-cell plate			24-cell plate		
	Kernels per Acre			Kernels per acre		
	12,000 RPM	16,000 RPM	20,000 RPM	12,000 RPM	16,000 RPM	20,000 RPM
3	15.3	20.2	25.4	10.2	13.5	16.9
5	25.4	33.7	42.3	16.9	22.5	28.2
7	35.6	47.1	59.2	23.7	31.4	39.5

The rpm increases as the speed of planting increases as shown by reading down in the columns. Reading across the columns, it will be noted that the rpm of the seed plate increases as the planting rate is increased from 12,000 to 20,000 kernels per acre. Table I also shows that the rpm of the seed plate increases nearly four times when both planting speed and planting rate are increased at the same time, for example, from increasing from 12,000 kernels at 3 mph to 20,000 at 7 mph when 16-cell seed plates are used. This high

speed means that 16 kernels are expected to drop out of the seed corn plates during each revolution. Very careful selection of the seed corn plate is necessary if we expect the corn planter to do an accurate job of planting when we are attempting to drop 16 kernels per second.

This problem of low seed drop in high speed planting can be partially remedied by using 24-cell seed plates. Table I shows that the rpm of the 24-cell plates at any one of the speed rate combinations is approximately 33% less than the rpm of the 16-cell plates. The lower speed gives more time for the kernels to drop into the cells which helps to increase the cell fill accuracy. Field trials were made to determine the extent of the seed drop decrease at three speeds using three seed corn plate sizes with a 4-row corn planter using 16-cell edge drop planter plates. In these trials, a uniformly sized lot of corn (13x21-18) was selected. The variation in length was quite small, 95% of the kernels were within a 4/64" variation.

In Table II the seed corn plate designations are:

- Too short - longest kernels fit snugly for cell length.
- Right length - longest kernels had 1/16" clearance for cell length.
- Too long - longest kernels had 1/8" clearance for cell length.

The planter was set to drop 20,000 kernels per acre. The kernels were caught in the corn planter boot while driven over a measured distance.

TABLE II

KERNELS DROPPED AT THREE SPEEDS USING THREE DIFFERENT SEED PLATES

Cell Length	3 mph	5 mph	7 mph
	Kernel/Acre	Kernel/Acre	Kernel/Acre
Too short	19,500 (3)*	17,500 (4)	11,500 (9)
Right length	20,400 (2)	17,900 (3)	13,800 (10)
Too long	22,500 (3)	22,100 (4)	20,600 (15)

* () % Broken kernels.

The total number of kernels dropped, as shown in Table II, decreased as the planting speed increased. The number of kernels dropped at a given speed increased as the cell length increased. When the right length seed cells were used in these trials, the seed drop decreased about 10% by changing from 3 mph to 5 mph. An additional 20% decrease occurred when the planting speed was increased to 7 mph. The percent of broken kernels, shown in parentheses, increased with both speed and longer seed cells. The planting was very accurate at 3 mph using a seed plate with the correct cell length. In most instances, a 24-cell plate at 5 mph will meter the corn at a comparable rate to a 16-cell plate at 3 mph.

Each year in Ohio, many acres of corn are fertilized adequately for high yields and planted for an intended harvest stands of 16,000 - 18,000 plants per acre. Stands far below this are common at harvest time. Maximum efficiency of the fertility and other management efforts cannot be obtained with low plant populations. Careful selection of the seed corn plates and a planting speed which will insure accuracy of seed drop will increase corn profits.

Agronomic Tips Committee

III. Principles of Corn Planter Operation:

A. Causes of inaccuracy of seed drop.

1. Selection of seed plate with improper cell size.
2. High r. p. m. of seed plate caused by:
 - a. Setting planter to plant more kernels per acre and / or
 - b. Increasing the speed of travel over the fields. (Seed plate r. p. m. is magnified when both speed of travel and rate of planting is increased.)

B. Speed of planting.

1. As the ground speed increases the number of kernels dropped decreases. Chart 8 - "Corn planting speed and its effect on seed drop," High Speed Planting Cuts Corn Yields, Gordon Ryder.
2. Greater accuracy of seed drop occurs at higher speeds when larger cell seed plates are used. Chart 9 - "Corn planting speed and its effect on seed drop," High Speed Planting Cuts Corn Yields, Gordon Ryder.
3. The proper size seed plate should be selected for a given ground speed. Table 11 - "Kernels Dropped at Three Speeds Using Three Different Seed Plates," Agronomic Tips C - 3, Gordon Ryder.
 - a. As speed increases the size of the seed plate cell must also increase to maintain accuracy of drop. The larger cells allow more time for the kernels to fit into the cells.
 - b. As both speed of seed plate travel (r. p. m.) and size of seed plate cells increased the amount of craked corn increased.
 - c. For a given rate of forward travel and planting rate the seed plate r. p. m. can be reduced about 33 per cent by changing from a 16 cell plate to a 24 cell plate.

Table I "Planter Plate Speed," Agronomic Tips C - 3, Gordon Ryder.

As the rate of planting and forward travel are increased from lowest setting to the highest setting the r. p. m. of the seed plate is increased about 4 times.

16 cell plate - 3 mph @ 12,000 kernels per A = 15.3 rpm.
7 mph @ 20,000 kernels per A = 59.2 rpm.

24 cell plate - 23 mph @ 12,000 kernels per A = 10.2 rpm.
7 mph @ 20,000 kernels per A = 39.5 rpm.

4. **Selecting seed plates for proper cell size. R e f e r e n c e s :**
"Planter plate Selection and its Effect on Seed Drop Accuracy,"
Agronomic Tips C-2, Dept. of Agronomy, O. S. U., Gordon
Ryder.

- a. Flat grades of corn are graded in 64ths of an inch for thickness, width, and length with length being the most difficult to grade accurately.

Round grades usually plant more accurately because there is only one general dimension, that is diameter.

- b. Most seed corn companies give recommended plate numbers for each grade of seed. Their tests are usually made at 3 mph with 10" spacing which does not apply to many farm situations.

- c. Matching kernels to seed plate cell size.

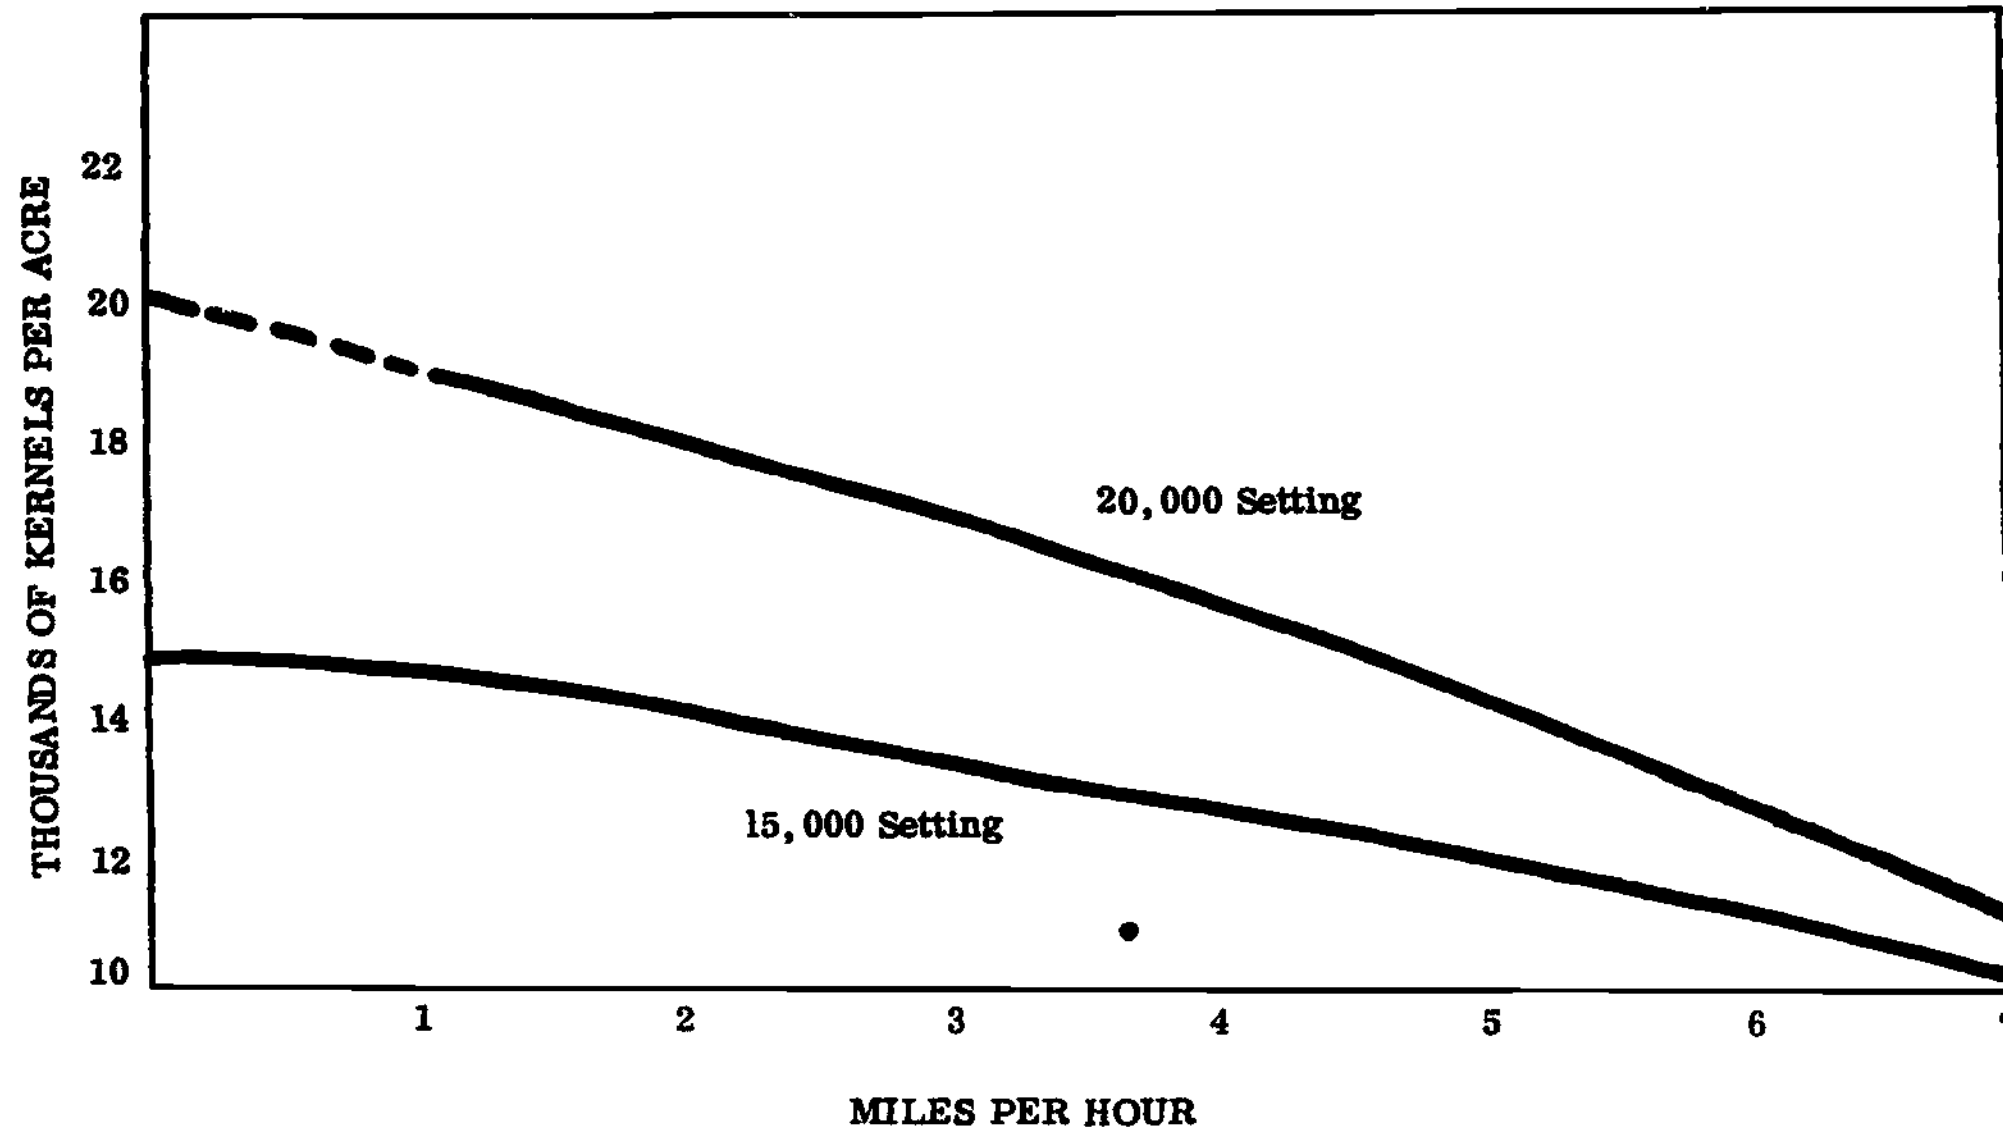

- (1) Too short - kernels wedged in and will not be ejected or will be cracked. Seed box grading will occur. (See Fig. 2.)
- (2) Correct - Cell is 1/16" longer than longest kernel. Kernels have room to drop into cell at high speed.
- (3) Too long - May pick up two kernels standing on end. May be broken or cracked as they pass under knock out housing.
- (4) The plate holder or false plate has a groove 2/64" or 4/64" deep on one side and is flat on the other side.

If kernels are wide the groove side of the seed plate holder should be up to take care of extra kernel width. Seed box grading will occur if the groove is not turned up.

CORN PLANTING SPEED AND ITS EFFECT ON SEED DROP

Planter setting: 15,000 and 20,000 seed drop

Seed plate: $\frac{36}{64}$ " length seed cell

High Speed Planting Cuts Corn Yields, PLANT FOOD REVIEW, by Gordon Ryder

CHART 8

CORN PLANTING SPEED AND ITS EFFECT ON SEED DROP

Planter setting: 15,000 and 20,000 seed drop

Seed plate: $\frac{40}{64}$ " length seed cell

High Speed Planting Cuts Corn Yields, PLANT FOOD REVIEW, by Gordon Ryder

CHART 9

Fig. 2

Seed Box Grading

Seed Plate Cell Length	% Drop At Start With Full Box	% Drop After 1/2 Bu. Had Been Planted
32/64"	99	92
36/64"	100	97

"Corn Planter Problems" G. J. Ryder and W. E. Gill, 24th annual Seed Growers School, Ohio Seed Improvement Association.

There may be seed box grading as the smaller kernels are selected and planted while the longer and/or wider kernels are rejected. A good rule is to empty and keep separate the lower 1/4 of the seed in the box after 4 fillings. A new plate selection may be needed to plant this corn.

IV. Corn Planter Calibration

Reference: Corn Planter Calibration for Highest Yields, AGDEX 111/742 Circular 840, University of Illinois, Urbana, price 10¢ Operator's Manual for planter being calibrated.

Steps	Procedure
1. Check planter parts.	<p>Thoroughly inspect, clean and service planter well ahead of planting time.</p> <p>Look at bottom of hopper. Check the hopper ring, cut off pawl, and knock out pawl.</p> <p>Check the power train from ground drive wheels to the seed plate. Loose or worn parts can affect accuracy.</p>
2. Select proper plant population for fertility level.	(See part I, Table 1 this outline)
3. Read the operator's manual carefully.	<p>The owners manual tells how to adjust the planter for proper operation.</p> <p>Do not exceed recommended speed of operation. (See part I, Table 1 this outline)</p> <p>Check tire pressure if pneumatic tires are used.</p>
4. Match grade of seed to seed plate cell size.	<p>For best results and to avoid damage to seed as it passes through the hopper mechanism the cell fill should be between 100 to 105%.</p> <p>Seed plate r. p. m. will also affect cell size selection. (See part III section B, 4 this outline.)</p>
5. Adjust planter for desired planting rate.	<p>Use the operator's manual and adjust the planter for the planting rate desired. (See part I, Table 1 this outline.)</p>
6. Calibrate in barn lot or roadway before planting	<p>Calibration should be done at planting speed. Leave planter in raised position and engage the seed plate drive with a wire or string. The following table shows the distances to measure for 1/200 A at different row widths and the number of kernels that should be dropped for the different rates of planting. (No. kernels x 200 = kernels per acre.)</p>

Table 4

Row spacing inches	Distance to Drive feet	Kernels to count for planting rates per A of					
		12,000	14,000	16,000	18,000	20,000	22,000
36	72	60	70	80	90	100	110
38	69	60	70	80	90	100	110
40	66	60	70	80	90	100	110
42	63	60	70	80	90	100	110

University of Illinois Circular 840

1. Stake out the calibrating distance.
2. Engage seed plate drive.
3. Start in advance of first stake and drive past 2nd stake at planting speed.
4. Collect and count all kernels from each row. Check against the desired rate and make adjustments if needed. (See part III this outline.)

The different planting assemblies on the same planter may not plant at the same rate. This probably can not be corrected.

Allow a few hundred kernels extra when calibrating since field planting rate will be below calibration rate.

7. Make a field check

Dig out several kernels along the row and estimate the average kernel spacing (Part I, Table 1). Make any adjustments necessary.

The practice of placing fertilizer or insecticides in the ground requires that extra pressure be applied to those units. This pressure may raise the drive wheels and cause wheel slippage which will in turn reduce the rate of planting.

8. Count Emerged Plants and Final Harvest Population

These counts will help determine whether the correct plant population for maximum yields is being planted. The following table will serve as an aid in estimating the stand of corn.

Table 5 How to Check Corn Stands Quickly

To estimate thousands of stalks per acre:

1. Measure the length of row equal to 1/1000 acre as shown in table below.
2. Count the number of stalks and multiply by 1000 to determine the estimated stand per acre. Check several sections of row and take the average.

Row Width inches	Length of Row for 1/1000 A. feet and inches
36"	14' - 6"
38"	13' - 9"
40"	13' - 1"
42"	12' - 5"

American Potash Institute, Inc.

Table 6 How to Determine Field Speed

In planting corn it is important to know how fast you are driving, especially if you are applying granular or liquid chemicals at the same time. You can determine your field speed as follows:

1. Carefully mark off a distance of 176 feet in the field.
2. As you plant, check the number of seconds required to drive between the markers with a stop watch or watch with a sweep second hand.
3. Divide the time in seconds into 120 for speed in miles per hour.

Time to drive 176 feet	Speed - Miles per hour
120	1
60	2
40	3
30	4
24	5
20	6
17	7

INSTRUCTIONAL MATERIALS

Vocational Agriculture teachers have the responsibility of developing curriculum for their local departments. An integral part of curriculum development is planning learning experiences for students. A complete library of instructional materials enables teachers to provide a wide range of meaningful learning experiences.

The materials listed in this catalog have been developed by teachers of vocational agriculture, curriculum specialists, technical specialists, and audiovisual personnel for use in teaching vocational agriculture

The charge for the materials is to provide funds to replace the items as they are sold out. Development costs are not included.

Use the order forms attached to the back of the catalog. A school purchase order or cash should accompany each order.

/mjs

FIELD CROPS Agdex 100

AN AID TO THE IDENTIFICATION OF 60 OHIO PLANTS, Agdex 100/40. Revised 1966, 23 pages. A brief description and illustration of the plants included in the Ohio agronomy and horticulture contests. It is written for student use. Price \$.50.

SOME COMMON CROP AND WEED PLANTS, Agdex 100/40, 1966. A series of 79 color slides with script to accompany the publication "An aid to the identification of 60 Ohio Plants". The series includes overall views of plants as well as close ups of important details. Price \$12.00

FUNDAMENTALS OF PLANT IDENTIFICATION, Student work sheets. Agdex 100/40, 1967, 10 pages. A set of student work sheets designed to familiarize students with the important identifying characteristics of plants. The work sheets should be used with the slide series of the same name and become a part of the student's notebook. Price\$.15

FUNDAMENTALS OF PLANT IDENTIFICATION, Agdex 100/40, 1966. A series of 18 color slides and script which illustrate, by means of sketches, the important identifying characteristics of plants. The student work sheets of the same name should be used with the series. Price \$3.00.

SOME IDENTIFYING CHARACTERISTICS OF 52 OHIO SEEDS, Agdex 100/40, 1965, 16 pages. A brief description and illustration of the seeds included in the Ohio agronomy contest. The publication is designed for student use. Price \$.80.

SOME COMMON CROP AND WEED SEEDS, Agdex 100/40, 1966, A series of 52 color slides and script to accompany the publication, "Some Identifying Characteristics of 52 Ohio Seeds". The series includes close up views of the crop and weed seeds included in the Ohio agronomy contest. Price \$8.00.

SEED PRODUCTION OF SOME COMMON FIELD CROPS, Agdex 100/40, 1966, 65 pages. A student study manual which considers the importance of the seed industry, losses from using poor seed, how plants produce seeds, crop varieties, production of certified seed, and seed laws. Price \$1.75.

SEED PRODUCTION EXAMINATION, Agdex 100/40, 1966. A suggested examination consisting of 48 objective questions that may be used with the publication "Seed Production of Some Common Field Crops". Price \$.10.

RATE OF PLANTING CORN, A Laboratory Exercise, Agdex 111/32, 1963, 31 pages. A laboratory exercise designed to be used with a corn planting unit in the shop to check plate selection and accuracy of drop at different speeds of operation. Information concerning the most effective rate to plant corn is included. Nine full page charts that may be made into transparencies are included. Price \$.50.

CORN ROOT DEVELOPMENT, Agdex 111/20, 1964, a series of 21 color slides with script, developed by Dr. Henry D. Foth, Department of Soil and Dr. Raymond Clark, Department of Agricultural Education, Michigan State University. The slides show the extent of corn root development at different stages of plant growth from the seedling stage to maturity. The soil has been carefully pulled away from the roots and the root pattern photographed. The corn was grown on medium textured soil and yielded well over 100 bushels per acre. Price \$5.50.

MAIZE DWARF MOSAIC, Agdex 111/630, 1965. A series of 24 color slides and script. The slides and script were prepared by Dr. Lansing Williams of the Ohio Agricultural Research and Development Center. The series shows how to identify the disease, how it spreads and the available control measures. A copy of the Ohio Bulletin 460 "Maize Dwarf Mosaic" should be used as an additional reference source by the teacher. Price \$4.80.

HORTICULTURE Agdex 200

LANDSCAPING YOUR HOME - A Teachers' Guide, Agdex 271, 1964, 72 pages. This is a guide to teachers who are starting to teach in a relatively unfamiliar field. The unit includes suggestions to teachers as to methods as well as to the major technical areas to be included. A number of suggested tests and student exercises are incorporated. Price \$1.00.

ESTABLISHMENT AND MAINTENANCE OF LAWNS-A Teachers Guide, Agdex 273, 1965, 59 pages. This unit has been prepared as a guide to teachers. Technical information has been divided into logical areas for teaching. The establishment of new lawns and the maintenance of established lawns is included. Price \$1.00.

CARE AND MANAGEMENT OF LAWNS, Agdex 273, 1965. A series of 41 color slides with script. May be used with the teachers guide "Establishment and Maintenance of Lawns". The series was developed by Dr. Robert W. Miller, Assistant Professor of Agronomy, The Ohio State University. It deals with the following areas of lawn management: Seed selection, seeding, fertilizing, mowing, weed control, disease control, watering, and thatch control. Price \$6.00.

WHAT IS HORTICULTURE? Agdex 200, 1966. A series of 40 color slides and script. The major subject matter offerings in horticulture are described. Student school activities and job opportunities are considered. May be used with groups considering offering horticulture in their school or with beginning students. Price \$6.00.

PRUNING FOR GARDEN BEAUTY, Agdex 275/24, 1966. A series of 21 color slides and script. Prepared by D.B. Lacey, Rutgers. Provides hints for pruning evergreens, flowering shrubs, roses, and trees. Price \$3.25.

FLORICULTURAL CROPS, Agdex 280, 1966. A series of 60 color slides and script. The objective of this slide series is to introduce vocational horticulture students to the major floriculture crops produced in the United States today. Individual crops are discussed briefly as to types and varieties available, some of the specific cultural requirements, and the uses of the plants by the ultimate consumer. Price \$9.50.

FLOWERS FOR GARDEN COLOR, Agdex 280, 1966. A series of 29 color slides and script. Prepared by D.B. Lacey and M.R. Harrison, Rutgers University. Describes how many common flowers may be used to their best advantage in landscape planning. Price \$4.25.

ANIMAL SCIENCE Agdex 400

LIVESTOCK MARKETING, Agdex 400/840, 1966. A packet containing a 128 page manual and about 25 pamphlets and materials order forms. The manual presents a thirty point lesson outline and supplemental references. The pamphlets in the packet provide additional reference materials. Price \$3.65.

DAIRY CATTLE STERILITY, Agdex 410/30, 1965. A series of 45 color slides and script. The slides illustrate both normal and abnormal conditions in the male and female reproductive tracts. The series has been organized into lessons that correspond to the lessons in the Hoard's Dairyman book "Dairy Cattle Sterility". Script prepared by Dr. Harry Barr, Dairy Science, O.S.U. Slides provided by Dr. Barr and Michigan State University Animal Reproduction Laboratory. Price \$6.50.

STEER MANAGEMENT, Resource Unit, Agdex 420, 1964, 81 pages. The unit structures the subject matter for teaching, suggests approved practices, and supplies related information. Price \$.75.

GESTATION LACTATION PERIOD MANAGEMENT of Sows and Gilts, Agdex 440/10, 1966. A series of 23 color slides and script. The slides and script were made available by Dr. R.F. Wilson, Animal Science, O.S.U. The series considers both feeding and management suggestions. It might be used to introduce the unit. Local or other research information may be added as needed. Both animated drawings and actual pictures are used. Price \$3.75.

THE OHIO PORK IMPROVEMENT PROGRAM, Agdex 440/40. Revised 1966. A series of 18 color slides and script. Mr. Wilbur Bruner, Swine Extension Specialist O.S.U. provided the slides and edited the script. The major findings of the Swine Testing Station are presented in the series. Price \$3.50.

HOW MUCH FEED IS REQUIRED TO PRODUCE A POUND OF PORK, Agdex 440/53, 1964, 10 pages. Information gathered from Iowa and Illinois research data. These are seven full page charts suitable for use with the overhead or opaque projector. Price \$.20.

SOILS Agdex 500

CORN FERTILITY PRACTICES IN OHIO (Agronomy Series # 1) Agdex 540, 1962. A series of 49 color slides and script. The slides were provided by the O.S.U. Department of Agronomy Extension Service. The recommended fertility practices for corn are illustrated by the slides. The script provides a brief description of the slides. Price \$7.35.

CORN PRODUCTION PRACTICES (Agronomy Series # 2) Agdex 510, 1962. A Series of 17 color slides and script. The slides were provided by the O.S.U. Department of Agronomy Extension Service. The series briefly covers minimum tillage and rate of planting. The script provides an extensive description of each slide. Price \$2.55

INTERPRETING SOIL TESTS (Agronomy series # 3) Agdex 530, 1962. A series of 65 color slides and script. The slides were provided by the O.S.U. Department of Agronomy, Extension Service. The series discusses the extent of soil testing, liming, sampling, testing, recommendations, and fertility status. The script is brief as many slides are self explanatory. Price \$9.75.

AGRICULTURAL ENGINEERING Agdex 700

CONCRETE MASONRY, Agdex 715, 1962. A series of 55 color slides and script. The series deals with the selection and handling of concrete blocks, preparing mortar, laying blocks, construction practices to insure durable walls, and cement painting. The series was prepared by the Ohio Vo-Ag. Service and the Portland Cement Association. Price \$8.25.

MR. QUALITY CONCRETE, Agdex 715, 1965. A series of 40 color slides. The slides are self explanatory thus no script is provided. The slide series is designed to accompany the Portland Cement Association's "Concrete Technology" instructors guide available from the Portland Cement Association, 33 West Grand Avenue, Chicago, Illinois 60610. Copies have been distributed to Ohio teachers. The slide series is only available through the Ohio Vo-Ag. Instructional Materials Service. Price \$6.00.

COMBINES AND COMBINING, Agdex 745, 1965, 82 pages. A manual structured for student use. It is extensively illustrated by means of line drawings, charts, graphs, and pictures. The subject matter is divided into the following areas. 1. What is the value of doing a good job of combining? 2. The basic design of the combine; 3. The operation of the combine, and 4. The economics of owning a combine. Price \$0.75.

COMBINES AND COMBINING, EXAMINATION, Agdex 745, 1965. A suggested examination consisting of 50 objective questions that may be used with the publication Combines and Combining. Price \$0.10.

COMBINES AND COMBINING, Agdex 745, 1965. A series of 30 color slides and script. The slide series is designed to accompany the manual Combines and Combining listed above. The slides have been selected from several hundred provided by the Allis Chalmers, J.L. Case, and International Harvester Companies. The design of the combine and how adjustments are made is illustrated. Price \$4.50.

EFFICIENT MACHINE HARVESTING, Agdex 745, 1965. A series of 21 color slides. A series of slides developed by Dr. D.M. Byg, Extension Agricultural Engineer in connection with his corn harvesting loss surveys. The results are shown in graphic form on the slides. The Ohio Extension Service publication MM 268 Machine Losses-Corn should be available for teacher reference. This publication has been distributed to Ohio teachers. Price \$3.50.

"MOWERS", Agdex 745, 1966, 58 pages. A student workbook designed to assist students in understanding the principles of cutterbar operation and in applying the knowledge to the operation and repair of the mower. An excellent reference for use with the workbook is "Field Mowers" produced by the American Association for Agricultural Engineering and Vocational Agriculture, Agricultural Engineering Building, Athens, Georgia, 30601. Price \$0.75.

AGRICULTURAL ENGINEERING Agdex 700

CONCRETE MASONRY, Agdex 715, 1962. A series of 55 color slides and script. The series deals with the selection and handling of concrete blocks, preparing mortar, laying blocks, construction practices to insure durable walls, and cement painting. The series was prepared by the Ohio Vo-Ag. Service and the Portland Cement Association. Price \$8.25.

MR. QUALITY CONCRETE, Agdex 715, 1965. A series of 40 color slides. The slides are self explanatory thus no script is provided. The slide series is designed to accompany the Portland Cement Association's "Concrete Technology" instructors guide available from the Portland Cement Association, 33 West Grand Avenue, Chicago, Illinois 60610. Copies have been distributed to Ohio teachers. The slide series is only available through the Ohio Vo-Ag. Instructional Materials Service. Price \$6.00.

COMBINES AND COMBINING, Agdex 745, 1965, 82 pages. A manual structured for student use. It is extensively illustrated by means of line drawings, charts, graphs, and pictures. The subject matter is divided into the following areas. 1. What is the value of doing a good job of combining? 2. The basic design of the combine; 3. The operation of the combine, and 4. The economics of owning a combine. Price \$0.75.

COMBINES AND COMBINING, EXAMINATION, Agdex 745, 1965. A suggested examination consisting of 50 objective questions that may be used with the publication Combines and Combining. Price \$0.10.

COMBINES AND COMBINING, Agdex 745, 1965. A series of 30 color slides and script. The slide series is designed to accompany the manual Combines and Combining listed above. The slides have been selected from several hundred provided by the Allis Chalmers, J.I. Case, and International Harvester Companies. The design of the combine and how adjustments are made is illustrated. Price \$4.50.

EFFICIENT MACHINE HARVESTING, Agdex 745, 1965. A series of 21 color slides. A series of slides developed by Dr. D.M. Byg, Extension Agricultural Engineer in connection with his corn harvesting loss surveys. The results are shown in graphic form on the slides. The Ohio Extension Service publication MM 268 Machine Losses-Corn should be available for teacher reference. This publication has been distributed to Ohio teachers. Price \$3.50.

"MOWERS", Agdex 745, 1966, 58 pages. A student workbook designed to assist students in understanding the principles of cutterbar operation and in applying the knowledge to the operation and repair of the mower. An excellent reference for use with the workbook is "Field Mowers" produced by the American Association for Agricultural Engineering and Vocational Agriculture, Agricultural Engineering Building, Athens, Georgia, 30601. Price \$0.75.

FARMING PROGRAMS Agdex .40

BUDGET FACTS, Agdex .40/22, 1966, 40 pages. The purpose of this publication is to assist students and teachers in developing meaningful budgets for livestock and crop projects. Price \$.40.

VT02175 University of Illinois

College of Agriculture

Vocational Agriculture Service is a division of the College of Agriculture at the University of Illinois. Its primary function is to produce and distribute subject-matter teaching materials for use in agriculture classes at the secondary and post-secondary level.

This catalog lists and describes briefly the various types of teaching materials that are available. Special order forms are also available for each category of materials.

Materials will be sent postpaid at the prices quoted if payment accompanies your order. However, orders are accepted without advance payment from any recognized school or other educational institution. Postage charges will be added to orders that are billed for payment.

Orders totalling less than \$10.00 are normally placed on open account and will be billed when open account charges reach \$10.00 or more. All accounts will be billed at the end of the current school year, regardless of size.

Orders totalling more than \$10.00 will be billed immediately. A receipted statement will be sent with cash orders of 25¢ or more.

Telephone orders will be accepted. Our telephone number is Area 217, 333-3870.

Our goal is to fill all orders within 24 hours after they are received. We will notify you when orders have been shipped. Please let us know promptly if your order does not arrive in good condition or if you have complaints of any kind.

ANIMAL AND DAIRY SCIENCE MATERIALS

SUBJECT-MATTER UNITS

Subject-matter units are prepared for student text and reference material. They are printed, 8½" x 11", illustrated, and punched for standard 3-ring notebook. Each unit carries a VAS number, as 1001. Units that have been revised have a letter following the number, as 1001a. Date of issue or revision is coded in letters on the last page. E-FG, for example, is 5-67 (May 1967).

<u>Unit Number</u>	<u>Title</u>	<u>Price per Copy</u>
1001a	Caring for the Sheep Breeding Flock, 8 pages	\$.10
1002a	Artificial Insemination of Livestock, 8 p..10
1003	Selecting and Purchasing Sheep, 8 p..10
1004	Diseases of Sheep, 12 p.15
1005	Internal Parasites of Sheep, 8 p.10
1006	External Parasites of Sheep, 8 p.10
1007	Capons and Caponizing, 8p.10
1008a	Making the Butterfat Test, 8 p.10
1009	Improving Animals Through Breeding, 16 p.20
1010	Producing Beef Cattle from a Beef Breeding Herd, 8 p.10
1011	The Ewe and Her Lamb, 8 p.10
1012	Buying and Feeding Beef Cattle, 12 p.15
1013	General Facts on Livestock Feeding, 8 p.10
1014	Poultry Lice and Mites, 8 p.10
1015	Internal Parasites of Poultry, 8 p..10
1016	Baby Chicks, 8 p.10
1017	Culling the Laying Flock, 8 p..10
1018	Minerals for Livestock, 8 p.10
1019	Judging Livestock, 24 p.30
1020	Feeding Dairy Cows, 12 p.15
1021	Raising Dairy Calves, 8 p.10
1022	Raising Dairy Heifers and Bulls, 8 p.10
1023	Classes and Grades of Livestock, 12 p.15
1024	Beef Cattle Breeds, 12 p..15
1025	The Cow's Udder and How it Functions, 12 p.15
1026	Digestion in Animals, 8 p.10
1027	Feeding Lambs, 8 p.10
1028	Managing the Dry Dairy Cow, 4 p..05
1029	The Swine Enterprise, 8 p.10
1030	Keeping and Usine Swine Records, 8 p..10
1031	The Sheep Enterprise, 4 p.05
1032	Castrating, Docking, and Dehorning, 8 p.10
1033	Selecting and Purchasing Hogs, 8 p.10
1034	Caring for the Swine Herd During Breeding and Gestation, 4p.05
1035	Cattle Grubs, 4 p.05
1036	Feeds and Feeding Swine, 12 p.15
1037	Caring for the Sow and Litter at Farrowing Time, 8 p..10
1038	Feed Additives, 8 p.10
1039	Systems of Swine Breeding, 8 p.10
1040	Selecting, Feeding, and Caring for Light Horses, 16 p.20
1041	Caring for the Brood Mare and Foal, 8 p.10

SLIDE FILMS

Slidefilms are 35 mm. single-frame, for use with a standard filmstrip projector. No separate syllabus is required as all of the text is included on the frames. Those that are in color are so marked on the list below. Unmarked slidefilms are in black and white. Slidefilms are available on a sale basis only.

<u>Film</u> <u>Number</u>	<u>Title</u>	<u>Price</u> <u>Each</u>
100	Selecting Beef Breeding Animals	\$1.70
164-61	Breeds of Swine	1.50
166-64	Selecting Breeding Hogs	1.50
181-65	Identification of Kinds of Meat (color)	2.30
182-65	Identification of Pork Cuts (color)	3.00
*182-65 (Supp.)	Practice Set for Identification of Pork Cuts (color)	2.70
183-65	Identification of Beef Cuts (color)	3.15
*183-65 (Supp.)	Practice Set for Identification of Beef Cuts (color)	2.85
185-65	Identification of Lamb Cuts (color)	2.45
*185-65 (Supp.)	Practice Set for Identification of Lamb Cuts and Variety Cuts (color)	2.55
206-65	Testing Milk for Butterfat	1.15
208	The Cow's Udder and How it Functions	1.15

*Practice sets consist of series of pictures shown in the companion slidefilms for use in practice work in teaching students to identify cuts. They are intended only as supplements to the identification films.

PROGRAMMED INSTRUCTION SERIES

These are sets of multiple-choice questions based, for the most part, on VAS units or other subject-matter materials. They are designed for use with the Rapid Rater (see Miscellaneous Materials), although they may be used by marking in a conventional way. Each set is in a package of 20 identical copies, all on the same subject.

<u>Item</u>	<u>Price</u> <u>per Package</u>
101 Selecting and Purchasing Hogs	\$.25
102 Caring for Sheep Breeding Flock25
103 Artificial Insemination of Livestock25
104 Cattle Grubs25
105 Feeds and Feeding Swine, Part 125
106 Feeds and Feeding Swine, Part 225
107 Making the Butterfat Test25

ANIMAL AND DAIRY SCIENCE MATERIALS (continued)

SCRAMBLED BOOKS

Scrambled books are programmed like a teaching machine. The student reads some information, reacts to a statement, and is directed to a certain page if he considers the statement true or to another page if he thinks the statement false. If his choice is correct, he is directed on; if incorrect, he is sent back. Scrambled books are based on VAS units or other subject-matter materials and are normally used only as supplementary teaching material.

<u>Item</u>	<u>Price</u> <u>Each</u>
101 Digestion in Animals	\$.15
102 Improving Animals Through Breeding.15

OTHER MATERIALS

Approved Practices for Swine. This is a 5-page publication which lists specific practices successful swine producers follow. It may be most useful to students in planning and carrying out their supervised farming programs where swine are involved. Price \$.05 per copy.

Meat Judging and Grading. This 32-page, 8½" x 11" publication discusses beef, pork, and lamb judging and carcass grading. It describes the retail cuts listed in the National Contest Rules. The score cards used in the national and state contests are shown in the back. Price \$.30 per copy.

Judging Milk, Sediment Discs, and Milker Unit Heads. This 8-page, 8½" x 11" publication discusses quality in milk, the steps in judging it, and how to score sediment discs and milker unit heads. Score cards used in the state and national contests are shown in the back. Price \$.15 per copy.

Visuals. These are 8½" x 11" instructional illustrations printed on heavy paper. They are for making transparencies for overhead projection, for use with an opaque projector, or for direct viewing. Each set is contained in a manila pocket folder with the title of the series stamped on the flap. Available sets are:

- Beef Visuals - (Set of 5) Price \$.25
- Dairy Visuals - (Set of 5) Price \$.25
- Meat Visuals - (Set of 19) Price \$.60
- Sheep Visuals - (Set of 7) Price \$.30
- Swine Visuals - (Set of 11) Price \$.40

OTHER MATERIALS

Analysis Charts and Tabulation Sheets. The charts are used for comparing students' productive enterprise results with class averages. The tabulation sheets provide a convenient means for computing these averages. Each package contains analysis charts sufficient for 10 students with crop and 10 with livestock enterprises, 5 sample charts filled in for a swine enterprise, and 5 tabulation sheets each for crops and livestock. Price \$.35 per package.

Farm Lease Reports

Livestock-Share Tenant's Farm Report to Landlord. This is a pad of 25 blank forms, in duplicate, that can be submitted monthly or for periods longer than a month. Price \$1.25 per pad.

Crop-Share Tenant's Farm Report to Landlord. This is a pad of 15 blank forms, in duplicate, considered to be a three-year supply for a crop-share tenant. Price \$1.25 per pad.

Farm Management Manual and Related Materials

Farm Management Manual. This 24-page publication provides budgeting information for use in a short-cut procedure for comparing alternate crop and livestock systems in determining which ones are the most profitable. Price \$.30 per copy.

Income Possibilities on Your Farm. This is a form for use by students or adult farmers in comparing alternate crop and livestock systems to determine the best long-time system for a farm. Price \$.30 per pack of 10 forms.

The Use of the 'Income Possibilities' Form. This is an illustration on how to use the Income Possibilities form. It illustrates how to use it for three different crop and livestock plans for a given farm situation. Price \$.60 per pack of 10.

Farm Record Materials

Illinois Farm Record Book, Parts I and II. This is a two-part record book developed by the department of Agricultural Economics for widespread use by Illinois farmers. Part I contains receipts and expenses, inventories, and farm business analysis information. Part II contains depreciation and net worth forms. Parts I and II are sold together. Price \$1.25.

Problem for Use with Illinois Farm Record Book. This is a set of transactions for a farm for student use with the Illinois Farm Record Book. After records have been entered and summarized, students can make an analysis of the farm business. Price \$.60 for a pack of 10 problems.

Key for Farm Record Problem. This is essentially a reproduction of parts of the Record Book filled in with information from the problem. It also shows results for the analysis measures provided by the Record Book. The key is normally for teacher use although some use keys in quantities for adult classes. Price \$.50 per copy.

OTHER MATERIALS (continued)

Financial Planning Materials

Farm and Family Financial Budget Form. This form is also known as a "cash flow budget." It provides space for anticipated cash income and expenses for each month, both for farm business and family living items. Price \$.30 per pack of 10 forms.

Farm and Family Financial Planning Problem. This problem provides information on monthly cash receipts and expenses for a 430-acre farm with steers and hogs as the main livestock enterprises. These figures are used for filling out the financial budget form. Price \$.15 for pack of 10.

Your Net Worth Statement. This form provides space for recording net worth information for five years. Price \$.30 for pack of 10.

Set of Budget Sheets. This 5-page set of budget sheets provides space for completing an annual operating budget -- crop production and crop costs, crop usage and feed requirements, livestock, and inventory-repair-replacement and improvement. Price \$.50 for pack of 10.

Mechanics of Farm Budgeting. This is a 28-page manual that explains and illustrates the use of all of the above forms. It also contains a key for the financial planning problem. Price \$.30 per copy.

Machine Costs. This 2-page item helps in determining machine charges in connection with crop enterprises in students' farming programs, or in other problems involving machinery costs. The material is mostly based on detailed cost data from Farm-Bureau Farm-Management farms. Price \$.15 for pack of 10.

Use
FARM
MANAGEMENT
MATERIALS
order form

Partial Budget Materials

Partial Budgets and Break-Even Problems. This 8-page item provides information and practice problems for preparing four partial budgets for adding livestock or machinery to the farm business. The break-even problems help determine the number of acres at which machine ownership is more economical than hiring custom work. A key is included which shows completed budgets and problem results. Price \$.80 for pack of 10 problems and 1 key.

Budget Forms. This 4-page set of 4 blank forms is for use in working the problems. They can also be used with VAS 2036, Simplifying Farm Work, or VAS 2039, Fitting Machinery and Equipment to the Farm. Price \$.40 for 40 forms (10 sets of 4 forms each).

Planning Your Farm Business. This 28-page booklet provides a method of working out plans for a farm and making income and cost estimates. It can be used separately or in conjunction with VAS units 2001-2007 and 2010-2015. Space is provided for drawing soil maps and providing related information. The book is suitable for students or adult farmers. Price \$.30 per copy.

Standards for Measures of Efficiency. This 6-page item is prepared in December each year, based on results obtained by about 6,500 farmers in the Illinois Farm-Bureau Farm-Management Service. Physical measures from previous years are used and dollar values are assigned according to current prices. Teachers can use these standards for comparing students' results or those of adult farmers enrolled in classes on record keeping. Price \$.60 per pack of 10.

AGRICULTURAL MECHANICS MATERIALS

SUBJECT-MATTER UNITS

Subject-matter units are prepared for student text and reference material. They are printed, 8½" x 11", illustrated, and punched for standard 3-ring notebook. Each unit carries a VAS number, as 3001. Units that have been revised have a letter following the number, as 3003a. Date of issue or revision is coded in letters on the last page. E-FG, for example, is 5-67 (May 1967).

PROGRAMMED INSTRUCTION SERIES

These are sets of multiple-choice questions based, for the most part, on VAS units or other subject-matter materials. They are designed for use with the Rapid Rater (see Miscellaneous Materials), although they may be used by marking in a conventional way. Each set is in a package of 20 identical copies, all on the same subject.

<u>Item</u>	<u>Price per Package</u>
301 Small Engines, Part 1	\$.25
302 Small Engines, Part 225
303 Farm Surveying, Part 125

AGRICULTURAL MECHANICS MATERIALS (continued)

OTHER MATERIALS

Electrical Materials

Applying Electrical Controls in Farm Production. This 10-page publication contains the basic subject-matter material for student use with the electrical controls kit. Principles of various types of manual and automatic control devices are explained and illustrated. Price \$.10

Student Exercises. A total of 17 exercises for student use with the electrical controls kit are stapled together. Questions are asked with space provided for answers. Directions and wiring diagrams are given which guide the student in assembling and testing the various exercises. Price \$.25.

Electric Motors for Farm Use. This 30-page, 8½" x 11" publication was prepared as a text and laboratory guide to accompany the electric motor kits. Some of the illustrations are in color. It explains the principles of electric motors, their selection, use, maintenance, testing, connecting and reversing. Price \$.45.

National Electrical Code, 1965 edition. This 433-page book, published by the National Fire Protection Association, is the standard for safety in electrical wiring. It is a valuable reference for use in teaching the various phases of electricity. Price \$1.00.

Field Notes for Surveying. This is a student field book for use in recording student notes in surveying. Price \$.15.

Plans

Plans for bolt rack, tool cabinet, and revolving device. This is a set of 3 drawings on 11" x 17" paper. They are for use in constructing these three items of shop equipment. Price for set of 3 is \$.20.

Welding Plans. This is a set of 39 plans, each on 8½" x 11" paper, stapled together, for welding projects. Most are for items of shop equipment and were submitted by teachers as useful projects for students to make. Price \$.40.

Safety Materials

Charts on Safety Rules for Power Tools. These are printed in two colors on 8½" x 11" heavy paper, plastic laminated on both sides, and punched for hanging near the power tool to which they apply. Each chart lists 10 important safety rules for students to observe in using the particular tool. Separate charts are available for each of the following: Arc Welder, Band Saw, Drill Press, Grinder, Jointer, Oxyacetylene Welder, Portable Electric Saw, Radial Arm Saw, and Tilting Arbor Saw. Price \$.25 each.

Safety Glasses. Two types of shop safety eye-protection devices are available. The spectacle type is of approved safety glass with side shields. The plastic face mask type is of soft, clear plastic with a replaceable lens. Prices: spectacle type, \$3.75; plastic face mask type, \$1.50; replacement lens for plastic face mask, \$.65.

OTHER MATERIALS (continued)

Student Tests on Shop Safety. This is a set of 20 student tests of 10 questions each based on VAS 3022, Safety in the Agricultural Mechanics Shop. Each test deals with a specific machine or tool. There is also a sheet of suggestions to the teacher and a page for the student to sign that he has received instruction in shop safety and that he has passed a written test on each machine that he uses. Price per package of 10 sets (for 10 students), \$1.25.

Small Engine Tools These are special small engine repair tools that are difficult to obtain. The complete set contains five tools, as follows:

Magnetic key inserter - for use in removing and replacing valve spring pins or other keepers. Price \$2.30.

Piston ring compressor - for use in replacing the piston in a small engine. Price \$2.25.

Piston ring expander - for use in removing the rings from a piston and in replacing them. Price \$3.00.

Hand valve grinder - for use in lapping valves with grinding compound. Price \$3.50.

Valve lifter and spring compressor - for use in removing and replacing valves in a small engine. Price \$5.45.

Price of the entire set of tools is the sum of the above figures, or \$16.50.

Tool Holders. These are gripper type clamps that can be used to hold most small tools in a cabinet or on a tool panel. They are available in two sizes. Prices: small \$.07 each; large \$.08 each.

Visuals These are 8½" x 11" instructional illustrations printed on heavy paper. They are for making transparencies for overhead projection, for use with an opaque projector, or for direct viewing. Supplementary information for use by the teacher as he projects the drawing are contained on the back of each visual. Each set is contained in a manila pocket folder with the title of the series stamped on the flap. Available sets are:

<u>Small Engine Visuals</u>	- (Set of 98)	Price \$2.65
<u>Oxyacetylene Welding Visuals</u>	- (Set of 73)	Price \$2.00
<u>Spray Painting Visuals</u>	- (Set of 50)	Price \$1.35

CROP AND SOIL SCIENCE MATERIALS

SUBJECT-MATTER UNITS

Subject-matter units are prepared for student text and reference material. They are printed, 8½" x 11", illustrated, and punched for standard 3-ring notebook. Each unit carries a VAS number, as 4001. Units that have been revised have a letter following the number, as 4002a. Date of issue or revision is coded in letters on the last page. E-FG, for example, is 5-67 (May 1967).

<u>Unit Number</u>	<u>Title</u>	<u>Price per Copy</u>
4001	Collecting and Preparing Soil Samples for Testing, 4 pages	\$.05
4002a	pH Test for Soil Acidity, 8 p.10
4003a	P ₁ and P ₂ Soil Tests for Phosphorus, 8 p.10

SCRAMBLED BOOKS

Scrambled books are programmed like a teaching machine. The student reads some information, reacts to a statement, and is directed to a certain page if he considers the statement true or to another page if he thinks the statement false. If his choice is correct, he is directed on; if incorrect, he is sent back. Scrambled books are based on VAS units or other subject-matter materials and are normally used only as supplementary teaching material.

<u>Item</u>	<u>Price Each</u>
401 Corn Production--As a Part of Your Farming Program. . . .	\$.20
402 Producing Oats15

OTHER MATERIALS

Approved Practices These are 4-page publications which list specific practices followed by successful crop producers. They are useful to students in planning and carrying out their supervised farming programs involving crops. They are available for the following crops:

- Approved Practices for Alfalfa - Price \$.05 per copy
- Approved Practices for Corn - Price \$.05 per copy
- Approved Practices for Oats - Price \$.05 per copy
- Approved Practices for Soybeans - Price \$.05 per copy
- Approved Practices for Wheat - Price \$.05 per copy

CROP AND SOIL SCIENCE MATERIALS (continued)

OTHER MATERIALS (continued)

Demonstrations on Weed Control This is a series of demonstrations for student use to show the effect of herbicides on weed control. All except Number 4 contain the essential items needed to set up the demonstration. Each one provides full directions for carrying out the demonstration and observing the results. They are as follows:

1. The Effect of Pre-Emergence Herbicide on Weed Growth - Price \$.25 ea.
2. The Effect of Post-Emergence Herbicide on Weed Growth - Price \$.25 ea.
3. The Effect of 2-4D on Broad Leaved Plants in Lawns - Price \$.25 ea.
4. Checking and Calibrating Farm Sprayers - Price \$.05 ea.

Land-Use Selection Cards. These are 5½" x 8" cards, printed on both sides, for use in Land-Use Selection contests. The information on them is based on Ill. Circular 758, "Understanding Soils." Land-use selection cards are available in packages of 25 cards (five boys on a team to judge five holes). Price \$.30 per package.

Munsell Color Book. This set of standard color charts in a soft, black loose-leaf binder is used to determine soil colors. It is available in two forms:

Kit Form. This includes the color charts, color chips to be glued on, and the notebook cover. Price \$5.25 each.

Assembled Book. This Munsell Color Book is completely assembled, ready to use. Price \$6.95 each.

pH Kit. The complete kit includes ¼ pound of pH powder, plastic wash bottle, instruction sheet, color chart, 1-gram measuring spoon, 2 vial racks containing 24 vials, and a metal carrying case. It can be used for making indicator pH tests of soils in the laboratory or in the field when soil is not too wet to plow. Price \$8.00 each.

Replacement pH Powder. In ¼ pound lots, sufficient to make about 100 tests. Price \$2.50 per ¼ pound.

Soil-Testing Spoons. These are copper spoons, double end, 1 and 2½ grams. Price \$.65 each.

Soil-Test Report Forms. This is a set of 6 forms for use in testing soil, recording results, and interpreting soil tests. The set includes one each of the following: Soil Test Form A; Soil Test Form B; D-1 Soil Test Report; D-2 Using the Results of Your Soil Acidity Test for Lime; D-3 Phosphorus--Maps and Interpretations; D-4 Potassium--Maps and Interpretations. Price \$.10 per set of 6 forms.

Subject-Matter Packet -- Corn Production. This is a collection of more than 30 publications on Corn Production, assembled in a manila pocket folder. This material may be handed out as it is discussed, and should make an extensive library on corn for a student or adult farmer. A teacher's guide is included with each order. Price \$2.50 per packet.

Visuals These are 8½" x 11" instructional illustrations printed on heavy paper. They are for making transparencies for overhead projection, for use with an opaque projector, or for direct viewing. Supplementary information for use by the teacher as he projects the drawing are contained on the back of each visual. Each set is contained in a manila pocket folder with the title of the series stamped on the flap. Available sets are:

- Weed Control Visuals - (Set of 36) Price \$1.00
- Weed Identification Visuals - (Set of 33) Price \$.95

Use

MISCELLANEOUS MATERIALS

Calendar of Events: This is a set of 8½" x 11" monthly calendars, printed on heavy paper, punched for easy hanging. Space is provided at each date for recording events. There is a sheet for each month, September through August. Price \$.20 per set.

Careers

Tape Recordings on Careers in Agriculture. These are 1200 ft. tapes for a standard tape recorder. The subjects and other information about each are as follows:

Careers in Agriculture, 25 minutes, 7½ ips.

Choosing a Career in Agronomy, 25 minutes, 7½ ips.

Choosing a Career in Ornamental Horticulture, 25 minutes, 7½ ips.

Junior College Programs in Agriculture in Illinois, 35 minutes, 3 3/4 ips.

The price of each tape is \$4.50 on a new tape; or \$2.00 if you send in your own tape for dubbing.

Programmed Instruction Series. This is a set of multiple-choice questions on the importance of agriculture and careers in this field. The questions are designed for use with the Rapid Rater (see Miscellaneous Materials), although they may be used by marking in a conventional way.

No. 501 Let's Look at Agriculture - Price \$.25 per package of 20 copies.

Cumulative Record Books for Foundation Awards

These record books were developed by the Illinois Foundation FFA for members to use in their improvement project programs. Completed books are submitted as official entries in the Foundation Award Fields listed below:

<u>Agricultural Electrification</u>	- Price \$.12 per copy
<u>Agricultural Mechanics</u>	- Price \$.12 per copy
<u>Beautification</u>	- Price \$.12 per copy
<u>Safety</u>	- Price \$.12 per copy
<u>Soil and Water Management</u>	- Price \$.12 per copy

Flannel Board Materials

Flocked Paper. This is a high-quality material that can be cut and attached to items you wish to use on a flannel board. It has a pressure-sensitive side for attaching to the display item and a rough texture that clings well to flannel. It is available in lots of two sheets, each 15" x 20". Price \$1.70.

Suede Paper. This is an economical material for making flannel board items. One side of the paper is rough and will adhere to the flannel surface. The other side is white and will accept ink, chalk, gummed letters or felt pen. It is available in 27" width and any length desired. Price \$.30 per yard.

Judging Materials

Illinois Scoring System Cards. This set of three 7" x 10" cards may be used to score any 4-place judging ring. The bottom card gives scores, divided into columns according to spacing between pairs. The top cards are "window" or "cut-out" cards, divided into columns according to placings, one card by numbers 1-2-3-4, and the other by letters A-B-C-D. To use the system, you match the top card and bottom card together according to correct placing and official spacing between pairs, and read off the scores directly on a basis of 100 points possible. Price \$.20 per set.

Hormel Computing Slide. The 4" x 6" plastic holder and nine inserts may be used for scoring any 4-place judging ring. By selecting the proper insert cards and assembling them correctly, the scores of all possible placings show through. This computing slide differs from most other systems by considering the closeness of the whole ring as well as placing and spacing between pairs. Scores are on a basis of 50 points possible. Price \$2.75 ea.

Judging Cards and Supplies. Placing, grading, and identification IBM cards are available for judging contests, classroom or practice work in 7 colors -- salmon, green, yellow, pink, blue, manila, and brown. Registration forms, scoring cards, judges placing cards, summary sheets, are furnished without charge with a judging contest card order. Price of cards is \$3.00 per 1,000.

Parliamentary Practice Materials

MISCELLANEOUS
MATERIALS
order form

Guide to Parliamentary Practices. This is a 58-page, 5½" x 8½" publication which is essentially a condensed version of Robert's Rules of Order. It was prepared to assist FFA officers and as basic text material in preparing parliamentary procedure contest teams. Price \$.30 per copy.

Beginning Steps in Parliamentary Procedure. This 13-page multilith is supplementary to "A Guide to Parliamentary Practices." It is essentially an outline of "steps up the ladder" for each main type of parliamentary action, with blanks for students to fill and questions to answer. A key to the correct answers is given on the last page. Price \$.10 per copy.

Scrambled Books on Parliamentary Procedure. Scrambled books are programmed like a teaching machine. The student reads some information, reacts to a statement, and is directed to a certain page if he considers the statement true or to another page if he thinks the statement false. If his choice is correct, he is directed on; if incorrect, he is sent back. These scrambled books are based on "A Guide to Parliamentary Practices."

- No. 501 Parliamentary Procedure--Presenting and Voting Motions - Price \$.15 ea.
- No. 502 Subsidiary Motions - Price \$.20 ea.
- No. 503 Incidental Motions - Price \$.15 ea.
- No. 504 Privileged and Unclassified Motions - Price \$.15 ea.

Rapid Rater. This is a punch-board device for use with the Programmed Instruction Series questions or any set of multiple choice questions with not more than 4 choices. The device can be used with up to 80 questions, coded to 8 different orders of correct answers. The student knows when he has answered each question correctly and a paper insert records the number of wrong efforts he makes in arriving at the correct answer. Price \$4.00 each.

Insert sheets for Rapid Rater. These are available in packages of 25, cut to correct size with space to identify student name and subject. Price \$.06 per package.

Replacement templates for Rapid Rater. These are not needed until original templates are lost or damaged. Complete set is a pair -- Coded 1-4, and 5-8. Price \$.35 each or \$.70 per pair.

Pressboard Covers. These are 9" x 11½" binders for use with 8½" x 11" punched materials. Each binder has a metal fastener and a blank label. Price \$.30 each.

/ Available Instructional Materials, - Tentative Revision 5/2/67

Administrative Handbook, Basic Philosophy - Teacher education materials. Excerpts from the administrative handbook which apply to vocational education are cited and commented upon.

Practical Nursing Job Analysis - (one sheet) chart form job analysis for practical nursing.

Opportunities in Off-Farm Agricultural Occupations - a brochure designed for counselors, parents, and prospective students in the area.

Electricians Fabrication Process and Technology, Revised - a series of assignment sheets and other instructional materials including some job sheets which deal with general sheet metal practices as applied to chassis construction and sheet metal work in electronics fabrication.

Basic Mathematics for Electronics - this is a course outline which includes both the instructors materials and the student assignment sheets.

Basic Vacuum Tube and Transistor Theory for Electronics - a third level course in a series of electricity electronics courses. It includes an instructional outline and student assignment sheets which structure the course.

Basic Vacuum Tube and Transistor Application for Electronics - this is a companion outline to the theory presentation. The theory is applied by a series of laboratory assignment sheets.

Basic AC-DC for Electronics - this instructors outline and compilation of student assignment sheets outline a basic course in electronics. It precedes the basic vacuum tube and transistor theory and application courses.

Laboratory Jobs for Electricians - assignment sheets for lab work.

Blueprint Reading for Metal Trades - a series of assignment sheets for related materials in the machine trades.

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

Carpentry, Building Trades Area - a rather complete instructional outline encompassing a curriculum guide, instructional sheets and other materials sufficient for day trade classes. The materials can also be used in apprenticeship training programs as related instructional materials.

Drafting Transparencies - a series of transparency masters which are intended to be selected by the instructor and used wherever applicable in a drafting class. There are no assignment sheets and the masters are not structured in any way, suggesting that they are used as supplementary or reference materials.

Check into Distributive Education - a brochure intended to describe the program and attract students. Basically for counselors, parents, supervisors, and other interested persons.

Career in Vocational Practical Nursing for High School Students - a brochure describing the practical nursing program - for use with counselors, parents, and students.

Cooperative Office Education - brochure describing the program. For counselors, students and parents.

Electronics Symbols - this is a series of sheets duplicated for teachers who wish to make schematic diagrams by scissors and paste technique.

Pipefitter Maintenance, Related Instruction for Apprentice - adapted from the University of the State of New York materials. A schedule of apprentice training.

Related Bench and Machine Operations - a series of assignment sheets and questions keyed to several textbooks to be used for machine shop training related instruction.

Metal Trades Technical Math - a rather comprehensive treatment of the related math necessary for machine shop training from common fractions through right angle trig.

Arc Welding - assignment sheets covering technical information related to arc welding.

Metallurgy and Heat Treating - a series of individual assignment sheets covering assigned reading and reference materials.

Welding, Blueprint Reading for Welders - a series of assignment sheets concerned with the symbols and typical notations on drawings containing welded assemblies.

Oxy-Acetylene Welding - a series of assignment sheets covering the related technical information for gas welding.

Precision Measurement - a comprehensive instruction manual including technical information, assignment sheets, and exercises for precision measurement. To be used in conjunction with machine shop training programs.

Machine Drafting, Geometric Tolerancing - a series of plates and technical information pertaining to dimensioning and tolerancing in machine drafting.

Power Mechanics in Industrial Arts - a teachers guide outlining the technical content and teaching student activities concerned with this course. Text references, audiovisual materials and other teaching aids are also part of the outline.

Pipefitter Related Instruction - adapted from the University of the State of New York. This is an apprenticeship schedule of related instruction for pipefitters. (5 - year program)

Optical Lens Grinder Apprentice - Related Instruction - materials obtained from the University of the State of New York which outline an apprenticeship schedule for a 4-year training program.

Coordinator's Manual for General Related Study Guides - this is a teachers manual for DCE. They are stocked in quantity as a standard item.

General Related Study Guide, DCE - a student manual for the DCE program. Stocked in quantity.

Indiana Vocational Acts - this is an historic treatment of the vocational acts, their significance with the various amendments. It does not include recent legislation. Primarily for teacher education.

Manpower Development Training Program - Evansville, Indiana - this is a statement of policy position, responsibilities, and so forth having to do with a specific program at Evansville. For Reference Center use only.

Projects Exchange Material - Made especially for day trade vocational machine shop program. A series of projects (prints) for use in machine shop program. A standing committee reviews and revises the material.

Shop Details for Proposed Area Schools, 1964 - this is a compilation of shop layout for area schools as of this date.

**1960 Report, Leadership Development Conference
1961 Report, Leadership Development Conference - workshop bulletins designed to accompany a special presentation designed to extend some of the benefits of the national leadership development conference to local personnel. Of reference value only.**

Baker Apprentice Related Instruction - A schedule of the related instruction for baker apprentice representing the required 144 hours per year for a 4-year period.

Machine Trades Grinding and Heat Treating - this is a compilation of related technical information. The publication also contains some suggested projects. The prints of data instruction for the manipulative part of the course.

Industrial Technical Mathematics I and II - This is a series of assignment sheets and instructor information for the topic noted.

Organizing and Conducting Programs in Agricultural Sales and Service Occupations - This is directive type publication from the state office personnel indicating the trends and desirable direction of programs in the agricultural field.

Distributive Education, Cooperative Study and On-the-Job Training Program for In-School use Designed to Attract and Prepare Young People for Careers in Merchandising, Marketing, and Management in Distributive Occupations - this is also a directive manual prepared by the state office personnel, distributed to teachers in Indiana as guidelines and direction for establishing programs in distributive education.

Basic Hydraulics - a course outline consisting of 11 sessions. The material is adapted from those produced by Racine Hydraulics and Machinery, Inc., Racine, Wisconsin.

"How It Operates" - a brochure describing DCE

Introduction to Fluid Power - a course outline for an introduction to fluid power with educational materials list. Materials reproduced from the National Fluid Power Association.

Instrument Making - A proposed course of study for a three year program.

Shop Trigonometry - Basic trigonometry course presented by means of students assignment sheets.

Progress Report - DCE in Indiana 1960 - Of historic and reference value only.

Related Technical Information: Turret Lathes
Shapers
Drill Press
Milling Machines
Grinders
Technology

Analyzing the Instructor's Job - Job instruction manual written by Dr. Yoho.

Leather Technology and Shoe Repair - A complete course outline and course materials for the service trade associated with shoe repair.

Film Bibliography for Printing - Note: This has not been brought up to date.

Tape Controlled Machines - Technical information for the Pratt & Whitney Co. Model A, Tape-o-matic Numerically Controlled Drill.

Manpower Projections & Training needs Forecast to 1975 for the Terre Haute Area - An RCU Report.

Business and Office Education - A directive statement from the State Office of Education which outlines business and office education training and designing an intensive lab.

Indiana State Plan for Vocational & Technical Education

Machine Trades Individual Progress Records Analysis Charts

Legislation for Vocational Education - Does not include recent legislation; revision planned.

Electrician's Blueprint Reading and Sketching - Assignment sheets for blueprint reading in electricity.

Basic Electronic Science - A series of lesson outlines for electronics which could be applied to electronics servicing or electronic-technical programs.

Carpenter Apprentice - Related Instruction
Pressman Apprentice - Related Instruction
Painter & Decorator Apprentice - Related Instruction
Electro-Plater Apprentice - Related Instruction
Oil Burner Mechanic Apprentice - Related Instruction
Electrical Lineman Apprentice - Related Instruction

Job Analysis Cards - Trade, Operation, Information, Guidance, Evaluation

INSTRUCTIONAL MATERIALS FROM MISSOURI
CURRICULUM MATERIALS LABORATORY

Available through
Department of Industrial Education
University of Missouri
Columbia, Missouri
February 1, 1967

SECTION I. INSTRUCTIONAL MATERIALS FOR COOPERATIVE CLASSES

Description: The GENERAL RELATED STUDY GUIDE (student's manual) includes instructional materials common to and essential in the occupational adjustment of all young workers, organized into assignments for individual and group study. It is intended that each student in the class should have a copy of this manual. The COORDINATOR'S MANUAL for the General Related Study Guide includes a list of references needed, suggested extra assignments for advanced students, lists of visual aids for use in teaching the various units, and an objective test, with key, covering each assignment outlined in the student's manual.

Each STUDY GUIDE FOR SPECIFIC OCCUPATIONS (student's manuals) includes an analysis showing what the worker must know and be able to do, and the personality traits essential for success in the occupation, with assignment sheets containing learning activities, references, and objective type questions for individual study. The teacher's keys for these specific occupational materials include answers to questions in the student's manual and page numbers where answers are found in the references assigned. They are intended to enable the coordinator to check accurately and quickly the student's work in the classroom.

Note: Order all materials by full title shown (Specify if key is desired) SEE HOW TO ORDER--LAST PAGE

SECTION II. INSTRUCTIONAL MATERIALS FOR PREPARATORY CLASSES (Student Manuals and Instructor's Guides)

Description: The following materials are designed for group instruction in day and evening classes in vocational-technical education. The Student's Manuals are designed to be issued to the individual student as a study guide for technical and related information. The Instructor's Guides are designed with a source of reference for the discussion questions, suggested instructional aids and other helpful instructional devices (some include unit tests).

Where Group Instruction is designated it is intended that such study guides should be used with a large group or class in guiding class

discussion. There is a corresponding study guide in Section I which is correlated with the Group Instruction study guide that may be used for providing an objective type examination covering the identical content of each respective assignment.

Note: Order by full title as shown. (Specify if Instructor's guide is desired)

<u>Title</u>	<u>Publication Date</u>	<u>Price of Student's Manual*</u>	<u>Price of Instructor's Guide*</u>
***41. Auto Mechanics Group Instruction	1966	\$1.50	\$1.50

45. Merchandising Group Instruction	1966	1.50	.50
***46. Salesmanship Group Instruction	1966	1.50	.50

SECTION III. COMPREHENSIVE COURSES OF STUDY (For Instructors' Use Only)

Description: Unless otherwise stated, the following courses of study are designed as teachers' guides and include a detailed analysis of instructional units texts and references keyed to assignment sheets, suggested evaluation procedures and sample tests, suggested facility, equipment lists, instructional aids and devices, films and supplementary references. These are intended to be used in preparatory and in-service classes in industrial education.

<u>Title</u>	<u>Publication Date</u>	<u>Price</u>
47. Applied Electricity	1964	\$2.00
48. Design Drafting (for title III G.B. technical classes)	1966	2.00
49. Electronics Technology (for title III G.B. technical classes)	(Available Fall 1967)	
50. Materials Testing (course out- line only--for title III G.B.)	1963 (limited copies free)	
51. Water and Sewage Treatment	1963	2.00

How to Order:

Orders should be sent to the DEPARTMENT OF INDUSTRIAL EDUCATION, UNIVERSITY OF MISSOURI, COLUMBIA, MISSOURI. Send an official order stating full title (specify if key or Instructor's guide is desired), and the instructional materials will be forwarded. A statement for such material is sent to you at the time the material is shipped, for which prompt remittance is expected. Such remittance should be returned directly to the University Cashier's Office, 123 Jesse Hall, Columbia, Missouri.

*** See Section I for study guides designed for individual instruction for objective tests corresponding to the "Group Instruction Material."

PUBLICATIONS PREPARED BY
BUREAU OF INDUSTRIAL EDUCATION

Published by California State Department of Education

PRICES EFFECTIVE SEPTEMBER 1, 1966

Orders for publications should be addressed to:

California State Department of Education
Sacramento, California 95814

Purchase orders without remittance will be accepted only from public agencies. However, in billing for such orders, the California State Department of Education can use only its own invoice forms; it cannot fill out special invoices or voucher forms from the ordering agency. All other orders, including those from student book stores, must be accompanied by remittance. Books cannot be returned for refund or exchange.

The sales tax of 4 percent must be added to the prices quoted here on all orders to California locations, except orders for resale, which should be marked "For Resale" and should show the resale permit number.

The courses of instruction for the various apprenticeable trades are planned so as to require that each apprentice have both a workbook and testbook plus a reasonable number of reference books. Therefore, an equal number of workbooks and testbooks should be ordered at the same time.

Orders for examinations will be accepted only from schools or from authorized agencies, and must be on official purchase order or stationery.

The following publications designed for apprentice training programs are available free of charge to schools using California instructional materials. Requests for these should be addressed to Instructional Materials, State Department of Education, Sacramento, California 95814.

1. Answer sheets for both testbooks and final examinations. These should be requested on official request forms supplied by Instructional Materials or official school stationery. Either should be signed by the school official responsible for the apprentice training program.

2. A publication entitled Introduction to the Teaching of Classes for Apprentices, which explains in detail how the instructional material is to be used.

ERIC

THE INSTRUCTIONAL MATERIALS PUBLICATIONS

Contains Descriptions - of instructional materials developed by the Instructional Materials Laboratory, Trade and Industrial Education Service, College of Education, The Ohio State University, Columbus, Ohio.

Type Of Materials - The materials contained in this booklet have been designed to aid both the instructor and learner. They consist mainly of lesson plans or informative materials for the instructor and assignment sheets for the learner. Also included are two complete text books.

Using The Materials - In general, the organization of the class will govern how these materials will be used. In cases where enrollment is enough to warrant individual classes, and group instruction methods can advantageously be used, the Instructor's Manual becomes an indispensable aid. It should, however, be kept in mind that all classes will be made up of persons who possess varied individual differences and it is, therefore, poor teaching to rely entirely upon group instruction methods. For this reason, each member of the class should be supplied with a Learner's Manual so as to assist with individual learning.

When the class is composed of several years or levels of training, the instruction should be taught mainly on an individual basis and the old "country school house" method should be used. For such instruction, the Learner's Manual becomes the important aid. This does not imply that there is no place for using group instruction techniques. On the contrary, the class should be brought together as a group for points of common and general interest. For this purpose, the Instructor's Manual will undoubtedly be found to be of great value.

Order Information

ORDERS SHOULD BE PLACED WITH:

Instructional Materials Laboratory
1885 Neil Avenue
The Ohio State University
Columbus, Ohio -- 43210

Remittance should accompany all individual orders.

CHECKS OR MONEY ORDERS SHOULD BE MADE TO:

THE INSTRUCTIONAL MATERIALS LABORATORY

Shipping directions should be given indicating whether material is to be sent parcel post, express, or freight.

ALL CURRENCY SENT BY MAIL AT SENDER'S RISK

Order forms are included in the last pages of this catalog.

Bricklaying

BRICKLAYING - Learner's Manual - BRLM-1
(49 individual assignments and reviews,
approximately 1st and 2nd years work)

This manual has been designed to assist the instructor with the teaching of related technical knowledge for the bricklaying trade. It has been especially constructed for related apprenticeship training and includes the first two years of related instruction. It will be of assistance when using group instruction methods, and of even greater value when using individual instruction procedures.

Comprehensive objective reviews or tests are spaced periodically throughout the manual to provide a "check" on individual progress and ability.

The manual contains such assignments as: Apprenticeship; Safety; The Story of Brick; Fundamentals of Brickwork; Properties of Mortar and Mortar Joints; Layout; Bricklaying Trade Terms; Foundation Walls; Freehand Drawing; Bonding; Tile; Block; Cornices; Cleaning Brickwork; Blueprint Reading; Mathematics; etc.

BRICKLAYING II - Learner's Manual - BRLM-2
(39 individual assignments and reviews,
approximately 3rd and 4th years work)

The Learner's Manual is designed to cover approximately the 3rd and 4th years of apprenticeship instruction. There are numerous reproductions and drawings and photographs intended to help the student.

This manual contains such assignments as: Stonework; Cornices; Efflorescence; Moisture Proof Walls; Steps; Principles of Brick Fireplaces; Chimneys; Spiral Columns; The Ellipse; Glass Block; Masonry; Art in Brickwork; Brick Veneer; Rolo Courses; Arches; Blueprint Reading; Mathematics; etc.

BRICKLAYING - Answers - BRA-1
BRICKLAYING - Answers - BRA-2

Electricity

BASIC ELECTRICITY - Instructor's Manual - ELIM-1
(38 separate related lessons, 12 individual jobs, approximately 60 hour course)

A complete course in the form of lesson plans designed to aid both the related and shop instructor in the presentation of the principles of basic electricity. Each lesson is complete in itself and incorporates the introduction, presentation, application, and follow-up steps of good teaching. Basic experiments for group or individual demonstration are used throughout. This manual is an invaluable aid when teaching in-school, trade extension, or apprenticeship groups. Course covers only the necessary basic principles needed.

BASIC ELECTRICITY - Learner's Workbook - ELLM-1
(38 individual assignment sheets and 12 job sheets)

Individual assignments designed to give the learner a thorough understanding of basic electricity. The material is so organized that it can be used in conjunction with the instructor's manual for group instruction or it can be used by itself for individual instruction. It contains such assignments as: The Complete Circuit; Paths For The Electric Current; Sources of Electrical Energy; Frictional Or Static Electricity; Resistance In Conductors; Ohm's Law; Controlling Current By Resistance; Heating Effect Of Current; Safeguarding The Circuit; The Simple Cell; The Dry Cell; Connecting Cells; Magnets And Magnetic Fields; Electromagnets; etc.

BASIC ELECTRICITY - Experiment Manual - ELEX-1

A series of simple but highly important experiments designed to accompany the basic electricity course. These experiments can be utilized to give either individual or group demonstrations. A list of needed equipment, none of which is difficult to obtain, is contained at the start of the manual. Each experiment is correlated with the lesson plans or the learner's manual so as to assure a thorough understanding of the subject.

Electricity

(Continued)

BASIC INSTRUCTIONAL UNITS FOR THE ELECTRICAL TRADE - ETIM-2

This manual contains a suggested course outline for basic electricity and basic electronics. It is designed to aid the instructor in developing a more complete course of study in these areas. In addition to the course outline it contains suggested jobs and problems which should be supplemented by additional and alternate jobs designed to meet local needs.

Residential Wiring

RESIDENTIAL WIRING - Learner's Manual - ELLM-7 (37 individual assignments, including 5 reviews and a general review)

This manual is a part of a series of instructional materials which has been developed in the field of electricity and electronics. The series consists of materials which will aid both the instructor and the learner in the presentation and mastery of related technical information.

The assignments cover the following subjects: Safety; History of Electricity; Apprenticeship Standards and Electrical Standards; Basic Principles and Measurements; Overcurrent Devices; Wiring Branch Circuits and Service Entrances; Adequate Wiring, Lighting, and Motors; Exercises embracing various types of Installations; House Wiring and Farm Wiring. A number of Review Sections are provided at various appropriate points during the course and the last assignment provides a final review.

This book is recommended for related instruction for the training of apprentices as well as for a unit of work for the in-school electrical trade program.

RESIDENTIAL WIRING - Answers - ELA-7

This answer book has been compiled for use with the Residential Wiring Learner's Manual. Answers to all assignment questions are contained in this publication. The assignment sheets in the answer book are numbered to correspond to the assignment sheets in the Learner's Manual.

Electronics

ELECTRONICS - Learner's Manual - ELLM-14

A learner's manual for the teaching of basic electronics including assignment and work sheets. It is based on the well-known text Industrial Electricity, by Nadon and Gelmine, published by the D. Van Nostrand Book Company. It is desirable that learners have a knowledge of basic electricity before taking this course. Basic Electricity, Learner's, Instructor's, and Experiment Manuals, Ohio Trade and Industrial Instructional Materials Laboratory, are recommended.

Electric Lineman

ELECTRIC LINEMAN TRAINING

A series of printed, plastic bound manuals developed cooperatively by Ohio Electrification personnel and Rural Electrification Job Training and Safety Instructors throughout the nation. The manuals were edited by a Committee consisting of past presidents of the National Rural Electrification Job Safety and Training Conference.

ELECTRIC LINEMAN TRAINING, SERIES 100 - Learner's Manual - ELTL-8

The Series 100 Manual includes forty-five basic job training procedures and fifty-four assignment sheets. Emphasis is placed on safe working procedures.

ELECTRIC LINEMAN TRAINING, SERIES 200 - Learner's Manual - ELTL-9

The 200 Series Manual includes fifty-five job training procedures and fifty-six assignment sheets. Safety is stressed throughout the manual.

ELECTRIC LINEMAN TRAINING, SERIES 300, Learner's Manual - ELTL-10

The 300 Series Manual includes twenty-one job training procedures and twenty-nine assignment sheets. This manual is designed to cover the more advanced jobs and technology of the line craft.

ELECTRIC LINEMAN TRAINING, SERIES 400 - Learner's Manual - ELTL-11

The 400 Series Manual includes thirty job training procedures and forty-one assignment sheets on line craft skills, essential technical information and safe working practices in order to qualify for a lineman first class and for a foreman to effectively supervise line craft work.

Answer books are made available for each series as they are published.

ELECTRIC LINEMAN TRAINING, SERIES 100 - Answer Book - ELTA-8

ELECTRIC LINEMAN TRAINING, SERIES 200 - Answer Book - ELTA-9

ELECTRIC LINEMAN TRAINING, SERIES 300 - Answer Book - ELTA-10

ELECTRIC LINEMAN TRAINING, SERIES 400 - Answer Book - ELTA-11

Radio

UNDERSTANDING RADIO - Instructor's Manual - ELIM-5 (25 units of instruction)

A manual to give the instructor an abbreviated lesson plan when using group instruction methods for the teaching of a course in radio. The lessons are correlated with the assignment sheets found in the Learner's Manual, and a combination of both will greatly aid in the teaching of both shop and related information for the radio trade. The manual includes a list of reference reading for each lesson. A series of "guide posts" for effective presentation calls attention to visual aids and models, and lists the assignment sheets which will aid in the mastery of each lesson. A valuable aid when using the group instruction methods of teaching in-school or trade extension or apprentice groups.

UNDERSTANDING RADIO - Learner's Manual - ELLM-5

This manual consists of 60 individual assignments which make up a beginning course in radio. Each assignment covers a fundamental, easily understandable lesson and is correlated with the Instructor's Manual. The material is excellent for individual as well as group instruction use. It will be found of value when instructing school, trade extension, or apprenticeship groups.

Hydraulics

BASIC HYDRAULICS - Learner's Manual - HYLM-1

Basic Hydraulics, Learner's Manual, has been developed to meet an expressed need for basic training materials for the training of maintenance personnel and others involved with the use of hydraulics. The need for such a manual was made known by a number of industries through the Statewide Instructional Materials Advisory Committee.

A Statewide Hydraulics Curriculum Committee was organized to study the need further and to plan an approach. As a first step, an outline was developed of the recommended topics to be covered in a basic hydraulics course. All available training materials were then collected and reviewed by the committee in light of the outline. After thorough study of available materials, the committee decided that a course could be organized around the three basic texts listed in the manual.

The manual contains nearly 100 pages and has twenty-five assignments based on available text materials. It also contains hydraulic symbols and a glossary of terms.

BASIC HYDRAULICS - Answer Book - HYL A-1

The Basic Hydraulics Answer Booklet has been fabricated for use with the Basic Hydraulics Learner's Manual. The answers to all assignment questions found in the Learner's Manual are contained in this booklet and assignment sheets are numbered to correspond with those in the Basic Hydraulics Learner's Manual.

Machine Trades

The following machine trades learner's manuals are designed so as to aid either group or individual instruction. They consist of a series of assignment sheets which take the student in easy, progressive steps from the simple to the complex. Each assignment lists several up-to-date texts as reference material, any one of which will satisfactorily supply the required information for completion of the questions.

These manuals are excellent for in-school related work, apprenticeship and trade extension type training.

MACHINE TRADES I - Learner's Manual - MTLM-1 Revised 1965

This manual covers the following trades: Bench Work; Drilling Machine Work; Engine Lathe Work; Turret Lathe Work; and Power Saw Work.

Numerous reproductions of drawings and photographs are provided to help the student, in the belief that "one picture is worth a thousand words."

A comprehensive objective review, or test, follows each unit to provide a "check" on individual progress and ability.

MACHINE TRADES II - Learner's Manual, Second Edition - MTLM-2 (153 assignments)

This manual is a companion volume to Machine Trades I. The Learner's Manual MTLM-2 contains the following trade areas: Shaper Work; Milling Machine Work; Planer Work; Grinder Work; Metallurgy; Heat Treating; and Gears and Gearing.

MACHINE TRADES - Answer Book - MTA-1

MACHINE TRADES - Answer Book, Second Edition - MTA-2

These answer books have been compiled for use with the Machine Trades I and Machine Trades II Learner's Manuals. Answers to all assignment questions are contained in these publications. The assignment sheets in the answer books are numbered to correspond to the assignment sheets in the Learner's Manuals.

JIGS AND FIXTURES - Learner's Manual - MTLM-3 (29 assignments)

This manual covers elementary design as it applies to the designing of simple jigs and fixtures. Plates are furnished for the learner's drawing of each assigned jig or fixture. This manual is recommended for both group and individual instruction methods.

Machine Trades

(Continued)

BASIC INSTRUCTIONAL UNITS FOR THE MACHINE TRADES - MTIM-4

This course outline has been produced as an instructional aid for adult and in-school instructors to be used in conjunction with MACHINE TRADES I & II, LEARNER'S MANUALS. The manual contains titles of preparatory steps; basic and supplementary operations for manipulative work; titles of assignment sheets for basic and supplementary items of trade technology; and suggested progress chart headings for manipulative work.

MACHINE TRADES JOBS AND JOB SHEETS

The following 100-Series and 200-Series jobs progress from the simple to the complex and cover the complete range of basic operations in the machine trade. The material consists of drawings for the job and job sheets which provide detailed information about the job. The drawings are printed on a vellum type paper so that blue prints can be made for shop use.

This material is an excellent aid for the teacher in the manipulative phase of the vocational machine trade course. Jobs may be purchased individually in the 100-Series and 200-Series or in bound sets.

100- Series - Machine Trades Jobs and Job Sheets.

A bound set of twenty-four Series 100 jobs - MJJS - 100.

These jobs are selected for first year students in the vocational machine trade course. Bound copies are recommended for instructor use only and the drawings should not be removed from the bound copies due to difficulty in replacing them. Order individual copies for student use, or for purposes of reproduction for student use.

► Prints are available for these jobs, but job sheets are not included.

Machine Trades

(Continued)

200-Series - Machine Trades Jobs and Job Sheets.

A bound set of twenty-six Series 200 jobs - MJJS - 200

The Series 200 Jobs consist of 26 advanced machine trade jobs suitable for second year students in the vocational machine trade course. Bound copies are recommended for instructor use only and the drawings should not be removed from the bound copies due to difficulty in replacing them. Order individual copies for student use, or for purposes of reproduction for student use.

- Information regarding castings for these jobs may be secured by writing the Instructional Materials Laboratory. These make excellent advance production type jobs.

- ▶ Prints are available for these jobs, but job sheets are not included.

Plumbing

PLUMBING I - Learner's Manual - PLLM-1 (59 individual assignments, approximately 1st, 2nd, and 3rd years' work)

The purpose of this manual is to aid the instructor and learner in the teaching of related information for the plumbing trade. It is so designed as to enable instruction to be given on an individual or group basis, depending upon the make-up of the class. There is no instructor's manual to accompany this material, however, the assignment sheets themselves can be used as the instructor's guide when group instruction methods are used.

The manual contains such assignments as: Laws and Regulations Governing Apprenticeship Training; Trade Safety; Municipal and Private Sewage Disposal; Sewer and Pipe Materials; Joints in Clay and Iron Pipe; House Sewers and Drains; Wiping Joints and Lead Work; Kinds and Uses of Soil and Waste Pipe; Traps Used in Plumbing Systems; Code; Ventilation of Plumbing Systems; Blueprint Reading; Mathematics; etc.

PLUMBING I - Answers - PLA-1

PLUMBING II - Learner's Manual - PLLM-2 (51 individual assignments, approximately 4th and 5th years' work)

A continuation of Part I with the emphasis placed on blueprint reading, shop work, and residential hot water heating.

Contains such assignments as: Taking Off Quantities; Wiping Joints and Lead Work; Sketching; Using Specifications; Practical Problems; Boilers, Steam Radiator and Coils; Vapor Heating; Vacuum Systems; Pumps; Valves; Unit Heaters; Hot Water Heating Systems; Forced Hot Water Systems; Radiant Heating; etc.

TENTATIVE OUTLINE OF A COURSE OF STUDY IN PLUMBING SHOP PRACTICE - PLCO-1

This course of study was prepared as resource material for instructors of plumbing apprentices in the building trade. It is intended for indentured apprentices engaged in the plumbing trade and working for a recognized plumbing contractor. It cannot be considered as final and complete and is always subject to change.

TENTATIVE OUTLINE OF A COURSE OF STUDY IN PLUMBING TECHNOLOGY - PLCO-2

The specific objectives of this course are as follows: (1) to develop an understanding of the principles related to the operation of pumps, levers, pulleys, machines, forces, etc.; (2) to develop the ability to solve the technical, mathematical, and science problems of the trade; (3) to develop the ability to interpret the plumbing regulations and to apply the provisions of the code in a practical way when put on the job.

SERVICE

OCCUPATIONS

Fire Service Training

FIRE SERVICE TRAINING - Textbook - FT-2

This is a textbook designed to give necessary information for the training of competent volunteer and paid fire fighters. There are over four hundred pages with over 500 illustrations and charts showing and explaining proper fire fighting tactics, procedures and evolutions. This book is designed and used as the text for the statewide thirty-six hour basic and the advanced fire service training course. However, it will be found to be a valuable reference book for anyone who deals with the fighting of fires, and is used by many for self-study and improvement.

The contents of this manual include: Community Fire Defense; Chemistry of Fire; Classification and Use of Fire Extinguishers; Water as Used in Fire Fighting; Fire Hydrants; Standpipe and Hose Systems, Sprinkler Equipment and Automatic Alarms; Fire Pumps; Fire Hose; Tools and Equipment; Rope in the Fire Service; Ladders; Gas Masks; Advance Information, the Alarm; Size-Up; Forcible Entry; Rescue; Exposures and Confinement; Fire Extinguishment; Ventilation; Salvage; Overhaul and Pick-up; Care of Apparatus, Driving Suggestions, the Run; Post-Mortem Conference; Fire Detection and Arson Investigations; Radiation Hazards; Inspections.

FIRE SERVICE TRAINING - Instructor's Manual - Basic Course - FTIM-2

Contains twenty-six detailed teaching guides for the basic course and is keyed to the Fire Service Training textbook. These teaching guides will serve as a plan for the instructor when utilizing the group instruction method. This manual is an indispensable instructional aid to both the experienced and new instructor and is correlated with the above mentioned textbook.

FIRE SERVICE TRAINING - Learner's Workbook - Basic Course - FTLM-2 (26 assignments)

These 26 assignments break the Fire Service Training textbook down into easily understandable lessons. an excellent aid for individual or group study, as well as preparing for promotional exams, for this specialized subject. Each of the assignments may be thought of as a "digestible" part of learning easily comprehended by the average person. Excellent for DEPARTMENT and BRIGADE basic training, class study, of self-study and improvement when used with the above mentioned textbook in the basic training course.

Emergency Victim Care And Rescue Training

EMERGENCY VICTIM CARE AND RESCUE TRAINING - Textbook - EVCR

Revised 1965

A major revision of a previous publication, this text reflects the most recent medical findings about closed heart compression, artificial respiration, maneuvering auto accident victims onto backboards, and other new materials. This edition is over 300 pages with 404 illustrations. Medical aspects were thoroughly reviewed by physicians who are experts in their various specialties. Many emergency rescue procedures have been added, and materials which appeared in the original edition have been amplified.

Chapter titles for the revised manual are as follows: Emergency and Rescue Vehicles; Equipment; Personnel; Operations; Safe Driving Practices; Controlling the Situation; Childbirth; Common Squad Emergencies; The Mentally Disturbed Patient; Resuscitation; Oxygen Therapy; Closed-Chest Heart Compression; Use of Backboards; Rescue Carries and Drags; Aerial Ladder Rescue Procedures; Forcible Entry; Gas Masks; Electrical Emergencies; Cutting Torches; Rope and Rigging; Shoring and Tunneling; Waterfront Operations; Unusual Situations; Records and Reports; Post Mortem Conferences; Legal Aspects.

Custodial Training

CUSTODIAL TRAINING - Learner's Manual - CTLM-1

The Custodial Training Learner's Manual has been designed to give building custodians a better understanding of many of the problems involved in providing adequate building services. It brings together, in an organized program, many ideas, practices, and suggestions which have been used with success in various parts of the country. These have been collected from numerous magazine articles, conference reports, proceedings of professional organizations, professional literature, and from reported experiences of qualified people in this field.

The materials contained in this manual will serve as an up-to-date source of information covering the practices and techniques of building care. The content of this manual is adaptable for the training of custodians in any type of building, whether it be an office, school, industrial establishment, institution, hotel or public building.

This manual contains 165 pages, including a bibliography. The chapter on Work Schedules covers the routine jobs and the frequency each of the 15 major areas should be cleaned. Sample work schedules covering the 15 areas are included. Fifteen blank work schedule handouts are bound into the back of each manual to be used as work sheets by the custodian trainee in planning his own work schedule.

Law Enforcement Officer Training

LAW ENFORCEMENT OFFICER TRAINING, BASIC COURSE - UNIT I,

Learner's Manual - LELM - I

This manual is designed for use in the Law Enforcement Training Program of the Ohio Trade and Industrial Education Services which is to provide the law enforcement officer with the skills and technical knowledge essential in carrying out his duties. It provides the necessary learner instructional material which will serve as an up-to-date and comprehensive source of information, covering the practices and techniques of the following procedures: Acquiring and Maintaining Uniform; Patrolling On Foot - Daytime - Nighttime; Patrolling In An Automobile - Daytime - Nighttime; Handling Misdemeanors Witnessed By Officer; Handling Misdemeanors Not Witnessed By Officer; Handling Felonies; Handling Traffic Violations; Handling Traffic Accidents; Arresting; and Testifying in Court. The manual contains practices which have proven successful in organized training programs in various sections of the country.

LAW ENFORCEMENT OFFICER TRAINING, BASIC COURSE - UNIT I,

Instructor's Manual - LEIM-I

This instructor's manual contains the teaching guides for each of the training procedures contained in the Learner's Manual, Basic Course - Unit I, and also the training procedures. The teaching guides have been developed to serve as a teaching plan and to provide additional aids and methods for instructing the course. This manual is an indispensable aid to the new instructor and of great help to the experienced instructor in guiding the instruction.

LAW ENFORCEMENT OFFICER TRAINING, BASIC COURSE - UNIT II,

Instructor's Manual - LEIM - II

This manual contains the teaching guides for each of the training procedures contained in the Learner's Manual, Basic Course, Unit II.

LAW ENFORCEMENT OFFICER TRAINING, BASIC COURSE - UNIT II,

Learner's Manual - LELM - II

This manual is designed for advanced training in the areas covered by Basic Course, Unit I.

School Bus Driver Training

SCHOOL BUS DRIVING - Learner's Manual - SBLM-I

This School Bus Driving manual has been designed to give drivers a better understanding of the many responsibilities involved in providing safe and economical pupil transportation services. It brings together, in an organized program, many ideas, practices, and suggestions, which are being used in other parts of the country. Numerous manuals, conference reports, and professional literature, were reviewed for ideas and discussions were held with many experienced people in the field of pupil transportation.

The intent of this manual is to provide the necessary instructional material, which will serve as an up-to-date source of driver information and proper procedures necessary for driving a school bus.

NURSING PROCEDURES FOR THE PRACTICAL NURSE - Learner's Manual - NPPN-1

Nursing Procedures For The Practical Nurse is a learner's manual designed to assist in the teaching of those principles of nursing which are normally the responsibility of the practical nurse. It has been developed by a representative committee of coordinators and instructors of practical nurse programs, who are experienced in formulating efficient methods of nursing education.

With over 100 illustrations, this 497-page manual contains 81 procedures and 68 assignment sheets. Each assignment sheet serves as a study guide covering the corresponding procedure(s) and the most essential information in the assigned references. The manual is organized to provide effective instruction in the pre-clinical and clinical phases. It will also be very useful for reference and review by the practical nurse after she is employed and for use in refresher courses. An individual progress record sheet provides an aid in keeping an accurate record of each student's assignment sheet progress.

This manual is an invaluable aid and timesaver for the instructor, and will improve the program of instruction in the training of practical nurses.

NURSING PROCEDURES FOR THE PRACTICAL NURSE - Answer Book - NPA-1

NURSING ARTS PRACTICE - NALM-1 (64 topics)

A manual of basic nursing procedures for students in nurse's aide training programs. Each procedure sheet gives: purpose, equipment needed, a step by step breakdown of the procedure, and important points to remember. These procedure sheets have been developed over a period of years by the Cleveland Public Schools Practical Nurse Staff and the Cleveland Hospital Council. Manuals are printed and plastic bound.

HOSPITAL HOUSEKEEPING INSTRUCTOR'S GUIDE - HHIG-1

This is a manual of procedures for developing an organized training program for hospital housekeeping personnel. It is equally adaptable for establishing training programs in housekeeping in any type of institution or organization. It contains 43 job breakdowns relating to housekeeping, sections on setting up an instructional program, general instructions and sample forms and reports to be used in the training program. The guide can be used for individual or group instruction. In addition to training new personnel, this guide will prove valuable in raising the proficiency level of an existing staff of housekeepers.

HOSPITAL HOUSEKEEPING TRAINING PACKET - HHTP-2

As an aid for instruction, sample reports and forms in the Hospital Housekeeping Instructor's Guide are available in blank form. A packet of these consists of 10 copies each of the Skill Inventory and Classroom Record, and 50 copies of the Individual Employee Record, an adequate supply for a staff of fifty.

AND
PROGRAM
EVALUATION**

Research and Program Evaluation

FACILITIES AND EQUIPMENT FOR TRADE AND INDUSTRIAL PROGRAMS - 1966 - MIS-19

This manual provides boards of education, school administrators, vocational directors and supervisors of Trade and Industrial Education and others responsible for the initial planning of trade and industrial facilities, with authoritative information as a guide to shop planning. Sound suggestions are offered from the important stage of planning to the physical layout in terms of size, with recommendations concerning height of ceilings, size of entrances, lighting and storage requirements, etc. A suggested equipment list for each area is also included. There are 132 pages of modern guide lines for those school systems planning new or revised facilities.

USING TELEVISION FOR INDUSTRIAL SUPERVISORY DEVELOPMENT - MIS-12

A report on Using Television for Industrial Supervisory Development is a booklet outlining the methods and results of using the television screen as a teaching medium.

Through the combined efforts of the Ohio Trade and Industrial Education Service, the Foremen's Club of Columbus, the Columbus Public Schools, The Ohio State University Television Station WOSU-TV, and a number of individuals who were interested in the total program of producing more competent leadership in industry, an attempt was made several years ago to open new horizons of supervisory development through television.

This brochure serves as a permanent record of the study made at that time and should act as an aid to others who wish to use television as a device to teach.

Research and Program Evaluation

OHIO CAN MEET THE EDUCATIONAL CHALLENGE OF THE 60'S - RESEARCH BULLETIN #1 - MIS-14

This bulletin is based on a doctoral research study by Carl J. Schaefer, entitled "A Study to Determine a Master Plan for Post Secondary Vocational-Technical Education for the State of Ohio." 1959.

This bulletin summarizes this research which proposes to assure all Ohio residents, rural and urban, the opportunity to prepare themselves for entrance into the state's expanding industrial empire. The main features of this study consist of: (1) the development of a set of criteria to guide in the establishment of post-secondary vocational-technical institutions, (2) the creation of a firm basis for the best possible statewide program of vocational-technical education, and (3) the presentation of a concrete plan including geographic regions, curricula, facilities, financing, and legislation for vocational-technical institutes in the great state of Ohio.

TRADE AND INDUSTRIAL EDUCATION PROGRAM ANALYSIS QUESTIONNAIRE MIS-13

This is an analysis questionnaire for analyzing a local trade and industrial education program. It is a series of evaluative questions, the answers to which tend to analyze one phase of the program. Following each evaluative question is a series of checklist questions, the markings of which are intended to provide the factual basis for the choice of an answer to the evaluative question.

Research and Program Evaluation

(Continued)

LET'S FIND OUT THROUGH A TRADE AND INDUSTRIAL EDUCATION COMMUNITY SURVEY - MIS-3

This booklet is an outline of a method of determining, by survey, whether or not a vocational trade and education program should be established in a community.

It was developed as a result of notable increases in requests for trade and industrial programs from smaller and less industrialized communities. As a result, a more efficient community survey procedure had to be found. The procedure which is described in this brochure was developed by members of the state supervisory staff at a two-day conference in Granville, Ohio. Revisions were made in the procedure as surveys were conducted, resulting in this outline in its present form.

PRACTICAL NURSE EDUCATION IN OHIO RESEARCH BULLETIN #3 - MIS-16

This bulletin is based on a doctoral research study by Gordon G. McMahon, entitled "Comparison of Work Assignments With Training in Ohio Public Schools of Practical Nursing." Western Reserve University, 1963.

The bulletin summarizes a study which was made to determine whether schools are offering training which prepares the graduate to perform the duties assigned in her daily work.

Research and Program Evaluation

(Continued)

CERAMIC TECHNOLOGY RESEARCH BULLETIN #2 - MIS-15

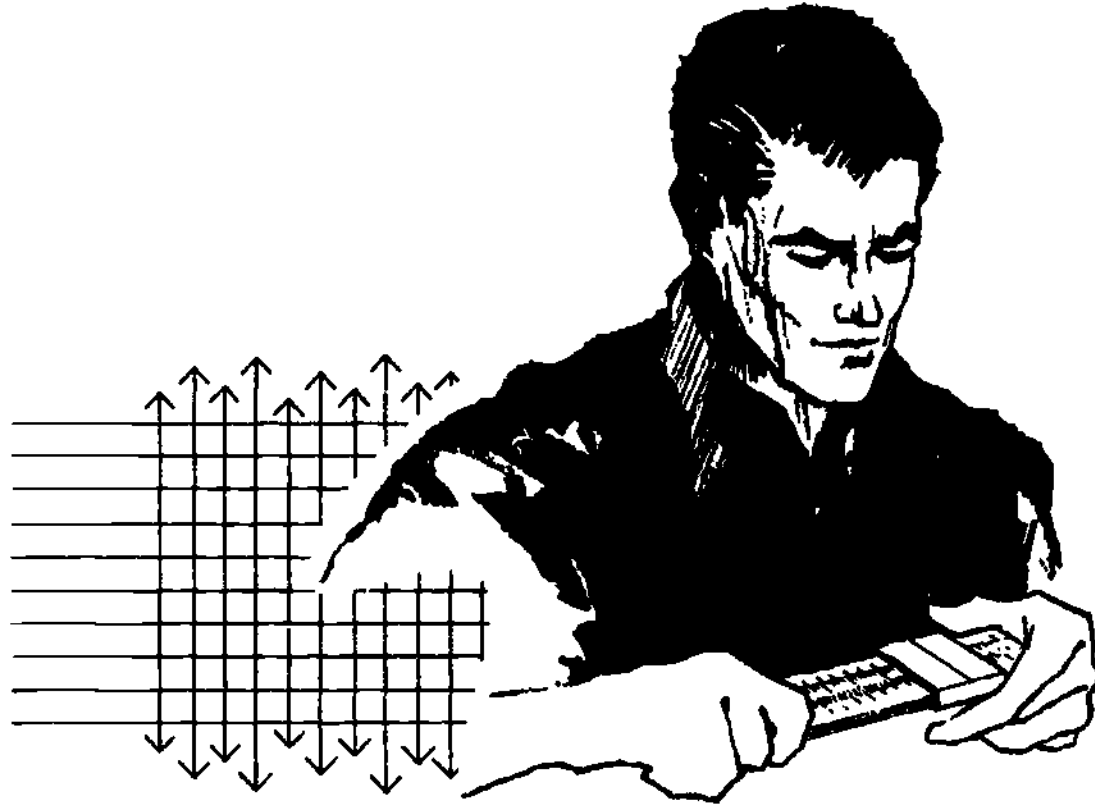

This bulletin is based on a doctoral research study by Robert Charles Fritz, Ohio State University, 1960.

It provides an overview of a comprehensive research study in the field of Ceramic Technology within the United States. The major purpose of the study was to provide a basis for the development of a curriculum in any one of the several industrial areas of instruction. This may be at the secondary Industrial Arts (general education) level or the high school and post high school skilled occupation and technician level of vocational instruction.

The detailed sections on Composition and Preparation of Ceramic Materials, Processing Methods and Testing Procedures will be particularly useful to a teacher in planning for instruction in ceramics.

Personnel of industry who find a need for a detailed analysis of the ceramics field will also find this bulletin useful.

Research and Program Evaluation

FACTORS CONTRIBUTING TO STUDENT ACHIEVEMENT IN TRADE AND INDUSTRIAL EDUCATION - MIS-18

This study was developed in an attempt to discover: (1) who is teaching in Ohio Trade and Industrial Secondary Education (2) what is his or her background and preparation (3) if there is any relationship between the amount of money spent per student and quality programs (4) if local supervisors' ratings describe quality programs (5) what are the behavior characteristics of Trade and Industrial Education teachers (6) what differences exist between specific areas of the many Trade and Industrial programs, and (7) what factors appear to be significant in quality programs.

Findings are presented in a 121 page attractively bound report which discloses many characteristics of the Trade and Industrial Education teachers. Traits indicated by an Opinion, Attitude and Interest Survey are reported for teachers in sixteen trades. Eleven traits including Achiever Personality, Intellectual Quality, Creative Personality, Social Adjustment, Emotional Adjustment, Masculine Orientation, Business Interest, Humanities Interest, Social Science Interest, Physical Science interest and Biological Science Interest were used in forming a profile for these teachers.

The conclusions and recommendations will be of special interest to individuals responsible for selection of teaching personnel.

SUPERVISORY TRAINING

Instructor Training

INSTRUCTOR TRAINING - Leader's Manual - STIM-1

(12 units of instruction, to be covered
in approximately 15 clock hours)

The course outlined here has two basic objectives. First, to provide the future tradesman-instructor with an approved method of instruction based on the laws of learning which will enable him to teach others the related technology or the manipulative skills of his trade.

Second, to build a corps of qualified, trained instructors for trade, public service, and industrial occupations in the adult training field.

A series of charts accompany the instruction plans and are to be used by the instructor-trainer as teaching aids in presenting his course of instruction.

The appendix contains hints and suggestions to the instructor trainer for the improvement of the instructor training course and handouts to aid in conducting the course.

INSTRUCTOR TRAINING - Handouts - STLM-1

A portfolio of 19 handout sheets designed to be used in conjunction with the Instructor Training Course (STIM-1). Each sheet "points up" some highly important information contained in the course.

HUMAN RELATIONS TRAINING - Leader's Manual - STIM-2

(10 hours, 5 - 2 hour sessions)

The development of this course is based on the belief that the fundamental principles of good supervisor-employee relations can be analyzed and expressed in concrete, workable elements which simplify and clarify the complicated subject of human reactions. The material presented has been drawn from the work experience of successful supervisors who have recognized and practiced the principles of good human relations. A step-by-step lesson break-down of each session. A complete leader's guide which assures a good job of instruction from the start.

HUMAN RELATIONS - Handout Sheets - STLM-2

(15 sheets in series)

A visual tie-in with the Leader's Manual. These sheets are designed to emphasize important points in presenting the course and will stimulate the interest and motivation of the group.

HUMAN RELATIONS - Flannel Board Cards - STFC-2

A set of 42 cards to be used by the leader in the presentation of the human relations training program. Each card is keyed for use with the manual.

HUMAN RELATIONS - Tape Recordings - STTR-2

Recordings of the cases which are to be presented by the leader may be procured on tape or records.

Conference Leadership

LEADERSHIP IN DISCUSSION TECHNIQUES - Leader's Manual - STIM-6

This manual has been prepared as an aid to the prospective conference leader who will be engaged in leading conferences in his own or other organizations. The procedures and techniques described are based upon the findings of those who have had experience as conference leaders, and they are methods which have been used with a considerable amount of success. The ideas and suggestions presented here are valuable aids for those who wish to make their conference leading more successful.

LEADERSHIP IN DISCUSSION TECHNIQUES - Handout Sheets - STLM-6

A portfolio of 35 handout sheets designed to be given out to the learner during the conference leadership course. Each sheet emphasizes some important information which is presented in the course.

LEADERSHIP IN DISCUSSION TECHNIQUES - Flannel Board Cards - STFC-6

A set of flannel board cards for the leader's use in presentation of the course. Each card is keyed for use with the manual.

Effective Speaking

EFFECTIVE SPEAKING - Leader's Manual - STIM-4

A complete 12-15 hour course designed to improve the ability of supervisory personnel to express themselves. A participation type course which emphasizes "learning by doing." Each lesson is broken down into the Purpose, Materials Needed, Presentation and Application steps. Excellent material for the training of supervisors.

EFFECTIVE SPEAKING - Handout Sheets - STLM-4

A portfolio consisting of a series of 20 handout sheets. These sheets are correlated with the leader's manual and each emphasizes an important part of the course. Each sheet is handed out as the point is covered -- a technique that has proven most effective.

EFFECTIVE SPEAKING - Flannel Board Cutouts - STFC-4

A series of flannel board cuts designed to accompany the leader's manual. Each cutout is on heavy poster board and has been produced in two colors with flock already on the back. Each cutout portrays some important phase of the course and tends to hold the interest of the group and motivates group participation. For information on how to make a flannel board on which to display these cutouts, write your Instructional Materials Laboratory.

Job Methods

JOB METHODS - Leader's Manual - STIM-5

An outlined text on procedures in training personnel to seek and initiate improvements in their daily work by means of finding more efficient ways of completing their tasks. Competence in improving methods of accomplishing work is one of the basic skills needed by every successful supervisor. This job methods training program has been designed as a practical and effective way to help supervisors develop their ideas and put them into use. This skill, like other basic supervisory skills, can be acquired and is necessary in our industrial society which demands efficiency with high productivity.

JOB METHODS - Handout Sheets - STLM-5

A portfolio of handout sheets essential to students to illustrate important points. There are 15 sheets and each sheet is keyed for use in the Leader's Manual, and should be given to learners and participants at the appropriate time.

JOB METHODS - Flannel Board Cards - STFC-5

A set of cards keyed for visual use to enable effective presentation of the course. Each card is designed to stimulate and hold interest, plus the emphasizing of key points in the course.

JOB METHODS - Demonstration Kit - STDK-5

This demonstration kit is used in Session One for performing the Demonstration Job by the proposed or improved method. The kit consists of a fixture with two staplers, two jigs, one stamp pad, one hand stamp, and the necessary cards representing the brass and copper sheets required for the job.

TEACHER IMPROVEMENT

Teacher Improvement

STUDY GUIDE 1, INTRODUCTION TO VOCATIONAL TRADE AND INDUSTRIAL TEACHING (PRE-SERVICE) - TISG-1

This study guide was prepared with the idea of improving teaching and evaluation technique in trade and industrial education. It provides study outlines and references designed to assist the instructor in the vocational education program. Covering only one phase of teacher improvement work, this guide is not intended to be an exhaustive treatment of the area represented by the title of the unit. It should be sufficiently comprehensive, however, to be really helpful to the vocational instructor during his early years of teaching.

STUDY GUIDE 2, INTRODUCTION TO VOCATIONAL TRADE AND INDUSTRIAL TEACHING (IN-SERVICE) - TISG-2

This study guide was prepared with the idea of improving teaching and evaluation techniques in trade and industrial education. It provides study outlines and references designed to assist the instructor in the vocational education program. Since it covers only one phase of teacher improvement work, this guide is not intended to be an exhaustive treatment of the area represented by the title of the unit. It is sufficiently comprehensive, however, to be really helpful to the vocational instructor during his first year of teaching.

HANDBOOK FOR TRADE AND INDUSTRIAL TEACHERS - TISG 1 & 2

Contains the preceding two study guides in a single bound volume.

STUDY GUIDE 3, RELATIONSHIP OF THE VOCATIONAL INSTRUCTOR TO THE COMMUNITY - TISG-3

This study guide will assist the trade teacher in becoming acquainted with duties and responsibilities outside of the shop or classroom by which the community in which he teaches will judge him and his school. It will assist in understanding the problems involved in working out satisfactory solutions.

STUDY GUIDE 13, TECHNIQUES OF DEVELOPING TRADE SKILLS IN STUDENTS TISG-13

The primary purpose of this study guide is to provide practical suggestions for instructors who are interested in improving the methods they use in developing trade skills in their pupils. Since the demonstration shop lesson is the foundation of any successful method, it has been reviewed in some detail in this material. In this regard, recommendations have been made based on experiment and actual practice in a number of shops in Ohio.

STUDY GUIDE 16, INSTRUCTION SHEET WRITING - TISG-16

The purpose of this guide on instruction sheet writing is to present the correct techniques of writing instructional materials to the beginning vocational instructor and to motivate him to write the various types of sheets he needs.

Teacher Improvement

STUDY GUIDE 18, COLLECTING AND CLASSIFYING INSTRUCTIONAL MATERIALS - TISG-18

This study guide is designed to help vocational instructors obtain valuable teaching aids from many sources and to suggest ways and means of classifying the aids obtained so that they can be easily identified and located for use when needed.

STUDY GUIDE 22, ORGANIZING AND OPERATING TOOL OR STORAGE ROOMS TISG-22

This unit will be most useful to those vocational teachers who need help in planning or reorganizing their tool and storage facilities. When the teacher-trainer discovers such a need, the material included herein will provide an excellent source of information.

STUDY GUIDE 23, ORGANIZING AND USING SHOP PERSONNEL SYSTEMS TISG-23

This study guide is intended to acquaint the vocational instructor with the (1) benefits to be derived from the use of student personnel systems, (2) fields or areas to be supervised by students, (3) duties to be delegated to student supervisors, and (4) details of operating a personnel organization.

STUDY GUIDE 25, ORGANIZING AND CONTROLLING STUDENT GROUPS TISG-25

This guide is intended to help vocational instructors improve themselves and their techniques as leaders which is essential to the successful organizing and controlling of student groups. It also suggests sources of information to which beginning instructors may go for help in their organization problems.

STUDY GUIDE 29, INSTRUCTOR'S RESPONSIBILITY FOR COORDINATION TISG-29

Some of the matters discussed in this guide are (1) basic aims of trade and industrial education, (2) adapting instruction to industrial needs, and (3) instructor's responsibility for coordination. This guide will be an asset to teachers who wish to improve their programs of coordination.

STUDY GUIDE 31, METHODS OF EVALUATING AND RECORDING STUDENTS' PROGRESS - TISG-31

The specific purpose of this study guide is to help the vocational instructor to develop and properly utilize concrete devices to evaluate and record student progress. Two phases of the problem, rating scales and progress charts, are included in this unit.

Teacher Improvement

STUDY GUIDE 32, DEVELOPING AND USING OBJECTIVE TESTS - TISG-32

This course is intended to give shop and classroom instructors a simple and practical presentation of the basic principles of educational measurements as applied to vocational teaching. The plan of treatment provides the vocational instructor with a guide for his individual study and research.

STUDY GUIDE 33, INDIVIDUAL DIFFERENCES - TISG-33

This study guide deals with the individual differences which are inherent in all persons and which are so readily apparent in student groups. The purpose of the discussion in this unit is to bring to the attention of the instructor the existence of these differences, their implications in relation to the preparation of instructional material, and the methods he may use in offsetting them.

STUDY GUIDE 34, RELATION OF STANDARDIZED TESTS TO THE VOCATIONAL PROGRAM - TISG-34

This unit treats the material relating to testing from the standpoint of the vocational instructor who has not had an opportunity to study tests and measurements in a formal class. This material relates largely to the use of standardized tests, especially those which will provide a better picture of the vocational students' abilities and limitations.

STUDY GUIDE 39, EQUIPMENT SELECTION, SHOP DESIGN, AND LAYOUT TISG-39

This study guide is intended to be used so that each member of the class will be working on his own problem, thus he may work singly or as a member of a group interested in a particular problem in shop design, layout or equipment selection. The material presented here suggests the areas that must be investigated before and during the planning and laying out of a successful vocational school or department, its shops, and all related facilities.

STUDY GUIDE 40, EQUIPMENT SELECTION, TRADE TECHNOLOGY, LABORATORY DESIGN AND LAYOUT - TISG-40

Vocational teachers who will benefit most from this unit of study are of two categories:

1. Those who contemplate changing their methods of teaching trade technology from old segregated subject matter areas to laboratory procedures.
2. Those who anticipate building changes or new school construction which will require the planning and equipping of a new laboratory for teaching trade technology.

In accepting this assignment, you are undertaking study in an area where little help can be obtained from published material and each situation requires the analysis and solution of specific problems.

Teacher Improvement

STUDY GUIDE 42, CONFERENCE LEADERSHIP TRAINING - TISG-42

This manual has been prepared as an aid to the prospective conference leader who will be engaged in leading conferences in his own or other organizations. The procedures and techniques described are based upon the findings of those who have had experience as conference leaders, and they are methods which have been used with a considerable amount of success. The ideas and suggestions presented here are valuable for those who wish to make their conference leading more successful.

STUDY GUIDE 43, APPROVED SUPPLEMENTAL WORK EXPERIENCE TISG-43

This unit has been prepared for the vocational instructor as a guide in acquiring added trade experience or special schooling. Provisions have been made for overcoming any deficiencies in trade background. To realize the goals set forth in this unit, it is necessary for the instructor and the teacher trainer to discuss frankly any existing weaknesses.

STUDY GUIDE 44, METHODS OF KEEPING UP-TO-DATE IN THE TRADE TISG-44

This guide, plus the actual supplemental work experience, will be of value primarily to instructors in two different classifications; first, to the instructor who has had no direct contact with the trade for several years and who now desires to acquaint himself with current manipulative practices and the technology; second, to the instructor who has had recent contact with the trade, but who is interested in extending his trade skill and knowledge.

UNIT C - TEACHING METHODS AND TECHNIQUES IN TRADE AND INDUSTRIAL EDUCATION

Study Guide C-1 - Questioning Techniques

This study guide has been designed to encourage the instructor to read some of the text materials on oral questioning techniques and enable him to understand and appreciate that the ability to ask oral questions effectively is an art calling for keen insight and a willingness to practice. It also offers the instructor an opportunity to practice asking questions during lessons under the observation of the teacher educator, using the controlled situations as the basis for discussions. Finally, this guide points out that oral questions during lessons have definite purposes.

Study Guide C-2 - Methods Of Group Instruction

This guide will acquaint the instructor with group instruction methods of teaching and help him provide more effective instruction. It will assist the instructor in choosing the most appropriate method of group instruction, encourage him to plan for this instruction, and provide him with an opportunity for practice of these methods.

Teacher Improvement

Study Guide C-3 - Methods of Individualized Instruction

This unit will help the instructor understand and appreciate the need for individualized instruction and familiarize him with the techniques and materials essential to this type of instruction. It will also provide the instructor with some suggestions for dealing with the problems of individual differences, individual needs, and correlation. The instructor will be shown the importance of teaching students how to study, and provided with a suggested study technique which he can teach his students. Finally, the instructor is offered some suggestions for coping with the problem of evaluating individualized instruction.

Study Guide C-4 - Organizing And Conducting Effective Demonstrations

This study guide has been designed to aid the instructor in using the demonstration as a tool for effective teaching. The instructor is acquainted with the importance of a properly planned demonstration, provided several suggested situations in which to practice demonstrations, aided in evaluating the effectiveness of his demonstrations, and helped to recognize when demonstrations can be most valuable in imparting information.

Study Guide C-5 - Principles of Learning

This study guide has been designed to help the instructor understand the learning process and to acquaint him with the processes for developing skills. It will aid the instructor in distinguishing between superficial learning, permanent learning, and in realizing that the capacity to learn varies widely with students.

Study Guide C-6 - Individualized Instruction In The Related Classroom

This study guide is to aid the instructor in providing a study technique he can teach his students. It will help him understand the importance of individualized lessons. There are practical suggestions for supervision and evaluation for the individualized planning. This study guide also contains suggestions on providing individualized instruction when instructional aids are not available.

Study Guide C-7 - Conference Techniques In Teaching

This study guide has been prepared to acquaint the instructor with the conference technique. It will further an understanding of the specific conditions of conference technique and skills of group instruction.

Study Guide C-9 - Use of Laboratory Procedures In Teaching Trade Technology

This unit is to assist the instructor in selecting items of trade information which can be better understood by teaching the principles involved. The study guide can be used in developing laboratory procedures and in showing how appropriate instructional materials can be used to teach principles and their applications.

Teacher Improvement

Study Guide C-10 - Correlation of Shop and Trade Technology Instruction

When one instructor shares instructional duties with another, both should decide the best method of securing instructional correlation. Instructors are obligated to give instruction which will be functional in the lives of their learners. A knowledge of the principle of correlation will provide a means of organizing the instruction in a trade and industrial education program in such a way that it will be more helpful and meaningful to those they teach. This manual was prepared as an aid for acquiring this principle.

Study Guide C-11 - Selection And Use Of Teaching Aids

This study guide will help the beginning instructor to become familiar with certain audio-visual aids which can enrich and strengthen his teaching program. It will assist him in preparation of the aids. The guide will encourage him to learn the sources of the teaching aids he will want to use.

UNIT D - SELECTION AND ORGANIZATION OF SUBJECT MATTER IN TRADE AND INDUSTRIAL EDUCATION

Study Guide D-2 - Trade and Occupational Analysis

The study guide is designed to familiarize the instructor with trade or occupational analysis procedures and terminology. It will help in learning a method of determining what to teach by knowing the values of trade and occupational analysis work in vocational trade and industrial curriculum construction. Finally, this study guide provides opportunity to put the analysis procedures into practice.

Study Guide D-4 - Course of Study Construction

The purpose of this guide is to study the elements and learn the technique of constructing a course of study. It will serve as a master plan for an entire one or two year trade program with the units of work blocked out, plans for their development set down, and an indication of the order in which they will be taken up and how they will be presented. Prerequisites for the study of this program should be the completion of the study guides on Instruction Sheet Writing (D-1), Trade and Occupational Analysis (D-2), Course Outline Writing (D-3), and Preparing and Using Lesson Plans (D-5).

Study Guide D-5 - Preparing And Using Lesson Plans

This study guide can be used by the instructor to identify the characteristics of a good lesson. The "Four Step" lesson plan is explained in this study guide. The "Four Step" plan is applied to shop and other related lesson plans.

Study Guide D-6 - Effective Teaching Of Safety

This guide is designed to assist the shop instructor in setting up and operating a shop safety program. The situations for teaching methods of safety are in this unit. The shop instructor will realize that safety is a con-

Teacher Improvement

tinuous process and will learn technique through the development of committees and teams to assist in making the shop a safe place in which to work. Finally, the study guide will aid in the development of tests and reports for safety programs.

Study Guide D-7 - Developing And Constructing Teaching Aids

This study guide has been prepared to provide the instructor with the basic knowledge needed to construct his own teaching aids. With this help, the instructor will be encouraged to develop teaching aids which will assist in effective instruction and make his job more meaningful and easier in the long run.

UNIT E - SHOP AND LABORATORY ORGANIZATION AND MANAGEMENT

Study Guide E-3 - Developing Appropriate Student Conduct

This unit is to help the instructor realize the importance of the establishment and maintenance of good shop and classroom conduct which is the product of the instructor's habits, conduct, personal appearance, speech, etc. It offers suggestions to the instructor on maintaining good discipline and the latest text materials on the subject of discipline.

Study Guide E-5 - Sponsoring A Vocational Industrial Club

This study guide is designed to help the instructor with the official youth organization of Trade and Industrial Education. It will assist in the organization and operation of the local clubs. This unit contains factual information regarding the Purpose, Pledge, Creed, Symbol, Opening and Closing Ceremony, and other important aspects to help guarantee a strong youth organization.

INSTRUCTOR TRAINING - Leader's Manual - STIM-1 (Also listed on p. 26)
(12 units of instruction, to be covered
in approximately 15 clock hours)

The course outlined here has two basic objectives. First, to provide the future tradesman-instructor with an approved method of instruction based on the laws of learning which will enable him to teach others the related technology or the manipulative skills of his trade.

Second, to build a corps of qualified, trained instructors for trade, public service, and industrial occupations in the adult training field.

A series of charts accompany the instruction plans and are to be used by the instructor trainer as teaching aids in presenting his course of instruction.

The appendix contains hints and suggestions to the instructor trainer for the improvement of the instructor training course and handouts to aid in conducting the course.

INSTRUCTOR TRAINING - Handouts - STIM I (Also listed on p. 26)

A portfolio of 19 handout sheets designed to be used in conjunction with the instructor Training Course (STIM-1). Each sheet "points up" some highly important information contained in the course.

Teacher Improvement

HANDBOOK FOR TRADE EXTENSION TEACHERS - MIS-7

This handbook has been prepared by the teacher educators of the Trade and Industrial Education State Staff as a guide to a four hour training program for trade extension teachers.

The following time allocations are suggested: Organization - 15 minutes, Teaching Aids - 30 minutes, Methods - 30 minutes, 4-Step Method - 2 hours, 45 minutes.

Each participant in a teacher training session should be furnished a copy of this booklet. Also it will be desirable to furnish copies of this booklet to trade extension teachers who are unable to attend an organized training session.

It is hoped that this booklet will stimulate the trade extension teacher to seek further information which will be helpful to him as a vocational education instructor.

OCCUPATIONAL COMPETENCY TESTS - MIS - 10

This booklet is designed as a general guide for those persons who undertake the special assignment of writing a trade competency test for a specialized field, working in collaboration with a teacher trainer, faculty advisor and/or other qualified staff member. The content covers test development procedures, construction of technology and performance tests, test administration procedures, and evaluation of test results.

MANUAL OF STANDARD FORMATS - For Written Instructional Aids - MOSF - 1

Preparation of instructional aids for teacher and student use are an important part of a teacher's responsibility. Written instructional materials have taken on many varied styles and formats over the years. This manual is an attempt in standardizing the formats to be used in preparing written instructional materials and also to be used in conjunction with the teacher education program. The formats for the various materials are the result of extensive study on the part of curriculum committees who took into consideration such factors as: organization, presentation of material, economy, simplicity of style, ease of reproduction, and uniformity. In addition to the information on how to prepare written instructional materials, the manual also provides information as to why they should be prepared and suggestions on how they should be utilized by the instructor.

**DIVERSIFIED
COOPERATIVE
TRAINING**

Diversified Cooperative Training

DIVERSIFIED COOPERATIVE TRAINING

Occupational Training Plans - Compilation - TP 1-45 - Bound Set

These forty-five training plans were developed as a valuable aid in conducting more effective cooperative training programs.

A compilation of TRAINING PLANS AND PROGRESS RECORDS, plastic bound in a durable cover, may be obtained for the following trades: Aircraft Mechanics, Automatic Pinspotter Mechanic, Auto Mechanics, Automotive Collision Repair, Baking, Bricklaying, Cabinet Making, Carpentry, Carpet and Linoleum, Cleaning and Pressing, Commercial Cooking, Custodial Work (School), Dairy Processing, Dental Assistant, Dietitians Assistant, Doctor & Dental Assistant, Drafting, Electrical Appliance Servicing, Electric Motor Repair, Electrical Wiring, Farm Machinery Servicing, Floriculture, Furniture Upholstery and Repair, Industrial Maintenance, Industrial Sewing Machine Mechanic, Lithography, Machine Trades, Making and Installing Neon Signs, Meat Cutting, Medical Laboratory Technicians, Monumental Stone Cutting, Motion Picture Projectionist, Painting and Decorating, Photography, Plumbing, Pre-Nursing, Printing, Radio & Television Servicing, Residential Wiring, Sheet Metal Work, Sign Painting, Watch and Clock Repair, Welding, Wheel Alignment and Frame Straightening, X-Ray Technician Assistant.

Each Training Plan and Progress Record is invaluable:

At the time of the first interview of the coordinator with the student, when determining the best possible choice of occupational training;

During interviews with prospective or already participating on-the-job instructors to determine which skills can be taught effectively;

In regular interviews with the student during the course of training, in order to keep the student up-to-date on the progress he is making and the goals that lie ahead;

In follow-up visits at the place of business of the on-the-job instructor, to make certain that the student is having the opportunity to progress from skill to skill within the scope of the facilities;

In the final interview with the student prior to graduation, at which time the record of the student's progress to date can be reviewed and a copy of the Training Plan and Progress Record can be presented to the student as the latter goes from the school to find full time employment.

Any of the above listed occupational training plans can be purchased individually or in a bound volume.

Diversified Cooperative Training

VOCATIONAL EDUCATION IN DIVERSIFIED COOPERATIVE TRAINING-MIS-4

This manual is a description of the objectives, standards, and operating policies of a trade and industrial education program planned to meet the needs of the small community. While several occupations may be included in this program, the individual student receives training in only one; thus the term "diversified" applies to the program as a whole and not to the experience of the student. For those schools and communities that are considering instituting such a program, this manual will be a valuable asset.

D. C. T. REFERENCE MATERIALS - MIS-9

A listing of instructional materials for the teaching of prominent vocational subjects. These materials have been chosen for their general excellence, by committee, and are comprised of publications from most states active in vocational education. Also listed, with the title of each publication, are the reference materials for each, plus the address from which the listed materials may be obtained.

MISCELLANEOUS

Miscellaneous

VOCATIONAL INDUSTRIAL CLUB OF OHIO (HANDBOOK)

This book is an invaluable aid for new members and officers of the Vocational Industrial Club of Ohio. Each and every member should be presented one of the manuals. It contains the purposes of V. I. C., the Pledge, the Creed, the Opening and Closing Ceremony, etc. The manual contains 89 pages.

OHIO LEGISLATION APPLICABLE TO VOCATIONAL EDUCATION WITH ATTORNEY GENERAL'S OPINIONS - 1956 - MIS-6

A listing from the Ohio Code of Ohio Laws and Attorney General's Rulings affecting Vocational Education. It is designed to help teachers and administrators in Ohio understand the regulations affecting the programs in the public schools.

TEACHING PARLIAMENTARY PROCEDURE - MIS-11

The Parliamentary Procedure booklet is a valuable aid for those wishing to master parliamentary procedure or to develop the ability to participate effectively and correctly in a business meeting, as well as to preside over an ordinary business meeting. This booklet contains lesson plans giving the instructor step by step procedures to follow for teaching a specific skill.

OCCUPATIONAL WORK EXPERIENCE PROGRAM - MIS-17

A description of the objectives and operating policies of an Occupational Work Experience Program planned to meet the needs of the limited academic achieving student. It is anticipated that not only may the Occupational Work Experience Program contribute to the development of the academic under achievers as productive citizens, but that it should eliminate the temptation of assigning this level of student to the regular vocational education programs for which they are not qualified.

Vocational Education Sound Filmstrips

The Divisions of Vocational Education and Guidance & Testing have cooperated in producing three color sound filmstrips with the following titles: "Your Future Through Vocational Education," "Your Future Through Technical Education," "Vocational and Technical Education for a Changing World of Work."

These filmstrips are proving to be of great value to school administrators, guidance counselors, vocational education directors and supervisors, and other educational groups who are concerned with providing high school students and young adults with concrete knowledge relating to the several vocational areas. The dramatic presentations enable the students and others to make more intelligent decisions in planning for an educational program which will lead to employment of their choice.

YOUR FUTURE THROUGH VOCATIONAL EDUCATION

"Your Future Through Vocational Education" is directed to the high school student who is at the point of selecting a vocation, and stresses the importance of choosing the right one. School counselors find this an invaluable aid with which to challenge the student. The program has 144 frames, and is approximately 25 minutes in length.

Record sound film strip	\$10.40
Tape sound film strip	15.20
Postage & Handling75 for each copy

YOUR FUTURE THROUGH TECHNICAL EDUCATION

"Your Future Through Technical Education" relates the importance and place of the technician in our society, and gives the student an idea of what he must accomplish to become a technician. Specific examples of technician's work, and areas in which they are becoming important are listed. The film has 69 frames and is approximately 15 minutes in length.

Record sound film strip	\$ 7.60
Tape sound film strip	15.20
Postage & Handling75 for each copy

Vocational Education Sound Filmstrips

VOCATIONAL AND TECHNICAL EDUCATION FOR A CHANGING WORLD OF WORK

"Vocational and Technical Education for a Changing World of Work" presents a broad view of vocational education and its value for high school students, post high school students and adults who wish to upgrade their job skills. This filmstrip consists of 110 frames and is approximately 19 minutes in length.

Record sound film strip	\$10.40
Tape sound film strip	15.20
Postage & Handling75 for each copy

All filmstrips are available in either record or tape versions. Write to the Instructional Materials Laboratory, Trade and Industrial Education, 1885 Neil Avenue, Columbus, Ohio 43210, for descriptive leaflets and prices.

HOME ECONOMICS CURRICULUM GUIDE - HECG

This 477 page guide has been developed through the cooperative efforts of home economics teachers, teacher educators of universities and the home economics supervisory staff of the State Department of Education. It is adaptable to any home economics program in any state.

The purpose of this guide is to provide a vital program of education which has as its major goal the development of our young people into homemakers and family members. The major outcomes of the program in homemaking must be the improvement and strengthening of home and family living.

The Curriculum Guide also contains the suggested scope and sequence of units of work for each grade level. The scope and sequence as outlined was planned so that it could be adjusted to a variety of types of programs without duplication of subject matter. Also included are resource units for the various subject matter areas and other materials that should help teachers plan objectives and learning experiences for the year and the specific units.

An important part of the guide includes student and teacher resource materials.

Price . . . \$3.85. See order form for postage, quantity discounts.

INTRODUCTION

This manual is organized and presented as a teaching aid for an adult distributive education class. It may be used by a distributive education teacher-coordinator on the secondary school level, or it may be used in a post-secondary vocational technical school. Personnel serving in private enterprise who come in contact with the public may find it helpful if used on an individual basis.

Personnel departments, business associations, and civic organizations will find this manual of value in promoting adult sales classes.

The length of teaching time required to cover material in this manual will depend upon the amount of discussion given each unit and the amount of audio visual aids used. Some units are to be considered more important than others and should be allowed more time. At least ten meetings of one hour for ten days would be justified.

The first unit is intended to show the student how we learn from coming into contact with other people. It is also intended to create an interest in telling the group what its members will be taught about salesmanship. The subsequent units analyze a sale in smallest details, teach the selling points, and then explain the salesman's part in the American economic system.

The overall objectives of this course in advanced selling techniques are: (1) to give a better understanding of the techniques involved in selling, (2) to aid in securing greater efficiency (sales per customer) in selling, (3) to give customers quicker and better service by teaching salesmen how to serve customer's needs and interests, (4) to increase the sales of a salesman, thereby increasing his purchasing power and standard of living, (5) to aid the salesman in building a clientele, (6) to create a demand for more goods brought about by new inventions and automation, and (7) to help the salesman realize his place and importance in the American economic system.

GENERAL SUGGESTIONS TO THE INSTRUCTOR

To aid in using this teaching manual in the most effective way, the following suggestions are offered:

1. Read introduction, including the overall aims and objectives.
2. Read the complete manual to get an overall picture of how the steps of a sale are used as tools of the trade. These salesmanship tools are made available to be used when needed, but are not necessarily needed, for every product or customer.
3. Consider your time schedule, as well as the needs of the class, and adapt the teaching outline to fit both.
4. Use the conference method of teaching whenever possible.
 - a. Ask questions which stimulate, advance, and provoke discussion.
 - b. Keep ahead of the discussion so you can sense its trend. Keep the discussion on the "beam."
 - c. Use chalkboard, or paper easel to note important points as they are developed. Use the words and expression of participants as often as possible.
 - d. Appreciate the personal reactions of people so that you do not hurt their feelings.
 - e. Maintain a sense of humor.
 - f. Avoid arguments.
 - g. Keep in mind, and emphasize when necessary, that the good of the group comes first.
 - h. Keep one person from doing all the talking.
 - i. Avoid talking too much yourself, and, when you do talk, don't be unduly assertive.
 - j. Give everyone adequate attention. Don't slight anyone. Be fair.
 - k. Avoid arousing antagonism.

UNIT I
INTRODUCTION

UNIT I

INTRODUCTION

I. Aims and objectives of this unit:

- A. To show the students how we learn.
- B. To tell the group how they will be taught in this class.
- C. To inform the group of what they will learn in subsequent meetings.

II. General outline of this unit:

- A. Who is a salesman?
- B. Selling to basic needs and desires.
- C. Who is a clerk or truck driver?
- D. Barbers and beauticians as salespeople.
- E. When you sell, what do you sell?
- F. Buying process.
- G. How you sell yourself, your company, and your merchandise.

III. Materials and teaching aids needed for this unit:

- A. Chalkboard
- B. Chalk and eraser
- C. Crayon or marker
- D. Paper easel
- E. Sample of certificates
- F. Paper and pencils

UNIT I
INTRODUCTION

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTOR
<p>I. Introduction</p> <p>A. Roll call</p> <p>B. Instructor's name</p> <p>C. What distributive education is</p> <p>D. Introduction of guests</p> <p>E. Background of experience</p> <p> 1. Instructor's</p> <p> 2. Class Member's</p>	<p>Write your name, sex, age, address, employer (name of company), (salesperson, supervisor, department head, etc.) on a sheet of paper and turn it in at the end of the class. From then on only sign your name on sheet of paper for roll.</p> <p>Write your name on chalkboard, your title or job, and the name of your school system or company.</p> <p>Distributive Education is a vocational training program for those who have already entered, or contemplate entering, the various fields of distribution as their life's work. This includes positions in wholesale, retail, or service organizations.</p> <p>List the various types of sales experiences, noting years or months on the chalkboard, and secure the total. (Newsprint sheets and marks-a-lot may be substituted for or used with chalkboard.)</p> <p>Take the above total and place it next to your name,</p>

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTOR
<p>F. Comparison of learning to be a top notch salesman to learning to be a good fisherman, golfer, cook, hunter, seamstress, card player, etc.</p>	<p>then list the members and their total sales experience. Add the total sales experience of the class.</p> <p>Explain to the group that you will not be the authority (only the leader) in answering the questions and problems but that you will use the total experience of the group just as you would if you had that much experience yourself. Also point out that a member, by failing to contribute, will reduce the experience and authority of the group. By using this conference method of instruction a member will not be put on the spot as a "know it all."</p> <p>Tell the class you expect to learn something from them, too. There may be some in the group that have more experience than you, and you hope to profit by their experiences.</p> <p>Ask if there are any fishermen in the group.</p> <p>How does a person learn to fish, play golf, or anything else?</p> <p>By listening to others, watching others, trying their methods and if they work, adding it to your own methods and techniques.</p> <p>The same can be done in selling. All you ask the group to do is try it.</p> <p>The class members are not expected to agree with you or their fellow members on everything that is said. They are</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTOR

G. Certificates

expected to try it on their jobs to see if it will work for them. If ideas produce results, we will continue to use them.

Certificates are given for being present and absorbing as much as possible. There will be no test or exam. (Mention absences allowed.)

II. Organization and Content

A. Who is a salesman?

Get members to write their definition on a sheet of paper. Go around and look at them. Get some of them to read them and draw key words such as: knowledge, desires, needs, service, enthusiasm, help, etc. Compose a definition that will cover all the above, such as: A salesman is one who serves a customer in such a way that he will return for future sales or services, and will also refer friends and relatives.

A salesman is one who helps customers buy.

B. Selling to basic needs and desires

Ask the group what basic needs and wants that customers buy for. Point out that all sales satisfy one or more of these basic needs or desires.

1. Food and drink
2. Shelter and comfort
3. Communication and transportation
4. Attracting opposite sex

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<ul style="list-style-type: none"> 5. Welfare of loved ones 6. Recreation and exercise 7. Freedom from fear and danger 8. Developing one's potential 9. Social acceptance 10. Health (freedom from pain and longer life) 	
<p>C. Who is a clerk or truck driver?</p>	<p>A clerk may be defined as one who says "Can I help you?" or "May I help you?" and then gives you what you ask for and wraps the package and makes change. Sometimes a salesperson has to clerk but later he reverts back to salesmanship by suggestive selling.</p>
<ul style="list-style-type: none"> 1. Do salespeople have to clerk sometimes or drive trucks sometimes 	<p>A salesman is more than a truck driver if he calls on a customer or client with a load of goods.</p>
<p>D. Barbers and beauticians as salespeople</p>	<p>Ask members where they get their hair cut, or fixed, and ask them why.</p>
<p>E. When you sell, what do you sell?</p> <ul style="list-style-type: none"> 1. Yourself <ul style="list-style-type: none"> a. So people will like you 	

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- b. So people will want to associate with you
- c. So people will have faith in you
- d. So people will want to buy from you
- e. So people will refer customers to you

F. Buying Process

1. Pre-approach
2. Meeting the customer-approach and greeting
3. Selecting the goods for the customer
4. Presenting the merchandise physically
5. Presenting the goods verbally
6. Salesperson's (objective) demonstration

We have heard or read of the four steps of a sale: Gaining attention, creating interest, creating desire, and producing action. (Store Salesmanship, Robinson-Blackler-Logan, pp. 20-31.)

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<ul style="list-style-type: none"> 7. Customer's (subjective) demonstration 8. Applying the appropriate selling technique 9. Summarizing the build-up 10. Suggestive selling 11. Routine details 12. Follow-up 	<p style="text-align: center;">Tell class what's to come in the next meeting: Tomorrow we will have a thirty minute sound film on selling yourself and we will discuss the first two of the twelve steps of a sale. We will start on time and end on time.</p>

UNIT II
PRE-APPROACH

UNIT II

PRE-APPROACH

- I. Aims and objectives of this unit:
 - A. To remind the group of their duties before approaching customers.
 - B. To stress the value of merchandise information.
 - C. To define prospects.
 - D. To suggest a source of prospects.

- II. General outline of this unit:
 - A. Salesperson's appearance.
 - B. Advertisements.
 - C. Merchandise appearance.
 - D. Previous store experiences.
 - E. Features that attract customers.
 - F. Keeping customer records.
 - G. Overcoming objections.
 - H. Merchandise knowledge.
 - I. Prospects.

- III. Materials needed for this unit:
 - A. Chalkboard
 - B. Chalk and eraser
 - C. Paper easel
 - D. Crayon or marker
 - E. Paper and pencils

UNIT II
PRE-APPROACH

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>II. Pre-approach</p> <p>A. Salesperson's appearance</p> <ol style="list-style-type: none"> 1. Dress <ol style="list-style-type: none"> a. Business b. Conservative c. Should not detract from merchandise d. Cleaned and pressed 2. Personal grooming <ol style="list-style-type: none"> a. Hair b. Fingernails c. Shoes 3. Cleanliness <ol style="list-style-type: none"> a. Teeth b. Body odors c. Breath <p>B. Advertisements</p> <ol style="list-style-type: none"> 1. What and when 2. Prices 3. Competitor's 4. Store's bulletin boards <p>C. Merchandise appearance</p> <ol style="list-style-type: none"> 1. Displays 	<p>In adult classes a salesperson's dress should be elaborated upon but grooming and personal cleanliness should be dealt with lightly to keep the discussion from becoming too elementary.</p> <p>Ask group if they have ever been caught by a customer who asked for an article that is currently being advertised.</p> <p>Displays should be kept neat and clean to give a good</p>

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<ul style="list-style-type: none"> <ul style="list-style-type: none"> a. Counter b. Wall c. Floor 2. Samples D. Previous experiences in store E. Durability 	<p>appearance. Merchandise should be rotated so it will not become shopworn.</p> <p>A salesman calling on a prospect should always check his sample case before making an appearance.</p> <p>The alert salesperson will keep a record of questions and objections asked by customers so he may answer them or meet them before they arise. (<u>Store Salesmanship</u>, Robinson-Blackler-Logan, pp. 32-36.)</p> <p>A mimeographed check list sheet on this knowledge of merchandise would be helpful and save time. (<u>Advanced Selling. Basic Instruction Series</u>, Janie Sullivan, page 104.)</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- b. Degree of color permanence
 - c. Shrinkage or stretchage (in case of textiles)
 - d. Breaking strength
 - e. Resistance to water, wind, wear, heat, light
 - f. Cost of up-keep
3. How the product is made (construction)
- a. Size
 - b. Weight
 - c. Weave (in case of textiles)
 - d. Finish
 - e. Handmade or machine-made
 - f. Pressed, molded, stamped, inlaid, etc.
 - g. Conditions under which goods are made
 - h. Packaging
4. How to use the product
- a. How to operate it, wear it, prepare it, eat it, apply it, arrange it, assemble it, display it, place it

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

5. How to care for the product
 - a. How to handle and adjust the product
 - b. How to clean the product
 - c. How to store the product
 - d. How to repair the product
 - e. How to oil and grease the product
 - f. How to refrigerate the product
6. Appearance of the product
 - a. Beauty
 - b. Style
 - c. Ensemble possibilities
7. Background of the product
 - a. History of the article
 - b. History of its manufacturer
 - c. History of its uses
 - d. History of competing articles
 - e. Rarity
 - f. Prestige
8. Services available with the product
 - a. Credit terms

Source of merchandise information will be covered in Unit VII - Presenting the Merchandise Verbally

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- b. Shipping terms
- c. Speed and cost of delivery

I. Prospects

1. Prospect defined

- a. One who has need for your product or service
- b. One who has the authority to buy
- c. One who is accessible

2. Kinds of prospects

a. Present customers

- (1) Prospects for future sales
- (2) Prospects for bigger sales
- (3) Prospects for sales of other products

b. Old customers who are not buying

- (1) Find out the cause
- (2) Get them back
- (3) Treat them better

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

c. New prospects

(1) People you know

(a) Your immediate family

(b) Friends, acquaintances, relatives

(c) People met in community activities

(d) People met in clubs and social organizations

(e) People from whom you buy

(2) Through research

(a) Newspapers

(b) Classified directories

(c) Trade and professional membership lists

(d) Building permits

(e) Tax lists

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

(f) Commercial advertising lists

(3) Past customers

(a) Calling past customers in follow-up and asking them to refer customers to you

(4) "Bird Dogging"

(a) A number of people looking for salesmen and referring them to them

3. Knowledge of prospect

- a. How to pronounce his name
- b. Financial ability
- c. His needs
- d. Past and present relations with the company - (Does he have an account with the company?)
- e. Name and title of person who does the buying or

If the salesman calls on a prospect or if he knows what customers are coming in, he should take time before the call to gain some knowledge of his prospect.

(Selling to Today's Customer, pp. 249-250, 313-315.)

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>will influence the buying for a business concern</p>	

UNIT III

MEETING THE CUSTOMER OR PROSPECT

UNIT III

MEETING THE CUSTOMER OR PROSPECT

- I. Aims and objectives of this unit:
 - A. To present information concerning human relations.
 - B. To train students to remember names.
 - C. To emphasize the importance of making customers feel at home in the business.
 - D. To teach types of approaches.

- II. General outline of this unit:
 - A. Company representative.
 - B. Creating good customer impressions.
 - C. Courtesy.
 - D. Types of approaches.

- III. Materials and teaching aids needed for this unit:
 - A. Chalkboard
 - B. Chalk and eraser
 - C. Paper easel
 - D. Crayon or marker
 - E. Paper and pencils
 - F. 16mm projector and screen
 - G. Film--By Jupiter
 - H. Film--The Right Approach

UNIT III

MEETING THE CUSTOMER OR PROSPECT

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTOR
<p>III. Meeting the customer or prospect</p> <p>A. Company representative</p> <ol style="list-style-type: none"> 1. Who the company is 2. Who you work for <p>B. Creating good customer impressions</p> <ol style="list-style-type: none"> 1. Customers get impressions from <ol style="list-style-type: none"> a. Your appearance b. Your facial expressions <ol style="list-style-type: none"> (1) eyes (2) mouth <ol style="list-style-type: none"> (a) smile c. Physical movements <ol style="list-style-type: none"> (1) Body <ol style="list-style-type: none"> (a) posture (b) poise 	<p>If you meet a customer or do a job for them, you are the company. In most cases the customer does not know the owner, the manager, or even the department head. In his eyes the salesman is the company. You are working for yourself and your dependents but you are working with (name of company).</p> <p>Any bad impression you make on a customer or any bad service you render him hurts the company; which is yourself, your fellow workers, and the management. If management makes a bad impression on a customer they are hurting you.</p> <p>One's first impression lasts the longest. This first impression is made in the approach and greeting.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTOR

d. Voice

- (1) tone
quality
- (2) volume
- (3) what you
say
- (4) how you
say it

- e. Attitude
- f. Alertness
- g. Enthusiasm

C. By Jupiter (16mm sound film)

1. Courtesy

- a. Something which comes from inside
- b. Patience and understanding of someone else's problems and troubles
- c. Being helpful and friendly to someone because you like and understand him

2. Proverbs

- a. A soft answer turns away wrath.
- b. You can catch more flies with sugar than you can with vinegar.
- c. Courtesy is contagious
- d. Say and do

The first few words you say will form more impression than any others in your sales talk.

We will have a film on enthusiasm later that will cover its importance.

By Jupiter is a twenty-eight minute film on meeting people and selling yourself. It has been copyrighted by Marshall Field and Company, the largest retail store in the world, and is about a false god looking down on a business man on earth. It first shows man using the wrong technique and getting nowhere in accomplishing his aims in everyday life. Then by an act of this false god, Jupiter, he is able to relive his day and meet his objectives by the technique Jupiter teaches him. (By Jupiter, 16mm sound film)

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTOR

- things to make life more pleasant for someone else and they will be extra nice to you.
- e. Put something in the Bank of Human Relations that will pay you back dividends.
 - f. Courtesy is not the tip of a hat, a warm handclasp, or a big fat compliment.
 - g. Courtesy is patience and understanding of someone else's problems and troubles.
 - h. Kindness like corn increases with sowing.
 - i. Every time you go out of your way to be kind to someone you are laying the groundwork for someone to be kind to you.
 - j. Save another guy's face in an argument so that you can save your own.

- D. Types of Approaches
 - 1. Address approach

Some of the films that are shown in this course are old, and some of them are modern. This shows economy in the education department since these films are very expensive. It also shows that some of the techniques used some time ago still hold true today.

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTOR
<p>a. Address customer by name.</p> <p>(1) How to remember names</p> <p>(a) Associate with other names you know.</p> <p>(b) Associate with places.</p> <p>(c) Associate with things.</p> <p>(2) Remember to remember names</p> <p>(3) Keep book with names of customers or prospects</p> <p>(4) Get names off charge accounts.</p> <p>(5) Get names off checks</p> <p>2. Merchandise approach</p> <p>a. Walk up to customer and give merchandise information</p>	<p>The trouble with most people who cannot remember names is that they do not take time out to remember the names of people that they meet. They will meet someone and right away they are either listening to this person or someone else, or they are thinking about what they are going to say. This can be avoided by asking the person they meet how to spell his name or if he is related to someone that you know with the same last name.</p> <p>To find out a person's name when you should know it and no one is around that you may ask, ask the person how he spells his last name. If it is a name like Smith, you can say, "It's spelled without an 'e'?" The same holds true for Brown. The only name you can get caught on is Jones.</p> <p>Go through the class and have each member give his last name and let the class practice association.</p> <p>Have members of class meet three people in the class that they did not know before. At the next meeting they will have to go back to these people and call them by name.</p> <p>The merchandise approaches do not have to be elaborate. Simple statements that tell the customer something like the following will be sufficient: This is advertised</p>

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTOR
<p>3. Conventional (greeting) approach</p> <ul style="list-style-type: none"> a. Use simple greeting with a smile b. Do not use "May I help you?" c. Nod to waiting customers. <p>4. The Right Approach (16mm sound film)</p> <ul style="list-style-type: none"> a. Advertising and displays invite customers into the store. b. Salesperson must make the customer welcome. c. Try to give your undivided attention to your customer. d. Try to answer customers' questions before they ask. e. You must have knowledge of merchandise before approaching customer. f. Use the merchandise approach. g. Excuse yourself from one customer to recognize 	<p>in _____. We have these in sizes _____ to _____. These are on special today. This suit is made of dacron. This sweater is 60 percent virgin wool and 40 percent nylon. This shirt is the new style. This shipment just arrived.</p> <p>Never use superlatives like nice unless you tell why.</p> <p>Simple greeting approaches are more effective than using "Can I help you?" or "May I help you?", which sounds like a broken record. A few examples are: Have you been served? Is someone waiting on you? Be with you in a minute. Sorry you had to wait. Good morning. Good afternoon. Good evening.</p> <p>Ask the class if they get tired of hearing "May I help you?" when they shop.</p> <p>The 16mm sound film, <u>The Right Approach</u> is an old film, but it shows the proper methods of meeting, approaching, and greeting customers.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTOR

- another.
- h. Encourage customers to handle the merchandise.
 - i. Make an "I'm looking" customer feel at home.
 - j. Suggest for immediate or future purchase.
 - k. Try to find out what customer wants without asking a lot of questions.
 - l. If customer is just looking, make him welcome, but suggest ideas for occasions like birthdays or Christmas.

UNIT IV
SELECTING THE MERCHANDISE

UNIT IV
SELECTING THE MERCHANDISE

- I. Aims and objectives of this unit:
 - A. To determine what merchandise should be selected.
 - B. To suggest methods that may be used in selecting the right merchandise for the customer.

- II. General outline for this unit:
 - A. Points to be determined.
 - B. Method of determining points.

- III. Materials and teaching aids needed for this unit:
 - A. Chalkboard
 - B. Chalk and eraser
 - C. Paper easel
 - D. Crayon or marker
 - E. Paper and pencils

UNIT IV

SELECTING THE MERCHANDISE

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>IV. Selecting the merchandise</p> <p>A. Determine</p> <ol style="list-style-type: none">1. Size2. Color3. Style4. Occasion5. Use6. Material7. Quality8. Quantity9. Make10. Ingredients11. Price <p>a. highest b. middle c. lowest</p> <p>B. Method</p> <ol style="list-style-type: none">1. Observation<ol style="list-style-type: none">a. styleb. size	<p>Be sure to select the proper merchandise for the customer before you go to the next step of the sale so time and effort will not be wasted too often.</p> <p>If you are working with a company that represents quality merchandise the customer will expect you to bring out the highest-priced first. You can then go down to something less expensive (never use the word cheaper) or inexpensive at the customer's request.</p> <p>Some salespeople like to start at the middle and then they can go down if necessary or trade up if they can.</p> <p>Some salespeople like to bring out all three price ranges and then let the customer decide.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- c. color
- d. present interest of customer in display

2. Hints or statements

- a. Tell what they want.
- b. Tell the purpose.
- c. May mention advertisement or display heard or seen

3. Questions

- a. phrasing questions

You can determine the colors customers should wear by the color of their eyes, complexion and hair.

If a customer is interested enough to be examining merchandise on display, it shows that he is interested in present or future purchase of it.

Customer's hints or statements may give you a lead for suggestive selling later.

Do not ask questions such as, "Do you like this?" Put the word "how" in front of it so the answer will not be "no."

Some questions may embarrass the customer, such as, "What size do you wear?" or "You want this for evening wear?" or "You don't want a hundred-dollar ring, do you?"

In estimating sizes you do so according to article and individual, for example: shoes - underestimate; men's coats - overestimate; large head - underestimate; skinny person - overestimate; fat person - underestimate; waist lines - underestimate.

A convenient statement to make when customers are disturbed by a larger size is to say that the sizes run a little smaller in that brand.

MICROCOPY RESOLUTION TEST CHART
 NATIONAL BUREAU OF STANDARDS - 1963

UNIT V
PRESENTING THE MERCHANDISE PHYSICALLY

64

UNIT V

PRESENTING THE MERCHANDISE PHYSICALLY

I. Aims and objectives of this unit:

To show the psychological effect the handling of goods has on customers.

II. Materials and teaching aids needed for this unit:

- A. Chalkboard
- B. Chalk and eraser
- C. Paper easel
- D. Crayon or marker
- E. Paper and pencils

UNIT V

PRESENTING THE MERCHANDISE PHYSICALLY

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>V. Presenting the merchandise physically</p> <p>A. Psychological effect</p> <p>1. Value</p> <p>2. Delicate</p> <p>3. Ownership</p>	<p>To give merchandise the appearance of value, always present it on a cleared counter. Remember when you display merchandise in a window display, space creates value. You get the same effect on a counter.</p> <p>Presenting the merchandise physically is the physical gestures you make with your body and merchandise when you bring out the merchandise. You may present the goods verbally before you present it physically or you may present the merchandise physically and verbally at the same time.</p> <p>Remove any uninteresting merchandise.</p> <p>Do not throw the merchandise around or down on the counter. Handle it as if it had value. Feel it or use it. Hold the merchandise for a while before you give it to the customer. Example: Fill a fountain pen, admire it, and write your name with it before making a gesture for the customer to take it and write with it. Take the nylon hose slowly out of the box using both hands, run your hand through one pair and then examine it yourself with a pleasing, self-satisfied smile, then show it to the customer. Take the gun off the rack, feel its weight, put it up to your shoulder and aim with it. Most of the time the customer will reach for it before you offer it to him. This is a hold-over from</p>

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
4. Refine	<p>babyhood. If you keep something from an individual he will want it more. Run your hand back and forth over a fine piece of furniture and keep feeling its finish while you are talking about it. Pat a used car while you are giving the selling points as if to say, "This is a fine 'baby'."</p>
5. Tough	<p>Drop a lawn mower out of the trunk of a car, before the prospect, when you are taking it out to show that it can take rough treatment.</p> <p>Use rough treatment when demonstrating a drill press.</p>
6. Physical move	<p>If the customer does not reach for the merchandise, move the merchandise toward him or sort of hand it to him so that he will automatically reach for it.</p>

UNIT VI

FOLLOW-UP OF REMEMBERING NAMES

UNIT VI

FOLLOW-UP OF REMEMBERING NAMES

- I. Aims and objectives of this unit:
 - A. To test the ability of students to remember names.
 - B. To reemphasize the importance of associating names to be remembered.
 - C. To further develop the method of remembering names.

- II. Materials and teaching aids needed for this unit:
 - A. Chalkboard
 - B. Chalk and eraser

UNIT VI

FOLLOW-UP OF REMEMBERING NAMES

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTOR
<p>VI. Follow-up of remembering names</p> <ul style="list-style-type: none">A. MethodB. EvaluationC. Applied practice	<p>Ask for volunteers from the group to stand up and name the three people they met at the last meeting. Ask them how they remembered the names.</p> <p>Ask the group if anyone met anyone outside of the group and how they remembered the name by association.</p>

UNIT VII
PRESENTING THE GOODS VERBALLY

UNIT VII

PRESENTING THE GOODS VERBALLY

- I. Aims and objectives of this unit:
 - A. To give students a source of merchandise information.
 - B. To encourage the students to have faith in themselves.
 - C. To inspire enthusiasm.
 - D. To illustrate how to sell quality merchandise.

- II. General outline of this unit:
 - A. What you say.
 - B. Source of merchandise information.
 - C. How you say it.

- III. Materials and teaching aids needed for this unit:
 - A. Chalkboard
 - B. Chalk and eraser
 - C. Paper easel
 - D. Crayon or marker
 - E. Paper and pencils
 - F. 16mm projector and screen
 - G. Film--How To Sell Quality
 - H. Film--The Power of Enthusiasm

UNIT VII

PRESENTING THE GOODS VERBALLY

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>VII. Presenting the goods verbally</p> <p>A. What you say</p> <ol style="list-style-type: none"> 1. Merchandise information <p>B. Source of merchandise information</p> <ol style="list-style-type: none"> 1. Tags and labels 2. Manufacturer's literature 3. Advertisements <ol style="list-style-type: none"> a. your own b. your competitor's 4. Trade publications 5. Observation of goods 6. Buyers 7. Fellow salespeople 8. Customers <ol style="list-style-type: none"> a. Testimonials 9. Your own use <p>C. How you say it.</p> <ol style="list-style-type: none"> 1. Faith 	<p>Refer back to Merchandise Knowledge, Unit II, and relate merchandise information. Never use superlatives such as "nice" in your sales talk unless you tell the reason.</p> <p>Examine and study merchandise when you are not waiting on customers and learn merchandise information.</p> <p>Have faith in yourself to go up to bat with prospects and know that you will fail sometimes, but, on the other hand sometimes you will make a home run.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

a. In yourself

(1) Babe Ruth

(a) 851 home runs

(b) 1,330 strike-outs

(2) L.S.U. student

b. In your company

c. In your product for the customer

Don't be afraid to fail. Babe Ruth is considered to be one of the best baseball players of all time and was known as the "King of Swat," but if you look at his professional record he was actually the king of strike-outs, striking out more times than any other player in history. (How I Raised Myself from Failure to Success in Selling, Frank Bettger, page 253.)

A certain Louisiana State University student was despondent because he had to work his entire way through school and at that time did not rate socially on the campus. Upon being examined by the campus physician he was ordered to the Charity Hospital in New Orleans to have his tonsils removed. During his stay there he was able to see the lowest physical existence of humanity. This student left the hospital, not only with his tonsils removed, but with a mental cure for life since he realized he had two good hands, two good feet, and the ability to climb as far as he cared to in life.

If you do not like the company you are working for, quit. You are not doing them any good and certainly you are not helping yourself.

In most cases, if you would like to own the merchandise, it is easy to sell. Sometimes you may not like the article but you still have to sell it. As long as you are satisfied that your customer is satisfying his needs and desires for a just price, that is all you have to be

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

2. Your speech .
 - a. English
 - (1) Depends on customer
 - b. Tone quality
 - c. Distinction
3. How to Sell Quality
(16mm sound film)
 - a. When you shave price, you shave the quality.
 - b. A quality salesman:
 - (1) arouses desires for quality
 - (2) Creates an atmosphere of quality
 - (3) Breaks down a big price
 - (4) Turns sales objections into sales-talk
 - (5) Look quality, talk quality, believe quality
 - c. Secret of how to sell quality

concerned about. A good example of this is modern art.

Use correct grammar in all your sales talks, but never let it be above the level of your customer.

The 16mm sound film How to Sell Quality can be shown with any of the units, but it must proceed the 16mm film, The Power of Enthusiasm, which is a good audio-visual aid for this unit.

How to Sell Quality first shows a milk routeman giving the added advantages of using his milk. Then an insurance salesman shows what the cut-rate policies have taken away. A wholesale salesman shows a retail jeweler how to sell quality silverware by dividing the additional price by the number of years of use. At a town council meeting a manufacturer's representative showed multiple uses for his equipment which actually would be cheaper to the taxpayer.

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- (1) Add the benefits and values.
- (2) Subtract the things that are taken away when you don't buy quality.
- (3) Show multiple uses.
- (4) Divide cost by number of years quality is used.

- d. We must sell quality to meet competition.
- e. Higher standards than just the ordinary attract buyers.
- f. Sell quality by comparing its features to those of the cheaper product.

4. The Power of Enthusiasm
(16mm sound film)

- a. The more convincing your sales talk is the more volume you will turn over.
- b. Extra knowledge makes your sales talk convincing.

(1) Extra knowledge allows:

- (a) quicker answers

The film Power of Enthusiasm first shows a salesman of service whose sales were dropping due to loss of enthusiasm. His supervisor made a few calls with him and analyzed his problem. This salesman had good home relations, was healthy, and had good customer relations, but lacked the necessary knowledge of his service to have enthusiasm.

A good many businessmen who have the knowledge and are healthy are prevented from becoming successful because they have problems at home.

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- (b) convinc-
ing sales
talk
- (c) confi-
dence
- c. Customers prefer
to buy from one
who knows their
product.
- d. Good salesmen are
made, not born.
- e. Enthusiasm and
knowledge are the
greatest assets
to selling.
- f. Enthusiasm is
knowledge on fire.
- g. Developers of
enthusiasm:
 - (1) good home
relations
 - (2) energy (good
health)
 - (3) sincerity
with customers
(good
customer
relations)
 - (4) knowledge
- h. Confidence, sin-
cerity, enthu-
siasm is provided
by knowledge.

UNIT VIII
DEMONSTRATIONS

UNIT VIII
DEMONSTRATIONS

- I. Aims and objectives of this unit:
- A. To inform students how a salesman should demonstrate his merchandise.
 - B. To acquaint students with methods that may be used to persuade customers to demonstrate goods to themselves.
 - C. To encourage salesmen to talk in the positive.
 - D. To help the students to get their customers to visualize ownership of the merchandise.
- II. General outline of this unit:
- A. Salesman's demonstration.
 - B. Customer's demonstration.
 - C. Making sales convincingly.
- III. Materials and teaching aids needed for this unit:
- A. Chalkboard
 - B. Chalk and eraser
 - C. Paper easel
 - D. Crayon or marker
 - E. Paper and pencils
 - F. 16mm sound projector and screen
 - G. Film--Presenting Your Sales Case Convincingly

UNIT VIII
DEMONSTRATIONS

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>VIII. Demonstrations</p> <p>A. Salesman's demonstration</p> <ol style="list-style-type: none"> 1. Point out the construction 2. Demonstrate how it works <ol style="list-style-type: none"> a. How to start and stop b. How to fill (pen) c. How to use <ol style="list-style-type: none"> (1) What colors they should wear (2) What styles they should wear 3. Demonstrate how to care for <ol style="list-style-type: none"> a. How to clean or launder b. How to oil 	<p>Point out the construction of the merchandise with your hand. Use such phrases as these: "Notice the double stitching here," "Look at this reinforcement," "How do you like this finish?"</p> <p>When the salesman demonstrates merchandise to a customer he is actually a teacher, and is teaching the customer all he knows about the product.</p> <p>If any feature is complicated such as disassembling and cleaning, it may be wise to withhold this until after the sale is closed.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- 4. Any special features
 - a. Safety features
 - b. New features

B. Customer's demonstration

- 1. Use of five senses
 - a. Touch
 - b. Taste
 - c. Smell
 - d. Hearing
 - e. Sight
- 2. Affirmative suggestions
- 3. Visualizing product in use
 - a. Swimsuit
 - b. Car
 - c. New dress

The salesperson's demonstration should have been so effective and the teaching so interesting that the customer will want to use superlatives at this time.

Get customer to use one or more of the five senses.

Get customer to handle and feel merchandise or try it on.

Get the customer to taste a sample.

Get the customer to smell merchandise such as cosmetics or leather goods.

Get the customer to listen to the radio, timepiece or motor.

Get the customer to examine the merchandise.

Make only affirmative suggestions to accomplish the above.

Example: "You can try it on here; step this way." (affirmative)

"You don't want to try it on, do you?" (negative)

Get the customer to picture himself using the merchandise after he has bought it. Make statements like this: "You are going to look good skiing in this suit this weekend."

You are going to have a care-free vacation with this car.

Are you going to be able to wear the new dress this weekend?

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- d. Camera
- e. Air conditioner

You are going to be able to get a full eight hours of sleep when you have to work the night shift after we install this unit in your bedroom. You will be shutting your door and you won't be able to hear the children in the rest of the house.

Get each salesman in the class to make one on their own merchandise.

4. Do not talk too much

If a salesman keeps on talking, he will not give the customer time to visualize ownership of the product.

5. Indicators of a decisor

a. Face

- (1) eyes
- (2) mouth
- (3) expression of interest
- (4) A frown of disapproval

Watch for indicators of a decision to buy. It may come at this time or sooner in your sales talk. Some easily distinguishable indicators of a decision to buy are a look of acceptance in the eye, a smile of approval, a facial expression of interest, or by the way the customer feels the merchandise or handles it.

Certainly a frown of disapproval will tell you that the customer has not been sold. If he shakes his head or puts the merchandise down you may have to go back and select some other item and start over.

b. Positive action

- (1) interested
 - (a) nodding his head
 - (b) handling the merchandise
 - (c) feeling the merchandise

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>(2) disinterested</p> <p>(a) shaking his head</p> <p>(b) putting the merchandise down</p> <p>c. Indirect agreement</p> <p>d. Certain types of objections</p>	<p>At this time a customer will make a statement such as, "I wonder if this tie would go with a grey suit." This indirect agreement tells you that he wants the tie, but is not quite sure of the color.</p> <p>Certain types of objections such as fading, shrinking, or cost of operation will tell the salesman that the customer wants to make the purchase. Example: "I believe this is a good air conditioning unit, but I am afraid it would increase my electric bill too much." The salesman should answer this objection by saying, "Yes, you are running an attic fan now and after you install this unit in your home you will have a smaller fan running in this unit and you will also have a compressor that runs part of the time. I don't know how much it costs you to run your attic fan, but here are the figures compiled by Gulf States Utilities for the four summer months under average conditions for 1,000 square feet."</p> <p>If these types of objections are answered satisfactorily, buying action will occur.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- C. Presenting your Sales Case Convincingly
1. Come to court with witnesses.
 - a. Witnesses are vital to the presentation of a case convincingly.
 - b. Support your statements with witnesses. (testimonials)
 2. Qualify your witnesses
 - a. Qualify your witnesses before you present his testimony.
 - b. Good for winning confidence of your customers. Convince your customers of your product before you begin your testimony or sales talk. This is presenting the goods verbally.
 3. Make tests testify
 - a. You move your prospect from the judge's stand to the witness stand.
 - b. "You are my witness."
 - c. You must effectively convert

In selling, the customer is the judge and jury. The 16mm sound film Presenting Your Sales Case Convincingly presents the sales case to a customer like a trial lawyer presents his case to a judge and jury.

Tell the group that you know that each and everyone of them has his own particular sales presentation, but ask them if they are satisfied with the amount of sales they make compared to the amount of work they put into it.

Let's see if we present our sales case like a trial lawyer does to get results.

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

your customer
from a judge
of the product
to a witness
to its quality
Use of subjective and objective demonstration.

4. Show externally the fire of internal belief.
 - a. Show enthusiasm.
 - b. A salesman weakens his chances when he displays nervousness.
 - c. To be believable, believe.
 - d. Explanation of how to present goods verbally.
 - e. Showing your determination and belief in your product during your sales talk convinces your customer.
 - f. To convince, be convinced; to make believe, you believe.
5. Use only strong lengths in your chain of testimony.
 - a. A chain is only as strong as its weakest link.
 - b. Do not exaggerate.

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- Beware of little exaggerations.
- c. Understate and overprove.
 - d. Tell only the strongest points in your salestalk.
 - e. Do not slip in a weak point.
 - f. One weak statement can destroy all the strong statements you have already made.

UNIT IX
APPROPRIATE SELLING TECHNIQUE

UNIT IX

APPROPRIATE SELLING TECHNIQUE

- I. Aims and objectives of this unit:
 - A. To show the methods of closing sales.
 - B. To become aware of common objections.
 - C. To train the students how to distinguish between excuses and real objections.
 - D. To develop technique in meeting objections.
- II. General outline of this unit:
 - A. Trial close.
 - B. Objections.
 - C. Serving according to type of customer.
- III. Materials and teaching aids needed for this unit:
 - A. Chalkboard
 - B. Chalk and eraser
 - C. Paper easel
 - D. Crayon and marker
 - E. Paper and pencils
 - F. 16mm sound projector and screen
 - G. Film--Overcoming Objections

UNIT IX

APPROPRIATE SELLING TECHNIQUE

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>IX. Appropriate Selling Technique</p> <p>A. Trial close</p> <p>1. Verbal move</p> <ul style="list-style-type: none"> a. Wear it b. Wrap it c. Charge - cash d. Gift wrap e. Deliver f. Pick-up g. Lay-a-way h. How financed i. Trading up <p>2. Physical moves</p> <ul style="list-style-type: none"> a. Reaching <ul style="list-style-type: none"> (1) Charge pad (2) Sales slip (3) Wrapping paper 	<p>In the preceding unit the customers tried the merchandise themselves. During this time the salesperson observed the customers for indicators of a decision to buy. When this indicator is recognized, moves to close the sale should be immediately taken. This is the psychological moment to close the sale.</p> <p>Some typical verbal moves to close the sale are:</p> <p>Do you want to wear it or do you want me to wrap it?</p> <p>Do you want to charge this or pay cash?</p> <p>Do you want this gift wrapped?</p> <p>Do you want this delivered tomorrow?</p> <p>When do you want to pick this up?</p> <p>Do you want this put on lay-a-way?</p> <p>How do you want it financed?</p> <p>You want three pairs for \$3.69, don't you? (trade up)</p> <p>Reaching for a charge pad or sales slip is a good physical move to close a sale. Others are: reaching for wrapping paper or bag, reaching for a pencil and putting date on sales ticket, or walking toward the cash register. (positive) Some salespeople suggest additional merchandise to go with the article as a means of closing the sale.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

- b. Writing date
- c. Walking toward register
- d. Suggesting additional merchandise

3. Physical and verbal moves

Physical and verbal moves should be developed by each salesman and are often made at the same time.

A high school distributive education student's move to close his sale of men's suits is typical: After covering the necessary steps of the sale he would get the customer to try on the pants and then he would start marking the length with chalk in front of the mirror. During this process he would look up at his customer and say that it would take three days for altering. Most customers immediately respond that they need the pants sooner, which this salesman was obliged to carry out.

B. Objections

1. Types of sales resistance

a. Excuses

(1) To stop the salesperson

Sales resistance that comes early in the selling process comes in the form of excuses to prevent the salesperson from interesting the customer in the merchandise. These should not be considered real objections. Some of these are:
 "I haven't time to look at it now."
 "I don't think I'm interested."
 "I'm well supplied now."

(2) To put off a decision

Other excuses that arise in sales but after some of the selling points are given are caused by lack of interest or some hidden objection. They usually appear as follows:
 "I must talk it over with someone else" or "I will be back later."

b. Real objections

When a customer objects to the need of merchandise the salesperson

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

c. Price

(1) Specific

should make no further attempt to sell. If this is not true the salesperson should bring out points that will make the customer see what it will actually mean to do without the merchandise.

A customer may have a specific objection such as "I can't afford it" or "The price is too high." The best way to meet these objections is to establish values in the customer's mind.

(2) Comparative

A customer may make a comparative price objection relative to a cheaper article in the store or a similar article carried by another store. Salespeople must be able to explain the difference in value. It may be wise to ask the customer about the value of competing merchandise such as: How many coats of varnish does that table have? This one has three. (Store Salesmanship, Brisco-Griffith-Robinson, pp. 66-85.)

d. Particular feature

A customer may object to a particular feature of the merchandise such as size, weight, or style. These objections must be met by one of the following methods:

2. Meeting objections

a. Indirect denial method

Indirect denial or "Yes, but..." method.

Agree with the customer and then tell how he is wrong.

Examples: "Yes, this coat is expensive, but it has room to be let out, and it can be worn for two years." "Yes, this is high, but look what you get for your money."

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>b. Reverse English method</p>	<p>In using the reverse English method of meeting objections you turn the objection into a selling point.</p> <p>Examples: "This raincoat is too light." "That's an advantage, you can carry it in your purse." "I like the house, but I don't like the ditch in the back yard." "Yes, but the water from your property will drain into it and you will never have any complaints from neighbors about your water draining on their property."</p>
<p>c. Reverse position method</p>	<p>Ask the customer to explain the objections. Lessen the objections by listening and he might overcome the objection.</p>
<p>d. Superior point method</p>	<p>Admit the objection, then point out all the other good features that will offset the objection.</p>
<p>e. Question method</p>	<p>Convert the objection into a question which when answered will overcome the objection.</p> <p>Examples: "What you want to know is if you can make a profit if you stock our merchandise." "Your price is too high. I can buy shoes cheaper." "I notice you are wearing an 'X' suit. Are you satisfied with it?" "Yes." "Why don't you try one of our \$22.50 suits?" "I wouldn't feel right in a cheap suit." "That's the same in shoes, and besides in the long run these are cheaper."</p>
<p>f. Direct denial</p>	<p>"This will fade." "Absolutely not; this material has been vat-dyed and has been tested thoroughly, and I assure you it is color-fast."</p>
<p>g. Use of testimonials</p>	<p>Make use of a neutral third party by telling your customer how this party uses the product.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

h. Keep your temper down.

Don't let customer's objections rile you into losing a sale. Keep your temper on ice.

i. Recognize the objection as a stall.

When customers stall, it shows that their desire is too low. Give selling points and demonstrate features.

j. Anticipate objections.

As you accumulate experience in selling a product, you will find some objections are common. Overcome these these objections before they are made. (Store Salesmanship, Brisco-Griffith-Robinson, pp. 66-85.)

3. Overcoming Objections
16 mm sound film

a. Lessen the objection by listening

(1) Let customer get off his mind what he has on it.

(2) Do not interrupt.

(3) Do not talk too much

(4) Let the customer talk.

(5) Soften an objection by hearing it out.

b. Convert the objection into a question

(1) An objection inviting an argument should become a

An appliance salesman converted the objection into a question.

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>question inviting an answer. Use subjective demonstration.</p> <p>(2) Answer. Do not argue.</p> <p>c. Soften the bump with testimonials.</p> <p>(1) Use a cushion of other people.</p> <p>(2) Transfer the burden of disagreement.</p> <p>(3) Your customer's pride is sacred.</p> <p>(4) He is not having his objection overruled by you.</p> <p>d. Keep your temper on ice.</p> <p>(1) Show no suggestion of temper.</p> <p>(2) The quickest way to cook your own goose is to lose your temper.</p> <p>(3) Do not let your face show your thoughts</p> <p>(4) Keep cool.</p> <p>e. Recognize the objection that is only a stall</p>	<p>An ice cream salesman and a machinery salesman used a neutral third party to cushion objections.</p> <p>A laundry salesman had to hold his temper in order to keep from losing a sale.</p> <p>A tobacco salesman had to recognize the objection was only a stall wearing whiskers.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

wearing whiskers.

- (1) Recognize the real face behind the whiskers.
- (2) Build up buying benefits.
- (3) Low desire masquerades as high price.
- (4) Back of those false whiskers is a customer whose desire for your product is not high enough.

f. Use today's objections as a sharpener to make tomorrow's sales talk sharper.

- (1) Plan your sales talk so that questions are answered before they are asked.

C. Serving according to type of customer

1. "I'm just looking" customer

All salesmen have to keep improving their sales talks and demonstrations to keep objections from arising.

An "I'm just looking" customer is one of the easiest customers to sell to. She is one that wishes to look around, and may not wish to buy at once, and does not want salespeople tagging along. Welcome them into the store by saying, "Make yourself at home. I'll be right over here. If I can help you, let me know." They may not wish to buy at the present time. Step away from

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
	<p>them and make believe you are arranging stock and watch them through the corner of your eye. When they raise their head, they are ready to buy or they need help. If you follow them you will follow them to the door. Serve other customers, if any.</p>
<p>2. Wavering customers</p>	<p>They cannot make up their minds which article to buy. They are undecided. Remove all uninteresting merchandise and narrow the goods down to two or three items. Give the selling points of only one. Then move to close the sale by saying, "You can take this one home and if you would rather have the other, you can exchange it."</p>
<p>3. Bargain hunter</p>	<p>One who wants a very good product or service but does not want to pay the price for it. Give merchandise information showing the customer what she gets for her money and also point out what the cheaper product does not have.</p>
<p>4. Wise customer</p>	<p>Easy customer to serve. May be either truly wise or falsely wise. One who knows or thinks he knows more about the merchandise than the salesman does. Bring out the merchandise for them to inspect. Let them talk themselves into a sale.</p>
<p>5. Silent customer</p>	<p>One who doesn't say anything. This type of customer does a lot of thinking and listening. Give one point at a time and ask questions which cannot be answered with yes or no.</p>
<p>6. The snob customer</p>	<p>Treats the salesperson as if he is an inferior person. She treats a salesperson as though she owns him. Follow out her orders, but be polite and show her that you have pride. Stay composed. Give her as much merchandise facts as possible so that she will know that you are well informed and educated.</p>

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
7. Suspicious customer	<p>This customer is distrustful of all that the salesperson says. Serve her by demonstrating and have the customer explain the merchandise. Ask questions that will lead her to talk about the merchandise, but do not give your opinions.</p>
8. The different customer	<p>One who takes the opposite point of view. This customer has reasons for doubting the salesperson. Let customer discover qualities herself and answer questions with facts.</p>
9. Argumentive customer	<p>A customer who will continually argue with you. Give in gracefully and do not argue back. This type of customer will add to your information.</p>
10. Those who delay	<p>A customer who has fear of her own judgment; she has little money to spend. Serve her by showing economical, durable, but rich looking merchandise.</p>
11. Stubborn customer	<p>Insists on certain types or brands of merchandise. Substitute if you can, but do not continue to show substitutes. If you do not have that brand or type of merchandise try to order it. If you cannot order the merchandise, refer customer to place where she can purchase it. Telephone if you have time.</p>
12. Cautious customer	<p>One who asks many questions before buying. Answer questions with facts and demonstrate. Show only solid, durable, and thoroughly useful merchandise.</p>
13. Conceited customer	<p>One who is always using "I," "My," or "Mine." Serve them by using "you" and "yours" in your sales talk.</p>
14. Nervous customers	<p>They are impatient and cannot stand delay. Recognize them if you are waiting on another customer. Hurry yourself and act a little nervous, but stay controlled.</p>

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
15. Slow customers	Do not want to be rushed. show them only a small amount of merchandise. Excuse yourself tactfully to wait on another customer.
16. Shy customer	Generally a man buying a present for a woman. Estimate sizes for this customer by observation of other customers or salespeople. Give suggestions and mention exchange if it is allowed by the store.
17. Dignified elderly customer	One who has finished his responsibilities of life. Be polite and respectful and bring out the best merchandise for him to inspect. Do not try to tell him anything about merchandise unless asked.
18. Foreign customer	Anyone who is out of his regular environment. This is the only customer that you use superlatives on. You can give a little opinion.
19. Child customer	They have not yet reached the age of maturity. They are the future buyers. Sell them nothing that you would not sell their parents. They will bring their parents to the store.
20. Talkative customer	One who thinks salespeople have time to listen. Listen if you have time, but excuse yourself to serve a waiting customer. Try to sell him something and he will leave.
21. Ill-informed customer	Generally buying for someone else. Get permission to call the actual customer.
22. Comparative buyer	One who compares all prices with other stores. Give merchandise information and ask the customer to check your competitor's merchandise to see if it has certain features. Then make another move to close the sale.
23. Exchange customer	Refund or correct size or exchange for other merchandise.

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
	<p>The cause of exchange is that the salesperson did not select the right merchandise or did not thoroughly sell the merchandise to start with or it was defective merchandise.</p>
<p>24. Rude customer</p>	<p>A customer who is obnoxious about your asking questions (disagreeable) Explain to the customer the necessity of obtaining information. A soft answer turns away wrath. Keep your temper on ice.</p>
<p>25. Race, creed, or color</p>	<p>At one time there were religious prejudices. Today in Texas there are the Mexicans; in California, the Chinese; in New York, the Porto Ricans; and in the North and South the Negroes, with racial and color prejudices on both sides. A salesman's individual prejudices should not cause a business to lose sales that are bought and paid for by advertising and good will. He may avoid using "Yes, sir," or "No, sir" if he wishes by being tactful and using other words such as "I don't know," or "I will check and see." Remember all customers should be treated courteously because they are the property of the store and not the salesman's personal possession.</p>

UNIT X

SUMMARIZE THE BUILD-UP

UNIT X

SUMMARIZE THE BUILD-UP

I. Aims and objectives of this unit:

- A. To teach students when to summarize.
- B. To determine when to substitute another product.
- C. To help the salesman realize the importance of summarizing before attempting another move to close the sale.
- D. To help the salesman retain his customer tactfully so that he may have more time to create a desire for the merchandise.

II. Materials and teaching aids needed for this unit:

- A. Paper easel
- B. Crayon or marker
- C. Paper and pencils

UNIT X

SUMMARIZE THE BUILD-UP

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>X. Summarize the build-up</p> <p>A. When</p> <ul style="list-style-type: none">1. Not sold2. Put off <p>B. How</p>	<p>In the appropriate selling technique we discussed trial moves to close sales. When this move to close the sale does not work and the salesman is sure he has selected the right merchandise, the customer may not be completely sold or may just be trying to put off the sale.</p> <p>The salesman should go over the high points of the sale and then make another move to close the sale. On large money items such as insurance, real estate, cars, appliances, and some expensive clothing the salesman may have to summarize several times.</p> <p>If at any time the salesman realizes that he has selected the wrong merchandise for the customer, he should start over.</p>

UNIT XI
SUGGESTIVE SELLING

UNIT XI

SUGGESTIVE SELLING

I. Aims and objectives of this unit:

- A. To further develop a salesman's method of increasing sales.
- B. To stress the importance of suggestive selling.
- C. To check the students' method of suggestive selling.
- D. To teach the students various ways of suggestive selling.

II. General outline of this unit:

- A. Related or tie-in sale
- B. Unrelated
 - 1. Necessity items
 - 2. Specialty items
 - 3. Trading up
 - 4. Gifts
 - 5. Future sales
 - 6. Other departments
 - 7. Hints
 - 8. Affirmative suggestions
 - 9. Negative suggestions

III. Materials and teaching aids needed for this unit:

- A. Chalkboard
- B. Chalk and eraser
- C. Paper easel
- D. Crayon or marker
- E. Paper and pencils

UNIT XI
SUGGESTIVE SELLING

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>XI. Suggestive Selling</p> <p>A. Related or tie-in sale</p> <p>B. Unrelated</p> <p>1. Necessity items</p> <p>2. Specialty items</p> <p> a. On sale</p> <p> b. New stock</p> <p> c. New fashion</p> <p> d. Currently advertised</p> <p>3. Trading up</p> <p> a. More than one</p> <p> b. Higher-priced</p>	<p>After the customer agrees to purchase an article, the salesman should suggest a related item to tie-in to the original sale. Some examples of these are: shirt-tie, hat-shoes or purse, shoes-socks or polish, gun-shells, television set-service policy.</p> <p>There are many necessity items that may be suggested. Salesmen should examine their merchandise to realize the items they carry that may be considered necessities in everyday life. Here are a few: department store-handkerchiefs or women's hose; filling station-oil, or tires; drug store-toothpaste, aspirins or razor blades; grocery store-bread, coffee, or sugar; record shop-needles.</p> <p>Some of the items that are stocked may be special in nature. They may be reduced, new stock, new fashion or advertised in a current magazine or newspaper.</p> <p>An easy way to increase sales is to trade up. Suggest more than one article, such as three pairs of hose at a certain price, or suggest a greater amount, such as ten pounds of sugar instead of five.</p> <p>Another method of trading up is to suggest to the customer to buy the higher-priced article.</p>

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

4. Gifts
- a. Christmas
 - b. Wedding
 - c. Graduation
 - d. Mother's Day
 - e. Father's Day

Suggesting for gift purchases is very appropriate for certain days or seasons. Leading statements or questions may be made or asked, such as, "Have you finished your Christmas shopping?" "Do you have to buy any wedding presents or graduation presents this year?" "Father's Day is next week. Let me show you an ideal gift."

5. Future sales

Suggest for future sales by asking customers if they would like you to call them when new merchandise comes in or ask them if they would like to open a charge account if they do not have one.

6. Other departments

Suggest that the customer visit other departments or fellow employees before leaving the store. Example: "Have you been in the household department? They have a special on towels today."

7. Hints

Continually listen for hints customers may make. They may be in the market for a gift for a certain occasion.

- a. Gifts
- b. Going to beach
- c. Daughter going to a party
- d. Vacation

The customer may mention going to a beach; a suggestion of a beach ball, towel, or crab nets would be in order in some stores.

Occasionally a hint will allow you to mention a suggestion for a member of the family.

Quick-drying lingerie, tires, suitcases, or sporting goods would be ideal suggestions for someone going on vacation.

8. Affirmative suggestions

Always suggest in the affirmative and in a helpful way. Examples:

"Let me show you something that I know you will enjoy for everyday use."

"You want three pair for \$3.95, don't you?"

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

9. Negative suggestions

"Do you have an extra fishing line in your tackle box? You will need one if you find yours rotten on your fishing trip."

"I think you would prefer the (not 'our') \$369.00 unit. You won't be running your compressor twenty-four hours a day."

(Customer buys some records.)

"Here is a Victor needle; you will enjoy playing your records with it. It will not only bring out the tone quality, but you will play one thousand records with it before needing a replacement."

Always talk in the positive; never use negative suggestions.

Examples of negative suggestions:

"You don't want anything else, do you?"

"You don't want to try it on, do you?"

"You don't want anything for evening wear, do you?"

"You don't want a \$369.00 unit, do you?"

UNIT XII
ROUTINE DETAILS

UNIT XII
ROUTINE DETAILS

- I. Aims and objectives of this unit:
- A. To show the students the importance of routine details.
 - B. To suggest ways in which mistakes may be avoided.
 - C. To remind the group of some of the routine details that are part of the salesman's job.
- II. Materials and teaching aids needed for this unit:
- A. Chalkboard
 - B. Chalk and eraser
 - C. Paper easel
 - D. Crayon or marker
 - E. Paper and pencils

UNIT XII
ROUTINE DETAILS

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>XII. Routine Details</p> <ul style="list-style-type: none">A. ChargingB. WrappingC. Making changeD. Lay-a-wayE. DeliveryF. RestockingG. Displays	<p>On every job there are details that have to be performed although the employee may not care to do it. Salesmen are required to fill out charge slips, wrap packages, make change, fill out lay-a-way forms, prepare merchandise for delivery, restock and straighten up the display after the sale is made. A good many customers are lost due to laxity on the part of a salesman in performing these duties. Mistakes are made by not writing names and addresses in a legible handwriting. Shortages sometimes occur through faulty method of making change. Sometimes salesmen fail to inform customers of the terms of lay-a-way or charging, or to specify when merchandise may be delivered.</p> <p>NOTE: Curriculum guides are available on cashiering, credit and collections, and gift wrapping from Distributive Education Section, Louisiana State Department of Education.</p>

UNIT XIII
FOLLOW-UP OF THE SALE

UNIT XIII
FOLLOW-UP OF THE SALE

- I. Aims and objectives of this unit:
- A. To introduce the students to the technique of follow-up so they will increase their clientele.
 - B. To increase the students' prospects by follow-up.
 - C. To show the student how to follow up a sale.
- II. Materials and teaching aids needed for this unit:
- A. Chalkboard
 - B. Chalk and eraser
 - C. Paper easel
 - D. Crayon or marker
 - E. Paper and pencils

UNIT XIII

FOLLOW-UP OF THE SALE

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
XIII. Follow-up of the Sale	<p>Call customers on telephone or go and visit them when you are not busy to see how they are getting along with the merchandise you sold them.</p> <p>Ask them if they have any neighbors or friends to whom they would like to recommend that product.</p> <p>Suggest additional merchandise you have available.</p> <p>Follow up on (future sales of suggestive selling) names to call on merchandise when it comes in.</p>

UNIT XIV
TELEPHONE SELLING

UNIT XIV
TELEPHONE SELLING

- I. Aims and objectives of this unit:
- A. To teach the group the proper method of taking incoming calls and making outgoing calls.
 - B. To show how customers are lost by bad telephone habits.
- II. General outline of this unit:
- A. Incoming calls.
 - B. Outgoing calls.
- III. Materials and teaching aids needed for this unit:
- A. Chalboard
 - B. Chalk and eraser
 - C. Paper easel
 - D. Crayon or marker
 - E. Paper and pencils
 - F. 16 mm projector and screen
 - G. The film--A Manner of Speaking

UNIT XIV

- answer phone.
2. Answer promptly.
 3. Identify yourself.
 4. Transfer calls properly.
 5. Keep pad and pencil handy.
 6. Leave a message when you leave your telephone.
 7. Place and receive your own calls.
 8. List frequently used numbers.
 9. Do not say "Who's calling?" Ask instead, "May I tell him who's calling?"
 10. If you have to leave the line, explain why.
 - a. Ask if you should call back.
 11. Terminate calls courteously.
 12. Telephone as you would be telephoned to.

in one rainy day and was not recognized by his staff. He was trying to postpone a meeting with one of his clients, but due to bad telephone habits on the part of the company the meeting was not canceled which resulted in the loss of this client.

A representative of the telephone company was called in and a complete analysis was made of telephone selling.

UNIT XV
CONCLUSION

UNIT XV

CONCLUSION

I. Aims and objectives of this unit:

- A. To reemphasize the use of the twelve steps of the building-up process.
- B. To illustrate the channels of distribution.
- C. To show the students how important their jobs are in the American economy.
- D. To award the certificates.

II. General outline of this unit:

- A. Summary of the building-up process.
- B. The American Economy.
- C. Reference material.
- D. Certificates.

III. Materials and teaching aids needed for this unit:

- A. Chalkboard
- B. Chalk and eraser
- C. Paper easel
- D. Crayon or marker
- E. Paper and pencils
- F. Certificates

XV. Conclusion

A. Summarize the twelve steps of the building-up process.

1. Pre-approach.
2. Meeting the customer.
3. Selecting the merchandise.
4. Presenting the merchandise physically.
5. Presenting the goods verbally.
6. Salesman's demonstrations.
7. Customer's demonstrations.
8. Applying selling technique.
9. Summarizing the build-up.
10. Suggestive selling.
11. Routine details.
12. Follow-up of the sale.

B. The American Economy

1. Channels of distribution
 - a. Producer-manufacturer
 - b. Jobber-wholesaler
 - c. Retailer
 - d. Consumer

Did you ever stop to think about the part we play in the American economy? What will happen to the economy if the salesman in retailing or the jobber in wholesaling slacks up on his job? The salesmen are the spokes of the wheel of progress. He gains the attention of the customer, arouses the interest, creates the desire and produces buying action. As a result of millions of salesmen's efforts throughout the nation and in foreign countries, we can produce goods by mass production and even automation and enjoy the highest standard of living known to man. (Retailing Principles and Practice, G. Henry Richert, pp. 47-67)

INSTRUCTIONAL OUTLINE

SUGGESTIONS TO INSTRUCTORS

C. Reference material

Get the local library to mimeograph available books on salesmanship and pass them out to the group.

D. Awarding certificates

It may be appropriate to turn this job over to the Adult Sales Clinic's promoting agency.

GENERAL INFORMATION

The following sheets, some of which are yellow, will give you various information which you will need throughout your typewriting course. The job sheets will frequently refer to items within these pages. To become even more proficient in your knowledge of the typewriter and its use, it is a good idea to review all of this material from time to time.

The Supplementary Materials referred to in the job sheets are the green pages in the back of the book.

ORGANIZATION OF MATERIALS

Whether you are an advanced student or a beginner, there are certain preparations you should make before you begin to type. The condition of your work area tells a lot about what kind of office worker you will make.

The frame of your typewriter should be even with the front of the table or desk. The cover should be folded neatly and put either in a drawer or any other designated place. Your book should be at your right in good reading position slightly tilted. Sufficient paper should be at the left of the machine, arranged so that it will not blow or fall off your desk. Erasers, carbon paper, and onion skin paper should be handy if you are going to use them.

Check the posture chart posted on your bulletin board or the technique check list on pages iv and v for correct sitting position at the typewriter.

CARE OF THE MACHINE

So that you can produce the best possible work, your typewriter must be properly cared for. Daily, you should brush the printing faces of the typebars with a stiff-bristled brush. With a long-handled, soft-bristled brush, dust inside the machine paying particular attention to the basket where erasure dust may have fallen. Wipe your entire desk and under the machine. It is not necessary to lift the machine--simply tilt it back slightly and dust under it. Be sure your machine is covered when not in use.

Your instructor will tell you if you should clean the typewriter with "Mr. Scat" or another chemical solution made for this purpose. If so, apply the solution generously to the face of the typebars with the applicator provided. Brush briskly over the typebars. Insert a sheet of paper and strike each key until there is no excess fluid remaining on them. If the "o's," "b's," or any other circular letters are still clogged, repeat the process. Some typewriter manufacturers recommend the use of a plastic type cleaner rather than a liquid. Ask your instructor to tell you which kind to use.

TECHNIQUES TO BE CHECKED

1. Arms--almost motionless; very steady
2. Back--straight, leaning forward slightly
3. Bell--consciously listened for
4. Bell--margin stop is set to use its warning
5. Bell--reaction to it is quick, without looking up
6. Body--centered on the letter J
7. Body--leans forward from the waist
8. Body--faces the machine and table squarely
9. Body--is positioned well back in the chair
10. Carriage return--a toss, not a throw or drag
11. Carriage return--hand gets "home" instantly
12. Carriage return--made without looking up
13. Continuity--no dawdling between tasks
14. Continuity--no dawdling while typing
15. Copy--placed at the right of the machine
16. Copy--slopes, is on easel or prop; not flat
17. Effort--constant, purposeful, sincere
18. Elbows--relaxed; hanging loose, but close to body
19. Eyes--remain constantly on the copy
20. Feet--both squarely on floor
21. Fingers--the A- and ;-fingers are firm anchors
22. Fingers--are kept curved, are never straight
23. Fingers--spread when you reach for margin release
24. Hands--bounce a little, but not much
25. Hands--close together (you could lock thumbs)
26. Hands--flat across the backs

TECHNIQUES TO BE CHECKED (continued)

27. Hands--base of hand does not touch the machine
28. Head--is erect, turned to face the copy
29. Margin release--used without fumbling or looking
30. Margin sets--used quickly, efficiently
31. Margin stops--reset, not recalculated*
32. Nails--trimmed short, are kept unbroken
33. Neck--straight, not bent or craned
34. Paper--insertion is correct, quick, efficient
35. Paper--straightening is quick, automatic
36. Paper--paper release is used
37. Poise--no exclamations, paper yanking, frowns
38. Rhythm--you show obvious effort for steadiness
39. Shift lock--used without fumbling or looking up
40. Shifting--the F- and J-fingers "stay at home"
41. Shoulders--are up and back, but are relaxed
42. Stroking--clean-cut, firm, brisk, decisive
43. Stroking--steady, unhesitant, continuous
44. Stroking space bar--use a "bounce-off" stroke
45. Tabulator--stops set and cleared efficiently
46. Tabulator--used without fumbling or looking up
47. Thumb left--kept close to left forefinger
48. Thumb, right--hovers $\frac{1}{2}$ inch above the space bar
49. Thumb, right--hovers over center of space bar
50. Wrists--kept level, with no arch and no dip

* Example: To change from 50 to 60 spaces, move each stop out 5 spaces; don't recalculate the settings.

E R R O R A N A L Y S I S C H A R T

ERROR	TROUBLE	CAUSE	SUGGESTED REMEDY
maie (make)	Wrong reach	Overreaching or underreaching for a key	You just need more practice using this difficult reach
laf (lag)	Adjacent reach	Usually indicates the need for more practice or a faulty hand position	Keep wrists low and fingers close to home keys
saki (sake)	Opposite reach	You used the correct finger but on the wrong hand	You need more practice on these letters
bilss (bills)	"Doubling wrong letter	Due to lack of concentration	Type double letters more slowly until you have control
xii threee (three)	Extra letters	Due to nervousness or from sloppy and hurried stroking	Slow down and relax
wen to (went to)	Omissions (letters)	Omissions are errors of timing or reading too fast	Slow down and strike the key firmly. Keep your eyes on the word being typed until you have control. Then read no more than one word ahead
I plan go (I plan to go)	Omissions (words)	You looked up and lost the place or you were misled by proximity in copy	Same as above
plaec (place)	Transpositions	Due to typing or reading too fast	Go back to letter by letter typing until you have control
ju st (just)	Spacing (between letters)	Poor stroking rhythm	Don't let your finger linger on a key

ERROR	TROUBLE	CAUSE	SUGGESTED REMEDY
index card (index card)	Spacing (extra)	You are riding the space bar or striking it too heavily	Keep the thumb a half inch above the space bar and use a rhythmic stroke
indexcard (index card)	Spacing (omitted)	You did not strike the space bar at all, or you struck the space bar at the same time you hit the last letter of a word; or you did not strike the space bar hard enough	Tap your space bar with the same quick snappy stroke that you use on any key and say the word "space" to yourself after each word
Race (Race)	Poor Capitals	You released the shift key too soon or did not press it all the way down	Hold the shift key down firmly while you strike the letter, then release it quickly. Use a 1, 2, 3, count
MN (mN)	Capitalizing (wrong letter or failure to do so)	You were anticipating the typing of a capital letter and were too eager	Concentrate
We MAY SEe (We MAY see)	Shift Lock (all caps)	You failed to release or set the Shift Lock Key	Concentrate and keep alert
so ld (sold)	Crowding	Two or more type bars collide or two keys were struck so close together that one letter touches another	Practice rhythm drills. Select a rhythmic speed that will avoid crowding or uneven stroking
gam (game)	Piling	One letter is typed on top of another	Listen for the bell. Count the number of strokes that can be made after the bell rings before the carriage sticks
Claim (Claim)	Strikeovers (intentional)	Improper use of the backspace key	This is the unpardonable sin in typing

ERROR	TROUBLE	CAUSE	SUGGESTED REMEDY
_____	Occasional line much too long or short	Bell does not ring loudly enough or you are not responding to it	Learn to distinguish the sound of your own bell, and know exactly how many letters you can type after the bell sounds its warning
They took the car from him	Irregular left-hand margin	You are throwing the carriage too hard or not hard enough	Return the carriage with a quick movement of your wrist and just hard enough so that it will slide into position
be do if be do if be do if	Irregular indentions or tabulatings	The tab bar was released too soon. Or, you were using the space bar instead of the tab	Hold the tab bar down until the carriage fully stops
there (their)	Confusing like words and poor spelling	Slow down, be alert and check pronunciation and spelling in the dictionary	Could be due to lack of concentration, reading too far ahead, mispronunciation of a word or your inability to spell even in longhand
keep (keep)	Unevenness in copy (light and dark letters)	You are typing in jerky spasms instead of in a smooth rhythmic pattern	Type as though you hear music and snap the keys harder
lake (lake)	Shadowed letters	You are pushing keys, mashing them down	Peck or snap the keys and release them more quickly. Fingers should be curved
	Miscellaneous errors		Study carefully to determine the cause

* Note alternate method in job sheet, page 7.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

BASIC INSTRUCTIONS

1. Read "Principal Parts of Manual Typewriters" on pages 2-5 in your textbook. Pay particular attention to the illustration describing the machine you are using. Refer to the drawings on pages vi-xi of these job sheets. As you read about a machine part, locate it on your typewriter and touch it. The lower portion of page 5 of the textbook shows the parts you will particularly need to know and be familiar with for the first lesson. Review them thoroughly.
2. Read Supplementary Sheet 3, "Pica or Elite?" and determine which type you are using. (Green sheets in the back of this book.) Page 7, paragraph 6 in the textbook gives more information about pica and elite type.
3. Read "Horizontal Spacing," pages 6 and 7 of the textbook.

NOTE: Read Supplementary Sheet 1, "Finding the Center of the Paper," for further instruction. Read also, "Figuring a 40-space Line," page 2 in the Supplementary Sheets.

4. Read "Vertical Spacing," page 8 of the textbook.
5. If you have not already done so, read "Organization of Material" in the yellow pages preceding these job sheets.
6. Tell your instructor when you have completed reading the above information. If there is any part of it that you do not understand, ask her to explain it to you now.
7. Now your instructor will want to go over with you the "Steps in Preparing to Type," page 9 of your textbook. She will also tell you what supplies, if any, you will need to furnish throughout your typing course.
8. Turn to page 5 in your WORKBOOK. Complete the Learning Guide following all instructions carefully. Remember, a great deal of your success in typewriting will depend on your ability to follow instructions.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

BASIC INSTRUCTIONS

2

9. Your instructor will tell you whether you should turn in your Learning Guides after you have completed them.

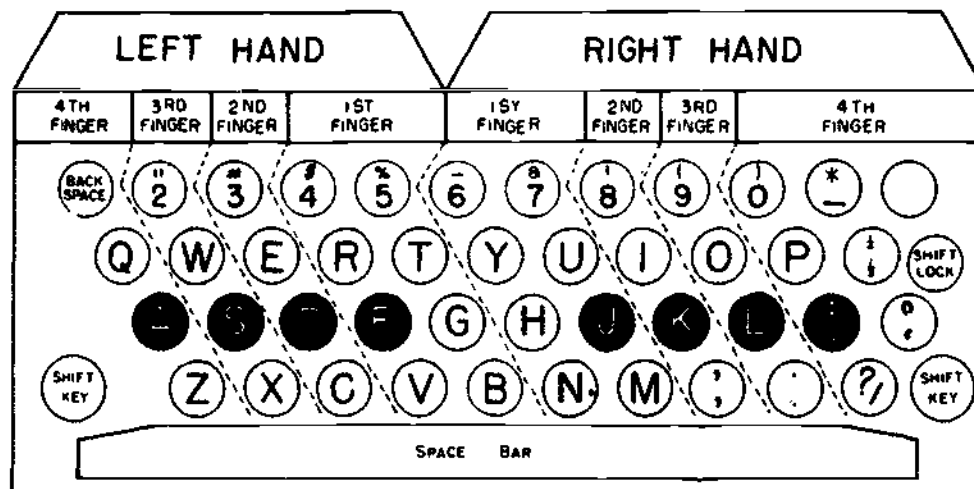

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART I, Unit 1

3

Lessons 1-6

1. Study the diagram below. Notice the home-row keys are in black. If your instructor permits, and it is an easier reach for you, strike the number 6 with the "F" finger instead of the "J" finger and the letter "C" with the "F" finger instead of the "D" finger.

2. Study the Technique Check list on pp. iv and v in these job sheets. Your instructor will observe, make suggestions, and perhaps grade you from time to time on your typing techniques. But, Practice These Correct Techniques at all Times whether graded or not.
3. Turn to the sample lesson on pp. xv-xvii in the yellow pages of this book. Note the procedure you are to use in typing each lesson. Ask your instructor if you should turn in your work at the completion of each Unit, each Lesson, or daily.
4. You will, of course, make errors. These will undoubtedly concern you. There is an error analysis sheet in the yellow pages which should help you discover the cause of your errors. You will want to keep this handy as problems arise.
5. WORKBOOK. Read page 7, "A Look at Lesson 1."
6. Type Lesson 1, pages 10 and 11. Be sure to read the material in the colored margin as you proceed with the lessons. Compare your typed lesson with that on page 8 of your WORKBOOK.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART I, Unit 1

4

7. Refer to page iii in the yellow pages, "Care of the Machine." Ask your instructor to tell you how often you should use one of the chemical or plastic cleaners on your machine, but remember, you should always dust and cover your machine daily.

8. WORKBOOK, page 9. Learning Guide.

9. Type Lessons 2, 3, 4, pages 12-16, following marginal instructions.

NOTE: Study the keyboard chart in each lesson before you begin typing. Feel the new reaches several times before you actually strike the keys. Remember to proofread carefully everything you type, and circle your errors. A typed page is never complete until you have checked for errors.

10. Type Lesson 5, pages 16 and 17.

NOTE: Disregard paragraph 5-D and Learning Guide, WORKBOOK, page 1, until Lesson 18.

11. Type Lesson 6, page 18.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART I, Unit 2

5

Lessons 7-12

1. Type Lessons 7, 8, 9, 10.
2. WORKBOOK. Your teacher may want you to use the Skill Scoreboard on page 3 of the WORKBOOK. If so, ask her to explain it to you and begin using it with Lesson 7.
3. Type Lesson 11, pages 25 and 26.

NOTE: Read paragraph 11-D carefully. If you do not understand the tabulation technique introduced, ask your instructor to help you.

4. Type Lesson 12, pages 26 and 27.

NOTE: When you have completed Lesson 12, your instructor may want you to type the accuracy Clinic Alphabet practice on page 11 of your WORKBOOK. You should ask her.

5. Remember to proofread and circle all errors. Review the Technique Check List in the yellow pages of this book.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART I, Unit 3

6

Lessons 13-18

1. Type Lesson 13, pages 28 and 29.

NOTE: Study paragraph 13-G carefully. Read Supplementary Sheet 1, "Horizontal Centering" at the bottom of the page.

2. WORKBOOK: Learning Guide: Horizontal Controls, page 13.
3. Type Lesson 14, pages 29 and 30.
4. Read Supplementary Sheet 6, "Vertical Centering." Refer to page 8 of your textbook for more explanation.
5. Type Lesson 15, pages 30 and 31.

NOTE: After you have read paragraph 15-G you should type the exercise shown on a half sheet of paper. Center it both vertically and horizontally. If you make a typographical error, go right on. Do not start over. Proofread and circle your errors when you have completed the typing.

6. Type Lesson 16, pages 32 and 33.
7. WORKBOOK, Learning Guide: Vertical Controls, page 15.
8. Type Lesson 17, pages 33 and 34.
9. Turn back to page 17, Lesson 5, paragraph 5-D and study carefully how your speed is measured.
10. WORKBOOK, Learning Guide: Computing Typing Speed, page 10.
11. Read Supplementary Sheets 4 and 5.
12. Turn back to the sample lesson (yellow pages) and study the correct procedure to follow when setting up a lesson to hand in which includes timed writings.
13. Type Lesson 18, pages 34 and 35.

NOTE: Take 2 one-minute timed writings on paragraph 18-B, page 35. Take at least 1 one-minute writing on paragraph 18-F.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART 1, Unit 3

7

IMPORTANT: As soon as you complete each timing, proofread, circle errors, figure your score, and place it in the right-hand margin beside your timing. Your instructor will tell you if you should subtract 10 from your gross count when figuring your score.

Examples: When following Supplementary Sheet 5-D

$$\begin{array}{r} 30 \text{ Words} \\ -10 \text{ 1 Error} \\ \hline 20 \end{array} \qquad \begin{array}{r} 20 \text{ wam} \\ 1/20 \\ \hline \end{array}$$

When not deducting for errors

30/1/1
Words
Error
One minute

Follow the same procedure for all future timed writings.

14. If you are using the Scoreboard Chart in your WORKBOOK, turn to it and record your score.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART I, Unit 4

8

Lessons 19-24

1. Study the diagram below. Note that the numbers and symbols are in black. If your instructor permits and it is an easier reach for you, strike the number 6 with the "F" finger instead of the "J" finger.

2. Type Lessons 19, 20, 21, 22, 23, and 24, pages 36-43.

NOTE: As each new number key is introduced, feel the reach several times without actually striking the key. Remember, keep your eyes on your copy.

NOTE: In Lesson 21, page 39, omit paragraph 21-H at this time.

3. The two paragraphs below may be used with each lesson as one-minute timed writings. Set your goal a little higher with each lesson.

(1) There is no doubt that you can learn to type well¹⁰ if you type in the right¹⁵ manner. It is always easier to do what we are striving²⁵ for if we think positively.^{30 31}

(2) A man who reads will go⁵ far in an office. The more¹⁰ you read, the more you¹⁵ can learn. The big jobs²⁰ require men who read more²⁵ and learn more.²⁸

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART I, Unit 4

9

4. NOTE: Type the optional review of centering, Lesson 21, page 39.
5. WORKBOOK, Learning Guide: "Spacing after Punctuation," page 17.
6. a. WORKBOOK, General Information Test on Part 1, page 19.
b. Textbook Progress Test on Part One, Lesson 25, pages 44 and 45. Follow all instructions carefully.

NOTE: Your instructor may wish to use the WORKBOOK and textbook tests as review material for you. If this is the case, after you have completed the textbook and WORKBOOK tests, ask for your instructor's test for Part I.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 5

10

Lessons 26-27

1. WORKBOOK. If you are using the Scoreboard Chart on page 3, record your timed writing progress. You will not be reminded any more, so keep the chart handy for daily use if necessary.
2. Type Lessons 26 and 27, pages 47-49. Read the instructions in the colored margins carefully and type each exercise accordingly.

NOTE: Paragraph 27-A, page 48, tells you how to respond to the margin bell. Since there are others typing around you, you will have to learn to distinguish the sound of your bell from any other. In an office you will probably also be typing in an area with others, so now is a good time to become accustomed to outside distraction. Concentration is one of the keys to success.

3. WORKBOOK, Learning Guide: Making Line-Ending Decisions, page 25.

NOTE: If you haven't already, you will want to familiarize yourself with Gregg's 20,000 Words. It is a ready source for both spelling and word division in many cases. Since it is such a helpful aid, you may wish to buy your own copy. Your instructor can tell you the approximate price.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 5

11

Lessons 28-29, pages 50-52.

1. Type Lessons 28 and 29, pages 50-52.

NOTE: Take 2 two-minute timings on paragraph 28-B. Type the first one, then read the marginal information and type the second timing. Decide whether speed or accuracy should be your goal and target on your goal.

2. Follow all marginal instructions for the remainder of the two lessons.
3. WORKBOOK, Learning Guide: When Not to Divide Words, page 27.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 5

12

Lessons 30-31, pages 53-55.

1. Type Lessons 30 and 31.

NOTE: Read carefully paragraph 31-A.

2. Paragraph 31-F. Take a five-minute writing on this paragraph. Relaxation is very important when typing for a sustained period. Before you begin, let your arms hang down by your side and relax your shoulders. Then assume correct typing position and begin.
3. WORKBOOK, Learning Guide: How to Divide Words, page 29.
4. Ask your instructor which parts of the Speed Clinic Material you should type. (Page 31 in your WORKBOOK).

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

Lessons 32-33

1. WORKBOOK, Learning Guide: Basic Parts of Business Letters, page 33. Your instructor may have illustrations of business letters she will want to show you. You should ask.
2. Type the drills on page 56, Lessons 32-33. Paragraphs 32-A, 32-C, and 32-D. Read paragraph 32-B carefully and experiment with your own name, etc.
3. Read paragraph 32-F, page 57 and follow the instructions when setting up letters 1, 2, and 3 on the next two pages.
4. Memorize the Placement Guide (blue block) in the left column, paragraph 32-F.

NOTE: Even though the number of spaces is given, you should know how to figure a 4-, 5-, or 6-inch line. Remember, pica spacing has 10 spaces to an inch; so a 4-inch line would be: $10 \times 4 = 40$ space line. Elite spacing has 12 spaces to an inch; so a 4-inch line would be: $12 \times 4 = 48$. (round off, calling this a 50-space line) Read Supplementary Sheet 2 "Converting Inches to Spaces."

5. Ask your instructor if you should use the "Production Scoreboard" on page 4 of your WORKBOOK for the next few jobs.
6. Instructions for the letters to follow are in paragraph 32/33-G. Read these instructions carefully before proceeding. Use WORKBOOK Letterheads, pages 35, 39, and 41. Type Letters 1, 2, 3, and 4, pages 58 and 59 after you have read the two notes below.

NOTE: You may wish to tear page 37 from your WORKBOOK to use as an aid in setting your margins. Be careful not to become dependent upon it, however. Your goal is a mailable letter in the shortest possible time.

NOTE: Read Supplementary Sheet 11-S, "Erasing" and paragraph 56-A, page 92 in the textbook. Your instructor may wish to demonstrate how to make a good erasure. Be sure to ask. She will also tell you when you should begin correcting your errors.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 6

14

OPTIONAL: If you are to begin making corrections at this point, turn to page 77 in your WORKBOOK, Learning Guide: Making Corrections and follow instructions given. If your instructor does not want you to erase now, the Learning Guide should be completed at the end of Lesson 52.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 6

15

Lessons 34-35, pages 60-62.

1. Type paragraphs 34-A, 34-B. Read paragraph 34-C, page 60.
2. WORKBOOK, Learning Guide: Sequences of Punctuation and Quotation Marks, page 45.
3. Type paragraph 34-D following marginal instructions.
4. Set your own goals for the letters on pages 61 and 62 using the suggested ones at the top of page 61 as guides. After you have typed them satisfactorily, cut a stencil of Letter 5, page 61. Your instructor will give you detailed instructions on how to cut it and run it off after you have completed the job.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 6

16

Lessons 36-37

1. Type drills 36-A, 36-B, and 36-C, page 63. Take at least 2 one-minute timings on paragraph 36-C.
2. Type 36-D following marginal instructions. When typing paragraph 36-37-E, use WORKBOOK pages 47-50 or plain paper, whichever your instructor prefers.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 7

17

Lessons 38-39

1. Type the drills on page 65, Lessons 38-39.

NOTE: In this lesson type at least two perfect copies of paragraph 38-A.

2. Paragraph 38-C. If you need to review horizontal centering, refer to Supplementary Sheet 1 or page 7 in your textbook.
3. Read paragraph 38-E and F carefully.
4. WORKBOOK, Learning Guide: Basic Tabulation, page 51.
5. Follow instructions given in paragraphs 38-39-G and type page 67 accordingly.
6. Take a five-minute timing on paragraph 38-D. Do NOT underline the word "Tabulation."
7. Read the instructions for "Typewriter Mystery Games," on the next two pages of this book. Type any one of these to hand in.

TYPEWRITER MYSTERY GAMES

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 7

20

Lessons 40-41, pages 68-70.

1. Type two perfect copies of each line in paragraph 40-A.
2. Type remaining drills on page 68. Take 2 one-minute writings on paragraph 40-D.
3. Read paragraph 40-C carefully.
4. Follow instructions in paragraph 40-E for typing Table 4.
5. WORKBOOK, Learning Guide: Tables with Column Headings, page 53.
6. Follow instructions in paragraphs 40-41-G for typing Tables 5, 6, and 7, page 70.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 8

21

Lessons 44-45

1. Type the drills on page 73, Lessons 44-45. Read the contents of paragraph 44-B before typing the drill.
2. Read paragraphs 44-D and E carefully. Your instructor may have illustrations of manuscripts to show you. If so, this will help you determine the parts of a manuscript.
3. Follow instructions in paragraphs 44-45-F and type the exercise.

NOTE: WORKBOOK, page 59 is a visual guide for a short manuscript. Read instructions for using it before typing your short manuscript.

4. Cut a stencil of the manuscript on page 76 after you have typed it once. Your instructor will review with you how to cut the stencil and run it off.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 8

22

Lessons 46-47, pages 77-79

1. Type the drills on page 77, Lessons 46-47.
2. Follow the directions given in paragraph 46-47-D, page 78 for Manuscripts 5, 6, 7, and 8. Ask your instructor whether you should use WORKBOOK FORMS, pages 61-64 for these manuscripts.

NOTE: There are several acceptable ways to type manuscripts. Your instructor may wish to explain some of these to you for your own information. She may also have various forms for you to see. Ask her to talk with you about this.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 8

23

Lessons 48-49

1. Type review lessons 48-49, pages 80 and 81 following all marginal instructions. Use WORKBOOK letterhead for Letter 15, page 67.
2. WORKBOOK, pages 65 and 66. You may wish to type these timed writings in order to build your skill as well as check your progress.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART II, Unit 8

24

Lesson 50, pages 82-83

1. WORKBOOK test, pages 69 and 70. General Information Test on Part II.
2. Proceed with Progress Test on Part II, Lesson 50, pages 82 and 83. Follow all instructions carefully.
3. If your instructor has another test for you, ask for it now.
4. On page 75 in your WORKBOOK are speed and accuracy drills. With the help of your instructor, you should decide which of these drills will help you achieve your goals.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 9

25

Lessons 51-52

1. It's time to change typewriters--you may come back to your favorite machine later. Your instructor wants to explain to you now how to operate the other makes of typewriters in the room. (You will get some practice on the electric typewriters when you begin the lessons in the second half of your text.)
2. Type the drills on pages 85 and 86, Lessons 51-52. Read the marginal instructions and then set your goals for these drills.
3. Read paragraph 52-A carefully. Refer to the machines parts diagrams in the front of this book to determine where the variable line spacer is on your machine. Follow the instructions given for the practice material.
4. Type the remainder of the drills on page 86 and those on page 87. Take at least 1 five-minute writing on paragraph 52-E.
5. BE SURE TO PROOFREAD CAREFULLY.
6. OPTIONAL: Learning Guide, page 77. (If you didn't complete it in Lesson 32-33).

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 9

26

Lessons 53-54

1. Type Lessons 53-54, page 36-50. Read paragraph 54-A carefully and follow the practice instructions.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 9

27

Lessons 55-56

1. Type the drills on page 91, Lessons 55-56 following marginal instructions. Be sure to circle your errors.
2. Type paragraph 55-F for practice, then take a one-minute writing.
3. Paragraph 56-A. Read carefully even if you are already making corrections. It is a good review. Type the remainder of the drills on pages 92 and 93 following marginal instructions.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 10

28

Lessons 57-58

1. Type the drills on page 94.
2. Read paragraph 57-D and the marginal note which accompanies it. Your instructor may wish to discuss "sight placement" with you in more detail. Be sure to ask.
3. Type the exercises on pages 95 and 96, Lessons 57-58. Use WORKBOOK forms for cards 1-6, pages 80 and 81.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

Lessons 59-60

1. Type paragraphs 59-A, B, and C, page 97, Lessons 59-60.
2. WORKBOOK, Learning Guide: Special Parts of Business Letters, page 83. Your bulletin board display of letter illustrations may show these special parts. It will help you to see each part correctly placed.
3. From this point on, you will need to make a carbon copy of all your letters. In an office, this is automatically required--at least one carbon for the files. Other carbons are noted as explained in paragraph 59-60-D. Weights and various other characteristics of carbon paper will be described to you later. For making the single carbon required now, you may follow the instructions given below.

Method I

1. Place a sheet of onion-skin paper flat on the desk; then place a sheet of carbon paper with the glossy side down. Add the original to the top.
2. Turn the pack so that the glossy side of the carbon paper faces you and tap it lightly on the desk to straighten the sheets.
3. Insert into the machine using the paper-release lever to make the pack roll in easier. Straighten the pack more if it is necessary and operate the paper release several times to eliminate wrinkles. (Wrinkles on carbon copies are called "treeing" and spoil the appearance and sometimes the readability of the carbon copy).

Method II

1. Arrange the original and onion skin paper for normal insertion into the machine.
2. Turn the cylinder knob until the sheets are slightly gripped and lay the first sheet over the top of the machine.
3. Insert the carbon paper with the glossy side facing you, then roll into typing position.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 10

30

NOTE: Page 111 of your textbook illustrates Method I described on the preceding page.

HOW TO ERASE ON CARBON COPIES

Of course, all typographical errors must be corrected on carbons as well as on the original. The following steps will explain the procedure.

1. Move the carriage to the left or right--away from the typing mechanism.
2. Turn the cylinder forward so that the alignment will not be disturbed.
3. Place an erasure shield, 3 X 5 card, or even a small folded piece of paper back of the original and in front of the carbon; then erase the error on the original.
4. Turn both the original and carbon sheet over the top of the machine and erase the error on the copy. Use a pencil eraser or any other soft eraser. Your regular typewriter eraser is not satisfactory for errors on carbons.
5. Type the correction.

NOTE: Most of this will be assigned as review in your textbook as it is presented. There will be, however, new information provided, so be sure you read everything carefully.

4. Type Letter 17, page 98, Lessons 59-60. Make one carbon on all future letters unless otherwise instructed. Use the WORKBOOK Letterhead, page 85. Address the simulated envelope on page 86, WORKBOOK. Follow the instructions given for all future WORKBOOK letterheads.
5. Type Letter 18, page 99 using WORKBOOK Letterhead, page 87.
6. Type a ditto master of Letter 18, page 99. Your instructor will explain the process to you and show you how to run it off.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

7. You have advanced far enough now that your production work must be neat and correct--in other words: All letters you turn in should be "MAILABLE." There are several things which have equal importance in making a letter (or any other production work) "MAILABLE." These are:
 - a. Good neat erasures. If you erase a hole in your paper or leave smudges from erasing or any other visible marking, the erasure is not acceptable.
 - b. Correctly spelled words and names. Your 20,000 Words should be beside you constantly.
 - c. Good placement. A letter which is too high or low or too far to the left or right does not present an attractive picture. The over-all, first impression depends on good placement.
 - d. No strikeouts. This is the "unforgivable sin" in typing. Nothing is acceptable with a strikeover.
 - e. Consistent punctuation following salutation and complimentary closing. Don't mix open, closed, or standard punctuation.
 - f. Properly erased errors on carbons.
8. Ask your instructor if she wishes to discuss these or other good typing qualities with you.
9. Type Letter 19, page 100. Use WORKBOOK Letterhead, page 89.
10. Study the illustrations at the top of page 101 in the text-book. Practice folding a letter using scratch or used paper.
11. Type Letters 20 and 21, page 101. Use WORKBOOK Letterhead, pages 91 and 93.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 10

32

Lessons 61-62

1. Type Lessons 61-62, pages 102 and 103 according to marginal instruction; however, remember to correct your errors on assignment 61-62-D beginning at the bottom of page 102. Use WORKBOOK Letterheads, pages 95-98.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 11

33

Lessons 63-64

1. Type the drills on page 104, Lessons 63-64 according to marginal instructions.
2. Read paragraphs 63-64-D and follow the procedure described for typing Form 4. Use WORKBOOK Form, page 99. Make a carbon copy of all interoffice memos.
3. Type Forms 5, 6, and 7, page 106, Lessons 63-64. Use WORKBOOK Forms on pages 100 and 101. On page 102 in your WORKBOOK there is an illustration of an interoffice envelope. Its use is explained in the copy below the illustration.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 11

34

Lessons 65-66, pages 107-109.

1. Type the drills on page 107 following marginal instructions.
2. Read paragraphs 65-66-D. Type Forms 8, 9, 10, and 11, pages 108-109, using WORKBOOK Forms, pages 103-105.
3. Study the illustrative telegram on page 109. Type Forms 12 and 13, page 109. Use WORKBOOK Forms, page 107. Make a carbon copy of each telegram.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 11

35

Lessons 76-68

1. Type these review lessons following all instructions carefully, after you have reviewed the illustrations at the top of page 111, Use the WORKBOOK Forms provided on pages 109, 111, and 113.
2. Take a five-minute writing on the copy on page 113 in your WORKBOOK.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 12

36

Lessons 69-70

1. WORKBOOK, Learning Guide: Revision Marks, page 115.
2. Follow all marginal instructions for completing the exercise on page 112, Lessons 69-70.
3. Type the manuscript on pages 113 and 114. Ask your instructor to show you how to make a carbon copy while using the visual guide on page 117 of the WORKBOOK.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 12

37

Lessons 71-72

1. Type the drills on page 114, Lessons 71-72.
2. Read Manuscript 13-14 before you type it. The content will help you to type the footnotes properly.
3. Type the manuscript on pages 115 and 116, Lessons 71-72. If your instructor has an illustrative manuscript with footnotes, compare yours with it and criticize your own work. Manuscripts are not easy to type, and you may wish to retype yours in order to improve it.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 12

38

Lessons 73-74

1. Type paragraphs 73-A, 73-B, and 73-C, following marginal instructions.
2. Type Letter 27, paragraph 73-74-D. Use WORKBOOK Letterhead, page 119. Don't forget to make a carbon copy.
3. Type Forms 17-18, page 118 according to instructions.
4. You have already been erasing your errors for quite a while. Manuscript 15-16 will be a good review on the art of erasing. Read it before you type it. Make a carbon copy.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART III, Unit 12

39

Lesson 75

1. Complete the General Information Test on Part III, WORKBOOK, pages 123 and 124.
2. Proceed with Progress Test on Part III, Lesson 75, pages 119 and 120. Follow all instructions carefully. WORKBOOK, pages 125-128.
3. If your instructor has another test for you, ask for it.

Before beginning Part IV, Read Supplementary Sheet No. 11, "Crowding and Spreading for Manual Typewriters." Insert a sheet of scratch paper in your typewriter and practice the crowding and spreading examples shown at the bottom of Supplementary Sheet No. 11. Let your instructor see your practice work.

If your school has an offset press available, your instructor will want to show you how to type an offset master. She will demonstrate the procedure for preparing the master.

WORKBOOK II will now be needed. See your instructor.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Unit 13

40

Lessons 76-77

1. Type all the skill drive exercises in Lessons 76-77, pages 122-124 according to marginal instructions.
2. WORKBOOK, Learning Guide: Review of Word Division, page 133.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Unit 13

41

Lessons 78-79

1. Type both lessons, pages 125-127 following instructions carefully.

NOTE: If you are still making more than the acceptable number of errors, ask your instructor to give you some special assignments before you begin Lesson 80.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Units 13 and 14

42

Lessons 80-81

1. Follow marginal instructions for typing these number review lessons.

UNIT 14

Lessons 82-83

1. Type drill material on page 130, Lessons 82-83. Disregard marginal instructions for paragraph 82-C. Instead, type the drill concentrating on accuracy.
2. Type Letter 29, page 131. You may use the visual guide in your WORKBOOK, page 135 and Letterhead on page 137.

NOTE: Disregard the error limit discussed in paragraph 82-83-D, page 130. You should always concentrate on accuracy, and, of course, you erase and correct all errors on production work.

BE SURE TO MAKE A CARBON COPY.

3. Type Letters 30, 31, 32, page 132. The preceding instructions apply for all letters, Use WORKBOOK Letterhead, pages 139, 141, and 143.

NOTE: Remember, your letters must be "MAILABLE."

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Unit 14

43

Lessons 84-85

1. Omit paragraph 84-A, but type paragraph 84-B until the words are easy for you to type. .
2. Type paragraph 84-C disregarding marginal instructions. Type for accuracy.
3. Since you have been asked to erase and correct all errors on production material, you will not be told anymore to disregard textbook instructions which indicate an error limit in a given time. Always type each letter as rapidly as possible, but accuracy is more important than speed.
4. Type Letters 33-37 using WORKBOOK Letterhead, pages 145-153.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Unit 14

44

Lessons 86-87

1. Type the drills on page 136, Lessons 86-87.
2. Paragraph 86-87-D tells you what you are to do with letters 38-41. Type each letter after you have read the instructions carefully.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Unit 15

45

Lessons 88-89

1. Review tabulation techniques by reading Supplementary Sheet 7, a and b parts. Different machines have different levers for controlling tab setting and clearing. Be sure you understand how your machine operates.
2. Type Lessons 88-89, pages 138-140, following marginal instructions.
3. Type Tables 14-18, pages 139 and 140. Make carbon copies of each table.

Lessons 90-91

1. Type the drills on page 141, Lessons 90-91, following marginal instructions.
2. Read paragraph 90-D before typing Tables 19 and 20, page 142.
3. Type Table 19.

NOTE: There are three methods of ruling lines: (1) Leave the paper in the typewriter--take a pencil and place it in the corner of the left card holder or at the edge of the card holder and move the carriage up and down and across. (2) Leave the paper in the typewriter and strike the underscore key for all horizontal lines. Then take your paper out of the typewriter and insert the paper the long way; strike the underscore key again. (3) Remove your paper from the typewriter and draw your lines in pencil by using a ruler. CAUTION: Typewritten and pencil lines should not be combined on any table.

4. Type Table 20 using any one of the methods described for producing the table in "boxed" form.
5. Type Tables 21 and 22, page 143, after you have read and understood the instructions in paragraph 91-E.
6. WORKBOOK, Tabulation Clinic, page 159.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Unit 15

47

Lessons 92-93

1. Type drills 92-A and 92-B.
2. Paragraph 92-C. Type the copy once for practice and review the contents. Type again on WORKBOOK paper, page 161. Center it horizontally but not vertically. Leave three blank spaces between the printed title, "Three Ways to Type Any Table," and your first line of typing.
3. Type tables 23, 24, and 25, page 145 using WORKBOOK paper, pages 162, 163, and 164. Follow instructions carefully.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Unit 16

8

Lessons 94-95

1. Type the drills on page 146, Lessons 94-95. Ignore marginal instructions for paragraph 94-C and take 2 five-minute writings. Try to keep your errors within $\frac{1}{2}$ error per minute.
2. Review the use of revision symbols on page 112, then type manuscript 19, page 147, using WORKBOOK Form, page 165. Make a carbon copy.
3. Type manuscript 20, WORKBOOK Form, page 167.
4. Ask your instructor if you should type manuscripts 21 and 22.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Unit 16

49

Lessons 96-97

1. Type the drills on page 149, Lessons 96-97.
2. Type manuscripts 23 and 24, following instructions within the box at the top of page 150.
3. Type manuscript 25. Be sure to read "Notes about Book Manuscripts" at the top of page 151 before you type. You will want to make two carbon copies of this exercise instead of just one. Assemble your carbon pack exactly the same way as for one carbon--just add another carbon and another sheet of onion skin. Remember you'll always have one more sheet of paper than of carbon paper. If your stroking is firm and even, you will not need to increase your pressure.
4. WORKBOOK--"Typing-Technique Checkup," page 169. Ask your instructor to help you evaluate your typing when you have completed it.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IV, Unit 16

50

Lessons 98-99

1. Type the drills on page 152. Disregard marginal instructions. Instead, for paragraph 98-A and B, type each line twice. Paragraph 98-C. Take 2 five-minute writings. Try to keep your errors within $\frac{1}{2}$ per minute.
2. Type Letter 42, page 153, using WORKBOOK Letterhead, page 173.
3. Type Table 26, page 153, and Manuscripts 26 and 27 according to instructions.
4. WORKBOOK, General Information Test on Part IV, Lesson 100, pages 175-176. Proceed with textbook progress test, pages 154 and 155. Use WORKBOOK forms, pages 177-180.
5. If your instructor has another test for you, ask for it.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 17

51

Lessons 101-102

1. Omit the marginal instructions on page 157, Lessons 101-102, and type each drill once. Evaluate your own work according to your own progress goals. If you decide you need to repeat any of the exercises, do so.
2. Read paragraph 101-H, page 158. This report describes features and varieties of carbon paper--information every secretary or typist should know. After you have studied the information, type the exercise according to the instructions in paragraph 101-B, page 157. Make two carbon copies.
3. Type the exercises on page 159 according to the suggested goals in paragraph 102-A.
4. WORKBOOK, Speed Clinic, page 181. OPTIONAL--you decide.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 17

52

Lessons 103-104

1. Type the exercises on page 160, Lessons 103-104, following marginal instructions. Omit paragraph 103-B at this point.
2. Paragraph 103-B is a continuation of the report you previously typed about carbon paper. Follow the same instructions given for it. Type paragraph 103-H.
3. Read the marginal notation 104-A, page 162 and type the exercises on page 162 accordingly.
4. If you have not already typed on an electric typewriter, your instructor will want to show you how to operate one now. Repeat the drills on page 162 on the electric typewriter after you have studied the parts diagram which corresponds to the machine you are assigned to use. You will find the diagrams on pages viii-xi in the yellow pages of this book.
5. Read Supplementary Sheet No. 11 "Crowding and Spreading on Electric Typewriters." Insert a sheet of scratch paper in your electric typewriter and practice the examples shown at the bottom of the Supplementary Sheet. If you are using an I B M Selectric, your instructor will demonstrate the technique.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 17

53

Lessons 105-106

1. Type the exercises on pages 163 and 164. Set your own goals for these exercises and type each as many times as you need to in order to achieve your goal. Marginal instructions may be disregarded.
2. There are three ways to make lines end evenly at the right margin. This is called "justifying" the lines. The most common illustration of "justified" lines is in your daily newspaper or any magazine you pick up. Office typists are frequently called upon to produce copy with an even right margin, so it is important that you learn how it is done.
 - a. You may sometimes change a word or a sentence so that all your lines will end evenly.
 - b. You may put some extra spaces between the words, to spread them out so that they fill lines evenly. When you do this, try to avoid putting the extra spaces of one line directly under those of the preceding line.
 - c. If you prefer, you may spread or squeeze some words, thus stretching or condensing a line to make it fit.

In all cases, you must type a line first, then see how much space is to be saved or added, and type it over with all the lines "justified." Regardless of the method you choose to use, you will always have to make a "rough" copy first in order to determine how much "justifying" is necessary. Look at the following copy and the illustration of the rough draft and finished copy. Then type the paragraphs with a 20-space line with single spacing. Center your copy and indent each paragraph three spaces.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 17

54

Once in a while a
typist has a task///
that is important///
enough for him to///
take extraordinary//
pains in making it//
look professional,//
such as in writing//
books and submitting
articles to a maga-/
zine or newspaper.//

Once in a while a
typist has a task
that is important
enough for him to
take extraordinary
pains in making it
look professional,
such as in writing
books and submitting
articles to a maga-
zine or newspaper.

Once in a while a typist has a task that is important enough for him to take extraordinary pains in making it look professional, such as in writing books and submitting articles to a magazine or newspaper.

When you wish to justify a group of lines (that is, make all the lines end at the same point), you start by typing a first draft. You set the margins for the length of line you want to fill; and then you type the material, making every line come as close as you can to your desired point of line ending. Scrutinize the draft carefully and note exactly how many spaces have to be saved or inserted to make the lines end evenly. With a pencil, indicate where you will squeeze or spread the words. Finally, retype your good copy, being sure that you observe your marking. If you forget one, you will soon know it and have to start over.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 18

55

Lessons 107-108

1. Omitting marginal instructions, type paragraph 107-A twice.
2. Take a five-minute timing on paragraph 107-B, then type it as directed for manuscript 29, using WORKBOOK paper, page 183.
3. Type Letters 44 through 47, pages 166 and 167, using WORKBOOK Letterheads, pages 185, 187, 189, and 191. Do not hand in any of these until you have completed Letter 47, or you may wait until after you complete Letter 53 if your instructor prefers. Be sure to review the illustrations for each type, paying close attention to the placement of any special parts. Envelopes to be addressed for each letter are on the reverse side of each letterhead.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 18

56

Lessons 109-110

1. Type each line in paragraph 109-A, page 168 twice.
2. If you have forgotten the meaning of various revision marks, turn to page 112 in your text and review. Read the marginal instructions accompanying paragraph 109-B and select your method for typing the paragraph.
3. Read carefully the instructions given in paragraph 109-110-C, page 168, for typing letters 48-51, pages 169 and 170. Use WORKBOOK Letterheads, pages 193-200. Type Manuscript 30 as directed. Remember to make carbon copies.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 18

57

Lessons 111-112

1. Type paragraphs 111-A and 111-B, page 171, according to marginal instructions.
2. Read the instructions in paragraph 111-112-C, page 171 and type letters 52 and 53, page 172 accordingly. Use WORKBOOK Letterheads, pages 201 and 203.
3. Type manuscript 31 as directed. If you have held all your letters for the "Letter Style Books," assemble it now and turn it in.
4. Turn to Supplementary Sheet No. 10--"Sample Letter." Assume your supervisor has just received this letter. He reads it and asks you (the typist) to make a copy of the letter and address a large envelope. Send the letter to: Mr. Wayne Lott, Big Chain, Inc., 685 Ryan Street, Sulphur, Louisiana. When you retype the letter, leave off the page number, SAMPLE LETTER (Semiblock Form), the parts of the business letter, and spacing notes. The word C
O hand corner of the page to
P certify that you are mailing a
Y copy of the letter and not the
original. The original is filed
in your office.
5. Review Supplementary Sheet No. 7--"Tabulating," and type the two tables on the next page using the tabulating method explained in the Supplementary Sheet. Center each table horizontally and vertically on separate half sheets of paper.

NATIONAL BUREAU OF STANDARDS-1963

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 19

59

Lessons 113-114

1. WORKBOOK, Learning Guide: Business Forms Review, pages 205 and 206.
2. Type the drills on page 173, Lessons 113-114, following marginal instructions.
3. Read the instructions in paragraph 113-114-D, page 173 before typing Forms 20-31. Use WORKBOOK forms, pages 207-218.

NOTE: When actually typing forms of this type in an office, you will probably be using a secured carbon pack with the printed material on each carbon copy. It will not be necessary, therefore, for you to make carbons of any of these forms. Generally, there are several copies needed for various departments and these will be provided.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 19

60

Lessons 115-116

1. Type each line in paragraph 115-A twice.
2. Paragraph 115-B is Form 32 (white block in margin). Read the instructions and study the form; then type, using WORKBOOK Forms on page 219 or 220.

NOTE: The series of dots are called "leaders." If you were producing the entire form on the typewriter, you would want to be careful to place each dot directly below the one above, not staggered.

3. Read the copy below Form 34, page 178 before typing it on WORKBOOK Form, page 221. Be sure to cut the page properly because you'll need the lower half for forms in Lesson 117.
4. Type Forms 35-36, page 178, WORKBOOK pages 223 and 224.
5. Read all the information pertaining to Forms 37-41, page 179, and type them using WORKBOOK forms, pages 225-228.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 19

61

Lessons 117-118

1. Type the drills on page 180, Lessons 117-118. After you have typed paragraph 117-C as a drill, type it in proper form using WORKBOOK Letterhead 54, page 229.
2. Using WORKBOOK voucher checks, page 231 and 232, type Forms 42-43, page 180.
3. After you have studied the illustrations at the top of page 181, type Forms 44-48 according to instructions. Did you save the lower half of WORKBOOK page 221 for Forms 46-47?

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 20

62

Lessons 119-120

1. Type two perfect copies of each line in paragraph 119-A, page 182.
2. Type paragraph 119-B as a five-minute timed writing, then type as Manuscript 32, page 182.
3. Read the marginal instructions accompanying paragraph 119-C and type accordingly.
4. Study the manuscripts on pages 183 and 184, then type. Set your own goal for finishing each. Be sure you proofread carefully.
5. Type a ditto master of Manuscript 35, page 184 after you have typed it once. Ask your instructor to review the technique with you if you've forgotten. You may wish to draw some marginal decoration. If so, your teacher will help you get started.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 20

63

Lessons 121-122

1. Type paragraph 121-A, page 185 at least once.
2. Read the copy in paragraph 121-B, page 185, and type as a five-minute timing. Try to keep errors within $\frac{1}{2}$ per minute.
3. Type Manuscript 37, page 186 in single spacing. (Omit Manuscript 38.) The copy contains information you'll want to learn. Read and study it carefully before you type. Make three carbons.
4. Study Manuscript 39, page 187. It, too, contains some vital information you'll want to retain. Type according to instructions. Make two carbon copies.
5. WORKBOOK, Learning Guide: Expressing Numbers, pages 235 and 236.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART V, Unit 20

64

Lessons 123-124

1. Follow all textbook instructions for this review lesson, pages 188 and 189. Use WORKBOOK forms, page 237 and 238 for Form 49.

NOTE: Sooner or later you will be required to complete an application form and a personal data sheet. You may wish to substitute your own "vital statistics" for those given in the text. Ask your instructor if you may.

2. WORKBOOK, General Information Test on Part Five, pages 239 and 240.
3. Proceed with Progress Test on Part V, Lesson 125, pages 190-191. Use WORKBOOK pages, 241 and 246. If your instructor has another test for you, ask for it now.

NOTE: In your WORKBOOK, pages 247-249, there are some optional technique drills. You should utilize this material if you and your instructor consider it beneficial to you.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 21

65

Before beginning Lesson 126, study display lettering examples on the following page. After you have read the instructions, design a display of your own and type it to turn in. Try to be original.

Lessons 126-127

1. Type two perfect copies of each line in paragraph 126-A, page 193.
2. Read the marginal instructions carefully for paragraphs 126-B, page 193, and type each drill, concentrating on the instructions you have been given.
3. Type the entire manuscript on page 194. Read the second half of it on page 197.
4. Follow marginal instructions for all drills on page 195.

DISPLAY LETTERING EXAMPLES

How to "Half Space" Vertically...

1. Type the material that will appear on the regular single-spaced lines.
2. Using the variable line spacer in the left cylinder knob, turn the paper down half a line (until the top of a small letter like w or m disappears under the aligning scale). Check the position by typing lightly one or two of the strokes that you wish to type between the single-spaced lines.
3. Having adjusted the paper for in-between writing, complete the fill-ins.

Made with small "m's" and half-spacing

Made with pairs of parentheses, the underscore, and some diagonals

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 21

67

Lessons 128-129

1. Ask your instructor to help you evaluate your skill. Then decide which of the drills you should type in Lessons 128-129, pages 196-198.

Be sure to read the material on page 197 if you haven't done so.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 21

68

Lessons 130-131

1. Except for timing yourself, follow marginal instructions for drills on page 199, paragraph 130-F. Try to keep your eyes on your copy while typing the number reviews.
2. Practice the construction of the brackets used in the drills on page 200 by typing lines 24 and 25 first. After you have mastered the technique, complete all the drills on page 200.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 22

69

Lessons 132-133

1. Omit marginal instructions for paragraphs 132-A and B, page 201. Type each line twice stressing accuracy.
2. Read paragraph 132-C for content, then type as a five-minute timed writing.
3. Read Letter 57 carefully, page 202, and study the second page headings illustrated on page 203. Type the letter using WORKBOOK paper, page 251. Use plain paper for the second page. Remember the carbon copy.
4. Type Letters 58 and 59, page 203 according to instructions.

NOTE: The two illustrations of second-page headings are probably the most accepted and widely used forms. As is true with any other detail of format, there are other possible ways of doing it. Always check the files where you work to see what method your employer prefers, or ask. It is much less expensive to a company to take a few seconds to explain format procedures than to have you retype a letter.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 22

70

Lessons 134-135

1. Type the drills on page 204. Take a five minute timing on paragraph 134-C.
2. Type Letters 60-65, pages 205-206. Use WORKBOOK paper, pages 253-258. Study the stationery illustrations explained in the textbook and the additional material in the WORKBOOK.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 22

71

Lessons 136-137

1. WORKBOOK, Learning Guide, page 259.
2. Type drills 136-A and B twice.
3. Read paragraph 136-C and follow marginal instructions for typing.
4. Read paragraph 136-137-D carefully. After you have read the entire paragraph, review it for study. The contents are points which you will need to know throughout your working experience.
5. Type Letters 66 and 67, page 208. Use WORKBOOK paper, page 261.
6. Type Letters 68, 69, and 70, page 209, using WORKBOOK paper, pages 263 and 265. Read the instructions carefully.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 23

72

Lessons 138-139

1. Before beginning Lessons 138-139, turn to the extra practice material in your WORKBOOK, pages 267-270. Scan the material to determine which portion you need to practice. Spend a few minutes practicing using this material.
2. Type the drill material, paragraphs 138-A and B, page 210.
3. Type paragraph 138-C as a five-minute timed writing. As you proofread your copy, read also for content.
4. Type Tables 28-29 and 30-31, page 211, following textbook instructions.
5. Type Tables 32-33 and 34-35, page 212. Be extremely careful when you type the "leaders" shown in each table. They should be vertically straight as well as horizontally straight.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 23

73

Lessons 140-141

1. Ignore the marginal instructions accompanying paragraph 140-B, page 213. Instead, set your own goals based on your achievement level and type as a five-minute timing. Repeat, after you have proofread, and increase your goal.
2. Type Table 36, page 214. Scan the material to help you determine where to set your tabs. The double rulings shown are made by using the variable line spacer for spacing. If you don't understand how to manipulate that part of your machine, ask your instructor to help you.
3. Read the printed copy above Table 37, page 215. The conclusion is on page 216. Following the instructions, type Tables 37, page 215, and 38, page 216. Make a carbon copy of both tables.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 23

74

Lessons 142-143

1. Type paragraph 142-A, page 217 according to marginal instructions.
2. Read the marginal instructions accompanying paragraph 142-B, page 217. Follow them for producing the letter, except omit the ten-second pauses after each minute.
3. Type Table 39 according to instructions.
4. Type Letter 71, page 217. Use WORKBOOK paper, page 271.
5. Scan Table 40, page 218 to help you determine your tab stops. Type an exact copy after you have reviewed the information about "boxed" tables on pages 142 and 143 of your textbook.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 24

75

Lessons 144-145

1. WORKBOOK, Learning Guide: Legal Papers, pages 273 and 274.
2. Type paragraphs 144-A, B, and C according to marginal instructions.
3. Read paragraph 144-145-D, items 1, 2, and 3, page 219. Omit the alternate suggestions.
4. If you did not read paragraph 144-C, page 220 for content when you proofread, do so now.
5. Type Manuscripts 42 and 43, pages 221 and 222 after you have studied carefully the marginal instructions. Rule lines with a red lead pencil.
6. Ask your instructor to show you some legal-sized paper and compare it to the standard 8½ by 11 you have been using.
7. Type forms 55 and 56, page 222 using printed WORKBOOK forms, pages 275 and 277. Complete the endorsement on the back of each printed form. Typing on printed forms of this type will be much easier if you release the Line-Space Ratchet Release.
8. Type Manuscript 44, page 223. Follow the instructions carefully. Make two carbon copies.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 24

76

Lessons 146-147

1. Type each line in paragraph 146-A, page 223, twice.
2. Follow marginal instructions for typing paragraph 146-B.
3. Type paragraph 146-C following the "practice steps" instructions on the margin.
4. Read paragraph 146-147-D, but omit the alternate suggestions.
5. Type Manuscript 45, page 225. Make three carbon copies. Read the material before you type it. (Omit Manuscript 46.)
6. Type Manuscript 47-48, page 226. Use single spacing and make three carbon copies. Remember, your erasures should be just as neat on each carbon as they are on the original.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VI, Unit 24

77

Lessons 148-149

1. Omit paragraphs 148-A and B, page 227. Take a ten-minute timing on paragraph 148-C, page 228. Proofread very carefully.
2. Type Tables 41-43, page 229 according to instructions.
3. Type Letter 72, page 229 using WORKBOOK paper, page 279.
4. Read Manuscript 49, page 230 before you begin typing. Then type it making three carbon copies. Rule with a red-lead pencil.
5. WORKBOOK, General Information Test on Part VI, pages 281 and 282.
6. Proceed with the Progress Test on Part VI, Lesson 150, pages 231 and 233. Use WORKBOOK paper pages 283 and 287. WORKBOOK III will now be needed. See your instructor.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VII, Unit 25

78

Lessons 151-156

1. Unit 25, Lessons 151-156, pages 235 through 242, consists of skill development exercises. There is nothing new in any lesson. Study the marginal instructions accompanying each exercise and type accordingly, or alter the instructions, with the help of your instructor, to suit your achievement level better. Keep your work until you have completed Lesson 156. Compare your progress at the end of Lesson 156 with your work at the beginning of Lesson 151. Is your achievement level higher? If not, ask your instructor to help you discover causes for your weaknesses.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

Lessons 157-158

1. WORKBOOK, Learning Guide: Review of Business Letters, pages 293, and 294.
2. Follow marginal instructions when typing drills, paragraphs 157-A, and B, page 243.
3. Notice the "Thumbnail Letter Index" in the margin of page 243, you will want to review the topics indicated as you type the letters in this unit.
4. Before beginning the letters on page 244, review the Letter Placement Guide Scale below.

Estimate number of words in body of the letter.....
 Set margin stops for corresponding line length*.....
 Type date; then drop this many lines to inside address.....

SHORT	AVERAGE	LONG
Under 100	100 to 200	Over 200
4 Inches	5 Inches	6 Inches
5 Lines	5 Lines	5 Lines

*Reminder: There are 10 pica spaces to an inch & 12 elite spaces to an inch.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VII, Unit 26

80

NOTE: Now that you have reviewed the Guide, keep in mind the placements it indicates, but try to type your letters accurately by "sight placement," i.e., insert the paper and type the letter with good visual placement without counting every line and space. Your ultimate goal, of course, is a "mailable" letter in the shortest possible time. You'll probably have to experiment a few times with "sight placement" before you master it.

5. Type Letters 74-77, pages 244, and 245. Be sure to read the instructions carefully and check all enclosures. Use WORKBOOK paper, pages 297-302. After these letters have been checked and returned to you, keep them--you'll need them for reference later.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VII, Unit 26

81

Lessons 159-160

1. Warm up on paragraph 159-A, page 246 according to instructions.
2. Read paragraph 159-B carefully and absorb the contents. Type as a five-minute timed writing.

NOTE: Notice the "bcc" and "cc" illustration in the margin, page 246.

3. Type Letter 78, page 247. Read the instructions carefully. Use WORKBOOK paper, page 303.

NOTE: Be very careful to make all your erasures on carbon copies as neat as possible. Do not hand in until you have completed Letter 81, page 248.

4. Type Letters 79-81, page 248. Read the instructions carefully. Do you still have Letters 74-77? You should. Use WORKBOOK paper, pages 305-309.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VII, Unit 26

82

Lessons 161-162

1. Type paragraph 161-A, page 249, three times.
2. Omit unblocked marginal instructions for Letter 82, page 249. Try to make an accurate copy the first time you type it. Use WORKBOOK paper, page 311. Keep the letter until you have completed Letter 84, page 250.
3. Type Letters 83 and 84, pages 249 and 250, using WORKBOOK paper, page 313 for Letter 83.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

Lessons 163-164

1. Type each line in paragraph 163-A and B, page 251, twice.
2. Follow marginal instructions when typing paragraph 163-C.
3. WORKBOOK, Learning Guide: Alphabetic Filing Rules, pages 315-317.
4. Read the instructions carefully and type Form 57, page 252. Use WORKBOOK paper, page 319.
5. Study the illustration showing the use of the card holder, page 252 and type Form 58. Use WORKBOOK paper, pages 321, and 322. Type on both sides of the WORKBOOK forms.
6. Read "To Chainfeed Envelopes and Cards," page 253. Ask your instructor to demonstrate the procedure.
7. Type Form 59, page 253.

NOTE: If you cut paper for these index cards, be certain that it is straight and each is the same size.

8. Type Form 60, page 253, using WORKBOOK paper, pages 323 and 324.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VII, Unit 27

84

Lessons 165-166

1. Type paragraphs 165-A and B according to marginal instructions.
2. Take two five-minute timed writings on paragraph 165-C, page 254.
3. Do not read or study Form 61, page 255 before typing. As was suggested in paragraph 165-C, you must learn to "think while you type." Use WORKBOOK paper, page 325.
4. Omit Forms 62-63 unless your instructor tells you otherwise.
5. Read the printed material on page 256, Form 64, then type, using WORKBOOK paper, page 327.
6. Omit Form 65, page 256, if your instructor does not object.
7. Type Form 66, page 256. Follow instructions carefully. Use WORKBOOK paper, page 331.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VII, Unit 27

85

Lessons 167-168

1. Type each line in paragraph 167-A, page 257, three times.
2. Omit paragraph 167-B marginal instructions. Type Form 67, using blocked instructions. Use WORKBOOK paper, pages 333 and 334.
3. Type Form 68, page 257, using WORKBOOK paper, page 335. Address the postal cards on page 336.
4. Type Letter 85, page 258, on plain paper--think as you type.
5. Cut a stencil of Letter 85. Show it to your instructor before you run off several copies.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

Lessons 169-170

1. WORKBOOK, Learning Guide: Manuscript Review, page 337 and 338.
2. Type paragraphs 169-A, and B, page 259, according to instructions.

NOTE: Beginning with paragraph 169-C, page 259, keep all the manuscripts you type through Lesson 174. Prepare the table of contents and title sheet before you hand in your work. You may, however, take any part of it to your instructor for help while you are working. Make one carbon of each assignment.

3. Take a five-minute timed writing on paragraph 169-C. Then, retype it carefully for your booklet according to instructions on page 268 (Manuscript 61).

NOTE: You may want to use the visual guide on page 339 in your WORKBOOK.

4. Review formal manuscript arrangement on pages 113-114 of your textbook and ruled table arrangement, pages 139-140.
5. Type manuscript 51, page 260. Be sure you read the contents carefully. Each manuscript contains information you should know.
6. Type Manuscript 52, page 261. Read all instructions carefully.
7. Type Manuscripts 53 and 54, pages 262 and 263.
8. Type Manuscript 55, page 263.

NOTE: Have you remembered to underscore all italicized words?

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VII, Unit 28

87

Lessons 171-172

1. Unless you need the practice, omit paragraphs 171-A, B, and C, page 264 and proceed with your manuscript booklet.
2. Type Manuscripts 56 and 57, page 265.
3. Type Manuscript 58, page 266. Remember, anticipate how many lines will be needed for the footnotes.
4. Type Manuscript 59, page 267. Review any proofreaders' marks you may have forgotten.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VII, Unit 28

88

Lessons 173-174

1. Type each line in paragraphs 173-A and B, page 268, twice.
2. Take a five-minute timed writing on paragraph 173-C, page 268; then retype as Manuscript 60 for your booklet.
3. Prepare the table of contents and title sheets according to instructions given for manuscripts 62 and 63, page 269.

NOTE: Be sure to align properly the "leaders" in the table of contents.

4. When you have completed all the manuscript assignments, collate your report properly and staple for a "bound manuscript." Proofread again carefully before you hand it in. The entire job should be perfect.
5. Type Form 69, page 269, using WORKBOOK forms, page 341.
6. Study the correspondence transfer form (Form 70, page 269) and the instructions before you type it. Use WORKBOOK paper, page 343.

NOTE: This is a typical example of the type of instructions you will be expected to grasp immediately when you begin working. Think carefully!

7. WORKBOOK test, pages 345-346. General Information Test on Part VII.
8. Proceed with the Progress Test on Part VII, Lesson 175, pages 270-272. Use WORKBOOK paper provided.
9. If your instructor has another test for you, ask for it now.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 29

89

Lessons 176-177

1. Before beginning Lessons 176-177, you may wish to practice speed and/or accuracy using the practice material in your WORKBOOK, pages 351 and 352.
2. Type each line in paragraph 176-A, page 274, three times.
3. Take 2 three-minute timings on paragraph 176-B. Proofread your first copy carefully and set your goal for the second one a little higher.
4. Type paragraphs 176-C and E according to instructions.
5. For the remainder of Lessons 176-177, pages 275-276, follow marginal instructions.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 29

90

Lessons 178-179

1. Type the drills on page 277 according to instructions. Concentrate on keeping a steady rhythm at all times.
2. Type the first three paragraphs on page 278 as a five-minute timing. After you have proofread carefully, type the entire page as a 10-minute timing. Proofread carefully and rest your arms for a few minutes before proceeding with the remainder of the lesson.
3. Complete the drills on page 279 according to marginal instructions.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 29

91

Lessons 180-181

1. These lessons contain drills with figures. Type them all following instructions carefully. Be sure to keep your eyes on the copy.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 30

92

Lessons 182-183

1. Type each line in paragraphs 182-A and B twice.
2. Read paragraph 182-C before you type it as a five-minute timing.
3. Read paragraph 182-D and study it carefully.
4. WORKBOOK, Learning Guide: Review of Capitalization, pages 353-354.
5. After you have read the instructions, type letters 87, 88, and 89, page 283. It is important that you produce an accurate letter on the first attempt, so think carefully. Use WORKBOOK paper, pages 355, 357, and 359. Don't neglect to make the proper number of carbons.
6. Letters 90 and 91, page 284, should be typed with the same concentration you applied on the preceding ones. Use WORKBOOK letterhead, pages 361-363.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 30

93

Lessons 184-185

1. Type each line in paragraph 184-A twice.
2. Read paragraph 184-B and study it carefully. Type, making one carbon copy for your own files. The information provided will always be useful to you.
3. WORKBOOK, Learning Guide: Review of Comma Usage, pages 365, 366.
4. Your instructor may wish to dictate Letter 92 to you. You should ask. If not, follow the instructions carefully for Letters 92 and 93. Use WORKBOOK paper, pages 367 and 369.
5. The instructions in No. 4 also apply to Letters 94, 95, and 96. Use WORKBOOK paper pages 369 and 371, but type Letter 95 on plain paper. Be sure to read the letters so you will know how many carbons you need to make.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 30

94

Lessons 186-187

1. Read paragraph 186-C, page 288 in your textbook; then complete WORKBOOK, Learning Guide: Review of Semicolon Rules, pages 373, 374.
2. Type each line in paragraphs 186-A and B twice.
3. Type paragraph 186-C, page 288. Be sure you understand the rules for use of the semicolon before you proceed with the lesson.
4. Your instructor may wish to dictate Letter 97, page 289 to you. You should ask. If not, type it according to instructions.

NOTE: From time to time, any office becomes very busy. During these times, your employer may be too rushed to prepare material for you to type; so you will probably be expected to turn out a finished copy from his dictation "directly into the typewriter."

5. Follow instructions in No. 4 for Letter 98, page 289.
6. Type Forms 72-73 using WORKBOOK paper, page 375. Remember the carbon copies.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 31

95

Lessons 188-189

1. Type each line in paragraph 188-A and B, page 290 twice.
2. Read paragraph 188-C, then take 2 five-minute timings. Try to keep your errors within 1/2 per minute.
3. Read the blocked instructions (blue print) at the top of page 291; then read the problems sketched for you in Tables 51, 52, 53, and 54. All data that you will need to produce the tables are specifically indicated, and you will want to re-read the instructions carefully before typing each table. Please hand in all the tables and related letters together.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 31

96

Lessons 190-191

1. Warm up on paragraphs 190-A and B, page 293. Type each line twice. After you have proofread and circled your errors, practice any word which was difficult for you.
2. Read the contents of paragraph 190-C before you type it as a five-minute timing.
3. As you did in Lesson 189, read all the material on pages 294 and 295 to get a "bird's eye view" of the projects. Study the summary of guides for arranging a ruled table, page 295. There is a textbook error in the figures. Check the average. Can you find it? Re-read instructions accompanying each table and type Tables 55-61 accordingly. Hand in only when you have completed Table 61, page 295.

NOTE: Be sure your vertical rulings are exactly perpendicular to the horizontal ones you make with the underscore key. Use BLACK ink.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 31

97

Lessons 192-193

1. Type two perfect copies of each line in paragraph 192-A, page 296.
2. Follow the instructions (first) and type paragraph 192-B, page 296.
3. Read the situations discussed in Table 62, letter 102, and Table 63, page 297; then type them according to instructions. All of these problems will involve some thought on your part--you'll probably want to re-read carefully.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 32

98

Lessons 194-195

1. Type each line in paragraph 194-A, page 298, three times. Strive for accuracy.
2. Read paragraph 194-B carefully. As you read, practice the manipulations described without typing.
3. Reproduce the illustration in the margin opposite paragraph 194-B.
4. Read paragraph 194-C and the marginal instructions. Type as Manuscript 65. Make one carbon copy.
5. Read paragraph 194-195-D; then type, as indicated, Manuscript 66 on a spirit master and Manuscript 67 on a stencil, pages 299-300. Run off eight copies of each on your machines. Even though most of the contents of these manuscripts are review, read them carefully.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 32

99

Lessons 196-197

1. If you are not presently using an electric typewriter, ask your instructor if you may for this lesson. Type each line in paragraph 196-A, page 301, three times.
2. You have already been introduced to the electric typewriters, so some of the mechanics described in these lessons will be review. There is, however, some information discussed which might be new to you. Scan the entire lesson before you type it on an electric typewriter. Note carefully the marginal instructions, particularly the last one at the end of the manuscript on page 304.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART VIII, Unit 32

100

Lessons 198-199

1. Follow marginal instructions when typing paragraph 198-A and B, page 304.
2. Type paragraph 198-C as a five-minute timed writing. If you don't finish the copy, read the remainder for content after you proofread.
3. Paragraph 198-199-D will be a review in line justification. Read the steps before you begin or refer to page 35 of this book. Make one carbon copy of your finished product.
4. Type Manuscript 70, page 306, according to instructions-- except, don't make a carbon copy.
5. Type Manuscript 71, page 306. Make one carbon copy.
6. Scan the problems on page 307 for an overall idea of what you will do. Then, type Table 64, Letter 104, and Letter 105 carefully. Use WORKBOOK paper, pages 377-379. Hand in after you have completed Letter 105-Table 65.
7. WORKBOOK test, pages 381-382. General Information Test on Part VIII.
8. Proceed with the Progress Test on Part VIII, Lesson 200, pages 308-309. Use WORKBOOK paper, pages 383-386.
9. If your instructor has another test for you, ask for it now.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IX, Unit 33

101

Before beginning Part IX, ask your instructor to help you evaluate your progress in order to determine which elements of typewriting you should emphasize during this refining period.

Lessons 201-202

1. Follow marginal instructions which accompany paragraph 201-A, page 311.
2. Read the instructions carefully and type paragraph 201-B accordingly.
3. Type each line in paragraph 201-C twice. Double space between each line group. Repeat, if you make more than two errors in a group.
4. Follow marginal instructions when typing paragraph 201-D.
5. Follow all marginal instructions for paragraphs 201-F and 202-E, pages 312-313.
6. If you have been typing steadily since you started this lesson (201), rest for a few minutes before taking a five-minute timing on paragraph 202-F, page 313.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IX, Unit 33

102

Lessons 203-204 and 205-206, pages 314-318, are also skill drives. Evaluate your own skill level; then type these lessons. Follow all instructions carefully. When you have finished, you may want to ask your instructor for additional material to help you in refining your typing techniques.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IX, Unit 34

103

Lessons 207-208

1. Warm up using the copy in paragraph 207-A, page 319.
2. Read the marginal instructions beside paragraph 207-B and type the exercise accordingly. Retype as Manuscript 73. Read the instructions carefully. This manuscript is part of the secretarial project which follows.
3. Paragraph 207-208-C, page 320, is a project simulating a realistic situation. For all the assignments, you will need to call on your best ability to follow instructions. No outside help (your teacher or classmates) can be enlisted--you're on your own! Use WORKBOOK paper, pages 389-398. Hand in when you have completed the entire project. You should complete the project in about one hour.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IX, Unit 34

104

Lessons 209-210

1. Type each paragraph in 209-A, page 322, at least twice. If you make more than one error per paragraph, type each a third time.
2. Follow marginal instructions when typing paragraph 209-B.
3. Read all the material and instructions included in project B, pages 322-324. Make a "mental note" of the instructions that will require your close attention; such as, number of carbon copies, enclosures, etc. Your employer, Mr. Lawrence, wants all this material ready for distribution in about one hour. Begin timing yourself after you have scanned the material. You should finish all the assignments in an hour and fifteen minutes, at the most--so stop then. Mark your total time in the left, top corner of Form 75 and turn in your work. WORKBOOK paper, pages 399-404, is to be used according to instructions.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IX, Unit 34

105

Lessons 211-212

1. Follow marginal instructions for paragraph 211-A and B, page 325.
2. Type the letter, paragraph 211-C, as a five-minute timed writing. Make corrections as you type. Repeat timing, trying to decrease your errors.
3. Do not preview Project C, pages 325-327. Read these general instructions and begin timing.
 - a. Assemble your supplies: WORKBOOK paper, pages 405-410, carbon paper (several sheets), onion skin paper (several sheets), typewriter eraser and carbon eraser, black-ink pen, envelopes (large), plain bond paper. Be sure your work area is neat and supplies accessible.
 - b. On the last (file) carbon copy type the names of all persons receiving blind carbon copies in the top left-hand corner. An additional "bcc" note should be shown on the file copy, too.
 - c. Address envelopes where they are needed.
 - d. Read all figures in tables to confirm totals.
 - e. Ask only your instructor if you have questions as you proceed.

You should complete this project in 1½ hours. Mark your time, and turn in your work.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IX, Unit 35

106

Lessons 213-214

1. Ask your instructor for copy for a 10-minute timed writing; then warm up on paragraph 213-A, page 328. Type each paragraph twice.
2. Read paragraph 213-B carefully.

NOTE: Project D is primarily an exercise in arrangements for a conference involving travel, hotel facilities, and material to be distributed. You do not have a time limit on this project, but certainly it should be completed within a reasonable time. Try not to have to "start over" on your assignments. Read all instructions carefully, especially those referring to distribution. Use WORKBOOK paper, pages 411-416.

STATE VOCATIONAL-TECHNICAL & TRADE SCHOOLS of LOUISIANA

PART IX, Unit 35

107

Lessons 215-216, 217-218

1. Before beginning either of the projects (E and F) in these four lessons, warm up on the review lines at the beginning of each lesson. Follow marginal instructions.
2. Projects E and F, pages 331-337, will test further your mastery of typewriting techniques as well as your ability to follow instructions. Read all notations and instructions carefully and proceed with the projects. These are your last learning experiences--they should be your very best!

Ask your instructor for instructions before you begin the testing series in Lessons 220-225.

THINGS TO REMEMBER

1. Standard size typing paper is $8\frac{1}{2}$ x 11. Government paper is $10\frac{1}{2}$ x 8.
2. Pica print is the large print which has 10 spaces to an inch and 85 typing spaces across a standard size sheet of paper. Government paper has 80 spaces measuring across a pica scale.
3. Elite print is the small print which has 12 spaces to an inch and 102 typing spaces across a standard size sheet of paper. Government paper has 96 spaces measuring across an elite scale.
4. Standard typewriters provide 6 single spaced lines to an inch up and down the paper--this applies to both pica and elite print.
5. There are 66 lines up and down to a full sheet of standard size typing paper and 33 to a half sheet. Government paper has 63 lines up and down and 31 lines to a half sheet.

FINDING THE CENTER OF THE PAPER

Insert your paper so that the center comes at 50 on the printing scale. If your scale has fewer than 95 marked spaces, however, use 40 instead of 50 as the centering point for the paper, for setting the paper guide, and for planning margins.

Each typewriter has a paper guide that can be adjusted to guide paper into the machine so that the center of the paper will come at whatever point on the scale you wish. To adjust the paper guide so that it will center your paper at 50, take these steps:

1. Use the space bar or carriage release and set the carriage at 50.
2. Mark the center of the paper, at the top, by a pencil mark or crease.
3. Insert the paper.
4. Loosen the paper by depressing the paper release.
5. Check to see if the paper is straight--move it so that its center mark is at the printing point.
6. Restore paper release to normal.
7. Adjust the paper guide: Move it so that its blade edge is snugly against the left edge of the paper.

You may also find the center of your paper by placing your paper guide on zero. Then divide 2 into the total number of typing spaces across your paper. For example, if your paper reads 0 to 85 on the scale: Disregard the $\frac{1}{2}$ and the center of your paper is $42\frac{1}{2}$ --this also tells you your print is pica. If your paper had read from 0 to 102 on the scale, your center would be 50 or 51 to be exact, and you would have elite print.

HORIZONTAL CENTERING

To center a line or word across your paper, follow these steps:

1. Clear tabs and set a tab stop at the center of your paper.
2. Place your carriage at the center of your paper. (40, 50, or whatever your center is).
3. Backspace once for every two strokes (beginning with the first) in the line you are to center--then type the full line. NOTE: Blank spaces count as a stroke.
4. Place your carriage back at the center of the paper for the beginning of the next line, and again backspace once for every other stroke. For example:

Mary Adams

(5) Backspaces

FIGURING A 40-SPACE LINE

Let's say the longest line in the drill you have been assigned to type will use up 40 spaces or strokes across your paper. These 40 spaces are referred to as a 40-space line and should be centered on the page according to the following steps:

1. Crease your paper in the center and place it in the typewriter so that its center comes at 50 on the printing scale. (Use 40 as the center only when you have fewer than 95 marked spaces on the scale.)

2. Divide 2 into the space line which we said was to be $\triangleleft 40 \triangleright$. $\frac{20}{2/40}$
NOTE: If you put half of your 40-space line ($\frac{1}{2}$ of 40 = 20) to the left of the center of the paper, and half to the right, you should have a centered 40-space typing line. Do not forget to add 5 extra spaces to the right margin. This allows for variation in the length of the last word on each line. A warning bell will ring when the carriage is 7 or 8 spaces from the right margin. When the bell rings (1) finish a short word or divide a long word on a syllable; (2) return the carriage, and start the next line. Press the Margin Release, if necessary.

CHECK:

- | | |
|---|--|
| <p>a. 50 Center of Paper
 - 20 $\frac{1}{2}$ of 40-space line
 ———
 30 = Left Margin Set</p> <p>c. 70 Right Margin before 5 extra spaces
 - 30
 ———
 40 = Space Line</p> | <p>b. 50 Center of Paper
 + 20 $\frac{1}{2}$ of 40-space line
 ———
 70</p> <p> + 5 Spaces for Warning Bell
 ———
 75 = Right Margin Set</p> |
|---|--|

60-Space Line ($\triangleleft 60 \triangleright$)

Use the same procedure to figure a 60-space line. Add and subtract 30 from 50 (center of paper) instead of the 20 used above because ($\frac{1}{2}$ of 60 = 30).

COMMON MARGIN SETTINGS (With the paper centered at 50*)

Line Length Desired	Left Margin Stop At	Right Margin Stop At
40 Spaces	50 - 20 = 30	50 + 20 + 5 = 75
50 Spaces	50 - 25 = 25	50 + 25 + 5 = 80
60 Spaces	50 - 30 = 20	50 + 30 + 5 = 85
70 Spaces	50 - 35 = 15	50 + 35 + 5 = 90

* With paper centered at 40, settings will be 10 lower than shown on this table.

CONVERTING INCHES TO SPACES (When Planning Margin-Stop Settings)

Directions often indicate the length of typing line in terms of inches. When planning the setting of margin stops, the typist must translate these inches into spaces.

Number of Inches in the Line	Pica Print 10 Spaces = 1 Inch	Elite Print 12 Spaces = 1 Inch (Round Off)
4"	40-Space Line	50-Space Line
5"	50-Space Line	60-Space Line
6"	60-Space Line	70-Space Line

PICA or ELITE

1. If you have pica print (the large print, pronounced pie-ka), it takes 10 typing spaces measuring across your paper (horizontally) to equal one inch.
2. If you have elite print (the small print, pronounced ay-leet), it takes 12 typing spaces measuring across your paper (horizontally) to equal one inch.
3. To determine the difference between pica and elite print, follow these steps:
 - a. Insert your paper in the typewriter so that the center of your paper will be either 40 or 50. In this example, we will use 50.
 - b. Check to see where the left edge of your paper falls on the scale--now the right edge.

- c. Subtract the left paper edge (8) from the right paper edge (93).

-----	93
-	8

	85
- d. If you are using standard size typing paper (8½ x 11), your answer is 85 for Pica Print Typewriters. This also means you have 85 typing spaces across your paper. To double check your answer, multiply the width of your paper (8½) times one pica inch which is (10). Remember, pica print takes 10 spaces to equal one inch so $(8\frac{1}{2} \times 10 = \frac{17}{2} \times 10 = 85)$.
- e. If your same sheet of paper was inserted in an Elite Print Typewriter, it would read this way:

- f. This time, the left edge of your paper is one space back from 0 and the right edge ends on 101. Add the left paper edge to the right paper edge.

101	Your answer is 102 for Elite Print Typewriters. You also have 102
+ 1	typing spaces across your paper. Check: 8½ (paper width) x 12
-----	(one elite inch) = $\frac{17}{2} \times 12 = 102$.
	2
- g. When setting margins on the older model Underwood Typewriters (illustrated in the drawing on p. 11 in these job sheets) you will find the small numbers on the Carriage Position Scale control the left margin even though they appear on the right side, and the larger numbers control the right margin even though they appear on the left. This method of margin setting only applies to Underwood's older models since their most recent typewriters have the small numbers appearing on the left side of the Carriage Position Scale and the large number on the right. NOTE: 40 is the center of your paper on the scale below because your scale has fewer than 95 marked spaces. In order to make 40 the exact center, move your paper guide 2 spaces to the left of 0.

TYPEWRITING CONTEST RULES

A. Rules for Correcting Papers

1. General Rule. Every word (including its following punctuation and spacing) omitted, inserted, misspelled or changed in any way from the test copy must be penalized. Only the one error may be charged in any word.

2. Errors in Printed Copy. Any error in the printed test copy may be copied exactly or corrected.

3. Punctuation and Horizontal Spacing. An otherwise correct word must be marked as an error if its following punctuation mark or spacing is omitted, incorrectly made, or changed from the copy.

4. Erasing. Erasing is not allowed, unless agreed upon prior to a specific test.

5. Transposition. Any transposition in any word or group of characters constitutes an error. Single words or groups of words that are transposed are penalized one error for the transposition, plus one error for each mistake in the transposed matter.

6. Rewritten Matter. Rewritten words, groups of words, or characters are charged one error for the rewriting, plus an error for each mistake in the rewritten matter.

7. Last Word. An error made in the last word typed, whether the word is completed or not, must be charged.

8. Crowding, Piling, and Misspacing. No word shall occupy other than its proper number of spaces. If a portion of another character extends into the space between words so that it would overlap a portion of any character that might be in the space, it is an error.

9. Word Division. A word incorrectly divided at the end of a line is penalized.

10. Faulty Shifting and Lightly Struck Characters. Unless the complete character is discernible, an error is charged.

11. Left-Hand Margin and Paragraph Indentation. The first character on all lines, except those that begin paragraphs, must appear at the same point on the line scale--at the left margin. Each line not starting thus, and each paragraph indented other than 5 spaces will constitute errors.

12. Short and Long Lines. The last character typed on each line (other than the last line of a paragraph or of the test) must rest on same space. Margins must be as even as possible.

13. Line Spacing. Double spacing is required. Each line irregularly spaced is penalized one error.

14. Cut Characters. If any part of a character or word is cut off at the edge of the paper, it is an error.

Start off with both hands of the clock on 10--turn the hands counterclockwise and stop on "1" if the drill calls for a one minute timing. As soon as you pull the handle down, it will stay down, and the clock will begin ticking. It rings automatically when the one minute is up.

FIGURING YOUR WORDS A MINUTE (wam)

Always double space your timings and never erase on a timing. Type as much as you can while the clock is ticking. If you complete the paragraph before the clock stops, start back at the beginning. Be sure to stop though when the bell rings on the clock.

<u>Example</u>	Words	Score
If Mr. Quigley can have sixteen crews out by	9	
the middle of June, you can take the first prize.	19	$\begin{array}{r} 25 \text{ Words} \\ - 10 \text{ 1 error} \\ \hline 15 \end{array}$
This prize is worth taking, too; it provides	28	
a January excursion up to Quimby for all winners.	38	$\begin{array}{r} 15 \text{ Wam.} \\ \hline 1/15 \end{array}$

Each block represents 5 strokes--it takes 5 strokes to equal one average word. Blank spaces count as a stroke.

1. Let's say the bell rang after you typed the "t" in the word too (the first line in the second paragraph). Notice the number in the right margin. If you type the first two lines in one minute, you have typed 19 words--but you typed part of the third line also. Check to see what square in the block below the letter "t" falls in. You will notice it is in the 7 block. Normally you would add 7 + 19 to compute your total number of words, but the third line is the beginning of a new paragraph and is indented 5 spaces; so, subtract 1 from 7. The total number of typed words will be: 6 + 19 = 25.

2. Go back and circle errors. Remember, count only one error to a word. Typing contest authorities have set a penalty of minus 10 for each error, because they figured you would lose 10 words from the time it took you to correct that error until the time you started to type again. In the example above, there is one error--middle.

3. Divide the time (one minute) into your score of 15 to get your correct words a minute (wam). If this had been a two minute timing, you would divide 15 ÷ 2 = 7 1/2 = 8 wam. If you have a half or more, count it as the next higher number.

The formula reads: WORDS minus ERRORS divided by the TIME = the correct WAM

SPEED SPRINTS

A speed sprint or 12 second timing is a short timing in which you try very hard to reach a new rate of typing for 12 seconds. Always pick as your goal a few words above your present top rate. For example, if you typed 15 wam on the Alphabet-Review Paragraphs in Lesson 13, then 20 or 25 would be a good goal on the 2 & 3-Letter Speed-Up drills in Lesson 11. When you are able to reach this new goal with no more than one error, raise your goal higher. Place your score in the right-hand margin beside each timing. You do not have to count off for errors because speed sprints are used only to boost speed.

VERTICAL CENTERING

When any material is centered exactly, it will seem to be a little low. If you want something to seem to be centered, you must raise it just a bit above what would be the perfect center. The bottom margin should be at least one or two lines wider than the top margin.

Typed material may be single, double, or triple spaced. When it is single spaced, typing appears on each line. In double spacing, typing appears on every other line with 1 blank line between the typed ones. In triple spacing, typing appears on every third line with 2 blank lines between the typed lines.

SINGLE SPACING

To center vertically (up and down), follow these steps: NOTE: There are 33 lines up and down to a half sheet of 8½ x 11 paper and 66 lines to a full sheet.

1. If you have 5 lines to be centered vertically on a half sheet using single spacing, subtract 5 from 33 to see how many blank lines you have left.

33 lines to ½ sheet	Mary Adams
- 5 typed lines	Harry Hale
<u>28 blank lines left</u>	John Monks
	Ruth Smith
	Ron Wilson

2. Now divide 2 into 28 to get equal top and bottom margins $\frac{2}{28}$. Count down 14 lines from the top of your paper and begin typing on line 14.

3. Check your work as follows:

13 blank lines at the top
+ 5 typed lines
<u>15 blank lines at the bottom</u>
= 33 total number of typing lines on a ½ sheet

DOUBLE SPACING

Figure the same 5 lines using double spacing--half sheet. For every double spaced line, count only one blank line because you actually type on the second line.

5 typed lines	33	$\frac{12}{24}$ come down
+ 4 total blank lines between typed lines	- 9	12 lines
<u>9 = total number of lines you know will be used</u>	<u>24 blank lines left</u>	from the top of your paper

Check: 11	Mary Adams
+ 9	Harry Hale
<u>20</u>	John Monks
= 33	Ruth Smith
	Ron Wilson

TRIPLE SPACING

Figure the same 5 lines using triple spacing--half sheet. For every triple space, count only two blank lines in between the typed lines because you actually type on the third line.

5 typed lines	33
+ 8 blank lines	- 13
<u>13 = total number of lines you know will be used</u>	<u>20 blank lines left</u>

Check: 9	John Monks
+ 13	Ruth Smith
<u>22</u>	$\frac{10}{20}$
= 33	Ron Wilson

TABULATING

If you are asked to tabulate columns and you prefer not to leave the usual 6 spaces between columns or you decide your copy would look better if you had more or less than 6 spaces between columns, then follow the steps below using this STATISTICAL REPORT as your guide.

<u>STATISTICAL REPORT</u>				
<u>States</u>	<u>Cities</u>	<u>Number</u>	<u>Date</u>	<u>Year</u>
Alabama	Montgomery	10	September 5	1903
California	San Francisco	18	July 22	1905
Oregon	Eugene	21	August 23	1930
Louisiana	Lake Charles	23	April 26	1931
Virginia	Norfolk	25	January 18	1942
22 (L.Mar.)	41 (1st Tab)	63 (2nd)	78 (3rd Tab)	98 (4th)
(10)]....9....	(13)]....9....	(6)]....9....	(11)]....9....	(4)]....9....
California	San Francisco	Number	September 5	Year--KEY

1. Clear out any tab stops that may be set.
2. Check to see whether you have pica or elite print. Remember: Pica print has 85 available typing spaces measuring across the paper and elite print has 102 spaces across 8 1/2 x 11 paper.
3. Count the number of strokes in the longest word of each column and add them all together. You must consider individual headings above the columns in this calculation. For example: 10 + 13 + 6 + 11 + 4 = 44.
4. Subtract the figure you got in Step 3 from the total number of typing spaces on your paper. This is elite print so the paper has 102 available spaces across (horizontally). 102 - 44 = 58 blank spaces.
5. Divide 6 into 58 since you want all blank spaces to be equal. The number 6 represents the number of places you will leave blank spaces--this includes the left and right margins and the spaces between columns.

$$\begin{array}{r} 9 \\ 6 \overline{)58} \\ \underline{54} \\ 4 \end{array}$$

Since there is a remainder of 4, it is necessary to place these 4 extra spaces somewhere. For better balance, add 2 of these 4 extra spaces to the left margin and 2 to the right margin. The left and right margins will each contain 11 blank spaces, and the number of blank spaces between each column will be 9.

NOTE: If (after dividing) there had been a remainder of 5, I would have added 1 extra space to the Left Margin and 1 extra to each of the first 4 blank spaces between the columns, leaving the Right Margin as is (with only 9 blank spaces).

6. Look at the left edge of your paper--what number on the Carriage Position Scale is the left edge of your paper on? In the example above, we will say the left edge of the paper is on the number 10. For example:

Left Edge of Paper	Right Edge of Paper
8 1/2 x 11 Paper	
0	120
10	110
20	100
30	90
40	80
50	70
60	60
70	50
80	40
90	30
100	20
110	10

(Cont'd on the next page)

7. Count over 11 blank spaces from the left edge of your paper and set the left margin on the 12th space. In the example above, the edge of the paper is on 10, so space forward 11 blank spaces from 10 and set the left margin on the 12th space which is the number 22. Type or space out California, then space over 9 more strokes and set the 1st tab (which is column 2) and continue on across setting the other tab stops.

NOTE: The word "number" is longer than the column of numbers centered under it. After the column headings are typed, you will want to eliminate the tab set for the word "Number" and reset this tab for the numbers.

8. You may check your work as follows:

21	41--(1st Tab)	63--(2nd Tab)	78--(3rd Tab)	98--(4th Tab)
+ 10	12	5	10	3
9	9	9	9	11
<u>40</u>	<u>62</u>	<u>77</u>	<u>97</u>	<u>112</u>

TABULATING

(Backspace-from-Center Method)

Another method of tabulating is illustrated below. When using this method, the standard rule is: Always put 6 spaces between columns.

SPELLING CONTEST WINNERS		
<u>Name</u>	<u>School</u>	<u>Grade</u>
Mary Archer	Wilson	12
Bill Jennings	Wilson	11
Harry Flemming	Central	12
Janice Snyder	Central	11
Ruth Landers	Oak Grove	12
Joyce York	Oak Grove	11

KEY: Harry Flemming.....Oak Grove.....Grade

The basic steps in following this method are:

1. Clear the machine, move the margin stops to the ends of the lines and clear out any tab stops that may be set.
2. Position your carriage at the center of the paper.
3. Select the key items (longest line) in each column. The key items in the example above are: Harry Flemming, Oak Grove, and Grade.
4. From the center of the paper, backspace once for every 2 strokes in the longest line in each column, or its heading; and backspace once for every 2 blank spaces to be left between columns.
5. Set the left margin at the point to which you have backspaced.
6. To set the tab stops, start from the left margin and tap the space bar once for each stroke in the key item in column 1 and once for each of the 6 strokes in the blank area between the columns and set a tab stop at this point. Continue spacing forward in this manner until all tab stops have been set.

ESTIMATING LETTER SPACINGMethod 1

Horizontal centering is controlled by setting the margin stops for:

Up to 100 words:	40 space (7 word) line
101 to 200 words:	50 space (9 word) line
201 to 250 words:	60 space (11 word) line
251 to 300 words:	65 space (12 word) line

Vertical centering is determined by computing the number of lines needed; then subtracting from 66 and dividing by 2 in the usual manner. The "lines needed" include:

1. Typed lines in the material
2. Blank lines in the material
3. Typed lines in the title
4. Blank lines after the title

To determine the number of typed lines, divide the total number of words by the number you can get on each typed line--by 7, 9, 11, or 12.

Example: Assume 248 words and a one line title, all to be centered on a full page & double spaced. You would use a 60-space (11 word) line.

1. Number of lines on a full page		66
2. Number of lines of typing is $248 \div 11 = 22.6$ or 23	23	
3. Number of blank lines between 23 double spaced lines	22	
4. Number of lines for the title	1	
5. Number of blank lines after title	2	
6. Total number of lines needed		48
7. Difference between 66 and 48 is		18
8. Divide by 2 to get starting line		9

Method 2--Estimating Length of Handwritten Copy

1. Select three full handwritten lines and count the number of words they contain. Divide this number by 3, to get the average number of words for each line of copy in the material.
2. Count the number of lines (including any short ones, too) and multiply the number of lines by the average number of words for each line. The result is the estimated number.

Method 3--Letter Placement

SHORT....under 100 words
Line...40 pica, 50 elite
Date.....on Line 16
Address.....6 lines down

AVERAGE..100 to 199 words
Line....50 pica, 60 elite
Date.....on Line 15
Address.....5 lines down

LONG...200 to 300 words
Line..60 pica, 70 elite
Date.....on Line 14
Address....4 lines down

LETTER STYLES & PUNCTUATION

Semiblock Form

Extreme Open Punctuation--permits only a colon after the salutation and a comma after the complimentary closing. Any line that ends in an abbreviation is followed by the usual period.

Enclosure--means something extra is enclosed in the letter. It is typed below the reference symbols (either a single or double space).

Indented Style

2nd Page Heading to Ltr. Above

Modified Block

Closed Punctuation--requires that a punctuation mark of some kind be used to "close" every line in the heading and closing. Company firm name is in all caps and a double space below the complimentary closing. Leave 3 blanks in between Co. name & typewritten signature.

Subject Line

cc: (Carbon Copy)-- placed below the reference symbols. The SUBJECT line is placed between the salutation & the body of the letter. (May be blocked or centered. Example: **SUBJECT:**

Extreme Block

P.S. (Post Script) The Post Script is below the enclosure. You may indent or block the P.S.--most common form is PS:

Reference Symbols-- indicate the person who dictated and the typist. Usually a double space below the typewritten signature, Examples are: REF:ld, RC/MC, rej/ek.

Attention Line

The ATTENTION line is between the inside address & the salutation. Use the same style as you do for the SUBJECT line. The ATTN. line on an envelope is near the bottom left margin.

We have just received your order #123497, dated February 22.

! DOUBLE SPACE

The prices on several of the items in the order have advanced since our latest catalog #10a was issued January 1. For quick reference, we give you the old and new prices on these items:

Preserved Pineapple @ 45½¢ a pound;
 3 *** Peaches, Melba Halves @ \$1.68 doz., now \$1.72;
 Hand-dipped Chocolates (hard) @ 45¢, now 48½¢ a pound;
 Gallon Cans Fountain Fruits (Alta Brand) 60¢, now 64½¢.

--(BODY OF LETTER)

In your letter accompanying the order you wrote: "Rush this order! We are completely out of some of the items; stock on the others is very low."

Because of your urgent need, we are taking the liberty of shipping the entire order, including these items which have advanced in price. We expect further advances of from 5% to 10% immediately on all fountain supplies. We urge you to complete your stock at this time.

You will find B/L enclosed. Goods were shipped by S. P. R. R., car #219864.

May we send you a copy of our company's new catalog?

Enc.

To Erase Neatly:

- a. Be sure your hands and eraser are clean. To clean eraser, rub it briskly on clean paper or on a fine-grained sandpaper.
- b. Move the carriage to the extreme right or left so that eraser crumbs will not fall into the type basket. Whenever necessary, depress the margin release key.
- c. Roll the paper up so that the error to be corrected is on top of the roll. Hold the paper firmly by pressing it against the roll with your finger tips.
- d. Erase the error with a light, short, circular motion, blowing very lightly to keep the dust out of the machine. Do not scrub or press hard.
- e. Return the paper to the writing position and type the correction carefully. Strike the key lightly; then backspace and strike it again until the corrected letter is exactly as dark as other letters on the page.

CROWDING AND SPREADING

A high per cent of typing errors involve a space problem (that is, a letter was left out, in which case you must squeeze it in; or an extra letter or space was inserted, in which case you must find a way to conceal the extra space). There are several different ways to manage the spreading or squeezing. All methods require your erasing the whole word that is to be corrected and then your making the correction half a space to the left, for a squeeze; or half a space to the right, for a spread. In just one detail do the methods vary: how you go about moving the correction half a space.

Manual Typewriters

When crowding and spreading, hold the backspace key half way down, place the ribbon indicator on white, and strike the key desired. If the key strikes the correct place, just flip your ribbon indicator back on blue and strike the letter again. If you must reinsert the paper to make the correction, slide the paper a half space horizontally.

Electric Typewriters

Brace your hand against the left end of the carriage to keep it from spacing in the usual way. You push the carriage half a space and hold it at that position long enough to hit the next letter; you do this pushing and holding for each space in the correction. Also place your ribbon indicator on white when making corrections on the electric typewriters.

Examples of Spreading

How will they go?
How c a n they go?

How could they go?
How c a n they go?

Examples of Crowding

How can they go?
How will they go?

How can they go?
How could they go?

In the first example under Examples of Spreading, the word can should have been typed on the page instead of the word will; so the word will is erased and the word can is spread out to fill up the space that will was using.

INTRODUCTION

OVERALL OBJECTIVES

The purpose of this course is to help the trainee acquire or reinforce the basic (a) skills, (b) attitudes, and (c) knowledge which a tour-guide needs in order to conduct sight-seeing tours in a dignified, entertaining, and informative manner.

A. The basic skills include:

1. Fluency: the ability to deliver a consistent and coherent commentary.
2. Salesmanship and Tact; the ability to:
 - a. anticipate and cater to the client's needs and expectations.
 - b. promote the interests of the employer and the industry as a whole.
 - c. convey to the client a favorable impression of the community.
3. Practical Scholarship: the ability to carry on simple library reference, research and effective reading.

B. The basic attitudes include:

1. A sense of civic responsibility, based primarily on an

acceptance of tourism as an economic asset to the community as a whole.

2. A sense of community pride, manifested by a fundamental respect for the community's cultural and social values.
3. A sense of job importance; which is both implied by, and implicit in:
 - a. a conviction that tour-guiding is a dignified and useful occupation.
 - b. an inherent interest in community lore.
 - c. a desire for broader knowledge and general self-improvement.

a

C. The basic information includes.

1. A grasp of the social and economic principles underlying the tourism industry.
2. Sufficient factual data to discuss intelligently
 - a. the architecture
 - b. the customs and traditions
 - c. the economy
 - d. the geography
 - e. the history and
 - f. the recreational and cultural offerings of the area

OF ED 333

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963

3. A fund of local legend and anecdote, humorous and otherwise.

THE TRAINEE

The course, as outlined, is intended to up-grade the person who has had a little practical experience as a guide, usually on a sight-seeing tour bus. The idea for the course originated, in fact, because of an Ordinance passed by the City of New Orleans requiring Tour Guides to be licensed. Under the Ordinance, guides with more than two years' experience were certified automatically; those with less experience than that were required to pass a qualifying examination. It was this latter group for which the pilot course was designed. However, it should serve the purposes of the beginner equally well.

The nature of both course and trainee will be discussed in greater detail in Section V, "General Suggestions to Instructors."

IMPORTANCE OF THE PROGRAM

One aspect of the course's occupational importance is implicit in its relationship to the licensing procedure, mentioned above. Still another is the incontestable fact that the tour guide who has heretofore been trained under a sort of apprentice system (explained later), is not properly prepared for his job. The New Orleans sightseeing companies have been aware of this for some time, as

have municipal authorities and civic and cultural organizations. Official and quasi-official agencies which promote tourism have pointed out the economic importance of the tourist trade and have lobbied for improvement in existing tour guide services. Their interest is understandable because in 1965 the tourist trade brought an estimated \$175,000,000 into the city of New Orleans.

Thus the course, even if it is no more than moderately successful, will make an important contribution, not only to individual employment but to the economic assets of the community.

DURATION OF THE COURSE

The course is designed to run two nights a week, two hours a night, for approximately eight weeks or 30 classroom hours.

It will be noted that no specific training activities have been specified for the last three hours of classroom time. The omission has been made in view of the volume of material which has been planned for the first thirteen sessions plus the fact that no time has been set aside for lectures by authoritative guest speakers in the outline. As indicated previously, the instructor must have considerable latitude in revising the order in which the units are scheduled and making other desirable adjustments in content or procedure.

INFORMATION FOR THE CONFERENCE LEADER

The person for whom this course is designed is a mature individual who has been working at the business for some time.

If he is typical, he has already acquired enough basic information (and unfortunately misinformation) to conduct a standard bus tour for a sightseeing company. He has probably served his apprenticeship as a driver of a bus and acquired his "education" by listening to the regular guide.

By the nature of both his present assignment and his training, his functions are limited to delivering a commentary which is superficially convincing but lacking in both depth and accuracy. As a consequence he is not prepared to guide smaller groups who are at liberty to ask direct questions and to expect direct answers.

On the plus side he is alert, intelligent, interested in his business and anxious to learn more about it. But he lacks the know-how and skill necessary for practical research and effective reading. Furthermore, he is without the knowledge required to select, organize and impart information in a manner which will be both informative and satisfying to his client. Finally he tends to rely too heavily upon apocryphal anecdote and irrelevant humor, some of which is not

always in the best taste. But whatever his shortcomings, he is not a beginner, and this course of study is therefore intended to upgrade rather than initiate.

This is not to say however that the approach used here is unsuited to the novice. On the contrary, it should prove as effective for the novice as for the veteran. Nor should it be assumed that the "apprenticeship" system of training tour guides is inherently bad, excepting insofar as it tends to perpetuate inaccuracy. The learning of dry historical dates and economic data, particularly when these have not been organized into some sort of meaningful pattern, is at best a dull business and the technique which manages to instruct with the least effort on the part of the learner and teacher alike is a kind of sustained, hypnotic repetition. Listening to the same commentary day after day has just such an effect.

SUBJECT MATTER AND APPROACH

Information acquired by rote tends to be given back in a like manner; nevertheless, periodic reiteration is essential to the learning of details and a thirty-hour course can hope to do little more than introduce the learner to the process and encourage him to continue it on his own.

In consequence, this outline is primarily intended not to impart facts and dates but to develop a sense of values and inculcate learning techniques. The effort is therefore made to present only the essential facts, in the form of a basic framework, either

logical or chronological in order, and to encourage the student to commit them to memory, gradually filling in the gaps with such supporting detail, anecdote and personal observations as he may think appropriate. If he can manage this, then his training course has fulfilled its intended purpose.

In the outline and note sheets which follow, the liberal use of terms from the social sciences may give the impression that the material is too highly theoretical for the average man. This is not the case, however; the material is not only important to a mastery of the tour guide's understanding and appreciation of his business, but will prove to be both interesting and assimilable if it is presented in the form and manner proposed. The writer is prepared to affirm this from personal experience; he has effectively used the psycho-sociological approach as the basis for supervisory training, foremanship training, sales training and human relations courses in the past, with groups of adults whose backgrounds ranged from eighth grade through the university.

MECHANICS OF PRESENTATION

This outline envisages the employment of five major teaching techniques, namely:

- (a) Lecture-discussion sessions, conducted by the instructor.
- (b) Use of the voluntary services of guest lecturers who are authorities in their respective fields.

- (c) Use of selected film, slides, maps, etc.
- (d) Use of duplicated outlines which set forth some of the facts and information required by the tour guide
- (e) Encouragement of outside reading and reference.

CLASS PROCEDURE

The course is divided into two sections. The first of these, comprising Units One through Five, deals with the philosophy and the mechanics of the business. The second section, comprising Units Six through Fifteen, helps the student to unearth and organize the essential facts and information which the guide purveys to his clients. The first section is perhaps the more important because it covers a subject matter area which the guide is unlikely and probably unequipped to explore on his own initiative.

Under ideal conditions it would be desirable to present the first five units consecutively. There are two conditions which might render this unwise, however. The first is the difficulty of procuring guest lecturers and/or appropriate films on the date which would render the presentation most effective from the educational standpoint. The second is the fact that the trainee's expectations usually run to the acquiring of material for a glib commentary and he is likely to become impatient with so much apparently irrelevant matter. The teacher must therefore adapt his plans to the

exigencies of the situation. He may find it necessary to interrupt the consecutive presentation of Units One to Five; hence these have been planned and subdivided with that possibility in mind. No serious disadvantage will be incurred as long as the units are presented (a) in order, (b) not too far removed in time from one another and (c) with a brief recapitulation of the last unit preceding the discussion of the next. As for Units Six through Fifteen, there would appear to be no inherently logical sequence, excepting that Units Six, Seven and Eight should probably precede the others, in order.

As a final suggestion, and to repeat, neither teacher  student should entertain the hope that the course will impart all the factual data needed by the guide. The research of the German psychologist Ebbinghaus, fifty years ago, and the subsequent findings of the Gestalt school point to the futility of such a hope. (An adaptation of Ebbinghaus' principles of learning forms the basis of Unit Five: Acquiring, Selecting, Organizing, and Presenting Information.)

Pamphlets should play an important part in the training program. It is probably best that these be procured (assuming they are available at no cost) by the instructor and distributed to the trainees. Individual copies of the Tour Guide Note Sheets should also be given each trainee for review purposes. Library reference

and reading from books listed in the bibliography should be encouraged. Recommendations of appropriate films will appear in the individual lesson outlines.

The literature on the subject of New Orleans and Louisiana is formidable, and only those works which the writer considers basic for guides are included in the bibliography. Each trainee should have them all in his personal library; in any case, he must own, or have unlimited access to those marked with an asterisk (*) in order to participate in the course as it is outlined herein.

UNIT ONE

COURSE ORIENTATION

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To prepare the student for participation in the course by explaining:
 - 1. What he may expect to get from the course.
 - 2. What is expected of him.
- B. To acquaint him with the kind of subject matter to be covered.
- C. To make known to him the means and facilities available to him for self-improvement.

II. GENERAL OUTLINE OF THIS UNIT

- A. Opening formalities
- B. Terms of reference
- C. Preliminary review of course content
- D. Preliminary review of resources
- E. Methods of evaluation
- F. Introduction to tourism
- G. The psychology of tourism

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

- A. Chalk board
- B. Chalk
- C. Tour Guide Note Sheet--Unit One
- D. Sample pamphlets
- E. Film (optional; in case needed)

TOUR GUIDE NOTE SHEET - UNIT ONE

I. INTRODUCTION:

The tourist's interest is by no means limited to history, buildings, and scenery. Tourists are also interested in people. Furthermore, tourists are people. This gives the tour guide two good reasons to learn all he can about people and "what makes them tick," both as individuals and as a community.

In the first place, a knowledge of how people think and act as individuals should help the tour guide to handle clients-- to give them what they want and send them away happy.

In the second place, a knowledge of how people think and act as a community should help him to explain his own city's "way of life" to his client. This is more important than the average guide realizes because it has a lot to do with something called "atmosphere."

II. WHAT IS ATMOSPHERE?

The tourist is very fond of "atmosphere." He is seldom clear as to what it is--it is something he "feels" but "can't put his finger on."

Actually it is not hard to explain "atmosphere." Part of it, of course, is history, architecture and "local color." But its most important ingredient is the local people themselves-- the way they feel, act and think as a group; the way they work, play and live. If a community is a little different from other towns in these respects, it has "atmosphere" and it therefore has a strong attraction for tourists.

The guide who can "play up" local atmosphere, who can help his client to identify and understand the unique character of his own community, is helping to build the reputation of his city as a tourist center. At the same time he is rendering the client a useful service.

In order to do this properly the guide should understand some basic principles of sociology, one of the Sciences which explains "What makes people tick."

III. SOCIOLOGY? WHY NOT?

This subject is not as "way out" as the name suggests because most intelligent people who "get around the city" have already learned something about it from their own day-to-day experience and observation.

However, the sociologist does a few things with his knowledge which men-about-town usually don't bother to do with theirs.

For example:

1. He looks for the reasons behind the things he notices.
2. He also looks for "the reason behind the reason." He likes to go deep.)
3. He tries and usually succeeds in distinguishing between causes and effects. (The untrained observer often confuses the two.)
4. He has organized his knowledge in such a way that it can be used in a business-like manner for practical purposes (e.g. predicting public reactions).

Much of what the sociologist has learned is of interest only to other sociologists. But some of his knowledge is of direct practical value to the tour guide. The next lesson will present this knowledge to you in a brief and simple form.

UNIT TWO
BASIC CONCEPTS OF TOURISM

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To deepen and broaden the guide's appreciation of his job by giving him
 - 1. a basic understanding of the social structure of an American city.
 - 2. the nature, needs and expectations of the typical American tourist.

- B. To arouse an interest in the guide which will motivate further inquiry into the deeper implications of his work; to give direction and momentum to this inquiry.

II. GENERAL OUTLINE OF THIS UNIT

- A. What is the typical tourist like?
- B. What is he seeking?
- C. What does he bring to the process?
- D. What is the sociological background of tourism?

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

- A. Chalk board
- B. Chalk
- C. Tourguide Note sheet--Unit II

UNIT TWO
BASIC CONCEPTS OF TOURISM

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>I. TOURIST PSYCHOLOGY</p> <p>A. The Typical Tourist</p> <ul style="list-style-type: none">1. Most common age group2. Income bracket3. Other characteristics<ul style="list-style-type: none">a. Otherwise, present the final summary only.</p>
<p>B. Application of this information to the guide's work.</p>	<p>Repeat importance of interpreting the local way of life to the tourist. Ask class to contribute illustrations from their experience.</p>
<p>III. SUMMARY</p>	

TOUR GUIDE NOTE SHEETS - UNIT TWO

I. INTRODUCTION

We said earlier that a town had to be "different" in order to attract tourists. We also said that the guide should be able to explain how New Orleans is "different" from other cities in America if he wants to do a good job.

But before he can do this he has to understand the ways in which all big towns are similar.

The following discussion attempts to help him understand the points in which American communities resemble one another.

II. POLITICAL CONCEPTS:

- A. A country's political system depends on the kind of beliefs which are shared by the majority of its people (Such "shared beliefs" are called values by sociologists.)

America is no exception to this rule.

1. Some of the values of a society are written into its laws. Here are a few examples in modern America.
 - a. Equality of everyone in the eyes of the law.
 - b. Trial by jury and the right of appeal.
 - c. Everybody is innocent until proven guilty.

2. Other values are embodied in "unwritten laws" which the majority of people accept without question and which influence their behavior without their realizing it. Here are some examples of America's "unwritten laws."
 - a. Everybody has to stand on his own two feet.
 - b. The underdog deserves sympathy and support.
 - c. Everybody deserves a chance to show what he can do.
- B. Political values are what transforms a "population" into a "nation."
1. Almost 200-million Americans are welded together into a united people primarily by the political beliefs which they share.
 2. This unity is noticeably mostly in times of national crisis, war, etc. (Remember Pearl Harbor?) Otherwise people seldom think about it.
- C. A nation's total set of political values is one of the factors which gives the nation's citizens their distinctive national character. For example, French political ideas help to make the French people look, think, and act like Frenchmen.

D. However, it is a narrower, more specialized set of social values which gives a community its distinctive character (e.g. which makes a native New Orleanian different from a Philadelphian). In order to understand these social values it is necessary to go a little further into the science of sociology.

III. SOCIAL CONCEPTS

- A. Politically, America is democratic. This is to say that the government does not officially recognize "classes" or special "class privileges."
- B. Socially, however, Americans tend to divide themselves into classes without knowing that they are doing it. The combined classes add up to a social system, or structure.
- C. Two important principles are basic to an understanding of social structure:
1. Social classes are informal organizations. This is to say that
 - a. They do not have a charter and/or officers, etc., nor a conscious objective.
 - b. The vast majority of the "members" don't even know that the "organization" exists, much less that they "belong" to it.

2. But social classes are very much like formal organizations (i.e. clubs, sports teams, religious sects, etc.) in several important respects, namely:
 - a. They are "held together" by similar values:
that is to say, by
 - 1) Shared purposes, ambitions and aspirations
 - 2) Shared likes and dislikes
 - b. They give the "members" a sense of "belonging" and security. (People are always more comfortable with "their own kind.")

D. We are far more conscious of social class, and far more influenced by it than we realize. For example

1. An individual's social class usually determines his customary manner of
 - a. speech
 - b. dress
 - c. behavior
 - d. thinking"Class will tell" in little things like (1) the way a man "relaxes" or (2) the way he gives a "tip."
2. When a person is "sizing up" or "placing" other people he is unconsciously trying to decide in which "class" they belong.
3. Furthermore, most of us are sizing up the other fellow constantly, and without realizing that we are doing it.

IV. SOCIAL CLASS IN AMERICA

A. Some additional principles regarding social class are as follows:

1. The same basic social structure is found in practically every American city. The differences are far less important than the similarities (except to the tourist business of course).
2. A man's social position in any city ranges from "high class" (i.e. desirable), to "low class" (undesirable).
3. Generally speaking the "height" of a man's social position is determined by the number of people who "look up to him."

In practice, unfortunately, it is also indicated by the kind and number of people who are resentful or jealous of him.

4. Specifically a person's social position is determined by how he stacks up when looked at from the standpoints of:
 - a. Wealth
 - b. Birth, family
 - c. Influence, connections
 - d. Education
 - e. Occupation
 - f. Personal accomplishments

5. Just looking at the preceding list, you can see that a person's social status is influenced by economic factors (i.e. occupation, income, property ownership, etc). For this reason sociologists prefer to use the term socio-economic status in talking about social class.

B. Social classes are not very clear-cut in America. There is too much overlapping, for reasons which will be discussed very shortly. However, sociologists have come up with a classification system which is based on three major classes and several sub-classes.

The chart on the following page is like the one the sociologists have devised; but it has been modified somewhat so that it will be more useful to tour guides. Study it carefully, and see if you recognize anybody you know.

However, remember that nobody fits exactly in any one of these classes. Classes deal with the average man, but there is no such thing (e.g. the newly-rich oil man who still dresses, acts and talks like a cowboy).

VI. SUMMARY

We all think of America as a "classless" society with everybody equal. This is true politically but socially people "divide" themselves into classes.

B. Bases of this division are

- a. Wealth and influence
- b. Occupation, accomplishments
- c. Religious and moral beliefs

C. Membership in a social class is noticed in a lot of little things like

- a. Speech, accent
- b. Clothing, personal accessories
- c. Behavior--ways of treating others, spending money, relaxing, etc.

D. You can "place" a person by observing the things mentioned above.

E. You can also usually tell how he expects to be treated.

F. However, in America people do not fit neatly into patterns; low-class manners sometimes accompany upper-class wealth and vice versa.

G. The importance of all of this to the guide will be further discussed in the next lesson.

CLASS STRUCTURE IN AMERICA

CLASS	MONEY AND INFLUENCE	RELIGIOUS, MORAL ATTITUDES	EDUCATION	PUBLIC ACTIVITIES	TYPICAL EMPLOYMENT
I. UPPER					
A.	Rich for several generations. Blue chip investors. Internationally influential.	Usually belong to fashionable churches. Either very moral or very discreet. Marriage more or less stable; divorce kept quiet.	Ivy-league	Civic activity usually "behind the scenes." Publicity avoided. Mingle professionally with "B" group but not socially.	Corporation presidents, Board members, etc. (Seldom have to work)
B.	Rich but comparatively recently. Nationally	Same as above but less exclusive, less reserved about personal matters.	Exclusive schools and Universities	Same as above but less averse to publicity and public prominence	Upper level corporation officers,
II. MIDDLE					
A.	Well-to-do. Modest investments. Influential locally	Church goers, but not active workers. Divorce not uncommon, family life not close	Private Universities	Prominent citizens. Usually "front" for upper class on civic committees. Women usually active in civic and political movements.	Leading business men and executives; prominent professional men, etc.
B.	Financially solvent; "get along-O.K." Have savings accounts, small investments, Little influence	Active church goers; divorce uncommon; family life close. Believe in "doing the right thing." Very ambitious for children to do better than I did."	State Universities or High schools	Active in fraternal and "service" organizations (e.g. Kiwanis). Women are garden-clubbers, Friendlier, "noiser" than above	Foremen, supervisors, small businessmen. Better-paid technicians and white collar workers. Teachers, ministers, some doctors, lawyers, etc.
C.	Poor but honest, Hardworking and thrifty, but little savings or investments.	"Backbone of society"; very stable. Good church goers. Divorce uncommon. Family ties very close.	Usually less than high school	Little or none	Junior white-collar workers retail salespeople, craftsmen, better-paid service occupations. (Seldom self-employed).

CLASS STRUCTURE IN AMERICA

CLASS	MONEY AND INFLUENCE	RELIGIOUS, MORAL ATTITUDES	EDUCATION	PUBLIC ACTIVITIES	TYPICAL EMPLOYMENT
III. LOWER					
A.	Live from day to day; no savings (victims of loan sharks and installment buying at high interest rates)	Usually religious but not regular church goers. Family ties loose, common law marriages and illegitimacy general	Barely literate	None	Common labor, menial occupations
B.	No financial stability; no possessions	Moral standards non-existent. Crime, drug addiction, etc. common. Family life non-existent.	Illiterate	Anti-social; Society is the "enemy."	Odd jobs, if any; petty criminals, public charges, etc.

UNIT THREE

BASIC CONCEPTS (CONTINUED)

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To help the guide understand "local atmosphere" and the factors which produce it.
- B. To show him how he can use this knowledge in performing his job.

II. GENERAL OUTLINE OF THIS UNIT

- A. What makes a city
- B. The city dweller's environment
- C. Institutions; customs, traditions, etc.; their origin and function.
- D. Natural and physical environmental factors: their effect on cities and their people

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

- A. Chalk board
- B. Chalk
- C. Tour guide Note Sheet--Unit III

UNIT THREE
BASIC CONCEPTS (CONTINUED)

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
I. REVIEW	Brief summary of material from preceding session
II. WHAT MAKES A CITY	Use Tour-Guide Note Sheets, Unit Three as basis of this discussion. Do not distribute until end of class.
A. Difference between urban and primitive life B. Effect of cities on people	
III. THE CITY DWELLER'S ENVIRONMENT	
A. Cultural 1. Tangible 2. Intangible	
B. Physical and natural	
IV. INSTITUTIONS	
A. Their origin and purpose B. Their effect C. Their relation to tourism	
V. NATURAL AND PHYSICAL FACTORS	

TOUR GUIDE NOTE SHEET--UNIT THREE

I. WHAT MAKES A CITY?

A. The factors which make up any concentrated population center may be studied under three major headings as follows:

1. The people
2. Their cultural environment
3. Their physical environment

It is hard to separate these three groups of factors because they all work together. However, for study purposes we must try to examine each one as if it were independent and then analyze the part it plays in making a city what it is.

B. The primary difference between primitive life and city life, besides size, is found in:

1. Uniformity in the case of tribe members. People think, dress and act in much the same way.
2. Variety, in the case of the city. Wide differences in:

- a. Education
- b. Occupation
- c. Racial origin
- d. National origin
- e. Moral beliefs
- f. Religious beliefs
- g. Political beliefs

C. Result: infinite variety, no single individual having very much in common with any other.

"The city is large enough to contain all ... human variations and is sufficiently diversified so that there is room for all types. Urban populations are socially heterogeneous and so diverse that every human wish, whim, and impulse can be satisfied."

(Reissman, The Urban Process, p. 5)

"The city has more wealth than the country, more skill, more erudition within its bounds, more initiative, more philanthropy, more science, more divorces, more births, and deaths, more accidents, more rich, more poor, more wise men and more fools. It is characteristic of city life that all sorts of people meet and mingle without in the least understanding one another."

(Munro, quoted by Reissman, p. 7)

D. It is clear that the variety implies contradictions. For example, cities are distinguished by the following inconsistent conditions:

1. Privacy in the midst of a crowd: Individuals

"lead their own lives." Not like rural societies where "social pressure" restricts the individual's actions severely.

2. Conflict and cooperation

a. People living close together are thrown into competition with one another for living space, money, love, prestige, etc.

b. At the same time congested conditions make it necessary that people work together. (If everybody were in complete cut-throat competition with his neighbor, nobody would get any part of what he wanted.)

This leads to another contradiction, namely,

3. Freedom and regulation: The individual cannot enjoy freedom unless his neighbors are prevented from interfering with him. (The more people are crowded together, the harder it is for them to keep from stepping on each other's toes.)

E. SUMMARY:

1. When people live closely together the individual must be able to depend on certain kinds of behavior from his neighbors and vice versa.

2. Everybody must therefore accept certain restraints and restrictions on the free exercise of his will.
3. The result is the evolving of institutions, laws, rules, customs, etc. (More on this later)

II. THE CULTURAL ENVIRONMENT

The man-made part of the world is the next factor to be considered in studying "what makes a city tick." It is called Culture. (College Outline Series; Principles of Sociology, p. 114)

(Note that "culture" is also used in a narrower sense to mean "The theater, art, music, etc.")

A. Culture breaks down into two divisions

1. Material things: (things you can see and touch)
 - a. Buildings, roads, dams
 - b. Machines, tools, appliances, clothes, furniture, gadgets, vehicles, planes, etc.
 - c. Works of art: pictures, ornaments, etc.
 - d. Others

2. Immaterial things: (things which can't be seen, touched, bought and sold, etc.)

- a. Beliefs (religion, philosophy)
- b. Knowledge (science, etc.)
- c. Institutions, laws, etc. (rules which govern the way men treat one another).
- d. Others

B. Man develops all these things but they turn around and help to develop him.

- 1. Think how T.V., air conditioning, deep freezers, washing machines, etc., have changed your life.
- 2. Think also how these gadgets tend to standardize Americans as a whole. (The Frigidaire is the same in Detroit and New Orleans and has about the same effect on the people in both cities. This is bad for tourism. Who is going to spend two weeks and \$600 to go and see a carbon copy of the very place he wants to get away from, just for a change?)

(No, a tourist center must have something different to offer the tourist. And that difference lies mainly in the way that the natives think and feel about their work, their play and their lives.

Old buildings, and history are not enough by themselves. Who would dream of spending more than one day at Williamsburg?)

III. INSTITUTIONS:

These may be defined as "established practices, laws, and customs, etc." (Websters Collegiate Dictionary, 5th edition) Their purpose is to regulate man's dealings with his fellowman.

(In other contexts the word has a narrower meaning, e.g. organizations, schools, prisons, hospitals, etc.)

A. Under the general head of "Institutions" may be listed laws, established practices and customs.

1. Laws

- a. Put formal restrictions on man's conduct.
- b. Prescribe punishment for violations
- c. Set up and direct legislative, enforcement and service agencies (i.e. police, fire departments, courts of law, legislative assemblies).

2. Established practices: span, and to some extent overlap laws on one hand and customs on the other.

They include all "Unwritten laws" which govern men's dealings with one another. They include, among many other things:

- a. Religious Organizations
- b. Home, family, marriage
- c. Buying and selling
- d. Property rights
- e. Living up to your word
- f. Minding your own business, etc.

3. Customs: These, like practices, are not written laws. They are accepted by habit and the only penalty for violating them is the disapproval of other people. Here are a few examples.

a. General

- 1) Ladies first
- 2) Age before beauty

b. Religious

- 1) St. Joseph Altars
- 2) Attending nine churches on Good Friday

c. Local

- 1) Red beans and rice on Monday
- 2) French bread, poor-boys, etc.

IV. SUMMARY

A. The Institutions of a community have a number of common characteristics which are worth thinking about.

For example:

1. They are evolved, more or less unconsciously by the people themselves.
2. They are accepted without question by young children, challenged by adolescents and youths, but defended by old people.

(How else can you explain the fact that for thousands of years old people have always been sure the young adults were going to the dogs?)

3. They are intended to make the individual behave in a way that the majority of the people (i.e. the older group) think is right and proper.

B. The Institutions of a community and the behavior of its people are constantly reacting on one another (like a man on a trampoline).

- C. An understanding of the institutions (e.g. practices, laws and customs) of a community helps you to understand the "way of life" of its people.

V. PHYSICAL ENVIRONMENT

- A. The factors which "make cities what they are" can be studied under three headings:

1. People
2. Their cultural environment, and
3. Their physical environment.

We have already looked at the first two. Now we look at the third, namely the physical environment. This includes both man's natural world and the additions he has made to it. (i.e. buildings, bridges, roads, etc.)

The sociologist would object that these last are part of the cultural environment. We would agree, but would add that for the tour guide it makes more sense to lump man-made things which are of tourist interest with those which are natural (land, trees, lakes, rivers, etc.).

- B. For present purposes we will think of the natural environment as ecological and tangible, man-made things as cultural.

1. Ecological Factors are important determinants of the "way people think and act." The list of ecological factors is something like this:

- a. Location of the city's site.
- b. The topography of the site and its environs

Both of the above affect

- 1) Transportation; therefore they govern
- 2) Access to non-local raw materials and tend to determine
- 3) Architecture: the size, height, design and also the materials involved in buildings, etc.

c. The kind of raw materials grown or found in the area.

- 1) Agricultural
 - 2) Mineral, (including a fresh water supply)
- These are determined in part by (a) and (b) above. But they are also determined by the following factor, namely:

d. Climate

Climate also has some effect on

- 1) The temperament
- 2) The energy and
- 3) The will to work among the people.

This in turn has a bearing on the next factor, which is

e. Available manpower

The amount and type of labor in the area determines the balance which is reached between agriculture, manufacturing, distribution, (i.e. commerce and business, etc.)

1. Cultural Factors (physical)

Some cultural factors which have an influence on how the people think and feel are as follows:

a. The major businesses, industries, etc. in the area. How do the following affect the "flavor" of a town?

- 1) A new oil field
- 2) A big seaport
- 3) A military camp?

b. Modern structures:

- 1) Skyscrapers
- 2) Stadiums
- 3) Big bridges
- 4) Freeways, causeways, etc.

c. The evidence of a historic past

- 1) Old buildings
- 2) Statues
- 3) Ancient parks, trees, etc.

(What effect do these have on the way local people think?)

d. Cultural advantages

- 1) Modern parks and gardens
- 2) Universities, schools
- 3) Museums, opera houses, etc.

e. Organized recreational activities: These often exploit natural features (e.g. fishing, and boating, which exploit lakes and rivers; also hunting, golf, etc.).

VI SUMMARY

- A. A people's surroundings (i.e. environment) tend to make them a little different from other peoples who live in a different setting.
- B. But it works both ways, because people tend to change the environment in which they live; for example, they drain swamps, construct buildings, bridges, dams, roads, etc.
- C. The kind of a city a people build is the one which they think is best suited to the kind of life they lead.

- D. If the city is different from others (i.e. if it is quaint, picturesque, has local color, or offers unusual entertainment and recreational opportunities) it is a tourist city.
- E. The guide is urged to read this material over several times, then think about it and talk about it with his colleagues. The more he does this the better will be his appreciation and understanding of his job.

UNIT FOUR
TOURISM AS A BUSINESS

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To help the student understand the economic importance of Tourism to the community
- B. To help him appreciate the dignity and importance of his job.
- C. To present to him the basic operating principles of his job.

II. GENERAL OUTLINE OF THIS UNIT

- A. Advantages offered to tourists by the New Orleans area
- B. Benefits of Tourism to the community
- C. Local organizations and activities promoting tourism.
- D. The relationship between the sight-seeing company and its employees
- E. The tour guides' relationship to the client and to the community in which he lives
- F. Operating principles for tour guides

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

- A. Chalk board
- B. Chalk
- C. Tour guide note sheet--Unit four

UNIT FOUR
TOURISM AS A BUSINESS

TOUR GUIDE NOTE SHEET - UNIT FOUR

I. TOURISM STATISTICS

(The following estimates for the year 1965 were furnished by the New Orleans Tourist Commission).

- A. Total number of visitors - 1.5 million
- B. Total amount spent here - 175 million
- C. Correspondence handled by Commission
 - 1. 500,000 brochures sent
 - 2. 30,000 letters of inquiry handled
- D. Conventions and meetings in New Orleans
 - 1. 172 in 1961
 - 2. 375 in 1965
 - a. Total delegates - 120,000
 - b. Spent by delegates - 22.6 million
- E. Number of hotel rooms in New Orleans, 10,000

II. ORGANIZATIONS PROMOTING TOURISM

- A. Direct, full time promotion.
 - 1. Louisiana Tourist Development Commission

- a. Supported by state government
 - b. Head office Baton Rouge; local office in Jackson Square
2. Greater New Orleans Convention Commission
 - a. Privately supported; some money from city.
 - b. Head office, 400 Royal Street
- B. Indirect and/or part-time
1. Chamber of Commerce
 2. International House
 3. Hotels and motels
 4. Air lines and other transportation companies
 5. The following periodicals
 - a. This Week in New Orleans
 - b. Tourist Greeters Guide
 - c. New Orleans Guide for Visitors
 6. Mid-winter Sports Association

III. THE TOUR GUIDES' JOB

- A. The people of New Orleans and the city government both expect the tour guide to leave the tourist with a good impression of New Orleans and the desire to return in the future.

- B. The city authorities expect in addition, that the information given the tourist be reasonably accurate.
- C. The sight-seeing company's expectations are the same as those above.

The company expects in addition that the tourist be encouraged to take additional tours before he leaves the city.

The company expects that the tourist will have the inclination to employ the same sight-seeing company on his next visit; also to recommend the company to his friends back home.

- D. The client's expectations of the guide will be discussed in connection with the guide's conduct, immediately following.

IV. THE TYPICAL TOURIST

- A. There is no such thing as a typical tourist. As indicated previously everybody is different. However, so are life insurance risks, but the life insurance underwriters have to "play the averages." This means that they have to assume uniformity in all of their clients.

This is a good start for the guide. But it is only a start, as will be pointed out in the next few paragraphs.

This writer knows of no study as to what the typical tourist is like. His idea is as follows: (You may wish to correct it from your own experience).

1. Age - Late 30's to late 50's (usually married couples).
2. Middle class - probably saved all year for the vacation. Comfortable but not very well off.
3. Probably church goers - probably like an occasional risqué joke, but not "out in the open," and not in mixed company.
4. Looking to save money - a little bit afraid of being taken, but also afraid of being regarded as "cheapskates"; consistent but not heavy tippers.
5. Do not expect the guide to "kowitz" to them but want to be treated as ladies and gentlemen when on their vacation; usually enjoying luxury which they are not used to at home.

6. Anxious to tell their friends back home about their trip and to show them their films.

V. TOUR GUIDE CONDUCT

- A. It is not possible to tell the guide how he should act. The way he acts is a function of his personality. (You can no more expect another man to pattern his behavior on yours than you could lend him your suit and expect it to fit him and look good on him.)
- B. Nevertheless there are a few rules and prohibitions that every guide should bear in mind, even if he does not follow them to the letter. Here are some of them.
 1. A neat clean appearance is essential. (shave, haircut, shoeshine, clean shirt, etc.).
 2. A quiet, natural speaking voice is desirable. (Avoid a "barker" approach).
 3. Deal with clients in a respectable, but dignified way. This calls for
 - a. Avoiding personal contact (when helping ladies on or off the bus take her elbow).

- b. Avoiding personal remarks (even something as harmless as "that's a sharp pair of shoes you are wearing," might be resented. Why take the chance?).

European hotel, restaurant and tourist employees even avoid the use of the word "you." It is resented by the customer on the grounds that it is a "foot in the door" for familiarity. Examples are as follows:

- 1) European: perhaps the gentleman would like to stop for lunch?
- 2) Familiar American: How about something to eat?

The European method of address is artificial and unnecessary by American standards of professional hospitality, but the familiar approach is also likely to be distasteful to the ordinary American tourist who is on vacation and rather likes to be "treated like a gentleman" for two weeks.

C. The tour-guide should study his client

1. With individual tours or with small groups encourage the client to talk. This is to help in trying to guess how he wants to be treated.

If the clients are a unified group (e.g. a convention tour) try to find out something about them before setting out (you handle a group of churchmen altogether differently from a group of oil field equipment salesmen). Convention groups are often more interested in socializing than being shown the sights.

D. Avoid controversial or touchy subjects as far as possible. Some touchy subjects are as follows:

- | | |
|-------------|-------------------|
| 1. Sex | 3. Race relations |
| 2. Politics | 4. Religion |

E. Avoid any kind of profanity and racy slang

F. Laugh with people, not at them. Don't make fun of anything or anybody. As sure as you make a joke about stuttering for example, there will be somebody on the bus with the same affliction.

- G. If there is a grumbler on the bus who feels he is not getting his money's worth give him a little special attention. It will probably bring him around.
- H. The person who wants to hold up the tour while he takes a picture or explores a patio must be handled politely but firmly.
1. Point out tactfully that you work on a schedule and that other people in the bus will be delayed and inconvenienced if you accommodate him.
 2. Offer to take him around in a cab later when he can spend all the time he wants at his own expense.
- I. Sales promotion.
1. Always leave the client with the thought that there is still very much to see in New Orleans; if not this trip then next year, "when you come back" (not "if").
 2. Mention other tours which are available to him later on.
 3. Use the "soft sell." Avoid high pressuring.

- a. The tourist usually expects to be "taken" and high pressuring immediately puts him on the defensive. He probably is worrying about how much the trip is costing.
 - b. Remember the old proverb: "When going on a vacation, take half as many clothes as you think you are going to need and twice as much money."
4. Don't "recommend" a restaurant or night club, etc., unless asked. The client will assume that you are getting a kick back and that the place is therefore a "clip joint."

If asked, mention two or three and give a few facts about each. Let the client choose; he is going to anyway and he likes it better that way.

VI. SUMMARY

- A. Personal neatness is the first thing for the tour guide to think about.
- B. He should handle the clients in a respectful, dignified and impersonal manner, to be on the safe side.

- C. He should study his client, bearing in mind the following:
1. The client is probably on the alert for dishonesty.
 2. The client has certain fixed attitudes, moral values, prejudices, etc.; he expects the guide to know these and to respect them.
- D. The guide has the following obligations:
1. He owes the client a comfortable satisfying experience at a reasonable cost.
 - a. He owes the company a reasonable expectation that the client will speak well of its services in his own home town.
 - b. He owes the community a reasonable assurance that the tourist leaves with a good impression of it.
 2. He owes himself the feeling of assurance that he has maintained his own dignity and that of his profession.
- E. The successful host, professional or otherwise, is the one who is

1. Always on the alert for any signs of discomfort, annoyance, or embarrassment on the part of his guests.
2. Able to remove the cause of such conditions smoothly and without attracting attention.

The ability to do this can be acquired, but only through observation, study and practice.

UNIT FIVE

ACQUIRING, SELECTING, ORGANIZING AND PRESENTING INFORMATION

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To familiarize student with the principles involved in acquiring and imparting information.
- B. To show how these principles apply to the guide's operation.

II. GENERAL OUTLINE OF THIS UNIT

- A. The guide as a student
- B. The guide as a teacher
- C. Composing and delivering the commentary
- D. Answering questions
- E. Summary

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

- A. Chalk board and chalk
- B. Tour Guide Note Sheets--Unit V

UNIT FIVE

ACQUIRING, SELECTING, ORGANIZING AND PRESENTING INFORMATION

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
I. THE GUIDE AS A STUDENT	
A. How to read effectively	
B. Evaluating information	Use "Note Sheets - Unit Five" as basis of this discussion
C. Organizing information	
II. THE GUIDE AS A TEACHER	
A. Maintaining interest	
B. Simplifying instruction	
III. COMPOSING AND DELIVERING THE COMMENTARY	
A. Selecting information	
B. Jokes and anecdotes	
C. Presentation	
IV. ANSWERING QUESTIONS	
V. SUMMARY	

TOUR GUIDE NOTE SHEETS

UNIT FIVE

A. INTRODUCTION

By the nature of his work, the tour guide is both a student and a teacher. As such, he should understand and be able to apply the basic principles of teaching and learning which have been discovered by the educational psychologist.

Teaching and learning are two names for the same process, seen from different points of view. Thus all the rules which apply to studying also apply to instructing.

B. HOW TO STUDY

1. Four-fifths of the average person's knowledge has been acquired through his eyes. Less than one-fifth comes to him through his ears. Learning-through-listening requires less effort on the learner's part, but it is not nearly as effective as observation and reading.
2. However, most people read inefficiently. Reading is a skill; and like any other skill it must be practiced regularly and correctly, otherwise it is soon lost.
3. Even though you are not a good reader you can make your reading more effective by following a few simple rules.

- a. Do not try to remember everything you read. That is an impossibility. At best you are going to remember only the most important facts. Train yourself to be looking out for these facts and don't pay much attention to minor details on the first go 'round.
- b. Read in units. The unit may be a paragraph, or it may be a chapter.
- c. After you read through the unit rapidly, go back and read it again more carefully and slowly.
- d. When you come to a fact you want to remember, write it down in the form of a note. The mere act of putting the idea in your own words and writing it down will help you to remember it. (Keep a pack of 3 x 5 file cards and a pencil at your side for the purpose.)

You will usually find that there is only one important idea in a paragraph and you may even have to read several pages before you find anything that is important enough to commit to memory.

- e. When you have finished your reading, reassess your notes. Study them and ask yourself again whether all of them are important enough to remember. Discard those which are not.

f. Arrange your cards in a logical order of some kind. In the case of a history book, the logical order is a chronological one, (i.e. the order in which the events took place).

There are many different "logical" arrangements, and it is hard to explain all the possibilities. However, an example will help.

Here are two paragraphs which contain the same information. The first one has no order whatever.

Mary is John's sister. Mary looks like her mother. John is about 25. He looks like his father. Mary is plump. John has curly red hair. Mary is short and blond. Mary's eyes are blue. John is tall and thin. Mary's hair is long. John's eyes are brown.

The second is arranged logically.

John, who is about 25, is tall and thin, with curly red hair and brown eyes. . . resembles his father. Mary, his sister, is short and plump with blue eyes and long blond hair. She looks like her mother.

You don't have to be a psychologist to know which of the paragraphs presents the information in a manner which is meaningful, and will therefore stick with the reader.

- g. Read your notes over repeatedly. Information is best memorized through short periods of review at frequent intervals.
- h. Avoid long sessions of reading or studying. One half-hour of study every night for a week is much more effective than a single, three-and-one-half hour study session in one day.
- i. Learn general things first and worry about specific details afterwards. The details usually take care of themselves in time; besides you will remember general information far longer than specific.

You probably remember what your history book said about the cause of the Revolution, but have forgotten the date of the Boston Tea Party.

- j. In studying, try to associate what you are learning with something that you already know. For example, you are less liable to forget that a certain thing took place in 1803 if you remind yourself that it happened in the same year the Louisiana Purchase was concluded.

C. SUMMARY

Details, facts and figures are easiest learned and longest remembered if

- a. they are acquired a few at a time
- b. they are reviewed regularly
- c. the review periods are brief and not too far apart and
- d. the details are related to one another or to some more important fact or occurrence which you already know.

D. HOW TO TEACH (OR INFORM)

In this section we think of the tour guide as the teacher and his client as the student. The major principles of teaching are as follows:

1. There is no learning without attention and no attention without interest. If the student is not interested in what his teacher has to say he will not hear it and the teacher must somehow arouse his interest.
2. Fortunately, the client has a ready-made interest, otherwise he would not have paid to take the tour.
3. Holding his interest, once you have it, is another thing however. Some rules regarding this are as follows:
 - a. Strive for variety: Do not be afraid to be quiet for 30 seconds if you have nothing appropriate to say. It is a mistake to assume that an uninterrupted commentary maintains interest. Most people tend to

"tune out" continuous chatter without realizing that they are doing it. Mix it up. Tell them something interesting and then give them a little while to let it sink in.

- b. With a little practice you can introduce variety in the tone and the intensity of your voice. It is easy for the guide to fall into monotonous sing-song, particularly when he is giving the same story day after day. Learn to change both volume and pitch on occasion.

3. Keep your dates and statistics general. Round figures are more easily understood and remembered longer. Here are examples:

- a. This took place on the afternoon of Thursday, November 12, 1932.
- b. This took place in early November, 1932.

The first example gives more detail than the average listener is able to take in at one hearing; besides the detail is unnecessary. For general purposes, the second example is much better.

Facts and dates should be given with reference to some other, more important date or occurrence as mentioned previously.

c. This took place in November, 1932, right after Roosevelt's first election to office.

This statement is probably the best of the three.

4. Remember that the good teacher is constantly watching his class for signs of boredom, annoyance or discomfort. These give clues as to how well the teacher is "coming over" and whether or not he should "change his pace."

E. THE COMMENTARY

In the case of regularly scheduled sightseeing runs the information involved and the order in which it is presented is determined largely by the itinerary. You simply talk about the points of interest as you approach them.

However, time also determines the amount you can say about any one thing, so a certain amount of selection is necessary. Here are some rules to follow:

1. Try to stick to general information (for reasons which have already been discussed).
2. Present the information in a logical order.
3. Bring in anecdotes about personalities wherever they apply. Dates and events are only the framework of history. The people of the same era, the common man, as well as

The people of the same era, the common man, as well as the great men, are the really interesting and important things to the tourist.

(A brief history of the Pontalba Buildings and Jackson Square will be considerably livened-up by mentioning the legendary love interest between the Baroness and General Jackson. The clients, especially the honeymoon couples, will remember it long after they have forgotten everything else.)

4. Make it clear when you are stating historical fact and when you are repeating a legend. Otherwise, some amateur historian (and there is one on every bus) will be sure to challenge you.

For the same reason, try to avoid having to give very specific dates. Even historians don't agree on these. So why risk an argument?

5. Wherever possible, quote your source. (Examples: "According to Lyle Saxon ..." or "Herbert Asbury's book says that ...")
6. Remember that brevity has its charm. Make your commentary thorough, but avoid telling your clients "more than they want to know."

7. Finally, bear in mind that you are a guide, not a comedian. Your gags, if any, should be somehow related to the matter you are talking about.

F. HOW TO ANSWER QUESTIONS

The following are a few rules to be followed in dealing with the questions of clients.

1. Never hesitate to say "I don't know," or "I am not sure."

The average man is shrewd enough to know when you are evading and a frank admission of ignorance leaves a better impression than a bluff.

(Of course, you will want to find the answer to that question as soon as possible, because if it has been asked once it will probably be asked again in the future.)

2. Answer questions as directly as possible. If a "Yes, sir," or "no, sir" will suffice, leave it at that.
3. Listen carefully to the question and think about it before you answer. Often people ask one thing when they really want to know something else. An important part of the teaching art is to listen to the questions being asked and then figure out exactly what the person would ask if he knew how.

UNIT SIX

GENERAL INFORMATION - NEW ORLEANS AND ENVIRONS

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To help the trainee acquire a fund of general information about New Orleans and the surrounding area.
- B. To show him the method of acquiring such information.

II. GENERAL OUTLINE OF THIS UNIT

- A. Study and discussion of the contents and arrangement of the Chamber of Commerce Information Sheet.
- B. Study and discussion of a format for collecting and organizing this information.
- C. Supervised practice in simple fact gathering and organizing.

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

- A. Chamber of Commerce release, "Brief Summary of Information about New Orleans" (latest revision).
- B. Tour Guide Note Sheet - Unit Six
- C. Textbook - New Orleans City Guide

- D. Film on New Orleans - Listing No. 14 in Bibliography.
- E. Film on Louisiana's Minerals - Listing No. 13 in Bibliography.
- F. 16 mm projector and screen.

UNIT SIX

GENERAL INFORMATION - NEW ORLEANS AND ENVIRONS

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
<p>I. STUDY AND DISCUSSION OF BRIEF SURVEY OF INFORMATION ABOUT NEW ORLEANS</p> <p>A. Content</p> <p>B. Arrangement</p> <p>C. Application</p> <p>D. Limitations</p>	<p>Furnish each trainee with a copy.</p> <p>Conduct the class on a "Guided Tour" of the pamphlet.</p> <p>Comment on arrangement, subject headings, etc.</p> <p>Indicate pertinent sections in New Orleans City Guide.</p>
<p>II. SURVEY AND DISCUSSION OF TOUR GUIDE NOTE SHEETS - UNIT SIX</p>	<p>Same as above</p>
<p>III. FILM EXHIBITION</p> <p>A. Listing No. 14, (30 min.)</p> <p>B. Listing No. 13, (13 min.)</p>	
<p>IV. COOPERATIVE CLASS RESEARCH</p> <p>A. Demographic Data</p> <p>B. Geographic Data</p> <p>C. Natural Features</p>	<p>Instruct class to search in <u>Brief Survey</u> and <u>City Guide</u> for information required by Note Sheet.</p> <p>Ask first finder to report location of information.</p> <p>Read to class and discuss as needed.</p> <p>Have class record own answers on sheets, cards or notebooks.</p>

TOUR GUIDE NOTE SHEETS

UNIT SIX

I. GENERAL

A. Population Statistics (in round figures)

1. City limits:
2. Metropolitan area:
 - a. Percentage distribution
 - 1) By race
 - 2) By religion
 - 3) By national origin
 - b. Recent trends in regard to above figures
3. General characteristics of people
 - a. Hospitable
 - b. Tolerant
 - c. Fun-loving

Mediterranean traditions

Carnival parades

B. Geographic features:

1. Area covered
2. Boundaries
3. Topography
 - a. Elevation with reference to:
 - 1) Gulf
 - 2) Lake
 - 3) Mean river level

- a. Drainage
 - 1) Water table
 - 2) Canal system
 - Artificial fall
 - Pumping station
 - Wood screw pump
- c. Terrain, soil
 - 1) Plant life
 - 2) Animal life
- 4. Interesting geological trivia (if any)
- 5. Climate
 - a. Rainfall
 - b. Temperature
 - 1) Winter mean: low and high-
 - 2) Summer mean: low and high-
 - 3) Record low and high, with dates
 - c. Snowfall
 - d. Hurricanes
 - 1) Record winds
 - 2) Dates (stress rarity)

C. The River

1. The Watershed

- a. Source
- b. Tributaries

Major rivers

Area drained

2. Statistics

- a. Length
- b. Breadth and depth at New Orleans
- c. High and low stages
 - 1) Volume of flow at each

3. Flood control system

- a. Past floods (stress rarity)
- b. Details about levees
- c. Spillways

4. General importance of river to:

- a. Literature and folklore
- b. Agriculture
- c. Industry
- d. Commerce

D. The Lake

1. Statistics
 - a. Length and breadth
 - b. Area
 - c. Average depth
2. The environs
 - a. Tributaries and distributaries
 - b. Nature of shores
 - 1) Terrain
 - 2) Vegetation
 - 3) Animal life
3. Importance to area
 - a. Historical
 - b. Recreational
 - c. Economic (former)

E. The Bayous

1. Historical importance
2. Past economic importance (see D, 3, c above)
 - a. The Old Basin Canal
 - b. The New Basin Canal

F. The Industrial Canal

(see port)

II. THE ECONOMY OF THE AREA

A. Inherent advantages for business and industry

1. The Mississippi
 - a. Plentiful supply of fresh water
 - b. Deep-water port facilities
2. Natural resources
 - a. Proximity or availability of:
 - 1) Oil and gas
 - 2) Certain other minerals
 - 3) Timber and other building materials
3. Mild climate
 - a. Uninterrupted operation year-round
 - b. Lower fuel, construction and maintenance costs
4. Minimum of civil strife or unrest
 - a. Racial tolerance
 - b. Well-established but conservative unions
5. Availability of land, tax benefits, etc.

B. Industry of the area

1. Extractive
 - a. Oil and gas wells
 - 1) Proximity to New Orleans
 - 2) Other interesting trivia
 - b. Salt
 - 1) Information on domes, etc.

c. Sulphur, etc.

- 1) Information on mining, shipping in liquid form, etc.

2. Processing

- a. Oil refining
- b. Other petrochemical operations in area
- c. Kaiser Aluminum

3. Manufacturing

- a. Heavy
 - 1) Shipyards
 - 2) NASA
- b. Light
 - 1) Celotex
 - 2) Others

C. Agriculture

1. General information

- a. Soil, climate, rainfall
- b. Corps, animal and vegetable

2. The sugar industry

- a. Methods of cultivation
- b. Methods of refining
- c. By-products
 - 1) Molasses
 - 2) Cattle feed
 - 3) By-products

3. The rice industry
 - a. Methods of cultivation
 - b. Methods of refining
 - c. By-products
4. Cotton
5. Specialties
 - a. Pecans
 - b. Perique
 - c. Tabasco

D. Fisheries

1. Shrimp
2. Oysters
3. Crayfish
4. Fish
 - a. Major catches
 - b. By-products
5. Related specialties
 - a. Turtles
 - b. Furs, etc.

III. THE PORT

A. Access to the Sea

1. The Passes
 - a. The Eads Jetties

- 1) Statistics
 - Width
 - Depth over sill
 - Other trivia
 - 2) Purpose served
 - 3) History
 - b. The pilot systems
2. The Gulf Ship Canal
 - a. Statistics
 - Width, length, etc.
 - b. Related trivia
 3. Bridges
 - a. Dates, history of each
 - b. Statistics
 - 1) Clearances
 - 2) Lengths of main spans
 - 3) Other unique features

B. The Harbor

1. General
 - a. Jurisdiction
 - 1) United States Engineers
 - 2) Coast Guard
 - 3) Dock Board

b. Regulation and protection

1) Dock Board Police

2) "Deluge"

c. Ferries

d. "Good Neighbor"

e. "President"

2. Statistics

a. Depth of water at docks

b. Number of miles of wharf

c. Tonnage, compared with other ports

d. Principal countries represented

e. Principal exports

f. Principal imports

3. Special Features

a. Banana conveyors

b. Cranes

c. Grain elevators

d. Shipyard

e. Inner Harbor Canal

UNIT SEVEN

GENERAL INFORMATION, ETC. (CONTINUED)

I. AIMS AND OBJECTIVES OF THIS UNIT

To give the student further experience in locating and organizing data.

II. GENERAL OUTLINE OF THIS UNIT

A. Supervised practice in fact-gathering (continued)

B. Introduction to Library Research Materials

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

A. Chamber of Commerce release, "Brief Summary of Information about New Orleans." (latest revision)

B. Tour Guide Note Sheet - Unit Seven

C. Textbook - New Orleans City Guide

D. Reference book - Louisiana - A Guide to the State

E. Film on Louisiana Opportunities - Listing No. 12

F. Film on the River - Listing No. 17

G. 16 mm projector and screen

- H. 35 mm Slide film projector
- I. The Library Series (Film strip)
- J. How to Use the Library (Pamphlet)

UNIT SEVEN

GENERAL INFORMATION, ETC. (CONTINUED)

INSTRUCTIONAL OUTLINE	SUGGESTIONS TO INSTRUCTORS
I. FILM(S)	
A. Listing No. 12 (30 min.)	
B. Listing No. 17 (32 min.)	
II. COOPERATIVE CLASS RESEARCH (CONTINUED)	Proceed as of last session
A. The Economy	Point out "logical organization" of topic headings in Note Sheets - Units Six and Seven.
1. Industry	Indicate other printed sources of information which might apply to present project.
2. Agriculture	Indicate agencies (i.e. Weather Bureau, Wildlife Commission, Sewerage and Water Board, City Archives, etc.) who may fill in the blanks.
3. Commerce and trade	Explain purposes, arrangement and use of each.
B. The Port	Review book list furnished by New Orleans Public Library, reproduced in Note Sheets - Unit Seven
III. INTRODUCTION TO LIBRARY RESEARCH METHODS	Announce field trip to inspect local library.
1. Card catalogues	Suggest that class be prepared with research problems or topics.
2. Indexes	Instruct class also to bring file cards (or notebook) and pencil.
3. Reference works	Use film strips and pamphlets.

TOUR GUIDE NOTE SHEET:

UNIT SEVEN

Here is a book list furnished by the New Orleans Public Library. It represents but a small part of the library's Louisiana Collection.

All books listed may be found and used in the Louisiana Room. In the case of those with an asterisk (*) next to the classification number, copies are also available for circulation.

The list also gives a general idea of the book's contents. Study it over, and refer to it from time to time. And when you have an hour or two free, go to the library and leaf through the books for a better idea of what they contain.

- 917.631* Arthur, Stanley C.
A 7902 Old New Orleans; a history of the Vieux Carre, its ancient and historical buildings. 1944.
Is arranged for convenient walking tours.
- 976.31* Asbury, Herbert
A 79 The French Quarter; an informal history of the New Orleans Underworld. 1936.
- 917.631* Basso, Etolia S.
B 32 The World from Jackson Square; a New Orleans Reader. 1948.
Social life and customs.
- 976.31* Castellanos, Henry C.
C 34n3 New Orleans As It Was. Episodes in Louisiana life. 1905, republished in 1961.
- 976.31* Chase, John C.
C 48f Frenchmen, Desire, Good Children, and Other Streets of New Orleans. 1960.
History of the City through its street names.
- 917.631 Cohn, David L.
C 61 New Orleans and Its living Past; photographs by Clarence J. Laughlin. 1941.
- 917.631 Curtis, Nathaniel C.
C 97 New Orleans, Its old Houses, Shops and Public Buildings. 1933.
- 917.631* Davey, Mary and Don
D 22 Mary and Don Davey's Companion Guide to the Colorful French Quarter; an Up-to-the Minute Guide to the Quarter's Most Outstanding Restaurants, Shops, Nighteries, and Historical Landmarks, Including a Complete Walking Tour, Nite Life Tour, Map, Diner's Dictionary, Facts, Figures and Selected Gourmet Recipes. 1964.

- 917.631* Delcroix, Eugene A.
D 34 Patios, Stairways and Iron Lace Balconies of Old New Orleans; a series of photographs. 1938.
- 917.631* Early, Eleanor
E 12 New Orleans Holiday. 1947. Story of New Orleans, her people and her customs.
- 917.631* Evans, Oliver W.
E 93 New Orleans. 1959. Includes the most stimulating points of interest, both old and new.
- 917.631* Federal Writer's Project.
F 29m New Orleans City Guide. 1952.
- 917.631* Fossier, Albert E.
F 75 New Orleans, the Glamour Period, 1800-1840; a history of the Conflicts of Nationalities, Languages, Religion, Morals, Cultures, Politics, and Economics during the Formative Period of New Orleans, 1957.
- 917.631* Griffin, Thomas K.
G 85n New Orleans: A guide to America's most interesting city. 1961.
- 917.63* Herrin, M. H.
H 56 The Creole Aristocracy: A Study of the Creole of Southern Louisiana, His Origin, His Accomplishments, His Contributions to the American Way of Life. 1952.
- 917.631* Kane, Harnett T.
K 16 Queen New Orleans, City by the River. 1949. Characterization of this languorous, exciting City on the Mississippi.
- 976.31* King, Grace E.
K 52 New Orleans; the Place and the People. 1907. Informal history of New Orleans, its culture and traditions.
- 917.631* Lester, John S.
L 64 I'll take New Orleans. 1948. A collection of newspaper articles that appeared in the New Orleans Item.
- 917.631 Lynn, Stuart M.
L 98 New Orleans. 1949. Collection of photographs of the architecture, courtyards, ironwork and cemeteries with detailed captions.
- 917.631 Ricciuti, Italo W.
R 49 New Orleans and its Environs; the Domestic Architecture; 1729-1870. 1938.

- 917.631* Robinson, Lura
R 65 It's an Old New Orleans Custom. 1948.
- 976.31 Samuel, Ray
S 19 "... to a Point Called Chef Menteur ...;" The story
of the Property known today as New Orleans East, Inc.
1959.
- 917.631* Saxon, Lyle
S 27f3 Fabulous New Orleans. 1950. Contains the history
and description of the Crescent City.
- 917.631* Tallant, Robert
T 14r The Romantic New Orleanians. 1950. Presents the
City in all of its turbulence, beauty, romance and fun.
- 917.631* Thompson, Ray M.
T 47 New Orleans from A to Z; Questions you'll ask about
this city of charm and its Famous French Quarter,
alphabetically arranged. 1951
- 976.31* Tinker, Edward L.
% 58 Creole City: its past and its people. 1953.

UNIT EIGHT

PRACTICE IN LIBRARY RESEARCH

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To introduce the student to the local library resources pertinent to his job.
- B. To give him actual experience in using the Library's facilities.
- C. To encourage him to use these resources and facilities regularly and systematically.

II. GENERAL OUTLINE OF THIS UNIT

- A. A field trip

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

- A. Note Sheets - Unit Six
- B. Note Sheets - Unit Seven
- C. Miscellaneous Reference questions
- D. File cards or notebook and pencils
- E. How to use the Library

UNIT EIGHT
PRACTICE IN LIBRARY RESEARCH

UNIT TEN

THE ARCHITECTURE OF NEW ORLEANS AND LOUISIANA

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To help the student develop an appreciation of the architecture of the area.
- B. To help him acquire the information needed for a typical commentary.

II. GENERAL OUTLINE OF THIS UNIT

- A. Historical summary (concluded)
- B. The architecture of "Old City"
- C. The architecture of the "Garden District" and "Uptown."
- D. Nearby plantation architecture
- E. The cemeteries.

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

- A. New Orleans City Guide
- B. State Guide
- C. Wilson, A Guide to Architecture of New Orleans
- D. Samuel, The Great Days of the Garden District
- E. Film Listing No. 9
- F. 16 mm projector and screen

UNIT ELEVEN

THE PEOPLE, TRADITIONS AND CUSTOMS

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To help the student develop a knowledge of the national and ethnic groups of the area, past and present.
- B. To reinforce his understanding and appreciation of local custom and folkways.
- C. To help him organize his information into material useful for a commentary.

II. GENERAL OUTLINE OF THIS UNIT

- A. Review of migration waves since 1800
- B. Characteristics and unique customs of each national group.
- C. Contributions of each to local industry and culture
- D. Review and discussion of customs unique to the area.

III. MATERIALS AND TEACHING AIDS NEEDED FOR THIS UNIT

- A. City Guide
- B. State Guide
- C. Kane, Deep Delta Country
- D. Saxon et als., Gumbo Ya-Ya

TOUR GUIDE NOTE SHEET

GENERAL:

Much of New Orleans history is the direct result of its low elevation and the prevalence of water--swamps, lakes, bayous, etc. Some of the lore related to this phenomenon is as follows.

Banquette is the local name for "sidewalk." It is a French word which means "bench," "footway," or "towing-path."

Due to standing water, many New Orleans sidewalks were long, raised wooden boardwalks (hence "benches"). Others were just the tops of the mud banks thrown up on either side of a ditch (hence "towing-path").

Some early roadways were "plank roads," for example, Carrollton Avenue.

There was plenty of wood, and planks made a good, cheap, solid roadbed over the marshy ground.

Bayou means a small natural stream with a sluggish current. It comes from the Indian word "bayuk."

Metairie Road is built along one bank of an extinct bayou, named Bayou Metairie.

Metairie is French for "small farm leased by the owner to the farmer on a profit-sharing agreement."

The lagoon in Metairie Cemetery and the parts of the City Park lagoon along the avenue are remnants of this bayou.

Gentilly Road (Highway 90) is also built along one bank of a dead bayou, Bayou Sauvage (means "savage" in French).

Gentilly was named after a suburb of Paris by the Dreux Brothers who founded their plantation in the area and gave it the name of their old home town in France.

The other bank of Bayou Sauvage is Crete Street (Crete is the French word for "crest").

Bayou St. John is believed not to be a normally developed stream, but is thought to be the result of an earthquake fault (i.e. crack).

This is based on the fact that it has no levees and not even a sluggish current.

Chef Menteur is thought to have been formed in the same way.

The name means "chief liar" in French. It is believed to have been so called by the Indians because of its treacherous and deceptive currents, which often change directions.

Neutral Ground is the local name for the median strip in the center of a boulevard.

It gets its name from the fact that the wide strip which is now Canal Street was a no-man's-land between the French and American cities during the early 1800's.

A drunk died there and lay there for three days before anything was done about him.

Later "Neutral Grounds" resulted from the need of wide drainage canals to carry off rainfall.

The canals are now under the neutral grounds. Examples: Orleans, Broad, Claiborne.

Perhaps the greater part of Modern New Orleans was under water a few hundred years ago, examples:

Broadmoor was a lake.

Carrollton, back from the river, was a swamp, called "Crawfish town"

Delgado site, 200 yards back from City Park Avenue, was a swamp.

That which is now Lake Vista and Lake Shore Drive was built up by dredging mud, sand and shells out of the lake bottom and throwing it back of a bulkhead.

THE FAUBOURGS

Early New Orleans grew as the result of consecutive real estate developments (cf. Modern Lake Vista, Terrytown, etc.).

The subdivisions were known as Faubourgs.

This is a French word meaning "suburb" or "outskirts." (It also means "The working class who live in the Faubourgs.").

Locally it appears also to have meant "plantation."

The first settlement was the Vieux Carre

This is the French phrase meaning "old square." The word square, as used here, appears to mean an enclosure or a garden plot. The phrase does not mean "Old city" in the literal sense.

Piecemeal, unorganized and consecutive development of the Faubourgs is the reason why the streets of New Orleans often fail to continue and in places follow a crazy-quilt pattern.

Faubourg Ste. Marie was the first of the suburban developments.

It was set off by the first of the great fires (1788). It was called Ville Gravier after the first owner and rechristened Faubourg Ste. Marie by Bertrand, the developer.

It began at Tchoupitoulas and included Magazine, where the Graviers lived. It was flanked by Common Street and Gravier and went back to Camp Street.

Magazine means "warehouse" in French. Kentucky tobacco and other goods were stored in warehouses along there.

Two men named Poydras and Girod were also interested in Gravier's real estate. Both men had streets named after them.

The streets were paved with planks from flatboats which came down from Kentucky.

The boats could not be pushed back upstream so they were disassembled (this was the very early 1800's).

The so-called "Americans" from up the river moved into this section and took it over. The "Neutral Grounds" on Canal Street separated the two groups. The groups were also separated by custom, tradition and a mutual dislike and misunderstanding.

The American Section became the city's commercial center.

The Faubourgs of Delord, Soulet, LaCourse and Annunciation were subdivided by Lafon between 1806 and 1810.

Lafon, however, saw to it that the streets which he built lined up with those of Ste. Marie.

Lafon, a surveyor, facilitated future growth by developing the wheel-and-spoke pattern of streets uptown.

Educated men in those days knew Latin and Greek, hence the many classical street names. For example the streets in the Terpsichore and Melpomene area are named after the Greek Muses, a sort of patron saints of the arts. (Examples: Terpsichore is the Muse of dancing.)

The city of Lafayette, which now includes the Garden District, was the next Faubourg going up stream. It included four smaller ones called Nuns, Wiltz, Livaudais and Delasize. (See Chase, p. 137 for map.)

THE "NAPOLEON" STREETS

An interesting point has to do with Faubourg Boulogny, which is divided approximately in two by Napoleon Avenue.

Many streets in this area were named for Napoleon's victorious battles, or other Napoleonic associations. (i.e. Milan, Cadiz, etc.)

Two of these, Berlin and Austerlitz, were changed to General Taylor and General Pershing during World War I, on patriotic grounds.

CARROLLTON

Two possible explanations for the name are as follows:

1. It was named for Charles Carroll of Carrollton, a signer of the Declaration of Independence.
2. It was named for William Carroll, General and Governor of Tennessee who brought 25,000 men to help Jackson at the Battle of New Orleans. His army camped on the Macarty Plantation which later became Carrollton. (This explanation seems to be the most likely one.)

Carrollton and the rest of uptown New Orleans, was helped by the construction of the New Orleans and Carrollton Railroad (began in 1835).

It began at Poydras and Baronne and went to the intersection of St. Charles and Carrollton, following the same right-of-way now used by the St. Charles streetcars.

It is reputed to be third oldest railroad in the United States.

It used "canned steam." The steam was pumped into storage tanks on the engine at each terminal.

DOWNTOWN

Faubourg Marigny was developed at about the same time as Faubourg Ste. Marie, the American section. It began at Esplanade Avenue and extended back and down along the river.

All the streets in this area were laid out at 50-degree variance with Pauger's original city layout for the Vieux Carre. In 1808 it was a separate community with different street names.

Marigny was a wealthy but wasteful young man who was sent to Paris to study. All he learned was a game called "Hazard," like the modern game of dice.

According to legend, dice got to be called "craps" because Marigny who introduced the game was a Frenchman.

The American called Frenchmen "Frogs."

One French word for frog is "crapaud." The game was called "The crapaud's game" and shortened to Craps." (This is legend, not fact.)

UNIT THIRTEEN
THE DELTA COUNTRY

I. AIMS AND OBJECTIVES OF THIS UNIT

- A. To broaden the student's understanding and appreciation of Bayou Culture.
- B. To furnish related materials for commentaries

II. GENERAL OUTLINE OF THIS UNIT

TOUR GUIDE NOTE SHEETS

UNIT THIRTEEN

ACADIANS OF LOUISIANA AND LONGFELLOW'S EVANGELINE

Louisiana is the home of the French-speaking Americans who trace their ancestry back to the earliest white settlers on the North American continent. Often called "Cajuns" locally, they cherish the language and traditions of the Acadians of French Canada, who were expelled by the English from Nova Scotia beginning in 1755 because they did not assimilate readily with their conquerors.

Their French ancestors are supposed to have settled Ste. Croix in 1604, three years before Jamestown, and Port Royal in 1610.

Fighting between English and French in Europe caused the settlements to be raided frequently. In 1627 the English named the land Nova Scotia, or New Scotland. The French returned, but in 1706 the English, with colonial help, captured the French Fort of Port Royal. In 1713 the treaty of Utrecht gave Nova Scotia to the English.

The English wished the Acadians to take an oath of allegiance, but they refused if it meant bearing arms against the French. Then the English conceded this reservation, but during the Seven Years War the English determined to get rid of the "stubborn" Acadians. Beginning in 1755 they dispossessed them of lands and livestock and moved them to towns on the Atlantic Seaboard, from Boston down to Savannah.

The Acadians kept moving to French territory and in 1756 the earliest emigres arrived in St. James Parish, Louisiana. In 1765 the French Commissaire at New Orleans recorded the arrival of 193 Acadians from Santo Domingo. They went to the Poste des Arrakapas on the Bayou Teche. This is the black-earth delta country, where sugar cane is grown, timber is cut and great live oaks stand bearded with Spanish moss. There were 4,000 Acadian settlers by 1790, and now over 50,000 persons trace their descent from them.

In 1847 Henry Wadsworth Longfellow based his long poem, *Evangeline*, on the legend of two Acadian lovers, parted in Nova Scotia, reunited in Louisiana just before death. The story was suggested to him by Nathaniel Hawthorne. It may have been based on the actual search conducted by Emmaline Labiche for her lover Louis Arceneaux. When she found him at Poste des Attakapas on the Bayou Teche, he was married to another woman, and the shock killed her. She was buried in the ancient cemetery at Poste des Attakapas, now St. Martinville. Her grave is marked by a statue of *Evangeline*, posed by Delores Del Rio, who played the role in a motion picture and donated the monument. The legendary spot where Longfellow's heroine met her lover also is commemorated by the *Evangeline Oak*, an ancient tree on the waterfront.

Located in a wooded area near St. Martinville is the Longfellow-Evangeline Memorial Park, where the state maintains a museum of Acadian relics in an old Acadian farmhouse. There are canals, rustic bridges and tourist shelters.

UNITS FOURTEEN AND FIFTEEN

No work has been planned for these two units to allow latitude in the employment of guest lecturers. (It will be noted that the individual lesson outlines make no time provision for such lectures.)

In the event that this time is still available by the fourteenth session it is recommended that it be employed for general review and the exhibition of Film Listing No. 11, (77 min.) on Life Through the Eyes of a Bayou Boy.

BIBLIOGRAPHY

PRINTED MATERIALS:

The literature on New Orleans and Louisiana is so voluminous as to render the presentation of an adequate bibliography impractical in this outline. Accordingly, only those books which bear directly on activities prescribed in the course outline are listed herein. Further listings will be found in "Tour Guide Note Sheets--Unit Seven," preceding.

For more detailed bibliographical information the student is referred to the catalogues of the New Orleans Public Library and the Louisiana State University Libraries.

FILMS:

A representative selection of films which are applicable to the course are also listed in the following pages. They have been selected on the basis of the description found in the "Educator's Guide to Free Films"; these descriptions are summarized briefly following each listing. The instructor is advised to preview these films wherever possible in order to confirm their applicability to his particular situation.

Those films suggested for inclusion in course activities are marked by an asterisk (*). Sources from which these films may

be obtained are indicated by code symbols inclosed in parenthesis.

The significance of some of the symbols are as follows:

EGFF - Educator's Guide to Free Films

Jeff - Jefferson Parish Library

LACI - Louisiana Department of Commerce and Industry

LSL - Louisiana State Library

LSUAG - Louisiana State University Agricultural Division

NOPS - New Orleans Public Schools

TU - Tulane University

PRODUCING HIGH CORN YIELDS

ED013339

1. When Should I Plant Corn?
2. How Thick Should Corn Be Planted?
3. How Deep Should I Plant?
4. What Row Width Should I Use?
5. Should Corn Be Drilled or Hill Dropped?
6. Should I Use Fertilizer at Planting Time?
7. Should I Apply Insecticides at Planting Time?
8. Should I Apply Herbicides at Planting Time?

Corn is the leading crop in Illinois, accounting for about one-half of the value of all harvested crops. Illinois ranks second in corn acreage, being surpassed only by Iowa. About one-half of the corn produced is sold as grain off the farm. Less than 5 percent of the corn acreage is harvested for silage.

In early times, corn yields were rather low and remained fairly constant, except for yearly changes due to weather. However, as farmers applied the knowledge gained from agricultural research, corn yields have steadily increased. From 1940 to 1950, hybrid seed corn probably caused the greatest increase in yield (Fig. 1). Since then, more fertilizer; better weed, insect and disease control; thicker

planting; and more timely operations (made possible by more and better machinery) have accelerated the rate of increase.

Fig. 1. Trend of corn yields in Illinois

1. WHEN SHOULD I PLANT CORN?

Planting corn early has paid off in higher yields in recent tests in Illinois and many other states. The question of when to plant corn is not new by any means. Earlier tests conducted at Urbana for nine years indicated that the yields were about the same for all plantings made before the third week in May. In these tests the top yields were approximately 110 bushels. If you are producing at a medium level for your soil, the results of these tests are probably still valid. However, if you are pushing for higher corn yields, early planting can mean more bushels in the bin at harvest. This, however, may not mean extra corn unless you are using other good growing practices. Remember that any one poorly planned or poorly executed practice can hold down your yield.

If you are following this new practice of early planting, plant corn when the soil temperature reaches 50° to 55° F. This is usually about the first of May in the northern half of the state and 10 days to 2 weeks earlier in the southern part of the state. Current research indicates a loss of 1 bushel per day for each day you delay planting after the optimum planting date. The rate of planting should also be increased about 20 percent because of the higher "mortality rate" in cool soils.

Planting corn early is one way you can increase the odds of getting more favorable weather at tasseling, the most critical time in the life of the corn plant. The nearer to June 22 you can get ear filling, pollination, and the corn to tassel, the more daylight you

VT 02257

will have and thus usually the most favorable light conditions. Studies of long-time weather conditions indicate that the probability of receiving an inch or more of rainfall is 30 to 35 percent during any week prior to July 10. Between July 10 and August 10, the probability drops to 20 to 25 percent. If we can get corn to tassel in early July, you will have a better chance of getting rain and also a shorter period of hot weather to accelerate surface evaporation of water. Early planting also means early shading and a reduction of soil water evaporation. Sunlight provides the energy to keep the corn plant factory going, and the peak demand is at tasseling and immediately thereafter. Hence, early planted corn has a better chance for favorable moisture at tasseling. When you add all the weather factors, you find that early planted corn has a better chance for favorable weather at tasseling and thus a greater chance of achieving maximum yields.

There are other advantages for early plantings. The plants will be shorter, will have lower ears, and therefore will stand better. The grain will be drier, and harvest can begin earlier.

Table 1 shows the results of one experiment conducted to determine the effect of time of planting and moisture content. Note that the later-planted corn contained more moisture and had fewer erect plants at harvest.

Another hidden bonus for early corn plantings will come from the earlier planted soybeans on the same farms. Although soybeans are not as responsive as corn to planting date, yields of full-season adapted varieties generally trend downward.

A grower's requirements for early planting of corn are a brave heart, optimism, and a great deal of planning. You must partly accept the concept of minimum tillage and gear up accordingly. Although the seedbed in the row is important, there is no need for a "lettuce bed" between the rows. A great amount of research in Illinois and other states shows that yields from minimum tillage plots are equal and sometimes superior to those from traditional finely pulverized seedbeds. Fall plowing of level land will allow you to plant early in the spring. This is especially important on heavy, high clay content soils. Sandy soils usually dry out earlier and warm up sooner than finer-textured clay soils; therefore, planting can usually be started earlier on the sandy soils than on the finer-textured soils.

Early hybrids will seldom if ever out-yield adapted full-season hybrids when both are planted early. Although they will permit harvest to begin earlier in the fall, only in unusual seasons or very late plantings are early hybrids likely to yield as well as medium or late hybrids. Fig. 2 shows the response of an early and late hybrid to planting date at DeKalb, Illinois, at a population of 18,000 plants per acre. Table 2 presents yield data collected in an extremely good growing season (1965) at Urbana, Illinois, at a plant population of 24,000.

Because of cold soils often encountered in early plantings, the following cultural practices are necessary for a maximum yield bonus: (1) Overplanting the desired final plant population by 15-20 percent, (2) planting

shallow, (3) using small amounts of row fertilizer, and (4) controlling weed and soil insect pests by using pre-emergence herbicides and soil insecticides.

New, modern hybrids with proper seed

Table 2. Effect of planting date on grain yields of two hybrids (30-inch rows, 24,000 plant population, Urbana, Ill.).

Planted	Early Variety	Late Variety	Average
April 19	184	217	201
April 30	192	213	202
May 14	160	195	177
May 31	141	162	151

care and seed treatment have a lot of "get up and grow." However, as the trend toward earlier planting continues, corn breeders will need to screen germ plasm more closely for uniform germination and growth under cold, unfavorable growing conditions and for frost tolerance. Plant physiologists will also need to meet this challenge by initiating basic studies toward understanding these phenomena. This two-front attack might permit corn to be planted much earlier than we now assume possible.

2. HOW THICK SHOULD CORN BE PLANTED?

A high yield cannot be attained without a high corn-plant population, but a large number of plants per acre is no guarantee of a high yield. As the number of plants increases, the amount of grain produced per plant is decreased, but up to a certain limit the total yield will be greater due to more plants. The proper rate of planting will depend largely on soil productivity and weather conditions. Planting rates aiming at 12,000 to 16,000 plants per acre were commonly recommended a few years ago for the average farmer. Today planting rates are being increased on farms capable of producing 125 or more bushels of corn per acre.

The practice of recommending a plant population on the conservative side of the yield plateau was influenced by (1) drought, (2) standability, and (3) harvestability. The latter two do not carry the importance they once did because of the advent of earlier harvest and better standing hybrids. Drought, however, still remains a real threat to heavy plant populations. Yet, early plantings, coupled with improved hybrids and fertility prac-

tices, have not shown the drastic yield reductions for droughty periods that previously occurred.

Although it is true that increasing plant population will do little to increase yields at the 75- to 125-bushel yield level, this statement does not hold for soils capable of producing really high yield levels. In fact, this production practice of low planting rates may be one of the limiting factors insofar as future high corn yields are concerned. Improved hybrids have changed our concepts of stands. There is some trend toward higher plant population already. According to a 1965 survey by the Illinois Cooperative Crop Reporting Service, the average spacing of drilled corn in the row was 9.1 inches, as compared to 10.6 inches in a similar survey three years earlier (1962), and 11.3 inches apart in 1959.

Numerous studies are underway to correlate plant populations with yields. However, to obtain the maximum yield of corn for a specific fertility level and soil type, it is important to plant the proper number of ker-

nels per acre. Plant at a rate, which, in normal years, will produce ears averaging about one-half pound (Fig. 3). The population at harvest is often less than the number of kernels planted (or assumed to have been planted). Therefore, planting rates should be adjusted accordingly. Table 3 may be used as a guide to determine the number of kernels to plant from the desired number of stalks per acre at harvest.

Fig. 3. The half-pound ears of corn on the left indicate good balance of stand with soil productivity. The ears on the right, with average weights of 0.8 pound, indicate that the stand could have been increased profitably by 5,000 to 6,000 plants per acre.

Table 3. Select the Proper Population for the Fertility Level

Expected yield per acre	Kernels planted per acre	Stalks at harvest per acre
75 bushels	13,300	12,000
100 bushels	16,500	14,000
125 bushels	20,000	17,000
150 bushels	25,000	20,000

When striving for high yields, a planting rate

of 18,000 to 20,000 kernels per acre is commonly recommended for soils with good water holding capacity. Rates of 20,000 or more are recommended on good soils when the row width is reduced to 30-inches or less.

Since the proper planting rate is essential for high yields, be sure to select planter plates recommended for the grade of corn used and adjust the planter to drop at the desired rate (Fig. 4). During the planting operation, be sure to dig out several kernels along the row and make an estimate of the average kernel spacing as a final field check (See Appendix). By checking this spacing with the desired rate, you can determine the accuracy of your calibration and make whatever adjustments are necessary on your planter.

Fig. 4. Select planter plates recommended for the grade of corn you plan to use.

3. HOW DEEP SHOULD I PLANT?

When planting corn, place the seed deep enough in the soil so that it is in close contact with warm, moist soil and has enough covering for reasonable protection against birds, rodents, and surface drying. Quick germination and seedling emergence mean less trouble from soil insects and disease pests or from crusted

soil.

A good general rule to follow is to put the corn deep enough to be in moist soil and no deeper. For wet, heavy soils, shallow planting is usually best, especially early in the season. In the lighter, sandy soils where low moisture

rather than low temperature slows germination, it may be necessary to plant the seed 3 inches deep or more to reach moisture (Fig. 5). Remember that the seed is hard, so don't bury it--plant it.

If the soil is moist from the surface on down, one inch is deep enough to plant. The depth of the permanent root system is not increased by planting deeper than one inch.

Fig. 5. Plant corn deep enough to be in moist soil.

4. WHAT WIDTH OF ROW SHOULD I USE?

Prior to 1960, corn row spacing had become standardized at about 40-inches, along with the standardization of row-crop equipment. However, since that time many farmers have been considering narrower rows. According to a survey by the Illinois Cooperative Crop Reporting Service, almost half of the 9.7 million acres of corn in 1965 were planted in rows less than 40 inches. Approximately two percent was planted in 30-inch rows. While the latter figure is not very great, this was the first year that commercial machinery could be purchased in these dimensions (narrow row widths).

Agronomists at Illinois and surrounding states have been evaluating various corn row spacings. Their reports show yields for narrow rows that vary from little or no increase up to 25 percent.

Experimental results at Illinois indicated at high yield levels, corn yields increase about 5 percent by narrowing rows from 40-inch to 30-inch widths. This difference is small and it is sometimes difficult to measure on the farm or in experimental plots. Sometimes the tests showed yield increases of 15 bushels and occasionally they showed no difference. However, so far, no experiments have been reported where 30-inch corn rows yielded lower than 40-inch rows.

Narrow rows simply permit a more even plant distribution and a reduction in inter-plant competition for moisture, nutrients, and light. This lessening of competition per-

mits greater economic use of increased planting rates. Such plantings also shade the ground sooner and thereby reduce weed growth and soil moisture evaporation.

You are most likely to benefit from narrow rows when the following situations occur:

1. Your total acreage of corn and soybeans is large.
2. Your yields in recent years have surpassed 125 bushels.
3. Your plant population exceeds 20,000. You have a high fertility program, good weed control, and practice early harvests.
4. Your present corn growing and harvest equipment is worn and needs replacement.

With most midwest farmers at present, the big question is "Can I afford to convert to narrow rows?" As your present equipment wears out and if your farming operation already includes the first three situations listed above, then your next question may be, "Can I afford not to convert to narrow rows?"

A change to narrow rows will benefit soybeans more than corn in the North Central States. Research results with this crop show yield increases of 10 to 20 percent by narrowing rows. Grain sorghums also respond similarly. The same equipment used for narrow row corn can also be used for soybeans. Therefore, you should consider the benefits from both corn and soybeans when deciding if narrow rows can be justified.

If you decide to go to narrow rows, you may ask, "Why not go to 20-inch rows?" In corn the greatest yield increase seems to come in narrowing from 40-inches down to 30-inch row spacings. It is extremely doubtful if the same increment of difference will be recovered between 30- and 20-inch rows. A preliminary 2-year study at Illinois (Table 4) questions the

Table 4. Grain yields from three row spacings at three plant populations (Urbana, Ill., 2-year average).

Plant Population at Harvest	Row Spacing		
	40-inch Bu./A.	30-inch 15.5% moisture	20-inch
16,000	136	135	135
24,000	146	157	151
32,000	146	154	150

desirability of going "all the way" to 20-inch rows at the present time. In addition, several machinery companies now have equipment on the market that will allow a farmer to standardize all row crops at about 30-inch spacings.

If you do change to a narrow row system, remember that high population and narrow rows will increase the tendency for lodging or stalk breakage. Thus, you should choose hybrids adapted to high planting rates with excellent stalk quality. Research results indicate that the shorter, earlier hybrids will do better in narrow rows than tall late varieties. Early planting also seems to favor narrow rows.

Like most management decisions on the farm, the decision to convert to narrow rows is primarily an economic one and thus, varies with the individual operator.

5. SHOULD CORN BE DRILLED OR HILL DROPPED?

Development of herbicides and improved tillage equipment for weed control has largely ruled out any advantage of check-row planting. Today less than one percent of the corn is planted by this method. The 1965 Crop Reporting Service survey indicates that 48 percent of the corn is drilled, 51 percent is hill-dropped, and 1 percent other; however, the trend seems to be toward drilling in recent years. When drilling, the planter drops one seed at a time and the plants grow singly spaced. Hill-dropping consists of dropping two or more kernels in one spot at regular intervals in the row in hills.

Plant population shows a greater effect on yield than the planting pattern within rows. However, many experiments have been conducted to compare drilled and hill-dropped corn. Most of these show a small difference favoring the drilled pattern. Yield differences have ranged from 0 to 13 percent.

Early studies at Illinois indicate that under favorable weather conditions, drilled corn gave a greater yield than hill-dropped. The greatest advantage of drilled was obtained at relatively high plant populations. When dry weather occurred during July and August,

hill-dropped corn produced just as high yields as drilled corn. On the other hand, in seasons with ample rainfall, drilled corn produced a larger yield than hill planted corn.

Even though drilling is apparently best for producing grain under ideal moisture conditions, this method has some disadvantages. Lodging (broken stalks) is worse than in hill-dropped plantings even though the diameter of the stalks is larger. Early studies showed lodging averaged 36.1 percent for drilled and 31.9 percent for hill-drop planting in Illinois. Although this percent of lodging was only slightly different, it was statistically significant. Drilled corn will also sucker or tiller more than those hill-dropped. However, these two factors will not be so important in the future as they have been in the past. Corn breeders have systematically improved hybrids, eliminated heavy-suckering varieties, and the trend toward faster and earlier harvesting may reduce lodging.

You may wonder how narrow-row corn will effect plant distribution in the row. Table 5 presents the information on this subject ob-

tained at Urbana, Illinois, in 1965 with three single cross commercial hybrids in 30-inch rows at a final stand of 24,000 plants per acre.

All three hybrids performed best when distributed in the row. An average yield difference of 11, 12, and 23 bushels was noted for single plants versus 2, 3, and 4 plants per hill respectively.

Table 5. Effect of plant distribution in 30-inch rows at high productivity level on grain yield—Bu./A.

Spacings	Hybrid			Average
	A	B	C	
1 plant every 8.7 inches	194.7	204.8	209.2	202.9
2 plants every 17.4 inches	181.2	191.6	204.0	192.3
3 plants every 26.1 inches	185.0	187.1	201.9	191.0
4 plants every 34.8 inches	169.4	178.7	190.0	179.7

6. SHOULD I USE FERTILIZER AT PLANTING TIME?

Whether or not you use fertilizer at planting time will depend upon the fertility program on your farm. If your basic build-up requirements have been met, soil-improving legumes and manures have been added, and maintenance amounts of fertilizer applied at other times during the rotation, you may receive very little, if any, benefit from adding fertilizer at planting time. On most soils, however, the corn crop will benefit from at least a small amount of fertilizer applied at planting time.

Applying 80 to 150 pounds per acre of a fertilizer containing a small amount of nitrogen, a larger percentage of P_2O_5 , and an intermediate amount of K_2O at planting time will usually help corn get a vigorous start (Fig. 6). Apply the fertilizer in one or two bands about 2 inches to the side and 2 inches deeper than the seed (Fig. 7). When drilling corn, make the bands continuous. When check-

Fig. 6. Fertilizer applied at planting time can help give young plants a vigorous start.

Fig. 7. Fertilizer applied at planting time should be placed to the side of and below the seed (courtesy Velsicol Chemical Corp.).

ing or hill dropping, drop the fertilizer about 6 to 8 inches along the side of the hills.

Some planters are equipped to apply liquid fertilizer (Fig. 8). Liquid fertilizer may be easier to handle and is just as good as dry fertilizer providing equivalent amounts of actual fertilizer are used.

Fig. 8. This planter is equipped to apply liquid fertilizer at planting time (courtesy Deere and Co.).

7. SHOULD I APPLY INSECTICIDES AT PLANTING TIME?

Wireworms, grape colaspis, root worms of various kinds, grubs, seed-corn beetles, and seed-corn maggots are some of the more common stand-destroying and root-pruning insects which can damage corn yields if not controlled. Reports indicate that farmers lose 5 to 6 bushels of corn per acre to these hidden pests.

Many of these insects may be controlled and yields increased by applying such insecticides as aldrin or heptachlor to the soil. They may be worked into the soil before planting, applied with fertilizer, or applied with a special planter attachment (Fig. 9). To get maximum benefits, use 1 1/2 pounds of actual aldrin or heptachlor per acre when broadcast and 1 pound of either per acre when used as a row treatment.

Aldrin, heptachlor, or dieldrin applied to the seed at planting time can also help to give protection against some insects.

Fig. 9. Insecticides may be applied at planting time by using a special attachment on a planter.

You have probably noticed that most seed corn is treated before it is sold to the farmer. This treatment is usually a fungicide for controlling plant diseases rather than insects.

8. SHOULD I APPLY HERBICIDES AT PLANTING TIME?

A herbicide is a chemical used to kill or prevent the growth of some plants but not others. A pre-emergence herbicide is one which is applied before the crop has emerged or come through the ground.

A pre-emergence herbicide may be applied at planting time or shortly after to help control weeds as they germinate. The material may be applied by mounting equipment on the planter so that the spray or dry granules fall in a band over the row behind the planter press wheels (Fig. 10) or broadcast application may be made within a few days after planting. Some herbicides are available which help control both grass-type and broad-leaf weeds.

The use of herbicides to control a serious weed infestation can be a good investment. For example, research shows that 50 giant foxtail plants per foot in the corn or soybean row can reduce yields by 25 to 30 percent. Most people are willing to invest \$5.00 per acre if more than the amount invested is re-

Fig. 10. This farmer is applying a pre-emergence herbicide over the row behind his planter to help control weeds.

turned in increased yields.

Most pre-emergence herbicides cost \$2.00 to \$5.00 per acre for band application. If you can achieve economical and satisfactory weed control without pre-emergence herbicides, you probably would be wise to invest the money for other needs, such as fertilizer. In some years, however, a pre-emergence herbicide

does not give satisfactory weed control and you may not have a suitable return on your investment.

Using pre-emergence herbicides is an economical practice about three years out of four. One of the main reasons for failure is lack of adequate rain to activate the herbicide. However, on the other hand, pre-emergence herbicides are sometimes called "wet weather insurance." It is during the wet years when weeds grow best and cultivation may be delayed that you really need help and that is when pre-emergence herbicides often work best. When it is dry for a few weeks after planting, the herbicide may not be very effective, but weeds are usually not very serious then either and cultivation can be timely. If you could predict the weather, there would be no need to buy "pre-emergence insurance" in the dry years.

For those of you who have changed to narrow rows, it is a common belief that narrow rows give more shade between the rows and thus improve weed control. If, however, you still do use a pre-emergence herbicide, the change from 40- to 30-inch rows means a band application of herbicide on nearly half rather than only a third of the actual area. Band application still costs less than broadcasting in terms of herbicide, but with narrow rows the difference between banding and broadcasting decreases. With narrow rows the cost of two cultivations may still be less than the cost of applying the herbicide between the rows. However, you must consider the price you are willing to put on weed control during a wet period, when labor is short, or on being able to eliminate a cultivation when time is at a premium.

CHEMICAL WEED CONTROL FOR CORN

CROP	CHEMICAL*	REMARKS
CORN, pre- emergence	ATRAZINE (2 to 3 lb.)	Controls annual grass weeds and broad-leaved weeds. Adjust rate for soil type. Performs best on low organic matter soils. Injury to spring oats and soybeans has sometimes occurred the following year.
	RAMROD (4 lb.)	Controls annual grass weeds, pigweed, and lambsquarter. Best adapted to dark soils, but better than Radox on light-colored soils. Control lasts a little longer than with Radox. Less irritating than Radox, but use care to avoid irritation. Do not feed forage to livestock.
	RANDOX (4 lb.)	Controls annual grass weeds and pigweed. Do not use on sandy soils. Performs best on soils moderate to high in organic matter. Use appropriate precautions to avoid irritation to skin and eyes.
	RAMROD plus ATRAZINE (3 lb. Ramrod plus 1 to 1½ lb. Atrazine)	Trial use. For spray application. This combination appears promising for obtaining a broader spectrum of weed control under a wide variety of soil and climatic conditions. The reduced rate of atrazine reduces the possibility of residue problems. Federal registration has been applied for. Handle with care to avoid irritation.
	ATRAZINE plus LOROX (Adjust rate for soil type)	Performs better on light, low organic matter soils than on the moderately dark to dark soils. Crabgrass and panicum control may be better than with atrazine alone. Reduced rate of atrazine reduces possibility of residue problem.
The following pre-emergence herbicides have label clearance for corn but, because of lower crop tolerance or less weed control, are not considered as satisfactory as the above.		
	RANDOX-T (see label)	Controls annual grass weeds and broad-leaved weeds. Use precautions to avoid irritation to skin and eyes. Do not use on sandy soils. Corn tolerance not as good as with Radox. Soybeans and some vegetable crops planted the year following application have sometimes been injured.
	ROUNDUP (3 lb. Ramrod plus 1 lb. 2,4-D)	Trial use. The addition of 2,4-D to Ramrod improves control of broad-leaved weeds. However, a preferred alternative would be a pre-emergence application of Ramrod followed by an early post-emergence application of 2,4-D. Available in granular form. Handle with care to avoid irritation.
	KNOXWEED (2 lb. Eptam plus 1 lb. 2,4-D)	Controls annual grass weeds and broad-leaved weeds. Corn injury possible, but less likely than with Eptam alone.
	2,4-D ESTER (1 ½ lb. liquid or 2 lb. gran.)	For control of broad-leaved weeds. May give some control of annual grass weeds. Some hazard to corn if heavy rains occur soon after treatment. Do not use on sandy soils. Do not use amine form for pre-emergence.

* Rates indicate active ingredient or acid equivalent per acre broadcast unless otherwise indicated. Rates for Dowpon refer to pounds of commercial product per acre broadcast.

APPENDIX

Table 1. Kernel spacing to obtain various plant populations in different row widths in a Drilled Planting Pattern. A 10% stand loss is calculated into each rate.

Plants/acre	Kernel spacing

TRANSPLANTING SHADE TREES

1. How Should I Prepare a Tree for Moving?
2. How Should I Plant a Tree?
3. How Should I Protect the Tree?

1. HOW SHOULD I PREPARE A TREE FOR MOVING?

Careful attention to recommended practices—including predigging preparations, methods of digging, and protection of roots—is good insurance for your success in getting a tree off to a good start after it is moved.

Tying-in branches, marking orientation

Tying-in the branches of low-branched or bushy plants will help avoid injury and facilitate digging. Heavy twine is usually used for tying-in branches, but burlap strips or 1/4-inch rope may also be used. To tie-in the branches, attach the twine or other suitable material to a branch at the base of the tree and then wind it spirally around the plant to the top and tie it in a loop (Fig. 1).

Fig. 1. To prevent unnecessary injury, tie-in with rope or strips of burlap.

Before digging the tree, mark a branch that faces north (or any other direction) so the tree can be properly reoriented when planted.

Digging the tree

After the branches are tied-in, the tree is ready for digging. Deciduous trees under 2 1/2 to 3 inches in trunk diameter, measured 1 foot above the ground, are usually moved with bare roots. "Bare root" means that most or all of the soil is removed from the roots when the tree is dug. Thus, a tree can be dug with a larger root system than if it is taken with a ball of soil.

The digging operation consists of trenching around the tree and removing the soil from around the roots. Dig the trench far enough from the tree to preserve a large proportion of the fibrous roots. This distance is usually 6 inches for each inch of diameter of the trunk. Thus, for a tree with a 3-inch trunk, the trench would be 18 inches from the trunk. Make the trench deep enough to extend below the level of the lateral roots; the depth may vary from 12 to 18 inches (Fig. 2).

After digging the trench, remove the soil from around the roots. It may be shaken off if the tree is small or it can be loosened and combed out of the fibrous roots with a spading fork. Special care is required to keep root injury to a minimum. This is accomplished by working inward from the trench with the spading fork. Greater root protection is obtained if the tree is moved with "semibare" roots—some soil is left clinging to the fibrous roots. This added protection will help the tree recover more rapidly.

02259

111

Fig. 2. Dig the trench deep enough to extend below the main lateral roots and far enough from the tree to preserve a large proportion of the fibrous roots (courtesy National Park Service).

After the lateral roots are free of soil, tip the tree to remove the soil from under the plant. Tip the tree very gradually to avoid straining or breaking the roots and loosening the bark near the base of the trunk. Cut any anchor roots or tap roots that still hold at a depth of 14 to 18 inches. To lift the tree out of the hole, grasp it at the junction of the roots and trunk. Pack the exposed roots in some moisture-holding material, such as straw, sphagnum, peat moss, sawdust, shingle tow, or wood chips, and wrap in burlap to protect against drying and mechanical injury (Fig. 3).

"Balled and burlapped" means that the soil is not removed from the roots when the tree is dug. This is referred to as a B&B tree by the nursery trade. Deciduous trees 2 1/2 to 3 inches and larger in trunk diameter, measured 1 foot above the ground, and evergreens are usually moved and planted with balls of soil covering their roots. The size of the ball will depend on the size and species of the tree and the type of soil in which the tree is growing. Trees that are difficult to move, such as beech, hickory, hornbeam, sassafras, sweet gum, tupelo, walnut, and white oak, need larger balls than trees that are easy to move. Trees growing in loose, well-drained soil, such as a sandy soil, will have more extensive or spreading root systems than trees growing in a hard, poorly drained soil like a tight clay.

Fig. 3. Trees can be "balled and burlapped" for transplanting. (A) Burlap cut for wrapping small tree, (B) Small evergreen properly wrapped, and (C) Strips of burlap are used on larger trees (courtesy National Park Service).

In general a ball for deciduous trees is approximately 10 inches in diameter for each inch of trunk diameter 1 foot above ground. Therefore, a tree with a trunk 3 inches in diameter needs a ball 30 inches in diameter. If a ball is too large, the roots will be inadequate to hold the soil together and the ball may break apart when the tree is moved.

The ball of soil for evergreens is determined by the height of the plant rather than by the diameter of the trunk. Evergreens 1 1/2 to 2 feet high need a ball 12 inches in diameter. For each additional foot in height, up to 10 feet, the ball diameter is increased 2 inches. For each additional foot in height above 10 feet the diameter is increased 1 1/2 inches.

Before digging is started, remove any loose soil above the roots. Then make a circle around the plant approximately 6 inches beyond the anticipated diameter of the finished ball. Cut the roots to a depth of approximately

of pieces by inserting a spade at the marked circle with the back side of the spade toward the tree. Using a sharp spade will result in clean cuts which heal rapidly. Next, dig a trench outside and adjacent to the marked circle and about three-fourths the desired depth of the ball, which is usually 10 to 16 inches.

Trim the ball to proper size and shape with the spade, keeping the back side of the spade toward the tree. Round off the trimmed ball at the top edge and taper it inward toward the base (Fig. 4). Avoid loosening the soil

Fig. 4. Dig the trench approximately three-fourths of the desired depth of the ball, then undercut and trim it to proper shape.

to break roots by cutting small roots with a sharp spade and large roots with hand or logging shears. Next, undercut the ball of soil at an angle of about 45 degrees to sever any remaining roots and to loosen the ball from the soil beneath.

To prevent drying, cracking, and crumbling of soil, wrap the ball tightly with burlap.

Balls up to 15 inches in diameter can be completely covered with burlap. One method is to tip the ball and place a piece of rolled burlap under half of the ball. Then tip the ball in the opposite direction and pull the burlap under the other half. Pull the burlap up around the ball and tie the diagonal corners at the top. Wrap loose folds of burlap tightly around the ball and pin the burlap in place with sixpenny or eightpenny balling nails.

Balls of soil are heavy and difficult to move. A ball of soil 15 inches in diameter and 15 inches deep may weigh 200 pounds or more, and one 24 inches in diameter and 18 inches deep will weigh over 400 pounds. A tree with a small ball of soil can be lifted out of the hole with two spades inserted under the ball from opposite sides, or by placing a piece of burlap under the ball and lifting while grasping the four corners of the burlap. Balls of soil weighing several hundred pounds must be handled carefully to avoid injury to the roots. They should be prepared and moved by arborists, nurserymen, or other persons familiar with the procedures of digging, burlapping, rope lacing, and moving such large balls.

Transporting the tree

One or several small trees obtained from a nursery or woodland are frequently transported by car or truck. Trees ordered from distant nurseries are usually sent by freight and shipped by train or truck. Large trees, especially those with soil balls weighing several hundred pounds, are transported by special types of trailers or automotive equipment. This specialized equipment is used by nurserymen, arborists, and other commercial operators engaged in moving large trees.

Protecting the roots

The roots should never be allowed to dry from the time the tree is dug until it is planted in the new location. Prolonged exposure to air will cause the roots to dry out and die. Roots can be protected by packing them in moist straw, sphagnum, peat moss, sawdust, shingle tow, or other suitable material and then wrapping with burlap.

If your trees are delivered without balls of soil, plant them immediately or heel them in to prevent drying of the roots. Heeling-in consists of digging a trench wide and deep enough to accommodate the roots without crowding. A place with well-drained, sandy, or sandy-loam soil, and where the trees are protected from the sun and wind, is desirable. It is generally best to have the trench running east and west, and to place the trees so they lean toward the south or southwest. Throw the soil so that a bank will be formed against which the trees can lean. Remove

the packing and spread the roots in the bottom of the trench. Cover the roots with fine, moist soil, tamp firmly, and then add enough additional soil to make sure the roots will not dry out.

If the trees are delivered with balls of soil, and are not planted immediately, the soil and roots must be protected from drying out. Cover the soil ball with canvas, or with one of the mulch materials suggested for protecting bare roots, and keep moist until the trees are planted.

2. HOW SHOULD I PLANT A TREE?

Location, methods of digging the hole, soil conditions, and several other considerations are in order when planting your tree.

Location

Before planting a tree, give careful consideration to where it will be located. This is important because the tree must thrive in the soil where it is planted and also give the desired shading or ornamental effects. For good tree growth and development, the most important requirement is a site that has fertile soil and adequate drainage. There are three general soil types: loam, clay, and sand. Loam soil in general is high in nutrients and has water, air, and temperature conditions suitable for good growth. Clay soil ordinarily is low in nutrients and does not drain well. Sandy soil does not hold adequate water, contains too much air, and is too low in nutrients for good plant growth.

The term "soil" usually refers to the fertile, upper layer, which is also called topsoil. Below this layer is the subsoil, which is frequently composed of clay or hardpan. Subsoil usually is wet, low in fertility, and relatively impervious to root growth. Often when houses and other buildings are constructed the subsoil is mixed with the topsoil. Avoid locating a tree in such a soil mixture, if possible, because it is not suitable for rapid growth.

Good drainage is necessary to allow adequate aeration for root growth and to provide the conditions required by beneficial soil organisms. Bacteria and other microorganisms which decompose the organic matter and aid in releasing plant nutrients cannot function properly in wet soil devoid of air. Roots of trees planted in poorly drained soil, such as a clay fill, may be submerged in water for long periods of time and suffocate because of lack of air. A tree that was killed because of inadequate drainage is illustrated in Fig. 5. However, trees planted in sandy soil must be supplied with adequate water or the roots will die from lack of moisture.

Trees should be planted far enough from buildings and other obstacles to allow for adequate sunshine, rain, air circulation, and room for normal growth and spread of branches. Trees planted too close to buildings grow lopsided and crowd the buildings (Fig. 6), frequently resulting in damage to both trees and buildings.

Planting procedures

Digging the hole. Dig the hole for a bare-root tree large enough so the roots can be fully expanded and arranged in their normal position (Fig. 7). They should not be twisted, crowded, or arranged in a circle against the

Fig. 5. Death of the red oak shown in this picture followed root suffocation caused by lack of soil drainage. The leaves turned brown and died before they were fully developed.

wall of the hole or all in one direction. Fig. 8 shows the result of improper root arrangement, where the roots were twisted and pointed in one direction when the tree was planted.

Fig. 8. This twisted and lopsided root system resulted from improper planting. Such root systems frequently do not supply adequate nutrients and water for normal tree growth.

Fig. 6. Trees too close to buildings grow lopsided and their roots may damage the building foundations.

Improperly arranged roots may result in retarded growth or even death of entire trees after a few years. Balled trees need a hole 2 to 3 feet wider than the soil ball (Fig. 9). This allows for a trench 1 to 1 1/2 feet wide around the ball to be filled with good soil. The hole should be deep enough so the tree can be planted at the same depth as it was before it was dug. Some arborists prefer to set a tree slightly higher than it was in its original position. This allows for settling of the tree.

Fig. 7. In planting trees with bare roots, make the hole wide enough to allow 1 to 1 1/2 feet of backfill beyond the tips of the roots. This illustrates a bare root tree properly transplanted.

Fig. 9. Balled trees need a hole 2 to 3 feet wider than the soil ball.

Providing drainage. Adequate drainage is essential for the survival of newly planted trees, and any hole in soil that will not drain readily should have drainage provided. If clay or hardpan at the bottom of a hole is underlaid by gravel, you can provide adequate drainage with holes made by a soil auger or through fissures made by compressed air or dynamite. Fill holes made by a soil auger with gravel.

It is advisable to tile-drain holes for large trees. In clay soil, a single 3- or 4-inch standard agricultural tile drain across the bottom of the hole is adequate if the hole is not over 6 feet in diameter (Fig. 10). For larger

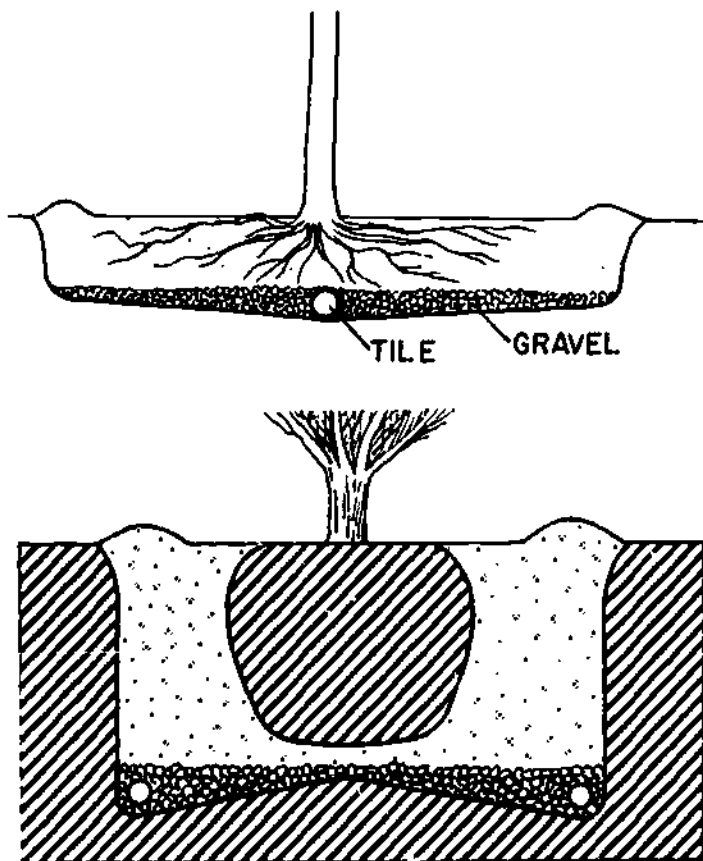

Fig. 10. Poorly drained soils may require additional drainage. Be sure to allow sufficient depth for the drain tile, gravel fill, and 2 to 3 inches of soil over the gravel before the tree is placed in the hole. The bottom of the hole should slope toward the tile.

holes and for evergreens, which in general require better drainage than deciduous trees, two lines of tile are recommended. The tile should lead to a suitable free outlet or, if such an outlet is not available, a dry well may be installed. A dry well (Fig. 11) is a large hole filled with gravel into which the water can flow. In some locations the drain tiles empty into a storm sewer. Never connect a drain to a sanitary sewer. Do not use crushed limestone in the bottom of the hole;

Fig. 11. A dry well or other suitable tile outlet may provide effective drainage in holes not over 6 feet in diameter. Use a single tile drain across the bottom and place enough gravel in the hole to cover the tile.

it tends to create an alkaline condition and cause a tree to develop chlorosis.

Improving soil fertility and texture. Heavy clay soil, low in nutrients, does not allow for adequate aeration and retains too much water for good root growth. Light, sandy soil is low in nutrients, allows for excessive aeration, and does not retain enough moisture for good root growth.

Poor quality soil can be improved in texture by adding peat moss, granulated sphagnum, well-rotted manure, or other suitable materials. Well-rotted manure supplies some nutrients. Usually it is not necessary to add commercial fertilizer until new root growth has developed. However, if the soil is low in nutrients you can improve it by adding superphosphate or commercial fertilizer high in superphosphate such as a 4-12-4 formulation. Five pounds of 20 percent superphosphate is recommended for each cubic yard of soil (3 3/4 ounces per bushel). The amount of commercial fertilizer to use varies from 3 pounds per cubic yard of soil (2 1/4 ounces per bushel) for small trees with bare roots to 10 pounds per cubic yard of soil (7 1/2 ounces per bushel) for large trees with balls of soil.

Breaking the ball. Delay in planting after a tree is dug may result in the formation of a

hard crust an inch or more deep at the surface of the ball of soil, especially if the soil is heavy clay. To assure a better moisture and air supply for good root growth, you can fork off or fracture the hard crust, or punch holes through it, before the backfill is added. A light surface application of a nonionized detergent (not over 1 ounce in 1 gallon of water) may help in initiating water penetration of the ball of soil that has a hard crust.

Placing the plant. Before placing the tree in the hole, put 2 or 3 inches of good loam soil in the bottom, or over any drainage material provided, including tile and gravel. To avoid air pockets under the soil ball, arrange the soil at the bottom of the hole so it is slightly higher in the center. If the tree was marked for proper orientation before it was dug, set it so that each side will have the same exposure or position that it had in its previous location. This is especially important in preventing sunscald or winter injury of bark on smooth- or thin-barked trees. If a tree cannot be properly oriented, you can protect its trunk and large branches by wrapping them with paper or burlap, or coating them with wax or latex.

Filling the hole. After placing the tree in the proper position, fill the hole with good loam soil. Bare-root trees need special attention. Work the soil in firmly around the roots as the hole is gradually filled. Gently raise and lower the tree slightly as the soil is added, to help eliminate air pockets around the roots. Add the soil in layers of about 6 inches, and tamp each layer to make it firm and to hold the tree perpendicular. Water may be used to settle the soil and to eliminate air pockets around the roots. If the soil is wet it should be tamped very little and the tree may not need "watering in." Spread a top layer of 1 to 2 inches of loose soil over the tamped soil to serve as a mulch. Leave a ridge or collar of soil at the margin of the hole (Fig. 12) to form a basin for holding water.

When planting a tree with a ball of soil, remove the burlap before filling the trench around the ball. Heavy burlap left around the ball of soil will reduce the amount of moisture reaching the roots. Also, the burlap may decay slowly and act as a barrier to normal

Fig. 12. A mound of earth, 3 to 4 inches high around a newly planted tree serves as the dike of a reservoir. This will hold sufficient water to soak the soil of the backfill and the soil contained in the ball about the plant roots.

root growth. However, if the soil in the ball is likely to crumble, the burlap can be slit along the sides with a sharp knife, rolled back from the top, and left on the ball.

Pruning. Newly planted trees should be pruned because many of the fibrous roots through which water is obtained are lost when the trees are dug. In general, removing 15-35 percent of the leaf-bearing wood to compensate for this root loss is recommended to help prevent injury or death of newly planted trees. Remove injured, weak, interfering, and poorly located branches. Entire branches should be removed, leaving the tree with a thinned out crown, one good leader, and an adequate number of well-spaced lateral branches with uncut tips (Fig. 13). Do not remove small twigs along the leader or main branches.

Fig. 13. The black bars on the branches indicate top growth that should be removed on newly planted trees.

TRANSPLANTING SHADE TREES

1. How Should I Prepare a Tree for Moving?
2. How Should I Plant a Tree?
3. How Should I Protect the Tree?

1. HOW SHOULD I PREPARE A TREE FOR MOVING?

Careful attention to recommended practices—including predigging preparations, methods of digging, and protection of roots—is good insurance for your success in getting a tree off to a good start after it is moved.

Tying-in branches, marking orientation

Tying-in the branches of low-branched or bushy plants will help avoid injury and facilitate digging. Heavy twine is usually used for tying-in branches, but burlap strips or 1/4-inch rope may also be used. To tie-in the branches, attach the twine or other suitable material to a branch at the base of the tree and then wind it spirally around the plant to the top and tie it in a loop (Fig. 1).

Fig. 1. To prevent unnecessary injury, tie-in with rope or strips of burlap.

Before digging the tree, mark a branch that faces north (or any other direction) so the tree can be properly reoriented when planted.

Digging the tree

After the branches are tied-in, the tree is ready for digging. Deciduous trees under 2 1/2 to 3 inches in trunk diameter, measured 1 foot above the ground, are usually moved with bare roots. "Bare root" means that most or all of the soil is removed from the roots when the tree is dug. Thus, a tree can be dug with a larger root system than if it is taken with a ball of soil.

The digging operation consists of trenching around the tree and removing the soil from around the roots. Dig the trench far enough from the tree to preserve a large proportion of the fibrous roots. This distance is usually 6 inches for each inch of diameter of the trunk. Thus, for a tree with a 3-inch trunk, the trench would be 18 inches from the trunk. Make the trench deep enough to extend below the level of the lateral roots; the depth may vary from 12 to 18 inches (Fig. 2).

After digging the trench, remove the soil from around the roots. It may be shaken off if the tree is small or it can be loosened and combed out of the fibrous roots with a spading fork. Special care is required to keep root injury to a minimum. This is accomplished by working inward from the trench with the spading fork. Greater root protection is obtained if the tree is moved with "semibare" roots—some soil is left clinging to the fibrous roots. This added protection will help the tree recover more rapidly.

Fig. 2. Dig the trench deep enough to extend below the main lateral roots and far enough from the tree to preserve a large proportion of the fibrous roots (courtesy National Park Service).

After the lateral roots are free of soil, tip the tree to remove the soil from under the plant. Tip the tree very gradually to avoid straining or breaking the roots and loosening the bark near the base of the trunk. Cut any anchor roots or tap roots that still hold at a depth of 14 to 18 inches. To lift the tree out of the hole, grasp it at the junction of the roots and trunk. Pack the exposed roots in some moisture-holding material, such as straw, sphagnum, peat moss, sawdust, shingle tow, or wood chips, and wrap in burlap to protect against drying and mechanical injury (Fig. 3).

"Balled and burlapped" means that the soil is not removed from the roots when the tree is dug. This is referred to as a B&B tree by the nursery trade. Deciduous trees 2 1/2 to 3 inches and larger in trunk diameter, measured 1 foot above the ground, and evergreens are usually moved and planted with balls of soil covering their roots. The size of the ball will depend on the size and species of the tree and the type of soil in which the tree is growing. Trees that are difficult to move, such as beech, hickory, hornbeam, sassafras, sweet gum, tupelo, walnut, and white oak, need larger balls than trees that are easy to move. Trees growing in loose, well-drained soil, such as a sandy soil, will have more extensive or spreading root systems than trees growing in a hard, poorly drained soil like a tight clay.

Fig. 3. Trees can be "balled and burlapped" for transplanting. (A) Burlap cut for wrapping small tree, (B) Small evergreen properly wrapped, and (C) Strips of burlap are used on larger trees (courtesy National Park Service).

In general a ball for deciduous trees is approximately 10 inches in diameter for each inch of trunk diameter 1 foot above ground. Therefore, a tree with a trunk 3 inches in diameter needs a ball 30 inches in diameter. If a ball is too large, the roots will be inadequate to hold the soil together and the ball may break apart when the tree is moved.

The ball of soil for evergreens is determined by the height of the plant rather than by the diameter of the trunk. Evergreens 1 1/2 to 2 feet high need a ball 12 inches in diameter. For each additional foot in height, up to 10 feet, the ball diameter is increased 2 inches. For each additional foot in height above 10 feet the diameter is increased 1 1/2 inches.

Before digging is started, remove any loose soil above the roots. Then make a circle around the plant approximately 6 inches beyond the anticipated diameter of the finished ball. Cut the roots to a depth of approximately

to be done by inserting a spade at the marked circle with the back side of the spade toward the tree. Using a sharp spade will result in clean cuts which heal rapidly. Next, dig a trench outside and adjacent to the marked circle and about three-fourths the desired depth of the ball, which is usually 10 to 16 inches.

Trim the ball to proper size and shape with the spade, keeping the back side of the spade toward the tree. Round off the trimmed ball at the top edge and taper it inward toward the base (Fig. 4). Avoid loosening the soil

Fig. 4. Dig the trench approximately three-fourths of the desired depth of the ball, then undercut and trim it to paper shape.

around the roots by cutting small roots with a sharp spade and large roots with hand or lopping shears. Next, undercut the ball of soil at an angle of about 45 degrees to sever any remaining roots and to loosen the ball from the soil beneath.

To prevent drying, cracking, and crumbling of soil wrap the ball tightly with burlap.

Balls up to 15 inches in diameter can be completely covered with burlap. One method is to tip the ball and place a piece of rolled burlap under half of the ball. Then tip the ball in the opposite direction and pull the burlap under the other half. Pull the burlap up around the ball and tie the diagonal corners at the top. Wrap loose folds of burlap tightly around the ball and pin the burlap in place with sixpenny or eightpenny balling nails.

Balls of soil are heavy and difficult to move. A ball of soil 15 inches in diameter and 15 inches deep may weigh 200 pounds or more, and one 24 inches in diameter and 18 inches deep will weigh over 400 pounds. A tree with a small ball of soil can be lifted out of the hole with two spades inserted under the ball from opposite sides, or by placing a piece of burlap under the ball and lifting while grasping the four corners of the burlap. Balls of soil weighing several hundred pounds must be handled carefully to avoid injury to the roots. They should be prepared and moved by arborists, nurserymen, or other persons familiar with the procedures of digging, burlapping, rope lacing, and moving such large balls.

Transporting the tree

One or several small trees obtained from a nursery or woodland are frequently transported by car or truck. Trees ordered from distant nurseries are usually sent by freight and shipped by train or truck. Large trees, especially those with soil balls weighing several hundred pounds, are transported by special types of trailers or automotive equipment. This specialized equipment is used by nurserymen, arborists, and other commercial operators engaged in moving large trees.

Protecting the roots

The roots should never be allowed to dry from the time the tree is dug until it is planted in the new location. Prolonged exposure to air will cause the roots to dry out and die. Roots can be protected by packing them in moist straw, sphagnum, peat moss, sawdust, shingle tow, or other suitable material and then wrapping with burlap.

If your trees are delivered without balls of soil, plant them immediately or heel them in to prevent drying of the roots. Heeling-in consists of digging a trench wide and deep enough to accommodate the roots without crowding. A place with well-drained, sandy, or sandy-loam soil, and where the trees are protected from the sun and wind, is desirable. It is generally best to have the trench running east and west, and to place the trees so they lean toward the south or southwest. Throw the soil so that a bank will be formed against which the trees can lean. Remove

the packing and spread the roots in the bottom of the trench. Cover the roots with fine, moist soil, tamp firmly, and then add enough additional soil to make sure the roots will not dry out.

If the trees are delivered with balls of soil, and are not planted immediately, the soil and roots must be protected from drying out. Cover the soil ball with canvas, or with one of the mulch materials suggested for protecting bare roots, and keep moist until the trees are planted.

2. HOW SHOULD I PLANT A TREE?

Location, methods of digging the hole, soil conditions, and several other considerations are in order when planting your tree.

Location

Before planting a tree, give careful consideration to where it will be located. This is important because the tree must thrive in the soil where it is planted and also give the desired shading or ornamental effects. For good tree growth and development, the most important requirement is a site that has fertile soil and adequate drainage. There are three general soil types: loam, clay, and sand. Loam soil in general is high in nutrients and has water, air, and temperature conditions suitable for good growth. Clay soil ordinarily is low in nutrients and does not drain well. Sandy soil does not hold adequate water, contains too much air, and is too low in nutrients for good plant growth.

The term "soil" usually refers to the fertile, upper layer, which is also called topsoil. Below this layer is the subsoil, which is frequently composed of clay or hardpan. Subsoil usually is wet, low in fertility, and relatively impervious to root growth. Often when houses and other buildings are constructed the subsoil is mixed with the topsoil. Avoid locating a tree in such a soil mixture, if possible, because it is not suitable for rapid growth.

Good drainage is necessary to allow adequate aeration for root growth and to provide the conditions required by beneficial soil organisms. Bacteria and other microorganisms which decompose the organic matter and aid in releasing plant nutrients cannot function properly in wet soil devoid of air. Roots of trees planted in poorly drained soil, such as a clay fill, may be submerged in water for long periods of time and suffocate because of lack of air. A tree that was killed because of inadequate drainage is illustrated in Fig. 5. However, trees planted in sandy soil must be supplied with adequate water or the roots will die from lack of moisture.

Trees should be planted far enough from buildings and other obstacles to allow for adequate sunshine, rain, air circulation, and room for normal growth and spread of branches. Trees planted too close to buildings grow lopsided and crowd the buildings (Fig. 6), frequently resulting in damage to both trees and buildings.

Planting procedures

Digging the hole. Dig the hole for a bare-root tree large enough so the roots can be fully expanded and arranged in their normal position (Fig. 7). They should not be twisted, crowded, or arranged in a circle against the

Fig. 5. Death of the red oak shown in this picture followed root suffocation caused by lack of soil drainage. The leaves turned brown and died before they were fully developed.

Fig. 6. Trees too close to buildings grow lopsided and their roots may damage the building foundation.

Fig. 7. In planting trees with bare roots, make the hole wide enough to allow 1 to 1½ feet of backfill beyond the tips of the roots. This illustrates a bare root tree properly transplanted.

wall of the hole or all in one direction. Fig. 8 shows the result of improper root arrangement, where the roots were twisted and pointed in one direction when the tree was planted.

Fig. 8. This twisted and lopsided root system resulted from improper planting. Such root systems frequently do not supply adequate nutrients and water for normal tree growth.

Improperly arranged roots may result in retarded growth or even death of entire trees after a few years. Balled trees need a hole 2 to 3 feet wider than the soil ball (Fig. 9). This allows for a trench 1 to 1½ feet wide around the ball to be filled with good soil. The hole should be deep enough so the tree can be planted at the same depth as it was before it was dug. Some arborists prefer to set a tree slightly higher than it was in its original position. This allows for settling of the tree.

Fig. 9. Balled trees need a hole 2 to 3 feet wider than the soil ball.

Providing drainage. Adequate drainage is essential for the survival of newly planted trees, and any hole in soil that will not drain readily should have drainage provided. If clay or hardpan at the bottom of a hole is underlaid by gravel, you can provide adequate drainage with holes made by a soil auger or through fissures made by compressed air or dynamite. Fill holes made by a soil auger with gravel.

It is advisable to tile-drain holes for large trees. In clay soil, a single 3- or 4-inch standard agricultural tile drain across the bottom of the hole is adequate if the hole is not over 6 feet in diameter (Fig. 10). For larger

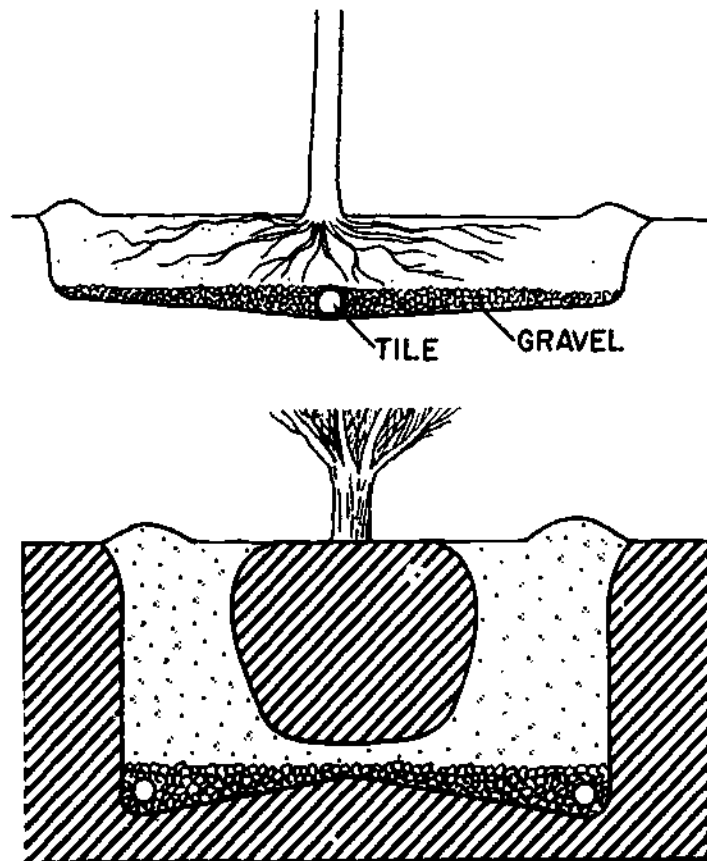

Fig. 10. Poorly drained soils may require additional drainage. Be sure to allow sufficient depth for the drain tile, gravel fill, and 2 to 3 inches of soil over the gravel before the tree is placed in the hole. The bottom of the hole should slant toward the tile.

holes and for evergreens, which in general require better drainage than deciduous trees, two lines of tile are recommended. The tile should lead to a suitable free outlet or, if such an outlet is not available, a dry well may be installed. A dry well (Fig. 11) is a large hole filled with gravel into which the water can flow. In some locations the drain tiles empty into a storm sewer. Never connect a drain to a sanitary sewer. Do not use crushed limestone in the bottom of the hole;

Fig. 11. A dry well or other suitable tile outlet may provide effective drainage in holes not over 6 feet in diameter. Use a single tile drain across the bottom and place enough gravel in the hole to cover the tile.

it tends to create an alkaline condition and cause a tree to develop chlorosis.

Improving soil fertility and texture. Heavy clay soil, low in nutrients, does not allow for adequate aeration and retains too much water for good root growth. Light, sandy soil is low in nutrients, allows for excessive aeration, and does not retain enough moisture for good root growth.

Poor quality soil can be improved in texture by adding peat moss, granulated sphagnum, well-rotted manure, or other suitable materials. Well-rotted manure supplies some nutrients. Usually it is not necessary to add commercial fertilizer until new root growth has developed. However, if the soil is low in nutrients you can improve it by adding superphosphate or commercial fertilizer high in superphosphate such as a 4-12-4 formulation. Five pounds of 20 percent superphosphate is recommended for each cubic yard of soil (3 3/4 ounces per bushel). The amount of commercial fertilizer to use varies from 3 pounds per cubic yard of soil (2 1/4 ounces per bushel) for small trees with bare roots to 10 pounds per cubic yard of soil (7 1/2 ounces per bushel) for large trees with balls of soil.

Breaking the ball. Delay in planting after a tree is dug may result in the formation of a

hard crust an inch or more deep at the surface of the ball of soil, especially if the soil is heavy clay. To assure a better moisture and air supply for good root growth, you can fork off or fracture the hard crust, or punch holes through it, before the backfill is added. A light surface application of a nonionized detergent (not over 1 ounce in 1 gallon of water) may help in initiating water penetration of the ball of soil that has a hard crust.

Placing the plant. Before placing the tree in the hole, put 2 or 3 inches of good loam soil in the bottom, or over any drainage material provided, including tile and gravel. To avoid air pockets under the soil ball, arrange the soil at the bottom of the hole so it is slightly higher in the center. If the tree was marked for proper orientation before it was dug, set it so that each side will have the same exposure or position that it had in its previous location. This is especially important in preventing sunscald or winter injury of bark on smooth- or thin-barked trees. If a tree cannot be properly oriented, you can protect its trunk and large branches by wrapping them with paper or burlap, or coating them with wax or latex.

Filling the hole. After placing the tree in the proper position, fill the hole with good loam soil. Bare-root trees need special attention. Work the soil in firmly around the roots as the hole is gradually filled. Gently raise and lower the tree slightly as the soil is added, to help eliminate air pockets around the roots. Add the soil in layers of about 6 inches, and tamp each layer to make it firm and to hold the tree perpendicular. Water may be used to settle the soil and to eliminate air pockets around the roots. If the soil is wet it should be tamped very little and the tree may not need "watering in." Spread a top layer of 1 to 2 inches of loose soil over the tamped soil to serve as a mulch. Leave a ridge or collar of soil at the margin of the hole (Fig. 12) to form a basin for holding water.

When planting a tree with a ball of soil, remove the burlap before filling the trench around the ball. Heavy burlap left around the ball of soil will reduce the amount of moisture reaching the roots. Also, the burlap may decay slowly and act as a barrier to normal

Fig. 12. A mound of earth, 3 to 4 inches high around a newly planted tree serves as the dike of a reservoir. This will hold sufficient water to soak the soil of the backfill and the soil contained in the ball about the plant roots.

root growth. However, if the soil in the ball is likely to crumble, the burlap can be slit along the sides with a sharp knife, rolled back from the top, and left on the ball.

Pruning. Newly planted trees should be pruned because many of the fibrous roots through which water is obtained are lost when the trees are dug. In general, removing 15-35 percent of the leaf-bearing wood to compensate for this root loss is recommended to help prevent injury or death of newly planted trees. Remove injured, weak, interfering, and poorly located branches. Entire branches should be removed, leaving the tree with a thinned out crown, one good leader, and an adequate number of well-spaced lateral branches with uncut tips (Fig. 13). Do not remove small twigs along the leader or main branches.

Fig. 13. The black bars on the branches indicate top growth that should be removed on newly planted trees.

3. HOW SHOULD I PROTECT THE TREE?

After planting a tree, take several precautions to protect it against wind, insect, drought, and other dangers. The following suggestions cover the most commonly required practices—bracing, wrapping, and watering.

Bracing

Most trees over 1 inch in trunk diameter must be braced with stakes or guys to hold them in an upright position and prevent loosening of the soil around the base of the trunk and drying out of the roots. Such bracing is usually required during the first year. One or two stakes are adequate for bracing trees less than 3 inches in trunk diameter. Trees can be braced with 2 x 2 or similar wood stakes, with light metal posts or with guys (Fig. 14). Either two stakes placed on op-

Fig. 14. Methods of staking and guying young trees. (A). Single stake, (B). Double stakes, (C). Triple stakes, (D). Three-way guys, and (E). Four-way guys (courtesy National Park Service).

posite sides of a tree, or one stake or metal post placed on the side of the prevailing winds (1 foot or so away from the tree and driven into the ground 2 or 3 feet), may be used. To avoid injuring the tree roots, set the stakes before the roots are covered with soil.

Attach the tree to a stake with a soft rope or wire run through a piece of hose (Fig. 15 and 16) or other suitable material to avoid injury to the trunk. If the wire encircles the trunk without such protection, it will girdle

Fig. 15. Metal posts are strong and durable, and may be used repeatedly for bracing newly planted trees.

Fig. 16. A single guy or wire is sometimes used for bracing small trees. Attach the guy to the tree through a piece of hose that encircles the trunk or a crotch and fasten the other end to a stake placed several feet from the tree.

the trunk and is likely to kill the tree (Fig. 17). Cross or "figure eight" the rope, or twist the wire between the stake and the tree, to prevent chafing of the bark.

Fig. 17. Bore guys or wires that encircle the trunk and that are too tight or left on too long will girdle the trunk. Such girdling frequently prevents enlarging of the trunk below the girdle as shown here.

Trees more than 3 inches in trunk diameter need three stakes or three or four guys for adequate bracing. To brace with three stakes, place the stakes at equal intervals around the tree and 1 foot from the trunk. Brace the stakes with cleats, attached 4 to 6 inches below the tops of the stakes, to form a triangular structure connecting the three stakes. Attach the tree to the stakes with soft rope or wire as described previously. Trees planted with large balls of soil may not need bracing.

Guys for large trees consist of 3/16- to 1/4-inch, 7-strand cable, or two strands of No. 9, or four strands of No. 10 or No. 12 galvanized steel wire, twisted. Attach the guys to the tree through pieces of hose that encircle the trunk at a crotch or through lag hooks equally spaced around the trunk. Place the lag hooks 8 or 10 inches apart to avoid weakening of the trunk, and in line with the deadmen (anchor pieces) to which they will be attached. Locate the deadmen, which may be 4- by 6-inch pieces of timber 4 feet long buried to a depth of 4 feet, or other suitable anchor materials, at a

distance from the tree so that the guys will be at a 45-degree angle when twisted taut. In clay and nonrocky soils, wing anchors 30 inches long or longer can be used in place of deadmen. Examine the guys at regular intervals to see that they are taut and that they are not injuring the trunk.

Wrapping

Protect the trunks of newly planted trees that have smooth bark from sunscald, drying, and borer attacks by wrapping them with special tree-wrapping crepe paper, Kraft wrapping paper of at least 40-pound weight, burlap, or other suitable material (Fig. 18). The trunks of trees with coarse or rough bark should be treated with DDT instead of being wrapped.

Fig. 18. Wrapping the trunks of newly planted trees protects the bark from excessive drying, sunscald, and borer injury (courtesy National Park Service).

Crepe paper reinforced with asphalt is effective in preventing borer injury. In addition to acting as a barrier, the wrapping reduces loss of water and thus prevents excessive drying of the bark. Dry bark is especially attractive to borers. As a general recommendation, keep the trees wrapped for two growing seasons or until they are growing vigorously. Remove the wrappings each spring and fall to examine the bark for insect injury. If borers are present, treatment is recommended.

Rolls of paper or burlap 3 to 8 inches wide are commonly used for spiral wrappings. Suitable widths are 3 or 4 inches for small trees, 5 or 6 inches for medium trees, and 7 or 8 inches for large trees. Burlap 4 inches wide and sewn on one edge makes a neater wrapping than unsewn or torn strips. Apply the wrapping material neatly. To wrap the trunk, start at the base of the branches and wrap spirally to the ground. Cover any bark exposed below the wrapping with soil. Secure the wrapping with raffia, string, or stout twine. The twine may be tied around the base of the wrapping with a slip knot and then wrapped, using spaced loops, as shown in Fig. 19.

FIG. 19. Tie twine securely on top of the wrapping paper to hold it in place.

or it may be wrapped spirally around the trunk in the opposite direction of the spiral of the wrapping paper. The twine is tied securely at the top of the wrapping. Examine the twine periodically and loosen it if this becomes necessary to avoid girdling the trunk.

Watering

Newly planted trees with limited root systems need an abundance of water during the growing season. Supply enough water to soak the soil around the roots at each watering, but do not water too often; allow the soil to dry sufficiently between waterings to provide adequate aeration for good root growth. A common practice is to soak the soil thoroughly every 7 to 10 days during prolonged dry periods in the growing season. Sandy soils require more water to maintain good tree growth than do loam or clay soils. You can get a rough idea of the amount of moisture present by squeezing a handful of the soil. Adequate moisture is available if the soil remains in a firm ball after it has been squeezed.

Water distribution will be more even throughout the root area if dikes, collars, or levees are made around the tree, as indicated in Fig. 12, beyond the edges of the original hole or beneath the tips of the branches, and holes are drilled to various levels in the soil within the dikes. Recently planted trees, and especially evergreens, also need an abundance of water before the ground freezes in the fall, to carry them through the winter months.

SETTING UP FARM RECORDS TO PROVIDE FOR ANALYSIS

1. What Do Records Tell About a Farm?
2. What Kinds of Analysis Measures are Needed?
3. Inventories and Depreciation Schedules
4. Records of Financial Transactions
5. Feed Records
6. Records of Production and Miscellaneous Items

Since farming is now a specialized business with large capital investments, analyzing records is more important than ever before. In this subject matter unit we will attempt to show the value of adequate records and how to set them up to provide for analysis measures.

Most of the illustrations can be used along with the Illinois Farm Record Book, made

available from the College of Agriculture, University of Illinois. A problem for use with the book is available from Vocational Agriculture Service and includes analysis measures, as well as material needed for making income and social security tax reports. The present unit will be concerned with analysis measures, rather than items needed only for tax reporting.

1. WHAT DO RECORDS TELL ABOUT A FARM?

This section will illustrate briefly what records can tell about a farm business. Fig. 1 shows 7 measures obtained from a 240-acre hog farm in a recent year. The measures were made possible by accurate and thorough record keeping.

Fig. 1 shows which items have a high rating on this farm and which have a medium or low rating. Production and income items were plotted upward from the center line of the chart if their values were higher than average. Expense items were plotted downward from center if the costs were higher than average so that a high cost item will have a low rating and a low cost item a high rating.

This farm rates considerably above average in returns to operator's labor, capital, and management and in value of farm production per man. Corn yields are somewhat above average. Returns per \$100 feed fed are average for hogs but below average for cattle. Labor and machinery costs per tillable acre are low; thus these items have a high rating.

These results give examples of strong and weak points of a farm's operations. With adequate records many other measures can be obtained; you need not consider all of them at this time.

Finding the strong and weak points is a major step toward bringing about improvement of any business. Knowing where the farm stands in relation to other farms does not give the details of exactly what to do to bring about improvement. However, a person thoroughly familiar with the farm's operation will usually have a good idea of the changes likely needed for improvement if he can tell just where the weak points exist.

The results in Fig. 1 indicate that this farmer should carefully study his cattle feeding operations and try to improve them. If he cannot bring about improvement in the next few years, he should probably put his feed and labor in another enterprise; at least he should consider alternatives to find whether they will increase his returns.

Several items may be responsible for the low rating for the cattle feeding operation.

V7 02259

Fig. 1. Comparison of results on a 240-acre hog farm with those on similar farms.

With only the preceding information at hand, each of the following may be responsible: low

feeding efficiency, high death losses, or purchase and sales prices out of line.

This farmer should also consider what he can do to bring returns per \$100 feed fed to hogs to a higher level. Perhaps he can increase his corn yield still more, even though that measure is above average at the present time. He has done a good job of keeping labor and machinery costs low. He will want to preserve his high rating for these items; however, additional expenses may be justified if they increase his income more than the added cost and if such an investment represents the best use of his available funds.

Record analysis thus makes it possible for a farmer to improve his business. Further study and budgeting will be necessary in order to get the full benefits. The analysis is made possible by keeping records carefully throughout the year after first setting up the record system properly. The next section will be concerned with classifying measures into major groups and the rest of the unit with setting up the record system to get such measures.

2. WHAT KINDS OF ANALYSIS MEASURES ARE NEEDED?

Section 1 showed some measures of comparison that can be obtained from complete and well-kept records. The record system must be set up properly if it is to provide the information that makes it possible to secure such measures. This section will classify the analysis measures into groups, give examples for each group, and tell why certain records need to be kept in order to obtain the measures. The kinds of measures discussed are: efficiency of crop and livestock production, costs per tillable acre, volume of business, and farm earnings.

Efficiency of crop production

The most commonly used measure of efficiency of crop production is yield per acre. This is a simple measure and does not require complicated records. However, you do need to know the total production and total number of acres of each crop. Production records are very important in this regard. Sometimes an inventory at the end of the year will help substantiate your estimate of production.

Efficiency of livestock production

Returns per \$100 feed fed is a very valuable measure of efficiency with livestock. To get this measure, you need to know two things: returns from each livestock enterprise and the value of feed fed to each kind of livestock. To find the livestock returns, you need to know the values of the beginning and ending inventories, as well as purchases, sales, and products consumed in the household. In order to find the value of feed fed to each kind of livestock, you will need to have some method of recording feed fed to hogs separately from feed fed to cattle, and so on.

Another measure is feed fed per 100 pounds of gain. To get this measure, you will need to know approximately the pounds of each feed fed to each kind of livestock and the total weight or other amount of livestock and livestock products produced during the year. To find the production for the year, you will need the approximate weights of animals in the beginning and ending inventories, of animals purchased and sold (and died), and the amounts of products used in the household.

Costs per tillable acre

An example of a cost item that can readily be calculated if adequate records are kept is machinery cost per tillable acre. Total machinery cost, as reflected in this measure, consists of: annual depreciation, repairs, gas and oil, machine hire, farm share of auto depreciation and operating expenses, and the farm share of electricity and telephone. A farmer also needs to know these amounts to make the proper deductions when he reports his income tax.

Labor cost per tillable acre is a measure which includes some costs that are not tax deductible. Besides including hired labor, a tax-deductible item, this measure also reflects the value of the operator's labor and unpaid family labor used in the farm business.

Volume of business

For a large livestock operation, you should know the hundred weight of pork or beef produced. To do so, you must keep careful account of the weight of livestock bought or sold. An accurate estimate of weights of animals in beginning and ending inventories is also needed. Whenever possible, enter the amounts of physical quantities, such as weight of livestock or bushels of grain, in your record book along with the dollar values.

Value of farm production per man can be found if you know total cash receipts and expenses, purchased livestock and feed, changes in inventories, value of products consumed, and the total months of labor.

Sometimes it is helpful to know the total value of land, labor, and capital going into the business annually. Besides cash operating expenses and depreciation, you also need the values of capital items, inventory items, and unpaid labor in making this calculation.

Farm earnings

You can get an idea of farm earnings from the net farm income figure of your completed income tax report. However, such a figure is not always the best measure of earnings to use when comparing your farm with averages for other farms.

When income tax is reported by the use of the cash method, net farm income may be higher during one year merely because a higher proportion of the corn and soybean crops has been sold and ending inventories are lower than usual. Net farm income may not be a good indication of how well the total farm business is managed because of such differences as ownership, rental rates, and interest payments on borrowed money.

A farmer usually earns money from three sources: his labor, his management, and his capital investment. The returns from his capital investment include returns from land if the farmer owns a part of his land.

In analyzing records we get such measures as management returns, labor and management earnings, and capital and management earnings. If we divide the latter item by the total farm investment, we can also find the rate earned on investment. In order to get these measures, we need to place a value on inventory and capital items and unpaid labor.

3. INVENTORIES AND DEPRECIATION SCHEDULES

In Section 1 we mentioned that inventories and depreciation schedules are necessary to find measures of livestock efficiency, costs per tillable acre, volume of business, and farm earnings.

Using inventories in analysis

A complete inventory account includes 4 parts: beginning inventory, purchases, sales, and ending inventory. Table 1 shows an arrangement of these parts that will be a help later when the records are analyzed; keeping this arrangement in mind while entering records will simplify the job at the end of the year.

The Illinois Farm Record Book does not provide for recording items in such an arrangement. Beginning and ending inventories are recorded in Part II of the book; purchases and sales are recorded in Part I. By reading carefully the column headings in the record book, you can find where to record these items.

When the records are summarized and analyzed, livestock product sales and the value of products used in the household should be added to the sales of livestock. Wool is recorded along with the sale of sheep; sales

Table 1. Inventory Accounts

Item	Beginning inventory	Purchases	Sales	Ending inventory
Feed, grain, & seeds				
Beef cattle				
Dairy cattle				
Hogs				
Poultry				
Sheep				

of eggs and dairy products are recorded on separate pages. Sales of livestock products are usually considered to be in cash accounts but need to be combined with sales of inventory items for analysis purposes. The value of home-raised products used in the household is recorded on a separate page near the end of Part I.

The actual taking of inventories at the beginning and end of the year is included in VAS 2008a, Record Keeping on the Farm. The beginning inventories should be taken promptly at the start of the year before any financial transactions are recorded. The beginning-of-year values will, of course, be the same as the end-of-year values for the preceding year.

Using depreciation schedules in analysis

Depreciation schedules are kept in connection with capital accounts. A complete capital account includes parts which in general correspond to those of the inventory accounts:

remaining cost at beginning of year, depreciation, remaining cost at end of year, purchases, and sales. Depreciation is a book-keeping method of spreading the cost of a capital item over its useful life. For items on hand at the beginning and end of the year, it corresponds to the differences between the remaining cost at the beginning and end of year. Table 2 shows the various parts of the capital accounts, including depreciation.

Filling in depreciation schedules is discussed in VAS 2008a, Record Keeping on the Farm. As was true for inventories, the beginning-of-year values should be entered before any of the financial transactions. Here again, the beginning-of-year values are the same as the end-of-year values for the preceding year.

For capital accounts, the beginning and end-of-year remaining costs and the annual depreciation are recorded in Part II of the Illinois Farm Record Book; purchases and sales are recorded in Part I.

Table 2. Capital Accounts, Including Depreciation

Item	Remaining cost beginning of year	Depreciation	Remaining cost end of year	Purchases	Sales
Machinery and equipment					
Auto (farm share)					
Soil improvements					
Farm improvements					

4. RECORDS OF FINANCIAL TRANSACTIONS

A major portion of record keeping consists of recording the financial transactions as they occur throughout the year. The main

job to be done at the time of setting up the records is to study the record book so you will know where to make the entries.

Points to remember

Physical quantities, as well as the dollar values, should be entered whenever possible. Always enter number, bushels, pounds, or tons whenever these items are known.

For the purpose of record analysis, all sales made during the year should be included for that year even though payment is not received until a later date. All farm expenses incurred should be included, regardless of whether or not payment has been made by the end of the year. Of course, if you report income tax on the cash basis, you will need to indicate in your record book the expense items not paid by the end of the year and the receipt items for which payment has not been received.

Always enter as sales the value of farm products traded for merchandise. Enter in the record book the full price of capital items purchased on time.

Receipts and expenses

Most receipt items are entered in the separate section for receipts in Part I of the Illinois Farm Record Book. Check the book carefully to find which columns to use.

Notice the instructions given for entering sales of purchased feeder livestock. The column you use will probably depend on whether you use the cash or accrual method of reporting income tax. Sales of breeding or dairy stock are entered in a special column under either method. Differences in entries for the sale of livestock are due chiefly to tax considerations; if the record were used only for analysis purposes, all sales of beef could be entered in a "beef sales" column, all sales of hogs in a "hog sales" column, and so on.

Most cash expenses are entered in the expense section in Part I. However, cash wages paid to hired labor, social security tax withheld from wages, products furnished to workers, and insurance on workers are recorded in a "hired labor" section. Each of these items is a part of the total cost of hired labor.

Most receipt and expense items are entered in two columns; one is a column for entering totals and the other is a classifying column. It is important to make entries in each of these two spaces as an aid in cross-checking totals at the end of the year.

5. FEED RECORDS

Some measures of feed efficiency were discussed in Section 1. These measures depend on a reasonably accurate record of feed fed to each kind of livestock. If you take inventories and estimate grain production accurately, the job of getting suitable feed records will be simplified. If you have more than one kind of livestock, you should work out a system that provides records of feed fed to each kind.

Getting accurate feed records

An accurate estimate of the bushels of corn and oats produced and amounts in beginning and ending inventories is very helpful as a check on the amount of feed fed. A simple method of determining the bushels of small grains or shelled corn on hand is to find the number of cubic feet and divide by $1\frac{1}{4}$ cubic feet per bushel. To find the bushels of ear corn, divide the cubic feet by $2\frac{1}{2}$.

The tons of roughage on hand can also be estimated by first determining the volume.

For baled hay, find the number of cubic feet and divide by 150 or 200 cubic feet per ton, depending on the tightness of baling and stacking. For example, hay tightly baled and stacked covers an area 16 feet long and 10 feet wide. The bales are stacked 5 feet high. The total volume is 800 cubic feet ($16 \times 10 \times 5$). The number of tons is 5.3 ($800 \div 150$).

The tons of tractor-packed silage in a trench or bunker silo can be estimated by dividing the volume in cubic feet by 57 cubic feet per ton for corn silage, or 50 for grass silage. Since the width at the top may be greater than at the bottom, you will want to use the average width in finding the number of cubic feet.

Various tables give the capacities of round silos. A portion of such a table that assumes average contents of moisture and grain and a settling period of a month or more is shown in the following:

Depth of silage in feet	Inside diameter in feet			
	14 (tons)	16 (tons)	18 (tons)	20 (tons)
10	27	35	44	55
14	39	51	64	80
18	51	67	85	105
22	64	84	106	130
26	77	100	127	157
30	90	118	149	184

Silage at the bottom of a silo is more densely packed than at the top. You can estimate the tons removed by subtracting the tonnage corresponding to the depth at the end of the year from that before any silage was fed. Example: An upright silo 16 feet in diameter held silage to a depth of 30 feet before feeding began. At the end of the year the silage was 14 feet deep. How much remained in inventory and how much was fed? The estimated weight of silage 30 feet deep is 118 tons; that of silage 14 feet deep in a silo that is 16 feet in diameter is 51 tons: The amount in the ending inventory (or beginning inventory for the next year) is therefore 51 tons; the amount fed was 67 tons.

Purchased feed should be accurately entered in the record book at the time of purchase. Be sure to include the volume in pounds, bushels, or tons along with the price. Also list the kind of livestock that will consume the feed if known, particularly for protein supplement.

You can get a rough estimate, or at least make a check, of each feed fed during the year by the following method: First add the amounts for ending inventory, the year's production, and sales. Then subtract the amounts for beginning inventory and purchases. The resulting figure should be the amount fed, adjusted for any shrinkage or overrun. That estimate of feed fed can be checked against periodic records you keep of amounts fed. Your accuracy in keeping records of beginning and ending inventories and production will therefore be very important in determining the usefulness of your records toward providing figures from which you can get measures of feeding efficiency.

Feed allocation records

If only one kind of livestock is fed, the job of keeping feed records is fairly simple. When more than one kind of livestock is fed,

you will need to know the amounts of feed fed to each kind.

Table 3 can be a help for periodically recording the feed fed to the various classes of livestock. You will need one form similar to Table 3 for each kind of livestock fed.

You will need to record periodically the feed fed to each kind of livestock. It is suggested that the recording be done each month; however, variations are permissible as long as all the feed is accurately recorded.

Where facilities permit weighing the feed, that practice will, of course, provide for greatest accuracy. In the absence of such facilities, the estimate should be made by the use of the best alternative. Alternative methods might be feeding from separate bins or estimating the amount for cattle on the basis of pounds fed per head per day. Checks should be made against inventories, production, and purchases as suggested in the first portion of this section.

The amounts of commercial feeds purchased can be obtained directly from the financial entry in the expense section of the record book. The same may also be true for other feeds purchased. Use the actual price paid for commercial feed; an average price for grains (both raised and purchased) will provide simplification.

The number of pasture days can be estimated by several methods. One method is to multiply the carrying capacity per acre of pasture (example: 175 pasture days per acre of alfalfa) times the number of acres consumed by the livestock. This method is commonly used for estimating the pasture days for hogs. Another method is to multiply the number of animal units by the calendar days on pasture. An animal unit equals 1 cow or mature bull, 1 1/2 yearling cattle, 1000 pounds of feeder cattle, 2 weaned calves, 15 pigs, 5 mature sheep, or 10 weaned lambs.

Pasture value can also be figured on the basis of cash rental value or value as hay minus harvesting cost; however, the number of pasture days is not provided directly by the latter methods.

6. RECORDS OF PRODUCTION AND MISCELLANEOUS ITEMS

Production records are very useful in record analysis. They are important from the standpoint of studying the efficiency of the entire farm business, as well as efficiency of crop and livestock production.

Crop production

The Illinois Farm Record Book provides a page for recording acreage, yield, and total production of each crop. Familiarize yourself with this portion of the book so you will know where to record these items as they become known during the year.

After each crop is planted, you will want to record the acreage planted. A farm map can be helpful in this respect. If the acreage harvested differs from the acreage planted, be sure to record these differences. As soon as bushels or tons harvested are known, record these items in the record book.

The tenant's share of crop acres, expressed as a percentage of total crop acres, may roughly reflect his share of the total value of production. Fig. 4 shows a situation where

a tenant receives 50 percent of the corn crop and 60 percent of the soybean and wheat crops. In terms of acres, his share of production is 54.3 percent.

The value of production for the tenant's share as shown in his records, for example, is \$12,000. Dividing the value of production by 54.3 percent gives a figure of \$22,100. The latter figure is a rough estimate of the value of production for the entire farm.

Determining your share of crop acres when the records are set up, or when the crops are planted, will simplify the job of finding the total value of production for the farm at the end of the year.

Livestock production

Only a limited amount of space is provided in the Illinois Farm Record Book for production records for livestock.

Some farmers keep special detailed records of production as members of livestock improvement associations, such as for dairy

(8)

Setting Up Farm Records to Provide for Analysis

Table 4. Crop Acreage and Summary of Operator's Share

Crop	Acres owned	Acres cash rented	Acres share rented				Total	Operator's share

Tenant's share (%)								54.3%

or swine enterprises. These records generally include such items as total production on an individual animal basis, weights at various ages, rate of gain, breeding records, and loss records. These records can be very valuable for longtime improvement of the breeding herd. Farmers who do not belong to livestock improvement associations also need records of some of these items as an aid in analysis at the end of the year.

and loss records have been devised. Usually the very minimum consists of breeding records and number of animals born, weaned, and died. Table 5 provides a method of keeping simple production records and Table 6 serves as a means for recording losses of livestock. Records of the amounts of eggs and milk sold should be kept in addition to the dollar value of such sales. When livestock products used in the household are added to amounts sold, the total production of livestock products can be estimated.

THE PLANTER — SELECTION, ADJUSTMENT, MAINTENANCE, AND USE.

ED013339

1. What Should I Consider When Selecting a Planter?
2. How Can I Understand the Operation of a Planter?
3. What Is the Proper Way to Adjust a Planter?
4. How Should I Use a Planter?
5. How Should I Maintain a Planter?
6. What Are Some Practical Applications?

Compared to the plow, the planter is a recent invention. Recorded history indicates that man used simple plows thousands of years before Christ's birth, but the first planter patent in the United States was issued in 1839. The Indians dug a hole for a dead fish and then planted some kernels of corn. They were practicing minimum tillage with starter fertilizer according to the terms that we use today. Planters have had many design improvements since that time.

If we ask a modern farmer what he expects a planter to do for him, he will promptly list some of the following functions: plant the seed accurately at high speed, at uniform depth, and at different row spacings; apply starter fertilizer, herbicides, and insecticides; and plant more than one crop.

The farmer, in turn, must understand

how the planter works if it is to perform all of the functions he expects from it. He must know how to adjust and use it properly and safely and how to maintain it if it is to serve him for a long period of time.

The purpose of this unit is to give some general information on the selection, operation, adjustment, use, and maintenance of modern planters. More complete information on each type of planter is provided in the operator's manual for that implement. Study it carefully for your planter. A "Corn Planter Information Sheet" is included at the end of this unit to provide a systematic approach to the understanding of the operation and adjustment of each type of planter. Suggested laboratory exercises are also included to provide additional information in the form of practical experience.

1. WHAT SHOULD I CONSIDER WHEN SELECTING A PLANTER?

A planter is designed primarily to plant accurately so you can get a plant population to match the fertility level and potential moisture level of the soil. There are also additional attachments available for the planter just as additional accessories are available for the modern tractor or automobile. When purchasing a planter, there are several questions that should be answered if the planter is to fit your needs.

What types of planters are available?

Planters today can be roughly divided into two kinds - drill planters and hill-drop planters.

Drill planters consist of a seed hopper, a metering mechanism, a seed tube to guide the seed to the soil, a furrow opener, and some device for covering the seed (Fig. 1). The design of the hopper and boot of this planter permits the seed to fall directly from the cell of the seed plate to the ground. The spacing of individual seeds is determined by the relation of the seed plate speed to the ground speed. Drill planters are simpler, less expensive, and easier to operate than hill-drop planters.

Hill-drop planters consist of a seed hopper,

Fig. 1. These drill-planter units are mounted on a tool bar. Hill drop planting cannot be done with this planter since the units do not have valves. Drill planting makes a more uniform load on the harvesting equipment.

a metering mechanism, and a valve system to collect the metered kernels and plant them closely grouped in a hill (Fig. 2). They also have a furrow opener and some device for covering the seed. Most hill-drop planters can be made to drill but drill planters cannot be made to hill-drop. Some hill-drop planters can also be used to check corn if a check-row attachment is available.

Check-row planters require valves in the seed tubes and use a wire with evenly spaced knots or buttons to trip the valves to place the seed in uniformly spaced hills in the row (Fig. 3). However, only a very small percentage of

Fig. 2. This planter can hill-drop several kernels in a hill by using a valve mechanism. It can also be changed to drill planting. Some farmers feel that hill-dropped corn will emerge better under crusty conditions and will be less susceptible to wind damage.

Fig. 3. This planter, equipped with a check-row wire and check attachment, can be used to drill, hill-drop, and check corn.

the corn is checked today. The chief advantage of check planting corn was to permit cross cultivation. Since these planters have such a limited application, the choice for most farmers lies between a drill planter and a hill-drop planter without the check-row attachment.

What type of mountings are available?

There are several choices of mounting for the planter units:

Trailing planters are independent implements that are towed behind the tractor or behind tillage equipment. They may or may not carry fertilizer attachments or herbicide and insecticide applicators. They can be readily detached from the tractor and easily moved from one field to another or changed from one tractor to another. If field conditions permit, these planters can be ganged together with a squadron hitch for eight- or twelve-row planting at one time (Fig. 4).

Mounted planters may be either rear

Fig. 4. For large operations, a squadron hitch permits one operator to plant with two four-row planters at one time.

Describe _____

Source (agency) _____
 (address) _____

mounted or front mounted. This depends on the type of tool bar used and whether or not the equipment is available from the manufacturer. Mounted planters have several advantages over trailing planters. One is the ease with which the row-spacing can be changed. Another is economy - the individual planter units, purchased separately, usually cost less than a trailing planter. The tool bar may thus be used for tillage, planting, and cultivation. The fertilizer units can be used to apply starter fertilizer at planting time and side-dressed fertilizer at cultivating time. The advantage of this economy must be weighed against some inconvenience and lost time in a busy season. Farmers who plant corn and soybeans may need to cultivate the corn before all of the soybeans are planted. The planter units must be removed and the cultivators installed, then the process reversed again in order to plant, cultivate, and then plant.

Front mounted planters permit good observation of the planting units making it easy to check their operation. Front mounted planters can be used on cultivator bars for four- and six-row planting. The addition of caster wheels on the outer ends of the bars will also permit eight-row planting and cultivating, but these wide sweeping units present problems with flexibility. Many of the bars need reinforcing and there are some problems with folding markers. However, the biggest objection to front-mounted planters is that the tractor is essentially tied up with equipment and it can not be easily detached in order to use the tractor for a day or two for plowing, disking, or harrowing.

Rear mounted planters may also be mounted on a tool bar or a cultivator bar just as front-mounted planters. However, visibility is more difficult with rear mounted units and the additional weight on the back of the tractor may make it necessary to counter balance the planter with fertilizer tanks or weights on the front of the tractor. Most rear-mounted planters can be attached by the three-point hitch or fast-hitch mountings (Fig. 5).

Size of planter

The size of planter will vary with each farmer's own situation. The spring planting season is usually a hurried one and with large acreages to plant, there is always an urgent

Fig. 5. This planter, consisting of unit planters mounted on a tool bar, can be quickly detached from the three-point hitch of the tractor.

need to plant as many acres as possible in a short time. Experimental results indicate an optimum time to plant corn from a yield standpoint. Yields of corn planted on these dates were 15 bushels higher than corn planted two weeks earlier and 31 bushels higher than corn planted two weeks later. The anxiety caused by a late season makes a 6-row or 8-row planter more appealing. However, comparisons of the planting capacity of four- and six-row planters, traveling at the same speed, will show about 30% to 35% increase rather than a 50% increase that might be expected for a 6-row planter over a 4-row. Increased coverage can be secured by using a 2-planter hitch with two 4-row planters. At the present time the choice of trailing planters is between standard two-, four-, and six-row planters, and narrow-row four-, six-, and eight-row planters.

The standard 40-inch row spacing that has survived since the days of farming with horses may soon disappear. Recent experimental results with various row spacings for corn and soybeans indicate definite yield increases for soybeans planted in narrow rows but less consistent increases for corn planted in narrow rows.

Changing equipment, however, to plant, cultivate, and harvest narrow-row crops is a complicated and expensive process (Fig. 6). If corn and soybeans are not planted at the same row widths, there will be considerable time spent changing cultivators and planters to fit the different row widths. Chemical weed control may partially solve this problem. If

Fig. 6. Changing to narrow rows may require the purchasing of a picker that can accommodate narrow rows or hiring the corn picked by custom pickers as shown here.

corn is planted in narrow rows, then the conventional pickers or picker attachments for combines will no longer fit and these may also have to be replaced.

Should minimum tillage planting equipment be considered?

There are several benefits associated with minimum tillage planting. (1) There are fewer operations to compact the soil. (2) There is less water runoff and reduced soil erosion because rough loose soil absorbs moisture quickly. This is less important on level fields than on hilly or rolling land. (3) Weed control problems are reduced because the corn can get a head start on the weeds since no seedbed is prepared except in the rows. (4) The number of field operations is reduced so labor and fuel costs are reduced. If you are interested in planting with minimum tillage, there are a number of systems available with planters to fit each system.

Wheel-track planters. Several manufacturers offer wheel-track planters that enable you to plant directly in a plowed field with no other tillage operation. This may be in soil that has been firmed by the tractor wheels or the packer wheels of the hitch (Fig. 7). The soil in the seed row has been firmed and freed of clods and air spaces while the inter-row is left open to catch water and rough enough to reduce weed competition. Some wheel-track planters may be used for conventional planting as well. The tractor wheel widths must usually be modified to match the double-row spacings. Since this system is usually practiced on spring plowing, it tends

Fig. 7. The tractor wheels are spaced to serve as packer wheels for the first and third rows. Special packer wheels serve to compress the seed zone for the second and fourth rows.

to concentrate the plowing workload to a short period of time. Fig. 8 shows a wheel-track planter hitch that actually carries the weight of the planter on the packer wheels of the hitch.

Strip tillage can be used with fall or early spring plowing (Fig. 9). A modified cultivator is used as a tillage machine and soil in the row

Fig. 8. The planter wheels are removed and the planter is suspended from the wheel-track planter hitch.

Fig. 9. This farmer has combined a row-crop cultivator with a corn planter to save tillage operations in a spring-plowed field.

is leveled by the rotary-hoe tines (Fig. 10). These units utilize a conventional pull-type 4-row planter towed behind a tractor equipped with tillage units on the cultivator tool bars. Unit planters mounted on a tool bar may be used instead of the trailing planter. Present cultivating equipment can be utilized with this system.

Mulch tillage consists of planting directly on soybean stubble or corn ground. The planter is pulled behind a field cultivator, chisel plow, or a mounted tool-bar cultivator (Fig. 11). The planters are usually equipped with spring teeth to push aside clods and mulch a 10-inch wide seedbed in front of each planting unit. Disk coverers will assure positive covering of the seed in rough conditions.

What type of seeding mechanisms are available?

Accurate planting of seed has more to do with producing maximum yields than any other single mechanical factor connected with grow-

Fig. 10. These tillage units use a sweep, disk hillers, and rotary-hoe wheels to prepare a strip for planting with a conventional planter.

Fig. 11. The planter, equipped with a tillage attachment to mulch a 10-inch seed bed, is shown behind a field cultivator.

ing the crop. If more seed is planted than the soil-fertility level will support, many weak plants and barren stalks will develop. If the seed population is too low, tillage, planting, cultivating, and harvesting time is wasted and the opportunity to get maximum returns from the investment in land and labor is reduced.

A few years ago, we relied on gravity to drop the seed from the level of the seed plate to the soil. As planting speed increased, changes were necessary in valve mechanisms to trap the kernels into clusters for hill-drop planting. At the present time, four types of seeding mechanisms are available.

Double-valve system. The valves have deep, "V"-shaped pockets to eliminate seed bounce and scattering of the hills. An upper valve collects the seed as it drops from the seed plate and a lower valve catches the seed dropped from the upper valve (Fig. 12). On the next opening of the valves, the lower valve ejects the seed rearward to compensate for the forward movement of the planter and the seed in the upper valve drops to the lower valve. These planters should not be operated over six miles per hour. The travel speed depends on the hill spacing desired and seed population desired.

Chain flight and valve. One planter uses the flights of a chain to carry the kernels to the lower valve (Fig. 13). This gives positive control of the seeds and virtually eliminates problems of seed bounce.

Drill planters have an open tube that allows the seeds to fall by gravity to the furrow.

Fig. 12. The seeds drop from seed plate A and are collected in upper valve B. When the valves open, the seeds collected in B are dropped to lower valve C. On the next opening of the valves, the seeds in the lower valve are dropped in the row while the seeds dropped by the upper valve are caught in the lower valve.

Fig. 13. The flights on the chain carry the kernels from the seed plate to the bottom of the boot where they are deposited in the soil. Each flight of the chain carries the entire hill of seed.

Rotary valves provide a continuous-controlled flow of individual kernels or groups of kernels from the hopper to the soil. The cam action of the impeller wheel opens the valve and ejects the kernel or groups of kernels into the furrow to give evenly spaced hills and closely grouped kernels in the hill (Fig. 14).

Fig. 14. The ejector lugs A, mounted on the rim of the rotor, catch the kernels discharged through spout B and carry them down where they are closely grouped at G. Kernels that reach point G ahead of the ejector lug are held there to prevent dribbling between the hills. The grouped kernels D are ejected directly into the trench made by the runner opener. The valve can be easily cleaned by removing pin F and cover plate E. Pin H must be in position against the spring to hold the valve in contact with the rotor.

VAS 3021

Which fertilizer applicator should be purchased?

The type of fertilizer applicators to purchase should be based on several factors. The kind of service available to the farmer by the fertilizer dealer is perhaps the most important one. Liquid fertilizer is often easier to handle than the dry types because the planter tanks can be pumped full or filled by gravity flow from a supply tank. This advantage must be weighed against a slightly higher cost per pound of plant nutrients in the liquid form. In some areas there is a more limited range of analysis available in liquid fertilizers than in dry. There is no appreciable difference between liquid and dry fertilizer as far as performance, leaching, or danger in handling is concerned.

Liquid fertilizer is metered by gravity flow under a constant head through an orifice in a given period of time so the planter must always travel at the same selected speed. If it travels faster, the application will be lighter than expected. If planting speed is slowed down, the rate of application will be heavier than calibrated.

Dry fertilizer is metered to the distance traveled and variations in speed will have little effect on the rate of application.

Type of seed hoppers

Most manufacturers offer a choice of seed hoppers to the buyer. Large capacity hoppers, holding up to 70 pounds of seed, reduce stops and cut down refill time. Transparent hoppers (Fig. 15) or those equipped with float-type seed gauges give a quick visual

Fig. 15. This planter is equipped with transparent hoppers. Either a transparent hopper or a floating seed gauge gives some indication of the rate at which each unit is planting.

check on the amount of seed in each hopper. This is also an indication that all units are planting seed at the same rate.

Types of seed plates

The selection of the correct seed plates is one of the most important decisions that must be made in the selection of planting equipment. The plates need to be checked every planting season for the grades and varieties used that year to be certain they are properly matched. It is often necessary to select different plates for the same variety of seed from year to year. Single cross seed is becoming more and more popular. This seed has greater irregularities in size and shape than conventional double-cross seed. For single-cross seed proper plate match is doubly important. As planting speed increases so do the chances for inaccurate planting because the plate cells have less time to fill and discharge the seed. Check the instruction book for the correct travel speed for a given plant population.

There are at least three ways to select seed plates. The best method is to select seed plates based on their performance in a test in the barnyard or driveway with the planter operating at the speed at which planting is to be done. Another method is to take a sample of the seed corn and plates to the dealer and check the seed against the plate in a seed-plate selector stand. Be sure the seed-plate tester is operated at a speed that corresponds to the actual seed plate speed when planting. The third and probably least reliable method is to follow the recommendations on the tag of the sack of seed.

Seed plates should be purchased as a full set (four plates for a four-row planter) rather than just replacing a worn or broken one. A set is more likely to give uniform planting rates among the rows. In the past, there has been some justifiable criticism of plastic seed plates but they do have some advantages. They are less expensive and quality control or uniformity among plates is better than with cast-iron plates; plastic plates are less likely to warp; and they are more accurate at high speeds because there is less reduction in cell fill due to increased speed.

Once you are in the field, spot check the

planting rate as you change varieties and the corresponding plates. Many fields of corn have been underplanted or overplanted because the operator used the wrong size plates for the grade of corn.

The faster the planter is operated, the faster the seed plate revolves. At faster planting speeds, it may be necessary to use seed plates with slightly longer cell length to obtain proper cell fill for the planting rate desired. With a 24-cell seed plate, there is better cell fill at the same planting speed because the plate revolves slower for the same seed rate. In general it is better to use a 24-cell seed plate for hill-drop or drill planting. The 24-cell plate is the same diameter as the 16-cell plate but has eight more seed cells available for filling at any one time. With this plate, you can normally expect 30% to 40% faster travel speed for a given planting rate.

The addition of a tablespoonful of powdered graphite to each hopper full of seed corn will help improve cell fill.

Many companies provide edge drop (Fig. 16), flat drop (Fig. 17), and hill-drop plates (Fig. 18). Over one-hundred different plates

Fig. 16. An edge-drop plate is used to plant graded seed. With this type plate, one seed stands on edge in each cell. Edge-drop plates take maximum advantage of accurate seed selection.

Fig. 17. A filler ring is required with a flat drop plate. It is best suited for flat kernels.

Fig. 18. A hill-drop plate has larger cells, so several seeds are gathered in each to plant an entire hill. These plates are adapted for hill dropping of poorly graded corn, irregularly shaped seed, and hybrid butt and tip kernels.

are available for some planters including plates for round kernels of corn, soybeans, and a variety of other crops.

What other special equipment is available?

In addition to the basic planter, there are accessories that make the planter function more effectively under certain conditions.

Gauge shoes are mounted on the planter runners to give a more uniform planting depth in extremely loose soil. They add flotation to the planter runners. They are adjustable up and down on the runner for deeper or shallower planting (Fig. 19).

Trash kickers are installed on planters that will be operated in fields with small stones or trash. They run directly in front of the planter runners and push aside small stones and trash (Fig. 20).

Fig. 19. Gauge shoes are mounted on the planter runners and can be adjusted for different depths.

Fig. 20. Trash kickers are mounted on the front of the planter runner.

VAS 3(7)

Multi-luber system or built-in lubricating system consists of a reservoir, pump, and outlets for greasing the planter (Fig. 21).

Press wheel scrapers keep the wheels clean if soil has a tendency to stick to the wheels (Fig. 22). These scrapers are not intended for use with the zero pressure press wheel tires.

Press wheel bands give a more compact seedbed when they are installed between the

Fig. 21. Multi-luber systems make lubrication of the planter a quick and easy process.

Fig. 22. Press-wheel scrapers clean the press wheels and prevent sticking soil from accumulating. They should be adjusted by the bolts (1) to bear lightly against the wheel (2).

rims of the open centered press wheels (Fig. 23). The overlap joints must be fitted so they prevent the press wheel scrapers from catching in them.

Press wheel tires. Zero pressure tires are designed to fit over the steel press wheels (Fig. 24). The flexing action of the semi-pneumatic rubber tires sheds the soil and keeps the wheels cleaner. No scrapers are used with tires.

Fig. 23. Press-wheel bands are used to convert open-center press wheels to solid-center wheels.

Fig. 24. Press-wheel tires can be smooth or cleated as shown.

Disc furrowing attachments (Fig. 25) permit uniform planting depth in rough seed-beds. The seed is placed deeper in moist firm soil. The distance from the bottom of the disk blades to the bottom of the runner heel is the depth of planting (Fig. 26). They can be adjusted for various depths.

Fig. 25. Disk furrowing attachments E are recommended with minimum tillage planting. They are mounted on both sides of the runners.

Fig. 26. This shows the relationship of the disk furrowers to the planted seed.

Covering attachments may be of the blade or disk type (Fig. 27). A pair of right and left units may be used with each row unit or one to each row unit if desired.

Seed firming wheels run directly behind the planter runners and press the seed against the moist soil in the bottom of the runner furrows (Fig. 28). If they are operated in moist soil, there may be clogging problems.

Minimum tillage attachment decreases tillage operations prior to planting (Fig. 29). It pushes clods aside, eliminates air pockets, and mulches the soil. It prepares a band of soil approximately 10 inches wide in front of the furrow opener.

Fig. 27. The blade covering attachment A or the disk covering attachment B is used for more positive covering, especially when planting shallow. 1 shows mounting locations. The depth is adjusted at 2 and the pressure at 3.

Fig. 28. Seed firming wheels are attached behind the planter runners.

Fig. 29. Minimum tillage attachments are mounted directly in front of the furrow openers.

Disk furrow openers are mounted on the front of the runners (Fig. 30).

Disk markers. For rough or trashy fields, disk markers are sometimes preferred instead of regular markers (Fig. 31).

Soil incorporation equipment. An additional accessory that seems to pay dividends under certain conditions is some device for incorporating herbicides and insecticides into

Fig. 30. These openers work well in trashy or stony fields, because the disks cut through or roll over obstructions.

Fig. 31. Disk markers roll over rough soil.

the soil (Fig. 32). Some chemicals are volatile and tend to dissipate when exposed on the surface. Others are susceptible to sunlight and break down if left on the surface. More uniform control is likely if the pesticides are incorporated because chemical activation is accelerated due to placement in moist soil. In dry periods some pesticides never function because they need moisture to become effective. Surface application confines them to dry soil which limits their effectiveness. With soil incorporation equipment the erosion losses are likely to be lower.

Fig. 32. The perforated roller mixes the herbicide with the soil.

2. HOW CAN I UNDERSTAND THE OPERATION OF A PLANTER?

Most farmers want the following operating features in a corn planter: 1) Be as simple to operate as possible and still meet the requirements of a modern planter. 2) Plant accurately at a uniform depth and be easily adjusted to different planting rates and planting depths. 3) Be able to operate for a sustained period at speeds up to 6 or 7 miles per hour. 4) Be easy to change from one crop to another and from drill to hill-drop planting. 5) Have the capacity to plant seed for high plant populations with starter fertilizer without frequent stops for refilling. 6) Have the strength to carry the seed, fertilizer, and pesticides without bending the frame or damaging the planter in other ways.

You must understand how the planter operates if you are to adjust, use, and maintain

it properly. The best way to gain this understanding is to carefully study the planter and the operator's manual. It may help to block up the planter and turn the wheels by hand.

WHAT ARE THE MAJOR PARTS OF A PLANTER?

Hitch

The hitch on a trailing planter is usually equipped with some clevis adjustment so the seed plates in the planter can operate level (Fig. 33). If the planter is hitched high, it tends to drag the planting units down and places undue strain on them. Also, the depth of planting may be affected by the height of the planter hitch.

Fig. 33. The adjusting holes for the hitch are shown here.

Power lift

The power lift on a planter may be a ground drive power lift or a hydraulic lift (Fig. 34).

Fig. 34. Hydraulic-lift planters are most prevalent, although ground driven power-lift planters can be purchased.

Frame

The frame of the planter must be strong enough to carry the load of seed and fertilizer. Some planters have transport wheels welded in place. Others are movable so the planting units may be adjusted to various row spacings from 28 to 40-inch rows. Some planter frames can be equipped with dual wheels for better flotation in soft soil (Fig. 35).

Planter units

The planter units consist of a frame, boot or valve case, seed hopper, hopper bottom, seed plate, runner, and press wheel (Fig. 36).

Fig. 35. The dual wheels provide better stability in soil where flotation is a problem.

Fig. 36. This illustration shows a row planting unit for a planter.

WHAT IS THE CORRECT IDENTIFICATION OF ALL PLANTER PARTS?

Study the planter and the operator's manual and learn to identify the parts. Be able to identify such parts as these:

- | | |
|----------------------------|-------------------|
| Hitch | Rotary valve |
| Power lift | Ejector lugs |
| Transport link | Accumulator plate |
| Transport wheels | |
| Main frame | Boot |
| Clutch | Upper valve |
| Marker | Lower valve |
| Drive chain | Gear case |
| Runner | Shift lever |
| Pressure rods | Drive sprockets |
| Press wheel | Drill shaft |
| Fertilizer hoppers (tanks) | Striker |

Fertilizer opener
 Disk opener
 Disk furrower
 Insecticide attachment
 Herbicide attachment

Seed hopper
 Cut-off pawls
 Seed plate
 Knock-out pawl
 Chain flight valve

HOW DOES THE PLANTING MECHANISM OPERATE?

Seed metering

The function of the seed metering assembly is to deliver an accurate number of seeds to the boot at the correct rate or at correctly spaced intervals.

Hopper bottom

The hopper bottom is cone shaped to feed the seed to the cells on the outer edge of the seed plate (Fig. 37). Lowering the planter engages the seed plate drive by the planter wheels. Seeds drop into the cells in the seed plate before the cells pass under a cut-off pawl that prevents more than one seed from entering the planting chamber at a time (Fig. 38). These cut-off pawls should be aggressive enough to prevent more than one seed from entering each cell. The cut-off pawls should not be aggressive enough to crack seeds. Inspect them to see that they operate freely.

Fig. 37. The conical hopper bottom forces the seed against the seed plate.

Fig. 38. As the seed plates rotate, the seeds drop into the cells. The cut-off pawls dislodge any seeds caught sideways in the cells. The knock-out pawl helps push the seed out of the cell.

As the cell in the seed plate turns over the hole in the hopper bottom, the seed drops from the cell through the passage. The knock-out pawl assists the seed out of the cell (Fig. 39). The empty cell passes out of the seed chamber under the gate on the rear side of the pawl cap. The gate is free to move up and down which allows loose seed or trash to move out of the chamber back into the seed can. The design of the gate prevents any seeds from entering the seed chamber from the back side.

Hill-drop planting

Two-stage valve. Some models of planters have an upper valve and a lower valve in the seed tube. The seeds are first held in the upper valve where they are retained in the "V" or upper pocket (Fig. 40). When a hill of two or three or four seeds, according

Fig. 39. The roller knock-out pawl may be assembled with the roller rim either toward the edge as in A, or toward the center as in B. Set the roller as in B for deep-cell plates.

Fig. 40. The seeds that have dropped from the planting chamber through the hole in the hopper bottom plate are retained in upper valve B. The valves are tripped simultaneously by pull rod A. The lower valve C catches the seeds released by upper valve B.

to the position of the selector lever, is collected in the upper valve, the valves are tripped and the seeds drop down the tube to the lower valve. Both valves open and close simultaneously during the cycle of operation. The lower valve closes and catches the seeds released by the upper valve. The rotating seed plate replaces the seeds in the upper valve. When the pull rod opens the valves again, the seeds held by the lower valve are deposited into the furrow prepared by the runner and opener.

Rotary valve. On one rotary-valve planter, the kernels drop from the seed plate to an accumulator plate (Fig. 41). This plate groups the kernels by twos or threes depending whether

Fig. 41. This accumulator plate has eight large notches cut in the circumference. Two kernels from the seed plate have dropped on the accumulator plate and the third kernel from the seed plate will drop just about the time the notch in the accumulator plate passes over the opening in the seed tube. Thus, the three kernels are dropped in the rotary valve as a group.

a 16- or 24-cell seed plate is used. The grouped kernels are dropped together when the opening in the accumulator plate passes over the opening in the hopper bottom plate. The ejector lugs on the rim of the rotary valve catch the seeds and carry them down through the valve and deposit them directly in the furrow made by the runner opener.

Chain-flight valve. On the chain-flight valve planter, the chain runs constantly when the planter is lowered and the drive wheels turn forward. The number of cells in the seed plate and the number of teeth on the valve sprocket regulates the number of kernels per hill. Each flight on the chain contains the entire hill of seed. The lower gate valve must work freely or the kernels will not be spaced evenly. The flights need to be timed to the cells in the plate and to the valve at the bottom of the boot.

Drilling

Two-stage valve. On the two-stage valve planters, the valves are locked open and the seed falls from the seed plate in the planting chamber through the seed tube to the soil.

Rotary valve. To change some rotary-valve planter models, simply reverse the hoppers and let the seed pass down the seed tube. On other models, you remove the rotary valve, chute, and sprockets and insert a drill tube. For power drilling, one model rotary valve operates as though it were hill-dropping one kernel at a time after the accumulator plate has been removed and two extra lugs bolted on the rotor. Drill planting can be done by removing the accumulator plate, disengaging the rotor valve, and removing the valve-case assembly and replacing it with a drill case (Fig. 42). The rotor must be pinned in place so the lug doesn't interfere with the drill case.

Chain-flight valve. The chain-flight valve planter can be set to plant one kernel per hill by using a 16-cell seed plate which is power drilling. The addition of powdered graphite to the seed corn will lubricate the chain flights. To drill soybeans, maize, or sorghum, the spring holding the arm on the cam should be released. Some operators prefer to remove the entire chain flight unit to plant soybeans.

Fig. 42. In this illustration, the rotary-valve case has been removed and replaced with a drill case, secured by pin R. The rotor is turned so the lugs T are in the position shown and a pin is inserted at U to lock the rotor.

HOW DOES YOUR PLANTER OPERATE?

Study the planter and the operator's manual and see if the planter can be set to drill corn. Can it be set to hill-drop one kernel per hill? How is it set to drop two kernels per hill? Can it be set to hill-drop three kernels per hill? Will it drop four kernels per hill?

Trace the power train from the seed plates to the drive wheels. What effect will it have on the number of seeds per hill if the drive chain is placed on a larger sprocket? What effect does increased ground speed have on seed plate speed? How is the planter changed to plant soybeans instead of corn?

Trace the power train to the fertilizer unit, herbicide, and insecticide attachments.

3. WHAT IS THE PROPER WAY TO ADJUST THE PLANTER?

With other farm operations like plowing, cultivating, or harvesting, you have an easy check on the operation and efficiency of the machine. Just a glance from the tractor seat will tell you what kind of job is being done when you are plowing. A more thorough inspection can be quickly made by checking depth, etc., as you walk around the plow. With the corn planter, however, a glance at the field behind the planter will only tell you if you are planting in straight rows and with

What effect does the runner have on seed placement? How is depth of planting increased? Why are furrow openers used? When are covering attachments used? How is the planter timed? Do the planting units operate separately?

HOW DOES THE MARKER WORK?

Automatic markers

The automatic markers raise and lower with the planter frame. They will operate efficiently and automatically if they are set correctly. The proper timing sequence can be set by manually changing the marker control lever or the ratchet timing dial when the planter is raised. Once the proper timing sequence is established, the markers will continue to operate with alternate markers dropping and raising as the planter is lowered and raised.

Grass waterway attachment

When planting fields with grass waterways, the marker will raise as the planter is raised to cross the waterway. Upon leaving the waterway, the opposite marker would normally drop because of the alternating feature of the automatic mechanism. With a grass waterway attachment, the desired marker will fall when the correct rope is pulled.

Dual marker control

A dual marker control is desirable when planting in irregularly-shaped fields so both markers may be lowered when starting in the center of a field or on a terrace.

some of the newer attachments even the wheel tracks may be covered over. You can not really tell what kind of job you've done with the planter until at least ten days after planting. As the corn plants emerge, you have a check on the effectiveness of the insecticide. As the plants continue to grow rapidly, you have a check on the starter fertilizer application and as the plants grow in a row almost free of weeds you have a check on the herbicide application. Now, it is relatively too late to

make any correction for this year's crop. Any checks must be made prior to the planting season by careful calibration of the planter before the rush of the planting season begins.

There are many variations in planting conditions! Soil types vary from one field to another; one planting season is damp and cold; another is hot and dry; and one field is more fertile than another. Soybeans may be profitably planted in narrower rows than corn. A particular hybrid that was planted last year is no longer available. A new variety of corn shows great promise.

Farmers want planters that can be adjusted for different row widths, planting rates, hill spacings in the row, drilling distances, planting depths, fertilizer rates and locations, kinds of crops, herbicide rates, and insecticide rates. In order to adjust a planter to meet these and other variations in planting conditions, you must be familiar with planter adjustment.

Row width

Changing row widths is currently receiving a great deal of attention. There is always interest among good farmers in ways to increase corn yields. One method that has attracted considerable interest is to change to narrow-row corn. The Agronomy Department of the University of Illinois has found that at high yield levels, corn yields benefit about five percent from narrowing rows from 40 inches to 30 inches. In no case did they find corn planted in 30-inch rows yielding less than corn planted in 40-inch rows. Soybean yields have been found to increase from 10 to 15% due to narrow rows.

Lodging and stalk breakage in corn seem to increase with narrow rows. Shorter, earlier hybrids yield better than tall late varieties. Narrow-row corn makes more efficient use of light and moisture and there is less competition from weeds. Changing to narrow rows is primarily an economic decision and many factors must be considered before making the change.

Study your planter and the operator's manual (Fig. 43). Can row width be varied? What row widths are possible? How can row widths be changed? Must the fertilizer discharge be changed? Will it be necessary to change the marker if row widths are changed?

Fig. 43. Study the operator's manual carefully. Keep it handy, in a safe place for future reference.

Planting rate

The importance of correct planting rate has been mentioned earlier. Select the proper population for the fertility and moisture level of your field.

The plant population at harvest time is usually less than the number of kernels planted or assumed to have been planted. This reduction in number can be caused by all or any one of the causes discussed here. Wheel slippage at planting time, losses from cultivation, damage by insects, competition from weeds, and failure to germinate usually reduces the population 15 to 20%.

Buying poorly graded seed can cause inaccurate planting. A seed plate actually grades seed corn. Larger kernels tend to be retained in the hopper while smaller ones are planted. For this reason, it is a good idea to dump all hoppers occasionally because the larger kernels accumulate and may actually prevent good cell fill. Failure to do this has caused some farmers to have a diminishing plant population from the desired planting rate they started with.

Planting too fast will result in a lower planting rate than expected. If the seed plates turn too fast, there will be an incomplete cell fill. When planting at faster speeds (4-5 miles per hour) the seeds should fit in the cells with sufficient clearance to allow them to enter and leave the cells freely. If the seed fits the cell too snugly, it won't have time to settle in the cell before reaching the cutoff and will be crowded back into the hopper. The addition of powdered graphite to the seed corn will improve the cell fill at higher speeds. Empty cells mean a lower planting rate than expected. The tables shown in the operator's manuals for different hill spacings also suggest a recommended planter speed.

The operator's manual also suggests a specified tire size and tire pressure. If tires are the wrong size or are not inflated to the correct pressures, then the planting rate will vary from the expected rate. If the planter wheels slip, the planting rate will be decreased.

If you calibrate your planter at one speed and plant at a different speed, you will not plant at the rate you expected.

The cut-off pawls are often a cause for inaccurate planting, even in a new planter. If the cut-off pawls stick open or are worn, then more kernels will be planted and you will overplant the field. If they stick closed or are too long, they may reduce the number of kernels planted. If the knockout pawls are worn or have weak springs, the planting rate will be reduced. If chain drives are placed on the wrong sprockets, the planting rate cannot be correct.

The corn planter can also be calibrated by pulling it at field travel speed in the barnyard. Lower the runners until they are just above the surface of the soil. On most planters the seed plates can be driven without lowering the runners but lowering the runners will keep the kernels closer together. Use the instruction book to find how to move the proper lever to put the planter in gear so the plates will turn. On some planters, it may be necessary to wire the seed plate drive in this

position to keep it engaged. On others, it may be necessary to block the valves open. Count the kernels for 66 feet for 40-inch rows, 72 feet for 36-inch rows and 87 feet for 30-inch rows. Then by multiplying the number of kernels in each row by 200, you will get the kernels per acre.

To insure planting at the correct rate:

- (1) Buy well graded seed.
- (2) Select seed plates carefully and check them on the dealer's seedplate test stand.
- (3) Check to see that all parts of the hopper bottoms are working properly, such as, cut-off pawls, knock-out pawls, and springs. See that the parts are free of excessive accumulations of dust, chaff, and rust.
- (4) Check the general condition of the planter sprockets, gears, tires, etc.
- (5) Check to see that chains are on the correct sprockets and the selector lever set correctly.
- (6) Calibrate the planter at the speed at which planting will be done.

Hill spacings

These are determined by the choice of sprockets (drive and driven) and the accumulator plate or the striker and selector lever position for planters so equipped.

Table 1 taken from an operator's manual shows the hilling distance variations that are possible by changing the striker, shift lever, and gear case chain drive.

Table 2 taken from an operator's manual shows the hill spacing variations that are possible by changing the lugs on the rotor, using the accumulator plate, and changing the drive chain to different sprockets.

Table 1. Approximate Hilling Distances and Maximum Recommended Speed

58. "	6. mph	4	-	Single	3	11-Tooth	8-Tooth
76. "	6. mph	4	-	Single	2	11-Tooth	7-Tooth
87.2"	6. mph	4	-	Single	2	11-Tooth	8-Tooth

Drilling distances

Drilling distances are determined by the choice of seed plate, choice of sprockets (drive and driven), and the choice of selector lever position. Table 3 shows the drilling distances in inches for different seed plates. Table 4 shows the drilling distances for another planter.

Notice that increasing the number of cells in the seed plate reduces the drilling distances. This is logical, because with the seed plate turning at the same rate the increased number of openings will permit seeds to drop closer together.

One model planter power drills one seed at a time by bolting two extra ejector lugs to the rotor. If straight drilling is desired, the accumulator plate is removed. By removing the valve, the planter can be made to operate like a drill planter.

Planting depth

On trailing planters the planting depth is gauged by the press wheel and not the hydraulic cylinder. The depth of each unit is adjusted by setting a depth adjusting pin. Moving the pin up one hole adds approximately 1/2 inch to the planting depth (Fig. 44). The pressure on the pressure springs helps insure uniform planting depth (Fig. 45).

**Table 2. Approximate Hill Spacings and Plant Populations

17-Tooth	8-Tooth		540

Fertilizer rates and locations

Dry fertilizer. Rates of dry fertilizer are adjusted by selecting a low or high rate auger and by selecting the correct sprockets (drive and driven). Table 5 shows the dry fertilizer rates in pounds per acre for one planter while Table 6 shows the fertilizer rates for another planter.

The charts serve as a guide but they are not precise. Dry fertilizer is metered by volume and not by weight so the weight metered may vary as much as 100% from the weight calculated in the charts. For accurate metering of the fertilizer, it is important that the augers be properly assembled -- the large tapered ends should be on the outside with the small tapers toward the center. A diagram similar to Fig. 46 and complete information are in the operator's manual.

Fig. 46. When the augers are removed for cleaning, it is important that they be re-assembled correctly as shown in the operator's manual.

On some planters the fertilizer can be applied in a short band next to the hill when hill-drop or check-row planting corn (Fig. 47). A striker plate is set to trip the pull rod on the fertilizer valves.

Shop calibration can be done with fertilizer in the hopper, and the planter on supports by placing a container under the discharge opening and turning the wheels ten revolutions. Measure the circumference of the tire and calculate the distance traveled. Multiply the distance by the width of the row. Divide this figure by 43,560. This gives the fraction of an acre covered. Weigh the fertilizer and divide by the fraction of an acre covered. The result will be approximately the amount applied per acre. It takes a great deal of effort to turn the wheels manually at the proper speed. On some planters the differential in the drive mechanism may also affect the calibrated rate of application. Field planting conditions may cause the applied rate to vary greatly from the rate calibrated in the shop.

Field calibration may be done by removing one delivery tube and tying a bag to the spout under the hopper. Engage the fertilizer attachment and drive forward 131 feet at the speed at which planting will be done. Weigh the amount of fertilizer caught and multiply this by 100. The result will be the pounds of fertilizer delivered per acre when planting 40-inch rows.

The fertilizer openers have a drawbar linkage that gives unrestricted flotation (if

they are not integral parts of the runner openers). The separate openers can be shifted to place fertilizer on either side of the seed and below if desired. The drawbars should retain vertical flexibility with the pressure springs for protection against breakage as well as penetration.

Liquid fertilizer. Rates of liquid fertilizer are determined by the metering head and the rate of travel. Table 7 shows the approximate delivery rates for a planter. Notice that for any given orifice, the rate of application decreases as the speed of travel increases.

Table 7. Delivery Rates of Liquid Fertilizer (Pounds per acre)

*Calculated for 40" Row Spacing

table for a planter for 40-inch rows. When row widths to be planted are other than 40-inch, allow for the difference when calculating pounds per acre or plant population per acre as follows:

<u>Row width</u>	<u>Multiply by</u>
38	1.05
36	1.11
34	1.18
32	1.25
30	1.33
28	1.43

Table 9 shows the approximate pounds per acre with two different seed plates for a planter. When planting soybeans with this planter, you may have to remove the chain valve to reduce wear on the valve assembly.

Different crops

A wide variety of crops can be planted with the conventional planter by changing plates. Soybeans are an important crop in the midwest. To plant soybeans with the planter, it may be desirable to change row spacings to a narrower row. Table 8 shows the distribution

Herbicide applications

The granular applicators are mounted on the planter frame or on fenders over the press wheels, and distribute a band of granular herbicide behind the press wheels (Fig. 48). Most applicators are considered gravity flow de-

85 Lbs.	80 Lbs.	76 Lbs.	4	18-Tooth	7-Tooth

Fig. 48. The herbicide is distributed over the row by a diffuser.

ances, since the rate is varied by changing the size of opening in the hopper bottom. The rotor in the hopper serves primarily to prevent bridging and assure a supply of granules to the opening. The amount of material fed is more a function of time than of distance traveled. Any changes in travel speed or size, shape, or density of the granules requires recalibration.

The liquid herbicide is usually applied under pressure from a supply tank (Fig. 49). The nozzles are mounted behind the press wheels and the height of the nozzles determines the width of pattern,

Fig. 49. A pump driven by the tractor power-take-off delivers liquid herbicide to the nozzles back of the press wheels.

Calibration of granular pesticides (herbicides and insecticides) should be done for the rate (number of pounds per acre) at the normal planting speed. Attach a cloth bag over the diffuser or the discharge tube, lower the planter and drive a complete row (preferably in the field at planting speed). Weigh the herbicide (or insecticide) caught in the cloth bag and calculate the rate per acre.

Make the necessary adjustments and recheck. This calibration should be done for both pesticides for each planting unit.

Calibration of liquid herbicide (and insecticide) applicators can be done by the following method. Drive a measured distance

of 176 feet in the field at the speed at which planting will be done. Record the time it takes to travel to 176 feet. Note the rpm of the engine or mark the throttle quadrant. With the tractor and planter stationary and the spraying pressure at 20 - 40 psi, place a container under a nozzle and advance the throttle to the rpm used in the field. Measure the amount of fluid caught under the nozzle in the recorded time.

Adjust pressure or change nozzles until the proper output is obtained.

Insecticide applications

Granular insecticide is placed in the furrow at the back of the runner (Fig. 50). Granular applicators are mounted on the press-wheel fenders or on the planter frame and the insecticide is delivered to the furrow through a spout connected to the rear of the runner.

Liquid insecticide is sometimes applied with liquid fertilizer. If applied separately, it should be applied in the furrow ahead of the press wheel.

Fig. 50. The insecticide attachment is mounted in front of the press wheels and the insecticide flows through the plastic tube to the furrow.

4. HOW SHOULD I USE A PLANTER?

Safety practices

Permit only one person on the tractor while the tractor and planter are in operation. Never permit others (especially children) to ride on the planter.

Do not drive at excessive speed (Fig. 51).

Do not clean, lubricate, or adjust the planter when it is in motion.

Be especially careful when operating on hillsides because the tractor may tip sideways if it strikes a hole, ditch, or bump.

Lower the planter to the ground when it is not in use (Fig. 52). Whenever possible, perform service work and adjustments with the planter on the ground. If the planter must be in the raised position while working on it, be sure it is securely supported on blocks.

Leave ample clearance when making turns (Fig. 53).

Lock the marker chains in transport position at all times except when actually plant-

Fig. 51. Do not operate the planter at excessive speeds.

ing. Markers can be accidentally tripped causing injury to someone or damage to the marker (Fig. 54). Keep the loose end of the marker chain from dangling.

Fig. 52. Never leave the planter in a raised position.

Fig. 53. Do not turn too fast and strike the planter on trees, fences, or gate posts.

Do not hurry when working around implements. Haste causes accidents (Fig. 55).

Always check behind the planter when backing the unit to avoid injuring a person or damaging the planter.

Keep small children away from the planter.

Use warning flags or Slow Moving Vehicle

Fig. 54. Lock the marker in transport position at all times, except when actually planting.

Fig. 55. Haste causes accidents.

emblems when transporting the planter on the highway in the daytime. Use accessory lights for adequate warning to other vehicle operators at night or dusk.

What preparation should be made to use the planter?

Clean the planter thoroughly. Be sure there are no obstructions in the valves.

Inflate the planter tires to the pressure suggested in the operator's manual.

Stop the tractor engine and let it cool before refueling. Do not smoke during refueling. A tractor fire will cause a greater delay in planting than a few seconds required to start the tractor engine.

Move the planting units to the desired row widths. Set the fertilizer openers as recommended in the operator's manual. Set the markers for the row width chosen.

Inspect the seed hopper bottoms. Be sure the cut-off pawls and knockers are free.

Set the hitch clevis so the planter is level when operating.

Be sure the marker-control latch is lubricated and working freely.

Be sure all set screws and bolts are tight and all cotters spread, to keep them from falling out.

Be sure all hose connections and gaskets are tight on liquid fertilizer attachments. If dry fertilizer parts were oiled when the planter was stored, wipe all parts dry.

Set the planting depth desired.

Check the planter parts for excessive wear.

Match the seed to the seed plate as discussed above. Check seed plates for wear. If the center of the seed plate is worn, there will be so much play between the seed plate and the side of the hopper bottom that there will be an imperfect cell fill.

Calibrate the seeding rate at the correct planting speed.

Calibrate the fertilizer applicator.

Calibrate the pesticide applicator(s).

Lubrication. First of all, consult the lubrication charts in the operator's manual for instructions on lubricating the planter as shown in Fig. 56. Check the oil level in the gear case if the planter is so equipped. Keep the clutch (or clutches) well lubricated for positive and easy action. Marker chains last longer and operate easier if they have a light coating of oil. Chain tighteners that turn freely provide less resistance to the moving chain so it is advisable to keep them well lubricated.

Follow the manufacturer's recommendations on daily lubrication.

What are some other practices that insure more satisfactory use of the planter?

Transporting the planter. The hydraulic cylinder on trailing planters should be extended or retracted as far as it will go. When moving the planter, the transport link should

be connected. On some planters it is advisable to detach the chain drive. The planter will not be as noisy and there will be far less wear on the parts.

Wait until the planter is in the field to fill large fertilizer hoppers and granular pesticide applicators. The dry fertilizer tends to pack so it is recommended that a wrench be used to turn the auger shaft after moving the planter with the hoppers loaded. This takes some of the shock load off the fertilizer drive. Transporting hoppers full of fertilizer has been known to pack it so tightly that the augers have been broken. Keep the hopper and agitator clean and free of caked materials to insure uniform application at the calibrated rate.

When contour planting is not necessary, it is suggested that the field be worked cross-wise or on a slight diagonal to the direction of planting so the marker lines can be seen more easily (Fig. 57).

Field conditions. A well prepared seed-bed aids in obtaining uniform depth of planting from all seed openers and assists the operator in obtaining straight rows.

Field operation. It is best if the planter wheels follow in the wheel tracks of the tractor, giving the planter greater stability. Do not operate the planter with pressure springs on the fertilizer openers or runner openers compressed tightly.

Do not drive nearer than eight rows of the end before raising the planter. Turn carefully and sharply at the ends of the field to bring the planter in proper location without backing up.

Raise the planter units before backing or the runners or boots will become clogged (Fig. 58).

The runners can be forced out of alignment by turning the planter around in hard ground without raising the planter units (Fig. 59).

Dump the seed hoppers occasionally to eliminate the accumulation of larger kernels.

What can be done if the planter fails to function properly?

Most planter troubles are caused by im-

Fig. 56. Lubrication Chart

Location	Number of Fittings or Locations*	Lubricant		Frequency	
		oil	pressure gun grease	twice daily	daily

Wipe the dirt from fittings before greasing. Apply sufficient lubricant to flush out the old grease and dirt. Wipe off excess grease because this accumulates dirt.

Fig. 57. The marker line shows up more clearly when the final tillage operation was crossways or diagonal to planting.

Fig. 58. Never back up with the planter in operating position.

proper adjustment. When you encounter trouble in the field make a systematic check of all planter adjustments. Checking and

correcting operating adjustments usually clears up planter troubles.

Fig. 59. These illustrations are exaggerated examples of what happens when the runners are out of alignment.

FURROW OPENERS NOT PENETRATING GROUNDPossible Causes

1. Hard ground
2. Worn out furrow openers
3. Fertilizer openers set too deep
4. Planter not level

Remedy

1. Use pressure spring attachment to increase pressure on runners.
2. Replace worn out runner openers. Weld additional plate to replace worn portion of opener.
3. Readjust fertilizer openers.
4. Adjust hitch clevis.

SEED OR FERTILIZER NOT PROPERLY COVEREDPossible Causes

1. Soil condition

Remedy

1. Use covering blades or covering disks.
2. Adjust covering blades or disks.
3. Prepare a better seedbed.
4. Set planter deeper.

SINGLE DISK FERTILIZER OPENER NOT ENTERING GROUNDPossible Causes

1. Depth set deeper than plowing depth

Remedy

1. Prepare deeper seedbed.
2. Adjust opener for shallower depth.

SOIL LOOSE AROUND SEEDPossible Cause

1. Cloddy soil condition
2. Insufficient press wheel pressure

Remedy

1. Use rubber tires on press wheels. Use seed firming wheels. Prepare seedbed more thoroughly.
2. Increase pressure on press wheels.

MARKERS NOT LATCHINGPossible Causes

1. Chain stretched
2. Chain too long

Remedy

1. Shorten length of chain.
2. Shorten length of chain.

INACCURATE SEED DROP

<u>Possible Causes</u>	<u>Remedy</u>
1. Poorly graded seed corn	1. Use seed that is graded more uniformly.
2. Planter speed too fast	2. Use recommended planter speeds. Check seed against seed plate on dealer's seed plate test stand at <u>recommended speed</u> . Reduce planter speed.
3. Wrong seed plates	3. Use recommended seed plates. Check seed against seed plate on dealer's seed plate test stand. Check planting rate in barn lot.
4. Planter out of time	4. Check timing of planter (see operator's manual for procedure).
5. Floor plate turned wrong side up	5. Check floor plate.
6. Wrong false ring used	6. Use correct false ring.
7. Cut-off pawls or knocker not working	7. Check for worn cut-off pawl. Check cut-off pawl springs. Check operation of knock-out pawls. Seed may get into housing of knock-out pawl and cut-off pawls. Pawls may be too rusty or too tight.
8. Chain on wrong sprocket or too loose	8. Check if chain is on correct sprockets. Tighten chain.
9. Weak rockshaft spring	9. Replace rockshaft spring.
10. Valves out of adjustment	10. Check valve adjustment.
11. Obstruction in shank	11. Check shanks for clear operation.
12. No oil or oil too heavy in gear case	12. Check kind and level of oil in gear case.
13. Check heads and check forks not adjusted properly on check-row planter	13. Check adjustment

SCATTERING OF HILLS IN ROW

Possible Causes

1. Planter out of time
2. Clogged boots or runners
3. Planting too fast
4. Valve rod out of adjustment
5. Check shaft spring out of adjustment
6. Check shaft binding
7. Worn runner openers
8. Poorly prepared seedbed

Remedy

1. Retime planter (see operator's manual for correct procedure).
2. Do not back up with furrow openers in ground.
Depth of split-row fertilizer boot set too deep.
3. Use recommended planting speeds.
4. Readjust valve rod.
5. Adjust spring to proper tension or replace spring.
6. Check for interference of misalignment of check shaft.
7. Replace or repair runner openers.
8. Prepare seedbed more thoroughly to eliminate trash, roots, or grassy conditions.

MARKER LINE NOT VISIBLE

Possible Cause

1. Marker shoe or disk improperly set

Remedy

1. Adjust angle of shoe or disk to drag smoothly on ground.
2. Place more weight on marker.

PLANTER DRIVE JERKING OR CATCHING

Possible Cause

1. Drive chain too loose

Remedy

1. Tighten drive chain

PLANTER MISSES SETS OF HILLS

Possible Causes

1. Clutch not engaging properly
2. Roller or clutch stop lever loose or worn
3. Clutch dog spring weak or broken

Remedy

1. Adjust clutch or repair.
2. Tighten clutch stop lever. Replace worn clutch stop lever.
3. Replace clutch dog spring.

PLANTING MORE CORN IN SOME ROWS THAN IN OTHERS

Possible Causes

1. Action of cut-off pawl or knocker
2. Wrong seed plate
3. Wrong false ring
4. Warped false ring
5. Hopper not clamped down tight
6. Not enough corn in the hopper

Remedy

1. Check for seed in cut-off pawl or knocker housing.
Check for weak or broken cut-off spring.
Check for worn cut-off pawl.
2. Check for uniformity of seed plates so they are the same in all planting units. Plates and hoppers are not all the same size which gives larger cell sizes in some hoppers.
3. Check for uniformity of false rings so they are the same in all planting units.
4. Check condition of false rings.
5. Be sure all hoppers are clamped down tight.
6. Empty when 2 inches of corn remains in the hopper to remove larger kernels.

5. HOW SHOULD I MAINTAIN THE PLANTER?

Care and maintenance of the corn planter is important for two reasons. (1) The corn planter is used only a few days each year. The performance of the planter during the few hours it is in the field may make the difference between a profit or a loss on the crops it plants. On a farm where the principal crops are row crops, the poor performance of the planter may mean financial ruin. Since its performance is so important, it deserves good care during the rest of the year when it is not in use. (2) Planters are precisely made farm implements and they are expensive. Equipment that represents this large an investment should receive good care. Good care and maintenance will assure efficient and accurate planting at high speeds for many years.

Remember, good care and long service go together. How long your planter will last and continue to do good work depends largely on the maintenance and care given by the operator.

What preparations should be made for off-season storage?

Store the planter on blocks or jacks. Block up the runners so the weight of the planting units doesn't rest on the zero-pressure press-wheel tires. This will prevent deformity or flat spots caused by the tires being depressed for a long period of time. Store the planter in a shed or cover the entire unit with a tarpaulin.

Replacement Parts. The first step in post-season service and repair is to determine in detail the needed replacement parts, adjustments, and service. These jobs should be marked with tags on the planter or written down in a notebook or on a service inspection sheet (Fig. 60).

Parts that are broken or badly worn may need to be replaced. Refer to the owner's manual and order these parts by the correct part number. Some worn parts can be built

Fig. 60. Planter repair jobs that need to be done before next planting season should be listed so they can be completed when the press of farm work is not so heavy.

up in the shop. Parts that are wearing by soil abrasion may be hard surfaced to prolong their life.

Cleaning and lubrication. Clean the planter to remove grease, dirt, chemicals, etc. This can be done with water pressure. The accumulation of grease may be softened with solvent and removed by putty knife or wire brush.

Grease the polished surface of all ground working parts of the planter (fertilizer opener, runners, marker, etc.).

Lubricate chains with heavy oil or grease.

Fertilizer attachments. The worst enemy of dry fertilizer distribution equipment is corrosion. Empty the hoppers as soon as possible after planting is completed. Wash out the hopper, tube, and opener thoroughly and replace them. Remove the augers and clean them thoroughly. Use a wire brush if necessary to remove any accumulation of fertilizer. Some manufacturers recommend repainting scarred surfaces with an aerosol spray can to prevent corrosion. Protect the parts subject to rusting with oil, grease, paint, or any suitable rust preventive.

As double disk openers wear, the disks of the offset type can be exchanged because the leading disk wears faster.

For liquid fertilizer attachments, open the distributor valve and flush the system well. If the tanks are metal, add a pint of light oil to the final flush. Use compressed air to clean and dry the liquid fertilizer system.

6. WHAT ARE SOME PRACTICAL APPLICATIONS?

Fill out this information sheet for your corn planter. Use the operator's manual as a reference.

CORN PLANTER INFORMATION SHEET

Mfg. Name _____ Model _____ Size _____

In the space below each unit list other information about the unit.

THE PLANTER

Identify the major parts of the planter

- Hitch and Frame
- Power Transmission Train
- Planter Unit and Gauge Wheel

What row spacings are possible?

Trace power from wheels to all attachments. (sketch if necessary)

List special precautions for transporting.

Describe marker operation.

Check the accessories noted.

- _____ runner openers
- _____ disk openers
- _____ check-row attachment
- _____ gauge shoes
- _____ trash kickers
- _____ multi-luber
- _____ press wheel scraper
- _____ press wheel bands
- _____ rubber press wheel tires
- _____ covering knives
- _____ covering disks
- _____ seed packer wheels
- _____ minimum tillage attachment
- _____ dual wheels
- _____ herbicide attachment
- _____ insecticide attachment
- _____ soil incorporating equipment
- _____ disk marker
- _____ check-row equipment
- _____ grass waterway attachment
- _____ fertilizer attachment
- _____ other

PLANTING UNIT

Identify all parts in planting unit and describe their function.

What is maximum and minimum distance between hills? Between kernels when drilling?

What maximum and minimum planting rates are possible? (40 in. rows)

How fast can you drive at different planting rates?

How is hill spacing varied?

How are kernels per hill varied?

How is the planter set for drilling?

How is planter set for hill dropping?

How many hill dropping rates are possible?

How is depth of planting controlled?

How is pressure on press wheel adjusted?

What is the capacity of seed hoppers?

How are the seed plates matched to seed?

FERTILIZER ATTACHMENT

Identify all parts of fertilizer attachment and describe their function.

What is the capacity of hoppers? Tanks?

How is the fertilizer attachment engaged?

What are minimum and maximum rates per acre? (40 in. rows)

How is fertilizer applicator calibrated?

How is depth of placement adjusted?

Where can fertilizer be placed in relation to the row?

What daily care is needed?

What maintenance is needed?

INSECTICIDE ATTACHMENT

What care is needed?

What is the range in rate of application per acre?

How is it calibrated?

HERBICIDE ATTACHMENT

What care is needed?

What is the range in rate of application per acre?

How is it calibrated?

LUBRICATION

What are the twice daily lubrication requirements?

What are the daily lubrication requirements?

What are the periodical lubrication requirements?

PRE-SEASON SERVICE CHECK

Is planter lubricated properly?

What tire pressure is recommended?

Are width settings correct? Are markers set to match row widths?

Are seed hoppers and hopper bottoms ready to use?

Does seed fit the seed plates?

Is fertilizer attachment ready for field use?

Are all bolts, nuts, set screws and cotter pins tight?

END - OF - SEASON STORAGE PREPARATIONS

Check for worn, lost, or damaged parts and replace them.

What service should be given fertilizer attachment?

What service should be given insecticide attachment?

What service should be given hoppers and hopper bottoms? Runners?

What protection should be given soil engaging parts?

How can planter parts be folded for close storage?

Be prepared to complete these Laboratory Exercises or Demonstrations:

1. Change press wheel pressure.
 - a. How much increase or decrease in planting depth does this cause?
2. Select correct seed plate to match seed.
3. Set planter to hill drop 2 kernels per hill for approximately 18,500 plants per acre population with 40-inch rows.
 - a. What seed plate is used?
 - b. What is the recommended planter speed?
 - c. What is the hill spacing in the row? If this is changed to approximately 21 inches, will it affect the population? How much?
4. Set planter to hill drop 3 kernels per hill for approximately 19,500 plants per acre with 40-inch rows.
 - a. What seed plate is used?
 - b. How far apart are the kernels in the row?
5. Set planter to hill drop 4 kernels per hill for approximately 23,000 plants per acre.
 - a. What sprockets are used on the drill shaft and counter shaft?
 - b. What change would be made if the sprocket on the drill shaft were changed to a 12-tooth sprocket?
6. Set planter to drill corn 6 inches apart in the row using the 16-cell seed plate, then the 24-cell seed plate.
 - a. What plant population will each setting give?
7. Set planter to plant 45, 46, 47, or 48 pounds of soybeans per acre.
8. Show how to change row spacings.
 - a. What different row spacings can be set on this planter?
9. Demonstrate how to clean and service fertilizer attachment.
 - a. What daily service is recommended?
 - b. What prestorage service is recommended?
10. Calibrate fertilizer attachment.
 - a. What are maximum and minimum rates that can be applied?

(Laboratory calibration) With fertilizer in hopper, and planter on supports, place container under the discharge opening and turn wheels 10 revolutions. Measure circumference of tire and calculate distance traveled. Multiply distance by the width of row. Divide this by 43,560. This gives the fraction of an acre covered. Weigh the fertilizer and divide by the fraction of an acre covered. The result will be the amount applied per acre.

(Outdoor calibration) Remove one delivery tube and tie a bag to the spout under the hopper. Engage the fertilizer attachment and drive forward 13 ft. after fertilizer starts flowing. Weigh the amount of fertilizer caught and multiply this by 100. The result will be the pounds of fertilizer delivered per acre when planting 40-inch rows.

11. Demonstrate how moist or lumpy fertilizer causes irregular flow.
12. Demonstrate how restricted fertilizer boot openings affect rate of application.
13. Demonstrate how gravity flow liquid fertilizer application rate is affected by forward speed.
14. Calibrate granular herbicide and insecticide attachments.
 - a. This should be done for the rate (number of lbs. per acre) at the normal planting speed. Attach a cloth bag over the diffuser, lower the planter and drive a complete row at planting speed. Weigh the herbicide caught in the cloth bag and calculate the rate per acre. Make necessary adjustments and recheck. This calibration should be done for each unit.
15. Calibrate liquid insecticide or herbicide attachments.
 - a. This should be done for the rate (gallons per acre) at the normal speed or rpm at which planting is done.
16. Demonstrate correct planter lubrication.
 - a. What parts require lubrication twice daily?
 - b. What parts require daily lubrication?
17. Time the planter.
18. Disassemble unit to inspect the valves.
19. Examine the runner.
 - a. Identify and explain the function of all parts.
 - b. Does runner opener need to be rebuilt.
20. Examine sprockets, chains, and gears.
 - a. Are any parts worn so badly they affect timing?
21. Examine planter for lost, worn, or broken parts.
 - a. What is correct replacement part number for this model planter?
(Use operator's manual to identify missing part)
22. Examine seed hopper, hopper bottom, and seed plates.
 - a. Are hopper bottom plates worn?
 - b. Are cut-off pawls worn? Is movement free?
 - c. Do the knock-out pawls need adjusting?
23. Outline pre-storage service procedure for the end of the season.
24. Outline pre-season checks and service before starting to plant.

The illustrations used in this unit were provided by Allis Chalmers Mfg. Co., Milwaukee, Wisconsin; Deere & Company, Moline, Illinois; Gandy Company, Owatonna, Minn.; International Harvester Co., Chicago, Illinois; and Massey Ferguson Inc., Detroit, Michigan.

Fill out this information sheet for your planter. Use the operator's manual as a reference.

SELECTING, FEEDING, AND CARING FOR LIGHT HORSES

1. Breeds of Light Horses and Their Characteristics
2. What Should I Look For When Selecting Light Horses?
3. How Should I Feed Light Horses?
4. What Care Should I Give Light Horses?
5. What Buildings and Equipment Are Necessary?

Horses may be classified as light horses, ponies, or draft horses, according to their size, build, and use.

Light horses stand 14-2 to 17 hands high,* weigh 900 to 1,400 pounds, and are used primarily for riding, driving, or racing, or for utility purposes on the farm. Light horses

are usually more rangy and capable of more action and greater speed than draft horses.

Ponies stand under 14-2 hands high and weigh 300 to 900 pounds.

Draft horses stand 14-2 to 17-2 hands high, weigh 1,400 pounds or more, and are used primarily for pulling loads and other heavy work.

1. BREEDS OF LIGHT HORSES AND THEIR CHARACTERISTICS

Some of the light-horse breeds, common to Illinois, are included here. Characteristics of the lesser common breeds may be found in some of the horse publications or from the respective breed associations.

American Saddle Horse (Fig. 1)

Animals of this breed furnish an easy ride with great style and animation. They may be either three or five gaited. Three-gaited horses, by custom, are shown with their manes roached, or clipped short, and the upper part of their tails clipped or sheared close. Five-gaited horses, by custom, are shown with flowing manes and full-length tails. Most of them are 15 to 16 hands high and weigh 1,000 to 1,200 pounds. This breed is noted for a beautiful head carried on a long, graceful neck; short, rounded back; level croup; high-set tail; and proud action.

Arabian (Fig. 2)

Distinctive characteristics of the Arabian

Fig. 1. American Saddle Horse stallion

breed are medium to small size, beautiful head, short coupling, docility, great endurance, and a gay way of going. The usual height is 14 to 15-1 hands and the weight, 850 to 1,100 pounds. The breed is used primarily for saddle, show, and stock purposes.

*A "hand" is 4 inches. The measurement is taken from the highest point of the withers to the ground when the animal is standing squarely on a level area. A horse measuring 62 inches is said to be 15-2 hands high (15 hands and 2 inches).

ED013339

VT 02262

Fig. 2. Arabian stallion

Hackney (Fig. 3)

High natural action is a distinguishing feature of this breed. The Hackney varies more in size than any other breed, ranging from 12 to 16 hands high; the Hackney pony should not exceed 14-2 hands. The Hackney was bred to be a heavy harness horse—a large light horse used for pulling carriages. It has become essentially a show animal. In the show ring, it is customary that heavy harness horses be docked and have their manes pulled.

Fig. 3. Hackney stallion

Morgan (Fig. 4)

The Morgan is an American breed that was developed in New England from the stallion

Fig. 4. Morgan mare

Justin Morgan. Very little, unfortunately, is known of his ancestry.

This breed always has been noted for smooth trim lines, good style, easy-keeping qualities, sturdiness, endurance, and docility—the last without sacrifice of spirit and courage. The average height is 15-2 hands and the average weight is 1,050 pounds. Representative animals of the breed, however, may range from 14-2 to 16 hands in height and from 800 to 1,200 pounds in weight.

Palomino (Fig. 5)

Palomino horses must be golden in color and have light-colored manes and tails. White markings on the face or below the knees or hocks are acceptable. The preferred height is 14-2 to 16 hands and the preferred weight, 1,000 to 1,200 pounds.

Fig. 5. Palomino stallion

Genetic studies of the Palomino indicate that the color is probably unfixable—that is, it cannot be made true through breeding—no matter how long or how persistent the effort.

Quarter Horse (Fig. 6)

Quarter horses are stout in build, but should not be the extreme "bulldog" type. They seldom exceed 15 hands in height; they weigh 1,000 to 1,200 pounds. The head is somewhat short and is distinctive because of the small, alert ears and heavily muscled cheeks and jaw. Their build makes them ideal stock horses—agile and speedy animals that have enough weight and power to hold heavy steers that have been roped. They have a calm disposition even during a roundup.

Certain families are being selected for great speed at short distances and are being used primarily for racing.

Fig. 6. Quarter Horse stallion

Shetland Pony (Fig. 7)

While ponies are normally classified in a class by themselves, this one breed will be described briefly in this light-horse publication.

Shetland Ponies are less than 11-2 hands in height—most are less than 10-2 hands. There are two distinct types—one resembles a small draft horse and the other a small road-type horse. They may be almost any of the horse colors, both broken and solid. Shetland Ponies are noted for their good dispositions.

Fig. 7. Shetland Pony stallion

Standardbred (Fig. 8)

While animals of this breed are generally smaller, longer bodied, less leggy, and less refined than Thoroughbreds, they show more substance and ruggedness and have more docile dispositions. They range in weight from 900 to 1,300 pounds, and in height from 15 to 16 hands.

Fig. 8. Standardbred stallion

Thoroughbred (Fig. 9)

Thoroughbreds possess a high degree of quality and refinement and are built for speed. Their bodies are long, deep chested, rather narrow, upstanding, and often a bit angular. They are active, energetic, and nervous. They are 15 to 17 hands high. In racing trim, Thoroughbreds may weigh 900 to 1,025 pounds; stallions in breeding condition may weigh up to 1,400 pounds or more.

Fig. 9. Thoroughbred stallion

2. WHAT SHOULD I LOOK FOR WHEN SELECTING LIGHT HORSES?

Horses, like other classes of livestock, may be selected on type, pedigree, and/or performance or progeny testing. While the latter two are very important for certain uses,

the emphasis in this publication will be on type alone.

When selecting on type, you should know the names of the parts of a horse (Fig. 10),

Fig. 10. Parts of a horse. (1) Muzzle, (2) Nostril, (3) Jaw, (4) Cheek, (5) Face, (6) Eye, (7) Forehead, (8) Poll, (9) Ear, (10) Mane, (11) Crest, (12) Neck, (13) Throatlatch, (14) Wither, (15) Back, (16) Loin, (17) Croup, (18) Hip, (19) Coupling, (20) Tail, (21) Point of the buttocks, (22) Thigh, (23) Quarter, (24) Stifle, (25) Rear flank, (26) Sheath, (27) Underline, (28) Gaskin, (29) Point of hock, (30) Hock, (31) Foot, (32) Coronet, (33) Pastern, (34) Fetlock, (35) Cannon, (36) Knee, (37) Forearm, (38) Point of elbow, (39) Arm, (40) Point of shoulder, (41) Ribs, (42) Heart girth, (43) Shoulder.

have in mind an image of the ideal-type animal, and be able to compare your animal with the ideal. Some of the characteristics of the ideal type, as well as some of the common faults, are given in Table 1.

Other items to be considered along with type are gaits and certain blemishes and unsoundnesses.

Gaits

A gait is a natural or acquired way of walking or running, characterized by a distinctive rhythmic movement of the feet and legs.

The gaits of light horses, especially show and racing stock, are very important. Three-gaited horses may include the walk, trot, and gallop or the walk, trot, and canter, depending upon the type of horse. Five-gaited horses must perform two additional gaits. A brief description of the most common gaits are as follows:

Walk is a slow, natural gait of four beats in which each foot leaves and strikes the ground at separate intervals (Fig. 11). The walk should be springy, regular, and true.

Fig. 11. The walk is the natural, slow gait of horses.

Trot is a rapid, natural two-beat diagonal gait in which the front foot and the opposite hind foot take off together and strike the ground simultaneously (Fig. 12).

Fig. 12. The trot is the natural, rapid gait of horses.

All four feet are off the ground at the same time for a brief moment, making the horse seem to float through the air.

This gait varies considerably with different breeds. The trot of the Standardbred is characterized by length and rapidity of individual strides, while that of the Hackney shows extreme flexion of the knees and hocks that produces a high-stepping show gait.

Run or gallop is a fast, three-beat gait during which two diagonal legs are paired and strike the ground together between the successive beats of the other two unpaired legs (Fig. 13). All four feet are off the ground for a brief interval. The two unpaired legs that act independently—the forefoot with which the horse leads and the diagonal hindfoot—naturally bear more weight and are subject to more fatigue than the paired legs that act jointly.

In the gallop, propulsion is chiefly in the hindquarters, although the forequarters sustain a tremendous jar as the horse lands. The gallop is the fast natural gait of horses.

Fig. 13. The gallop is the natural, fast, three-beat gait of horses.

Canter is a slow, restrained gallop or run (Fig. 14). Like the gallop, it is a three-beat gait, and it puts unusual wear on the leading forefoot and its diagonal hindfoot. It is impor-

Fig. 14. The canter is a slow, restrained gallop.

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS - 1963

Table 1. Light Horse Selection Guide

What to look for	Ideal type	Common faults
Front view: 1. Head..... 2. Femininity or masculinity..... 3. Chest capacity..... 4. Set of front legs.....	1. Head well proportioned to rest of body, refined, clean cut, with chiseled appearance; broad, full forehead with great width between eyes; jaw broad and strongly muscled; ears medium size, well carried, and attractive. 2. Refinement and femininity in brood mare; boldness and masculinity in stallion. 3. Deep, wide chest..... 4. Straight, true, and squarely set front legs.....	1. Plain headed; weak jaw. 2. Mares lacking femininity; stallion lacking masculinity. 3. Narrow chest. 4. Crooked front legs.
Rear view: 1. Width of croup and through rear quarters..... 2. Set of hind legs.....	1. Wide and muscular over croup and through rear quarters. 2. Straight, true, and squarely set hind legs.....	1. Lacking width and length over croup and muscling through rear quarters. 2. Crooked hind legs.
Side view: 1. Style and beauty..... 2. Balance and symmetry..... 3. Neck..... 4. Shoulders..... 5. Topline..... 6. Coupling..... 7. Middle..... 8. Rear flank..... 9. Arm, forearm, and gaskin..... 10. Legs, feet, and pasterns..... 11. Quality..... 12. Breed type (size, color, shape of body and head, and action) true to breed represented.	1. High carriage of head, active ears, alert disposition, and beauty of conformation. 2. All parts well developed and nicely blended together. 3. Fairly long neck, carried high; clean cut about throat latch; with head well set on. 4. Sloping shoulders (about a 45° angle). 5. Short, strong back and loin, with long, nicely turned and heavily muscled croup, and high, well-set tail; withers clearly defined and of same height as high point over croup. 6. A short coupling as denoted by last rib being close to hip. 7. Ample middle due to long, well-sprung ribs. 8. Well let down in rear flank. 9. Well-muscled arm, forearm, and gaskin. 10. Straight, true, and squarely set legs; pasterns sloping about 45°; hoofs large, dense, and wide at heels. 11. Plenty of quality, as denoted by clean, flat bone, well-defined joints and tendons, refined head and ears, and fine skin and hair. 12. Showing plenty of breed type.	1. Lacking style and beauty. 2. Lacking in balance and symmetry. 3. Short, thick neck; ewe necked. 4. Straight in shoulders. 5. Sway backed; steep croup. 6. Long in coupling. 7. Lacking middle. 8. High cut rear flank or "wasp waisted." 9. Light-muscled arm, forearm, and gaskin. 10. Crooked legs; straight pasterns; hoofs small, shelly, and contracted at heels. 11. Lacking quality. 12. Lacking breed type.
Soundness: 1. Soundness and freedom from defects in conformation that may predispose unsoundness.	1. Sound and free from blemishes.....	1. Unsound; blemished (over cuts, capped hocks).
Action:¹ 1. At walk..... 2. At trot..... 3. At canter.....	1. Easy, prompt, balanced; a long step, with each foot carried forward in a straight line; feet lifted off ground. 2. Rapid, straight, elastic trot with joints well flexed. 3. Slow, collected canter, which is readily executed on either lead.	1. Short step, with feet not lifted off ground. 2. Winging, forging, and interfering. 3. Fast and extended canter.

¹ The 3 most common gaits are given here. Five gaited horses must perform 2 additional gaits, intended gait, and (2) examine trained horses while performing at use for which they are intended.

In selecting for gait, (1) observe horse at each

tant to frequently change the lead. A well-trained horse will do this easily at the will of the rider.

In the show ring, the lead should be toward the inside of the ring, and the lead is changed by reversing direction of travel (when the ringmaster calls for "reverse and canter"). This gait should be executed in such a slow collected manner that the animal may perform in a relatively small circle.

Pace is a fast two-beat gait in which the front and hind feet on the same side start and stop together (Fig. 15). The feet rise just above the ground level. All four feet are off the ground for a split second and the horse appears to float forward.

Fig. 15. The pace is a fast, two-beat gait.

The pace is faster than the trot but slower than the run or gallop. It allows for a "quick getaway" but it produces an objectionable side or rolling type of motion. This gait is not suited to travel in mud or snow; a smooth, hard footing and easy draft are necessary for its best execution.

The pace once was popular in England but lost in favor soon after the development of the Thoroughbred early in the eighteenth century.

Rack is a fast, brilliant, flashy, unnatural, four-beat gait in which each foot strikes the ground separately at equal intervals; known originally as the "single foot." The rack is easy on the rider but hard on the horse. It is, undoubtedly, the most popular and flashy gait in the American show ring. On the tanbark, greater speed at the rack is requested with the command "rack on."

Defects in movement

The feet of a horse should move straight ahead parallel to an imaginary center line drawn in the direction of travel. Any move-

ment other than this may be considered a defect.

Some defects are:

Cross-firing. A "scuffing" on the inside of the diagonal forefeet and hindfeet. This is generally confined to pacers.

Dwelling. A noticeable pause in the flight of the foot, as though the stride was completed before the foot reaches the ground. This is most noticeable in trick-trained horses.

Forging. Striking forefoot with toe of hindfoot.

Interfering. Striking fetlock or cannon with the opposite foot. This is most often done by base-narrow, toe-wide, or splay-footed horses.

Lameness is a defect noticeable by an animal favoring an affected foot when standing. The animal also attempts to ease the load on the ailing foot in walking and the characteristic bobbing of the head occurs as the affected foot strikes the ground.

Paddling is the throwing the front feet outward as they are picked up. This is most common in toe-narrow or pigeon-toed horses.

Pounding is a heavy contact with the ground instead of desired light, springy movement.

Rolling is an excessive lateral shoulder motion, characteristic of horses with protruding shoulders.

Scalping. The hairline at top of hindfoot hits toe of forefoot as it breaks over.

Speedy cutting. The inside of diagonal fore and hind pastern make contact, as sometimes seen in fast-trotting horses.

Stringhalt. Excessive flexing of hind legs. This is most easily detected when a horse is backed.

Trappy. A short, quick, choppy stride. This is a tendency of horses with short, straight pasterns and straight shoulders.

Winging is an exaggerated paddling, particularly noticeable in high-going horses.

Blemishes and unsoundnesses

Anything abnormal about the body or movement of a horse may be considered an unsound-

ness. From a practical standpoint, however, abnormalities may be divided between those that do and those that do not affect serviceability.

Blemishes include the abnormalities that do not affect serviceability—such as wire cuts, rope burns, nail punctures, shoe boils, or capped hocks.

Unsoundnesses include more serious abnormalities that affect serviceability. Fig. 16 shows the location of common blemishes and unsoundnesses.

Consider the use to which you intend to put the animal before you buy a blemished or unsound horse.

Stable vices

Stable vices are bad habits of the horse in confinement. They may detract from the value of the animal.

Cribbing. A horse that bites or sets his teeth against the manger or some other object while sucking air is said to be cribbing. This causes hard keeping and a bloated appearance. Horses with this vice are subject to colic.

A common remedy for cribbing is a strap buckled snugly around the horse's neck in a way that will compress the larynx when the

head is flexed, but that will not cause any discomfort when the horse is not indulging in the vice.

Halter pulling. This term is applied to a tied horse that pulls back on its halter rope.

Kicking. A true stable kicker apparently kicks just for the satisfaction it gets out of striking something with its hind feet. Unusual excitement or injury may cause a gentle horse to kick.

Tail rubbing. Persistent rubbing of the tail against the side of the stall or some other object is objectionable. Parasites, such as lice or rectal worms, may cause this. A "tail board" or parasite control helps break animals of this habit. A tail board is a board projecting from the wall of the stall high enough to strike just below the point of the buttock, instead of the tail, of the rubbing horse.

Bolting. Horses that eat too rapidly are said to be "bolting." This can be controlled by adding chopped hay to the animal's grain ration, or by putting stones as big as baseballs in its feed box.

Weaving. A horse's rhythmic swaying back and forth while standing in the stall is known as weaving.

Fig. 16. Common unsoundnesses in horses. (1) Undershot jaw, (2) Parrot mouth, (3) Blindness, (4) Moon blindness, (5) Poll evil, (6) Fistulous withers, (7) Stifled, (8) Thoroughpin, (9) Capped hock, (10) Stringhalt, (11) Curb, (12) Bone spavin or jock, (13) Bog spavin, (14) Blood spavin, (15) Bowed tendons, (16) Sidebones, (17) Cocked onkles, (18) Quitter, (19) Ring bone, (20) Windpuffs, (21) Splints, (22) Knee sprung, (23) Colf kneed, (24) Capped elbow, (25) Sweeney, (26) Contracted feet, corns, founder, thrush, quarter or sand crack, scrotches, or greose heel, (General) Heaves, hernia, rooring, or thick wind.

Other vices. Other vices that may be difficult to cope with, especially in older animals, are: balking, backing, rearing, shying, striking with the front feet, a tendency to run away,

and objecting to harnessing, saddling, or grooming. Many of these bad habits are caused by incompetent handling, however.

3. HOW SHOULD I FEED LIGHT HORSES?

Feeding practices vary from one locality to another—and even among horsemen. The size of individual horses, the use to which they are put, and the size of the enterprise also makes a difference.

Feeds

Because horses have small digestive tracts, they cannot eat as much roughage as cattle. Feeds should be selected that will provide energy but not add surplus body weight or large, paunchy stomachs.

A light-horse feeding guide is given in Table 2. In selecting rations, compare them with commercial feeds. If you use small quantities or have little storage room, you may find it more satisfactory to buy ready-mixed feeds.

More than one kind of hay makes for variety and appetite appeal. In season, any good pasture can replace part or all of the hay unless work or training conditions make substitution impractical.

Good-quality oats and timothy hay have always been considered standard feeds for light horses. Feeds of similar nutritive properties can be interchanged in the ration as price relationships warrant. This makes it possible to obtain a balanced ration at lowest cost. Some of these feeds are grains (oats, corn, barley, wheat, and sorghum), protein supplements (linseed meal, soybean meal, and cottonseed meal), and hays of many varieties.

During winter months, add a few sliced carrots to the suggested ration, an occasional bran mash, or a small amount of linseed meal. Also, use bran mash or linseed meal to regulate the bowels.

The proportion of concentrates should be increased and the roughages decreased as energy needs rise with the greater amount,

severity, or speed of work. A horse that works at a trot needs considerably more feed than one that works at a walk. For this reason, draft animals that perform most of their work at a walk, require somewhat less grain and more hay in proportion to body weight than light horses that travel faster. Also, from an esthetic standpoint, large stomachs that result from high roughage rations are less objectionable on draft animals than on light horses.

The rations given in Table 2 are suited equally to light horses, draft horses, and mules. For light horses, use the upper limits of grain and the lower limits of hay. Keep the total allowance of concentrates and hay within the range of 2.0 to 2.5 pounds daily per 100 pounds live weight.

Minerals

The common horse ration of grass, grass hay, and farm grains is usually deficient in calcium, but adequate in phosphorus. Also, salt is almost always deficient, and many horse rations do not contain sufficient iodine. Thus, horses usually need special mineral supplements.

On the average, a horse will consume about 3 ounces of salt daily or 1 1/3 pounds per week, although the salt requirements vary with work and temperature.

The salt requirements, and any calcium or phosphorus requirements not met by feeds, can best be supplied by allowing free access to a two-compartment box containing minerals. One compartment should have salt (iodized in iodine-deficient areas), and the other should contain a mixture of 2 parts steamed bone meal (or other calcium-phosphorus supplement) and 1 part salt (the salt is for palatability). It is important, however, that the Ca/P ratio of horse rations be maintained at not less than 1:1. Narrower ratios may cause osteomalacia (softening of the bones) in mature

Table 2. Light Horse Feeding Guide

Age, sex, and use	Daily allowance	Kind of hay	Suggested grain rations		
			Rations No. 1	Rations No. 2	Rations No. 3
Stallions in breeding season (weighing 900 to 1,400 pounds).	$\frac{3}{4}$ to $1\frac{1}{2}$ pounds grain per 100 pounds live weight, together with a quantity of hay within same range.	Grass-legume mixed; or $\frac{1}{2}$ to $\frac{3}{4}$ legume hay, with remainder grass hay.	<i>Pounds</i> Oats..... 55 Wheat..... 20 Wheat bran.... 20 Linseed meal.... 5	<i>Pounds</i> Corn..... 35 Oats..... 35 Wheat..... 15 Wheat bran.... 15	<i>Pounds</i> Oats (alone).
Pregnant mares (weighing 900 to 1,400 pounds).	$\frac{3}{4}$ to $1\frac{1}{2}$ pounds grain per 100 pounds live weight, together with a quantity of hay within same range.	Grass-legume mixed; or $\frac{1}{2}$ to $\frac{3}{4}$ legume hay, with remainder grass hay (straight grass hay may be used first half of pregnancy).	Oats..... 80 Wheat bran.... 20	Barley..... 45 Oats..... 45 Wheat bran.... 10	Oats..... 85 Linseed meal.... 5
Colts before weaning (weighing 100 to 350 pounds with projected mature weights of 900 to 1,400 pounds).	$\frac{1}{2}$ to $\frac{3}{4}$ pound grain per 100 pounds live weight, together with a quantity of hay within same range.	Legume hay.	Oats..... 50 Wheat bran.... 40 Linseed meal.... 10	Oats..... 30 Barley..... 30 Wheat bran.... 30 Linseed meal.... 10	Oats..... 80 Wheat bran.... 20
Yearlings (weighing 350 to 450 pounds).	1 to $1\frac{1}{2}$ pounds grain and $1\frac{1}{2}$ to 2 pounds hay per 100 pounds live weight.	Grass-legume mixed; or $\frac{1}{2}$ to $\frac{3}{4}$ legume hay, with remainder grass hay.	Oats..... 30 Barley..... 30 Wheat bran.... 30 Linseed meal.... 10	Oats..... 70 Wheat bran.... 15 Linseed meal.... 15	Oats..... 80 Linseed meal.... 20
Yearlings, 2d summer (weighing 450 to 700 pounds).	Good, luxuriant pastures (if in training, or for other reasons without access to pastures, the ration should be intermediate between the adjacent upper and lower groups).				
Yearlings, or rising 2-year-olds, 2d winter (weighing 700 to 1,000 pounds).	$\frac{1}{2}$ to 1 pound grain and 1 to $1\frac{1}{2}$ pounds hay per 100 pounds live weight.	Grass hay.	Oats..... 80 Wheat bran.... 20	Barley..... 35 Oats..... 35 Bran..... 15 Linseed meal.... 15	Oats (alone).
Light horses at work; riding, driving, and racing (weighing 900 to 1,400 pounds).	<i>Hard use.</i> — $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds grain and 1 to $1\frac{1}{4}$ pounds hay per 100 pounds live weight. <i>Medium use.</i> — $\frac{3}{4}$ to 1 pound grain and 1 to $1\frac{1}{4}$ pounds hay per 100 pounds live weight. <i>Light use.</i> — $\frac{2}{3}$ to $\frac{1}{2}$ pound grain and 1 to $1\frac{1}{4}$ pounds hay per 100 pounds live weight.	Grass hay.	Oats (alone).	Oats..... 70 Corn..... 30	Oats..... 70 Barley..... 30
Mature idle horses; stallions, mares, and geldings (weighing 900 to 1,400 pounds).	$1\frac{1}{2}$ to $1\frac{3}{4}$ pounds hay per 100 pounds live weight.	Pasture in season; or grass-legume mixed hay.	(With grass hay, add $\frac{3}{4}$ pound of a high protein supplement daily.)		

Note: With all rations and for all classes and ages of horses, provide free access to separate containers of (1) salt (iodized salt in iodine-deficient areas) and (2) a mixture of 1 part salt and 2 parts steamed bone meal or other suitable calcium-phosphorus supplement.

horses. The latter condition may develop when rations with a Ca/P ratio of 0.8 to 1 are fed 6 to 12 months, and it will progress rapidly when the ratio is 0.6 to 1.

A good commercial mineral mixture may be fed if desired.

Vitamins

Certain vitamins are necessary to the growth, development, health, and reproduction of horses. The vitamins most commonly deficient are A and D. Also, indications are that vitamin E and some of the B vitamins (riboflavin and perhaps thiamine) are required by the horse. While these are all necessary for proper health, vitamin deficiencies in horses are the exception rather than the rule.

High-quality, leafy, green forages plus plenty of sunshine usually gives horses all the vitamins they need. Horses get carotene (which the animal can convert to vitamin A) and riboflavin from green pasture, (not over a year old), and grass or legume silage. They get vitamin D from exposure to sunlight, and from feeding on sun-cured hay.

Severe deficiency of vitamin A may cause night blindness, reproductive difficulties, poor or uneven hoof development, respiratory symptoms, and incoordination. There is also some evidence that deficiency of this vitamin may cause or contribute to certain leg bone weaknesses. When any of the deficiency symptoms appear, add dehydrated alfalfa or grass or a vitamin A supplement to the ration.

A deficiency in vitamin D, calcium, or phosphorus may cause rickets in foals. This can be prevented by exposing the animal to direct sunlight as much as possible, by allowing it free access to a suitable mineral mixture, or by providing it good-quality, sun-cured hay or lush pasture grown on well-fertilized soils. In northern areas lacking in adequate sunshine, many horsemen add a vitamin D supplement, such as cod liver oil or irradiated yeast, to the foals' ration.

Horses seem to require vitamin E, but most practical rations contain sufficient quantities of it. Rather than buy and use costly vitamin E concentrates because of a possible deficiency, add them to the ration only on the advice of a competent nutritionist or veterinarian.

Under some conditions, there is evidence that alpha tocopherol succinate (a relatively stable form of vitamin E) is effective in (1) increasing the conception rate of mares; (2) improving the breeding behavior, sex drive, sperm quality, and condition of stallions; and (3) improving the stamina, temperament, feed consumption, and track performance of racehorses. Where needed, the recommended daily doses of alpha tocopherol succinate in the feed are: Stallions and brood mares, 600 to 1,000 I.U. beginning a few weeks before breeding; and racehorses in training, 2,000 I.U.

A deficiency of riboflavin may cause moon blindness (periodic ophthalmia), but this is not the only factor in producing the condition (sometimes moon blindness follows leptospirosis in horses). Prevent moon blindness, caused by lack of riboflavin, by feeding green hays and green pastures, feeds high in riboflavin, or by adding crystalline riboflavin to the ration at the rate of 40 mg. per horse per day. A thiamine deficiency has been observed in horses fed on poor-quality hay and grain. Although thiamine is synthesized in the lower gut, the amount absorbed may not always meet the full requirements. Other vitamins of the B complex may be essential. Healthy horses usually get enough of them either in natural rations or by synthesis in the intestinal tract, primarily the caecum. When neither green pasture nor high-quality dry roughage is available, B vitamins may be provided by adding distiller's dried solubles, dried brewer's yeast, or animal liver meal to the ration.

Water

Horses should have ample quantities of clean, fresh, cool water. They will drink 10 to 12 gallons daily—the amount depending on the weather, amount of work done, and rations fed.

Free access to water is desirable. When this is not possible, water horses at approximately the same time each day.

Opinions vary as to the proper time and method of watering horses, but all agree that regularity and frequency are desirable. Most horsemen, however, agree that water may be given either before, during, or after feeding.

Frequent, small waterings between feedings are desirable during warm weather, or when the animal is being put to hard use. Do not allow a horse to drink heavily when he is hot, because he may founder. Do not allow a horse to drink a large amount of water just before going to work.

Pastures

Good pasturage is the cornerstone of successful horse production. Great horse-breeding centers are characterized by lush pastures produced on fertile soils. In season, there is no finer forage for horses.

A temporary pasture grown in a regular crop rotation is preferable to a permanent pasture that may be parasite infested.

Since horses are less likely to bloat than cattle or sheep, legume pastures are excellent for them. Specific grass or grass-legume mixtures vary widely from one area to another according to differences in soil, temperature, rainfall, and other natural factors.

Be sure horse pastures are well drained, that shade, water, and minerals are available, and that pits, stumps, poles, tanks, and places dangerous to horses are guarded.

4. WHAT CARE SHOULD I GIVE LIGHT HORSES?

Care of the feet

The value of a horse lies chiefly in its ability to move—hence the saying, "No foot, no horse." The important points in the care of a horse's feet are to keep them clean, prevent them from drying out, and trim them so they retain proper shape and length. The names of the parts of a horse's foot are shown in Fig. 17.

Clean the horse's feet regularly, with the hoof pick. Work from the heel toward the

Fig. 17. The parts of the foot of the horse are: (1) Bearing edge of the hoof wall. (2) Sole. (3) Median furrow of the frog. (4) Lateral Furrow of the frog. (5) Apex of the frog. (6) Branch of the frog. (7) Bar.

toe. Be sure to clean out the depressions between the frog and bars. While you are cleaning the feet, also inspect for loose shoes and thrush. Thrush is a disease of the foot, characterized by a pungent odor. It causes a softening of tissues in the cleft of the frog or in the junction between the frog and bars. This disease produces lameness and, if not treated, can be serious.

Hoofs which occasionally become dry and brittle, may split and produce lameness. The frog loses its elasticity and is no longer effective as a shock absorber. If the dryness is prolonged, the frog shrinks in size and the heel contracts. Prevent such drying by wetting the ground around the watering tank. If the hoofs of a shod horse become too dry, either pack them in wet clay once or twice a week after the horse has been used or attach burlap sacks around them. Keep the sacks moistened. A leather sole with tar and oakum packing beneath it may be used unless the horse travels over cinders. After the hoof has absorbed enough moisture, brush on a hoof dressing, such as neat's-foot oil, sweet oil, or linseed oil. Remove the oil before soaking again.

Trim the feet so that the horse stands square and plumb. This will prevent strain on the tendons and help prevent deformity, improper action, and unsoundness.

The healthy hoof grows $\frac{3}{8}$ to $\frac{1}{2}$ inch per month. If the hoof is not trimmed, the

wall will break off and will not wear evenly. To prevent this, trim the hoofs regularly, about once a month, whether the horse is shod or not. Use nippers to trim off the horn. Then, level the wall with a rasp.

Fig. 18 shows the proper posture of the hoof and incorrect postures caused by hoofs grown too long either in toe or heel. The slope is considered normal when the toe of the hoof and the pastern have the same direction. This angle should be kept always in mind and changed only as a corrective measure. If it should become necessary to correct uneven wear of the hoof, correct gradually over a period of several trimmings.

Fig. 18. (a) Hoof that is properly trimmed with a normal foot axis: O is coffin bone; X is short pastern bone; Y is long pastern bone; and Z is cannon bone. (b) Toe is too long, causing the foot axis to break backward. (c) Heel is too long, causing the foot axis to break forward.

Trim the hoof near the level of the sole. Otherwise, it will split off if the horse remains unshod. Trim the frog carefully. Remove any ragged edges that might allow filth to accumulate in the crevices. Trim the sole sparingly, if at all.

Never rasp the walls of the hoof. This removes the periople, or thin varnishlike outer layer provided by nature as a protective coating that prevents evaporation.

Shoe horses to be used on hard surfaces to prevent the wall from wearing down to the sensitive tissues beneath. A correctly shod horse is a more efficient performer. Shoes may be used to change gaits and action, to correct faulty hoof structure or growth, and to protect the hoof itself from such conditions as corns, contraction, or cracks.

Racing "plates" are used on running horses to aid in gripping the track.

Reshoe or reset shoes at 4- to 6-week intervals. Shoes that are left on too long, may cause the hoofs to grow out of proportion. This may throw the horse off balance.

An unshapely hoof causing uneven wear may cause foals to grow unsound limbs. Faulty limbs may be helped or even corrected by regular and persistent trimming. This practice also tends to educate the foal, making it easier to shoe at maturity. If the foal is run on pasture, you may need to trim the feet long before weaning time. Check the feet every 4 to 6 weeks. Trim a small amount each time rather than an excessive amount at longer intervals.

Before trimming the feet, inspect the foal while it is standing squarely on a hard surface. Then watch it walk and trot. Careless trimming may strain the foal's tendons.

Some common faults that may be corrected by trimming are:

Splayfoot (front toes turned out, heels turned in) can be helped or corrected by trimming the outer half of the foot.

Pigeon Toe (front toes turned in, heels turned out—opposite of splayfoot) can be helped or corrected by trimming the inner half of the foot more than the outer half.

Quarter Crack (a vertical crack on the side of the hoof) usually can be corrected if the hoof is kept moist and the toes shortened.

Cocked ankles (standing bent forward on the fetlocks—usually hind fetlocks) can be helped or corrected by lowering the heels. Cocked ankles will not occur if foals are allowed to get ample exercise and are not overfed, and the foal's heels are kept trimmed so that there is plenty of frog pressure.

Contracted heels (close at heels) can be spread apart if the heels are lowered and the frog allowed to carry more of the animal's weight.

Bedding

Select bedding material by availability and price, absorptive capacity, and potential value as a fertilizer. Bedding should not be dusty, too coarse, or too easily kicked aside.

Cereal straw or wood shavings usually make the best bedding material.

A soft, comfortable bed should insure proper rest. The animal will be much easier to groom if its bedding is kept clean.

A minimum daily allowance of clean bedding is 10 to 15 pounds per animal.

Exercise

Let your horses exercise as much as possible on pasture. They will develop strong, sound feet and legs from outdoor exercise. If no pasture is available, exercise mature animals for an hour or two a day under the saddle or in harness.

Horses with bad feet or faulty tendons may not be able to exercise on roads or under the saddle. Allow such animals to exercise in a large paddock, or on a 30- or 40-foot rope, or by leading.

5. WHAT BUILDINGS AND EQUIPMENT ARE NECESSARY?

Buildings and equipment for horses should be adequate, but need not be elaborate.

crowded. Barbed wire fence, however, is always hazardous to horses.

Fences

A preferred type of horse fence is constructed of poles or of 2-inch lumber. Avoid poles or lumber with projections that can cause injury.

Woven wire, or a combination of woven wire with one or more barbed wires at the top, may be used when the enclosure is not

Stable

One or two riding horses can be stabled in a barn with other animals, or in a building used primarily for storage. Figs. 19 and 20 show one design of a building for light horses. Working drawings of this or a similar barn may be obtained from the Agricultural Engineering Dept. at the University. Table 3 gives some average dimensions of stalls, mangers, etc.

Fig. 19. One design of a light-horse barn.

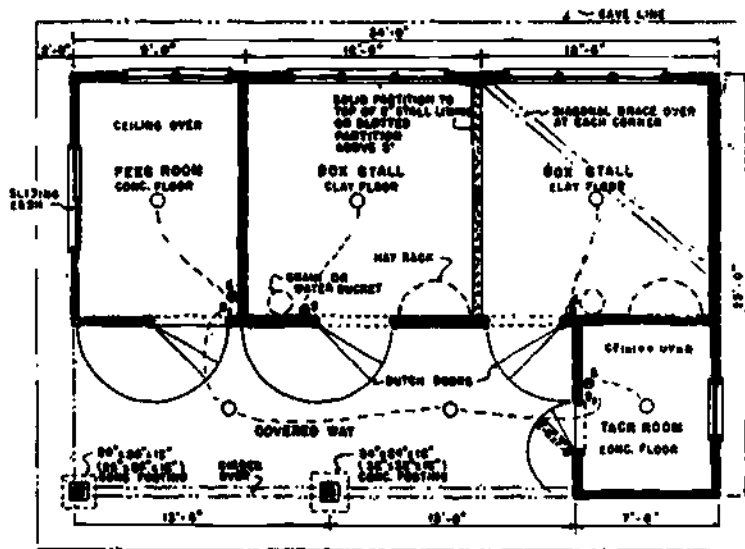

Fig. 20. Plan for barn shown in Fig. 19.

Foreword

The Vocational Curriculum Development and Research Center annually publishes a catalog of materials which are available to the state vocational-technical and trade schools of Louisiana.

This catalog is divided into four sections, Trade Preparatory Training Courses, Apprentice Training Courses, Trade Extension Training Courses and Supervisory Personnel Development Courses. Each course is described as to its format, how it is to be ordered, what instructors aids are available, the required bibliography, and a detailed outline of the material.

The catalog is punched for a three ring binder. It is recommended that it be placed in a binder so that new material can be readily added or revised material be replaced conveniently.

We hope this material will be of use to the various schools.

Table Of Contents

SECTION I

June, 1967

Trade Preparatory Training Courses

1. Auto Mechanics
2. Cabinetmaking
3. Carpentry
4. Civil Engineering Technology
 - (1) Map Drafting and Related Computations
5. Electrical Diagrams
6. Farm Mechanics
7. Fundamental Electrical
8. Industrial Drafting
9. Industrial Engines
10. Industrial Instruments Technology
11. Machine Shop
12. Office Occupations
 - (1) Accounting
 - (2) Business English
 - (3) Business Law
 - (4) Business Letter Writing
 - (5) Business Mathematics
 - (6) Business Structure, Organization, and Management
 - (7) Filing
 - (8) Full-Keyboard Adding-Listing Machine
 - (9) Key-Driven Calculator
 - (10) Office Practice
 - (11) Payroll Records and Accounting
 - (12) Personal Development
 - (13) Posting Machine
 - (14) Printing Calculator
 - (15) Rotary Calculator
 - (16) Salesmanship
 - (17) Shorthand
 - (18) Spelling
 - (19) Ten-Key Adding-Listing Machine
 - (20) Typewriting
13. Practical Nurse Education
14. Practical Physics
15. Radio-Television-Electronics
16. Refrigeration and Air Conditioning
17. Sheet Metal
18. Small Craft Operation and Navigation
19. Small Engines Mechanics
20. Tractor Maintenance and Repair
21. Vocational-Technical Drawing
22. Watchmaking Technology
23. Welding

Apprentice Training Courses

1. Carpentry
2. Electrical
3. General Apprentices
4. Machinist
5. Pipe Fitter
6. The Plumbing and Pipe Fitting Industry
7. The Plumbing and Pipe Fitting Industry - Steam Fitting

SECTION III

Trade Extension Training

1. Electrical Utility Workers Training Program
2. Highway Engineering Aide Training Program

SECTION IV

Supervisory Personnel Development

1. Business Letter Writing for Industrial Supervisors
2. Conference Leadership
3. Economics for Industrial Supervisors
4. Extemporaneous Talk for Industrial Supervisors
5. Highway Economics
6. Industrial Housekeeping
7. Industrial Relations
8. Interviewing for Supervisory Personnel
9. Introduction to Management
10. Listening
11. Report Writing
12. Understanding Human Nature
13. Work Simplification

AUTO MECHANICS
Trade Preparatory

C Page 1 of 9

The Auto Mechanics Course (Trade Preparatory) was published in 1948-49 and was revised in 1955, 1958 and again in 1963. This course is available in loose form with the Related Study Assignment, Job and Math stapled together and in book form.

A detailed outline of the Auto Mechanics Course (Trade Preparatory) follows:

Unit I - Benchwork

Math	1	Addition of Whole Numbers
Math	1A	Subtraction of Whole Numbers
Math	1B	Linear Measurement
R.S.A.	1	Hand Tools and How to Use
Job	1	Identify Assigned Tools
Math	2	Scale Practice
R.S.A.	2	Bolts and Nuts Specifications
Job	2	Identify Bolts and Nuts
Math	3	Addition of Scale Measurements
R.S.A.	3	Files and Filing
Job	3	Make a Drill Gauge
Math	4	Subtraction of Scale Measurements
R.S.A.	4	Twist Drills
Job	4	Sharpen a Twist Drill
Math	5	Multiplication of Whole Numbers
R.S.A.	5	Drilling and Tapping
Job	5	Reading the Micrometer
Job	5A	Make Internal Thread Block
Math	6	Division of Whole Numbers
R.S.A.	6	Threading
Job	6	Make a Stud
Math	7	Reducing Fractions to Lowest Terms
R.S.A.	7	Installing Studs and Removing Broken Studs
Job	7	Remove Broken Stud by Drilling
Job	7A	Remove Broken Stud with Extractor
Job	7B	Repair Damaged Threads by Installing Heli-coil

Unit I - Benchwork (Continued)

Math 8 Changing Improper Fractions to Mixed Numbers
R.S.A. 8 Solder, Soldering, and Soldering Coppers
Job 8 Soldering
Job 8A Make a Bolt and Nut Tray
Job 8B Wire Splicing and Soldering
Math 9 Changing Mixed Numbers to Improper Fractions
R.S.A. 9 Grinding a Screwdriver
Job 9 Grind a Screwdriver
R.S.A. 10 Tubing
R.S.A. 10A Flex Tubing (Hose)
Job 10 Tubing, Cutting, Flaring, and Bending

Unit II - Preventive Maintenance

R.S.A. 1 Lubricating Oils
Job 1 Drain Crankcase and Refill
R.S.A. 2 Engine Lubrication
Job 2 Remove and Replace Element in Oil Filter
R.S.A. 3 Air Cleaners
Job 3 Remove, Clean, Refill, and Replace Air Cleaner
R.S.A. 4 Lubrication
Job 4 Lubricate Automobile

Unit III - Front and Rear Wheel Service

R.S.A. 1 Front Wheel Service
Job 1 Remove, Lubricate, and Adjust Front Wheel Bearing
R.S.A. 2 Grease Seals and Rear Wheel Bearings
Job 2 Remove and Install Rear Wheel Bearings and Grease Seal

Unit IV - Shock Absorbers and Springs

R.S.A. 1 Operating Principles of Shock Absorbers and Stabilizer
Job 1 Remove and Replace a Direct-Acting Type Shock Absorber
Job 1A Remove and Replace Stabilizer
R.S.A. 2 Springs and Shackles
Job 2 Remove and Replace Rear Springs
Job 2A Remove and Replace Front Coil Spring
R.S.A. 3 Rear Coil Springs, Torsion Bars, Air Level Suspension
Job 3 Remove and Replace Rear Coil Spring
Job 3A Remove and Replace Torsion Bars and Adjust Front Suspension Height

Unit V - Steering and Front End Alignment

R.S.A. 1 Tie Rod Ends and Toe-in
Job 1 Remove and Replace Tie Rod Ends and Adjust Toe-in

Unit V - Steering and Front End Alignment (Continued)

R.S.A.	2	Steering Gear Adjustments
Job	2	Overhaul Gemmer Steering Gear and Adjust
Job	2A	Overhaul and Adjust a Saginaw Steering Gear
R.S.A.	3	Power Steering
Job	3	Checking a Power Steering Unit
R.S.A.	4	Principles of Front End Geometry
Job	4	Align Front Wheels, Caster, Camber and Toe-in
R.S.A.	5	Wheel Balancing
Job	5	Balance Wheel
R.S.A.	6	Reaming
Job	6	Rebush Spindle (Pressed in Bushings)
R.S.A.	7	Front End Alignment on Ball Joint Suspension
Job	7	Front Wheel Alignment on Ball Joint Suspension
Job	7A	Remove and Replace Front Suspension Ball Joint
Job	7B	Remove and Replace Upper and Lower Control Arms

Unit VI - Brakes

R.S.A.	1	Brake Shoes and Lining
Job	1	Adjust Hand Brakes
R.S.A.	2	Brake Adjustments
Job	2	Adjust Brakes (Minor)
R.S.A.	3	Principles of Hydraulic Brake Systems
Job	3	Bleed Hydraulic Brake System and Replenish Brake Fluid
R.S.A.	4	Hydraulic Master Cylinders and Wheel Cylinders
Job	4	Remove and Recondition Wheel Cylinders
Job	4A	Remove and Recondition a Master Cylinder
Job	4B	Replace Broken Brake Line
R.S.A.	5	Brake Drums
Job	5	Turn Brake Drum
Job	5A	Reline Brakes, and Adjust (Bendix)
R.S.A.	6	Power Brakes
Job	6	Remove and Recondition a Power Brake Unit and Replace
Job	6A	Reline Brake and Adjust (Lockheed)

Unit VII - Universal Joints, Drive Shafts, and Rear Axle

R.S.A.	1	Universal Joints and Drive Shafts
Job	1	Remove and Repair a Universal Joint (Cross and Two Yoke Type)
Job	1A	Remove and Repair a Universal Joint (Ball and Trunnion Type)
Job	1B	Remove and Replace Rear Axle
R.S.A.	2	Principles of the Differential
Job	2	Disassemble, Assemble and Adjust Rear End
Job	2A	Disassemble and Adjust Rear End (Chrysler Products)

Unit VII - Universal Joints, Drive Shafts, and Rear Axle
(Continued)

R.S.A.	3	Differential Service
Job	3	Overhaul Rear End
R.S.A.	4	Traction Drive
Job	4	Remove and Overhaul Safe-T Track Rear Axle

Unit VIII - Clutch and Transmission

R.S.A.	1	Principles of the Clutch
Job	1	Adjust Clutch Pedal Free Play
R.S.A.	2	Clutch Service
Job	2	Remove and Replace Clutch
R.S.A.	3	Principles of the Transmission
Job	3	Adjust Gearshift Linkage
R.S.A.	4	The Synchromesh Transmission
Job	4	Disassemble and Assemble Transmission (Ford)
Job	4A	Disassemble and Assemble Transmission (Chevrolet)
Job	4B	Disassemble and Assemble Transmission (Pontiac)
R.S.A.	5	Transmission Troubles
Job	5	Remove, Overhaul and Replace Transmission
R.S.A.	6	Overdrive
Job	6	Remove, Overhaul and Replace Overdrive
R.S.A.	7	Roto-Hydra-Matic Transmission
Job	7	Adjust Control Linkage on a Roto-Hydra-Matic Transmission
Job	7A	Disassemble and Assemble Roto-Hydra-Matic Transmission
R.S.A.	8	Controlled Coupling or Super Hydra-Matic Transmission
Job	8	Disassemble and Assemble a Controlled Coupling Transmission
R.S.A.	9	Powerglide Transmission Service Adjustments
Job	9	Powerglide Transmission Linkage Adjustment
R.S.A.	10	The Powerglide Transmission
Job	10	Disassemble and Repair Powerglide Transmission
R.S.A.	11	Cruise-O-Matic Band and Throttle Linkage Adjustment
Job	11	Adjust Throttle Linkage and Bands on Cruise-O-Matic Transmission
R.S.A.	12	The Cruise-O-Matic Transmission
Job	12	Disassemble and Repair a Cruise-O-Matic Transmission
R.S.A.	13	The Torqueflite Transmission
Job	13	Disassemble and Repair Torqueflite Transmission
R.S.A.	14	Transmission-Push Button Controls
Job	14	Push Button Control Cable Adjustment

Unit IX - Fuel System

- R.S.A. 1 Fuel Gauges and Fuel Pumps
- Job 1 Test Fuel Level Gauge
- Job 1A Replace Gas Lines and Flexible Gasoline Connection
- Job 1B Check Fuel Pump Pressure, Vacuum and Volume
- Job 1C Overhaul Fuel Pump, Install on Engine, and Test
- R.S.A. 2 Principles of Carburetion
- R.S.A. 2A Carburetor Circuits
- Job 2 Remove, Disassemble, Clean and Repair a Carburetor (Carter BBS)
- R.S.A. 3 Carburetor Circuits (Rochester)
- Job 3 Remove, Disassemble, Clean and Repair a Carburetor (Rochester Model BC)
- Job 3A Remove, Disassemble, and Repair a Ford V-8 Carburetor
- R.S.A. 4 Four Barrel Carburetor
- Job 4 Remove, Disassemble and Repair a Four-Barrel Carburetor (Rochester 4GC)
- R.S.A. 5 Choke Control and Manifold Heat Control
- Job 5 Free Up Heat Control Valve
- R.S.A. 6 Fuel Injection
- Job 6 Solder Leak in Fuel Tank

Unit X - Ignition System

- R.S.A. 1 Basic Principles of Electricity
- R.S.A. 1A Battery Service
- Job 1 Service a Battery
- R.S.A. 2 High Tension Cables and Spark Plugs
- Job 2 Service Spark Plugs, High Tension Wires and Distributor Cap
- R.S.A. 3 Ignition System
- Job 3 Remove and Replace Distributor Points and Set Ignition Timing
- Job 3A Tune Up Checks and Adjustment. (Vacuum, Dwell, Timing, Compression, Coil, Condenser, Spark Plugs, Distributor Resistance, and Ignition Primary Circuit Resistance)

Unit XI - Generators and Regulators

- R.S.A. 1 Generators
- R.S.A. 1A Generator Service
- Job 1 Remove, Disassemble, Repair and Replace a Generator
- R.S.A. 2 Generator Regulators
- Job 2 Check and Adjust a Voltage Regulator
- R.S.A. 3 Alternators (A.C. Generators)
- Job 3 Testing Alternator Output (A.C. Generator)

Unit XII - Starting Motors

- R.S.A. 1 Starting Motor Fundamentals, Cables, Controls and Drives
- Job 1 Install New Starter Cables and Solenoid Switch
- R.S.A. 2 Starter Maintenance and Test
- Job 2 Check Starter Insulated Circuit, Solenoid Resistance, Battery Capacity, and Starter Amperage Draw
- Job 2A Install and Test Field Windings for Open Circuits and Grounds
- Job 2B Remove, Overhaul and Replace Starter

Unit XIII - Cooling System

- R.S.A. 1 Functions of the Cooling System
- Job 1 Remove, Inspect, Test and Replace Water Pump, Thermostat, Fan Belt, and Pressure Cap
- R.S.A. 2 Flushing Cooling System
- Job 2 Remove, Solder, Test, And Replace Radiator
- R.S.A. 3 Antifreeze
- Job 3 Install and Test Antifreeze

Unit XIV - Engine Overhaul (Benchwork)

- R.S.A. 1 Engine Fundamentals and Components
- Job 1 Clean Engine with Cold (or Hot) Degreasing Solution
- R.S.A. 2 Oil Pumps and Pressure Regulators
- Job 2 Remove, Inspect, and Replace Oil Pump
- Job 2A Clean Oil Pressure Relief Valve
- Job 2B Remove and Replace Expansion Plug
- R.S.A. 3 Valve Operating Mechanisms
- Job 3 Remove, Reface and Replace Rocker Arms
- R.S.A. 4 Servicing Valves
- Job 4 Grind Valve on I-Head Engine
- R.S.A. 5 Valve Timing
- Job 5 Remove and Replace Timing Gear or Chain
- R.S.A. 6 Engine Bearing, Crankshaft and Camshaft
- R.S.A. 6A Piston Pins and Bushings
- Job 6 Remove Old and Fit New Piston Pin and Bushing, and Align Connection Rod
- R.S.A. 7 Piston, Rings and Cylinders
- R.S.A. 7A Cylinder Reconditioning
- Job 7 Rebore Cylinder
- Job 7A Overhaul Engine Completely

Unit XV - Engine Repairs

- Job 1 Remove Engine From Car and Replace it
- Job 2 Adjust New Connecting Rod Bearing with Engine in Car (Precision Insert Type)
- Job 3 Adjust Main Bearings with Engine in Car
- Job 4 Grind Valves on I-Head Engine in Car

Unit XVI - Lights and Horns

- R.S.A. 1 Lights and Lighting Circuits
- Job 1 Install Headlight Sealed Beam and Focus Headlights
- Job 1A Test for Short, Open and Ground Circuit at Headlight
- Job 1B Install Dimmer Switch
- Job 1C Install Stop Light Switch
- Job 1D Install Headlight Switch
- Job 1E Install New Wiring Harness
- R.S.A. 2 Horns, Switches, and Relays
- Job 2 Install New Horns and Relay
- Job 2A Test for Open and Short in Horn that will not Blow
- Job 2B Install New Horn Wiring Circuit
- R.S.A. 3 Turn Signals and Back-up Lights
- Job 3 Servicing Turn Signals and Back-up Lights

Unit XVII - Automobile Accessories

- R.S.A. 1 Accessory Equipment
- Job 1 Install Heater
- Job 1A Remove and Install Speedometer
- Job 1B Remove, Clean, Adjust, and Replace Vacuum Windshield Wiper Motor
- Job 1C Install Mufflers and Tail Pipes and Adjust Brackets
- R.S.A. 2 Electric Wiper Motors
- Job 2 Remove, Clean, Inspect, Replace and Adjust Electric Wiper
- R.S.A. 3 Power Seats
- Job 3 Remove and Replace Power Front Seat Adjuster
- R.S.A. 4 Air Condition Service
- Job 4 Check for Leaks, Repair Leaks and Recharge Air Conditioning System on Chevrolet
- Job 4A Remove and Replace Air Conditioner Dryer-Receiver Tank on Chevrolet
- Job 4B Remove and Replace Air Conditioning Thermostatic Expansion Valve on Chevrolet
- Job 4C Replace Air Conditioner Compressor Seal on Chevrolet

Unit XVIII Welding-Oxyacetylene

- R.S.A. 1 Setting Up Equipment
- Job 1 Set Up Oxyacetylene Welding Apparatus
- R.S.A. 2 Welding Steel
- Job 2 Run Beads, Flat Position 1/8" Material
- Job 2A Flat Position Butt Weld 1/8" Material
- R.S.A. 3 Flame Cutting
- Job 3 Hand Cut 1/2" Material

Unit XVIII - Welding-Oxyacetylene (Continued)

R.S.A. 4 Bronze Welding
Job 4 Flat Position Butt Welding 1/8" Material
Job 4A Bronze Weld Cast Iron Plate

Unit XIX - Arc Welding

R.S.A. 1 Equipment and Striking an Arc
Job 1 Set Up Welding Machine and Strike Arc
Job 1A Run Continuous Stringer Beads, Flat Position
1/4" Material
Job 1B Lap Joint Weld Flat Position 1/4" Material

Unit XX - Shop Practices

R.S.A. 1 Frame and Body
Job 1 Remove and Replace Door Lock; Adjust
Job 1B Adjust Striker Plate
Job 1C Align Doors

The Cabinetmaking Course was published in 1952. It is available in the following forms:
For students the material is stapled in individual packages. Related Study Assignments, Jobs, Job Information Sheets, Auxiliary Jobs, Tests and Math are included in Book 1 - Unit 1.

Related Study Assignments, Jobs, and Job Information Sheets are included in Book 2 - Units 2, 3, 4.

Answer Book
Complete for tests and math

The following instructor's aids are available:
Individual Folder Type

There are no references since all needed information is given in the Job Information Sheets.

A detailed outline of the Cabinetmaking Course follows:

Unit I - Furniture

Job	1	End Table Legs
J.I.S.	1	The Crosscut Saw
R.S.A.	1	Wood Screws
Math.	1	How to Use the Rule
Test	1	
Job	2	Stretchers for End Table
J.I.S.	2	Hand Rip Saw
R.S.A.	2	Wood Glue
Math.	2	Calculating Board Feet and Cost
Test	2	
Job	3	End Table Top and Assembly
J.I.S.	3	Dividers and Their Use
R.S.A.	3	Clamps and Clamping
Math.	3	Calculating Sheet Products and Their Cost
Test	3	
Job	4	Chair
J.I.S.	4	The Jointer and Its Use
R.S.A.	4	Nails
Math.	4	Laying Out a 45° Angle
Test	4	
Job	5	Night Table
J.I.S.	5	Preparation of Uniform Stock, Etc.
R.S.A.	5	Making a Template (The Cabriole Leg)
Math.	5	Addition of Fractions
Test	5	

Course Outline (Continued)

Unit I - Furniture (Continued)

Job	6	Step Table
J.I.S.	6	Drawer Construction (Flush Type)
R.S.A.	6	Making a Bill of Material
Math.	6	Subtraction of Fractions
Test	6	
Job	7	Bookcase
J.I.S.	7	Radial Saw
R.S.A.	7	Coated Abrasives
Math.	7	Division of Fractions
Test	7	
Job	8	Cocktail Table
J.I.S.	8	Basic Furniture Units of Construction
R.S.A.	8	Cabinetmaking Hardware - Hinges
Math.	8	The Decimal System
Test	8	
Job	9	Pembroke Table
J.I.S.	9	Making Rule Joint
R.S.A.	9	Wood Seasoning
Math	9	Simple Percentage
Test	9	
Job	10	Chest of Drawers
J.I.S.	10	Drawer Guides
R.S.A.	10	Plywood
Math.	10	Personal Checks and Drafts
Test	10	
Job	11	China Cabinet
J.I.S.	11	Lathe and Lathe Operations
R.S.A.	11	Grading of Lumber
Math.	11	Interest and Taxes
Test	11	
Job	12	Desk
J.I.S.	12	Woodworking Joints
R.S.A.	12	Lumbering
		Personal and Social Problems
Test	12	
Job	13	Special Project (Selected by the Student)
R.S.A.	13	Bearings and Power Transmission
R.S.A.	14	Evolution of Furniture
R.S.A.	15	Louisiana Woods Suitable for Cabinetmaking
Test	13	

Course Outline (Continued)

Unit I - Furniture (Continued)

- Auxiliary Job 14: Sharpening Handsaws
- Auxiliary Job 15: Attaching Sanding Disc
- Auxiliary Job 16: Care of Electric Motors
- Auxiliary Job 17: Sharpening Bevel Edge Tools
- Auxiliary Job 18: Sharpen Circular Saws
- Auxiliary Job 19: Replacing Jointer Knives
- Auxiliary Job 20: Changing Circular Saw Blade
- Auxiliary Job 21: Pulley Ratios and Machine Speeds
- Auxiliary Job 22: Sharpening Auger Bits
- Auxiliary Job 23: Dressing Abrasive Wheels
- Auxiliary Job 24: Replacing Band and Small Saw Blade

Unit II - Wood Finishing

- R.S.A. 16: Preparation of Surface
- R.S.A. 17: Varnish Brushes
- R.S.A. 18: Spraying Equipment
- R.S.A. 19: Finishing Abrasives
- R.S.A. 20: Stains
- J.I.S. 1: Applying Oil Stains
- J.I.S. 2: Applying Water Stain
- R.S.A. 21: Crack Fillers
- R.S.A. 22: Wood Fillers
- J.I.S. 3: Applying Filler

Course Outline (Continued)

Unit II - Wood Finishing (Continued)

- R.S.A. 23: Sealers
- R.S.A. 24: Shellac
- J.I.S. 4: Applying Shellac
- R.S.A. 25: Turpentine
- R.S.A. 26: Varnish
- J.I.S. 6: Applying Lacquer Sealers
- J.I.S. 7: Applying Lacquer
- R.S.A. 28: Linseed and Tung Oils
- J.I.S. 8: Oil Finish
- J.I.S. 9: A New Finish
- J.I.S. 10: Bleaching Wood
- R.S.A. 29: Enamels
- R.S.A. 30: Characteristics of Wood Affecting Finish
- R.S.A. 31: Pigments

Unit III - Custom Work

- Job 1: Kitchen Cabinet Base
- R.S.A. 32: Hardware, Trim, Its Application and
Miscellaneous Items
- R.S.A. 33: Covering Materials
Cabinetmaking Drawing, Plates 1-19

- Job 2: Kitchen Cabinet Top
- R.S.A. 34: New Materials
Cabinetmaking Drawing, Plates 20-44

- Job 3: Dining Corner Cabinet
Cabinetmaking Drawing, Plates 45-52

Unit IV - Production Work

Supplementary Hand Jobs

Unit I - Furniture

Job 1: Lawn Table
J.I.S. 1: Layout and Cut a Cross Lap Joint
Test 1

Job 1-A: Colonial Bench
J.I.S. 1-A: Bench Vise and Stops
R.S.A. 1-A: The Shop
Test 1-A:

Job 1-B: Utility Stand
J.I.S. 1-B: Layout and Cut Duplicate Parts
Test 1-B:

Job 1-C: Lawn Chair
Test 1-C:

Job 2: End Table
J.I.S. 2: Lay Out and Cut Tapers with Jack Plane
Test 2:

Job 3: Cobbler's Bench
J.I.S. 3: To Cut A Rabbet with a Rabbet Plane
Test 3:

The Carpentry Course (Trade Preparatory) was written and published in 1955. The course was revised in 1958 and again in 1963. Instructors may secure the material in book form (4 books; R.S.A.'s, Jobs, Tests, and Answers). Student material is stapled in loose form, that is, each job with the corresponding related material. The material is to be ordered by Unit and Job number. An individual permanent record folder is also available.

The references for the Carpentry (Trade Preparatory) Course are listed below.

A detailed outline of the Carpentry (Day Preparatory) Course follows.

- Unit I Hand Tools and Their Uses
- R.S.A. 1 - Measuring Tools, Bench Vise and Stops
 - Job 1 - Flower Pot Base, Octagon Top
 - R.S.A. 2 - Layout Tools, Testing Tools, and
Sawing Tools
 - Job 2 - Flower Pot Base, Bottom Cross Pieces (Legs)
 - R.S.A. 3 - Bench Planes, Edge Cutting Tools and
Mallets
 - Job 3 - Make 3 Tapered Table Legs
 - R.S.A. 4 - Boring Tools
 - Job 4 - Mortise Table Legs
 - R.S.A. 5 - Smoothing Tools and Coated Abrasives
 - Job 5 - Stretchers For End Table
 - R.S.A. 6 - Woodworking Joints and Moldings, Wood
Glues, and Clamps and Clamping
 - Job 6 - To Make An End Table
 - R.S.A. 7 - Miter Box and Fasteners Corrugated
 - Job 7 - Picture Frame, Size 8" x 10"

Course Outline (Continued)

Unit I (Continued)

- R.S.A. 8 - The Compass Saw and Coping Saw
- Job 8 - Make Book Ends
- R.S.A. 9 - Hand Router Plane, Dadoes, Plywood, and Grading
- Job 9 - Flower Box
- R.S.A. 10 - Sawhorses, Lumbering, Wood Seasoning, and Grading of Lumber
- Job 10 - Make a Sawhorse
- R.S.A. 11 - To Be Selected By Instructor
- R.S.A. 12 - To Be Selected By Instructor

Unit II Drafting

- R.S.A. 1 - Introductory Drafting Unit of Carpentry
- Job 1 - Basic Lines
- R.S.A. 2 - The Language of Drawing and Learning to Draw
- Job 2 - Lay Out Sheet, Horizontal and Vertical Lines
- R.S.A. 3 - Lettering
- Job 3 - Technique of Lettering
- Job 3A - Six Squares, Dividing Into Angles
- R.S.A. 4 - Lines and Dimensions
- Job 4 - Lines and Dimensions
- R.S.A. 5 - Geometrical Construction
- Job 5 - Geometric Problems
- Job 5A - Dial Plate
- R.S.A. 6 - Theory of Shape Description
- Job 6 - Slotted Block, 2-View
- Job 6A - Tenon
- R.S.A. 7 - Reading and Making Drawings
- Job 7 - Offset Spacer, 3-View
- R.S.A. 8 - Hidden Lines
- Job 8 - End Stop
- Job 8A - Inkwell Base
- Job 8B - Tool Post Slide
- Job 8C - V-Guide and Wedge
- R.S.A. 9 - Sections
- Job 9 - Protected Bearing
- Job 9A - Stuffing Box Gland
- Job 9B - Yoke
- Job 9C - Lever Arm
- R.S.A. 10 - Auxiliary Views and Revolutions
- Job 10 - Tapered Wedge
- R.S.A. 11 - Principles of Size Description
- Job 11 - Hollow Molding
- R.S.A. 12 - Technique of the Finished Drawing
- Job 12 - Adjustable Bracket
- Job 12A - Shaft Support

Course Outline (Continued)

Unit II (Continued)

- R.S.A. 13 - Sheet Metal Drafting (Isometric)
- Job 13 - Truncated Square Prism
- Job 13A - Transition Piece
- Job 13B - Truncated Cylinder
- R.S.A. 14 - Pictorial Drawing
- Job 14 - Isometric Figures
- R.S.A. 15 - Production Illustration
- Job 15 - Isometric Offset Block
- Job 15A - Dovetail Figures
- Job 15B - Isometric Cube
- R.S.A. 16 - Screws, Bolts and Other Fastenings
- Job 16 - Machine Bolt
- R.S.A. 17 - Architectural Drawings
- Job 17 - Floor Plan Garage
- R.S.A. 18 - Architectural Drafting
- Job 18 - Foundation and Detail of Roof Construction
- R.S.A. 19 - Architectural Drafting
- Job 19 - Front Elevation
- Job 19A - Side Elevation

Unit III Foundations

- R.S.A. 1 Surveying Instruments
- Job 1 - Set Up and Level the Builder's Transit or Level
- Job 1A - Find the Difference of Level of Two Points
- Job 1B - Run a Straight Line
- R.S.A. 2 - Principles of Laying Out Building Lines
- Job 2 - Locate a Building on a Lot
- R.S.A. 3 - Principles of Erecting and Leveling Batter Boards
- Job 3 - Erect Batter Boards
- R.S.A. 4 - Description, Construction and Erection of Continuous Wall Footing Forms
- Job 4 - Build and Set a Section of Continuous Footing Form
- R.S.A. 5 - Description, Construction and Erection of Pier Footing Forms
- Job 5 - Build a Pier Footing Form
- R.S.A. 6 - Description, Construction and Setting of Concrete Foundation Form Walls and How to Provide for Openings
- Job 6 - Build and Set a Section of Double Wall Form
- R.S.A. 7 - Description of and How to Suspend Anchor Bolts in Concrete Forms
- Job 7 - Suspend Anchor Bolts in Concrete Forms
- R.S.A. 8 - Description, Construction and Setting of Concrete Pier Forms
- Job 8 - Build a Concrete Pier Form

Course Outline (Continued)

Unit III (Continued)

R.S.A. 9 - Description, Construction and Setting of
Concrete Step Forms

Job 9 - Build and Set a Concrete Step Form

R.S.A. 10 - Description of and Setting Forms for
Concrete Floors and Sidewalks

Job 10 - Build a Section of Concrete Sidewalk Form

Job 11 - To Be Selected By Instructor

Unit IV Frame Construction

R.S.A. 1 - Description of Types of Sill Construction
and How to Frame and Install Sills

Job 1 - Lay Out, Cut and Assemble Solid Sills

R.S.A. 2 - Description of Floor Joists and How to
Install

Job 2 - Lay Out and Install Floor Joists

R.S.A. 3 - How to Lay Out, Cut and Install Bridging

Job 3 - Lay Out, Cut and Install Bridging

R.S.A. 4 - Description of Methods of Laying Subfloors

Job 4 - Lay Subfloor Diagonally to Floor Joists

R.S.A. 5 - How to Lay Out and Cut Plates to Length

Job 5 - Locate, Lay Out and Cut Plates

R.S.A. 6 - How to Lay Out and Cut Studs for Side
Walls

Job 6 - Lay Out and Cut Studs for a Single Story
building

R.S.A. 7 - Corner Posts

Job 7 - Build a Corner Post

R.S.A. 8 - How to Frame Walls in a Balloon Frame;
Description of and How to Frame Openings
in the Outside Walls of a Balloon Frame;
and How to Frame Walls in the Platform
and Modern Braced Frame

Job 8 - Assemble Wall Sections

R.S.A. 9 - Bracing

Job 9 - Bracing a Wall Section

R.S.A. 10 - Description of and How to Frame Interior
Partitions

Job 10 - Assemble and Erect an Inside Partition

R.S.A. 11 - How to Space the Second and Attic Floor
Joists

Job 11 - Install Ceiling Joists

R.S.A. 12 - Description of Methods of Applying
Sheathing

Job 12 - Apply Outside Wall Sheathing

R.S.A. 13 - Description and Function of Insulating
Materials

Job 13 - Install Insulating Material

Job 14 - To Be Selected By the Shop Instructor

Course Outline (Continued)

- Unit V Roof Framing, Sheathing and Shingles
- R.S.A. 1 - Terms, Types, and Principles of Roof Framing; Description of Methods of Laying Out a Common Rafter; and Steel Square Common Rafter Table
 - R.S.A. 1A - The Framing Square and The Rafter
 - Job 1 - Lay Out and Cut a Common Rafter Using the Step-off Method
 - R.S.A. 2 - How to Erect a Gable Roof, and Light Wood Framing Details
 - Job 2 - Frame a Gable Roof
 - R.S.A. 3 - How to Lay Out, Cut and Install Gable Studding
 - Job 3 - Lay Out, Cut, and Install Gable Studs
 - R.S.A. 4 - Determining the Length of a Collar Tie
 - Job 4 - Lay Out, Cut, and Install Collar Ties
 - R.S.A. 5 - Description of Methods of Laying Out Hip Rafters and Steel Square Hip Rafter Table
 - Job 5 - Lay Out and Cut a Hip Rafter
 - R.S.A. 6 - Method of Laying Out Hip Jack Rafters and Steel Square Hip Jack Rafter Table
 - Job 6 - Lay Out and Cut a Hip Jack Rafter
 - R.S.A. 7 - How to Erect a Hip Roof
 - Job 7 - Frame a Hip Roof
 - R.S.A. 8 - Description of Methods of Laying Out Valley Rafters; and Steel Square Valley Rafter Table
 - Job 8 - Lay Out and Cut a Valley Rafter
 - R.S.A. 9 - Method of Laying Out a Valley Jack Rafter; Method of Laying Out a Valley Cripple Jack Rafter; and Steel Square Valley Jack Rafter Table
 - Job 9 - Lay Out and Cut a Valley Jack Rafter
 - R.S.A. 10 - Method of Laying Out the Hip-Valley Cripple Jack Rafter and Steel Square Hip-Valley Cripple Rafter Table
 - Job 10 - Lay Out and Cut a Hip Valley Cripple Jack Rafter
 - R.S.A. 11 - How to Erect an Intersecting Gable Roof
 - Job 11 - Frame an Intersecting Roof
 - R.S.A. 12 - Types of Window Screens
 - Job 12 - Apply Roof Sheathing
 - R.S.A. 13 - Methods of Applying Roll Roofing
 - Job 13 - Apply Roofing Felt
 - R.S.A. 14 - Description of Composition Roof Covering and How to Apply Strip Shingles
 - Job 14 - Apply Strip Shingles

Course Outline (Continued)

Unit VI Exterior Trim

- R.S.A. 1 - Description and Construction of Window Frames
 - Job 1 - Build a Window Frame
- R.S.A. 2 - How to Assemble and Install Window Frames
 - Job 2 - Install a Window Frame
- R.S.A. 3 - Description and Types of Aluminum Window Units and Installation Instruction
 - Job 3 - Install an Aluminum Window Unit
- R.S.A. 4 - Types of Door Frames
 - Job 4 - Build an Exterior Door Frame
- R.S.A. 5 - How to Build and Install Door Frames
 - Job 5 - Install an Exterior Door Frame
- R.S.A. 6 - Description of Common Types of Cornices and How to Build
 - Job 6 - Apply Box Cornice
- R.S.A. 7 - Description and Application of Corner Boards
 - Job 7 - Apply Corner Boards
- R.S.A. 8 - Louvers in Frame Walls
 - Job 8 - Build and Install a Louver
- R.S.A. 9 - Description and Application of Exterior Side Wall Covering
 - Job 9 - Apply Bevel Siding
- R.S.A. 10 - Stair Types, Terms and Principles and Stair Layout
 - Job 10 - Lay Out, Cut and Assemble a Set of Steps
- R.S.A. 11 - The Miter Box and Saw
 - Job 11 - Build a Miter Box
- R.S.A. 12 - Types of Window Screens
 - Job 12 - Build, Fit and Hang a Window Screen
- R.S.A. 13 - How to Fit Full Surface Hinges and How to Apply Mortise Locks
 - Job 13 - Build, Fit and Hang a Screen Door
- Job 14 - To Be Selected by the Shop Instructor

Unit VII Interior Trim

- R.S.A. 1 - Description and Laying Finish Floors and Wood Flooring
 - Job 1 - Lay Finish Flooring
- R.S.A. 2 - Methods of Hanging Window Sash, How to Fit Window Sash, and Wood Double Hung and Wood Casement Windows
 - Job 2 - Install Window Sash
- R.S.A. 3 - Description and How to Apply Window Trim
 - Job 3 - Apply Interior Window Trim
- R.S.A. 4 - Description of Window Hardware
 - Job 4 - Apply Window Hardware

Course Outline (Continued)

Unit VII (Continued)

- R.S.A. 5 - Types of Door Frames and How to Install Door Frames
- Job 5 - Build and Install an Interior Door Frame
- R.S.A. 6 - Description of Interior and Exterior Doors; How to Fit a Door; and Stock Wood Doors
- Job 6 - Fit and Hang a Door
- R.S.A. 7 - Description of Finish Hardware and How to Apply Mortise Locks
- Job 7 - Install a Mortise Lock
- R.S.A. 8 - How to Build Stairs with Housed and Open Stringers and Description and How to Fit Newel Posts and Hand Rails
- Job 8 - Lay Out, Cut and Assemble a Stair
- R.S.A. 9 - Types and Installation of Baseboards
- Job 9 - Install Baseboards
- Job 9A - Install Shoe Moulding
- Job 10 - To Be Selected by the Shop Instructor

Unit VIII Portable Power Tools and Their Uses

- R.S.A. 1 - Description, The Circular Handsaw and Portable Saw Blades; Care of Circular Saw Blades; and Methods of Using The Portable Circular Saw
- R.S.A. 1A - Description of Kitchen Cabinets and How to Build and Install a Kitchen Cabinet
- Job 1 - Build and Install Kitchen Base Cabinet
- R.S.A. 2 - Description, The Radial Arm Saw; General Instructions for Operation and Adjustment of the Radial Arm Saw; and Methods of Using the Radial Arm Saw
- R.S.A. 2A - Description of Kitchen Wall Cabinets and How to Build Wall Cabinets
- Job 2 - Build and Install Kitchen Wall Cabinets With a Drop Ceiling
- R.S.A. 3 - Description, The Electric Router; Description of Router Bits and Methods of Inserting Bits in the Collet and Assemble Motor Into Router Base; and Basic Routing Cuts
- R.S.A. 3A - How to Construct Cabinet Drawers and How to Assemble a Cabinet Drawer
- Job 3 - Construct and Assemble Cabinet Drawers
- R.S.A. 4 - Description, The Portable Power Block Plane and Methods of Using the Portable Power Block Plane
- R.S.A. 4A - How to Fit Cabinet Doors
- Job 4 - Fit Cabinet Doors

Course Outline (Continued)

Unit VIII (Continued)

- R.S.A. 5 - Description, The Portable Electric Hand Drill; Drills and Bits; and Safety Precautions in Using the Portable Electric Hand Drill
- R.S.A. 5A - How to Apply Cabinet Hardware
- Job 5 - Apply Cabinet Hardware
- R.S.A. 6 - Description, The Portable Sabre Saw and Blades; How to Install Sabre Saw Blades and Base Insert; Methods of Using the Portable Sabre Saw
- R.S.A. 6A - Installing Counter Surfaces With Metal Trim and Cove Metal
- Job 6 - Fit and Apply Laminated Plastic Counter Top
- R.S.A. 7 - The Portable Electric Power Plane; Safe Methods in Using the Portable Electric Power Plane and How to Use the Electric Portable Power Plane
- R.S.A. 7A - Description of Mantel Shelves and How to Build Mantel Shelves
- Job 7 - Build and Install a Mantel Shelf
- R.S.A. 8 - Description, The Portable Belt Sander and General Procedures for Using the Belt Sander
- R.S.A. 8A - Selection of Abrasive Belts
- R.S.A. 8B - Methods of Building and Installing Built-In-Bookcases
- Job 8 - Build a Book Case
- R.S.A. 9 - Description, Finishing Sanders; Selection and Installation of Abrasives; and Care and Use of the Finishing Sander
- R.S.A. 9A - Description of Corner Cabinets
- Job 9 - Corner Cabinets
- R.S.A. 10 - Reciprocating Saws and Methods of Operating the Reciprocating Saw
- R.S.A. 10A - How to Build and Install a Medicine Cabinet
- Job 10 - Medicine Cabinet
- R.S.A. 11 - Description of Linen Closet
- Job 11 - Linen Closet
- R.S.A. 12 - Description, The Hinge Butt Templet; Description, The Lock Mortiser; Description, The Lock Face Templet
- R.S.A. 12A - Description of Clothes Closets
- Job 12 - Linen Closet

The Map Drafting and Related Computations section of the Civil Engineering Technology Course was written in 1964 and is available in bound form. The course is composed of 12 sections in one book, and a Field Book. A detailed outline of this course is given below.

- Section 1 Introduction
 - Section 2 Directions of Lines
 - Section 3 Plotting Angles
 - Section 4 Plotting Traverses
 - Section 5 Latitudes and Departures
 - Section 6 Calculation of Areas
 - Section 7 Route Surveys with Circular Curves
 - Section 8 Topographic Maps
 - Section 9 Profiles and Cross Sections
 - Section 10 Area Maps
 - Section 11 Reproduction of Drawings
 - Section 12 Assignments and Directions for Exercises
- Field Survey Notes

ELECTRICAL DIAGRAMS
Trade Preparatory

C Page 1 of 1

This compendium of Electrical Diagrams may be used in any situation requiring the use of such circuits. It is not designed to be limited to any one particular curriculum. It is recommended that it be used as a reference when and where needed. Other uses may develop depending on the requirements of a job and the ability of the student. Additional diagrams will probably be added to future editions of this reference if usage indicates that this is desirable.

A list of diagrams follows:

Signal Circuits	20 Diagrams
Lighting Circuits	26 Diagrams
Industrial Control Circuits	26 Diagrams
Appliance Circuits	5 Diagrams

The Farm Mechanics Course is available in loose leaf form. The references for the courses will be listed in the separate courses. The instructors will request jobs from the following courses as they see fit:

- Carpentry
- Electricity
- Machine Shop
- Plumbing
- Small Engine Repair
- Tractor Repair and Maintenance
- Welding

A detailed outline of the Farm Mechanics Course follows:

CARPENTRY

Unit I - Hand Tools (Required)

- Job 1: Use Layout Tools
- Job 2: Use Wood Cutting Tools
- Job 3: Use Boring and Driving Tools
- Job 4: Lay out and Construct a Sawhorse
- Job 5: Lay out and Construct a Shoulder Box
- Job 6: Lay out a House

- R.S.A. 1: Measuring and Layout Tools
- R.S.A. 2: Wood Boring Tools
- R.S.A. 3: Wood Cutting Tools
- R.S.A. 4: Wood Cutting Tools (Continued)
- R.S.A. 5: Driving Tools
- R.S.A. 6: Nails, Screws, and other Fasteners
- R.S.A. 7: Lumber

Unit II - Foundations (Required)

- Job 1: Build Bulkhead Forms for a Footing
- Job 2: Build Bulkhead Forms for a Slab
- Job 3: Mix, Pour and Darby a Concrete Slab

- R.S.A. 1: Concrete Formwork
- R.S.A. 2: Mixing Concrete

Unit III - Framing (Optional)

- Job 1: Install Wood Sills
- Job 2: Install Floor Joists
- Job 3: Install Floor Joist Headers and Bridging
- Job 4: Construct a Subfloor
- Job 5: Lay out, Assemble and Fasten Lower Plates (Soles)
- Job 6: Lay out, Fabricate and Raise Wall Frames
- Job 7: Lay out and Construct Ceiling Joists
- Job 8: Lay out, Cut and Erect Common Rafters

Course Outline (Continued)

Unit III - Framing (Optional) (Continued)

Job 9: Lay out, cut and Erect Hip, Valley, Hip Jack, and Valley Jack Rafters

Job 10: Sheathe a Wall

R.S.A. 1: Wood sills, floor joists, bridging and headers

R.S.A. 2: Subfloors

R.S.A. 3: Frame Lay Out (Plates)

R.S.A. 4: Wall Frames

R.S.A. 5: Ceiling Joists and Headers

R.S.A. 6: Common Rafters

R.S.A. 7: Hip Rafters, Hip Jack Rafters

R.S.A. 8: Valley and Valley Jack Rafters

R.S.A. 9: Sheathing

Unit IV - Exterior Trim (Optional)

Job 1: Lay out and Construct a Window Frame

Job 2: Lay out and Construct a Door Frame

Job 3: Set a Window and Door Frame

Job 4: Set a Sash

Job 5: Hang and Lock a Door

Job 6: Hang Finished siding

R.S.A. 1: Window and Door Frames

R.S.A. 2: Setting Frames

R.S.A. 3: Hanging and Locking Doors

R.S.A. 4: Setting Sash

R.S.A. 5: Siding

ELECTRICITY

Unit I - Bell Wiring (Required)

Job 1: Install a door bell or chime

R.S.A. 1: Care and use of hand tools

R.S.A. 2: Principles of electric circuit sketching

R.S.A. 3: Wire connections and soldering

Unit II - Indicating Instruments (Required)

Job 1: Connect a voltmeter, ammeter

R.S.A. 1: Principles of Meters

R.S.A. 2: Care of meters

R.S.A. 3: Reading a watt hour meter

Course Outline (Continued)

Unit III - Wiring to Existing Circuits (Optional)

Job 1: Install one light, one S.P. switch and receptacle using No. 12 nonmetallic sheath cable (Have Students make Sketch)

- R.S.A. 1: Introduction to National Electric Code R.S.A. No. 9 Book I Unit I
- R.S.A. 2: Polarity identification of systems and circuits R.S.A. No. 4 Book III Unit I
- R.S.A. 3: Selection of wire size and current carrying capacity Book I Unit III R.S.A. 7
- R.S.A. 4: Circuit sketching
- R.S.A. 5: Determine connected load
- R.S.A. 6: Types of Fasteners R.S.A. 7 Book I Unit I
- R.S.A. 7: Non-metallic cable wiring R.S.A. 8 Book III Unit I

Unit IV - Wiring to New Circuits (Optional)

Job 1: Install one procelain flush chain receptacle, one pendant light with type C lamp cord on lighting circuit and receptacle outlet on an appliance circuit (Have students make sketch)

- R.S.A. 1: Types of fuses and circuit breakers and their use. R.S.A. 8 Book I Unit III
- R.S.A. 2: Circuit planning
- R.S.A. 3: Circuit sketching
- R.S.A. 4: Determining illumination
- R.S.A. 5: Types of boxes, box covers, and methods of installation R.S.A. 3 Book III Unit I

Unit V - Wiring Between Buildings (Optional)

Job 1: Install one light using two three-way switches from house to barn (Have students make sketch)

- R.S.A. 1: Determining number of conductors in conduit or tubing
- R.S.A. 2: Grounding
- R.S.A. 3: Current carrying capacity of conductors run in free air or in conduit or tubing
- R.S.A. 4: Calculation and use of charts in determining tensile strength and voltage drop.
- R.S.A. 5: Types of service brackets and wire holders and their use
- R.S.A. 6: N.E.C. requirements on outside wiring

Course Outline (Continued)

Unit VI - Wiring (Meter Pole) (Optional)

Job 1: Install a three wire meter service and a two wire feeder between pole and barn and 3 wire feeder between pole and dwellings (Have students make sketch)

- R.S.A. 1: Determine service conductor and switch sizes
- R.S.A. 2: Locating the meter pole
- R.S.A. 3: Branch circuits and service entrance

Unit VII - Motors (Required)

Job 1: Disassemble, clean and reassemble split phase motor

- R.S.A. 1: Simple motor
- R.S.A. 2: Principle of split phase motor

Unit VIII - Motors (Optional)

Job 1: Mount and connect a split phase dual-voltage reversible motor 110V or 220 V

- R.S.A. 1: Calculation of pulley sizes
- R.S.A. 2: Determine H.P. of motor to do a job
- R.S.A. 3: Principle of capacitor motors
- R.S.A. 4: Methods of equipment grounding

Unit IX - Motors (Optional)

Job 1: Disassemble, clean and reassemble repulsion motor and reverse

- R.S.A. 1: Principle of repulsion motors
- R.S.A. 2: Principle of 3 phase motor
- R.S.A. 3: Principle of wound rotor motor

Unit X - Motors (Required)

Job 1: Trouble shooting on motors and motor controllers

- R.S.A. 1: Types and operating principles of motor Controller

MACHINE SHOP

Unit I - Lathe

Job 1: Turn a Shaft

Course Outline (Continued)

Unit I - Lathe (Continued)

- Job 2: Turn a Threading Blank
- Job 3: Threading a Blank
- Job 4: Drilling
- Job 5: Boring
- Job 6: Internal Threads

- R.S.A. 1: Principles of the Lathe
- R.S.A. 2: Lathe Holding Devices
- R.S.A. 3: Cutting Tools
- R.S.A. 4: Knurling
- R.S.A. 5: Shoulder Turning and Necking
- R.S.A. 6: Filing and polishing
- R.S.A. 7: Drilling and Reaming
- R.S.A. 8: Tapping
- R.S.A. 9: Screw Threads Standard
- R.S.A. 10: Internal Threading

PLUMBING

- Job 1: Setting grade lines for house sewer
- Job 2: Thread and connect pipe
- Job 3: Cut, bend, and flare copper tubing
- Job 4: Cutting and joining cast iron pipe

- R.S.A. A: Background of the plumbing trade
- R.S.A. 1: Cesspools
- R.S.A. 2: Septic tanks
- R.S.A. 3: Purification and disposal of discharged effluent, the filter trench and the distribution field
- R.S.A. 4: Tools and procedures for cutting and threading pipe
- R.S.A. 5: Tools, methods, and fittings for joining copper tubing
- R.S.A. 6: Materials used for sewage and vent pipes: Terra cotta; cast iron; galvanized and copper pipe

SMALL ENGINES

Unit I - Basic Repair Skills

- R.S.A. 1: Fastening Devices, Calipers, and Thread Gages
- Job 1: Identify Bolts and Nuts
- R.S.A. 2: Drills, Taps, and Dies
- R.S.A. 2A: Tools
- Job 2: Make Internal Thread Block and Studs

Course Outline (Continued)

Unit I - Basic Repair Skills (Continued)

R.S.A. 3: Installing Studs and Removing Broken Studs
Job 3: Remove a Broken Stud

R.S.A. 4: Soldering
Job 4: Make a Solder Joint

R.S.A. 5: Hand Tools and How to Use
Job 5: Identify Hand Tools

R.S.A. 6: Tubing
Job 6: Single Flare Copper Tubing

Unit II - Engine Overhaul

R.S.A. 1: Starting, Stopping, and Storing Small Engines
Job 1: Start and Stop Engine (4 Stroke Cycle)

R.S.A. 2: Principles of Operation, Four Stroke Cycles
and Two Stroke Cycle

R.S.A. 3: Cooling and Lubrication
Job 2: Clean Air Cooling System (Any Make)

R.S.A. 4: Operation, Repair, Timing, and Adjustment of
Valves
Job 3: Reface Valves and Seats (Head and Valve Cover
Removed)
Job 4: Remove Old and Install New Valve Seat Insert
Job 5: Counterbore Cylinder for Valve Seat Insert
(Valves Removed)

R.S.A. 5: Cylinders
R.S.A. 5A: The Micrometer
Job 6: Hone Cylinder For Oversize Piston, (Aluminum)
Job 7: Hone Cylinder For Oversize Piston, (Cast Iron)

R.S.A. 6: Pistons, Rings and Pins
Job 8: Remove and Replace Connecting Rod, Piston, and
Piston Rings (Briggs & Stratton 8 BH)
Job 9: Remove and Replace Connecting Rod, Piston, and
Piston Rings, (Briggs and Stratton Model 8)

R.S.A. 7: Connecting rods, Crank and Camshafts, Bearings
and Seals
Job 10: Check and Align Connecting Rod
Job 11: Remove and Replace Connecting Rod, Piston, and
Piston Rings, (Clinton Model VS 800)
Job 12: Remove Old and Install New Crankshaft Seals and
Bearings (Plain Type)

Course Outline (Continued)

Unit II - Engine Overhaul (Continued)

- Job 13: Overhaul Engine, Briggs & Stratton 8 B-H with Rewind Starter
- Job 14: Complete Engine Overhaul, Briggs & Stratton Model 8
- Job 15: Complete Engine Overhaul, Clinton Model VS 800
- Job 16: Complete Engine Overhaul, Clinton Model AVS 400
- Job 17: Complete Engine Overhaul, Lauson Model V17
- Job 18: Complete Engine Overhaul, Power Products Type 710112

Unit III - Starting Mechanisms

- R.S.A. 1: Manual Starters
- Job 1: Disassemble and Repair, Rewind Starter, Briggs & Stratton 8 B-H
- Job 2: Disassemble and Repair Rewind, Clinton A VS 400 (Fairbanks Morse)
- Job 3: Repair Recoil Starter, Lauson V-17

Unit IV - Magneto Ignition

- R.S.A. 1: Magnetism and Electricity
- Job 1: Repair Ignition System, Briggs & Stratton 8 B-H
- Job 2: Repair Ignition System, Briggs & Stratton Model 8
- Job 3: Repair Ignition System, Clinton VS 800

- R.S.A. 2: Magneto Construction and Operation
- Job 4: Repair Ignition System, Clinton AVS-400
- Job 5: Repair Ignition System, Lauson V-17, Wico Magneto
- Job 6: Repair Ignition System, Power Products Type 710112, Phelon Magneto

Unit V - Fuel System

- R.S.A. 1: Carburetion and Fuel System
- Job 1: Repair and Adjust Carburetor and Governor, Briggs & Stratton 8 BH (Float Type)
- Job 2: Repair and Adjust Carburetor and Governor, Briggs and Stratton, Model 8 (Gravity Feed Carburetor, Air Vane Governor)

Course Outline (Continued)

Unit V - Fuel System (Continued)

- R.S.A. 2: Governors
- R.S.A. 3: Repair and Adjust Carburetor and Governor,
Clinton VS 800 (Carter Type N)

- Job 4: Repair and Adjust Carburetor and Governor,
Clinton A VS 400; Clinton Carburetor Type
LMG - 13

- Job 5: Repair and Adjust Carburetor and Governor,
Lauson V 17, Walbro Carburetor

- Job 6: Repair and Adjust Carburetor and Governor,
Power Products Type 710112, Tillotson
Carburetor Series MT 33A

- Job 7: Repair Diaphragm Carburetor, Tillotson HL
Series

Unit VI - Applications

- R.S.A. 1: Types and Construction of Outboard Lower
Units
- Job 1: Repair Water Pump and Gear Case Assembly,
Johnson Model CD

- Job 2: Repair Water Pump and Gear Case, Scott-Atwater
5 H.P., 1954 and up (Powerhead Removed)

- R.S.A. 2: Small Engine Clutches
- Job 3: Remove and Repair Centrifugal Clutch, Clinton
Direct

TRACTOR MAINTENANCE AND REPAIR

Unit I - Preventive Maintenance Fundamentals

PACKAGE #1

- Math 1 The Steel Rule
- R.S.A. 1 Fastening Devices, Calipers, and Thread Gages
- Job 1 Identify Bolts and Nuts

PACKAGE #2

- R.S.A. 2 Drills, Taps, and Dies
- Job 2 Make Internal Thread Block and Studs
- J.I.S. 1 Tools (For use with Job 2)

Course Outline (Continued)

Unit I - Preventive Maintenance Fundamentals - (Continued)

PACKAGE #3

R.S.A.	3	Installing Studs and Removing Broken Studs
Job	3	Remove a Broken Stud
Math	2	Addition and Subtraction of Scale Measurements

PACKAGE #4

R.S.A.	4	Soldering
Job	4	Make a Solder Joint

PACKAGE #5

Job	5	Start, Operate and Stop Tractor
-----	---	---------------------------------

PACKAGE #6

R.S.A.	5	Hand Tools and How to Use
Job	6	Identify Hand Tools

PACKAGE #7

R.S.A.	6	Tire Service
Job	7	Remove, Repair, and Replace Tire and Tube

PACKAGE #8

Math	3	Addition and Subtraction of Whole Numbers
R.S.A.	7	Lubrication
Job	8	Lubricate Tractor

PACKAGE #9

R.S.A.	8	Lubricating Oils and Oil Filters
Job	9	Drain, Flush, Refill Crankcase and Service Oil Filter

PACKAGE #10

R.S.A.	9	Battery Service
Job	10	Service a Battery

PACKAGE #11

R.S.A.	10	Cooling Systems
Job	11	Flush Cooling System

Course Outline (Continued)

Unit II - Front Axle and Steering Gear

PACKAGE #12

R.S.A. 11 Front Wheel Service
Job 12 Remove, Repack, and Adjust Front Wheel Bearings
Math 4 Multiplication in Whole Numbers

PACKAGE #13

R.S.A. 12 Front Axles
Job 13-B Set Toe-In (Ford, 8N)
Job 13-C & E Set Toe-In (Farmall, Super-A and Case, LA)
Math 5 Division of Whole Numbers

PACKAGE #14

R.S.A. 13 Reamers and Reaming
Job 14-B Renew Spindle Bushings (Ford, 8N)
Job 14-C Rebush Steering Knuckles (Farmall, Super-A)
Job 14-E Renew Kingpin Bushings (Case, LA)
Job 15-B Renew Axle Pin Bushing (Ford, 8N)
Job 15-C Renew Axle Pivot Shaft Bushings (Farmall Super-A)
Job 15-E Renew Axle Pivot Shaft Bushing (Case L.A.)
Math 6 Changing Fractions

PACKAGE #15

Job 16-A Renew Vertical Spindle Bushing (John Deere-B)
Job 17-A Repair Roll-O-Matic (John Deere-B)
Job 18-D Renew Front Wheel Felt Washers (Allis-Chalmer,
W.C.)
R.S.A. 14 Steering Gears and Adjustment
Job 19-A Adjust Steering Gear (John Deere-B)

PACKAGE #16

Job 19-B Adjust Steering Gear (Ford, 8N)
Job 19-D Adjust Steering Gear (Allis-Chalmers, W.C.)
Job 19-E Adjust Steering Gear (Case, LA)
R.S.A. 15 Tie Rod Ends and Universal Joints
Job 20-B Overhaul Steering Gear (Ford, 8N)
Job 20-C Overhaul Steering Gear (Farmall, Super-A)
Job 20-E Overhaul Steering Gear (Case, LA)

Unit III - Cooling System

PACKAGE #17

R.S.A. 16 Radiators and Radiator Service

Course Outline (Continued)

Unit III - Cooling System (Continued)

PACKAGE #17

Math 7 Addition and Subtraction of Fractions
Job 21 Remove and Repair Radiator

PACKAGE #18

R.S.A. 17 Fans and Fan Drives
Math 8 Multiplication of Fractions
Job 22-A Repair Fan Assembly (John Deere-B)
(Hood and Radiator Removed)
Job 22-C Repair Fan Assembly (Farmall Super-A)
Job 23-A Check and Repair Ventilator Pump (John Deere-B)
(Fan Assembly Removed)

PACKAGE #19

Math 9 Division of Fractions
R.S.A. 18 Water Pumps
Job 24-B Remove, Repair, and Replace Water Pump
(Ford 8N)
Job 24-D Remove, Repair, and Replace Water Pump
(Allis-Chalmer WC)
Job 24-E Remove, Repair, and Replace Water Pump
(Case LA)

PACKAGE #20

R.S.A. 19 Thermostats, Shutters, and Temperature Gages
Job 25 Remove, Check, and Replace Thermostat
(Radiator Drained)

Unit IV - Attachments

PACKAGE #21

R.S.A. 20 Power Take-offs and Drawbars
Job 26-C Remove, Repair, and Replace Power Take-Off
(Farmall, Super-A) (To be performed with
Job No. 27-C)
Job 26-D Remove, Repair, and Replace Power Take-Off
(Allis-Chalmers W.C.)
Job 26-E Remove, Repair, and Replace Power Take-Off
(Case LA)

PACKAGE #22

Math 10 Pulley Speeds and Sizes
R.S.A. 21 Belt Pulleys and Pulley Speeds

Course Outline (Continued)

PACKAGE #22

- Job 27-B Remove, Repair, and Replace Belt Pulley (Ford 8N)
- Job 27-C Remove, Repair, and Replace Belt Pulley (Farmall, Super-A) (To be performed with Job No. 26-C)
- Job 27-D Remove, Repair, and Replace Belt Pulley (Allis-Chalmers W.C.)

PACKAGE #23

- Math 11 The Decimal System
- R.S.A. 22 Lighting Systems, Lights and Light Switches
- Job 28-A Install Lighting Attachment (John Deere-B)
- Job 28-B Install Lighting System (Ford 8N)
- Job 28-C Install Lighting System (Farmall, Super-A)
- Job 28-D Install Lighting System (Allis-Chalmers, W.C.)
- Job 28-E Install Lighting System (Case, LA)

PACKAGE #24

- Math 12 Addition and Subtraction of Decimal Fractions
- R.S.A. 23 Basic Hydraulic Principles and General Power Lift Operation
- R.S.A. 23-A Powr-Trol and Power Lift (John Deere, B)*
- R.S.A. 23-B Hydraulic Control Unit (Case L.A.)
- R.S.A. 23-C Touch-Control System (Farmall, Super A)
- R.S.A. 23-E Hydraulic Control Unit (Case L.A.)
- Job 26-B Remove and Repair Power Take-Off Shaft (Ford 8N)
- Job 29-A Repair Powr-Trol (John Deere-B)
- Job 29-B Remove, Repair, and Replace Hydraulic Control (Ford, 8N)
- Job 29-C Remove, Repair, and Replace Touch Control (Farmall, Super-A)
- Job 29-D Remove, Repair, and Replace Mechanical Lift (Allis-Chalmers, W.C.)
- Job 29-E Remove, Repair, and Replace Hydraulic Control Unit (Case, LA)

Unit V - Rear Axle, Final Drive, and Brakes

PACKAGE #25

- Math 13 Multiplication of Decimal Fractions
- R.S.A. 24 Bearings, Seals and Closures
- Job 30-C Remove, Repair and Reassemble Final Drive (Farmall, Super-A)
- Job 30-D Disassemble, Repair, and Reassemble Final Drive (Allis-Chalmers, WC)
- R.S.A. 25 Tractor Final Drives
- Job 33-D Remove, Repair, and Replace Brakes (Allis Chalmers W.C.) (Final Drive Disassembled)

Course Outline (Continued)

PACKAGE #26

- R.S.A. 26 Types of Rear Axles and Their Adjustment
- Job 31-A Remove and Renew Rear Axle Bearings or Seals (John Deere-B)
- Job 31-B Remove and Renew Rear Axle Bearings or Seals (Ford 8N)
- Job 31-E Remove and Renew Rear Axle Bearings or Seals (Case, LA)

PACKAGE #27

- Math 14 Division of Decimals
- R.S.A. 27 Brakes
- Job 32-A Adjust Brakes (John Deere-B)
- Job 32-B Adjust Brakes (Ford 8N)
- Job 32-C Adjust Brakes (Farmall, Super-A)
- Job 32-D Adjust Brakes (Allis Chalmers, WC)
- Job 32-E Adjust Brakes (Case, LA) (Mechanical-Internal Expanding)
- Job 32-E Adjust Hydraulic Brakes (Case, LA) (Minor Adjustment)
- Job 32-E Adjust Hydraulic Brakes (Case, LA) (Major Adjustment)
- Job 32-X Adjust Disc Type Brakes (All Models)
- Job 33-A Remove, Repair, and Replace Brakes (John Deere-B)
- Job 33-B Disassemble, Repair and Reassemble Brakes (Ford 8N) (Wheel and Brake Drum Removed)
- Job 33-E Remove, Repair, and Replace Brakes (Case, LA)
- Job 33-E Disassemble, Repair, and Reassemble Brakes (CASE, LA) (Hydraulic Brakes)
- Job 33-X Remove, Repair, and Replace Disc Brakes (All Models)

Unit VI - Differential

PACKAGE #28

- Math 15 Changing Common Fractions to Decimals
- Math 16 The Micrometer
- R.S.A. 28 Ring Gear and Pinion Adjustments
- Job 34-C Adjust Ring Gear and Pinion (Farmall, Super-A) (Final Drive Removed)
- Job 34-D Adjust Ring Gear Backlash (Allis-Chalmers, WC)
- R.S.A. 29 Differential Construction and Operation
- Job 35-A Remove, Repair, and Reassemble Differential (John Deere-B)
- Job 35-B Remove, Repair, and Reassemble Differential (Ford, 8-N)

Course Outline (Continued)

PACKAGE #28

- Job 35-C Remove, Repair, and Reassemble Differential (Farmall, Super-A)
- Job 35-D Remove, Repair and Reassemble Differential (Allis Chalmers, WC.)
- Job 35-E Remove, Repair, and Reassemble Differential (Allis Chalmers, WC.)
- Job 36-D Disassemble, Repair, and Reassemble Torque Tube (Allis-Chalmers, WC.)
- R.S.A. 30 Getting and Holding a Job

Unit VII - Transmissions

PACKAGE #29

- R.S.A. 31 Transmission Shifter Mechanism
- Job 37-A1 Disassemble, Repair, and Reassemble Shifter Mechanism (John Deere-B) (Differential Removed) (Serial No. B-9600 to B-201000)
- Job 37-A2 Disassemble, Repair, and Reassemble Shifter Mechanism (John Deere-B) (Differential Removed) (Serial No. B-201000 and Up)
- Job 37-B Disassemble, Repair, and Reassemble Shifter Mechanism (Ford, 8-N) (Differential Removed)
- Job 37-C Remove, Repair, and Replace Shifter Mechanism (Farmall, Super-A)
- Job 37-D Remove, Repair, and Replace Shifter Mechanism (Allis-Chalmers, WC.)
- Job 37-E Repair and Replace Shifter Mechanism (Case, LA.) (Differential Removed)

PACKAGE #30

- Math 17 Gear Ratios
- R.S.A. 32 Transmissions
- R.S.A. 32-A1 Transmission Construction and Operation (John Deere-B, Serial No. B-96000 to B-201000)
- Job 38-A1 Disassemble, Repair, and Reassemble Transmission (John Deere-B) (Differential and Shifter Mechanism Removed) (Serial No. B-96000 to B-201000)
- R.S.A. 32-A2 Transmission Construction and Operation (John Deere-B) (Serial No. 201000 and up)
- R.S.A. 38-A2 Disassemble, Repair, and Reassemble Transmission (John Deere-B) (Serial No. B-201000 and Up) (Differential and Shifter Mechanism Removed)

Course Outline (Continued)

PACKAGE #30

- R.S.A. 32-B Transmission Construction and Operation
(Ford, 8-N)
- Job 38-B Disassemble, Repair, and Reassemble
Transmission (Ford, 8-N) (To be Performed
with Job No. 37-B)
- Job 38-C Disassemble, Repair, and Reassemble Trans-
mission (Farmall, Super A.) (Differential
and Torque Tube Removed)
- Job 38-D Remove, Repair, and Replace Transmissio.
(Allis-Chalmers, W.C.) (Differential and
Torque Tube Removed)
- Job 38-E Disassemble, Repair, and Reassemble
Transmission (Case, LA) (Differential and
Shifter Mechanism Removed)
- Job 26-A Remove and Repair Power Shaft (John Deere-B)

Unit VIII - Clutches

PACKAGE #31

- R.S.A. 33 Types of Clutches; Care and Operation
- Math 18 Simple Percentage
- Job 39-A Repair and Adjust Clutch, Farmall A, B, or C
- Job 39-B Repair and Adjust Clutch, Allis-Chalmers WD
- Job 39-C Repair and Adjust Clutch, Ford 8N
- Job 39-D Repair and Adjust Clutch, John Deere B

Unit IX - Fuel Systems

PACKAGE #32

- R.S.A. 34 Fuel Supply and Replace Carburetor
- Job 40-A Remove, Repair, and Replace Carburetor,
Farmall A, B, or C
- Job 40-B Remove, Repair, and Replace Carburetor, Allis-
Chalmers WD.
- Job 40-C Remove, Repair, and Replace Carburetor, Ford 8N
- Job 40-D Remove, Repair, and Replace Carburetor, John
Deere B

PACKAGE #33

- R.S.A. 35 Governors, Types and Operations
- Math 19 Discount
- Job 41-A Remove, Repair, and Replace Governor, Farmall
A, B, or C
- Job 41-B Remove, Repair, and Replace Governor, Allis
Chalmers WD

Course Outline (Continued)

PACKAGE

- Job 41-C Remove, Repair, and Replace Governor, Ford 8N
- Job 41-D Remove, Repair, and Replace Governor, John Deere B

Unit X - Magneto Ignition

PACKAGE #34

- R.S.A. 36 Magnetism and Electricity
- R.S.A. 37 Magneto Construction and Operation
- Job 42-A Disassemble, Repair and Reassemble Magneto, Farmall A, B, or C

PACKAGE #35

- R.S.A. 38 Impulse-Starter Couplings; Timing and Care of the High-Tension Magneto
- Math 20 Personal Checks and Drafts
- Job 42-B Disassemble, Repair and Reassemble Magneto, Allis-Chalmers WD
- Job 42-C Disassemble, Repair and Reassemble Magneto, (John Deere B)

Unit XI - Battery Ignition

PACKAGE #36

- R.S.A. 39 Types and Requirements of Battery Ignition Systems
- Job 43-B Disassemble, Repair, and Reassemble Distributor, Allis-Chalmers WD

PACKAGE #37

- R.S.A. 40 Coils, Condensers, Contact Points, Distributor, and Spark Plugs
- Job 43-C Disassemble, Repair, and Reassemble Face Mounted Distributor, Ford 8N
- Job 43-D Disassemble, Repair, and Reassemble Angle Mounted Distributor, Ford 8N
- Job 43-E Remove, Clean, Adjust and Replace Spark Plugs

Unit XII - Cranking Motors

PACKAGE #38

- R.S.A. 41 Operating Principles of Cranking Motors and Drives
- Math 21 Work Orders and Bills
- Job 44 Remove, Overhaul, and Replace Cranking Motor

Course Outline (Continued)

Unit XIII - Generators

PACKAGE #39

R.S.A. 42 Generator Construction and Operation
Job 45 Remove, Disassemble, Repair and Replace a
Generator

PACKAGE #40

R.S.A. 43 Cutout Relays and Step-voltage Controls
Math 22 Keeping Accounts
Job 46 Remove, Check, and Adjust Step-Voltage Control

Unit XIV - Engines

PACKAGE #41

R.S.A. 44 Engine Fundamentals
Job 47 Clean Engine With Cold or Hot Degreasing
Solution
Job 48 Remove and Replace Expansion Plug

PACKAGE #42

R.S.A. 45 Valve Types and Construction
R.S.A. 46 Valve Mechanisms
Job 49 Reface Rocker Arms

PACKAGE #43

R.S.A. 47 Valve Service
Job 50 Remove, Clean, and Replace Rocker Arms
Job 51 Grind Valves on I-Head Engine
Job 52 Grind Valves on L-Head Engine

PACKAGE #44

R.S.A. 48 Pistons, Piston Rings, Cylinders and Sleeves
Job 58 Remove Old and Install New Piston Rings
Job 59 Remove Old and Install New Cylinder Sleeves,
Dry Type
Job 60 Remove and Install Cylinder Sleeve, Wet Type
Job 61 Rebore Cylinder
Job 62 Hone Cylinder and Fit Piston

PACKAGE #45

R.S.A. 49 Piston Pins and Bushings, Connecting Rods,
Crankshaft and Main Bearings

Course Outline (Continued)

PACKAGE #45

- Job 53 Remove Old and Fit New Piston Pins and Bushings
- Job 54 Install New Ring Gear on Flywheel
- Job 55 Adjust Connecting Rod Bearings With Engine in Tractor, John Deere (Shim Type)
- Job 56 Install New Connecting Rod Bearings With Engine in Tractor (Insert Type)
- Job 57 Adjust Main Bearings, John Deere B

PACKAGE #46

- R.S.A. 50 Engine Lubrication Systems
- Job 63 Remove, Inspect, and Replace Oil Pump

PACKAGE #47

- Job 64 Overhaul Engine Completely (Except John Deere)

PACKAGE #48

- Job 65 Overhaul Engine Completely, John Deere B

WELDING

Unit I - Welding - Oxyacetylene

- Job No. 1: Safety Rules for Oxyacetylene Welding
Mathematics
Related-Technical Information
- Job No. 2: Set Up Oxyacetylene Welding Equipment
Mathematics
Related-Technical Information
- Job No. 3: Regulate Oxygen and Acetylene Pressure and Light a Torch
Mathematics
Related-Technical Information
- Job No. 4: The Cutting Torch and Flame Cutting Steel
Mathematics
Related-Technical Information
- Job No. 5: Flat Welding Without Filler Rod
Mathematics
Related-Technical Information

Course Outline (Continued)
