INTRODUCTION

This collection of microfiche includes the documents announced in the Fall, 1967 issue of Abstracts of Instructional Materials in Vocational and Technical Education (AIM) with minor exceptions. The microfiche set is arranged in the following sequence:

1. Vocational Technical (VT) Number Index to Microfiche Collection of Documents Reported in AIM, Fall 1967.
2. VT Number List of Documents not in Microfiche Collection.
Copies of these documents may be obtained from the source indicated in the citation on page 6.
3. Source List of addresses for documents cited on pages 2-5.
4. Selected indexes from AIM, Fall 1967.
 - a. Author Index
 - b. Subject Index

The page numbers shown in these indexes refer to the location of the abstracts in AIM, Fall 1967.

5. The full text of documents listed in the VT Number Index on page 1.

The documents are arranged in numerical order according to VT numbers. The texts of materials in this microfiche set have been filmed continuously in VT number sequence thereby facilitating the purchase of the texts of all documents on microfiche with one order and lowering the cost of the entire set as contrasted to the purchase of microfiche of individual titles.

The documents identified in this collection of microfiche with an ERIC Document (ED) number are also available as separate documents from ERIC Document Reproduction Service (EDRS) by using the ED number. Items with the ED symbol but without the six numerical digits will be available as separate documents from EDRS when they have been fully processed into the ERIC system. Research in Education will announce those documents as they become available from EDRS.

The documents identified in this collection of microfiche without an ED number are titles in the local clearinghouse collection. Microfiche for these items is obtainable only through purchase of this set or from agencies who have this set, and who have the capability of reproducing microfiche.

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

- (1) Source of Available Copies:
 Agency ERIC Only, except for N. C. institutions.
 Address _____
 Limitation on Available Copies _____ Price/Unit _____
 (quantity prices) _____
- (2) Means Used to Develop Material:
 Development Group Author, under direction of staff consultant for health occupation
 Level of Group Author-local teacher
 Method of Design, Testing, and Trial None
- (3) Utilization of Material:
 Appropriate School Setting High school or post-high school educational agency in
 Type of Program Pre-employment / cooperation with a hospital
 Occupational Focus Hospital ward clerk (Nursing auxiliary personnel)
 Geographic Adaptability _____
 Uses of Material General guidelines for outline and lesson plan development
 Users of Material Teacher
- (4) Requirements for Using Material:
 Teacher Competency Registered nurse with ward administration experience
 Student Selection Criteria General qualifications for meeting public and
 maintaining effective communications, both oral and written.
 Time Allotment P

INTRODUCTION

This course guide was prepared to assist teachers in initial classes to be offered for prospective hospital ward clerks.

The guide includes a descriptive statement of each unit, a descriptive statement of each lesson, and suggested teaching methods for each lesson. Each teacher of the initial classes will need to develop a topical outline for each lesson, specific assignments, and, where desirable, information sheets for handout to students.

Clinical practice should be provided for students as soon as possible. The ratio of clinical hours to classroom hours should be progressively increased until, by the sixth week of the course, hours of clinical practice equal or exceed the number of classroom hours.

Students admitted to the course should be high school graduates and meet other admission criteria established by the sponsoring institution. On completion of the course, each graduate will be presented a certificate of graduation.

Following use of this guide by several teachers, a working committee will be formed to develop the guide into a full outline.

This guide was developed by Ida Collie, R.N., in cooperation with staff members of the Curriculum Laboratory. The Guide has been used for up-grading and pre-employment classes sponsored by the W. W. Holding Industrial Education Center in cooperation with Memorial Hospital of Wake County.

Course Description

HOSPITAL WARD CLERK

A course designed to prepare students to function effectively as clerks in the nursing unit of a hospital or clinic. Classroom procedures will introduce students to modern concepts of health and the functional relationships within a hospital, with emphasis on the role of the ward clerk. Classroom activities will include experiences to develop specific skills and personal qualities needed for public relations aspects of the ward clerk role. Clinical practice will be planned to further the students skills within the hospital environment and the nursing unit.

OUTLINE OF UNITS

UNIT I: HOSPITAL AND COMMUNITY	1
Lesson 1: Purposes of Hospitals	
Lesson 2: Types of Hospitals	
Lesson 3: Relationship of Hospital to Community	
UNIT II: HOSPITAL ORGANIZATION	5
Lesson 1: Organization of Hospitals	
Lesson 2: Nursing Service Organization	
Lesson 3: Nursing Unit Organization	
UNIT III: UNDERSTANDING THE ROLE OF WARD CLERK	9
Lesson 1: Appropriate Behaviors for Hospital Personnel	
Lesson 2: Communications	
Lesson 3: Personal Appearance	
Lesson 4: Understanding Patient and Family	
Lesson 5: Duties of the Ward Clerk	
UNIT IV: FUNDAMENTALS OF WARD CLERK PRACTICE	17
Lesson 1: Following Hospital Procedures	
Lesson 2: Use of Nursing Unit and Hospital Equipment	
Lesson 3: The Patient's Chart	
Lesson 4: Special Forms Required for Certain Charts	
Lesson 5: Requisitions Related to Patient Care, the Chart, and Interdepartmental Communications	
Lesson 6: Forms and Requisitions Related to Nursing Unit Management	
Lesson 7: Daily care of the Nursing Unit	

	<u>Page</u>
UNIT V: WARD CLERK PARTICIPATION IN SELECTED NURSING UNIT ACTIVITIES	27
Lesson 1: Prevention and Control of Disease	
Lesson 2: Admission, Transfer, and Discharge of Patients	
Lesson 3: Selected Activities in Which the Ward Clerk May Participate	
UNIT VI: BECOMING A HOSPITAL EMPLOYEE	31
Lesson 1: Assuming Responsibility for One's Job	
Lesson 2: Citizenship Responsibilities	
Lesson 3: Applying for or Resigning From a Position	

Course Outline

HOSPITAL WARD CLERK

UNIT 1: HOSPITAL AND COMMUNITY

TIME ALLOTMENT: 6 hours

OBJECTIVE: To help the student understand the overall role of various types of hospitals in the community-at-large.

UNIT DESCRIPTION: A study of the purposes of hospitals, types of hospitals, and the desirable relationship of hospital to community.

LESSONS:

1. Purposes of Hospitals
2. Types of Hospitals
3. Relationship of Hospital to Community

LESSON 1: PURPOSES OF HOSPITALS

TIME ALLOTMENT: 2 hours, approximately

OBJECTIVE: To help the student understand the various purposes hospitals may serve in a community.

LESSON DESCRIPTION: A study of the curative, rehabilitative, preventive, educational, and research responsibilities of the hospital, factors which influence the primary purpose of a particular hospital, and the importance of each purpose to the community.

SUGGESTED TEACHING METHODS: Have students list purposes of different types of hospitals and then discuss each purpose fully. List nearby hospitals which illustrate differences that result from different primary purposes, thus making the student more aware of facilities available in the community while clarifying each purpose.

SUGGESTED REFERENCES:

Harmer and Henderson. Textbook of the Principles and Practice of Nursing.

LESSON 2: TYPES OF HOSPITALS

TIME ALLOTMENT: 2 hours, approximately

OBJECTIVE: To help the student understand different types of hospitals, activities common to hospitals, and members of the health team who carry out these activities.

LESSON DESCRIPTION: A study of ways in which hospitals are classified, the variety of activities which are required for functioning of a hospital, and the numbers and types of workers necessary to carry out the various activities.

SUGGESTED TEACHING METHODS: Discuss fully the types of hospitals, using examples from Lesson 1; show films to illustrate types of hospitals, hospital activities, or roles of hospital personnel; make written assignment to concerning Lessons 1 and 2 which may be carried out in class or in the library.

SUGGESTED REFERENCES:

Harmer and Henderson. Textbook of the Principles and Practice of Nursing.

Fuerst and Wolff. Fundamentals of Nursing.

LESSON 3: RELATIONSHIP OF HOSPITAL TO COMMUNITY

TIME ALLOTMENT: 2 hours, approximately

OBJECTIVE: To help the student understand the interdependence of hospital and community and to be aware of the role of hospital personnel in maintaining good public relations.

LESSON DESCRIPTION: A study of ways the hospital affects the community including employment and service opportunities; quality of health care available; health education; promotion of community attitudes, causes of unfavorable attitudes, how a favorable public image can be maintained, and advantages of public enthusiasm and interest.

SUGGESTED TEACHING METHODS: Discuss lesson topics; show films to depict community life and hospital activities; make written assignment based on lesson content.

SUGGESTED REFERENCES:

Harmer and Henderson. Textbook of the Principles and Practice of Nursing.

Fuerst and Wolff. Fundamentals of Nursing.

Films: "The Old North State" (Available from Southern Bell Telephone Co.)
"Health Careers" (Available from local Health Careers Office or from the N. C. Hospital Association.)

UNIT 11: HOSPITAL ORGANIZATION

TIME ALLOTMENT: 18 hours

OBJECTIVE: To help the student learn about the organization of a hospital, the relationship of nursing units to other areas of the hospital, and the organization and division of the responsibilities of the nursing unit.

UNIT DESCRIPTION: The study of hospital structure, including organization of hospitals in general, nursing service organization, nursing unit organization, and areas of responsibility within the nursing unit.

LESSONS:

1. General Organization of Hospitals
2. Nursing Service Organization
3. Nursing Unit Organization

LESSON 1: GENERAL ORGANIZATION OF HOSPITALS

TIME ALLOTMENT: 6 hours, approximately

OBJECTIVE: To help the student understand the organization of hospitals and the importance of understanding organizational relationships.

LESSON DESCRIPTION: A study of the organizational structure of hospitals, including names and titles of key personnel in the affiliating hospital.

SUGGESTED TEACHING METHODS: Discuss organizational structure, including horizontal and vertical lines of authority and communication channels; explain meaning and value of organizational charts; explain organizational chart of affiliating hospital, supplying names and titles of key personnel. Each student should be provided with a copy of the organizational chart of the affiliating hospital, with space for entering names and titles of personnel the ward clerk should know.

SUGGESTED REFERENCES:

Harmer and Henderson. Textbook of the Principles and Practice of Nursing.

Organizational chart of affiliating hospital.

LESSON 2: NURSING SERVICE ORGANIZATION

TIME ALLOTMENT: 6 hours, approximately

OBJECTIVE: To help the student understand areas of responsibility within nursing service and within the nursing unit.

LESSON DESCRIPTION: A study of nursing service organization in the affiliating hospital; patterns of nursing care utilized in the affiliating hospital; and roles of various hospital personnel in carrying out the activities of a nursing unit.

SUGGESTED TEACHING METHODS: Hand out prepared copies of organizational charts to students; discuss nursing service organization, first in general, then specifically as in the affiliating hospital; have students write in names of key personnel in nursing service; introduce role differentiation of various members of the nursing team.

SUGGESTED REFERENCES:

Organizational chart of nursing service in the affiliating hospital.

LESSON 3: NURSING UNIT ORGANIZATION

TIME ALLOTMENT: 6 hours, approximately

OBJECTIVE: To help the student understand the organization of a nursing unit and the role of the ward clerk within the unit.

LESSON DESCRIPTION: A study of the specific tasks performed by the ward clerk, as related to the various activities carried on within the nursing unit; study of job descriptions and use of the job description to clarify areas of responsibility.

SUGGESTED TEACHING METHODS: Discuss fully the activities of the nursing unit, roles of various personnel, ward clerk participation in certain activities, use of job descriptions for defining areas of responsibility, extent and limitations of the ward clerk role; give a written assignment so that the student may apply her knowledge of nursing unit activities, role of the ward clerk, and interpersonal relations within the nursing unit. Orientation tour and period of observation in selected nursing units should follow this lesson.

SUGGESTED REFERENCES:

Ward Clerk Job Description from the affiliating hospital.

UNIT III: UNDERSTANDING THE ROLE OF WARD CLERK

TIME ALLOTMENT: 22 hours

OBJECTIVE: To help the student develop the personal attributes needed for a satisfactory relationship with other hospital personnel and the patient.

UNIT DESCRIPTION: A study of appropriate behaviors for hospital personnel, clear communications, good personal appearance, understanding the patient and family, and various aspects of ward clerk duties in relationships with others.

LESSONS:

1. Appropriate Behaviors for Hospital Personnel
2. Communications
3. Personal Appearance
4. Understanding Patient and Family
5. Duties of the Ward Clerk

LESSON 1: APPROPRIATE BEHAVIORS FOR HOSPITAL PERSONNEL

TIME ALLOTMENT: 4 hours

OBJECTIVE: To help the student learn appropriate behaviors for hospital personnel.

LESSON DESCRIPTION: A study of appropriate behaviors for hospital personnel: positive attitudes, courtesy in person-to-person contacts and in telephone conversations, ethical practices and moral standards.

SUGGESTED TEACHING METHODS: Present recorded lecture on attitudes.

Discuss development of favorable attitudes. Show a film on courtesy. Have students write a paper on some phase of desirable behavior.

SUGGESTED REFERENCES:

Dietz, Professional Adjustments 1.

Keane, Essentials of Nursing.

The Bible, Matthew 5, 6, and 7, Sermon on the Mount.

Recorded lecture: McFarland, Dr. Kenneth. "The Lamplighters."

(Available from Carolina Power and Light Company.)

Film: "By Jupiter" (Available from N. C. State Board of Health.)

LESSON 2: COMMUNICATIONS

TIME ALLOTMENT: 6 hours

OBJECTIVE: To help the student learn to communicate clearly within the bounds of acceptable legal and ethical standards.

LESSON DESCRIPTION: A study of acceptable legal and ethical standards in oral and written communications.

SUGGESTED TEACHING METHODS: Have Records Librarian lecture on standards to be observed regarding the patient's chart, follow with discussion. Have Administrator lecture on what type of information should be released to representatives of news media, law enforcement officers, insurance representatives, and any seeker of information. Invite an educational representative from the telephone company to discuss the proper use of the telephone. Have students engage in mock telephone conversations and record for playback and criticism.

SUGGESTED REFERENCES:

Lesnik and Anderson, Nursing Practice and the Law.

Dietz, Professional Adjustments 1.

Carney, Etiquette in Business.

Price, A Handbook and Charting Manual for Student Nurses.

LESSON 3: PERSONAL APPEARANCE

TIME ALLOTMENT: 6 hours

OBJECTIVE: To provide opportunities for students to learn to make the most of personal appearance.

LESSON DESCRIPTION: A study of how to cultivate natural attributes: good countenance; pleasing voice, avoidance of distracting mannerisms and offensive personal habits; good personal hygiene; well-groomed hair; good taste in make-up, jewelry, dress, and accessories; good posture; and desirable personal qualities needed for effective relations with others.

SUGGESTED TEACHING METHODS: Have students contrast affected speech with the voices of television or radio announcers. Discuss meaning of personality. Show films on good grooming, posture, and countenance. Demonstrate good posture and have students return the demonstrations. Invite an outside person to speak on subject of charm. Present recorded lecture on countenance. Have students conduct a panel discussion on personal hygiene.

SUGGESTED REFERENCES:

Films:

"Roots of Happiness"

"The Inside Story" (Mental Health)

"Making the Most of Your Face"

"Body Care and Grooming"

"Dynamic Posture"

Recorded Lecture:

McFarland, "Ropes of Gold"

Books:

Carney, Etiquette in Business Charm.

Fuerst and Wolff, Fundamentals of Nursing.

LESSON 4: UNDERSTANDING PATIENT AND FAMILY

TIME ALLOTMENT: 3 hours

OBJECTIVE: To help the student understand the patient as an individual and a member of a family and the community.

LESSON DESCRIPTION: A study of the patient as an individual with mental, physical, and spiritual needs and some possible effects of illness on his interaction with his family and community.

SUGGESTED TEACHING METHODS: Show a film depicting the patient as an individual. Have students recount illnesses they may have had or some they have known and some of the effects of illnesses they have observed.

SUGGESTED REFERENCES:

Films:

"The Patient is a Person"

"Mrs. Stephens Needs a Nurse"

Books:

McGhie, Psychology Applied to Nursing

Sellew, Sociology and its Use in Nursing.

Averill and Kempf, Psychology Applied to Nursing.

Keane, Essentials of Nursing.

Fuerst and Wolff, Fundamentals of Nursing.

LESSON 5: DUTIES OF THE WARD CLERK

TIME ALLOTMENT: 3 hours

OBJECTIVE: To help the student understand her role as a member of a team working for optimal care of the patient.

LESSON DESCRIPTION: A study of the role of the ward clerk as depicted in the job description.

SUGGESTED TEACHING METHODS: Have students review job descriptions from several institutions, especially the one from their affiliating hospital. Discuss differentiation of responsibilities of each member of the nursing team.

SUGGESTED REFERENCES:

"Ward Clerks' Duties," Hospitals, April 16, 1956, p. 24
Job Descriptions of Affiliating Hospital and Several Other
Nearby Hospitals.

UNIT IV: FUNDAMENTALS OF WARD CLERK PRACTICE

TIME ALLOTMENT: 28 hours

OBJECTIVE: To help the student learn fundamentals of the ward clerk role within a unit and in relation to other departments.

COURSE DESCRIPTION: A study of how to follow hospital procedures; the use of nursing unit and hospital equipment; the use, content, and care of the patient's chart; special forms required for certain charts; requisitions related to patient care, the chart, and interdepartmental communications; forms and requisitions related to nursing unit management; and daily care of the nursing unit.

LESSONS:

1. Following Hospital Procedures
2. Use of Nursing Unit and Hospital Equipment
3. The Patient's Chart
4. Special Forms Required for Certain Charts
5. Requisitions Related to Patient Care, the Chart, and Interdepartmental Communications
6. Forms and Requisitions Related to Nursing Unit Management
7. Daily Care of the Nursing Unit

LESSON 1: FOLLOWING HOSPITAL PROCEDURES

TIME ALLOTMENT: 6 hours

OBJECTIVE: To help the student gain a beginning understanding of hospital procedures and practices.

LESSON DESCRIPTION: A study of hospital procedures and practices related to patient care and to functions of various departments such as Nursing, Dietary, Pharmacy, Central Service, Laboratory, X-Ray, and Physical Therapy. Emphasis will be given to medical terminology needed for clerical duties related to each.

SUGGESTED TEACHING METHODS: Have students compile a manual for ward clerks for use in their affiliating hospital. This may be duplicated for each nursing station. Following is a suggested list of items to include:

Job Description	Laboratory Requisitions
Accident-Incident Report	Operating Room Forms
Admission Procedure	Pharmacy Forms
Chart Forms	Physical Therapy Forms
Kardex Model Form	Repairs Request Forms
Condition Sheet	Shipping Service-Information
Central Service Requisitions	Supplies-List of Sources
Dietary Department Forms	Telephone-Policies Regarding Use
Discharge Procedure	Television-Policies
Dumb Waiter-Use of	Time Record-Model
Fire Procedure	Transfers-Procedure and Forms
Housekeeping Forms	Tube System (Pneumatic) Use of
Inter-Communication-	X-Ray Forms and Requisitions
Use of Equipment	

Have students learn basic units and symbols of the metric and apothecary systems.

Have students learn combining forms used in medical terminology.

Encourage good handwriting.

Require use of abbreviations, symbols, common drug names, and medical terms in written and oral communications. Give students copies of abbreviations and symbols.

Have students study photostatic copies of doctors' orders made from old charts--without identity, of course. Students may then be taken to the clinical area for further study of orders.

SUGGESTED REFERENCES:

Clark and Clark, Guide to Medical Terminology.

Selected manual of drugs and solutions

Physician's Desk Reference

Selected Medical Dictionary

Manuals of departments in the affiliating hospital

LESSON 2: USE OF NURSING UNIT EQUIPMENT

TIME ALLOTMENT: 6 hours

OBJECTIVE: To help the student learn to use equipment available in the nursing unit.

LESSON DESCRIPTION: A study of the use of the addressograph, dumb waiter, pneumatic tube system, labeling machine, inter-communication system, and other specialized equipment in the nursing unit.

SUGGESTED TEACHING METHODS: Discuss, demonstrate, and have students practice operating available equipment in affiliating hospital. Help them learn to interpret written instructions for each item. They may practice following instructions by threading the movie projector.

SUGGESTED REFERENCES:

Manuals for operation of each item of equipment.

LESSON 3: THE PATIENT'S CHART

TIME ALLOTMENT: 6 hours

OBJECTIVE: To help the student learn the purpose of the patient's chart and how to fulfill ward clerk responsibilities for selected portions of the chart.

LESSON DESCRIPTION: A study of the purpose of the chart and how to carry out the ward clerk's responsibilities for the graphic sheet, the medication and treatment cards, the Kardex, and their relation to the chart.

SUGGESTED TEACHING METHODS: Make written assignment on the purpose of the patient's chart.

Give each student a chart, medicine cards, and Kardex card to practice on as the teacher instructs in the use of each form by the use of transparencies on the overhead projector.

Follow with supervised practice in the hospital.

SUGGESTED REFERENCES:

Ward Clerk Manual (which student previously prepared)

Nursing Service Manual from affiliating hospital.

Price, A Handbook and Charting Manual for Student Nurses.

Fuerst and Wolff, Fundamentals of Nursing, pp. 424-438.

Harmer and Henderson, Textbook of the Principles and Practice of Nursing.

LESSON 4: SPECIAL FORMS REQUIRED FOR CERTAIN CHARTS

TIME ALLOTMENT: 2 hours

OBJECTIVE: To help the student learn to use special forms required for certain patient's charts.

LESSON DESCRIPTION: A study of special forms and their specific use for certain patients' records, including diabetic records, blood pressure graphs, intake and output records, consultation reports, operative and/or delivery permits, sterilization permits, contraceptive device permits, anesthesia records, release from responsibility (for discharge against the doctor's advice), permit for disposal of fetus or limb, autopsy permits, and incident reports. This study includes legal requirements and hospital policies related to signing and witnessing permits.

SUGGESTED TEACHING METHODS: Use overhead transparencies to demonstrate how forms are filled out. Have students practice carrying out procedure for all forms the ward clerk may be responsible for in the affiliating hospital.

SUGGESTED REFERENCES:

Procedure and Policy Manuals of Affiliating Hospital.

**LESSON 5: REQUISITIONS RELATED TO PATIENT CARE, THE CHART
AND INTERDEPARTMENTAL COMMUNICATIONS**

TIME ALLOTMENT: 3 hours

OBJECTIVE: To help the student learn to use requisitions related to patient care, the chart, and interdepartmental communications.

LESSON DESCRIPTION: A study of requisitions used for tests or therapy in other departments, such as pharmacy, laboratory, X-ray, dietary, physical therapy, EKG, EEG, BMR, central service, and others. Some special reports are also studied: one for use of volunteer workers, showing which patients may use the shopping service cart; and one from X-ray department stating whether the X-ray has been completed. How to schedule a routine and how to carry out ward procedures for special tests and therapy are stressed.

SUGGESTED TEACHING METHODS: Use overhead transparencies to project forms, have students learn to fill them in, following instructions given in manuals. Stress importance of careful checking when patients are having multiple tests. Have students carry out procedures under supervision in the hospital.

SUGGESTED REFERENCES:

Procedure and Policy Manuals of Affiliating Hospital.

LESSON 6: FORMS AND REQUISITIONS RELATED TO
NURSING UNIT MANAGEMENT

TIME ALLOTMENT: 3 hours

OBJECTIVE: To help the student learn to use forms and requisitions related to nursing unit management.

LESSON DESCRIPTION: A study of the use of forms and requisitions related to nursing unit management, such as record of patients' scheduled tests or therapy in other departments, requisitions for supplies and equipment, loan slips, requests for repairs, return of supplies and equipment for credit, requisitions for linen, time cards and running record of each employee's time, vacation, sick leave, etc., permit for vacation, leave, etc., daily assignment sheets, daily census reports, condition sheet, and others.

SUGGESTED TEACHING METHODS: Use overhead projector to demonstrate use of forms; follow with supervised practice in hospital.

SUGGESTED REFERENCES:

Procedure and Policy Manuals of Affiliating Hospital.

LESSON 7: DAILY CARE OF THE NURSING UNIT

TIME ALLOTMENT: 2 hours

OBJECTIVE: To help the student learn responsibilities of the ward clerk in daily case of the nursing unit.

LESSON DESCRIPTION: A study of means for maintaining an efficient working area, such as an up-to-date bulletin board of personnel on duty and notices, visiting hours prominently posted, a notebook file of memoranda, a manual for ward clerks, a procedure manual and a policy manual for nursing service; a clean, neat working area; and well-stocked supply cupboards.

SUGGESTED TEACHING METHODS: Discuss daily care of the nursing unit; follow with further study in the hospital.

SUGGESTED REFERENCES:

Selected Manuals as Needed.

Archer, Brecker, and Frakes, General Office Practice

UNIT V: WARD CLERK PARTICIPATION IN SELECTED NURSING UNIT ACTIVITIES

TIME ALLOTMENT: 10 hours

OBJECTIVE: To help the student learn to apply principles of medical asepsis, to some of the activities in which the ward clerk participates and to follow hospital procedure in relation to selected activities,

UNIT DESCRIPTION: A study of the prevention and control of disease; admission, transfer, and discharge of the patient; and other selected activities in which the ward clerk may participate.

LESSONS:

1. Prevention and Control of Disease
2. Admission, Transfer, and Discharge of Patients
3. Selected Activities in Which the Ward Clerk May Participate

LESSON 1: PREVENTION AND CONTROL OF DISEASE

TIME ALLOTMENT: 6 hours

OBJECTIVE: To help the student learn principles of medical asepsis as applied to self-protection and prevention of transfer of organisms.

LESSON DESCRIPTION: A study of the causes of diseases and their prevention through the practice of medical asepsis.

SUGGESTED TEACHING METHODS: Use overhead transparencies to project pictures of various pathogenic microorganisms; discuss some of the diseases caused by each and how their spread of organisms may be controlled. Make an agar plate from washed hands and after suitable incubation period show the growth to students; emphasize ease with which personnel can transfer organisms if medical asepsis is not carried out.

Discuss the importance of good hygiene and good personal habits.

Show films: "Mr. Scattergerm", Parts II and III

"Hospital Sepsis"

LESSON 2: ADMISSION, TRANSFER, AND DISCHARGE OF PATIENTS

TIME ALLOTMENT: 2 hours

OBJECTIVE: To help the student learn the hospital procedures for admitting, transferring, and discharging patients.

LESSON DESCRIPTION: A study of procedures and forms involved in admitting, transferring, and discharging patients including discharge by death.

SUGGESTED TEACHING METHODS: Discuss routines of affiliating hospital for each procedure; use overhead transparencies to project forms used and demonstrate method of filling them in.
Have students practice in clinical area, under supervision.

SUGGESTED REFERENCES:

Fuerst and Wolff, Fundamentals of Nursing.

Policy and Procedure Manuals of Affiliating Hospital.

Keane, Essentials of Nursing.

Fuerst and Wolff, Fundamentals of Nursing.

LESSON 3: SELECTED ACTIVITIES IN WHICH THE WARD CLERK MAY PARTICIPATE

TIME ALLOTMENT: 2 hours

OBJECTIVE: To help the student know how to assist with selected tasks that are within her abilities but are not a routine part of ward clerk responsibilities.

LESSON DESCRIPTION: A study of the techniques for certain tasks not specifically assigned to the ward clerk such as transporting specimens, filling water pitchers, obtaining linen, and transporting sterile supplies. Discuss the handling of clean and sterile supplies, contaminated materials, and various types of specimens.

SUGGESTED TEACHING METHODS: Demonstrate how specimens should be transported, how to refill a pitcher with ice, how to handle contaminated material, how to handle clean and sterile items.

SUGGESTED REFERENCES:

Policy and Procedure Manuals of Affiliating Hospital.

Keane, Essentials of Nursing.

Fuerst and Wolff, Fundamentals of Nursing.

UNIT VI: BECOMING A HOSPITAL EMPLOYEE

TIME ALLOTMENT: 10 hours

OBJECTIVE: To help the student make the transition to employee status.

UNIT DESCRIPTION: A study of factors involved in assuming responsibility for one's job, citizenship responsibilities, and suitable behaviors in applying for and resigning from a position.

LESSONS:

1. Assuming Responsibility for One's Job
2. Citizenship Responsibilities
3. Applying for and Resigning from a Position

LESSON 1: ASSUMING RESPONSIBILITY FOR ONE'S JOB

TIME ALLOTMENT: 2 hours

OBJECTIVE: To help the student learn to assume moral and legal responsibility for the job.

LESSON DESCRIPTION: A study of one's moral and legal obligation to perform the job that has been accepted.

SUGGESTED TEACHING METHODS: Have students make oral reports; follow with discussion.

Recorded lecture.

SUGGESTED REFERENCES:

Carney, Etiquette in Business.

Dietz, Professional Adjustments I.

Morison and Farris, Approaches for Co-Workers in Professional Nursing.

Recorded Lecture: by Dr. Kenneth McFarland.

LESSON 2: CITIZENSHIP RESPONSIBILITIES

TIME ALLOTMENT: 4 hours

OBJECTIVE: To help the student learn the importance of assuming responsibility for the privilege of citizenship.

LESSON DESCRIPTION: A study of what it means to be a citizen: some of the privileges, responsibilities, and some ways the ward clerk may meet these obligations. Emphasis is given to responsibility, acceptance of responsibility for one's own actions, and responsibility for one's economic welfare, keeping informed on current events, how to vote intelligently on various issues, how to pay taxes, how to assume home responsibilities, and how to serve one's community.

SUGGESTED TEACHING METHODS: Have students participate in the panel discussion; follow with written assignment.

SUGGESTED REFERENCES:

Dietz, Professional Adjustments I.

Morison and Farris, Approaches for Co-Workers in Professional Nursing.

LESSON 3: APPLYING FOR AND RESIGNING FROM A POSITION

TIME ALLOTMENT: 4 hours

OBJECTIVE: To help the student learn what to consider when looking for a job, how to apply for a position, and how to leave a position in good standing.

LESSON DESCRIPTION: A study of how to choose a job that will be rewarding personally and economically, some ways to help decide when to change jobs, and the proper etiquette for applying for or leaving a position.

SUGGESTED TEACHING METHODS: Have students write letters of application and of resignation.

Discuss methods of choosing a job and considerations in resigning from a position.

SUGGESTED REFERENCES:

Morison and Farris, Approaches for Co-Workers in Professional Nursing.

INTRODUCTION

The continuing shortage of nursing personnel has created need for a nurses' assistant who is prepared to perform those duties associated with patient care and ward management which require only limited educational preparation.

This course outline was prepared to assist teachers throughout the State in pre-employment education of nurses' assistants; it is designed for approximately 330 hours of instruction, consisting of classroom, laboratory, and clinical experiences. Clinical practice should begin in the third unit and increase progressively throughout the remainder of the course. All clinical assignments must be planned and supervised by the teacher so that students will learn to apply classroom learnings to hospital practice. Insofar as possible, the student should develop during the course acceptable skill in performance of nursing procedures included in the outline.

The curriculum committee believes that the nurses' assistant should have a well-defined role on the nursing team and that the registered nurse must provide leadership in delegating responsibilities to non-professional personnel. For this reason, the course outline is limited to basic procedures commonly required in the care of convalescent and subacutely ill patients. Procedures related to acute illness, such as oxygen therapy, and procedures requiring depth of knowledge, such as traction and drainage tubes, have been omitted as being inappropriate to the role of the nurses' assistant. Patients whose condition requires depth of knowledge and highly developed skills should have the direct care of appropriate licensed personnel, either the registered nurse or the licensed practical nurse.

Admission requirements to the nurses' assistant course are established cooperatively by the sponsoring institution and the affiliating hospital. All students admitted to the course should be potentially employable by the hospital. Standards of achievement during the course will be established by the educational

institution. Graduates will receive certificates on satisfactory completion of the course.

The nurses' assistant who has completed this course is a beginning practitioner at the time of employment. The employing institution should assume responsibility for follow-up supervision and for an ongoing program of in-service education appropriate to the nurses' assistant level. In a few carefully selected cases, the institution may desire to upgrade a practitioner with individual instruction in more complex procedures. The committee recommends that such upgrading should be carefully planned, directed by a competent supervisor with teaching experience, and followed by ongoing evaluation of performance.

The work of the committee developing this outline was sponsored by the Curriculum Laboratory of the N. C. Department of Community Colleges. Committee members, representing hospitals and community college institutions throughout the State, are as follows:

Mrs. Peggy Cecil, R.N.	Forsyth Memorial Hospital
Miss Ida Collie, R.N.	W. W. Holding Industrial Education Center
Mrs. Joyce Goforth, R.N.	Wilson Technical Institute
Mrs. Ruth Jones, R.N.	W. W. Holding Industrial Education Center
Miss Ruth Parker, R.N.	Valdese General Hospital
Mrs. Marcia Powell, R.N.	James Sprunt Institute
Mrs. Mary E. Milliken, R.N.	Curriculum Laboratory

OUTLINE OF UNITS

Lesson 4: External Disaster	

UNIT V:	MEASURES TO PROMOTE THE PATIENT'S COMFORT	43
	Lesson 1: Care of the Patient's Unit	
	Lesson 2: Assisting the Patient with Personal Hygiene	
	Lesson 3: Maintaining the Patient's Body Function	
	Lesson 4: Diversional Activities	
UNIT VI:	MEASURES RELATED TO THE PATIENT'S ILLNESS	53
	Lesson 1: Care of the Patient in Isolation	
	Lesson 2: Irrigations	
	Lesson 3: Heat and Cold	
	Lesson 4: Procedures Related to the Surgical Patient	
UNIT VII:	BECOMING A HOSPITAL EMPLOYEE	63
	Lesson 1: Being a Responsible Wage-Earner	
	Lesson 2: Applying for and Resigning from a Position	
	Lesson 3: Maintaining High Standards	

Course Description

NURSES' ASSISTANT

A course designed to prepare qualified men and women to give effective nursing care to selected patients, to make and report observations, and to carry out routine aspects of ward management. Classroom teaching is centered around modern concepts of health, functional relationships within a hospital, fundamentals of effective interpersonal relations, and nursing procedures related to daily needs of patients and to common therapeutic measures. Throughout the course emphasis is given to the role of the nurses' assistant. Clinical experiences provide opportunities for applying classroom learnings to practice in the hospital setting.

Course Outline
NURSES' ASSISTANT

UNIT 1: INTRODUCTION TO ROLE OF THE NURSES' ASSISTANT

TIME ALLOTMENT: 15 to 25 hours

OBJECTIVE: To help the student develop awareness of the scope of the health field and beginning understanding of health facilities, modern nursing, and the role of the nurses' assistant.

UNIT DESCRIPTION: A study in broad perspective of the field of nursing, with emphasis on current trends related to division of responsibility among various types and levels of health workers.

SUGGESTED REFERENCES:

Abdallah, Mary C. Nurse's Aide Study Manual.

Cherescavich. A Textbook for Nursing Assistants.

Knoedler. The Nurse Assistant.

Ross. Personal and Vocational Relationships in Practical Nursing.

LESSONS:

1. Trends in Nursing
2. Modern Health Facilities
3. Modern Nursing
4. The Nurses' Assistant Today

LESSON 1: TRENDS IN NURSING

OBJECTIVE: To help the student develop awareness of nursing as it is today, in the light of historical backgrounds and social forces which have influenced its development.

LESSON OUTLINE:

- I. Introduction
- II. Origins of Nursing
- III. Survey of history
 - A. First hospitals
 - B. First nursing organizations
 - C. Early nursing education
 - D. The Nightingale Period
 - E. Early nursing in America
 - F. Nursing in the twentieth century
- IV. Forces which influence care of the sick
 - A. Social change
 - B. War
 - C. Economic trends
 - D. Scientific discoveries
 - E. Educational advances
 - F. Political philosophy
 1. Value of the individual
 2. Responsibilities of government to the citizen
 - G. Trends in medicine
- V. Current status in nursing
 - A. Levels of education
 - B. Influences on future developments

C. Importance of auxiliary personnel in care of the sick

VI. Summary

LESSON 2: MODERN HEALTH FACILITIES

OBJECTIVE: To help the student understand the types of modern health facilities and health services and become aware of the organizational plan of the modern hospital.

LESSON OUTLINE:

- I. Introduction to purposes of lesson
- II. Purposes of health facilities
 - A. Care of the sick
 - B. Prevention of illness
 - C. Rehabilitation
 - D. Education
 - E. Research
- III. Types of health facilities (local, state, and federal)
 - A. For inpatient care
 - B. For outpatient care
- IV. Classification of hospitals
 - A. According to primary purpose
 - B. According to types of patients
 - C. According to ownership
 - D. According to size
- V. Organization of the modern hospital
 - A. Influences on organizational pattern
 1. Type
 2. Size
 3. Primary purpose
 - B. Reasons for departmentalization

C. Organizational relationships

1. Vertical lines of authority and communication
2. Horizontal lines of authority and communication

D. Examples of hospital departments

VI. Summary

LESSON 3: MODERN NURSING

OBJECTIVE: To help the student understand modern nursing concepts which are basic to effective patient care.

LESSON OUTLINE:

- I. Introduction to purposes of lesson
- II. Philosophy of modern nursing
 - A. In relation to education
 1. Importance of education at all levels
 2. Effects on functions performed (role)
 - B. In relation to other health workers
 - C. In relation to patients
 1. Worth of the individual
 2. Rights of all to receive health care
 3. Right to quality nursing
- III. Nursing care patterns
 - A. Functional method
 - B. Case method
 - C. Meaning of comprehensive nursing
 - D. Meaning of team nursing
- IV. Roles in nursing
 - A. The supervisor
 - B. The head nurse
 - C. The team leader
 - D. The nursing team
 1. Registered nurse

2. Licensed practical nurse

3. Nurses' assistant

4. Ward clerk

V. Hospital relations

A. Functions of nursing service

B. Worker relationships within nursing service

C. Interdepartmental relations

VI. Summary

LESSON 4: THE NURSES' ASSISTANT TODAY

OBJECTIVE: To help the student understand the role of the nurses' assistant and set personal objectives for developing the qualities and skills needed for effective performance.

LESSON OUTLINE:

- I. Introduction to lesson
- II. Importance of the nurses' assistant
- III. Qualifications of the nurses' assistant
 - A. Personal traits needed in care of the sick
 - B. Personal habits to be developed
 - C. Personal hygiene
 - D. Relations with patients
 - E. Attitudes
 1. Toward one's job
 2. Toward one's uniform
 3. Toward other people
 4. Toward oneself
 5. Toward the patient
- IV. Functions of the nurses' assistant
 - A. Variations
 - B. Knowing policies of employing hospital
 - C. Limitations
 1. As established by hospital policies
 2. As established by law
 3. As established by educational preparation
 4. As established by personal qualities

V. Setting personal objectives

A. Striving for excellence

B. Habit formation

C. Attitude toward learning

D. Attitude toward change

VI. Summary

UNIT 11: UNDERSTANDING EFFECTS OF ILLNESS

TIME ALLOTMENT: 10 to 15 hours

OBJECTIVE: To help the student develop understanding of common effects of illness on patient, family, and community, and beginning skills in helping patients adjust to illness and/or hospitalization.

UNIT DESCRIPTION: A study of the diverse effects of illness on the patient, family, and community and the role of health workers in helping the patient and family to make adjustments.

SUGGESTED REFERENCES:

Abdallah. Nurse's Aide Study Manual.

Cherescavich. A Textbook for Nursing Assistants.

Knoedler. The Nurse Assistant.

LESSONS:

1. Common Effects of Illness
2. Common Reactions to Hospitalization
3. Aiding Adjustment to Illness and/or Hospitalization

LESSON 1: COMMON EFFECTS OF ILLNESS

OBJECTIVE: To help the student understand some common effects of illness and how the nurses' assistant applies such understanding in patient care.

LESSON OUTLINE:

- I. Introduction
- II. Those affected by illness
 - A. Patient
 - B. Family
 - C. Community
 - D. Health workers
 - E. Others according to role of patient in society
 - F. Others according to the type of illness
- III. Effects of illness on the family
 - A. According to the role of the patient
 1. The wage-earner
 2. The homemaker
 3. A child
 4. Elderly person
 - B. According to the illness
 1. Accident
 2. Communicable disease
 3. Serious illness
 4. Chronic illness
 5. Illness having long-term effects

IV. Effects of illness on the patient

A. Psychological

1. Common emotional reactions
2. Possible mental changes

B. Physical

1. Examples of altered body function
 - a. Digestive disturbances
 - b. Joint diseases
2. Examples of loss of function
 - a. Fracture
 - b. Injury to sensory organs
3. Examples of general effects on body function
 - a. Loss of appetite
 - b. Problems in elimination
 - c. Changes in sleep patterns
 - d. Weakness

V. Using knowledge of effects of illness

- A. To understand the patient
- B. To understand the family
- C. To understand self

VI. Summary

LESSON 2: COMMON REACTIONS TO HOSPITALIZATION

OBJECTIVE: To help the student understand how hospitalization may affect the patient and family and how such knowledge is applied in patient care.

LESSON OUTLINE:

- I. Introduction
- II. Reactions of the family
- III. Reactions of the patient
- IV. Influences on reactions
 - A. Previous experience
 - B. Attitudes toward hospitals
 - C. The illness
 1. Symptoms
 2. Amount of pain
 3. Whether surgery is expected
 - D. Behavior of hospital personnel
- V. Examples of behaviors on admission to the hospital
- VI. Summary

LESSON 3: AIDING ADJUSTMENT TO ILLNESS AND/OR HOSPITALIZATION

OBJECTIVE: To help the student understand the importance of patient-personnel relations, how to admit a patient according to hospital procedure, and how to help the patient and family make a beginning adjustment to hospitalization.

LESSON OUTLINE:

- I. Introduction
- II. Importance of first contact with personnel
 - A. Effect of first hospital experience
 1. Judgment of hospital and staff
 2. Expectations regarding other experiences
 - B. How to establish rapport
 1. With the patient
 2. With the family
- III. Admission procedure of affiliating hospital
- IV. Helping the patient to adjust
 - A. Information on the unit
 1. Location of supplies
 2. Location of bathroom
 3. How to call the nurse
 - B. Information on hospital routines
 1. Time for meals
 2. Doctor's rounds
 - C. Giving opportunity for questions
- V. Importance of each contact with personnel
- VI. Summary

UNIT III: MAKING OBSERVATIONS ON PATIENTS

TIME ALLOTMENT: 45 to 50 hours

OBJECTIVE: To help the student develop beginning skill in making reliable observations on patients and in reporting to appropriate nursing personnel.

UNIT DESCRIPTION: A study of common effects of illness in relation to observations the nurses' assistant should be able to make and report with accuracy and dependability.

SUGGESTED REFERENCES:

- Abdallah. Nurse's Aide Study Manual.
- Anderson. Basic Patient Care.
- Cherescavich. A Textbook for Nursing Assistants.
- Knoedler. The Nurse Assistant.
- Leake. A Manual of Simple Nursing.

LESSONS:

1. How to Make Reliable Observations
2. How to Observe Respiratory and Circulatory Function
3. How to Measure Body Temperature
4. How to Observe Body Specimens
5. General Observations to Be Reported

LESSON 1: HOW TO MAKE RELIABLE OBSERVATIONS

OBJECTIVE: To help the student understand the importance of observations on patients and develop beginning skill in using nursing vocabulary to report observations and other information on patients.

LESSON OUTLINE:

- I. Introduction
- II. Types of symptoms
 - A. Objective
 - B. Subjective
- III. Making observations
 - A. Methods
 1. Inspection
 2. Palpation
 3. Instrumental
 - B. How to be accurate
 1. Knowing what to look for
 2. Avoiding influence of opinion
 3. Knowing how to use instruments
 4. Knowing appropriate vocabulary
- IV. Receiving subjective reports
 - A. Recognizing significance in patient's statement
 - B. Asking for more information
 - C. Separating statements of fact from assumptions
Example: "I have indigestion"
- V. General rules for making observations
- VI. General rules for reporting observations
- VII. Summary

LESSON 2: HOW TO OBSERVE RESPIRATORY AND
CIRCULATORY FUNCTION

OBJECTIVE: To help the student develop awareness of the importance of respiration and circulation, how to make reliable observations of respiratory and circulatory function, how to detect significant deviations from normal function, and how to avoid common errors in obtaining respiratory and pulse rates.

LESSON OUTLINE:

- I. Introduction
- II. Respiratory function
 - A. Purpose
 - B. Structures involved
 - C. Why interference with respiration is serious
 - D. How to count the respiratory rate
 - E. Signs of abnormal function to be reported
 - F. Vocabulary related to respiratory function
- III. Circulatory function
 - A. Purpose
 - B. Structures involved
 - C. Why changes in circulation may be serious
 - D. How to count the pulse rate
 - E. Signs of abnormal function to be reported
 - F. Vocabulary related to circulatory function
- IV. How to be reliable in observing respiration and pulse
 - A. Common causes of error
 - B. How to avoid errors
- V. Summary

LESSON 3: HOW TO MEASURE BODY TEMPERATURE

OBJECTIVE: To help the student understand the significance of body temperature, how to take temperatures according to hospital procedures and aseptic principles, how to avoid error, and how to record information according to hospital practice.

LESSON OUTLINE:

- I. Introduction
- II. Influences on body temperature
- III. Significance of change in body temperature
- IV. Measurement of body temperature
 - A. The clinical thermometer
 1. Structure
 2. How to take a reading
 3. How to shake the mercury down
 4. How to handle thermometer aseptically
 - a. Before use
 - b. After use
 5. Care of thermometers
 - B. Areas used for measuring body temperature
 - C. Methods
 1. Oral
 2. Rectal
 3. Axillary
- V. How to be reliable in measuring body temperature
 - A. Causes of error
 - B. How to avoid errors
- VI. Recording temperature, pulse, and respiration
- VII. Summary

LESSON 4: HOW TO OBSERVE BODY SPECIMENS

OBJECTIVE: To help the student develop awareness of normal and abnormal characteristics of body specimens, indications of abnormal body function as related to specimens, and understanding of methods for collecting specimens and maintaining intake-output records.

LESSON OUTLINE:

- I. Introduction
- II. Types of specimens the assistant handles
 - A. Urine
 - B. Stool
 - C. Sputum
 - D. Emesis
- III. Observations to be reported
 - A. Urine specimen
 1. Abnormal color
 2. Abnormal amount
 3. Stones
 - B. Stool specimens
 1. Abnormal color
 2. Abnormal consistency
 3. Parasites
 - C. Sputum
 1. Consistency
 2. Color
 3. Amount
 - D. Emesis
 1. Consistency

2. Color

3. Amount

4. Odor

IV. Observations on body functions

A. Voiding

1. Frequency and amount

2. Inability to void

3. Pain

B. Defecation

1. Frequency

2. Absence

3. Pain

C. Vomiting

1. Time of occurrence

2. Possible related factors

D. Coughing

1. Type

2. Whether productive

3. Frequency

V. Collecting specimens

A. Why specimens are collected

B. Principles related to collection of any specimen

C. Method

1. Urine

2. Stool

3. Sputum

D. Disposition of specimens

E. Reporting collection and disposition of a specimen

VI. Summary

LESSON 5: GENERAL OBSERVATIONS TO BE REPORTED

OBJECTIVE: To help the student develop awareness of general observations on patients which may be of significance and should be reported to appropriate personnel.

LESSON OUTLINE:

- I. Introduction
- II. Possible significance of general observations
- III. Examples of observations to be reported
 - A. Change in patient's color
 1. Skin
 2. Nails
 3. Conjunctiva
 - B. Pain
 - C. Changes in body function
 - D. Changes in behavior
 - E. Changes in mental state or orientation
 - F. Unfavorable emotional states
- IV. Rules for making reliable observations
- V. Summary

UNIT IV: SAFETY MEASURES IN CARE OF THE SICK

TIME ALLOTMENT: 25 to 30 hours

OBJECTIVE: To help the student develop understanding of medical asepsis, safety, and emergency situations in relation to the role of the nurses' assistant.

UNIT DESCRIPTION: A study of methods used to protect patients and personnel from infections and accidents and the role of the nurses' assistant in the event of internal or external disaster.

SUGGESTED REFERENCES:

- Abdallah. Nurse's Aide Study Manual.
- Anderson. Basic Patient Care.
- Cherescavich. A Textbook for Nursing Assistants.
- Knoedler. The Nurse Assistant.
- Leake. A Manual of Simple Nursing.

LESSONS:

1. Medical Asepsis
2. Fundamentals of Safety In Patient Care
3. Internal Disaster
4. External Disaster

LESSON 1: MEDICAL ASEPSIS

OBJECTIVE: To help the student understand basic information on microorganisms, the meaning of medical asepsis, and how to apply principles of asepsis in performance of hospital duties.

LESSON OUTLINE:

- I. Introduction to lesson
- II. Meaning of medical asepsis
- III. Why aseptic technique is necessary
 - A. Presence of microorganisms
 1. In environment
 2. In human body
 - a. On skin
 - b. In mouth and nose
 - c. In feces
 - d. In drainage from wounds
 - e. In genitourinary secretions
 - B. How organisms are transmitted
 - C. Common examples of organisms
 - D. Transfer of organisms in hospitals
- IV. Controlling transfer of organisms
 - A. Clean technique
 - B. Mechanical cleansing
 - C. Disinfection
 - D. Antisepsis
 - E. Sterilization

V. Controlling bacteria in routine procedures

- A. Bedmaking
- B. Care of the unit
- C. Handling bedpans
- D. Handling patient property
- E. Filling water pitchers
- F. Handling linens
- G. Preparing bathroom for patient use

VI. Hospital procedures

- A. Cleaning the discharge unit
- B. Disinfecting equipment

VII. Nursing technique

- A. Clean
- B. Sterile

VIII. Summary

LESSON 2: FUNDAMENTALS OF SAFETY IN PATIENT CARE

OBJECTIVE: To help the student understand common causes of accidents in hospitals, how to practice safety for self and others, how to use hospital equipment safely, and how to practice safety in common and special nursing situations.

LESSON OUTLINE:

- I. Introduction
- II. General rules for self-protection
- III. General rules for safe practice
- IV. Maintaining a safe environment for the patient
- V. Safe use of movable equipment
 - A. Wheelchairs
 - B. Stretchers
- VI. Safe use of electrical equipment
- VII. Rules related to the patient's condition
 - A. The blind patient
 - B. The confused patient
 - C. The unconscious patient
 - D. The irresponsible patient
 - E. The seriously ill patient
- VIII. Rules related to the patient's age
 - A. The infant and child
 - B. The elderly patient
- IX. Rules related to the patient's therapy
 - A. Oxygen
 - B. Radiation
 - C. Drugs
 - D. Heat and cold

- X. Safety during patient care
 - A. The bath
 - B. Getting the patient out of bed
 - C. Ambulation
 - D. Performance of procedures
- XI. Examples of common hospital accidents
 - A. To patients
 - B. To personnel
 - C. To public
- XII. How to prevent accidents in the hospital
- XIII. Summary

LESSON 3: INTERNAL DISASTER

OBJECTIVE: To help the student understand types of internal disaster which may occur in the hospital, the hospital plan for internal disaster, and how the nurses' assistant role is affected if internal disaster occurs.

LESSON OUTLINE:

- I. Introduction
- II. Meaning of internal disaster
- III. Types of internal disaster
 - A. Explosions
 1. Common causes
 2. Effect on hospital function
 3. Role of the assistant
 4. Prevention
 - B. Fire
 1. Common causes
 2. Effect on hospital function
 3. Role of the assistant
 4. Prevention
 - C. Food poisoning
 1. Common causes
 2. Effect on hospital function
 3. Role of the assistant
 4. Prevention
- IV. The hospital plan for internal disaster
- V. Rules affecting all personnel in event of an internal disaster
- VI. Summary

LESSON 4: EXTERNAL DISASTER

OBJECTIVE: To help the student understand the meaning of external disaster, the hospital plan for various types of external disasters, and the effect of external disaster on the role of the nurses' assistant.

LESSON OUTLINE:

- I. Introduction
- II. Meaning of external disaster
- III. Types of external disaster
 - A. Industrial accidents
 1. Common examples
 2. Effects on the community
 3. Effects on hospital functioning
 4. Role of the assistant
 - B. Fires
 1. Common examples
 2. Effects on the community
 3. Effects on hospital functioning
 4. Role of the assistant
 - C. Transportation accidents
 1. Common examples
 2. Effects on the community
 3. Effects on hospital functioning
 4. Role of the assistant
 - D. Natural disaster
 1. Common examples
 2. Effects on the community

3. Effects on hospital functioning
4. Role of the assistant
- IV. The hospital plan for external disaster
- V. Rules affecting all personnel in event of an external disaster
- VI. Summary

UNIT V: MEASURES TO PROMOTE THE PATIENT'S COMFORT

TIME ALLOTMENT: 35 to 40 hours

OBJECTIVE: To help the student develop beginning skills in those aspects of patient care appropriate to the role of the nurses' assistant.

UNIT DESCRIPTION: A study of bedside nursing procedures used in assisting patients with daily needs.

SUGGESTED REFERENCES:

Abdallah, Mary C. Nurse's Aide Study Manual.

Anderson, Maja C. Basic Patient Care.

Cherescavich. A Textbook for Nursing Assistants.

Knoedler, Evelyn L. The Nurse Assistant.

Leake, Mary. A Manual of Simple Nursing.

LESSONS:

1. Care of the Patient's Unit
2. Assisting the Patient with Personal Hygiene
3. Maintaining the Patient's Body Function
4. Diversional Activities

LESSON 1: CARE OF THE PATIENT'S UNIT

OBJECTIVE: To help the student develop understanding of nursing principles and beginning skill in performing procedures related to care of the patient's unit.

LESSON OUTLINE:

- I. Introduction
- II. Requirements of a comfortable environment
- III. The patient's bed
 - A. Requirements of a comfortable bed
 - B. How to strip a bed
 - C. How to make a bed
 - D. Applying principles of asepsis
- IV. Daily care of the unit
 - A. The bedside table
 - B. Other furniture
 - C. Supplies
 - D. Flowers
- V. Summary

LESSON 2: ASSISTING THE PATIENT WITH PERSONAL HYGIENE

OBJECTIVE: To help the student develop understanding of nursing principles and beginning skill in performing procedures related to the patient's hygiene.

LESSON OUTLINE:

- I. Introduction
- II. Assisting the patient with daily bath
 - A. Bedbath
 - B. Tub or shower bath
- III. Assisting the patient with oral hygiene
 - A. General mouth care
 - B. Care of dentures
 - C. Special mouth care
- IV. Assisting the patient with grooming
 - A. Importance of grooming
 - B. Care of the hair
 1. Routine
 2. Long hair
 - C. Shaving the male patient
 - D. Care of hands and feet
 - E. Use of cosmetics
 1. Makeup
 2. Deodorants
 3. Use of scented materials in the hospital
- V. Summary

LESSON 3: MAINTAINING THE PATIENT'S BODY FUNCTION

OBJECTIVE: To help the student develop beginning skill in applying nursing principles to the performance of procedures related to maintaining body function.

LESSON OUTLINE:

- I. Introduction
- II. Assisting patients with their diets
- III. Maintaining circulation
 - A. The backrub
 - B. Activity for the bed patient
 1. Change of position
 2. Movement of extremities
 3. Deep breathing
 - C. Ambulation
- IV. Maintaining joint mobility
 - A. Passive exercise
 - B. Encouraging patient use of joints
- V. Maintaining urinary function
 - A. Assisting patients to void
 - B. Role of the assistant in relation to catheters
 - C. Care of the incontinent patient
 1. Importance of frequent changing
 2. Trying to control incontinence
 - a. Scheduled voidings
 - b. Getting patient out of bed
 - D. Intake-output records

- VI. Maintaining bowel function
 - A. Importance of defecation record
 - B. Patients most likely to develop problems
 - C. Promoting regular elimination
 - D. Care of the patient with bowel incontinence
- VII. Assisting the patient with nausea and vomiting
 - A. Effects of nausea on the patient
 - B. Assisting during episodes of vomiting
 - C. Measures to minimize nausea
- VIII. Special skin care
 - A. Common causes of skin problems
 - B. Preventing irritation
 - C. Preventing skin breakdown
- IX. Stimulating mental function
- X. Results of nursing neglect
 - A. Physical
 - B. Emotional
 - C. Mental
- XI. Summary

LESSON 4: DIVERSIONAL ACTIVITIES

OBJECTIVE: To help the student develop awareness of the importance of diversional activities for selected patients and understanding of types of diversional activities the nurses' assistant can promote.

LESSON OUTLINE:

- I. Introduction
- II. Purpose of diversion
- III. Effects of diversional activities
- IV. Types of patients needing diversion
- V. Types of diversion the nurses' assistant can encourage
- VI. Results of nursing neglect of diversional activities
- VII. Summary

UNIT VI: MEASURES RELATED TO THE PATIENT'S ILLNESS

TIME ALLOTMENT: 80 to 85 hours

OBJECTIVE: To help the student develop beginning skill in the performance of nursing procedures related to care of the isolated patient, in carrying out orders for unsterile irrigations and simple therapeutic measures, and in meeting selected needs of the surgical patient.

UNIT DESCRIPTION: A study of simple procedures commonly ordered by the doctor and appropriate to the role of the nurses' assistant.

SUGGESTED REFERENCES:

- Abdallah. Nurse's Aide Study Manual.
- Anderson. Basic Patient Care.
- Cherescavich. A Textbook for Nursing Assistants.
- Knoedler. The Nurse Assistant.
- Leake. A Manual of Simple Nursing.

LESSONS:

1. Care of the Patient in Isolation
2. Irrigations
3. Heat and Cold
4. Procedures Related to the Surgical Patient

LESSON 1: CARE OF THE PATIENT IN ISOLATION

OBJECTIVE: To help the student develop understanding of principles related to isolation precautions and beginning skill in carrying out isolation technique.

LESSON OUTLINE:

- I. Introduction
- II. Indications for isolation of a patient
 - A. Protection of the patient
 - B. Protection of others
- III. Types of isolation
 - A. Mask only
 - B. Gown and mask
 - C. Gown and glove
 - D. Linen
 - E. Body materials
- IV. Isolation technique
 - A. Handwashing
 - B. Gown
 1. Putting gown on
 2. Removing gown
 3. Placement of gown for re-use
 - C. Mask
 - D. Glove
 - E. Protection of shoes
- V. Procedure of affiliating hospital
 - A. Private room
 - B. Ward unit

VI. Nursing responsibilities to the patient in isolation

VII. Summary

LESSON 2: IRRIGATIONS

OBJECTIVE: To help the student develop understanding of related nursing principles and beginning skill in performance of selected irrigations as ordered by the physician.

LESSON OUTLINE:

- I. Introduction
- II. General purpose of irrigations
- III. Areas of body commonly irrigated
- IV. Enemas
 - A. Purpose
 - B. Types
 - C. Administration
 1. Preparation of materials
 2. Preparation of patient
 3. Giving solution
 4. Assisting patient following enema
 5. Observing results
 6. Aftercare of equipment
- V. Unsterile vaginal irrigation
 - A. Purpose
 - B. Types
 - C. Administration
 1. Preparation of materials
 2. Preparation of patient
 3. Giving solution
 4. Assisting patient following irrigation

5. Observations to be reported

6. Aftercare of equipment

VI. Perineal irrigation

A. Purpose

B. Types

C. Administration

1. Preparation of materials

2. Preparation of patient

3. Pouring solution

4. Assisting patient following irrigation

5. Observations to be reported

6. Aftercare of equipment

D. Recent trends in relation to perineal cleaning

VII. Summary

LESSON 3: HEAT AND COLD

OBJECTIVE: To help the student develop understanding of related principles and beginning skill in performance of selected procedures involving use of heat or cold, as ordered by the physician.

LESSON OUTLINE:

- I. Introduction
- II. Effects of heat
 - A. Immediate
 - B. Prolonged
- III. Effects of cold
 - A. Immediate
 - B. Prolonged
- IV. How water bottle and/or K-pad
 - A. Preparation
 - B. Placement
 - C. Aftercare
- V. Ice bag and/or K-Kooler
 - A. Preparation
 - B. Placement
 - C. Aftercare
- VI. Unsterile compresses
 - A. Types
 - B. Technique
 - C. Procedure
 - D. Observations to be reported

VII. Sitz bath

- A. Purpose
- B. Technique
- C. Procedure
- D. Observations to be reported
- E. Aftercare of equipment

VIII. Heat lamps

- A. Purpose
- B. Technique
- C. Procedure
- D. Observations to be reported
- E. Aftercare of equipment

IX. Soaks

- A. Types
- B. Technique
- C. Procedure
- D. Observations to be reported
- E. Aftercare of equipment

X. Responsibilities in using heat and cold

- A. Related to effectiveness of treatment
- B. Related to safety of the patient

XI. Summary

LESSON 4: PROCEDURES RELATED TO THE SURGICAL PATIENT

OBJECTIVE: To help the student develop awareness of the needs of surgical patients and beginning skill in performing selected aspects of preoperative and postoperative patient care.

LESSON OUTLINE:

- I. Introduction
- II. The surgical prep
 - A. Purpose
 - B. Areas to be shaved
 - C. Procedure
- III. Preparation of patient on day of surgery
 - A. Bath
 - B. Oral hygiene
 - C. Care of hair
 - D. Removal of nail polish
 - E. Voiding
- IV. Preparation of the surgical bed
 - A. Purpose
 - B. Procedure
 - C. Supplies for the unit
- V. The postoperative patient
 - A. Importance of close observation by nursing personnel
 - B. Assisting with voiding
 - C. Comfort measure
 - D. Intake and output records
- VI. Summary

UNIT VII: BECOMING A HOSPITAL EMPLOYEE

TIME ALLOTMENT: 80 to 85 hours

OBJECTIVE: To help the student make the transition to a fully responsible employee role, fulfill citizenship responsibilities as a wage-earner, and set personal standards for quality performance as a member of the nursing team.

UNIT DESCRIPTION: A study of the nurses' assistant as a practitioner, with emphasis on effective job performance and fulfillment of citizenship responsibilities.

SUGGESTED REFERENCES:

- Abdallah. Nurse's Aide Study Manual.
- Anderson. Basic Patient Care.
- Cherescavich. A Textbook for Nursing Assistants.
- Knoedler. The Nurse Assistant.
- Leake. A Manual of Simple Nursing.

LESSONS:

1. Being a Responsible Wage-Earner
2. Applying for and Resigning from a Position
3. Maintaining High Standards

LESSON 1: BEING A RESPONSIBLE WAGE-EARNER

OBJECTIVE: To help the student develop understanding of personal and citizenship responsibilities of the wage earner in a democratic society.

LESSON OUTLINE:

- I. Introduction
- II. Responsibilities of the wage-earner
 - A. To community
 - B. To family
 - C. To self
- III. Taxation and wage-earner
 - A. Purpose of taxes
 1. Local
 2. State
 3. Federal
 - B. Types of taxes
 1. Sales
 2. Excise
 3. Income
 4. On specific items
 - C. Benefits to the individual
 - D. Variations in taxation
 - E. How the good citizen views taxation
- IV. Management of income
 - A. Use of a budget
 - B. Buying habits
 1. Planned purchasing

2. Impulse buying

3. Cash payments

4. Credit buying

V. Planning for the future

A. Insurance

B. Savings plans

C. Investments

D. Retirement plans

VI. Summary

LESSON 2: APPLYING FOR AND RESIGNING FROM A POSITION

OBJECTIVE: To help the student develop understanding of how to apply for a position, how to leave a position, and how to maintain effective relationships with the employer.

LESSON OUTLINE:

- I. Introduction
- II. How to apply for a position
 - A. Obtaining information on positions
 - B. Filling in an application form
 1. General rules
 2. Giving references
 - C. The interview
 1. Obtaining an appointment
 2. Appropriate dress
 3. Appropriate behaviors
 4. Answering questions
 5. Asking questions
 - D. Accepting a position
 1. Verbal agreements
 2. Written agreements
- III. Employer-employee relations
 - A. What an employee owes the employer
 - B. What the employer owes the employee
- IV. How to leave a position
 - A. Written notice of resignation
 - B. The terminal interview
- V. Summary

LESSON 3: MAINTAINING HIGH STANDARDS

OBJECTIVE: To help the student develop an appreciation for standards of excellence in nursing practice, respect for the role of the nurses' assistant, and a desire for continued growth as a person and as a practitioner.

LESSON OUTLINE:

- I. Introduction
- II. Qualities patients want in hospital personnel
- III. Qualities nurses want in member of the nursing team
- IV. Job satisfaction
 - A. Meaning
 - B. Why it is desirable
 - C. Effect on performance
- V. Striving for excellence as a practitioner
- VI. Summary

INTRODUCTION

In recent years the demand for health services has been increasing, and shortages of health personnel continue to be critical. The Social Security Amendments of 1965 are expected to increase markedly the need for health workers at all levels and to require that health services be extended beyond those currently available.

In order to provide assistance to individuals and families with personal care and home-related problems, it is anticipated that relatively large numbers of nonprofessional workers must be prepared to assist in meeting demands for such service. It is hoped that this course outline will facilitate the pre-employment preparation of such workers through the institutions of the North Carolina Department of Community Colleges.

The course outline is designed to prepare enrollees to provide non-professional assistance with personal care and/or home-related problems. The overall purpose is twofold: to prepare individuals for employment and orientation to nonprofessional roles in community agencies; and, secondly, to prepare individuals to assist families with activities of homemaking and promotion of family well-being in situations not requiring professional direction. The graduate of the course is not qualified to render nursing care; hence role interpretation and guidance toward appropriate employment must be integral aspects of the instructional plan.

The course outline has been limited to general topics, because of the variety of work situations graduates may enter. Lesson plans developed within the framework of the outline should be adapted to meet the specific needs of each class in terms of local employment opportunities, requirements of agencies, and educational level of enrollees. The outline is designed for 220 hours of instruction, to include student activities designed to develop specific skills. By scheduling class time for four hours daily throughout one quarter, the educational institution may gain additional recruits among those who must retain their present jobs during the course. By scheduling more hours per day, the institution can have graduates available in a shorter period of time for employment and on-the-job training by community agencies. The need for non-professional employees in certain communities may be sufficiently urgent to justify this plan of scheduling, if enrollees can benefit from a full day of instruction.

Employment opportunities for the graduate include such areas as public health agencies, public welfare agencies, private agencies providing home services, institutions which provide care for dependent individuals, and families who need assistance with tasks not requiring professional supervision. Possible job titles for such roles include clinical aide, home aide, health

aide, homemaker's assistant, cottage parent, house parent, day-care aide, or kindergarten aide. Community opportunities for employment vary according to the types and numbers of local resources utilizing nonprofessional personnel to provide services to families and individuals. It is expected that the graduate who accepts employment in an agency or institution will receive thorough orientation, as this course is not designed to prepare the individual to function in any specific agency. Such on-the-job training should clarify and extend the employee's role by building on the basic preparation provided in this course.

Variability in community needs and opportunities, employment policies of agencies and institutions, and level of students' educational achievement, make it necessary to adapt the course content at the local level. Designing an instructional plan to meet community and student needs effectively can best be accomplished with the assistance of a local advisory committee, with representation from all service and health agencies in the community. This group should provide information and recommendations to the administration and faculty of the educational institution in regard to the following:

Community needs for nonprofessional service and health workers

Competencies students should be helped to develop

Employment criteria for nonprofessional personnel, as established by each local agency, local institution, or State Merit System

Minimum admission standards

Faculty requirements

Professional personnel available in the community to participate in the instructional program

The State Advisory Committee and various consultants have offered recommendations which may prove helpful as guidelines until specific policies can be developed locally.

The competencies students should develop are reflected in the course outline. Essentially these are encompassed by such generalities as the ability to follow instructions, ability to work effectively with professional personnel, skill in providing specific services to individuals and families, skill in adapting to a wide variety of home situations, basic understanding of human behavior and ability to work effectively with others, skill in organizing a work plan and in helping others to improve work and personal habits, and willingness to work within a specified role.

Employment policies of service and health agencies may vary from one community to another. In some cases, these policies may be established by the State Merit System. Representatives of these agencies and other potential employers will interpret these policies, which in turn will influence admission standards, course content, and graduation requirements.

A community survey will provide valuable information on employment opportunities. This survey should include public and private community agencies, institutions, day care centers, and a sufficient sample of individual health and social service personnel to determine community needs for home services. If the needs of a specific agency are sufficient for enrollment of a class, the course should be adapted to the requirements of that agency. If it appears that graduates will enter diverse fields, the course should be kept general in nature. Student goals and employment opportunities in the community thus influence to a great extent the instructional plan developed by the faculty.

Admission standards will be affected by policies of potential employers in the community. Minimum requirements should include basic skills in communications and simple mathematics and demonstration of interest in and a desire to serve others in an assisting role. Until admission standards can be determined empirically, the following might serve:

Evidence of completion of eighth grade or equivalent, or

Schools and College Ability Test, Level 3: Verbal, 248
Quantitative, 254
Total, 254

The nature of the course is such that subject matter from a variety of fields is covered, though not in depth. It is probable that a registered nurse would have adequate preparation for teaching this content. The planning of lessons and student activities, utilization of community resources, and adapting course content to community needs will challenge the teacher's resourcefulness; therefore, prior experience in teaching and thorough familiarity with community resources are desirable. In addition to the coordinating teacher, numerous professional workers can be utilized where appropriate to provide specific information on agencies or to direct student activities. Such resource personnel include:

Social workers from public welfare agencies, Family Service Society, or health agencies

Public health nurses

Physical therapists

Occupational therapists

Nutritionists

Health educators

Special education teachers

All such participants in the instructional program should be thoroughly familiar with the purposes of the course, student level, and specific objectives for their areas of instruction.

Guidelines for this course outline have been provided by the Advisory Committee for the Home Health Aide:

Mrs. Martha Allan, R.N.	Wake County Health Department
Mr. H. K. Collins, President	Durham Technical Institute
Miss Miriam Daughtry, R.N.	Department of Community Colleges
Dr. William H. Denton	Department of Community Colleges
Mrs. Betty Elliott, R.N.	Mecklenburg Health Department
Miss Mary I. Gordon, R.N.	Department of Preventive Medicine University of North Carolina
Miss Nancy Hall	Forsyth County Department of Public Welfare
Miss Elizabeth Holley, R.N.	State Board of Health
Dr. Burns Jones	State Board of Health
Mrs. Betty McCrary	Rowan Technical Institute
Mrs. Myra J. Mitchiner	State Board of Public Welfare
Mrs. Jane Norwood	State Board of Public Welfare
Mrs. Annie May Pemberton	State Board of Public Welfare
Mr. Curtis Phillips	Rowan Technical Institute
Mr. Gene Phillips	Rowan Technical Institute
Miss Frances Sellars, R.N.	Wake County Health Department
Mr. Carl C. Staley, Jr.	State Board of Public Welfare
Mr. Robert Williams	W. W. Holding Technical Institute

Much appreciation is due this group for the valuable assistance provided, both through committee meetings and individual conferences.

COURSE DESCRIPTION

THE PERSONAL CARE AND FAMILY AIDE

A course designed to prepare students to render services to individuals and families who need assistance with personal care or home problems. Classroom teaching emphasizes interpersonal relationships, needs of individuals at various life stages, basic principles of nutrition and meal preparation, home organization and management, community resources, effects of illness on individuals and families, and methods for assisting individuals with the activities of daily living. Student activities are intended to develop specific skills needed for assisting others with personal care or with home activities.

The assisting role of the Personal Care and Family Aide is the focus of each lesson, with emphasis on limitations imposed by legal control of health workers, by policies of employing agencies and institutions, and by the short period of educational preparation.

PERSONAL CARE AND FAMILY AIDE

COURSE OBJECTIVES:

1. To promote interest in and concern for individuals or families with needs for personal care within the home or other setting.
2. To promote awareness of needs of individuals as influenced by age, illness, circumstance, heredity and environment.
3. To promote awareness of the challenges and satisfactions of helping others.
4. To promote understanding of health needs and other services as they influence the individual, the home and the community.
5. To prepare individuals to function safely and effectively in assisting individuals or families in various situations.
6. To promote understanding of the role of the Personal Care and Family Aide and limitations of that role imposed by educational preparation, legislation, and policies of the employer.

LENGTH OF COURSE: Approximately 220 hours.

LESSON 1: INTRODUCTION TO HEALTH SERVICES

LESSON OBJECTIVE: To help the student understand the meaning and scope of health care, factors affecting health needs, types of health workers, and the role of the Personal Care and Family Aide as a member of the health team.

TIME ALLOTMENT: 12 hours.

OUTLINE OF LESSON:

- I. Introduction to course
 - A. Overview of course
 - B. The meaning of health
 1. Physical
 2. Mental
 3. Emotional
 - C. Influences on health
- II. History of health and family services
 - A. Past developments
 - B. Present trends
- III. Factors affecting health care
 - A. Educational advances
 - B. Social change
 - C. Economic change
 - D. Federal legislation
 - E. Personal attitudes
- IV. The service teams in various settings
 - A. Team members
 1. Health
 2. Social service
 3. The recipient

- B. Roles of team members
- C. Interaction of team members
 - 1. Relationships
 - 2. Division of responsibilities
 - 3. Advantages of team approach
- D. Legal factors affecting roles and practice
- V. Qualifications for the Personal Care and Family Aide
 - A. Personal habits
 - 1. Those important for personal health protection
 - 2. Those important for acceptance by others
 - B. Personal qualities
 - 1. Meaning of personality
 - 2. Desirable personality traits
 - C. Goals for improvement
- VI. Personal Care and Family Aide as a member of the health team
 - A. Pre-employment preparation
 - 1. Importance
 - 2. Responsibilities
 - a. The school
 - b. The student
 - B. Employment
 - 1. Agencies
 - 2. Private employment
 - 3. Work agreements
 - 4. Social Security
 - 5. Labor laws
 - 6. Taxes

C. Ethics

1. Meaning
2. Importance
 - a. Involvement in private affairs of others
 - b. Knowledge of confidential information
 - c. Access to property of others
3. Examples of ethical behaviors
 - a. In relation to individuals or families being served
 - b. In relation to members of the health team
 - c. In relation to employment agreements
 - d. In relation to role of the Aide

SUGGESTED RELATED ACTIVITIES:

1. Films available from the North Carolina State Board of Health:
 - a. "Home Care"
 - b. "Living Insurance"
 - c. "Body Care and Grooming"
 - d. "Helping Hands for Julie"
 - e. "Almost a Miracle"
 - f. "Cleanliness and Health"
 - g. "The Human Body"
2. Visiting speakers: prospective employers, social workers, public health nurses, physical therapists, health educators, nutritionists, and others.
3. Have students prepare a list of desirable personal qualities for the Personal Care and Family Aide and rate themselves as "satisfactory" or "need to improve".
4. Have students prepare a daily health care calendar for themselves for the period of one year.

LESSON 11: UNDERSTANDING HUMAN RELATIONSHIPS

LESSON OBJECTIVE: To help the student develop better understanding of human behavior in order to establish effective relationships with others.

TIME ALLOTMENT: 12 hours.

OUTLINE OF LESSON:

- I. Introduction to lesson
- II. Definitions
 - A. Attitudes
 - B. Behavior
 - C. Emotions
 - D. Worth of the individual
- III. Basic needs of individuals
 - A. Love
 - B. Security
 - C. Recognition
 - D. Self-respect
 - E. Others
- IV. Influences on behavior
 - A. Basic needs
 1. Characteristic behaviors when needs are not met
 2. Characteristic behaviors when methods of meeting needs are threatened
 - B. Past learnings
 - C. Interests and values
 - D. Behavior of others
 - E. Current circumstances
 - F. Illness
 - G. Others

V. Human relationships

A. Understanding self

1. Attitudes

a. Toward oneself

b. Toward one's job

c. Toward other individuals

2. Basic needs

3. Behavior habits

4. Relations with others

B. Understanding others

1. Causes of behavior

2. Effects of behavior

3. Personal influence on behavior of others

4. Behavioral change under stress

C. Communicating with others

1. In person

2. By telephone

VI. Making behavior acceptable to others

A. Appropriate attitudes

B. Acceptable behaviors

C. Effective communications

VII. Fulfilling responsibilities of the Personal Care and Family Aide

A. To individuals and families

B. To supervisors

C. To members of the service team

D. To others

SUGGESTED RELATED ACTIVITIES:

1. Films:
 - a. "By Jupiter"
 - b. "Working for Public Health Through Recognition of Feelings"
2. Group discussions:
 - a. Development of favorable attitudes toward an uncooperative family
 - b. How to overcome prejudice
3. Demonstration: Proper use of the telephone, by representatives from the telephone company
4. Handout pamphlet, available from Department of Mental Health, Raleigh:
 - a. "Mental Health Is - - + 1,2,3"

LESSON III: UNDERSTANDING FAMILY LIVING

LESSON OBJECTIVE: To help the student become aware of differences in families and to understand how role of the Aide would vary according to family and the situation creating need for assistance.

TIME ALLOTTMENT: 8 hours.

OUTLINE OF LESSON:

- I. Introduction to lesson
- II. Principal functions of today's family
 - A. Reproduction
 - B. Physical, emotional, economic support
 - C. Education of children
 - D. Promoting responsible citizenship
- III. Family relationships
 - A. Variations in family roles
 1. Husband
 2. Wife
 3. Children
 4. Others
 - B. Adult influence in the home
 1. On children
 2. On home environment
 3. On economic resources
 4. On home management
 5. On health practices
 6. On attitudes toward illness
 - C. Differences in families
 1. Customs

2. Interests
 3. Values
 4. Financial responsibility
 5. Respect for education
 6. Interpretation of family roles
 7. Religious practices
 8. Desire for self-improvement
- IV. Family responsibilities for health
- A. Examples
 1. Health protection
 2. Teaching health habits
 3. Securing medical attention when needed
 4. Obtaining health information
 - B. Differences in acceptance of health responsibilities
- V. Possible threats to family life
- A. In relation to roles
 1. Disagreement
 2. Failure to fulfill responsibilities
 - B. Economic problems
 - C. Lack of discipline
 - D. Illness
 1. When the "breadwinner" is ill
 2. When the homemaker is ill
 3. When a child is ill
- VI. Role of the Personal Care and Family Aide
- A. Using knowledge of family life

1. Roles
 2. Effects of threat
 3. Disorganization during illness
- B. Adjusting to differences in families
 - C. Maintaining high personal standards
 - D. Respecting differences of others
 - E. Assisting in teaching good health practices
 - F. Relations with professional workers

SUGGESTED RELATED ACTIVITIES:

1. Films:

- | | |
|--------------------------|-------------------------|
| a. "Family Life" | c. "Home Again" |
| b. "You and Your Family" | d. "Roots of Happiness" |

2. Group Discussions:

- a. Variations in family roles
- b. Variations in role of Aide in several situations

3. Speakers from community agencies:

- a. Public health nurse
- b. Medical social worker
- c. Case worker from public welfare
- d. Counselor from Family Service Society

LESSON IV: ORGANIZATION AND MANAGEMENT

LESSON OBJECTIVE: To help the student develop understanding of organization and management and beginning skill in applying principles to performance of duties.

TIME ALLOTMENT: 12 hours.

OUTLINE OF LESSON:

- I. Introduction to lesson
- II. Principles of organization
 - A. Survey needs
 - B. Construct a plan
 - C. Proceed in logical sequence
- III. General rules for home management
 - A. Use of time
 - B. Conservation of energy
 - C. Utilization of space
 - D. Utilization of equipment and materials
 - E. Conservation of materials
- IV. General rules for management of resources
 - A. Use of a budget
 - B. Buying habits
 1. According to needs
 2. Credit buying
 - C. Planning ahead
 1. Insurance
 2. Savings
 3. Investments
 4. Retirement

V. Role of the Personal Care and Family Aide

A. Factors affecting role

1. Individual or family needs for assistance
2. Role of individual needing care
3. Age of individual needing care
4. Family members able to assume responsibilities

B. Developing a work plan

C. Examples of effective management.

D. Examples of poor management

E. Setting a good example

F. Assisting family members with organization and management

G. Securing cooperation of family

SUGGESTED RELATED ACTIVITIES:

1. Time and motion studies on performance of household tasks. List ways to conserve time and energy.
2. Preparation of a personal or family budget.
3. Development of work schedule for a hypothetical family; group evaluation of individual schedules.
4. Practice in improvising equipment to use in a home lacking common conveniences.
5. Practice in use of automatic appliances.
6. Red Cross films on home nursing to illustrate improvisation of equipment.

LESSON V: PROVIDING A SAFE HOME ENVIRONMENT

LESSON OBJECTIVE: To help the student recognize hazards in the environment and develop a sense of responsibility to provide a clean, safe environment.

TIME ALLOTMENT: 12 hours.

OUTLINE OF LESSON:

- I. Introduction to lesson
 - A. Meaning of environment
 - B. Types of environment
 1. Physical
 2. Social
 - C. Significant environmental influences on individuals
- II. The environment and health
 - A. Examples
 1. Favorable
 2. Unfavorable
 - B. Modification of the environment to promote health
 1. Physical health
 2. Mental health
 - C. Characteristics of a healthful environment
- III. Principles of controlling the environment
 - A. Providing a clean environment
 1. Prevention of disease
 2. Control of illness
 3. Control of insects and vermin
 4. Use of disinfectants

B. Providing a safe environment

1. Safe working practices
2. Correct use of equipment
3. Proper care of equipment

C. Improving the environment

1. Utilizing available resources
2. Improvising

IV. Hazards in the home

A. Types of hazards

1. Mechanical
2. Electrical
3. Burns
4. Poisons
5. Microorganisms

B. Elimination of hazards

1. Recognizing hazards
2. Methods of elimination

C. Causes of home accidents

1. Carelessness
2. Indifference
3. Ignorance

V. Common home emergencies

A. Examples

1. Those involving children
2. Those involving the elderly
3. Those common to other age groups

B. How to administer simple first aid

1. Principles to follow

2. Limiting factors

3. Legal Implications

VI. Role of the Personal Care and Family Aide

A. In care of the environment

B. In control of hazards

C. In home emergencies

D. In relation to self-protection during performance of duties

SUGGESTED RELATED ACTIVITIES:

1. Films:

a. "Accidents Don't Just Happen"

d. "Rescue Breathing"

b. "Too Young to Burn"

e. "A Matter of Seconds"

c. "Children at Play with Poison"

f. "How to Have an Accident
In the Home"

2. Laboratory demonstrations and practice in selected first aid measures.

3. Have students prepare a list of hazards in their own homes.

4. Practice in making simulated telephone reports of a home emergency:

a. To family physician

b. To agency supervisor

c. To police

d. To fire department

e. To rescue squad or ambulance service

5. Demonstration and practice (on model or Resusci-Anne) of resuscitation.

6. Lecture, demonstrations and supervised practice in use of fire extinguishers and home methods of extinguishing small fires. Should be directed by member of fire department.

LESSON VI: EFFECTS OF ILLNESS

LESSON OBJECTIVE: To help the student understand the effects of illness and begin to develop skill in recognizing ways the Personal Care and Family Aide assists individuals and families.

TIME ALLOTTMENT: 8 hours.

OUTLINE OF LESSON:

- i. Introduction to the lesson
- ii. Effects of illness on the individual
 - A. Physiological
 - B. Emotional
 - C. Behavioral
- iii. Effects of illness on the family
 - A. According to role of the patient
 1. Wage earner
 2. Homemaker
 3. Child
 4. Elderly person
 - B. According to type of illness
 1. Acute
 2. Long-term
 3. Chronic
 4. Terminal
 5. Communicable
 6. Disabling accident
- IV. Effects of illness on the home environment
 - A. Common problems
 - B. Examples of adjustments which may be needed
 - C. Recognizing illness as a threat

1. To adjustment
 2. To self-image
- V. Controlling effects of illness
- A. Organization of home environment
 1. To provide for needs of sick
 2. To minimize family inconvenience
 - B. Maintenance of family unity
 - C. Provision of assistance by qualified persons
 1. Role of professional staff
 2. Role of Aides
- VI. Role of the Personal Care and Family Aide
- A. Using information about illness
 1. To understand the patient
 2. To understand the family
 3. To make work plan
 4. To protect self
 - B. Developing assisting skills

SUGGESTED RELATED ACTIVITIES:

1. Films:
 - a. "Living Insurance"
 - b. "Guard Your Heart"
2. Have students write a short paper on an illness they or someone else had and describe the effects observed

LESSON VII: NUTRITIONAL NEEDS

LESSON OBJECTIVE: To help the student understand basic principles of nutrition and the role of the Personal Care and Home Aide in assisting others to improve nutrition.

TIME ALLOTMENT: 20 hours.

OUTLINE OF LESSON:

- I. Introduction to the lesson
- II. The importance of nutrition
 - A. Effects of good nutrition
 - B. Effects of poor nutrition
 - C. Purposes of food
 - D. Functions of nutrients
 - E. Sources of nutrients
 - F. The "Basic Four"
- III. Factors affecting nutritional needs
 - A. Age
 - B. Sex
 - C. Activity
 - D. Illness
 - E. Faulty metabolism
 - F. Other
- IV. Meal planning
 - A. Considerations
 1. Family size
 2. Food habits
 3. Age of family members
 4. Likes and dislikes

- 5. Religious restrictions
- 6. Special requirements
- B. Advantages of a weekly menu
- C. Providing a balanced diet
- D. Food misinformation
- V. Storage of foods
 - A. For convenience
 - B. For preservation
- VI. Meal preparation
 - A. Definition of cooking terms
 - B. Preparation of meats
 - C. Preparation of vegetables
 - D. Preparation of eggs, fish and salads
 - E. Menu in relation to preparation time
 - F. Conservation of food nutrients
- VII. Meal Serving
 - A. Attractive servings
 - B. Appropriate servings
 - 1. In amount
 - 2. According to age
 - 3. According to needs
 - C. Table setting
 - D. Serving foods at proper temperatures
- VIII. Sanitation in food handling
 - A. Prevention of spoilage
 - B. Prevention of contamination
 - C. Causes and effects of food poisoning
 - D. Importance of order in the kitchen

- E. Proper preparation of dishes for washing
- F. Sanitary methods of dishwashing
- IX. Role of the Personal Care and Family Aide
 - A. Recognizing family need for guidance
 - B. Providing nutritional needs
 - 1. For a family
 - 2. For a dependent individual

SUGGESTED RELATED ACTIVITIES:

1. Films:

<ul style="list-style-type: none"> a. "Cooking: Kitchen Safety" b. "Wonderful World of Food" c. "More Food for Your Money" d. "Food Preparation" e. "An Outbreak of Salmonella Infection" f. "Mr. Scattergerm", Parts II and III 	<ul style="list-style-type: none"> g. "Better Breakfast" h. "Design for Happy Mealtime" i. "Four Food Groups" j. "Nonfat Dry Milk" k. "Nutrition: Sense and Nonsense" l. "The Color of Health"
--	--
2. Field trips to food stores for practice in shopping techniques, selection of foods, price comparison and recognizing false advertising.
3. Preparation of sample menus to meet nutritional needs at various age levels.
4. Preparation of posters or charts to illustrate good or faulty nutrition.
5. Handout pamphlets, available from State Board of Health:

<ul style="list-style-type: none"> a. "A Guide to Good Eating" b. "Food for Fitness" c. "Foods to Build Red Blood" d. "Make The Team With Good Nutrition" e. "Going Steady with Good Nutrition" f. "Mother, This is for You"
--	---

LESSON VIII: LIFE SPAN: CHILDHOOD AND ADOLESCENCE

LESSON OBJECTIVE: To help the student develop attitudes and skills necessary for assisting children with their needs at various stages of development.

TIME ALLOTMENT: 16 hours.

OUTLINE OF LESSON:

- I. Introduction to the lesson
- II. Factors affecting growth and development
 - A. Heredity
 - B. Environment
 - C. Nutrition
 - D. Illness or accident
- III. Stages in development
 - A. Infancy
 1. Physical growth
 2. Motor development
 3. Socialization
 - B. Pre-School
 1. Physical growth
 2. Motor development
 3. Socialization
 - C. Childhood
 1. Physical growth
 2. Motor development
 3. Socialization
 - D. Adolescence
 1. Physical growth

2. Motor skills
 3. Socialization
 4. Common problems
- IV. Needs of children
- A. Physical
 - B. Intellectual
 - C. Emotional
 - D. Social
- V. Typical behaviors of children
- A. Infancy
 - B. Pre-School
 - C. Childhood
 - D. Adolescence
- VI. Health protection of children
- A. Prevention of illness
 - B. Prevention of accidents
 - C. Protection from threat and insecurity
- VII. The child with special problems
- A. Examples
 - B. General rules
 1. Accept the child
 2. Assist the child according to professional direction
 3. Encourage independence
 4. Assist the family
 - a. To accept child as he is
 - b. To carry out professional directions

VIII. Role of the Personal Care and Family Aide

- A. In care of normal child
- B. In care of sick child
- C. In care of retarded child

SUGGESTED RELATED ACTIVITIES:

- 1. Films:
 - a. "Bathing Your Baby"
 - b. "Answering the Child's Why"
 - c. "Meeting the Needs of Adolescents"
 - d. "Fears of Children"
 - e. "Introducing the Mentally Retarded"
 - f. "Why Tommy Won't Eat"
 - g. "Discovering Individual Differences"
 - h. "Each Child is Different"
- 2. Visits to community facilities for child care
- 3. Field trip to a rehabilitation center
- 4. Make written assignment based on lesson content
- 5. Handout sheets, available from State Board of Health:
 - a. "Accident Hazards-Birth to 6 Months"
 - b. "Accident Hazards-6 Months to 2 Years"
 - c. "Accident Hazards- 2 to 3 Years"
 - d. "Accident Hazards- 3 to 6 Years"
 - e. "Accident Hazards- 6 to 8 Years"
 - f. "Accident Hazards- 8 to 12 Years"

LESSON IX: LIFE SPAN - ADULTHOOD

LESSON OBJECTIVE: To help students become aware of problems and needs of adults and how they may better assist adults with whom they work.

TIME ALLOTMENT: 8 hours.

OUTLINE OF LESSON:

- I. Introduction to the lesson
- II. Meaning of maturity
 - A. Period of Independence
 - B. Accepting adult responsibilities
 - C. Characteristics of the mature person
- III. Factors influencing needs of adults
 - A. Heredity
 - B. Environment
 - C. Attitudes
 - D. Degrees of adjustment
 - E. Physical influences
- IV. Needs of young adults
 - A. Physical
 - B. Social
 - C. Economic
 - D. Establishment of a home
 - E. Adjustments
- V. Needs of the middle-aged person
 - A. Physical
 - B. Social
 - C. Economic

D. A plan for the future

E. Adjustments

VI. Common problems of adulthood

A. Financial responsibilities

B. Rearing of children

C. Responsibilities

1. To family

2. To employer

3. To self

D. Outside pressures

E. Health problems

F. Adjustments

1. To the aging process

2. To loss of family members

3. To children leaving home

4. To use of time

5. Other

VII. Role of the Personal Care and Family Aide

A. Assisting in adjustments to illness

B. Recognizing own adjustments as an adult

SUGGESTED RELATED ACTIVITIES:

1. Speaker from or visit to a Family Service Society.

2. Written assignment based on lesson content.

LESSON X: LIFE SPAN: SENESCENCE

LESSON OBJECTIVE: To help students learn about the aging process, needs resulting from these changes, and the responsibilities of the Personal Care and Family Aide in assisting the elderly.

TIME ALLOTMENT: 8 hours.

OUTLINE OF LESSON:

- I. Introduction to the lesson
- II. Definitions
 - A. Geriatrics
 - B. Senescence
 - C. Aging
 - D. Senility
- III. The aging process
 - A. Effects
 1. Physical
 2. Mental
 3. Emotional
 - B. Behavior changes
 - C. Necessity for adjustments
- IV. Needs during senescence
 - A. Physical
 - B. Psychological
 - C. Social
 - D. Spiritual
- V. Problems of senescence
 - A. Economic
 - B. Housing

- C. Loss of purpose
- D. Threat of illness and accidents
- E. Loss of family and friends
- F. Inadequate community resources
- G. Changes in body function

VI. Assisting the aging person

- A. Recognizing problems, fears and insecurities
- B. Obtaining assistance with spiritual needs
- C. Encouraging self-care in activities of daily living
- D. Protecting from hazards
- E. Providing good nutrition
- F. Providing good skin care
- G. Understanding behavior
- H. Maintaining individuality and independence
- I. Maintaining body functions
- J. Assisting in adjustments
 - 1. Use of time
 - 2. Personal habits
 - 3. Social activities
 - 4. Handling of finances
 - 5. Family relationships
 - 6. Acceptance of limitations

VII. Role of the Personal Care and Family Aide

- A. Personal qualities needed to work with the aged
- B. As a member of health team
- C. As an employee of a social agency
- D. As a family employee

SUGGESTED RELATED ACTIVITIES:

1. Films:
 - a. "The Proud Years"
 - b. "Second Chance"
 - c. "Adventures In Maturity"
 - d. "The Critical Decades"
2. Field trip to a nursing home.
3. Guest speakers or auxiliary instructional personnel:
 - a. Public health nurse
 - b. Social case worker
 - c. Physical therapist
4. Handout folder, available from State Board of Health, Raleigh:
 - a. "Safety For The Aging"

LESSON XI: ASSISTING OTHERS WITH PERSONAL CARE

LESSON OBJECTIVE: To help the student develop assisting skills in those aspects of personal care appropriate to the role of the Personal Care and Family Aide.

TIME ALLOTMENT: 80 hours

OUTLINE OF LESSON:

- I. Introduction to lesson
- II. Assisting others with personal care
 - A. The bath
 1. Tub
 2. Shower
 3. Bed bath
 - B. Oral hygiene
 - C. Grooming
 1. Daily care of hair
 2. Shampoo
 3. Shaving
 4. Care of nails
- III. Assisting with needs related to comfort and protection
 - A. Bedmaking
 - B. Turning and positioning
 - C. Special skin care
 - D. Getting in and out of bed
- IV. Assisting with nutritional needs
 - A. Feeding the patient
 - B. Observing intake and output
 1. Measurement

- 2. Recording
- V. Assisting with elimination
 - A. Promoting regularity
 - B. Using facilities
 - 1. Bathroom
 - 2. Bedside commode
 - 3. Bedpan or urinal
 - C. Observing elimination
 - 1. Significant changes
 - 2. Reporting or recording
- VI. Assisting with special needs
 - A. Encouraging oral medications
 - B. Encouraging medical care
 - C. Assisting with special exercises
 - D. Encouraging acceptance of special diet
 - E. Other
- VII. Assisting with activity and diversion
 - A. Needs of various age groups
 - B. Needs of those with specific handicaps
 - C. Encouraging full participation according to professional direction
 - D. Encouraging acceptance of limitations
- VIII. Making observations
 - A. Body temperature
 - 1. How to read a clinical thermometer
 - 2. How to take the temperature
 - 3. Care of thermometers
 - B. Changes
 - 1. Physical

- 2. Emotional
 - 3. Behavioral
- IX. Using and caring for equipment
- A. Wheelchair
 - B. Crutches
 - C. Walker
 - D. Splint
 - E. Sling
 - F. Brace
 - G. The hospital bed
- X. Role of the Personal Care and Family Aide
- A. Developing assisting skills
 - B. Following professional direction
 - C. When to seek help from supervisor
 - D. Providing self-protection
 - 1. Handwashing
 - 2. Body mechanics
 - 3. Practicing within specified role

SUGGESTED RELATED ACTIVITIES:

- 1. Teacher demonstrations of selected assisting skills.
Note: It is suggested that a nursing procedure manual be used as a reference by the teacher for this lesson.
- 2. Student laboratory practice and return demonstrations of selected assisting skills.
- 3. Practice in taking and recording body temperature.
- 4. Practice in making accurate observations, reporting orally, and preparing written records.
- 5. Group discussions: How to cope with problems, such as the patient who refuses to take prescribed medication.

6. Student practice in providing diversion for various age groups and for those with special problems.
7. Practice in care and use of equipment.
8. Films:
 - a. "Handwashing in Patient Care"
 - b. "Prevention of Disability from Stroke"
9. Home visits with members of the health team.
10. Suggested auxiliary instructional personnel:
 - a. Social case worker
 - b. Public health nurse
 - c. Physical therapist
 - d. Nutritionist
 - e. Specialists in gerontology and/or care of exceptional children
11. Handout pamphlet, available from State Board of Health:
 - a. "Home Nursing Handbook"

*Red Cross Home Nursing Care Films - a series of ten - may be ordered individually from State Board of Health, Film Library, or from the Red Cross. See "Health Education Visual Aids, 1965-66" (Catalogue of the Film Library), pages 65-66, for a description of each film.

LESSON XII: OBSERVING AND REPORTING

LESSON OBJECTIVE: To help the student understand the importance of observing and to develop beginning skill in making reliable observations and reporting to appropriate persons.

TIME ALLOTMENT: 4 hours.

OUTLINE OF LESSON:

- I. Introduction to the lesson
- II. Importance of reliable observations
 - A. To the physician
 1. Diagnosis
 2. Results of treatment
 3. Planning care
 4. Detecting new needs
 5. Preventing complications
 - B. To supervisor
 1. Evaluating change
 2. Determining need for medical attention
 3. Planning other referrals
 4. Modifying services
- III. Significant observations
 - A. Physical
 1. Severe pain
 2. Loss of consciousness
 3. Changes in body functions
 4. New symptoms
 5. New complaints

- 6. Other
 - B. Mental change
 - C. Behavioral change
 - D. Change in capacity for self-care
- IV. Reporting observations
- A. Importance
 - B. General rules
 - 1. Report to proper persons only
 - 2. Be accurate
 - 3. Have all information needed
 - 4. Use judgment on what to report
 - 5. Report at proper time
 - 6. Report observations, not opinions
 - C. Oral reports
 - 1. Principles
 - 2. General rules
 - 3. When to use
 - D. Written reports
 - 1. Principles
 - 2. General rules
 - 3. When to use
 - 4. Disposition
 - E. Legal implications
- V. Role of the Personal Care and Family Aide
- A. In making observations
 - B. In reporting to professional personnel

SUGGESTED RELATED ACTIVITIES:

1. Student practice in making oral and written reports.
2. Class discussion: The Aide and confidential information.
3. Further practice in making observations in a hypothetical situation.
4. Practice in identifying opinions, inconsistencies, inaccuracies, and misuse of terminology in oral or written reports.
5. Practice in identifying significant information in description of a patient's condition.
6. Films:
 - a. "The Eye of the Beholder"

LESSON XIII: COMMUNITY HEALTH RESOURCES

LESSON OBJECTIVE: To help the student become aware of community resources and understand types of services available through community agencies.

TIME ALLOTMENT: 8 hours.

OUTLINE OF LESSON:

- I. Introduction to the lesson
- II. Conditions affecting community health
 - A. Economic factors
 - B. Education
 - C. Medical services
 - D. Health facilities
 - E. Health education
- III. Need for community health agencies
 - A. For health protection
 - B. For control of disease
 - C. For assistance with special problems
- IV. Agencies
 - A. Types
 1. Official
 - a. Local
 - b. State
 - c. Federal
 2. Volunteer
 - B. Examples
 1. Agencies which provide for community sanitation
 2. Agencies which promote safety

3. Agencies which assist with family problems

4. Agencies which promote health

V. Interaction of agencies

A. Interaction within the home

B. Importance of coordinated efforts

1. Avoiding duplication of services

2. Providing for comprehensive services

VI. Role of the Personal Care and Family Aide

A. Know of available agencies

B. Refer problems to supervisor

C. Know how to secure agency services

D. Promote community use of resources

SUGGESTED RELATED ACTIVITIES:

1. Field trips to community agencies.

2. Speakers from appropriate community agencies.

3. Handout pamphlet, available from State Board of Health:

a. "It's Your Health Department"

4. Film:

a. "Health In Our Community"

LESSON XIV: BECOMING AN EFFECTIVE PERSONAL CARE AND FAMILY AIDE

LESSON OBJECTIVE: To help the student prepare for employment, recognize responsibilities in applying for or leaving a position, and develop understanding of personal obligations as a citizen and as a participant in community services to others.

TIME ALLOTMENT: 12 hours.

OUTLINE OF LESSON:

- I. Introduction to the lesson
- II. Securing a position
 - A. The letter of application
 - B. The form of application
 - C. The personal interview
 1. Making the appointment
 2. Importance of appearance
 3. Questions to be asked
 - D. Contracts
- III. Employer - employee relations
 - A. Responsibilities of employer to employee
 - B. Responsibilities of employee to employer
- IV. Resigning a position
 - A. The letter of resignation
 - B. The terminal interview
- V. Role of the Personal Care and Family Aide
 - A. Job opportunities
 - B. Limiting factors to role
 1. Policies of employing agency
 2. The Nurse Practice Act

3. Education and experience
 4. Personal qualifications
- C. Responsibilities to self
1. Continuing to grow as an individual
 2. Setting goals for improvement
 3. Achieving job satisfaction

SUGGESTED RELATED ACTIVITIES:

1. Practice in writing a letter of application.
2. Practice in writing a letter of resignation.
3. Role playing: the job interview.
4. Speakers from prospective employing agencies.

INTRODUCTION

With continuing shortages of professional personnel, there is urgent need for training programs to prepare nonprofessional workers for assisting with patient care in psychiatric institutions. This course outline has been developed to facilitate the offering of such courses through institutions of the North Carolina Department of Community Colleges, in affiliation with appropriate clinical facilities.

The outline covers classroom content and suggests student activities and clinical experiences to accompany each lesson. The teacher should further develop lesson topics and include laboratory and clinical learning experiences which are appropriate to the affiliating hospital.

Student practice in patient care should begin following Unit III, with the number of hours devoted to clinical practice increasing progressively until equal to or exceeding the time allotted to classroom instruction.

Time allotments stated in the course outline apply to classroom and nursing laboratory only. With the course scheduled for one quarter, the teacher will have a minimum of 148 hours for planned clinical experiences.

Students admitted to the psychiatric aide course should meet employment requirements of the affiliating hospital, in addition to admission criteria established by the sponsoring institution. Upon satisfactory completion of the course, each graduate will be presented a certificate of graduation by the sponsoring institution.

Course Description

PSYCHIATRIC AIDE

Designed to introduce students to basic concepts and skills needed for participating in the care of mentally and emotionally ill patients. Classroom study includes modern concepts in prevention of illness, rehabilitation, and care of the sick; basic procedures for care of patients; and the role of the psychiatric aide as a member of the health team. Correlated clinical practice provides opportunities to apply classroom learnings to care of patients, with the assistance and supervision of the teacher.

The Psychiatric Aide

COURSE OBJECTIVES:

To prepare qualified individuals for participation on the psychiatric health team by promoting

1. awareness of influences and variations in human behavior, both normal and deviant.
2. awareness of common mental and emotional illnesses.
3. understanding of the role of psychiatric aides in patient care and in relation to other members of the health team.
4. understanding of self as a means of improving interpersonal relationships and patient rapport.
5. beginning skill in performing selected aspects of patient care.
6. understanding of responsibilities as a citizen and as an employee of a psychiatric hospital.

LENGTH OF COURSE: Eleven weeks.

COURSE HOURS PER WEEK: Thirty to forty.

UNIT 1: INTRODUCTION TO HEALTH SERVICES

TIME ALLOTMENT: 12 hours.

OBJECTIVE: To help the student acquire a general understanding of modern concepts of health, community health services, the health team, and the role of the psychiatric aide.

UNIT DESCRIPTION: Introduces the student to modern concepts of health, to health agencies, to the place of the psychiatric aide within the hospital organization, and to the responsibilities of the psychiatric aide as a member of the nursing team.

LESSONS:

1. The Psychiatric Aide as a Member of the Health Team
2. Community Health Agencies
3. Organization of Hospitals
4. Qualifications of Health Workers

SUGGESTED REFERENCES:

Ross, Carmen F. Personal and Vocational Relationships in Practical Nursing; Second Edition. Philadelphia: J. B. Lippincott Company, 1965.

Thompson, Ella & LeBaron, Margaret. Simplified Nursing; Seventh Edition. Philadelphia: J. B. Lippincott Company, 1960.

LESSON 1: THE PSYCHIATRIC AIDE AS A MEMBER OF THE HEALTH TEAM

LESSON TIME: 3 hours.

OBJECTIVE: To introduce the student to modern concepts of health and to the role of the psychiatric aide.

OUTLINE OF LESSON:

- i. Orientation to course
 - A. Purpose and objectives
 - B. Overview of the instructional plan
 - C. Policies affecting students
 1. Those of the educational agency
 2. Those of the affiliating hospital
- ii. Modern concepts of health
 - A. Meaning of health
 - B. Components of health
 1. Physical
 2. Mental
 3. Emotional
 - C. Health services
 1. Purposes
 - a. Prevention
 - b. Care of the sick
 - c. Rehabilitation
 2. Trends
 3. Community needs
 4. Types

iii. Becoming a psychiatric aide

A. Adjustments

1. To student role
2. To the hospital environment
3. To responsibility for the well-being of others

B. Overview of psychiatric aide responsibilities

1. To the hospital
2. To the health team
3. To patients
4. To co-workers
5. To self

IV. Job descriptions

A. Purpose

B. Uses

C. Value to the employee

D. Example

Job description of psychiatric aide in the affiliating hospital

LESSON 2: COMMUNITY HEALTH AGENCIES

LESSON TIME: 3 hours.

OBJECTIVE: To help the student become aware of types of health agencies in the community, of services offered, and of the relationship of each to the affiliating hospital.

OUTLINE OF LESSON:

- I. Types of health organizations
 - A. Official
 1. Meaning
 2. Examples
 - B. Volunteer
 1. Meaning
 2. Examples
- II. Agencies concerned with health protection
 - A. Types
 - B. Functions
 - C. Examples
 1. Local
 2. State
 3. Federal
- III. Agencies concerned with care of the sick
 - A. Types
 1. Hospitals
 2. Nursing homes
 3. Public health agencies

4. Nonresidential

5. Other

B. Examples

1. Local

2. State

3. Federal

IV. Agencies concerned with rehabilitation

A. Types

1. Hospital departments

2. Community agencies

B. Functions

C. Examples

1. Local

2. State

3. Federal

V. Agencies associated with affiliating hospital

A. Referring patients to the hospital

B. Offering follow-up services

VI. Role of the psychiatric aide in relation to health agencies

A. Promoting understanding of services available

B. Promoting community support

LESSON 3: ORGANIZATION OF HOSPITALS

LESSON TIME: 3 hours.

OBJECTIVES: To help the student understand about hospital organization, departmental functions, the importance of interdepartmental cooperation, and the place of the psychiatric aide in the organizational structure.

OUTLINE OF LESSON:

- I. Hospitals
 - A. Purposes
 - B. Types
 - C. Departments
- II. Understanding an organizational chart
 - A. Relationships
 1. Vertical
 2. Horizontal
 - B. Communication lines
 - C. Lines of authority
- III. Hospital personnel
 - A. Those who aid in evaluation and diagnosis
 - B. Those who participate in therapeutic procedures
 - C. Those who provide other services
- IV. Interdepartmental relations
 - A. Importance of each department
 - B. Necessity for effective communications
 - C. Maintenance of cooperative attitudes
 - D. Effects on patient care

V. The psychiatric aide

- A. Within total organization of the hospital
- B. Within nursing service
- C. Relations with personnel of other departments

LESSON 4: QUALIFICATIONS OF HEALTH WORKERS

LESSON TIME: 3 hours.

OBJECTIVE: To help the student become aware of the knowledge, skills, and personal traits needed by members of the health team and to encourage each student to set personal goals for achievement and self-improvement.

OUTLINE OF LESSON:

- I. Personal characteristics
 - A. Importance in relations with others
 - B. Relation to achievement and satisfactions in living
 - C. Examples
- II. The patient's viewpoint
 - A. Importance of personnel-patient relationships
 - B. Potential effects of the health worker's characteristics
 1. Favorable
 2. Unfavorable
- III. Needs of the psychiatric aide
 - A. Types of knowledge
 - B. Work habits
 - C. Personal traits
 - D. Attitudes
- IV. How to improve personal qualities
 - A. Self assessment
 - B. Identification of changes needed
 - C. Setting goals
 - D. Developing a plan
- V. Guidelines for personal growth as a psychiatric aide

UNIT 11: MEETING MENTAL AND EMOTIONAL NEEDS

TIME ALLOTMENT: 20 hours.

OBJECTIVE: To help the student acquire basic knowledge and understanding of human behavior, common adjustment problems, and effects of mental and emotional needs on interpersonal relations.

UNIT DESCRIPTION: Introduces the student to some of the fundamentals of human behavior, life situations which require adjustment, defense mechanisms, and applications of knowledge about human behavior to personal living and to patient care.

LESSONS:

1. Understanding human behavior
2. Adjustment
3. Using Knowledge of Mental and Emotional Needs

SUGGESTED REFERENCES:

- Bailard, Virginia and Strang, Ruth. Ways to Improve Your Personality. New York: McGraw-Hill Book Company, 1951.
- Muller, T. G. Fundamentals of Psychiatric Nursing. Paterson, N. J.: Littlefield, Adams and Company, 1962.
- Robinson, Alice. The Psychiatric Aide; Third Edition. Philadelphia: J. B. Lippincott Company, 1964.
- Ross, Carmen F. Personal and Vocational Relationships in Practical Nursing. Philadelphia: J. B. Lippincott Company, 1961.

LESSON 1: UNDERSTANDING HUMAN BEHAVIOR

LESSON TIME: 12 hours.

OBJECTIVE: To help the student understand fundamentals of human behavior as related to interpersonal relations.

OUTLINE OF LESSON:

- I. Personality development
 - A. Infancy
 - B. Preschool
 - C. Six to twelve
 - D. Adolescence
 - E. Middle age
 - F. Old age
- II. The emotions
 - A. Positive emotions
 - B. Negative emotions
 - C. Unhealthful use of emotions
 - D. Healthful use of emotions
 - E. Influence of emotions on behavior
- III. Behavior
 - A. influences
 - B. Habit patterns
 - C. Interpretation
 1. Indication of emotional state
 2. Indication of degree of adjustment
 3. Indication of attitudes
 4. Indication of illness

IV. Defense mechanisms

- A. Meaning
- B. Purpose
- C. Common examples

V. Influences on human relations

- A. Understanding oneself
- B. Understanding others
- C. Using knowledge of behavior in interpersonal relations

VI. Related clinical activities

- A. Assignment to selected patient
 - 1. To observe behavior
 - 2. To establish rapport
- B. Conference
 - 1. Report on behavior observed
 - 2. Discussion of student-patient interaction

LESSON 2: ADJUSTMENT

LESSON TIME: 6 hours.

OBJECTIVE: To help the student understand common problems of adjustment and mechanisms used by people in attempting to cope with life situations.

OUTLINE OF LESSON:

- I. Adjustment
 - A. Meaning
 - B. Examples
 1. Situations requiring adjustment
 2. Behavior changes to effect adjustment
- II. Threats to adjustment
 - A. Problems of each developmental stage
 - B. Change in life situation
 - C. Crisis situations
- III. Mechanisms of adjustment
 - A. Meaning
 - B. Examples
 1. Healthful
 2. Unhealthful
- IV. Poor adjustment
 - A. Common causes
 - B. Degrees
 - C. Dangers

- D. Some characteristics of a poorly adjusted person
- E. General rules for improving adjustment

V. Related clinical activities

- A. Assignment to selected patient
 - 1. To observe behavior
 - 2. To identify signs of poor adjustment
- B. Conference
 - 1. Report on patient behavior
 - 2. Discussion of student-patient interaction

LESSON 3: USING KNOWLEDGE OF MENTAL AND EMOTIONAL NEEDS

LESSON TIME: 2 hours.

OBJECTIVE: To help the student understand how to apply knowledge of mental and emotional needs of people to patient care, to interpersonal relations, and to the student's own life situation.

OUTLINE OF LESSON:

- I. Interpersonal relations
 - A. Meaning
 - B. Influences
 - C. Factors in improvement
 1. Developing self-understanding
 2. Striving to understand behavior of others
- II. Mental health
 - A. Meaning
 - B. Influences
 - C. Factors in improvement
 1. Recognizing threats to adjustment
 2. Learning to cope effectively with life problems
- III. Therapeutic use of self
 - A. Meaning
 - B. Influences
 - C. Examples
 1. Effective psychiatric aide-patient relations
 2. Changes in patient behavior as rapport develops
- IV. The health team
 - A. Participants

B. How it functions

C. Role of the psychiatric aide

D. Team conferences

1. Purposes

2. Value in identifying and planning to meet mental and emotional needs

V. Related clinical activities

A. Assignment to social service

1. To observe admission procedure

2. To observe discharge procedure

3. To observe patient behavior

4. To observe interaction of social worker with patient

B. Assignment to admissions ward

1. To observe behavior

2. To observe patient for indications of emotional influence on behavior

3. To observe effects of personnel behavior on patient behavior

UNIT III: DAILY CARE OF PATIENTS

TIME ALLOTMENT: 60 hours.

OBJECTIVE: To help the student learn basic principles of patient care and specific procedures for assisting patients with their daily needs.

UNIT DESCRIPTION: Introduces the student to daily physical needs of patients, measures used to assist patients in meeting these needs, and measures for preventing or correcting problems related to daily needs. Emphasis is on the basic principles underlying nursing technique, performance of specific procedures, and development of skill in observing and reporting. Each student will have opportunities for supervised practice in the clinical area.

LESSONS:

1. Maintaining Body Cleanliness
2. Maintaining Good Nutrition
3. Maintaining Elimination Processes
4. Encouraging Appropriate Activities
5. Understanding and Influencing Sleep Patterns
6. Improving the Hospital Environment
7. Making and Reporting Observations

SUGGESTED REFERENCES:

Procedure Book of affiliating hospital.

Thompson, Ella & LeBaron, Margaret. Simplified Nursing; Seventh Edition. Philadelphia: J. B. Lippincott Company, 1960.

LESSON 1: MAINTAINING BODY CLEANLINESS

LESSON TIME: 12 hours.

OBJECTIVE: To help the student develop beginning skill in performance of procedures related to the patient's cleanliness and in recognizing and coping with related problems.

OUTLINE OF LESSON:

- I. Cleanliness and grooming
 - A. Importance
 1. To self
 2. To others
 - B. Influences
 1. Early learning
 2. Illness
 3. Other
- II. Common patient attitudes toward cleanliness
 - A. Excessive concern with cleanliness
 - B. Resistance to cleanliness
- III. Procedures for maintaining cleanliness
 - A. The bath
 1. Bedbath
 2. Tub bath
 3. Shower bath
 - B. Care of hair
 - C. Care of hands, feet, and nails
 - D. Care of clothing

- E. Use of cosmetics
- F. Use of psychiatric razor
- IV. Problems related to skin care
 - A. Irritated skin
 - B. Dry or scaly skin
 - C. Skin with poor circulation
 - 1. Pressure areas
 - 2. Extremities
- V. Problems related to hair
 - A. Matted hair
 - B. Treatment of pediculosis
 - C. Giving a shampoo
 - D. Role of the beautician or barber in meeting special problems
 - E. Patient who resists care of the hair
- VI. Problems related to oral hygiene
 - A. Patient with sordes
 - B. Patient with poor dental health
- VII. Teaching the patient self-care
 - A. Recognizing readiness for self-care
 - B. Indications of need for learning hygienic habits
 - C. Ways to promote interest in self-care
- VIII. Related clinical activities
 - A. Assignment to selected patient
 - 1. To assist with physical care
 - 2. To observe problems related to cleanliness and grooming
 - B. Conference
 - 1. Problems encountered

2. Indications a procedure should be modified
 3. Indications that self-care should be encouraged
- C. Observation of special activities
1. "Charm class" for patients
 2. Activities in beauty shop and barber shop
- D. Performance of procedures
1. Mouthwash
 2. Prescribed treatments for poor oral hygiene
 3. Care of matted hair
 4. Treatment of pediculosis
 5. Giving a shampoo
 6. Care of pressure areas
 7. Care of decubitus ulcers
 8. Use of lotions and creams for topical application
 9. Use of heat lights
- E. Cooperative planning with other workers
1. Planning with beautician on specific hair problem of a patient
 2. Group planning for coping with patient attitudes or specific behaviors

LESSON 2: MAINTAINING GOOD NUTRITION

LESSON TIME: 8 hours

OBJECTIVE: To help the student understand body needs for a balanced diet, problems commonly resulting from poor diet, methods used to promote good nutrition for patients, and measures for coping with patients' nutritional problems.

OUTLINE OF LESSON:

- I. The balanced diet
 - A. Meaning
 - B. Why the body needs a balanced diet
 - C. Effects of diet on health
- II. Common dietary problems
 - A. The overweight patient
 - B. The underweight patient
 - C. The patient with poor eating habits
 - D. The patient on special diet
 - E. The patient who refuses food
- III. Methods for assisting with the patient's nutrition
 - A. Feeding patients
 - B. Assisting patients to feed self
 - C. Assisting patient to develop improved eating habits
 - D. Use of special feeding methods
 1. Tube feeding
 2. Intravenous fluids
 3. Hypodermoclysis

IV. The intake record

- A. Purpose
- B. Methods for measuring intake
- C. Recording intake
- D. Significant observations related to diet and fluid intake

V. Common problems related to the patient's nutrition

- A. The patient who refuses food
 - 1. Possible reasons for refusal
 - a. Physical
 - b. Mental or emotional
 - 2. Use of persuasion
 - 3. Measures used when nutritional status is deteriorating
- B. The patient who is unable to feed self
 - 1. Principles for feeding a patient
 - 2. Emotional needs of patients who must be fed
- C. The patient with poor eating habits
 - 1. Causes
 - 2. Influencing eating habits
- D. The patient who has difficulty swallowing
 - 1. Dangers
 - 2. Controlling choking during feeding

VI. Related clinical activities

- A. Assignment to selected patient
 - 1. To assist with meal
 - 2. To observe for feeding problems
- B. Performance of procedures
 - 1. Feeding a patient
 - 2. Measuring and recording intake

C. Observation of procedures

1. Tube feeding
2. Administration of parenteral fluids

LESSON 3: MAINTAINING ELIMINATION PROCESSES

LESSON TIME: 16 hours.

OBJECTIVE: To help the student understand the importance of elimination to health, significant observations related to processes of elimination, and measures used to correct problems of elimination.

OUTLINE OF LESSON:

I. Elimination of body wastes

A. Routes

1. Skin
2. Respiratory system
3. Urinary system
4. Colon

B. Relation to health

1. Influences
2. Individual variations
3. Effects of waste accumulation

II. Normal function

A. Urinary

1. Characteristics of urine
2. Average output
3. Variations (nonpathologic)

B. Bowel

1. Characteristics of feces
2. Average rate
3. Variations

- III. Common problems related to urinary function
 - A. The patient on output record
 - 1. Review measurement of liquids
 - 2. Recording urinary output
 - B. The patient with indwelling catheter
 - 1. Purposes of indwelling catheter
 - 2. Dangers of indwelling catheter
 - 3. Daily care of indwelling catheter
 - 4. Observing and recording changes related to urinary function
 - C. The patient with urinary incontinence
 - 1. Effects of prolonged incontinence
 - a. Physical
 - b. Psychological
 - 2. Nursing care
 - 3. Positive approaches to re-establishing bladder control.
- IV. Problems related to bowel function
 - A. Constipation
 - 1. Prevention
 - 2. Measures for correction
 - B. Impaction
 - 1. Causes
 - 2. Symptoms
 - 3. Treatment
 - 4. Prevention
 - C. Promoting effective bowel function
 - 1. Daily habits
 - 2. Laxatives

3. Suppositories
4. Enemas
- D. Controlling loose stools
 1. Possible causes
 2. Observing and reporting loose stools
 3. Measures commonly used to control loose stools
- V. Administration of enemas
 - A. The cleansing enema
 1. Purposes
 2. Types of solutions commonly used
 3. Preparation of enema
 4. Methods of giving enemas
 5. Observing and recording enema results
 - B. Other types of enemas
 1. Purposes
 2. Types of solutions
 3. Preparation
 4. Administration
- VI. Insertion of suppositories
 - A. Procedure
 - B. Examples of suppositories used to promote elimination
- VII. Role of the psychiatric aide
 - A. Observing and reporting significant observations
 1. On urine
 2. On feces
 3. On patient habits

- B. Recording
 - 1. Output of urine
 - 2. Bowel function
- C. Influencing patient's habits
 - 1. Intake of fluids
 - 2. Diet
 - 3. Regularity
- D. Recognizing significant attitudes toward elimination

VIII. Related clinical activities

- A. Assignment to selected patients
 - 1. To observe elimination while performing daily care
 - 2. To maintain output record
 - 3. To observe urine and feces for abnormal characteristics
- B. Performance of procedures
 - 1. Enema
 - 2. Insertion of suppository

LESSON 4: ENCOURAGING APPROPRIATE ACTIVITIES

LESSON TIME: 6 hours.

OBJECTIVE: To help the student learn about activity and diversion, measures commonly used to influence the patient's activities, and responsibilities of the psychiatric aide.

OUTLINE OF LESSON:

I. Activity

A. Importance to health

B. Influences

1. Physical

2. Mental and emotional

C. Types of activity

1. For the bedfast patient

2. For ambulatory patients

3. For patients with a specific disability

II. Diversion

A. Meaning

B. Purpose

1. Group

2. Individual

C. Influences on selection of type for specific patient

D. Types of diversional activities

E. Possible effects

1. Favorable

2. Unfavorable

III. Common problems

A. The patient who is underactive

1. Possible reasons for inactivity
2. Measures for promoting patient participation
 - a. For the bedfast patient
 - b. For the ambulatory patient

B. The patient who is overactive

1. Possible reasons
2. Measures used to control excessive activity

IV. Responsibilities of the psychiatric aide

A. As a participant in planning

B. Encouraging patient activities as planned

C. Reporting and recording

1. Degree of participation
2. Apparent effects

V. Related clinical activities

A. Assignment to selected patients

1. To assist with daily needs, including activity
2. To observe and report patient response to activity and diversion

B. Participation in planning diversion for various types of patients

1. Bedfast
2. Overactive
3. Underactive
4. Cooperative
5. Resistant

C. Assignment or visit to hospital departments

1. Occupational therapy

2. Recreational therapy
3. Vocational rehabilitation
4. Physical therapy

LESSON 5: UNDERSTANDING AND INFLUENCING SLEEP PATTERNS

LESSON TIME: 4 hours.

OBJECTIVE: To help the student understand the importance of rest and sleep to health, some factors which alter sleep patterns, and measures used to influence the patient's sleep and rest.

OUTLINE OF LESSON:

- I. Sleep and rest
 - A. Importance
 1. To physical health
 2. To mental and emotional health
 - B. Factors which affect sleep patterns
 - C. Significance of sleep patterns in disturbed patients
- II. Measures used to control sleep and rest
 - A. General
 - B. Specific
- III. Mental illness and sleep
 - A. Why sleep is affected
 - B. Common patterns
 1. The underactive patient
 2. The overactive patient
- IV. Responsibilities of the psychiatric aide
 - A. In team planning for specific patients
 - B. In daily care of patients
 1. Following patient's plan
 2. Controlling naps

3. Promoting participation by patient in activities
 4. Observing and recording patient behavior
 - a. Recognizing significant behavior or change
 - b. Using terminology related to activity, mental and emotional status, and behavior
- V. Related clinical activities
- A. Assignment to selected patient
 1. To assist with daily care
 2. To observe sleep and activity patterns
 3. To implement plan for patient's sleep and activity
 - B. Conference
 1. Observations on assigned patient
 2. Group discussion of appropriate plans for patients
 - a. The patient who sleeps excessively
 - b. The patient who is unable to sleep

LESSON 6: IMPROVING THE HOSPITAL ENVIRONMENT

LESSON TIME: 6 hours.

OBJECTIVE: To help the student understand the importance of environment to patients and personnel, the measures necessary to maintain a clean and safe environment, and hospital procedures to be followed in specific situations.

OUTLINE OF LESSON:

- I. Effects of environment
 - A. On personnel
 - B. On patients
- II. Factors which influence environment
 - A. Cleanliness
 - B. Use of color
 - C. Lighting
 - D. Ventilation
 - E. Neatness
 - F. Safety
 - G. Human element
- III. Care of the hospital environment
 - A. Daily cleaning
 - B. Terminal cleaning of a patient unit
 - C. Disinfection of an isolation unit
 - D. Creating favorable conditions
 1. Physical
 2. Social

IV. Hazards in the hospital environment

A. Accidents

1. To patients
2. To visitors
3. To personnel

B. Bacterial

C. Human

V. Prevention of accidents

A. Fire

B. Falls

C. Assault

D. Control of dangerous objects

VI. Hospital procedures

A. Fire plan

B. Moving patients

C. Reporting accidents

1. Patient

2. Personnel

VII. Related clinical activities

A. Practice in use of hospital equipment

1. Wheelchair

2. Stretcher

3. Hydraulic lift

4. Restraints

B. Participation in fire drill

C. Assignment to selected patient requiring use of hospital equipment

D. Conference

1. Hazards observed
2. Plan to correct existing hazard
3. Use of hospital forms for reporting an accident
 - a. To a patient
 - b. To self

LESSON 7: MAKING AND REPORTING OBSERVATIONS

LESSON TIME: 8 hours.

OBJECTIVE: To help the student understand types of observations which are significant, common terminology used in reporting observations, procedures for making oral reports, and procedures for making written reports.

OUTLINE OF LESSON:

- I. Importance of observations
 - A. In diagnosis
 - B. In detecting change in condition
 - C. In evaluation of therapeutic plan
- II. How to observe accurately
 - A. Knowing what to report
 - B. Making objective observations
 - C. Avoiding opinions and judgments
- III. How to make reliable reports
 - A. Use of appropriate vocabulary
 - B. Making oral reports
 - C. Making written reports
 1. Use of the patient's chart
 2. Principles of charting
 3. Use of the daily notes
 4. Use of special forms
- IV. Related clinical activities
 - A. Assignment to selected patient
 1. Daily care
 2. Observations on respiratory and circulatory functions
 - B. Practice in charting

UNIT IV: PROCEDURES

TIME ALLOTMENT: 40 hours.

OBJECTIVE: To help the student learn about aseptic technique and selected procedures related to care and observation of patients.

UNIT DESCRIPTION: Introduces the student to medical asepsis, selected therapeutic procedures, patient records, observations of patient condition, collection of specimens, and hospital policies in specific situations. Following classroom discussion of each procedure, students will have opportunities for supervised practice in the classroom and/or clinical area as opportunities arise. Emphasis is given to basic principles of technique related to each procedure studied.

LESSONS:

1. Medical Asepsis
2. Dressings and Bandages
3. Collection of Specimens
4. Observation of Cardinal Symptoms
5. Use of Heat and Cold as Therapeutic Measures
6. Care of the Body After Death

SUGGESTED REFERENCES:

Garnett, T. V. and Barbata, J. C. Collection of Laboratory Specimens and Diagnostic Procedures. Paterson, New Jersey: Littlefield, Adams and Company, 1964.

Procedure Book of affiliating hospital

Thompson, Ella & LeBaron, Margaret. Simplified Nursing; Seventh Edition. Philadelphia: J. B. Lippincott Company, 1960.

LESSON 1: MEDICAL ASEPSIS

LESSON TIME: 6 hours.

OBJECTIVE: To help the student learn principles of medical asepsis and develop beginning skill in applying aseptic technique to patient care.

LESSON OUTLINE:

- I. Medical asepsis
 - A. Meaning
 - B. Importance
 - C. Examples
- II. Problems related to medical asepsis
 - A. Presence of microorganisms
 - B. Transfer of microorganisms
 - C. Difficulties of destroying microorganisms
 - D. Types of microorganisms to which hospital personnel are commonly exposed
 - E. Responsibilities of the attendant in control of microorganisms
- III. Control of microorganisms
 - A. Antisepsis
 1. Meaning
 2. Methods
 - B. Disinfection
 1. Meaning
 2. Methods
 - C. Sterilization
 1. Meaning
 2. Methods

IV. Medical asepsis in nursing procedures

- A. Importance
- B. Examples of techniques applicable to procedures
 - 1. Clean
 - 2. Antiseptic
 - 3. Sterile

V. Isolation technique

- A. Purpose
- B. Principles
- C. Types
- D. Procedure of affiliating hospital

VI. Related clinical activities

- A. Demonstrations
 - 1. Isolation technique
 - 2. Medical asepsis as applied to routine ward duties
- B. Assignment to selected patients
 - 1. In isolation
 - 2. Requiring special attention to aseptic technique in daily care

LESSON 2: DRESSINGS AND BANDAGES

LESSON TIME: 4 hours.

OBJECTIVE: To help the student develop beginning skill in applying various types of dressings and bandages with appropriate technique.

OUTLINE OF LESSON:

- I. Dressings
 - A. Purpose
 - B. Types
 1. According to purpose
 2. According to materials
 3. According to technique
- II. Bandages
 - A. Purpose
 - B. Types
 - C. Influences on choice of type
- III. Technique
 - A. For applying dressings
 1. Clean
 2. Sterile
 - B. For securing a dressing
 1. Small
 2. Large
 - C. For applying bandages
 1. Roll
 2. Triangle

IV. Related clinical activities

- A. Assignment to selected patients
- B. Application of dressings
- C. Application of bandages

LESSON 3: COLLECTION OF SPECIMENS

LESSON TIME: 3 hours.

OBJECTIVE: To help the student learn how to collect various types of specimens with appropriate technique and how to test a diabetic urine specimen.

OUTLINE OF LESSON:

- i. Specimens
 - A. Importance
 - B. Types
- ii. Collection of specimens
 - A. Urine
 - 1. Single, voided
 - 2. Clean catch
 - 3. Twenty-four hour
 - 4. Special
 - B. Stool
 - C. Sputum
 - D. Throat
 - E. Skin lesion
 - F. Other
- iii. Specimens collected by the physician
 - A. Spinal fluid
 - B. Cervical smear
 - C. Fluid from a body cavity
 - D. Other

- IV. Observing and recording information on specimens
 - A. Examples of significant observations
 - B. Related vocabulary
- V. When to save a specimen
 - A. Potential value
 - B. Examples
 - C. Care
 - 1. Preservation
 - 2. Labeling
 - D. Reporting
- VI. Diabetic specimens
 - A. Importance
 - B. Testing
 - 1. For sugar
 - 2. For acetone
 - C. Recording
 - 1. Test results
 - 2. Other information
- VII. Related clinical activities
 - A. Procedures
 - 1. Collection of a urine specimen
 - 2. Testing of urine for sugar and acetone
 - 3. Collection of a stool specimen
 - B. Observation of medical procedures
 - 1. Lumbar puncture
 - 2. Cervical smear
 - 3. Aspiration of joint or body cavity

LESSON 4: OBSERVATION OF CARDINAL SYMPTOMS

LESSON TIME: 18 hours.

OBJECTIVE: To help the student understand the importance of the cardinal symptoms and develop beginning skill in obtaining and recording observations on temperature, pulse, respiration, and blood pressure.

OUTLINE OF LESSON:

- I. The cardinal symptoms
 - A. Meaning
 - B. Importance
 - C. Individual variability
 - D. Possible significance of changes
- II. Body temperature
 - A. Methods of measurement
 1. Oral
 2. Rectal
 3. Axillary
 - B. Care of the clinical thermometer
 - C. Avoidance of errors
 - D. Recording temperatures
 1. Graphic sheet
 2. Daily notes
 - E. Related vocabulary
- III. The pulse
 - A. Sites for obtaining pulse rate
 - B. How to count the pulse rate

- C. Other observations on pulse
- D. Avoidance of errors
- E. Recording observations on pulse
 - 1. Graphic sheet
 - 2. Daily notes
- F. Related vocabulary
- IV. Respiration
 - A. Obtaining the respiratory rate
 - B. Other observations related to respiration
 - C. Recording observations on respiration
 - 1. Graphic sheet
 - 2. Daily notes
 - D. Related vocabulary
- V. Taking blood pressure
 - A. Method
 - B. Common causes of error
 - C. Recording
 - 1. Graphic sheet
 - 2. Daily notes
 - D. Related blood pressure
- VI. Practice in recording observations
 - A. Graphic sheets
 - B. Daily notes
 - C. Other ward records or chart forms
- VII. Related clinical activities
 - A. Practice in making observations
 - 1. Temperature, pulse, and respiration

2. Blood pressure

3. Related symptoms

B. Practice in recording observations

1. Temperature, pulse, and respiration

2. Blood pressure

3. Related symptoms

LESSON 5: USE OF HEAT AND COLD AS THERAPEUTIC MEASURES

LESSON TIME: 6 hours.

OBJECTIVE: To help the student learn to perform therapeutic procedures involving the use of heat and cold.

OUTLINE OF LESSON:

- I. Heat as a therapeutic measure
 - A. Effects of heat
 - B. Dangers in the use of heat
 - C. Methods of applying heat
 1. Moist
 2. Dry
 - D. Observing and recording patient reactions to heat
 - E. Related vocabulary
- II. Cold as a therapeutic measure
 - A. Effects of cold
 - B. Dangers in use of cold
 - C. Methods
 - D. Observing and recording patient reactions to cold
 - E. Related vocabulary
- III. Principles and techniques of selected procedures
 - A. Utilizing moist heat
 - B. Utilizing dry heat
 - C. Utilizing cold

IV. Related clinical activities

A. Demonstrations

1. Hot water bottle
2. Ice bag
3. Sitz bath
4. Heat lamp
5. Compresses
 - a. Hot
 - b. Cold
6. Packs
 - a. Hot
 - b. Cold

B. Supervised practice in performance of selected procedures

LESSON 6: CARE OF THE BODY AFTER DEATH

LESSON TIME: 3 hours.

OBJECTIVE: To help the student understand the hospital procedure for care of a body after death and responsibilities of the psychiatric aide, including ethical and legal aspects.

OUTLINE OF LESSON:

- I. Care of the body after death
 - A. Ethical aspects
 - B. Legal aspects
- II. Procedure of affiliating hospital
 - A. Care of the body
 - B. Removal of the body
 - C. Forms to be completed
- III. Role of the psychiatric aide
- IV. Related clinical activities
 - A. Assisting in care of the body after death
 - B. Caring for the body with supervisory assistance
 - C. Completing all hospital forms

UNIT V: PATIENT PLACEMENT

TIME ALLOTMENT: 14 hours.

OBJECTIVE: To help the student understand hospital procedures related to patient assignment to a hospital area or to temporary absences from the area.

UNIT DESCRIPTION: Introduces the student to the procedures and hospital policies related to admission of patients, discharge of patients, absence from the hospital without permission, absence for home visitation, and transfer of patients from one hospital area to another. Emphasis is on the possible effects of changing status on the patient, responsibilities of the aide, and record-keeping for each situation.

LESSONS:

1. Admission of a New Patient
2. Discharge of a Patient
3. The Patient on Home Visitation
4. The Patient Absent Without Leave
5. Transfer of Patients

SUGGESTED REFERENCES:

Procedure Book of affiliating hospital

Robinson, Alice. The Psychiatric Aide; Third Edition. Philadelphia: J. B. Lippincott Company, 1964.

Thompson, Ella & LeBaron, Margaret. Simplified Nursing; Seventh Edition. Philadelphia: J. B. Lippincott Company, 1960.

LESSON 1: ADMISSION OF A NEW PATIENT

LESSON TIME: 6 hours.

OBJECTIVE: To help the student learn to follow hospital procedure for admitting a patient and to have good interpersonal relations with patient and family.

OUTLINE OF LESSON:

- I. Admission to the psychiatric hospital
 - A. Effects
 1. On family
 2. On patient
 - B. Importance of first personnel contacts with patient
 1. Establishing rapport
 - a. With patient
 - b. With family
 2. Observations
 - a. Patient-family relationship
 - b. Patient behavior
 - c. Appearance
 - d. Ability to communicate
 - C. Responsibilities of social service department
 - D. Responsibilities of the psychiatric aide
- II. Common problems related to types of admissions
 - A. Voluntary admission
 - B. Commitment
 - C. Emergency admission
 - D. Medical certification

III. The admission ward

- A. Purpose
- B. Differences from other wards
- C. Role of the aide on the admission ward
- D. Procedure of affiliating hospital
 - 1. Receiving the patient
 - 2. Care of clothes
 - 3. Observations to be recorded
 - 4. Physical examination

IV. Setting up admission records

- A. The patient's chart
- B. Ward records
- C. Forms for other departments

V. Related clinical activities

- A. Assignment to the admitting office
- B. Assignment to the admission ward

LESSON 2: DISCHARGE OF A PATIENT

LESSON TIME: 2 hours.

OBJECTIVE: To help the student learn to follow hospital procedure for discharging a patient and to maintain good rapport with patient and family throughout the discharge proceedings.

OUTLINE OF LESSON:

- I. Importance of psychiatric aide-patient relations at time of discharge
 - A. Potential effects
 - B. How to terminate the relationship
- II. Discharge procedure of affiliating hospital
 - A. Preparation of the patient
 1. Clothing and valuables
 2. Grooming
 3. Instructions for aftercare
 - a. Importance
 - b. Responsibilities
 - B. Notification of other departments
 - C. Hospital policies related to discharge
- III. Closing the patient's chart
 - A. Final comments
 1. Significant observations
 2. Name of person accepting responsibility for patient
 - B. Final disposition

IV. Discharge and readmission trends

- A. Recent statistics
- B. Influences
- C. Rates for affiliating hospital

V. Aftercare

- A. Importance
- B. Responsibilities
 - 1. Planning
 - 2. Provision of services

C. Agencies

- 1. Clinics
- 2. Halfway houses

D. Role of the family

E. Common problems

VI. Related clinical activities

- A. Assignment to patient scheduled for discharge
- B. Discharge of a patient

LESSON 3: THE PATIENT ON HOME VISITATION

LESSON TIME: 2 hours.

OBJECTIVE: To help the student learn to follow hospital procedure for releasing patients for home visitation, to keep records related to home visitation, and to be aware of potential problems associated with home visitation.

OUTLINE OF LESSON:

- I. Home visitation
 - A. Purpose
 - B. Variations
 - C. Responsibilities
- II. Procedures
 - A. Preparation of patient
 - B. Release to family
 - C. Records
 - D. Reception of the returned patient
 1. Observations
 2. Records
- III. Potential problems
 - A. The patient who does not return when scheduled
 - B. The patient who is disturbed on return to hospital
- IV. Related clinical activities
 - A. Participation in team conference
 1. Patient being considered for home visitation
 2. Patient who is disturbed on return

- B. Preparation and release of patient for home visitation
- C. Reception of a patient returning from home visitation

LESSON 4: THE PATIENT ABSENT WITHOUT LEAVE

LESSON TIME: 2 hours.

OBJECTIVE: To help the student understand responsibilities of the psychiatric aide when a patient is found to be absent from the hospital without leave.

OUTLINE OF LESSON:

- I. Absence without leave
 - A. Why patients leave without permission
 - B. Types of patients likely to leave
- II. Procedure when a patient is missing from assigned area
 - A. Whom to notify
 - B. Forms to fill out
 - C. Notations on the patient's chart
- III. Procedure when patient is found
 - A. Whom to notify
 - B. Forms to fill out
 - C. Observations
 - D. Notations on the chart
- IV. Related clinical activities
 - A. Note policies of assigned area which are for the purpose of preventing absence without leave
 - B. List steps the psychiatric aide would follow if a very disturbed patient is missing from the assigned area

LESSON 5: TRANSFER OF PATIENTS

LESSON TIME: 2 hours.

OBJECTIVE: To help the student learn to follow hospital procedure in transferring patients, to take all necessary precautions, and to keep records associated with transfer of a patient from one hospital area to another.

OUTLINE OF LESSON:

- I. Patient transfer
 - A. Reasons
 - B. Common reactions of the patient
- II. Transfer procedure of affiliating hospital
 - A. Preparation of patient
 - B. Notification of other departments
 - C. Escort for the patient
 - D. Orientation of transferred patient to new area
 1. Personnel
 2. Other patients
 3. Ward policies
 - E. Changes on chart
 - F. Changes on ward records
- III. Common problems related to transfer
 - A. Causes
 - B. Prevention
- IV. Related clinical activities
 - A. Assisting with transfer of patient to another area
 - B. Receiving and orienting a patient who has been transferred to the student's assigned ward

UNIT VI: CARE OF PSYCHIATRIC PATIENTS

TIME ALLOTMENT: 30 hours

OBJECTIVE: To help the student learn about common manifestations of mental and emotional illness and their influence on hospital organization and patient care.

UNIT DESCRIPTION: Introduces the student to common psychiatric conditions, therapeutic principles, and the role of the psychiatric aide in caring for patients with selected manifestations of mental or emotional illness.

LESSONS:

1. Placement of Patients
2. Care of Patients With Mental and Emotional Disorders
3. The Therapeutic Milieu

SUGGESTED REFERENCES:

- Muller, T. G. Fundamentals of Psychiatric Nursing. Paterson, New Jersey: Littlefield, Adams and Company, 1962.
- Robinson, Alice. The Psychiatric Aide; Third Edition. Philadelphia: J. B. Lippincott Company, 1964.
- Ross, Carmen F. Personal and Vocational Relationships in Practical Nursing. Philadelphia: J. B. Lippincott Company, 1961.

LESSON 1: PLACEMENT OF PATIENTS

LESSON TIME: 4 hours.

OBJECTIVE: To help the student understand the purposes of patient placement, the differences in types of hospital wards, and the effects on personnel responsibilities.

OUTLINE OF LESSON:

- I. Patient assignment
 - A. Influences
 - B. Purpose of specialized wards
- II. The closed ward
 - A. Purpose
 - B. Rules
 - C. Schedules
 - D. Responsibilities
 1. Patient
 2. Psychiatric aide
 - E. Identification of closed wards in affiliating hospital
- III. The open ward
 - A. Purpose
 - B. Rules
 - C. Schedules
 - D. Responsibilities
 1. Patient
 2. Psychiatric aide
 - E. Identification of open wards in affiliating hospitals

IV. The convalescent ward

A. Purpose

B. Rules

C. Schedules

D. Responsibilities

1. Patient

2. Psychiatric aide

E. Identification of convalescent wards in affiliating hospital

V. Related clinical activities

A. Assignment to open ward

B. Assignment to closed ward

C. Assignment to convalescent ward

LESSON 2: CARE OF PATIENTS WITH MENTAL AND EMOTIONAL DISORDERS

LESSON TIME: 20 hours.

OBJECTIVE: To help the student develop beginning understanding of nursing principles related to care of selected patients with mental or emotional disorders.

OUTLINE OF LESSON:

- I. Psychiatric nursing
 - A. Trends
 - B. Basic principles
- II. Functional disorders
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes
 - D. Therapeutic management
 - E. Role of the psychiatric aide
- III. Organic disorders
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes
 - D. Therapeutic management
 - E. Role of the psychiatric aide
- IV. The withdrawn patient
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes

- D. Therapeutic management
- E. Role of the psychiatric aide
- V. The patient with affective disorder
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes
 - D. Therapeutic management
 - E. Role of the psychiatric aide
- VI. The patient with personality disorder
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes
 - D. Therapeutic management
 - E. Role of the psychiatric aide
- VII. The psychoneurotic patient
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes
 - D. Therapeutic management
 - E. Role of the psychiatric aide
- VIII. The convulsive patient
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes
 - D. Therapeutic management
 - E. Role of the psychiatric aide

- IX. The mentally retarded patient
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes
 - D. Therapeutic management
 - E. Role of the psychiatric aide
- X. The alcoholic patient
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes
 - D. Therapeutic management
 - E. Role of the psychiatric aide
- XI. The drug addict
 - A. Characteristic behavior
 - B. Significant observations
 - C. Progress notes
 - D. Therapeutic management
 - E. Role of the psychiatric aide
- XII. Related clinical activities
 - A. Assignment to selected patients
 - B. Patient-care conferences
 - 1. With instructor
 - 2. With professional staff

LESSON 3: THE THERAPEUTIC MILIEU

LESSON TIME: 6 hours

OBJECTIVE: To help the student understand the meaning of the therapeutic milieu and its various aspects.

OUTLINE OF LESSON:

- I. The therapeutic milieu
 - A. Meaning
 - B. Influences
 - C. Aspects
 1. Physical
 2. Social
 - D. Role of the psychiatric aide
- II. Personnel-patient relations
 - A. Attitudes
 1. Of psychiatric aide
 2. Of patient
 3. Indications
 - a. Verbal
 - b. Non verbal
 4. Effect on behavior
 - B. Influencing patient behavior
 1. Objective methods
 2. Subjective methods
- III. Patient relations with other members of health team
(Selected representative speakers from various hospital departments)

IV. Related clinical activities

A. Observation and/or participation in work of other departments

B. Assignment to selected patients

C. Oral or written reports

1. Case studies

2. Therapeutic milieu interpreted in terms of needs of a specific patient

UNIT VII: BECOMING A HOSPITAL EMPLOYEE

TIME ALLOTMENT: 6 hours.

OBJECTIVE: To help the student understand personal responsibilities as a hospital employee and as a citizen.

UNIT DESCRIPTION: Promotes further understanding of hospital policies and procedures, job relationships, procedures for applying for or resigning from a position, role of the psychiatric aide as a member of the health team, and various aspects of citizenship.

LESSONS:

1. Assuming Responsibility as a Psychiatric Aide
2. Applying for or Resigning from a Hospital Position
3. Citizenship Responsibilities

SUGGESTED REFERENCES:

Ross, Carmen F. Personal and Vocational Relationships in Practical Nursing. Philadelphia: J. B. Lippincott Company, 1961.

Thompson, Ella & LeBaron, Margaret. Simplified Nursing; Seventh Edition. Philadelphia: J. B. Lippincott Company, 1960.

LESSON 1: ASSUMING RESPONSIBILITY AS A PSYCHIATRIC AIDE

LESSON TIME: 2 hours.

OBJECTIVE: To help the student learn about factors which promote good employer-employee relations.

OUTLINE OF LESSON:

- I. What the hospital can expect of employees
 - A. Personnel policies
 1. Purpose
 2. Advantages of written policies
 - a. To the employee
 - b. To the hospital
 - B. Employee behaviors
 1. Performance of duties
 2. Interpersonal relations
 - a. With supervisors
 - b. With co-workers
 - c. With patient and family
 3. Off-duty behavior
 - C. Appropriate employee attitudes
- II. What the employee can expect of the employing hospital
 - A. Written personnel policies
 1. Importance
 2. Topics to be covered
 - B. Written rules and regulations
 - C. Provision for handling of grievances

D. Concern with working conditions

E. Provision for personal development

LESSON 2: APPLYING FOR OR RESIGNING FROM A HOSPITAL POSITION

LESSON TIME: 2 hours.

OBJECTIVE: To help the student learn appropriate behavior when applying for a position or when resigning from a position.

OUTLINE OF LESSON:

- I. The personnel office
 - A. Importance of first impressions
 - B. Factors which influence judgments
 - C. General rules for making a favorable impression
- II. Applying for a position
 - A. Applications
 1. By letter
 2. Telephone inquiry
 3. Completing an application form
 - B. The job interview
 - C. References
- III. Resigning from a position
 - A. The letter of resignation
 - B. The terminal interview
 - C. Importance of leaving a favorable record
- IV. Student activities
 - A. Letter-writing
 - B. Role playing
 1. Application interview
 2. Terminal interview

LESSON 3: CITIZENSHIP RESPONSIBILITIES

LESSON TIME: 2 hours.

OBJECTIVE: To help the student be more aware of the responsibilities of adults in relation to community activities and personal living.

OUTLINE OF LESSON:

- I. Citizenship
 - A. Meaning
 - B. Privileges
 - C. Responsibilities
 - D. Examples of good citizenship
- II. Responsibilities in personal living
 - A. Observance of community regulations
 - B. Cooperation with others to promote group well-being
 - C. Fulfillment of financial responsibilities
- III. Responsibilities in the community
 - A. Support of activities
 - B. Loyalty to hospital
 - C. Promotion of health
 - D. Provide good example
 1. Citizenship
 2. As representative of the health team
 - E. Support of community costs

FOREWORD

This list is intended to serve as a guide for teachers and administrators in selecting reference books for departments of vocational agriculture in Arizona. While considerable study has been given to finding the best references for conditions in the state, the list does not include all books that would be of value in a department library. Effort has been made to keep the list small enough to come within the scope of department budgets, and the books listed have been carefully examined and evaluated.

Vocational agriculture teachers and supervisors in Arizona were requested to give suggestions on useful text and reference materials, and their suggestions have been included. Subject matter specialists in the College of Agriculture, The University of Arizona, assisted in evaluating books in the several fields.

The numbers after the title of the book refer to the list of publishers and book distributors in the front of this bulletin.

Asterisks have been used to indicate the probable usefulness of the various volumes in departments of vocational agriculture. This evaluation is only a suggestion to the teacher who may not be familiar with all of the books listed. The list has been classified into three groups as follows:

****Books that should be in every department library in multiple copies sufficient for student use.**

***Those of value as a single copy reference for teacher and students. (The purchase of more than one copy of a book marked with one or no asterisk may be advisable in some departments when the book covers an enterprise of particular importance in the community.)**

Titles without asterisks are not considered as an essential part of the minimum library for a department. They are very useful books and should be purchased insofar as funds will permit to enrich and expand the scope of the library after minimum standards have been attained.

LESSON 3: ORGANIZATION OF HOSPITALS

LESSON TIME: 3 hours.

OBJECTIVES: To help the student understand about hospital organization, departmental functions, the importance of interdepartmental cooperation, and the place of the psychiatric aide in the organizational structure.

OUTLINE OF LESSON:

- I. Hospitals
 - A. Purposes
 - B. Types
 - C. Departments
- II. Understanding an organizational chart
 - A. Relationships
 1. Vertical
 2. Horizontal
 - B. Communication lines
 - C. Lines of authority
- III. Hospital personnel
 - A. Those who aid in evaluation and diagnosis
 - B. Those who participate in therapeutic procedures
 - C. Those who provide other services
- IV. Interdepartmental relations
 - A. Importance of each department
 - B. Necessity for effective communications
 - C. Maintenance of cooperative attitudes
 - D. Effects on patient care

FOREWORD

This publication is intended to serve as a guide for teachers and administrators in selecting reference books for departments of vocational agriculture in Florida.

This list was compiled on the basis of the experiences and recommendations from several other states and the experiences of a number of teachers and staff personnel in Florida. This is by no means a complete list of all publications in this field; however, it is believed that the references listed include some of the best.

The references are grouped into the broad categories of agricultural management, off-farm agricultural occupations, agricultural mechanics, animal science, plant science, soil science, general agriculture, leadership activities, miscellaneous, professional, and yearbooks of agriculture. Within these categories, sub-groupings of general references and references for specific areas such as electricity, beef cattle, or fertilizers have been given.

Many references have been coded as to extent of usefulness, and in some cases, level of use. The fact that some volumes have not been coded does not necessarily mean that a book is not recommended but that a coding was not available at this time. The following coding was used:

- S - Books that could be in every department library in multiple copies for student use
- R - Books of value as a single copy reference for teacher and student use
- J - Suitable for use with junior high school students
- H - Suitable for use with senior high school students
- A - Suitable for use with young adult and adult students

Some books have been rated as being "excellent," "good," or "fair" references where evidence for such a rating was available. Abbreviations used are:

Ex - Excellent

G - Good

F - Fair

Those reference books considered essential in any department providing instruction in the area indicated have been marked with an asterisk following their rating. Unmarked references have not been rated.

This code is intended to be used as a guide in selecting books for those who may not be familiar with books in certain areas.

Needs should be carefully analyzed before buying books. Before ordering, copies should be obtained for examination if the person ordering it is not familiar with a book. School discount prices are available from most publishers. Check with other teachers and supervisory staff members for their evaluation before placing your order. By following such a sound procedure, your departmental library should become a sound, desirable learning aid to your students. In many cases, it will be possible to order reference books through the school library for reassignment to the department of vocational agriculture.

Clarence J. Rogers, Assistant Professor
Institute of Food and Agricultural Sciences
Department of Agricultural Engineering
University of Florida

APPLICATION OF THE UNIT

COMBINES AND COMBINING

The manual "Combines and Combining" has been developed by the Ohio Vocational Agriculture Instructional Materials Service to assist vocational agriculture students in gaining knowledge about this important harvesting machine. For most efficient use, each student should have a copy of the manual available during his study of the unit on combines. The manual suggests teaching procedures and student experiences that would be conducted in the classroom, the agricultural mechanics shop, and on field trips to farms and implement dealers.

The manual is not designed to be used as a workbook, although there are certain forms designed for recording information during the course of study that the teacher may wish to reproduce in quantities for student use. This may be accomplished by preparing spirit masters with an office copying machine for reproduction with a duplicating machine. The same office copying machine will usually prepare transparencies for use with the overhead projector.

For most effective work the students should have ready access to a combine to enable them to put their theory into practice. It is highly recommended that one or more combines be available in the agricultural mechanics shop during the course of study. Other combines may be studied during field trips to farms and to implement dealers.

Since the individual features of the different makes and models of combines cannot be included in one publication, it is also strongly recommended that the operator's manual for the combines being studied be made available. This manual refers to the manufacturer's manual for specific recommendations and adjustments. If the operator's manual is not available locally, copies may be obtained from the manufacturer's branch office.

SUPPLEMENTAL MATERIALS

A set of thirty 2 x 2" color slides has been selected from several hundred slides made available by Allis-Chalmers, J. I. Case, and The International Harvester Companies to illustrate the operation and design of the combine. The slides, with the accompanying script, may be purchased from the Vocational Agriculture Instructional Materials Service.

A sample 50-question examination and key has been prepared in accordance with the educational objectives that were followed in developing the manual. The examination contains the following type questions: true or false, multiple choice, matching, and mathematical problems. In addition to the 50 questions, the illustrations showing the combine cross section and the flow chart found on pages 22 and 24 respectively are included as part of the examination. Copies of the examination may be purchased from the Vo-Ag Instructional Materials Service.

EDUCATIONAL OBJECTIVES

Effective teaching has resulted when an evaluation indicates that students have attained desirable knowledge, skills, attitudes, and aspirations in the subject being taught. The ability to think clearly in the subject matter area as well as the ability to perform manual operations is an important goal.

The following objectives, stated in terms of student needs and behavior, were used as a guide in developing the manual:

STUDENT NEEDS —

1. To appreciate the harvesting losses that may occur when the combine is improperly operated and adjusted.
2. To appreciate the economic loss that can occur.
 - a. Through grain lost in the field.
 - b. By marketing a damaged and contaminated product.
3. To understand the design and principles of operation of the combine.
4. To understand the principles of the various combine adjustments.
5. To be able to evaluate his need for a combine.
6. To be able to select a combine that will meet his needs.
7. To be able to understand practical and experimental knowledge concerning combine operation and desing.

DESIRED STUDENT BEHAVIOR —

1. The ability to recognize and determine the extent of combine harvesting losses.
 - a. Field losses.
 - b. Machine losses.
 - c. Damaged grain loss.
 - d. Losses due to foreign material in the grain.
2. To identify the basic operations of the combine.
 - a. Cutting and feeding.
 - b. Threshing.
 - c. Separation.
 - d. Cleaning.
3. To identify the cause of each kind of combine loss.
4. To make proper adjustments with the machine or method of operation to correct the losses.
5. To determine his need for a combine in his farming operation.
6. To select a combine that will meet his farming needs.
7. To make repairs on his combine.
8. To apply practical and experimental knowledge in solving combining problems.
9. To make use of the manufactures operator's manual in operating and repairing the machine.

ACKNOWLEDGEMENTS

The manual "Combines and Combining" was prepared by Harlan E. Ridenour of the Ohio Vocational Agriculture Instructional Materials Service. Many persons provided invaluable assistance in compiling and organizing the material presented in this manual. The manuscript has been reviewed by Mr. S. G. Huber, Department of Agricultural Engineering, Dr. G. S. Guiler, Department of Agricultural Education, The Ohio State University, and Dr. W. H. Johnson, the Ohio Agricultural Experiment Station, for both content and arrangement. Dr. Ralph J. Woodin of the Department of Agricultural Education provided assistance in determining the organization of the manual.

Farm machinery company representatives from the following Columbus, Ohio branch offices provided assistance and materials for the manual: Allis-Chalmers Manufacturing Company, J. I. Case Company, International Harvester Company, John Deere Company, and Massey-Ferguson Company.

The first printing of the manual "Combines and Combining" has been extensively reviewed by D. M. Byg, Extension Agricultural Engineer, Farm Machinery, of The Ohio State University. Mr. Byg has suggested certain changes and additions which have been included in the second printing. In addition, D. M. Byg, W. E. Gill and W. H. Johnson conducted a survey to determine the actual grain losses that farmers were experiencing with their corn harvesting equipment throughout the 1964 harvest season. Some of the findings resulting from this survey have been added to the manual.

Harlan E. Ridenour

Instructional Materials Service

COMBINES AND COMBINING

I. WHAT IS THE VALUE OF DOING A GOOD JOB OF COMBINING?

The combine can be adapted to harvest any of our seed growing crops by use of the appropriate attachments and by making the proper adjustments on the machine for the kind of crop to be harvested. The principles of operation are the same for each of the crops even though different attachments may be used. In Ohio the combine is widely used in the harvesting of our grain crops. This means that we must understand how to operate the combine properly if we are to avoid large losses of grain at harvest time.

The large investment the farmer has in grain crops makes it important to harvest all the high quality grain he can from his fields. A recent study shows that the cost per acre of raising the following crops was: corn - \$58.85, soybeans - \$44.25, and wheat - \$47.30.¹

Student exercise: Study your farming program or farm account records to find your cost of production per acre for the crops you will be harvesting with the combine. Does this make it seem important to save all the high quality grain you can?

A. WHAT KIND OF LOSSES DO WE HAVE BECAUSE OF POOR COMBINE OPERATION AND ADJUSTMENT?

1. Field losses of grain.

No matter how careful we are some grain will always be left in the field. Some will be lost on the ground before combining, some will be missed by the machine because of cutting too high or poor driving, while some will be lost through the machine because the heads are not completely threshed out or the kernels thrown out of the machine. These losses will be greater than necessary unless the combine is properly operated and adjusted.

The graph shown in Figure 1 may be used to show the dollars per acre loss with different possible rates of loss per acre with grain at different prices.

2. Marketing losses caused by poor quality grain.

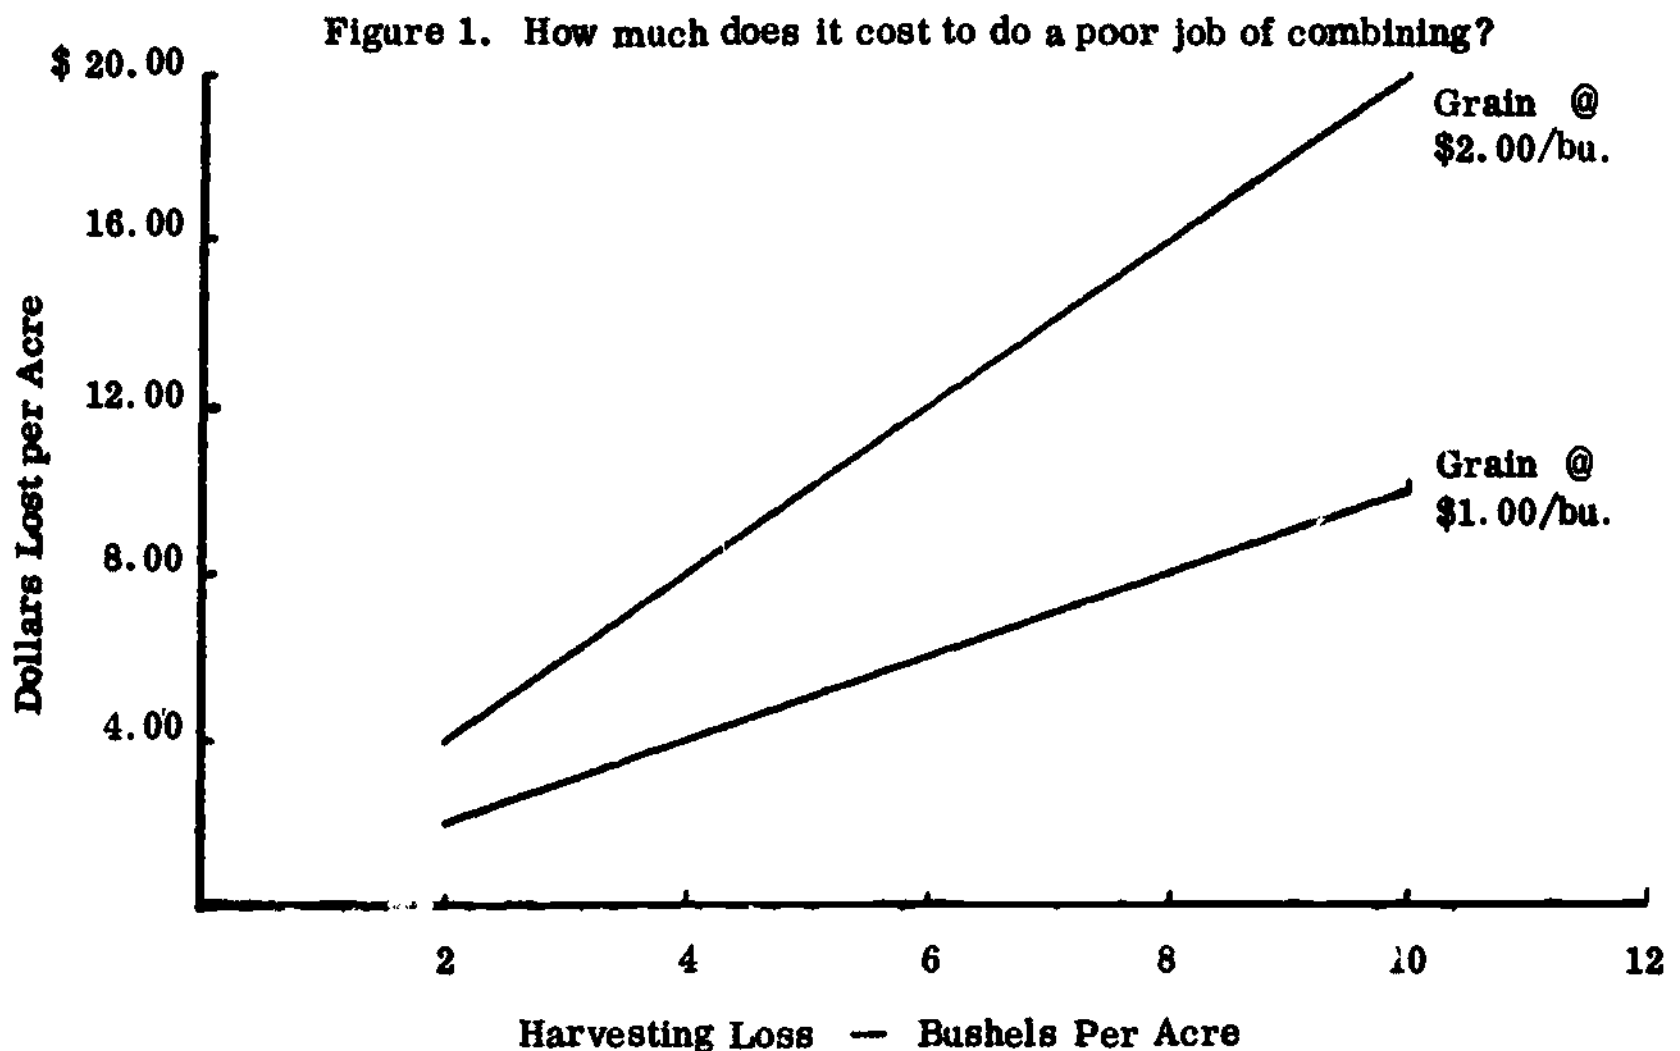

Poor adjustment and operation of the combine may cause damaged

1. G. V. Vollmar and R. H. Blosser, Crop Economics for Ohio, Bulletin 423, The Ohio State University, Department of Agricultural Economics.

grain that will lower the sale price or storage quality. This will cause an economic loss to the farmer. By understanding the principles of operation of the combine these losses can be kept to a minimum.

Grain damage that will cause the price to be discounted include the following: low test weight per bushel, high moisture content, heat damage, foreign material, shrunken - broken kernels, and split grain in the case of soybeans. These losses can be kept to a minimum by proper timing of the combine operation and by having the machine in proper adjustment.

Figures 2, 3, and 4 prepared by Ross Milner, Extension Specialist, Grain Marketing, The Ohio State University, show the effect of the different kinds of grain damage and the approximate discounts that may be applied to the market price of the grain.

In the example above the loss in dollars per acre has been plotted for grain prices at \$1.00 and \$2.00 per bushel for losses from 2 to 10 bushels per acre. You may substitute any crop at its current market value and plot the dollar loss for different harvesting losses.

CORN GRADES - PREMIUMS AND DISCOUNTS*

Grade Factors	Buying Grade No. 2	Approximate Discounts by Processors and Terminals
Test Weight	Min. 54 lbs.	1/2 to 1¢ each lb. or fraction under 54 lbs.
Moisture	Max. 15.5%	1 to 1/2¢ each 1/2% over 15 1/2%
Broken & F.M.	Max. 3 %	1¢ each 1% or fraction over 3%
Total Damage	Max. 5 %	1/2 to 1¢ each 1% or fraction over 5%
Heat Damaged	Max. 0.2%	1/2¢ each 1/10% over 2/10% to 3% then 1¢ each 1/10%
Additional Grade Factors (Always SAMPLE GRADE when present)		
Inseparable Stones (over 7)		Subject to negotiation
Musty		5 to 10¢ or subject to negotiation
Sour		10¢ or subject to negotiation
Heating		5 to 10¢ or subject to negotiation
C. O. F. O. 1/		subject to negotiation
D. L. Q. 3/		subject to negotiation or rejection

FIGURE 4

SOYBEAN GRADES - PREMIUMS AND DISCOUNTS *

Grade Factors	Buying Grade		Approximate Discounts by Processors and Terminals
	No. 1	No. 2	
Test Weight	Min. lbs.	54	1/2 cent each lb. or fraction under 54
Moisture	Max. %	13	2 to 2 1/2¢ each 1/2% or fraction over 13%
Splits	Max. %	20	1/4¢ to each 5% or fraction over 20%
Total Damage	Max. %	2	1¢ each 1% or fraction over 2%
Heat Damaged	Max. %	.5	1¢ each .5% or fraction over .5%
Foreign Material	Max. %	1	All over 1% deducted from weight
Other Colors <u>4/</u>	Max. %	1	1/2¢ each 1% or fraction over 1%
Musty		Sample	negotiated
Sour		Sample	negotiated
Heating		Sample	negotiated
C. O. F. O. <u>1/</u>		Sample	negotiated
Inseparable Stones (over 7)		Sample	negotiated
D. L. Q. <u>5/</u>		Sample	negotiated
Purple Mottled			
or Stained <u>6/</u>	Not higher than No. 3		negotiated
Materially Weathered	Not higher than No.4		negotiated

- 1/ C. O. F. O. - Commercially objectionable foreign odors -- includes skunk, smoke, burned decaying plants or animals, oil, etc.
- 2/ D. L. Q. Wheat - Distinctly low quality -- included three or more rat and mouse pellets, bird droppings, and treated pink wheat. Also large stones, glass, castor beans, Crotalaria seeds, foreign substances and other unusual conditions.
- 3/ D. L. Q. Corn - Distinctly low quality -- includes rodent excreta in excess of .2% based on 1 1/8 to 1 1/4 quarts of original sample, stones, pieces of glass and concrete too large to enter the probe, castor beans, cockleburrs, Crotalaria more than 2 in 1000 grams and unknown foreign substances or commonly recognized harmful or toxic foreign substances. Also, other unusual conditions which adversely affect the quality and which cannot be properly graded by specified factors.
- 4/ Other Colors - mean brown, black and/or bi-colored soybeans in yellow or green soybeans. Color is a grading factor up to and including 10% of other colors. Above 10% class changes to "Mixed Soybeans."
- 5/ D. L. Q. Soybeans - Distinctly low quality -- large stones, glass, concrete too large to enter the probe, castor beans, more than 2 Crotalaria seeds/1000 grams, visible contamination by rodents, birds or other sources of filth, unknown foreign substance or a commonly recognized harmful or toxic foreign substance, and other unusual conditions which adversely affect the quality.
- 6/ Includes discoloration due to fungus growth, dirt or nontoxic inoculants and other nontoxic substances.

* Ross Milner, Extension Specialist, Grain Marketing, The Ohio State University.

3. Operating the combine with improper adjustments or under poor conditions may require excessive amounts of power. This will increase the cost of harvesting the crop.

4. Operating the combine under poor conditions with improper adjustments will increase the wear on the machine. This will shorten the life of the combine and increase repair bills.

B. CHARACTERISTICS OF A GOOD JOB OF COMBINING.

A poor job of combining means that too much grain will be left in the field and that some will be damaged so much that the market grade will be lowered. Both of these losses mean that we will not receive as much for our work and investment as we would if we did a good job of combining. The cost of doing a good job is no more than for doing a poor job.

Let us see if we can tell what a good job of combining should be like. Where would you look?

The field.

1. Uncut grain left standing.
2. A few grains left in some of the heads.
3. Straw and heads are not excessively chewed up.

The machine.

1. Very few unthreshed heads at the rear of the machine.
2. Material spread evenly over the rack.
3. Little or no grain found coming from shoe or rack.
4. A small amount of material in the tailings auger.

The grain tank.

1. The grain is not cracked.
2. There is a small amount of chaff and other foreign matter in the grain.
3. The grain has a satisfactory moisture content for storage or marketing without excessive losses.

C. WHAT ARE THE THINGS THAT EFFECT THE KIND OF JOB OF COMBINING WE SHOULD DO?

1. The combine:
 - a. The power needed to run the combine at constant r. p. m. (revolutions per minute.).
 - b. The speed of forward travel.
 - c. The adjustment of the combine.
 - d. The skill of the operator.
 - e. The width of the combine.

2. The natural conditions.

- a. The lay of the land. (Topography.)
- b. The condition of the crop for threshing.
- c. The stand of the crop.
- d. The amount of weeds in the field.
- e. The variety of the crop.

D. THERE ARE SEVERAL THINGS WE NEED TO KNOW ABOUT A COMBINE IF WE ARE TO BECOME EFFICIENT OPERATORS WITH THE ABILITY TO DO THE KIND OF JOB WE DESCRIBED.

Even if we hire our combining done we should be able to tell whether or not the custom operator is doing a good job for us.

Some of the things we need to know are listed here. They will be studied in more detail later in this manual.

1. To understand the functional design of the combine.
2. To understand the basic principles of operation of the combine.
3. To have the ability to identify combine losses.
4. To have the ability to make the proper adjustments on the combine to keep the losses as low as possible.
5. To have the ability to maintain the combine in efficient operating condition.
6. To have the ability to determine the need for a combine in the farming operation and to select the machine that would best meet the need.

II. THE BASIC DESIGN OF THE COMBINE:

In studying the design of the combine it is recommended that one or more combines be available in the school shop. These may be obtained from the students' home farms or from a local implement dealer. Copies of the operator's manual should also be provided for the combines being studied. Quantities for class use can usually be obtained by writing direct to the manufacturer. The use of the operator's manual will serve two purposes: (1) to help in identifying the parts of the combine, their function and necessary adjustments, and (2) to illustrate the importance of using the operator's manual when working with the combine.

A. TYPES OF COMBINES.

1. Width of cut is one way of classifying combines.
2. The way power is supplied is another classification.
 - a. Pull type power take - off drive.
 - b. Pull type with an auxilliary engine to supply cutting and threshing power.
 - c. Self-propelled combines.

B. BASIC OPERATIONS PERFORMED BY THE COMBINE.

As the name implies the combine harvester performs several harvesting operations at the same time. The grain is cut, or picked in the case of corn, fed into a threshing unit where the grain is removed from the husk, the grain is then separated from the straw or husks, and finally the grain is cleaned and delivered into the grain tank.

A study of the cross section of the combine will help in understanding what takes place in the machine when it is operating and also will show the relationship of one part of the combine to another. (See figure 5.) To do a good job of combining the operator must understand the function of each unit of the combine, its adjustment, and the effect of each adjustment on the performance of the machine.

1. Cutting and feeding unit: Figures 6, 7, and 8.

The function of this section of the combine is to cut only as much of the crop as is necessary to get all the heads, lay the cut crop on the platform or auger, and then feed it uniformly into the threshing unit. Different makes and models of the combines will do this in somewhat different ways.

Figure 5. Combine Operating Cycle. Courtesy International Harvester Company.

The Combine Operating Cycle (Figure 5)

The reel (1) momentarily holds the crop against the guards until the knife (2) cuts the stems, and then it sweeps the cut material onto the platform. The platform auger (3) delivers the cut grain to the feeder (4) which carries the cut grain to the cylinder (5). The grain is rubbed out of the head between the rotating cylinder (5) and the concave grates (6). The cylinder beater (7) strips the cylinder, continues separating loose kernels of grain through the finger grate (8) then moves the material onto the straw rack (9) where final separation takes place. The adjustable cylinder beater check flap (10) regulates the flow of material over the racks. The grain pan (12) catches the grain separated at the concave, cylinder beater grate, and return from the straw racks and delivers it to the chaffer (11). The cleaning fan (15) supplies the wind blast which is the medium of separation. The shoe and sieve (13) operates in the direct opposite to the grain pan and chaffer which assures double action cleaning (as the grain pan and chaffer moves forward, the shoe and shoe sieve move towards the rear.) The shoe sieve (13) is where the final cleaning takes place. The threshed grain falls through the chaffer, and shoe sieve, and into the grain trough (14) where it is moved to the grain elevator by the grain auger. The grain elevator conveyor chain then delivers the clean grain to the grain tank. Unthreshed heads will move rearward across the chaffer and shoe sieve and drop into the tailings return auger trough (16). From this point, the unthreshed heads are returned by the tailings elevator to the cylinder for re-threshing.

Figure 6. Cutting and feeding unit using a feeding auger, feeding beater, and undershot feeder.

Figure 7. Cutting and feeding unit using a feeding auger and feeding beater.

Figure 8. Cutting and feeding unit using a feeding auger and undershot feeder.

Not all combines will perform this operation in exactly the same way. How is your combine designed to take care of the cutting and feeding operation?

Figure 7. Cutting and feeding unit using a feeding auger and feeding beater.

Figure 8. Cutting and feeding unit using a feeding auger and undershot feeder.

Not all combines will perform this operation in exactly the same way. How is your combine designed to take care of the cutting and feeding operation?

The main parts in the cutting and feeding area are:

a. Cutter bar: The cutter bar works like a series of shears running through the field to cut the grain. This is accomplished by knife sections reciprocating (working back and forth) over ledger plates which are held in place by guards. Hold down clamps, wearing plates, and shims are used to keep the knife flat on the ledger plates. Figure 45.

The sickle bar is usually driven by a pitman drive assembly. Figure 53.

Power will usually be supplied to the pitman crank by means of a series of belts and chains.

b. Reel: The reel slats gather in the crop, hold it until it has been cut by the knife, and then move it onto the platform. The reel must be square, level, and at the proper height and position to feed the grain uniformly and steadily. The reel may be ground driven or power driven.

c. Platform: The platform holds the cutter bar and feeding mechanisms.

d. Cutting platform auger: The cutting platform auger moves the cut grain to the center of the platform where the retractable auger fingers feed the grain into the feeder conveyor or the feeder beater depending on the design of the combine.

e. Retractable finger feeder beater: In some combines the cutting platform auger is followed by a retractable finger feeder beater which moves the grain into either the feeder conveyor or into the threshing unit. Figure 7.

f. Feeder conveyor: The feed conveyor or feed rake, as it is sometimes called, is designed to feed the grain in a steady even flow into the threshing unit. Proper feeding into the threshing unit will cause less clogging.

g. Feeder beater: Some models of combines will have a feeder beater which takes the grain from the feed conveyor and feeds it uniformly into the threshing unit.

Student exercise: Study the combines you have in the school shop or at home, and make a schematic drawing of the cutting and feeding areas. Label all the parts and describe the flow of the grain. Use the operator's manual for the machine to help you.

2. Threshing Unit. Figure 9.

The function of this section of the combine is to thresh the grain from the heads. This is done by passing the grain between a rapidly revolving cylinder and a stationary surface underneath which is called the concave. The rubbing action on the grain caused by the bars on the cylinder passing over the concave channel bars causes the grain to be removed from the head.

The principle of threshing will be the same for all combines, but different makes and models will use different design and methods of making adjustments

Figure 9. THRESHING UNIT

The design of some of the parts shown on this schematic diagram may be different on your combine. Some combines will not have a separate shelling plate and may not have finger grates.

The main parts of the threshing unit are:

- a. Cylinder: The cylinder will have either bars or spikes that will cause the rubbing of the grain against the concave.
 - (1). Rasp bar cylinder: The cylinder bars are rasp shaped as shown in the illustration. Figure 10.
 - (2). Rub bar cylinder: The cylinder bars are angle shaped and faced with rubber. Figure 11.
 - (3). Spiked tooth cylinder: The cylinder has spikes instead of bars. This type is not suited for corn harvesting. Figure 12.

Figure 10. Rasp bar cylinder.

Figure 11. Rub bar cylinder.

Figure 12. Spiked tooth cylinder.

b. Concave: The concave is the stationary part that the cylinder works against in the threshing action. It is the rubbing action between the cylinder bars and the concave bars that removes the seed from the head or pod. The concave is a grate composed of rods and bars or wires. (Figure 13.) It is at the concave grate and finger grate that as much as 90% of the grain is separated from the grain or husk. The separated grain falls through the grate onto the shoe pan where it is delivered to the cleaning unit. The straw and the remaining grain pass on into the separation unit. One make, the Gleaner combine, separates the grain from the straw by use of a riddle located behind the cylinder. Clean grain falls through the suspended straw and is conveyed to the cleaning shoe. (See figure 17.)

Figure 13. Concave

c. Cylinder beater: The beater behind the cylinder slows down the material coming from the cylinder, tears apart the straw, and delivers the material to the straw rack or the straw walker as it may be called. The beater helps in cleaning the straw from the cylinder thus preventing cylinder wrapping and feed back. Figure 9.

d. Feeding plate: The feeding plate (figure 9) is an adjustable plate located where the cut grain is fed into the cylinder concave unit. Much of the threshing can be done here.

e. Cylinder stripper: The cylinder stripper is set parallel to and above the cylinder and prevents back feeding.

3. Separating Unit.

The separating unit agitates the straw after it comes from the threshing unit. This shakes out the loose grain remaining in the straw and delivers it to the cleaning unit. Since the threshing unit separates up to 90% of the grain, only about 10% remains to be separated in this unit. The straw is carried out of the combine by the rack.

There are several designs used to collect the grain from the straw rack and concave grate. The schematic drawings in figures 14, 15, 16 and 17 show four possible methods of doing this.

Figure 14. Separating unit using straw rack return pan under the straw rack.

Figure 15. Separating unit using straw rack return pan and grain conveyor.

Figure 16. Separating unit using grain return conveyor under the straw rack.

Figure 17. Separating unit using a grain return pan under the straw rack. A cleaning fan is also used in the separating section of this combine.

The main parts of the separating area are:

a. Concave grate and finger or cell grate which has been described in the threshing unit.

b. One piece straw rack: The straw rack is a one piece unit with risers pointed toward the rear of the combine. Figure 18. The straw rack is mounted on cranks located at the front and rear which give it an oscillating motion. As the rack moves rearward and upward the straw is tossed up and to the rear. As the rack returns forward and downward the straw stays in mid air for a short time and then falls onto a section of the rack nearer the end of the combine. In this way the straw moves step by step out of the combine. This tossing action causes the grain to be separated from the straw.

Figure 18. One piece straw rack.

c. Walker type straw rack: Some large combines may use a walker type straw rack which operates on the same principle as the rack. The straw walker has three or more narrow sections placed side by side. Each section is mounted on multiple throw cranks located at the front and rear. The crank throws for each section are equally spaced around the circle of rotation thus the sections do not operate as a unit as the rack does. Figure 19.

Figure 19. Walker type straw rack.

d. Grain return pan: The grain return pan is located under the straw rack. It catches the grain as it falls through the rack and moves forward to the grain pan. The straw walker usually has a return pan under each unit. Figures 14 and 15.

e. Grain return conveyor: In place of the grain return pan some combines will use a conveyor to catch the grain and move it forward. Figure 16.

f. Grain pan: The grain pan is usually located under the forward part of the straw rack behind and below the cylinder. Its function is to catch the grain from the concave and cylinder grates and from the grain return pan or conveyor for delivery to the cleaning unit. Figures 14 and 16.

g. Grain conveyor: Some combines will use a conveyor in place of the grain pan to collect and deliver grain to the cleaning unit. Figure 15.

h. Check flaps or curtains: The check flaps or curtains deflect the straw and grain onto the rack as the full length of the rack is used for separation. They should not be in the way of the straw as the rack moves it to the rear.

Student exercise: The basic principles of separation are the same in all combines. However, different makes and models will have different designs. Prepare a schematic diagram of the separating unit of your combine after studying both the combine and the operator's manual. Explain the basic principles of separation.

4. **Cleaning unit:** The function of this unit is to separate the clean grain and send it to the grain tank, return the tailings (partially threshed heads) to the cylinder for rethreshing, and move the remaining material out of the combine. This is accomplished by means of gravity and air blast. Figure 20.

Figure 20. Cleaning unit.

a. **Adjustable chaffer:** The adjustable chaffer acts as a sieve. It is made up of a series of cross pieces mounted on rods and fastened together so they can be moved at the same time to adjust the size of the openings. Figures 20 & 21.

Figure 21. Side and flat views of the chaffer showing how the lips may be adjusted to control the amount and kind of materials passing through.

Figure 21. Partial views of two types of adjustable chaffer sieves.

b. Chaffer extension: As the name suggests this is an extension of the chaffer. In addition to having adjustable lips the chaffer extension will also swing up and down on the end of the chaffer. The unthreshed portions of grain heads fall through the chaffer extension into the tailings auger. The bulky material passes over the chaffer extension and out of the combine. Figure 22.

c. Sieve: The sieve is like the chaffer except that the lips and openings are smaller. The final job of cleaning is done here. The material that is too large to pass through the sieve is carried over the the tailings auger and returned to the cylinder for rethreshing. Figure 22.

d. Special chaffer and sieve equipment: Many combines will have special screens available for some crops that are difficult to clean.

e. Cleaning fan: The fan furnishes a blast of air. The strength of the air blast is controlled by the speed of the fan and by shutters in the air intake. The direction of the air blast is controlled by windboards. The function of the air blast is to keep the material "alive" on the chaffer and sieve. The air blast should be strong enough to lift the chaff slightly off the chaffer and sieve, but not strong enough to blow grain out of the combine.

f. Clean grain auger and clean grain elevator: The clean grain auger collects the cleaned grain and augers it to the clean grain elevator which delivers the clean grain to the grain tank.

g. Tailings auger and tailings elevator: The tailings auger collects all of the material which comes off the lower sieve plus any material which falls through the extension chaffer.

Figure 22.
The chaffer and chaffer extension are located above the sieve. The two units agitate back and forth. This along with the air blast help screen the material and move the chaff out of the combine.

h. Tailboard: The tailboard keeps the unthreshed material from being carried out of the rear of the combine while still allowing the chaff to be blown out. It may be raised or lowered as needed.

Student exercise: Prepare a schematic diagram of the cleaning unit on your combine showing the basic parts of the cleaning section on your combine. What are the basic principles of the cleaning operation?

5. How do the four areas of the combine work together?

The four areas of the combine must work together if the machine is to be expected to do an efficient job of harvesting. The way one section is operated and adjusted will affect the efficiency of the remaining areas. The following laboratory exercise will help you to understand how the combine areas work together.

Student exercise: Now that you have completed the study of the four basic areas of the combine — cutting and feeding, threshing, separating, and cleaning — turn to figure 23 and see how the material flows from one area of the combine to the next. Keep in mind that all combines will have each of these basic areas but may use different mechanical design to carry out the necessary work. After becoming familiar with the principal parts and their functions turn to figure 24, and see if you can name them. (Do not write in this book unless your teacher tells you to.)

Do you know how the material moves through the combine and the process that takes place in each of the sections? Turn to figure 25 and study the flow chart to see how the material moves through the machine. A look back to figure 5 (combine cross section) may help you. Next see if you can trace the flow of material through a combine in the school shop or at home. Use the blank flow chart in figure 26 while doing this.

Figure 23. FLOW OF MATERIALS THROUGH THE COMBINE.
 Courtesy Massey - Ferguson Co.

CUTTING

The adjustable reel positions the crop for cutting. The auger moves the grain to the elevator.

FEEDING

The elevator feeds the grain uniformly to the cylinder.

THRESHING and SEPARATING

The cylinder and concave thresh the grain and separate it up to 90% from the straw.

SEPARATION

The separation of grain from straw is completed on the rack.

CLEANING

Forced air and the shaking action of sieves used to clean the grain.

GRAIN TANK

To receive and hold grain while combine is operating.

UNLOADING

Auger and to remove grain from tank.

Figure 24. COMBINE CROSS SECTION

Write in the names of the parts of the combine that are indicated by the numbers on the drawing of the combine. Use the blanks below the drawing.

Sections of a Combine: A _____ ; B _____ ; C _____ ; D _____

III. OPERATION OF THE COMBINE.

If you are operating or intend to operate a combine it will be important for you to understand the sources and causes of grain loss and the adjustments that should be made to correct these losses. The quality of the job of combining you will be able to do will depend on your understanding of these adjustments and your ability to make the proper adjustments in the field when you are operating your combine.

This section of the manual should help you become familiar with the basic principles of some of the common adjustments to meet different operation conditions. You should also have a copy of the manufacturer's operator's manual to use with the combine you are studying in this exercise. It will give you the specific adjustments for the machine you are working with.

A. SOURCES OF GRAIN LOSS FROM THE COMBINE.

Each of the four separate areas of the combine - cutting and feeding, threshing, separating, and cleaning - can be a source of loss. The losses in these areas are usually known as the cutter bar, cylinder, rack, and shoe losses.

1. Cutter bar loss: Any or all of the following items may cause cutter bar loss.

- a. Heads of grain missed by the cutter bar.
- b. Grain shattered out of the head as the knife cuts the straw.
- c. Grain cut and dropped to the ground before reaching the feeding platform.
- d. Grain shattered out when the reel strikes the standing grain.
- e. Heads of grain thrown out by the reel.

The grain that has been shattered onto the ground ahead of the combine should not be included with the cutter bar loss.

2. Cylinder loss: The cylinder can cause loss in two ways. They can be identified as follows:

- a. Unshelled grain left in the heads and carried to the rear of the combine by the rack.
- b. Cracked grain in the grain tank caused by the cylinder running too fast or the concave cylinder clearance being too close.

3. Rack loss: The rack loss is the loose grain which has not been separated from the straw as it passes over the rack and is carried out of the machine with the straw.

4. **Shoe loss:** The shoe loss is the grain that is carried over the rear of the sieves with the chaff or blown out of the combine with the fan.

The four losses taken together will show how good a job of combining you are doing.

5. **How much loss can be expected:** Losses, with the best combine adjustment, will vary greatly depending upon the type, variety, and the condition of the crop. Total losses in clean crops of wheat, oats, barley, and rye will vary from approximately 1% to 4% of the total yield. Under good harvesting conditions the total loss should not be more than one and one-half percent.

a. **Small grain losses:** Under average conditions the following range of losses might be expected when small grain crops are harvested.

- (1) Cutter bar loss .5% to 2%. When the combine is properly adjusted this will usually be higher than for the other parts of the combine.
- (2) Cylinder loss .5% to 1%. It is usually best not to reduce cylinder loss below .5% because rack shoe losses will increase rapidly if the straw is over threshed.
- (3) Rack loss .2% to .4%.
- (4) Shoe loss .2% to .4%.

b. **Soybeans:** Researchers at the Ohio Agricultural Experiment Station ran tests on farmer operated combines, under typical harvesting conditions, for a period of seven years. These tests show that the following results might be expected.

- (1) Cutter bar loss 12.6%. This loss included the following:
 - (a) Beans shattered onto the ground.
 - (b) Beans remaining in pods on the stubble.
 - (c) Beans remaining in pods on stalks which had been cut off but not fed into the machine.
 - (d) Beans in pods on lodged stalks.
- (2) Cylinder loss .96%. Nearly all of the beans are threshed out by the cylinder.
- (3) Rack and shoe 1.0%. The separating and cleaning area did not have serious losses.

The total loss for the seven year test ranged from 8.8% to 19.3% of the total crop.

- c. Corn: Research at the Ohio Agricultural Experiment Station shows that the following losses might be expected when harvesting corn.

- (1) Gathering Unit
Lost ears 1% - 20%
Snapping roll loss 1% - 5%
- (2) Cylinder loss 0 - 5%
- (3) Rack and shoe .5% - 5%
- (4) Cracked kernels .5% - 4%
- (5) Invisible loss 0% - 5%

B. HOW COMBINE LOSSES CAN BE MEASURED.

Each of the four areas of the combine - cutting and feeding, threshing, separating, and cleaning - has its own adjustments. The first step in finding out what machine adjustments are needed to improve your job of combining is to measure the amount of loss from each of the combine areas. This can be done accurately on most crops except grasses and legumes by the method used by the Ohio Agricultural Experiment Station.² A simpler, although less accurate, method is described in this manual.

1. Will it be worthwhile for you to check your combine losses to find the adjustments you should make to correct them?

The Ohio Agricultural Experiment Station conducted tests with combines being operated by farmers to harvest wheat. Each of these machines was out of adjustment in some way. The harvesting losses were checked on the machines as they were being run by the operators. The needed adjustments were made, and the harvesting losses were checked again. A summary of these tests is shown in figure 27. It should be mentioned that another machine being operated by a farmer was only losing two pounds of wheat per acre.

FIGURE 27. ADJUSTING COMBINES REDUCES GRAIN LOSSES

Losses checked on eight combines before and after making adjustments. The before adjustment loss ranged from 388 lbs. to 12 lbs. per acre.

Grain losses in pounds per acre.

From Ohio Agricultural Experiment Station

2. G. W. McCuen and E. A. Silver, Combine Harvester Investigations, Bulletin 643, The Ohio Agricultural Experiment Station.

2. Figuring the harvesting loss per acre.

The bushels of grain lost per acre can be estimated by collecting the number of kernels lost in a measured test area. The test area should contain about 50 square feet for small combines and about 100 square feet for large combines. Smaller areas may be used by increasing the number of samples to maintain accuracy.

The test areas can be set up as follows: Measure the distance on the ground that the combine will need to travel in cutting the desired number of square feet. Mark this distance by setting stakes beside the standing grain. Example: a 12 foot combine will travel 8 feet 4 inches in cutting 100 square feet of grain. (Figure 28.) The material can be collected in a box or on canvas as the combine passes through this area and the kernels of grain separate from the chaff and straw. If the combine has a straw spreader it will need to be disconnected during the test.

Figure 28. Measuring the test area for checking combine harvesting loss.

The kernels collected in the test area can be changed to bushels per acre by one of the following methods:

a. Counting the kernels.

- (1) Count the kernels found in the test area.
- (2) Find the number of kernels per square foot.
- (3) Divide the kernels per square foot by the number of kernels per square foot equal to one bushel loss per acre found in table 1.
This will give you the loss in bushels per acre.

Example: In checking soybean harvesting loss, 400 soybeans were picked up from a 20 square foot test area. What is the loss in bushels per acre?

$$\frac{400 \text{ soybeans}}{20 \text{ sq. ft.}} = 20 \text{ soybeans per sq. ft.}$$

$$\frac{20 \text{ soybeans per sq. ft.}}{5 \text{ kernels per sq. ft.}} = 4 \text{ bu. per acre loss.}$$

Table 1. Approximate Number of Kernels Per Square Foot to Equal One Bushel Loss Per Acre

Crop	Approximate Number of Kernels Per Square Foot
Wheat	18 - 20
Oats	10 - 12
Soybeans	4 - 5
Barley	13 - 15
Rye	21 - 24
Corn	2

The Ohio State University, Department of Agricultural Engineering.

If losses are high you must count large numbers of kernels which would require too much time. You may want to use the following method.

- b. Measuring the kernels: Calibrated plastic tubes may be used to change the volume of kernels collected from the test area to loss in bushels per acre. Glue one end of a clear plastic tube to a block of wood. (See figure 29.) The position of the calibration marks will depend on the square feet of ground in the test area and the inside diameter of the plastic tube. Table 2 shows the volume required to equal one bushel loss per acre from a given test area.

Figure 29. Calibrated plastic tube for measuring bushel per acre grain loss.

Table 2. Cubic Inches Required to Equal One Bushel Grain Loss Per Acre With Different Size Test Areas

Square feet of ground in test area	Volume in tube equal to 1 bu. per acre cubic inches
20	1
50	2 1/2
100	5

Example: If you have a plastic tube one inch in diameter how far apart will the calibration markings be to equal one cubic inch of volume in the tube.

Formula: Volume of a cylinder = $\pi r^2 h$

$$1 \text{ cu. in.} = 3.1416 \times (.5'')^2 \times X (\text{height})$$

$$1 \text{ cu. in.} = .7854 X$$

$$X = 1.27''$$

When a one inch inside diameter tube is used each 1.27 inches of height will equal one cubic inch of volume in the tube.

Problem: If you are using a 1 1/2 inch inside diameter tube what will be the inches in height required to equal 1 cubic inch of volume in the tube?

3. **Finding the loss from each combine area:** The following procedures may be used to find the loss from each of the four areas of the combine. The location and the kind of loss you find will show you the kind of adjustment that needs to be made to improve the efficiency of your combine.

- a. **Finding the cutter bar loss:** Stop the combine and count the kernels of grain found on one square foot of ground under the machine including the kernels in unthreshed heads. Subtract from this the shattered kernels and grain in heads of grain on one square foot of ground in the standing grain in front of the cutter bar. The difference will be the cutter bar loss. For more accuracy use several square foot areas in each location. The loss per acre can be figured from Table 1.

Example: If fifteen kernels of wheat per square foot are found under the machine and five per square foot are found ahead of the cutter bar the cutter bar loss is 10 kernels per square foot or 1/2 bushel per acre. (Table 1.)

- b. **Finding the cylinder loss:** The following steps may be used in finding the cylinder loss:
- (1) Select the size test area you want to use and mark it off on the ground. (Follow the instructions given earlier in this section.)
 - (2) Catch all the material coming from the rear of the combine.
 - (3) Collect the heads that are all or partly unthreshed. Thresh these out and measure the approximate loss in bushel per acre by one of the methods described.
 - (4) Examine the material for an excessive amount of chaff and short lengths of straw. Look in the grain tank for cracked kernels.

- c. Finding the rack loss: The rack loss may be found as follows:
- (1). Measure and mark with stakes the distance necessary to travel in cutting the test area.
 - (2). Catch all the material coming from the straw rack in a box or canvas.
 - (3). Collect the loose kernels and measure the loss in bushels per acre by one of the methods described.

Check the condition and the amount of straw as it comes from the rack to check the kind of job of combining you are doing. Has the straw been broken up by the cylinder?

- d. Finding the shoe loss: On some combines this can be done by catching the material as it comes from the shoe and follow the same procedure used in finding the rack loss.

If it is not possible to catch the material as it comes from the shoe you will need to catch all the material coming from the rear of the combine. Collect the kernels which will represent both the rack and shoe loss. Subtract the rack loss from this and the remainder will be the shoe loss.

Examine the material in the tailings for excessive amounts of chaff and other debris. Look in the grain tank for dirt.

Student exercise: A field trip for the purpose of checking combine losses is recommended if combines are in operation at the time of this lesson. Otherwise, students should be encouraged to put this knowledge into practice at the first opportunity. The form "Record for Checking Losses" may be used to record the results of the tests.

RECORD FOR CHECKING COMBINE LOSSES

Name of farmer _____ Crop _____

Condition of Crop (weedy, lodged, wet, etc.) _____

Width of cut _____ ft. x distance traveled _____ ft. = _____ ft. sq. ft of test area.

Source of Loss	When kernels are counted		When kernels are measured	Loss in Bu. / A.
	Total No. Kernels	Kernels per sq. ft.	Cubic inches of Kernels	
1				
2				
3				
4				
5				
6				
7				

Observations:

Condition of straw as it leaves the rack: _____

Amount of chaff and other debris in tallings: _____

Are unthreshed heads going over the chaffer extension? _____

Condition of threshed grain in the tank (damaged kernels or extensive dirt): _____

C. HOW COMBINE LOSSES MAY BE REDUCED.

What information did your combine test give to you? If the grain loss was low there may be no need to make adjustments in the machine. However, if the grain loss was high the results of your test will help you in deciding on the adjustments you should make.

Refer to your record of combine losses as you study this section on combine adjustments. Tests conducted by agricultural engineers show that adjustments should be made in the following order.¹

1. Machine speed. Check the machine speed to see that the combine is operating at the recommended revolutions per minute (r.p.m.). Steady, smooth power is very important. Any changes in engine speed will change the speed of the separator. Uneven speed will cause loss of grain, poor threshing, and sometimes complete plugging of the machine. You should be sure your combine is operating at the proper machine speed before going into the field. The manufacturer's operator's manual will give the basic speed of the machine. This may be given as beater shaft speed, engine speed at full throttle, separator shaft speed, etc. Some service men will call this the "key shaft" since the operating speed of the entire machine depends on this shaft operating at the recommended speed. Adjust the engine governor so that the basic speed is 3 to 5% above normal when the combine is running empty. A revolution counter, figure 30 should be used to measure power take off and straw rack speeds since most tachometers cannot be read accurately enough at low speeds.

Figure 30. Check the machine speed by using a speed indicator on the "key" shaft.

1. S. G. Huber, *Harvesting With Combines*, The Ohio State University.

Student exercise: Check the operating speed of the combine you are working on in the shop.

Speed adjustments on the combine. Some parts of the combine are driven by belts running on pulleys or adjustable sheaves while other parts are run by chains and sprockets. Sometimes it is necessary to change the operating speed of a part such as the reel or the cylinder. This can be done as follows:

a. **Pulleys.** Power is supplied by one of the pulleys called the driver. This power is then transmitted by means of a belt to another pulley called the driven. Figure 33.

Figure 33. Pulley speeds

If the driven pulley is to operate at the proper speed or r.p.m. (revolutions per minute) there must be a proper relationship between the size of the driver and the driven. The r.p.m. of the driver will usually not change because its power is supplied by the combine or tractor motor which should be run at full throttle all the time. This means that the speed of the driven can be changed by changing the size of one or both of the pulleys. The formula for this relationship is as follows:

Speed is measured by r.p.m.

Size of pulley is measured by diameter or d.

$d \text{ of driver} \times \text{r.p.m. driver} = d \text{ of driven} \times \text{r.p.m. of driven.}$

Example 1: If the driver pulley is 5 inches in diameter and is operating at 100 r.p.m., what will be the r.p.m. of a 10 inch diameter driven pulley?

$$5' \text{ driver} \times 100 \text{ r.p.m. driver} = 10'' \text{ driven} \times X \text{ r.p.m. driven}$$

$$500 = 10X$$

$$X = 50 \text{ r.p.m. of driven}$$

Example 2. If the driven pulley is 4 inches in diameter and operating at 500 r.p.m., what would the diameter of the driven pulley be to operate at 800 r.p.m.?

$$4'' \times 500 \text{ r.p.m.} = X \times 800 \text{ r.p.m.}$$

$$800 X = 2000$$

$$X = 2.5'' \text{ diameter}$$

b. **Sprockets.** When sprockets and chain are used to transmit power from the driver to the driven the same principles of proportion are used except the size of the sprockets is measured by the number of teeth instead of using the diameter as with pulleys.

Example 3. If a driver sprocket has 5 teeth and is operating at 100 r.p.m. what will be the r.p.m. of a 10 tooth driven sprocket?

$$5 \text{ teeth} \times 100 \text{ r.p.m.} = 10 \text{ teeth} \times X \text{ r.p.m.}$$

$$500 = 10X$$

$$X = 50 \text{ r.p.m. of driven}$$

Notice that the answer is the same as in the first example with the pulleys since the proportions were the same.

Problem 1. If the sheave that drives the cleaning fan is 5 inches in diameter and operates at 750 r.p.m., what would the diameter of the driven sheave need to be to operate the fan at 900 r.p.m.? (Figure to the nearest tenth of an inch.)

Problem 2. If the sprocket that drives the cylinder has 32 teeth and operates at 650 r.p.m. and the cylinder driven sprocket has 19 teeth, what will be the speed of the cylinder in r.p.m.? (Figure to the nearest whole number.)

Problem 3. In the illustration below at what r.p.m. is the reel traveling if the driver pulley is 5 inches in diameter and running at 300 r.p.m.?

Schematic drawing of a reel driving power train.

Figure 31. Small Cylinder Concave Clearance Reduces Cylinder Loss but Increases Total Loss.

OAES 643, p. 13, Fig. 6.

Figure 32. As Cylinder Speed Increases Cylinder Loss Decreases, but Rack and Shoe Losses Increase.

OAES 643, p. 14, Fig. 8.

Figure 31 shows that a small cylinder clearance reduced the cylinder loss but increased the total loss. Increasing the cylinder clearance increased the cylinder loss slightly but decreased the rack and shoe loss making the total loss much less.

Figure 32 shows that high cylinder speeds reduce cylinder losses but increase rack and shoe losses. Decreasing the cylinder speed increased the cylinder loss slightly but reduced the rack and shoe losses greatly making the total loss less.

Many things will influence the proper cylinder speed and cylinder-concave clearance that will bring about the most efficient job of combining possible for your conditions. Increasing the cylinder speed seems to cause less over threshing than does decreasing the cylinder-concave spacing. Figure 34.

Figure 34.

The percentage of chaff in the straw increases as the cylinder speed increases and as the cylinder concave clearance

Cylinder and Concave Setting Speed

The first step is to study the operator's manual to determine the settings recommended for the crop you are harvesting.

Student exercise: Find this information for your combine and fill in table 5.

Table 5. Manufacturers recommendations for cylinder speed and cylinder - concave clearance.

Crop being harvested _____		
Condition of crop _____		
Adjustment	Recommendations	How adjustment is made
Cylinder speed (r.p.m.)		
Cylinder - concave clearance. (inches)		

These adjustments will be satisfactory for a trial run, but as one manufacturer says in his operator's manual, "The correct cylinder adjustment for any kind of grain must be determined by trial." ¹

The cylinder speed recommendations for threshing some crops will be given as peripheral speed which is the feet per minute a given point on the circumference of the cylinder would travel (sometimes called surface feet per min.)

Example: If the recommended peripheral speed of the cylinder is 4500 ft. per minute and the diameter of the cylinder is 24 inches, at what r.p.m. should the cylinder run to maintain this peripheral speed?

You will first need to know the circumference of the cylinder to know how far a point on the cylinder must travel to complete one revolution. The number of times the circumference is contained in the recommended peripheral speed will give the required r.p.m. of the cylinder.

$$\text{Circumference} = \text{diameter} \times \pi \text{ (7)}$$

$$C = 2 \text{ ft.} \times 3.1416$$

$$C = 6.2832 \text{ ft.}$$

$$\frac{4500 \text{ ft. / min.}}{6.2832 \text{ ft.}} = 716 \text{ r.p.m.}$$

Problem: You are preparing to combine alfalfa seed. You want the cylinder to have a peripheral speed of 5000 ft. per minute. Your cylinder is 18" in diameter. At what r.p.m. should it operate to give you the desired peripheral speed?

1. Operator's Manual, IHC COMBINE.

3. Adjust the cutter bar height. The cutter bar area usually has highest loss of the four areas of the combine. The height of cut should not be lower than required to get all or most of the heads off the grain. Figure 35. Height of cut losses will show up as follows:

Too high: Heads or pods of grain will be left in the field.

Too low: Too much material will be run through the combine and will over load the rack causing this loss to increase more than it should. Figure 36.

Figure 35. Increasing the height of cut decreases the total loss. (Wheat)
Due to over loading the combine.*

*Harvesting With Combines, The Ohio State University.

Figure 36.

Cut just low enough to get all the heads.

Raising the height of cut increased the cutter bar loss slightly but greatly reduced the rack loss of the machine. The soybean plant is low growing and when ripe, the beans shatter easily. Because of this, over 80% of the combine loss takes place in the cutting and feeding area.

Student exercise: Study your operator's manual, your combine, and the condition of the crop being harvested to find the information for table 6.

Table 6. Recommendations for height of cut.

Crop being harvested _____		
Condition of crop _____		
Adjustment	Recommendations	How adjustment is made
Height of Cut		

4. **Adjustable reel.** A poorly adjusted reel will cause some of the loss in the cutter bar area of the combine. The reel may be adjusted for speed, height, and forward or rearward. Reel losses will show up as follows:

- Reel too fast: (1) The bats strike the grain with such force that grain will be shattered and lost.
(2) Grain carried over top of reel.
- Reel too slow: (1) The cut grain may fall to the ground and be lost.
(2) The cut grain may fall on the cutter bar causing the grain to be cut up or the knife to choke.
(3) Down, tangled grain or short straw may not be moved onto the platform.
- Reel too low: (1) The grain may tend to wrap around the bats.
- Reel too high: (1) The grain will not be moved onto the platform.
- Reel too far forward: (1) The grain will not be moved onto the platform.
- Reel too far back: (1) The grain may not be fed uniformly into the combine.

The adjustment of the reel will depend on the condition and the nature of the crop being harvested. Manufacturers give the following recommendations for the reel setting:

a. **Reel speed:** The speed of the reel depends on the condition of the crop. It should be as high as possible without shattering the grain or throwing grain from the feeder. The reel should travel slightly faster than the forward travel of the combine.

b. **Reel height:** Usually the reel should be set so the bats, when in their lowest position, will strike just below the lowest heads of grain. Figure 37. This will keep the bats from beating the grain from the heads.

Figure 37. Reel Adjustment. (Courtesy J. I. Case Company.)

c. For different crop conditions:

- (1) For medium and short crops, adjust the reel approximately four inches above the cutter bar and far enough forward so that the bats do not leave the grain until it is cut.
- (2) For taller crops, set the reel back and raised so the bats run close to the top of the grain.
- (3) For down crops, adjust the reel to a low and forward position with reel bats set flat.

Student exercise: Study your operator's manual and the condition of the crop to be harvested to find the information for table 7.

Table 7. Recommended Reel Adjustments

Crop being harvested		
Condition of crop		
Adjustment	Recommendations	How adjustment is made
Reel Speed (r. p. m.)		
Reel Height		
Position forward or rearward		

5. Speed of forward travel: Figure 38. Driving too fast will overload the combine causing excessive rack loss.

Overloading the combine by driving too fast or setting the cutterbar too low is the most common cause of high rack loss. Figures 35 and 39 show the effects of overloading on machine losses. Although these charts were made from studies in combining wheat, the same principles apply to combining other crops. The only way to find out if the machine is overloaded is to measure rack loss. The straw rack usually overloads before other parts of the machine.

Overloading is one of the big problems in harvesting legume seed. A very low rate of travel is advisable.

Figure 38. Fast driving overloads the combine.

Figure 39. Driving too fast increases total losses due to overloading the combine.

Ground speed should not be changed by using the throttle. The engine should always be run at full throttle to keep the machine speed up to recommended levels. (See section C. 1.) Forward travel speed should be adjusted by shifting transmission gears and, also, on self-propelled combines, by changing the selective ground speed drive adjustment.

Student exercise: Study your operator's manual, the condition of the crop to be harvested, and the kind of ground you have to cover to determine your recommended speed of forward travel. Place your recommendations in Table 8.

Table 8. Speed of Forward Travel

Recommended Speed m.p.h.	Transmission gear to use	Selective ground speed lever adjustives for self propelled machines

6. Adjust the cleaning sieves and fan blast.

Some of the losses in the cleaning area are caused by poor adjustments in other sections of the combine and can only be reduced by making the proper changes in these areas. These causes are as follows:

Overthreshing causing chopped up straw and excessive chaff which overloads the chaffer and sieve. (See section C-2.)

Overloading the combine by cutting lower than necessary to harvest the grain. (See section C-3.)

Overloading the combine by driving too fast for the condition of the crop. (See section C-5.)

Poor adjustments in the cleaning area of the combine will also cause grain loss. These adjustments and the operating loss or trouble they will cause are as follows:

a. Chaffer opening adjustment.

Figure 40

Chaffer Opening Adjustment

The lips may be raised or lowered to regulate the size of openings on the chaffer.

- (1) Chaffer openings too large allowing too much chaff and other trash to fall through the chaffer onto the sieve.
- (2) Chaffer openings too small allowing the grain to be carried over the chaffer in a blanket of material.

The chaffer openings should be large enough to allow the grain to work through the chaffer before it passes over two thirds of its length. At the same time chaff, weed stems, straw joints, and other coarse materials should be floated onto the chaffer extension.

b. Chaffer height adjustment. On some combines the rear of the chaffer can be raised causing the material to move up hill thus keeping it on the chaffer longer and increasing the cleaning action. When this is done the chaffer openings must be made smaller. This adjustment is used when light seeds, such as clover, are being harvested.

c. Chaffer extension opening adjustment.

- (1) Chaffer extension openings too large, allowing too many weed stems, straw joints, and other coarse material to pass through into the tallings. This material is returned to the cylinder and will cause overloading in that area.
- (2) Chaffer extension openings too small, allowing unthreshed portions of the heads to pass out of the combine.

The chaffer extension openings should be large enough to allow the unthreshed portions of the heads to pass through into the tallings trough to be returned to the cylinder for rethreshing. At the same time the coarse materials should be carried out of the machine.

d. Chaffer extension height adjustment.

- (1) Chaffer extension adjusted too high causing choking at the rear of the chaffer sieve. Figure 41.

Figure 41. Chaffer extension too high causing material to accumulate on chaffer causing choking.

- (2) Chaffer extension adjusted too low allowing light grain to be blown over.

The chaffer extension should be just high enough to prevent light grain from being blown over and low enough to prevent clogging at the rear of the chaffer.

e. The shoe sieve opening adjustment.

- (1) Shoe sieve openings too large allowing an excessive amount of trash to fall into the clean grain auger. This trash will show up in the grain tank.
- (2) Shoe sieve openings too small causing the grain to be carried over the sieve into the tailings auger where it is returned to the cylinder. This overloads the cylinder and increases the amount of damaged kernels.

The shoe sieve openings should be small enough to allow only threshed grain to pass through into the grain auger. White caps, straw joints, and pieces of unthreshed heads should be floated over into the tailings auger.

f. Shoe sieve height adjustment. On some combines the rear of the sieve can be raised causing the material on the sieve to be retarded, thus keeping the material on the sieve longer and giving the grain a better chance to pass through to the clean grain auger.

g. Special shoe sieve. Round or elongated hole sieves are available for cleaning special crops. See your operator's manual for recommendations.

h. The cleaning fan. The air blast from the fan is directed upward and to the rear through the sieves agitating or floating the material on the chaffer to aid in separation of the seed as the material moves to the rear. The air blast also blows out most of the light, chaffy material as the seeds fall through the openings of the chaffer sieve and then through the smaller openings of the shoe sieve.

i. Force of cleaning fan air blast. The force of the cleaning fan air blast may be controlled by regulating the speed of the fan or by controlling the amount of air coming into the fan.

(1) Fan speed.

- (a) If the fan speed is too high the force of the air blast will blow the grain over the sieves.
- (b) If the fan speed is too low the material will form a mat on the sieves keeping the grain from falling through.

(2) Fan wind regulators control the amount of air that enters the fan which in turn helps to regulate the strength of the air blast.

- (a) Opening the wind regulators too much will increase the air blast and blow the grain over as in (a) above.
- (b) Closing the wind regulators too much will decrease the air blast allowing the material to form a mat on the sieves keeping the grain from falling through as in (b) above.

The force of the cleaning fan air blast needed to do a satisfactory job of cleaning is determined by the size and weight of the seed, plus the amount of chaff going over the sieves. In general, the smaller the seed the less the force of the air blast should be and the larger the seed the greater the force of the air blast should be. Dirty crops usually require a stronger air blast than do clean crops. Figure 42.

Figure 42**Use Proper Amount of Blast**

j. Direction of the air blast. The direction of the air blast is controlled by a fan wind deflector, wind boards, or air valves as they may be called.

- (1) Air blast directed too far back on sieves will cause grain to be carried over with the chaff.

The deflector must be set to suit crop conditions. If grain is being carried over with the chaff, after the chaffer and shoe sieve are properly adjusted, set the deflector in a position to direct the air upward to the front of the chaffer and shoe sieve.

k. Tailboard. The tailboard can be raised and lowered as necessary to prevent unthreshed material from being carried out of the rear of the separator while still allowing for the chaff to be blown out.

7. **Cutter bar adjustment.** The cutter bar provides the support for the guards and sickle. The cutting is accomplished by the shearing action caused as the knife section slides over the guard. To cut properly, the knife must run smoothly in the cutter bar and every knife section must rest on the guard in position to make a shear cut. This means the guards, wearing plates, and knife clips must be in good condition and properly set. (Figure 45.) If these parts become loose or worn, the knife will chew and tear the crop instead of cutting it. This will also cause excessive shattering of ripe crops.

Figure 45. Cutter Bar Adjustment. (Courtesy, J. I. Case Company)

a. **Guard alignment.** Set each guard up or down as necessary to obtain a shear cut between the knife section and the guard. Tighten the bolt as each guard is aligned. (Figures 46 and 47.)

Figure 46. Setting Guard Down.
(Courtesy, John Deere)

Figure 47. Setting Guard Up.
(Courtesy, John Deere)

b. **Knife clips.** The knife clips must keep the knife sections from lifting off guards and permit the knife to slide without binding. Set the knife clips after guards are aligned. Never bend a knife clip down when the knife is under it. See figures 48 and 49 for instructions. Some models use shims under the knife clips so they may be adjusted up or down by adding or removing shims. (Fig. 48)

Figure 48. Setting Knife Clip Down
(Courtesy, John Deere)

Figure 49. Setting Knife Clip Up
(Courtesy, John Deere)

c. Wearing plates. Wearing plates are located along the entire length of the knife back and may be moved back and forth to take care of wear on the knife back. The turned down edges of the wearing plates must line up with each other to give the knife back a straight bearing edge along its entire length.

Figure 50

Wearing Plate Adjustment

d. Sickle register. With each revolution of the pitman sickle drive, the sickle moves to the left and to the right. The sickle is in proper register when the sections center on the guards with the sickle at the end of its strike. Figure 51, proper register, provides good shearing action by the sickle section. Figure 52 shows the sickle sections out of register.

Figure 51. Proper Sickle Register
(Courtesy, John Deere)

Figure 52. Improper Sickle Register
(Courtesy, John Deere)

The sickle register is usually adjusted by lengthening or shortening the pitman arm. (Figure 53.) Check your operator's manual for the instructions on your combine.

e. The sickle may develop an excessive amount of vertical or lateral play caused by wear and loose parts. Follow your operator's manual in making the adjustments to correct this condition. The sickle may also develop back lash because of wear in the sickle drive mechanism. Your operator's manual will tell you how to correct this. After making the above adjustments be sure the sickle moves freely throughout its normal stroke. If any of the parts are adjusted too tightly heating and excessive wear will take place.

Figure 53. Sickle drive assembly:

8. Factors affecting combine efficiency. Adjustments must be made frequently to meet changing crop conditions. Harvesting characteristics of grain will change from hour to hour, day to day, and field to field.

a. Varieties. Different varieties of grain may require considerable change in machine adjustment. Always check machine adjustment when starting to harvest a different variety.

b. Effect of weeds. Weeds, or other green material, increase losses in combining (Figure 54) and also increase the moisture content of the harvested grain. The losses increase because of the heavy mat of green material which forms on the straw rack, chaffer and sieves. Some things that may be done to reduce losses and the amount of moisture added to the grain are as follows:

- (1) Reduce the amount of green material taken into the machine by cutting around patches of weeds or raising the cutter bar if the green material is not as tall as the crop.
- (2) If green material must be taken into the machine the following steps may be taken:
 - First, reduce the rate of travel or take a narrower cut.
 - Second, increase the cylinder-concave clearance so the green material is broken up as little as possible.
 - Third, change the direction of the fan blast forward so that a strong air blast is present where the grain leaves the grain pan and passes onto the chaffer.
- (3) Windrowing may be used to avoid taking green material into the machine. The crop should be cut and windrowed about a week to ten days before a clean crop would be combined. Two or three good drying days are required for the windrow to reach threshing condition. The windrow should be loose and fluffy and resting on stubble.

Figure 54. WEEDS INCREASE COMBINE LOSS

(OAES 643, pg. 19)

9. Stone ejector: Under some harvesting conditions it is desirable to operate the cutter bar or corn head, as the case may be, as close to the ground as possible. If stones or other foreign objects are on the surface of the ground they may be picked up and fed into the cylinder causing a great amount of damage to this part of the combine. To safeguard against this happening some combines are equipped with a stone ejector which permits stones to be thrown out before they have the opportunity to damage the cylinder and concave. Figure 55 shows the safety concave door on the Gleaner combine.

(Courtesy Allis-Chalmers Mfg. Co.)

Figure 55. Stone ejector: If a stone or other foreign object enters, the concave door opens to eject it. Merely relatch door and continue combining.

10. Automatic height of cut controls: Under certain harvesting conditions it is desirable to operate the cutter bar as close to the ground as possible to reduce cutter bar losses. It is difficult for the operator to gauge the height of the cutter bar above the ground. Devices which maintain a pre-set height have resulted in less operator fatigue and more efficient harvesting. (Figure 56)

Figure 56

Automatic Header Control

(Courtesy Roper Wright Co., Inc.)

The automatic height of cut controls are of two types:

a. Hydraulic control: (Figure 56) A feeler bar is suspended from the platform on several hangers. The feeler bar is free to move up and down and follows the contour of the ground. When the feelers drop into a low spot they cause the hydraulic control to lower the cutter bar and likewise cause the cutter bar to be raised when the feelers strike a high spot. (For additional information contact M & W Gear Company, Gibson City, Illinois or Roper-Wright Mfg. Company, Inc., Box 343, Elwood, Indiana.)

b. Mechanical spring float has an adjustable plate under the full width of the cutter bar. The device is counterbalanced with springs and allows the cutter bar to float at a uniform height above the surface of the ground. (Available for John Deere Combines)

11. Conclusion: Before the operator makes adjustments on his combine to reduce harvesting losses he should first determine the causes of these losses by means of field checks and observations of the combine while it is working. Adjustments should then be made in the order recommended in this manual. A knowledge of the functional design of the combine and the principles of operation will help him in determining the parts that need adjusting and what the adjustment should be. This knowledge may be obtained by a combination of experience in operating the combine and in studying the operator's manual and other materials on combines.

Experience shows that operators will often make adjustments that do not correct the trouble and move on to make an adjustment in another area of the combine without returning the first adjustment to its original setting. If this procedure is continued the entire combine will soon be completely out of adjustment. Thus, if an adjustment is made that does not correct the trouble the setting should be returned to the position recommended by the manufacturer before making another change.

The service hints given in figures 43 and 44 should serve as a guide in adjusting and maintaining the combine. The charts are adopted from the Massey-Ferguson "Combine Packet Manual."

D. HARVESTING RECOMMENDATIONS BY CROPS

Each crop will present different problems to the combine operator. The combine manufacturer's operator's manual gives recommended adjustments, attachments, and operating suggestions for each of the crops the machine is designed to harvest. These recommended adjustments are starting points for the operator. The procedure outlined previously should be followed to get the best possible job of combining.

Our Experiment Stations have conducted tests to determine the most favorable condition for harvesting some of our main crops. This information can help

us in determining the best time to combine from the standpoint of crop quality and harvesting losses.

1. Wheat harvesting recommendations:^{1/} The usual recommendations for combine harvesting of wheat is not to start the machine until the moisture level is below 14 per cent. This permits safe storage of the grain or selling without dockage due to excess moisture.

Wheat matures at about 30 per cent moisture. With each day of delay in combining after maturity there is about 12 pounds per acre less grain to harvest due to shattering and other losses.

It is not recommended that wheat be combined when it contains between 20 and 30 per cent moisture for the following reasons:

- a. The kernels are badly damaged by the cylinder action.
- b. The grain will not keep well in storage.
- c. The test weight per bushel is lowered.
- d. The germination is lowered.

Some of the problems caused by delaying combining until the grain reaches 14 per cent moisture are as follows:

- a. More shattering takes place. (About one bushel per acre each five days.)
- b. More cutter bar loss.
- c. More weed and legume growth takes place causing more green material to be taken into the combine.
- d. More risk of lodged grain.
- e. Test weight per bushel will be reduced. (Figure 57) (One pound per bushel each four days.)

Figure 57. Test weight per bushel decreases as the harvest date is delayed.

1. Johnson, W. H., "Harvesting and Drying of High Moisture Wheat," OAES Bulletin 841, 1959.

The principal reason for the reduction in test weight per bushel for grain standing in the field is that as the grain dries and is rewetted with rain or dew it swells and does not re-dry back to its original volume. Thus there are less kernels in a bushel and the weight is lower.

Recent tests conducted over a period of five years at the Ohio Agriculture Experiment Station show that grain losses can be reduced by starting to combine when the grain reaches 20% moisture. (Fig. 58) At this moisture level the test weight is kept high, germination is not harmed, and the kernels are not damaged if the machine is properly adjusted.

Figure 58. Grain losses increase as harvesting time is delayed.

If high moisture grain is harvested it must be dried to 14 per cent moisture before it can be safely stored. The cost of drying, either on the farm or at the elevator, must be compared with the advantages of early harvesting.

Under good harvesting conditions it will take about 5 days for wheat to dry in the field from 20 per cent moisture to 14 per cent. (Figure 59) Under poor conditions it has required up to 16 days. Thus, at least 5 or more days can be gained by starting to combine when the grain reaches 20 per cent moisture.

Figure 59

Rate of drying
wheat standing
in the field.

Tests show that combining high moisture wheat (14 to 20 per cent) has the following effects on losses in the different areas of the combine:

- (1) Cutter bar loss is less. The loss in 20 per cent grain is about 1/2 that in 14 per cent grain.
- (2) Cylinder loss increases slightly but can be held to less than one per cent with proper cylinder-concave adjustment.
- (3) Rack loss is lower. There is less over-threshing.
- (4) Shoe loss is lower. There is less over loading since more chaff clings to the straw.

The total loss is less when high moisture wheat is combined. Refer back to Figures 57 and 58.

The following recommendations are given by the Ohio Experiment Station for combining high moisture grain. "At 20 per cent grain moisture the cylinder concave clearance on rasp and bar type cylinders will have to be adjusted at a near minimum, 3/16" to 1/4", for the high moisture harvest, and then be increased as the grain becomes drier. A good rule of thumb is to check for unthreshed grain and adjust the cylinder-concave clearances or cylinder speed until about six grains per square foot are found in the head."

Problem: Farmer Jones started combining his wheat at 20 per cent moisture and completed the job before it reached 14 per cent moisture. His combining losses were 3 bushels per acre, and the test weight per bushel was 59 pounds. His cost of drying the harvested grain was 5¢ per bushel.

Farmer Brown started combining his wheat when it reached the 14 per cent moisture level. His losses were 5 bushels per acre, and the test weight per bushel was 56 pounds. He had no cost of drying.

The actual yield for each farmer was 45 bushels per acre before harvesting losses, and the discount for test weight per bushel is 1¢ for each 1/2 pound under 60 pounds.

If the price of wheat is \$1.80 per bushel, what is the gross (total) income per acre for each farmer?

Student exercise: If you raise wheat at home would you recommend the practice of starting to combine when the grain moisture content reaches 20 per cent?

Keeping your home situation in mind, make a list of advantages and disadvantages of the practice. On some of these items you will need to find the extra cost that would be involved and on others the extra returns you might expect if the practice were followed. If you want to do more studying ask your teacher for a copy of the Experiment Station Bulletin 841, "Harvesting and Drying of High Moisture Wheat."

2. Soybean harvesting recommendations: ^{1/} Losses with the combine have commonly been from 10 to 20 per cent of the available crop. Recent research at the Ohio Agricultural Experiment Station shows that with proper adjustment and operation of the combine and timely operation up to 95 per cent of the crop can be harvested.

Source of Loss: The first step in adjusting the combine is to determine the source of loss and its cause as outlined in section III of this manual.

Harvesting Tips: The following harvesting tips have been given by the Experiment Station researchers: High moisture combining of soybeans is considered to be when the kernels are above 12 per cent moisture, and the pods are dampened from dew or rain. (Notice that some of these recommendations are different from those given for wheat.)

a. Adjust the cylinder and concave so that cylinder losses will be practically nothing. In soybeans this will not have a tendency to overload the rack and shoe with chaff as it would in wheat. When high moisture beans are being harvested the cylinder will need to be run at nearly twice the speed recommended for dry beans. Cylinder clearance generally need not be changed. At high cylinder speeds germination will be reduced, but this will not reduce the market quality of the crop.

b. Lower the cutterbar to about four inches above the ground if possible. This adjustment reduces shatter loss due to direct cutting of beans and stubble loss caused by cutting above the pods. The distribution of pods above the ground is affected to some extent by variety, but the greatest difference is caused by the method of planting. The general tendency is that the thicker the plant population the higher the pods will be set on the plant. Thus, if the plant spacing within the row remains nearly constant and the width between the rows is narrowed, the pods should set higher on the plants.

1. Lamp, B. J., Johnson, W. H., Harkness, K. A., Smith, P. E., "Soybean Harvesting," OAES Bulletin 899, 1962.

c. Adjust the reel so that:

- (1) The bat speed is about 25% faster than ground speed. (Fig. 60)

Figure 60

The faster the reel operates in relation to the ground speed the greater the shattered loss will be. Combine speed 2.6 to 2.9 m.p.h. Bean moisture 10 - 11%. (1 = reel traveling at ground speed of combine, 2 = reel traveling twice combine ground speed, etc.

- (2) The bat penetrates the grain no more than necessary to hold the beans while being cut and move them onto the platform. (Figure 61) In case of lodged beans the reel will need to be operated at a lower setting.

Figure 61

Shatter losses increase as the reel is adjusted downward. Dry beans shatter more than moist beans.

- (3) The axis of the reel is adjusted so that it is 6 to 12 inches ahead of the knife. Except for stalk carryover this adjustment has little effect upon losses.

d. Keep forward speed reasonable. The effect of speed on losses is shown in Figure 62. The increase in loss is due largely to stripping of beans at the cutterbar.

e. Don't wait until the beans are overdry. Beans are harder to thresh at higher moisture (13 - 16 per cent), but they are also harder to shatter at the reel and the cutterbar. Beans above 14-15 per cent moisture will need to be dried artificially. Another loss will show up when beans are too dry. Market price is based on 13 per cent moisture and beans with less moisture will be penalized since it will require more beans to make a bushel.

f. Take advantage of the dew. Harvesting losses can be reduced by early morning harvesting. (Figure 63) This same advantage can be gained by combining after dry beans have been re-wet following a rain. When wet beans are combined the cylinder speed must be increased.

A farmer needs to know how many favorable working days he can expect to have available for a given operation. This will help him in determining the number of acres of a crop that he can take care of and the size of machinery he needs to do the required jobs.

Figure 62. The effect of combine ground speed on harvesting loss.

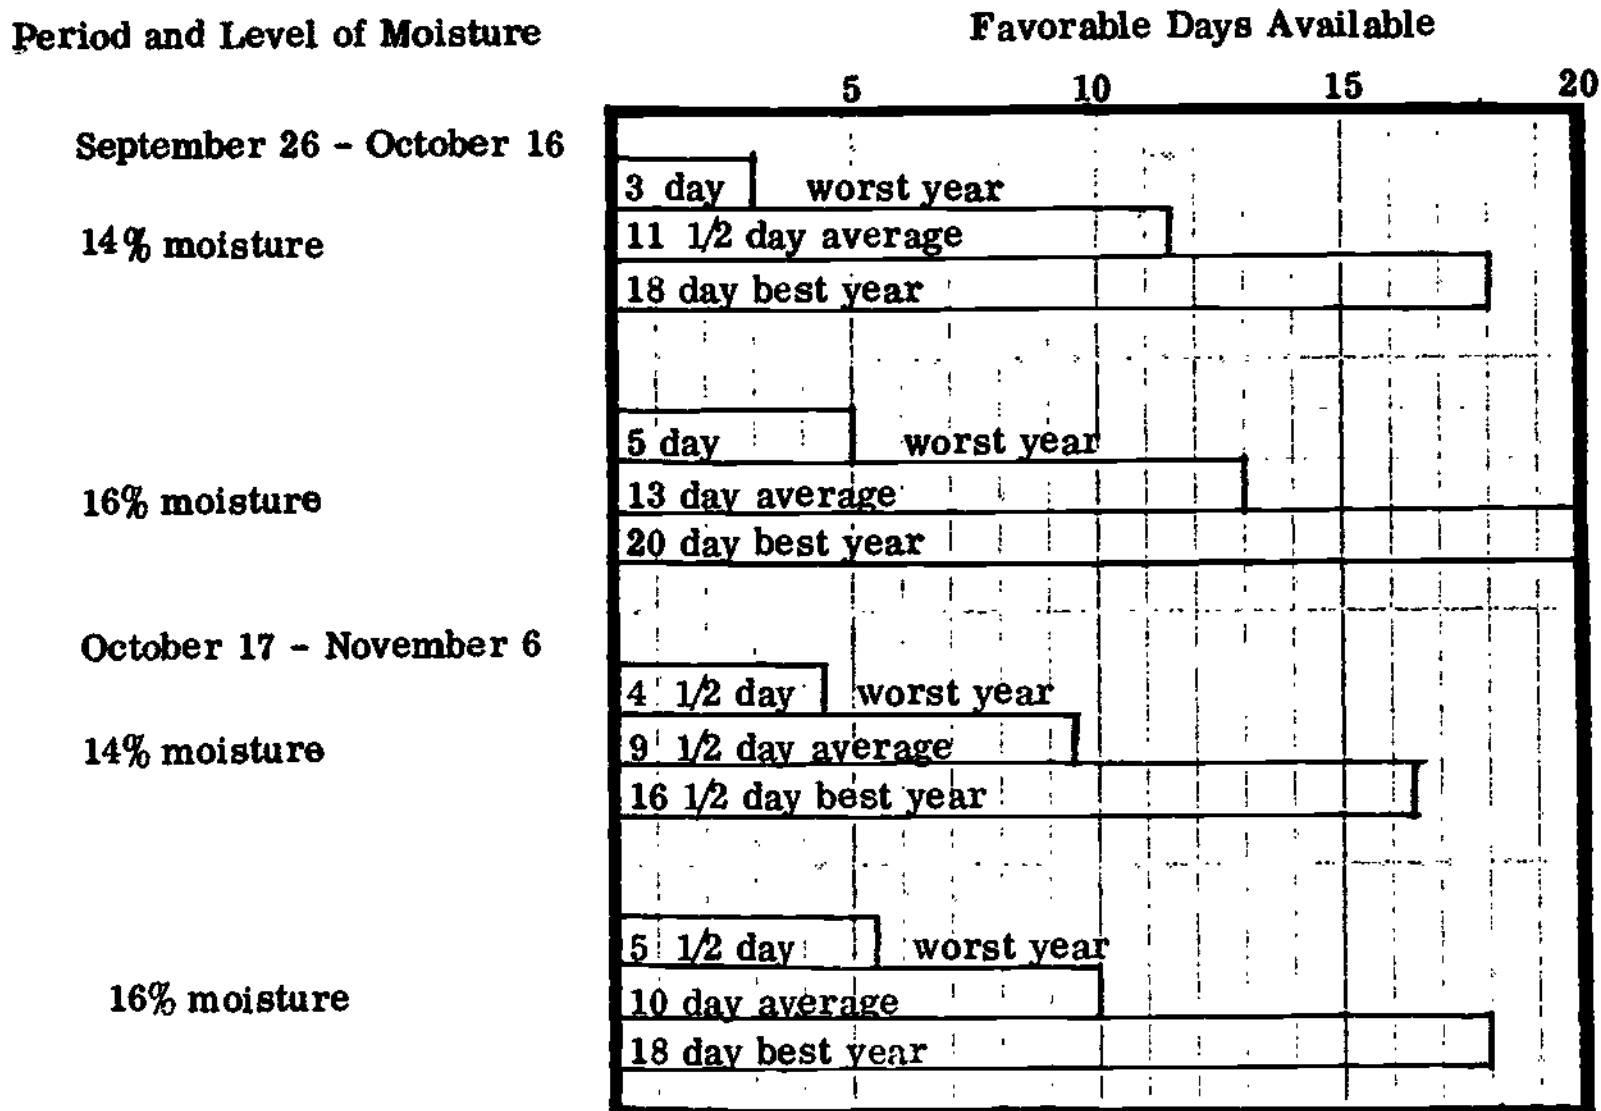

Figure 63

The effect of the time of day upon shattered loss and kernel moisture. As the beans dry during the day the shatter loss increases.

The Department of Agricultural Economics at The Ohio State University¹ has conducted a study to determine the information. The days available for both early and late harvest of soybeans for two moisture levels are given in Figure 64.

Figure 64. Favorable Days Available for Combining Soybeans. (1938-1957)

1. The Effect of Weather on the Days Available to do Selected Crop Operations, 1938 - 1957. Department of Agricultural Economics, The Ohio State University, 1960.

3. Corn harvesting recommendations.¹ The combine can be converted from small grain to shelled corn harvesting by exchanging the small grain cutting and feeding unit for the corn head attachment.

The corn head snaps the ears from the stalks and feeds them into the cylinder for shelling. (Figures 65 and 66)

Figure 65.

Corn head attachment using a conveyor to feed material into the cylinder.

Figure 66.

Corn head attachment using augers to feed material into the cylinder.

1. Johnson, W. H., Lamp, B. J., Henry, J. E., and Hall, G. E., Corn Harvesting Performance at Various Dates, ASEA Paper 61-603, 1961

The corn head operates somewhat differently than the corn picker. The stalks of corn are pulled straight down through the stalk rolls. Snapping bars or stripper plates snap the ears off at the shank. (Figure 67)

Since the ears do not come in contact with the rolls, as in the picker, there is much less shelling in this area. A field study by agricultural engineers in 1964 revealed that average losses for machines with snapping bars was one bushel per acre as compared to the conventional snapping roll which lost an average of three bushels per acre.¹

Figure 67

Snapping bars should be adjusted as close together as possible and still allow passage of stalks.

From the snapping area the ears are then fed into the cylinder for shelling. (Figure 68) See your operator's manual for recommended attachments to convert the cylinder and concave to the job of shelling corn.

Figure 68. The ears are fed into the threshing unit where they are shelled by the rubbing action of the rotating cylinder against the concave. (Courtesy of International Harvester Company.)

1. Byg, D. M., Gill, W. E., and Johnson, W. H., "Machine Losses in Harvesting Ear and Shelled Corn," Bulletin MM-247, The Ohio State University, 1965, p. 3.

(1) Pre-harvest loss. (The amount of corn lost before harvesting starts.) The longer corn dries in the field the greater the pre-harvest losses will be. Figure 69 shows that pre-harvest losses increase as corn dries down in the field.

Figure 69. Pre-harvest corn losses increase as corn dries down before harvesting. (W. H. Johnson, "Corn Harvesting Data," OAES, 1964.)

(2) Highest machine yields (the amount of shelled corn actually harvested by the combine or picker) are obtained when corn is combined between 20 and 30 per cent moisture. (Figure 70)

Figure 70

Yields of dry shelled corn per acre when harvested at different moisture levels with a combine and a picker. (Based on an average yield of 80 bushels per acre.)

At high moisture content (35 per cent) a part of the reason for combine yields being lower than picker yields is due to invisible losses. (Losses caused by imperfect shelling such as kernel tips remaining in the cob and small chips of kernels which could not be measured as a visible loss.) The effect of moisture content of kernels on the invisible loss in yield is shown in Figure 71.

A 1964 field survey by agricultural engineers revealed that the amount of fine materials (corn chips and meal) found in the grain tank was in the range of .4 to 3.7 per cent of the total yield and averaged 1.5 per cent.¹

Figure 71 The invisible loss in combining corn decreases as the corn dries down. (W. H. Johnson, "Corn Harvesting Data" OAES, 1964.)

Corn will not mature and dry down at exactly the same dates each year although the moisture content will be approximately the same for a given time each year. Research conducted by the U. S. Department of Agriculture² provides us with information that makes it possible to estimate, as early as the water blister stage, when kernels will dry to 30 per cent moisture.

There is no exact gauge to use in measuring rate of drying:

- (a) Drying rate decreases as moisture in the corn goes down.
- (b) Drying rate changes fairly consistently within a certain moisture range, but weather (cool and damp or hot and dry) may greatly influence rate of change in early stages of drying and again when the grain is below the 25 per cent.

The estimated rate of drying is illustrated in figure 72.

(3) Ears dropped. The amount of lodging (a stalk broken over below the ear or leaning greater than 45 degrees) will greatly influence the number of ears lost. (Figure 73)

Figure 73. Influence of lodged stalks on lost ears of 15,000 plants per acre.

1. Byg and others, *ibid.*, p. 7.

2. How to Tell When Corn Will Mature, Agricultural Research, U. S. D. A., September, 1955.

Figure 72. How to Tell When Corn Will Mature. (USDA Agr. Research Sept. 1955)

Ear losses from corn combines averaged 3.15 bushels per acre as compared to the corn picker which averaged 1.73 bushels per acre loss. Due to the danger of running stones through the combine many operators are afraid to lower the gathering mechanism enough to pick up broken stalks. The stripping bars, commonly found on combines gathering units, also require more careful driving than the picker snapping rolls to keep losses down.¹

As corn weathers in the field, some ears drop before harvesting, but the machine is responsible for most of the ears dropped. A light blow by the gathering unit will knock off a mature ear before it is gathered in. Figures 74 and 75 show that date of harvest as well as moisture content influence the amount of lodging. Delayed field drying led to a higher ear loss caused by a greater amount of lodging.

Figure 74

Late season harvesting resulted in increased loss of ears. (Wooster)

Figure 75

Early season harvesting resulted in less loss of ears. (Columbus)

1. Byg and others, *ibid.*, p. 3.

- (4) Cylinder loss. The cylinder loss increases as the amount of kernel moisture increases. (Figure 76) This loss can be recognized by the kernels left on the cob. It is possible through proper adjustment to keep the cylinder loss under one per cent.

Figure 76

Range of cylinder loss at different kernel moisture levels.

- (5) Separation loss. The separation loss increases as the amount of kernel moisture increases. (Figure 77) This loss can be recognized by the amount of loose kernels passing through the machine.

Figure 77

Range of separation loss at different kernel moisture levels. (William Johnson, OAES, 1964.)

- (6) **Test Weight Per Bushel.** The market price of corn may be affected by the test weight per bushel. Tests show that generally high moisture corn tests lighter than dry corn due to moisture and kernel damage. (Figure 78) See Figure 3, page 3, to determine approximate market discounts for corn.

Figure 78. High moisture corn has a lower test weight per bushel. (Test weight observed after corn from field has been dried to 15 1/2 per cent moisture.)

- (7) **Cracked kernels.** Tests show that kernel damage will be increased when high moisture corn is combined. (Figure 79) For the effect of kernel damage on market price of corn see Figure 3, page 3.) Kernels with cracks in the seed coating will not keep in storage as well as sound kernels. Weevils are more of a problem and air for drying will not flow freely through damaged kernels.

Figure 79. Kernel damage increases when corn is combined at high moisture content.

Student Exercise: Farmers are faced with the management decision of whether to use the combine in harvesting their corn or to use another method. Using the information presented here and other reliable sources decide whether or not you should use the combine in harvesting your corn crop.

Some of the factors to consider are as follows:

- (1) Use to be made of the crop:
 - Marketed from field.
 - Stored and marketed at later date.
 - Kind of storage and drying facilities available.
 - Corn to be fed to livestock.
- (2) Number of acres to be harvested.
- (3) Harvesting machinery available.
- (4) Comparison of combine harvesting losses with losses from other methods.

Table 10 and Figure 80 will assist you in comparing the losses under different moisture levels and expected length of harvest period for the picker and the combine. For example, if you pick corn at 27.5% moisture traveling at 2 miles per hour and require 21 days to complete the job, the expected loss would be 6.7% of the total yield. Under the same conditions of time and moisture the expected combine loss would be 7.3% of the total yield. If, in the same example, picking was delayed until the corn reached 20.8% moisture, the loss would be 13.8% of the total yield.

You can also compare losses at 2 m.p.h. and 5 m.p.h.

- (5) The effect of different harvesting methods on market and storage quality of corn.

What is your management decision, and why did you decide on this method of harvesting your corn?

Table 10. Average total field losses of corn as a percentage of gross corn yield, by length of the harvest period and moisture content at the beginning of harvest

Length of harvest, days	Moisture at beginning of harvest, %						
	35.0	33.0	30.2	27.5	25.1	22.9	20.8
	Average field losses, % of gross corn yield

IV. ECONOMICS OF OWNING A COMBINE.

References for additional study: "Crop Economics for Ohio," Bulletin 423 and "Farm Custom Rates," Leaflet 74, Agricultural Extension Service, The Ohio State University.

If you are a grain farmer you will be faced with the following problem: Should I own my combine or hire a custom operator to harvest my grain? In solving this problem you will need to keep two things in mind.

1. How many acres of all grain crops will I be harvesting? The more acres you harvest the lower your cost per acre will be when you own your combine.

2. How long would I need to wait for a custom operator? Harvesting losses increase rapidly after the best date for combining has passed.

A. What are the costs of combining?

It is easy to determine the charge per acre for custom combining. If you do not know the usual rate for your area call some local custom operator for their prices or refer to the Farm Custom Rates bulletin.

It is much more difficult to determine the cost per acre for combining when you own your own machine. Your costs of combining can be divided into the following three areas:

1. The overhead or fixed cost of owning the machine. These are costs you have whether you use your machine or not. They are as follows:

- a. Depreciation
- b. Interest on the invested capital
- c. Taxes
- d. Insurance

2. The variable or operating costs. These costs largely depend on the amount of use given the machine during the year. They include the following items:

- a. Fuel
- b. Lubrication
- c. Repairs
- d. Operator's labor

3. Risk-loss from delayed harvesting. This cost will only appear when you must wait for the custom operator to do your combining. (Refer to section III of this publication.)

B. Determining the cost of owning and operating a combine.

The following example will help you in figuring how much it will cost you to own and operate a combine on your farm.

Example: A farmer has 40 acres of soybeans, 40 acres of oats, and 20 acres of wheat to harvest each year. He has been using a custom operator to harvest these crops and has found that on the average he has to wait about five days beyond the best time to combine for the custom operator to do his work. He has priced a twelve foot, 70 horsepower gasoline engine driven self-propelled combine and found that the model he needs costs \$7,000. Should he continue using a custom operator or should he buy the new machine? How can he determine which decision to make?

Procedure for estimating the cost of owning the combine:

Step 1. Determining the overhead costs.

a. Annual depreciation:

$$\frac{\text{Purchase price } \$7,000}{\text{Expected life } \dots 10 \text{ years}} = \text{annual depreciation } \underline{\$700.00}$$

b. Annual interest:

$$\begin{array}{l} \text{Interest rate} \\ 8\% \text{ short term} \end{array} \times \frac{\text{Purchase Price } \$7,000}{2} = \begin{array}{l} \text{Annual interest} \\ \text{on} \\ \text{capital invested} \end{array} \underline{\$280.00}$$

c. Annual personal property tax: (This is an average figure. Check the local rates when figuring your situation.)

$$\begin{array}{l} \text{Purchase} \\ \text{Price} \end{array} \$7,000 \times 30\% = \$2,100.00 \text{ Assessed value.}$$

$$\begin{array}{l} \text{Assessed} \\ \text{Value} \end{array} \$2,100.00 \times 3\% = \text{Annual Property Tax } \underline{\$63.00.}$$

d. Annual Insurance:

$$\begin{array}{l} \text{Purchase} \\ \text{Price} \end{array} \frac{\$7,000.00}{2} = \$3,500.00 \text{ Average Value}$$

$$\begin{array}{l} \text{Average} \\ \text{Value} \end{array} \frac{\$3,500.00}{100} \times \$0.40 \text{ (rate per } \$100 \text{)} = \text{Annual Insurance } \underline{\$14.00}$$

$$\text{Total Overhead Costs } \underline{\underline{\$1057.00}}$$

Step 2. Determining Variable Costs.

The actual variable costs cannot be accurately determined without records of these items of expense. However, few farmers would have these detailed records available. The figures used in this illustration to estimate costs have been taken from the University of Illinois farm management studies.

a. Fuel costs: Motors normally require about .07 gallons of gasoline or .05 gallons of diesel fuel per horsepower hour of operation. Hours of use can be estimated by using the following table from Ohio Bulletin 423, "Crop Economics in Ohio."

Time Used for Combining in West Central Ohio

Job Done	Size of Tractor Used ¹	Man Hours Used per acre ²	
		Average	Range for Middle Half of Farms
Combine with 5-foot combine	2, 3	.95	.97-1.27
Combine with 6-foot combine	2, 3	.85	.72-1.05
Combine with 7-foot combine	2, 3	.75	.65- .95
Combine with 10-foot combine	SP ³	.46	.38- .59
Combine with 12-foot combine	SP	.42	.36- .50

R. H. Blosser, "Crop Economics for Ohio," The Ohio State University.

1. Stated in number of plows tractor is rated to pull.
2. Unless otherwise stated, number of tractor and machine hours used per acre is same as number of man hours used.
3. Self-propelled.

Maximum drawbar horsepower 70 x .07 gasoline or .05 diesel price of fuel x of \$.20 x 42 hours* = fuel cost \$41.16

*100A x .42 hr. per A = 42 hrs. use.

b. Lubrication Costs: Oil costs about 10 per cent of the total fuel cost and grease about 3 per cent of the total fuel cost making a total of 13 per cent of fuel costs for lubrication charges.

fuel cost \$41.16 x 13% = lubrication cost \$5.35

c. Repair Costs: Repair costs are caused by deterioration, rust, accidental breakage, and wear. They do not depend entirely on the amount of use given a machine and usually increase as the machine ages. An average charge per year is 4 per cent of the purchase price of the combine.

purchase price \$7,000 x 4% = annual repair charge \$280.00

d. Operator's Labor:

hours per acre .42 x 100 acres x \$1.50 per hr. = labor costs \$63.00

Total Variable Costs \$389.51

Step 3. Determining Total Cost Per Year:

Overhead Costs	\$ 1057.00
Variable Costs	<u>\$ 389.51</u>
Annual Cost of Owning Combine	\$ 1446.51

Step 4. Determining Average Cost Per Acre for Combining:

$$\frac{\text{Annual Cost of Owning Machine } \$1446.51}{\text{Number Acres Harvested } 100 \text{ acres}} = \$14.46 \text{ Cost Per Acre}$$

This is the actual cost per acre based on the situation used in this example and will change as any of the factors in the example change. The figures for the factors in your situation will be different from those used here.

Step 5. Comparing Cost of Owning a Combine With the Custom Rate:

My cost per acre when I own my combine is \$ _____
 The custom rate per acre in my community is \$ _____

The extra cost of custom combining due to crop loss caused by delay beyond the best harvest date is not figured here. You may obtain information that will help you in estimating your probable losses due to delayed harvesting by referring to Section III of this publication.

Some additional factors to consider before deciding to buy a combine or hire a custom operator are as follows:

- a. Timeliness of operation. What will be the loss in yield and quality if the time of the crop is delayed?
- b. Does the custom worker have the ability to do a satisfactory job of combining?
- c. Do I have the mechanical ability to operate a combine efficiently?
- d. How does owning a combine fit into my overall farm plan? (Labor supply, crops raised, long time farm plan.)
- e. Can I reduce my cost by joint ownership?
- f. Will a used machine meet my needs?
- g. Is it possible to lease a combine when I need one?
- h. Is adequate repair service available in my community?
- i. Will the combine become obsolete before I have it paid for or worn out?
- j. Could I use the money I would invest in the combine to a better advantage elsewhere in my business? (Opportunity cost.)
- k. If I purchase the combine do I have the financial ability to pay for it? (Debt load, repayment ability, capital resources.)
- l. Would I have time to do custom work?

Step 6. Determining the Number of Acres of Annual Use of a Combine to Justify Owning a Machine:

The more acres combined per year, your own as well as custom work, the lower the overhead cost per acre will be. The following formula will help you in determining the number of acres of annual use required to cover the overhead cost of owning the machine:

$$\frac{\text{Annual Overhead Cost } \$ 1,057.00}{\text{Custom Rate } \$500 - \text{Variable Cost/A } \$3.89} = \text{Number of acres combining required } 952 \text{ A to break even}$$

As the difference between custom rates and variable costs per acre becomes smaller more acres must be harvested to make the overhead cost per acre comparable to custom rates.

Farm management studies show that high overhead costs result in low profits on many farms. The procedures explained in the example above can serve as a guide in determining the overhead costs involved in owning a given combine for harvesting your crops. For a more detailed study of the effect of overhead costs on profits see Part V, Analysis of the Farm Business, page 55, of the publication, "Farm Records - A Management Tool," available from the Ohio Vocational Agriculture Instructional Materials Service.

The cost per acre of combining is shown graphically for a 7 foot pull-type and a 12 foot self-propelled combine in Figure 82. A study of this chart will give you a rough estimate of whether or not you can afford to own a combine. Figure 82 was adapted from "Crop Costs and Returns," B 909, Ohio Agricultural Experiment Station, 1962.

Figure 82. Combining costs decline as acreages increase.

ORGANIZATION AND MANAGEMENT OF AGRICULTURAL MACHINERY DEALERSHIPS

Major Teaching Objective

To develop an understanding of the organization and management of agricultural machinery dealerships

Suggested Time Allotments

At school		
Class instruction	<u>18</u>	hours
Laboratory experience	<u>0</u>	hours
Total at school	<u>18</u>	hours
Occupational experience	<u>0</u>	hours
Total for module	<u>18</u>	hours

Suggestions for Introducing the Module

A person planning to work in the service occupations of an agricultural machinery dealership must understand the organization and management of the dealership if he is to be effective as a service employee. He must understand (1) the importance of the local dealership and the agricultural machinery industry to the agricultural industry of the community, nation, and world, (2) the relationship of the local dealership to the farmer and the parent organization, (3) the ways the local dealership carries out its business, (4) the jobs and job functions of employees in the local dealership, and (5) show the relationship of farming to merchandise handled by the dealership. A local agricultural machinery dealer expects his employees to be able to do their jobs with a high degree of speed and efficiency. In order to meet these expectations, the employees must have a thorough knowledge of the complete operation of the business.

The techniques to use in creating interest in the module are:

1. Tour a local agricultural machinery dealership emphasizing the availability of modern equipment and the variety of services provided by the dealer.
2. Thought questions
 - a. What is a retail agricultural machinery dealership?
 - b. What is meant by "dealership"?
 - c. How is an agricultural machinery dealership organized?

- d. What do people do who work in these dealerships?
 - e. How is a local agricultural machinery dealer able to provide these services for the farmer?
3. Point out that approximately fifty per cent of the employment appointments are in the service occupations of the agricultural machinery industry.

Competencies to be Developed

1. To understand the importance of the retail agricultural machinery industry

Teacher Preparation

Subject Matter Content

Agricultural machinery dealers have played a vital role in the social and economic life of those engaged in production agriculture as well as the standard of living of all people.

1. They have provided the farmer with efficient and economic production tools.
2. Modern agricultural machinery has lowered the costs of production for the farmer. The following table bears out this fact.

Farm Output and Labor and Machinery Inputs Index 1947-49 = 100

Year	(Indices)				
	Farm Output	Farm Labor	Power and Machinery	Labor Plus Machinery	Relation of Combined Labor and Machinery Inputs to Output
1910	61	135	28	163	133
1920	70	143	44	187	133
1930	72	137	55	192	133
1940	82	122	58	180	110
1950	101	90	118	208	103
1955	113	76	136	212	94
1956	114	72	137	209	92
1957	114	68	138	206	93
1958	124	66	137	203	84
1959	126	64	139	203	81

The use of agricultural machinery has promoted an increase in farm production and income in spite of a decrease in the number of persons employed on the farm.

1. While farm workers have decreased in number, farm production has increased.

2. The agricultural machinery industry has managed to keep its price rise on production costs relatively low.

3. Fifty years ago one farmer could produce food and fiber for 6 other persons, whereas today, that same man can produce food and fiber for at least 29 others.
4. Today, 40 per cent of the farms produce 87 per cent of the food and fiber sold from the farms.

The use of modern agricultural machinery has aided in raising the standard of living of the farmers.

1. Today farmers have more time for recreation, more conveniences, better educational advantages and improved facilities.
2. The investment in agricultural machinery is highest on farms in states having the highest standard of living.
3. The development and use of labor saving machines have made it possible for millions of farm workers to enter other industries, the arts, sciences, and professions.

Suggested Teaching-Learning Activities

1. Bring a local farm machinery dealer before the class to discuss his role as an agricultural machinery dealer in the community.
2. Using the latest census, have each student identify the number of farms in the county, state, and nation and the number of tractors and agricultural machines on these farms.

Suggested Instructional Materials and References

Instructional Materials

Overhead transparencies of the table and graphs presented

*The symbol T (teacher) or S (student) denotes those references designed especially for the teacher or for the student.

II. To understand the methods of distributing agricultural machinery**Teacher Preparation****Subject Matter Content**

The distribution of agricultural machinery follows this route: from manufacturer - to dealers - to customers. All orders for machines by the local dealership are placed with the branch house.

The above pattern of distribution accounts for practically the entire output of domestic sales of tractors and other agricultural machinery.

The primary function of the manufacturer is to supply the agricultural machinery needed by the agricultural industry.

1. Manufacturers employ competent product engineers to design the new machines needed by the agricultural industry.
2. Manufacturers supply the branch houses with the parts and some machines to supply their dealers.

In addition to performing these functions, the manufacturer does the following:

1. Keeps in touch with machinery problems and needs of farmers
2. Through research, develops machines and systems to meet the needs of the farmer

The function of the branch house is to move the machinery from the factories to the farms in the most economical manner.

1. The branch house provides storage for the manufacturer.
2. The task of sales and distribution for the manufacturer is undertaken by the branch house.
3. Through this medium, the manufacturer gets national distribution more quickly and more thoroughly.
4. Retail dealers get more prompt and reliable service.

5. As the manufacturer's distributive agent, the branch house keeps the manufacturer advised on market conditions and needs of a particular area.
6. The branch office lowers substantially the manufacturer's handling cost of agricultural machinery and ultimately the farmers' purchasing costs.
7. The branch house buys parts in large quantities, relieving the manufacturers of the details of selling, warehousing, shipping of merchandise to individual dealers, and carrying of dealer accounts.
8. The branch house carries adequate stocks of repair parts at strategic locations, resulting in better service to the dealer, and thus the customer.

The distributor (branch house) builds a good dealer's organization and confines all his efforts to selling through dealers.

1. The distributor's organization includes a service department with personnel who thoroughly understand the servicing of each machine handled.
2. A well developed program of selling is maintained by the distributor who aids the dealer in realizing a greater profit through better service to the customer.

The local agricultural machinery dealer is the vital link in this distribution pattern.

1. The dealer is the final link between the manufacturer and the user of the machine.
2. The dealer contributes greatly to the farmer's knowledge of machinery servicing.
3. He demonstrates the efficiency of the company machines to the farmer and explains how the machine can benefit the farmer.
4. He extends credit in many cases to the farmer so the machine can pay for itself in labor saved or money earned.

5. The dealer makes an effort to understand farm machinery problems and the need of the farmer and conveys these needs back to the manufacturer to provide a basis for improvement of farm machines through research.

Suggested Teaching-Learning Activities

1. Have a branch house employee discuss with the class how parts or machines are supplied to the branch house and from the branch house to the dealer.
2. Tour a branch house.

Suggested Instructional Materials and References

Instructional Materials

1. Overhead transparencies and mimeos on the organization of a major line of agricultural machinery
2. Overhead transparencies and mimeos showing the pattern of distribution of agricultural machinery

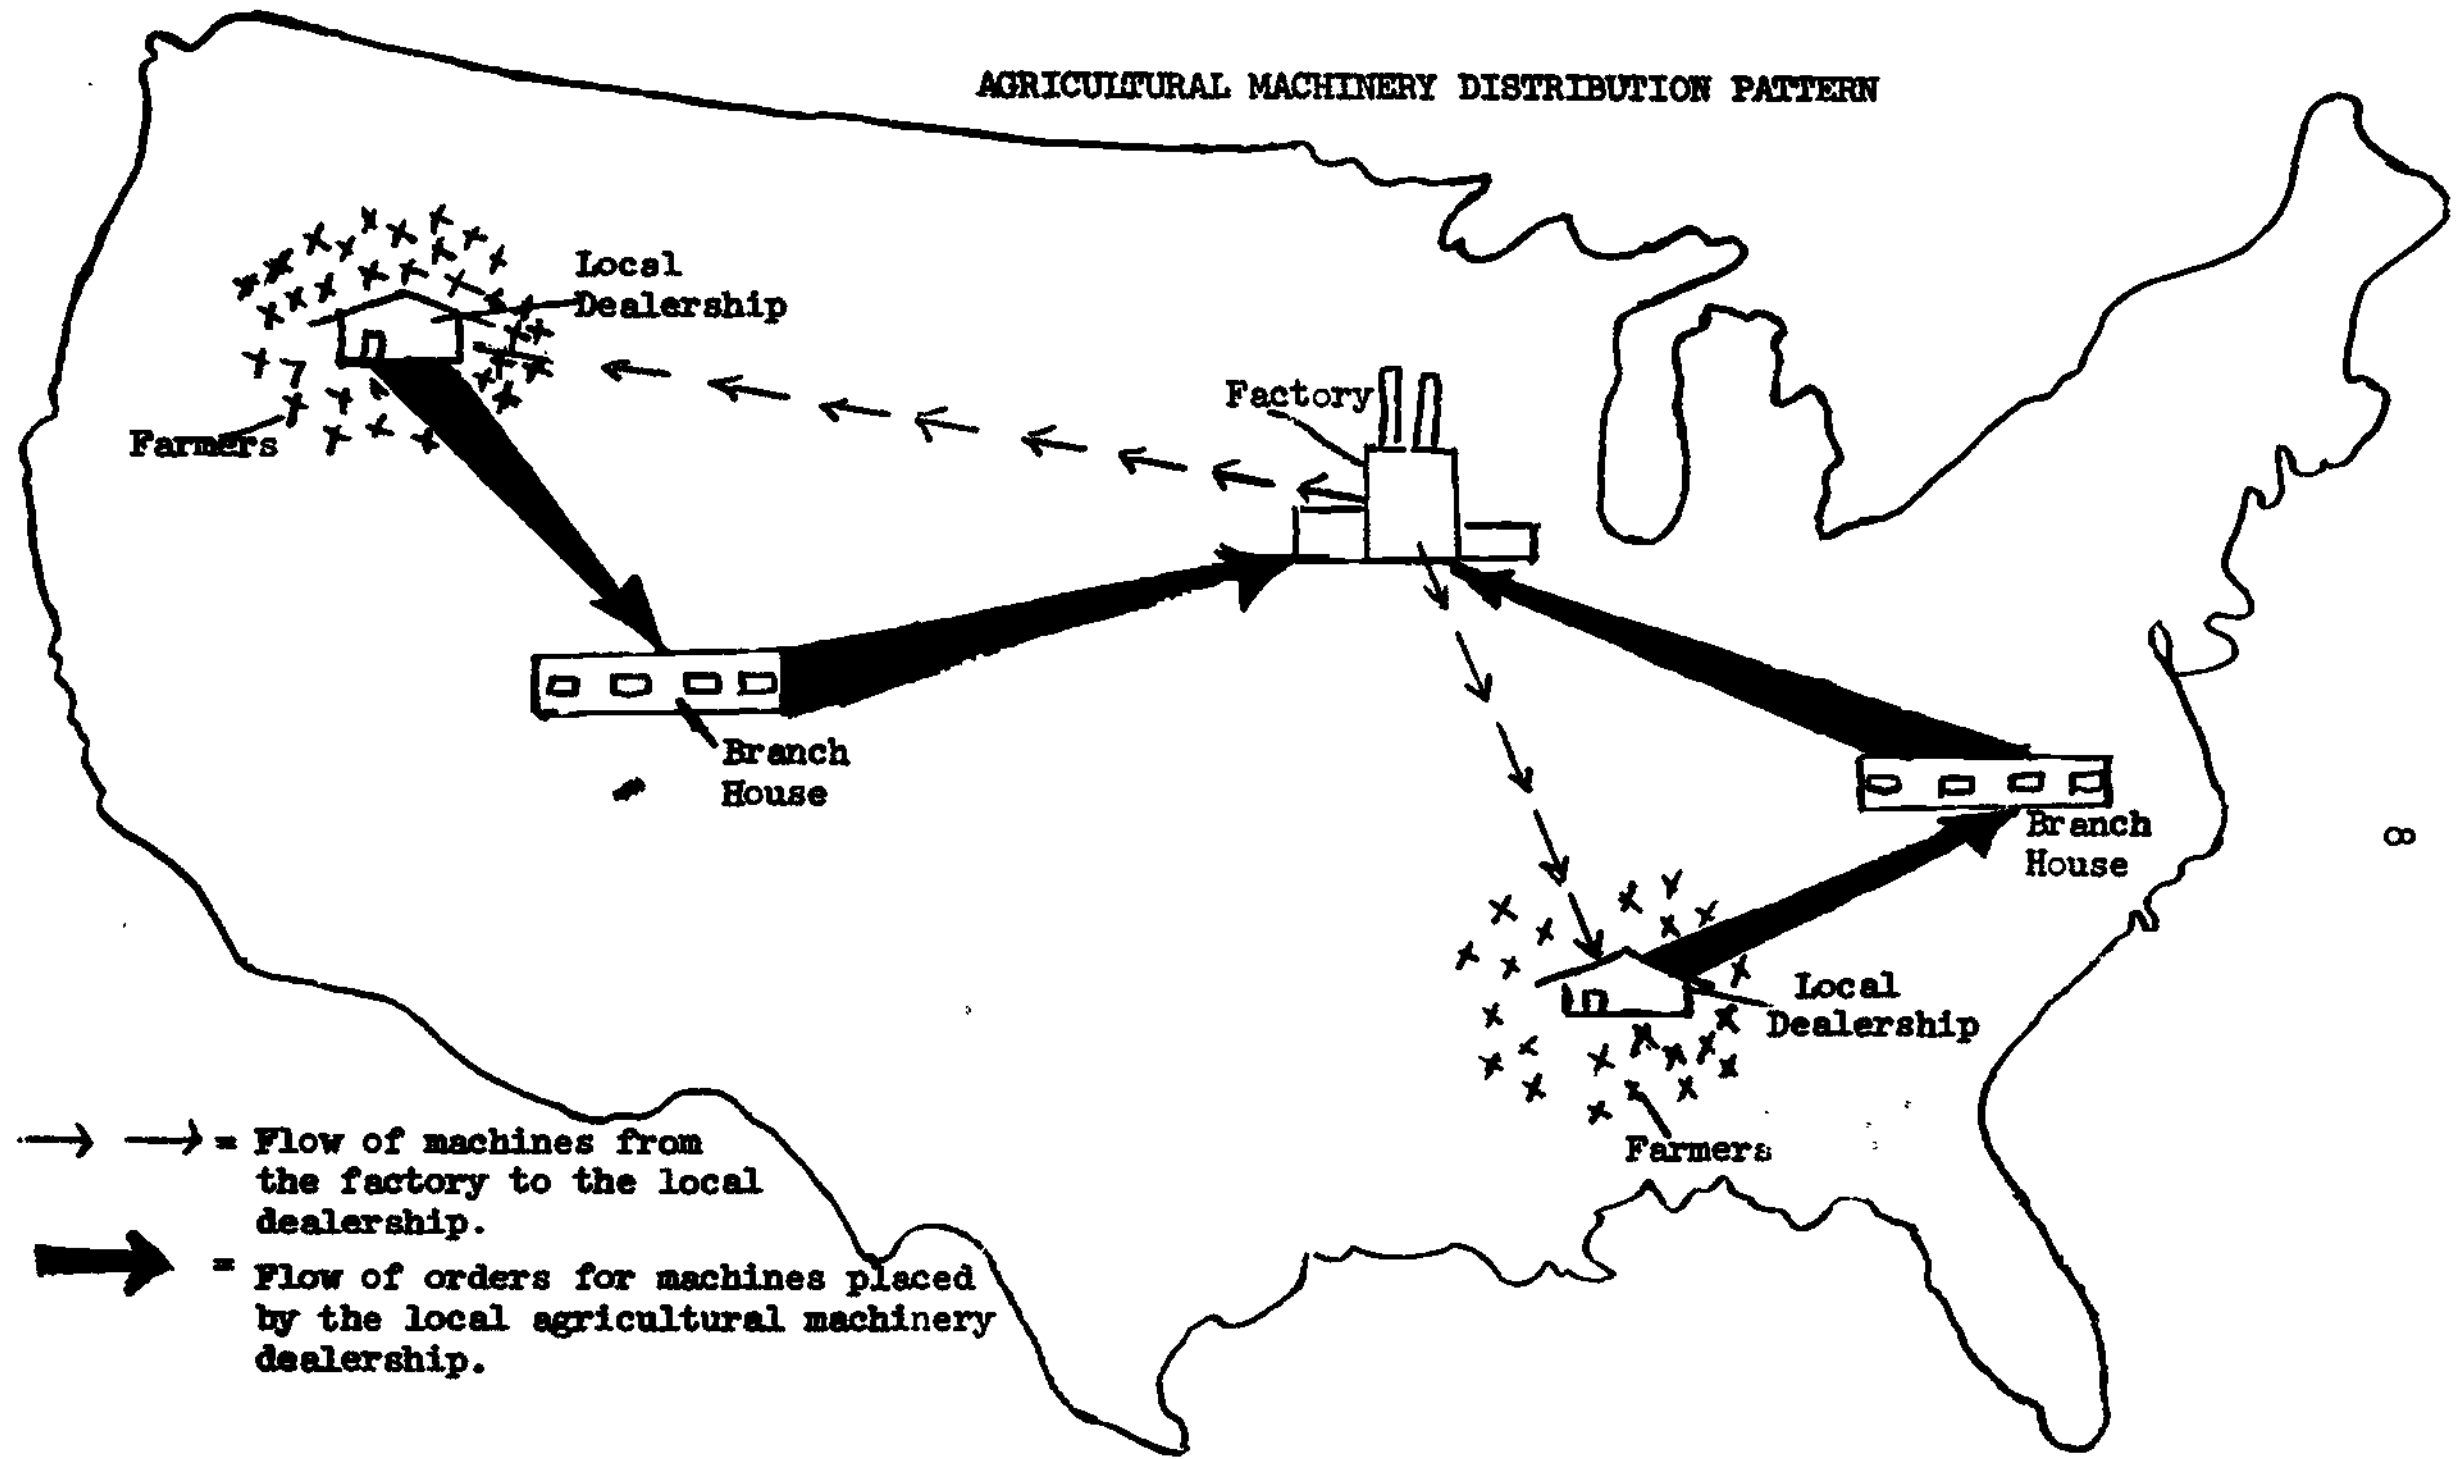

References

1. S Farm and Power Equipment Retailers Handbook,
pages 7-21.

Suggested Occupational Experiences

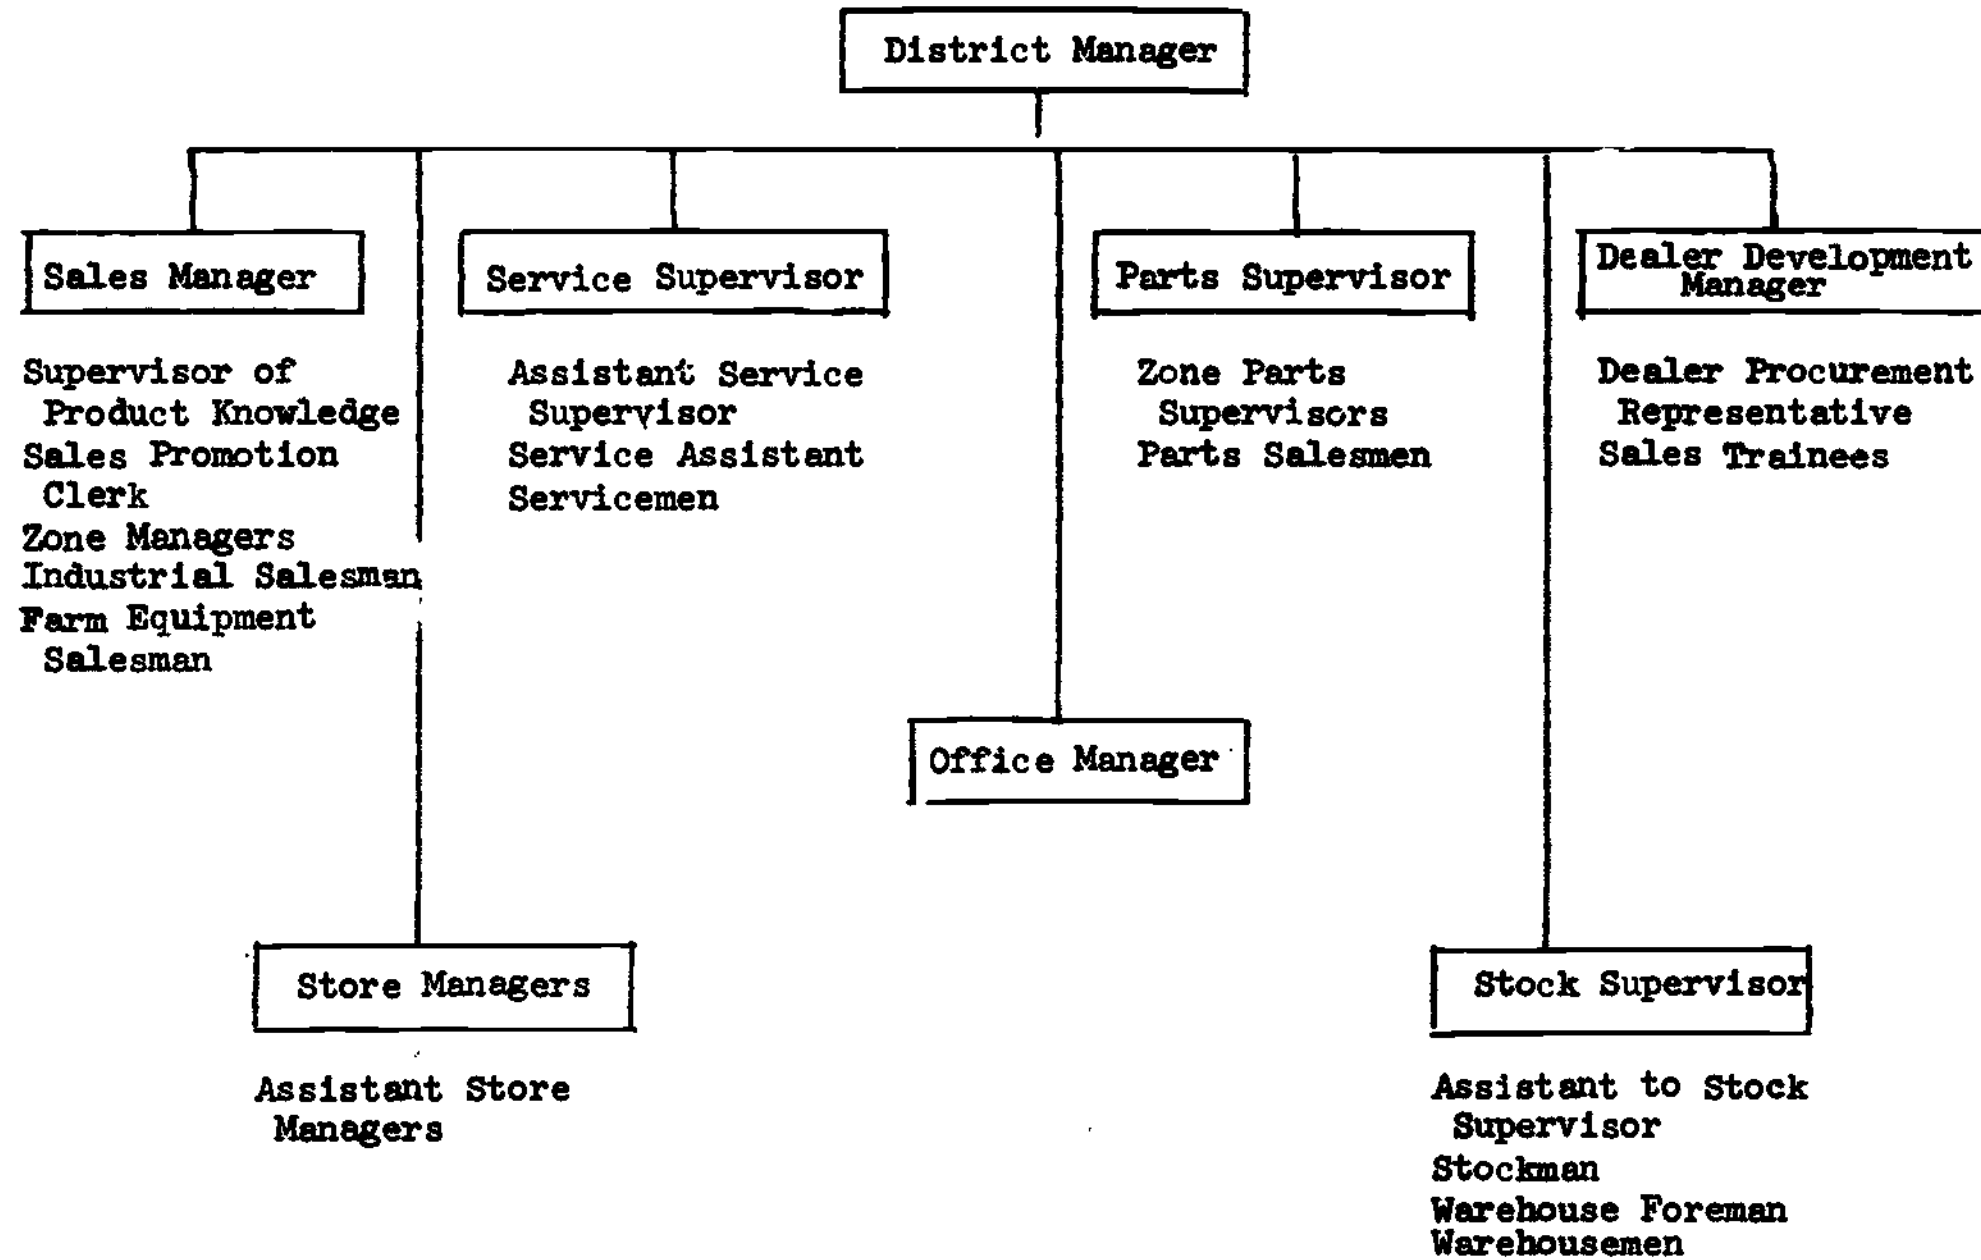

If the class is being conducted in an area close to a branch house, each student should be required to spend a week observing and taking part in the operating of the service and parts department in the branch house.

AGRICULTURAL MACHINERY DISTRIBUTION PATTERN

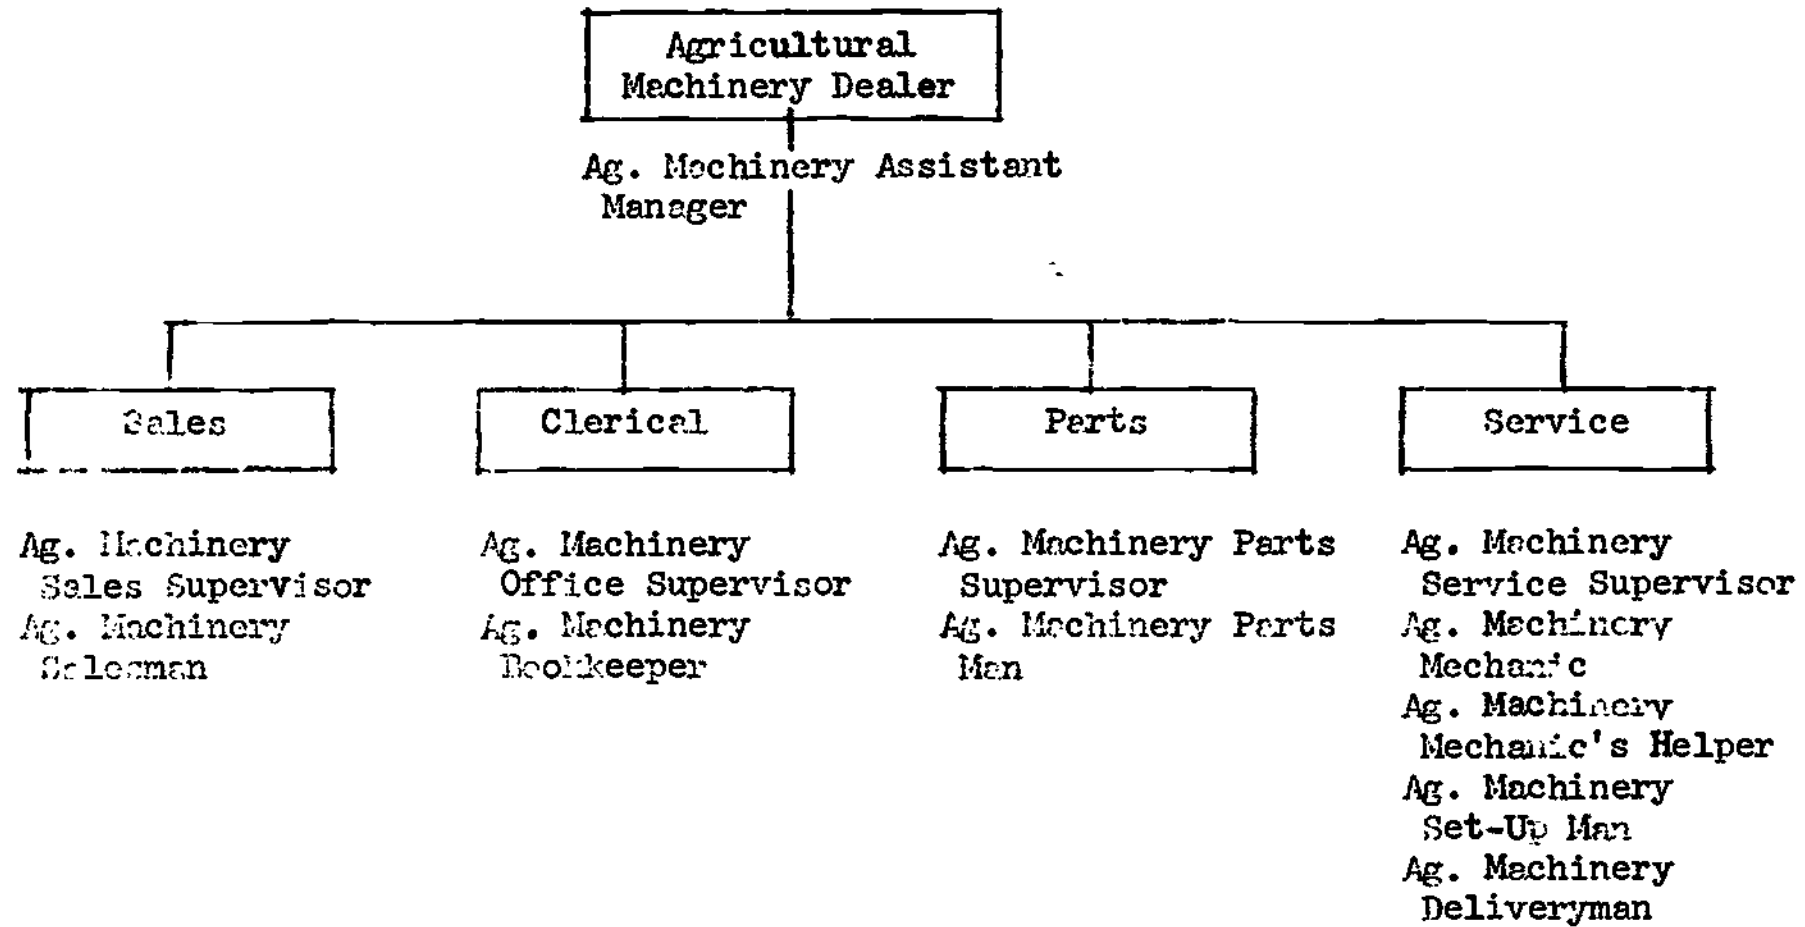

→ → = Flow of machines from the factory to the local dealership.
→ = Flow of orders for machines placed by the local agricultural machinery dealership.

**An Example of the Organizational Structure of a
Major Line Agricultural Machinery Branch House**

**Organizational Structure of a
Local Agricultural Machinery Dealership**

III. To understand the jobs and job functions in the organization of the local agricultural machinery dealership

Teacher Preparation

Subject Matter Content

The operation of the agricultural machinery dealership is divided into five areas.

1. Management
2. Sales
3. Clerical
4. Parts
5. Service

The nature of the work carried out in each area is determined by its function in the operation of the total business.

People in each area are employed with specific responsibilities.

1. Management

Determine company policies
 Exercise financial control over the business
 Select, train and supervise employees
 Forecast and plan future company business
 Direct customer and employee relations
 Promote sales
 Coordinate jobs

2. Sales

- a. Sales Supervisor

Directs sales work
 Directs sales records
 Promotes sales
 Trains sales employees
 Assists in job coordination

- b. Salesman

Finds prospective buyers
 Conducts demonstrations

Appraises used machinery
Closes sales
Makes financial arrangements for customer to
purchase machinery
Maintains sales room
Follows up past sales

3. Clerical

a. Office Supervisor

Directs record keeping
Directs office procedures
Directs collections
Directs payments
Checks financial standing of potential customers

b. Bookkeeper

Posts books
Directs depository funds
Writes orders and letters
Prepares payroll
Writes contracts
Assists in closing books

4. Parts

a. Parts Supervisor

Directs ordering and selling of parts
Selects parts employees
Trains parts employees
Maintains inventory control
Maintains catalogues and price lists
Plans merchandising programs

b. Parts Man

Dispenses shop parts
Dispenses customer parts
Maintains parts inventories
Checks inventories
Maintains price catalogue
Constructs displays
Maintains parts identification

5. Service

a. Service Supervisor

Directs personnel
 Selects and trains personnel
 Maintains service records
 Advises on service problems
 Inspects repair jobs
 Directs machinery storage
 Schedules machinery assembly
 Prepares delivery orders
 Directs delivery

b. Mechanic

Makes general repairs
 Handles field repairs
 Conducts special operations
 Reconditions trade-ins
 Makes pre-delivery checks
 Maintains demonstration units
 Services rolling stock
 Maintains shop equipment

c. Set-up and Deliveryman

Picks up and receives new machinery
 Assembles new machinery
 Delivers and starts machinery

These areas have well-defined limits in which to operate in the dealership.

Suggested Teaching-Learning Activities

1. Tour a local agricultural machinery dealership to observe the five areas of operation in the dealership.
2. Have each student visit a local dealership and prepare a detailed floor plan of the facility.
3. Have each student interview a parts man and a service man to understand their jobs. The student should present a written and oral report of his interview.

Suggested Instructional Materials and References

Instructional Materials

1. Mimeo of the activities of each area in the dealership
2. Overhead transparencies of the organization of a local agricultural machinery dealership and the floor plan of the dealership included in this module
3. Floor plans of local agricultural dealerships for use with the class at the time the areas are discussed

References

S Farm and Power Equipment Retailers Handbook,
pages 74-76 and 251-256.

Suggestions for Evaluating Educational Outcomes of the Module

The following criteria should be used to evaluate the educational outcomes of this module:

1. Student interest in the module
2. Extent to which class assignments are carried out
3. The quality of the written and oral reports

AGRICULTURAL MACHINERY SERVICE DEPARTMENT OPERATING PROCEDURES

Major Teaching Objective

To develop (1) an understanding of the operating procedures of an agricultural machinery service department and (2) the ability to carry out the functions of a service employee.

Suggested Time Allotments

At School

Class instruction	<u>30</u> hours
Laboratory experience	<u>36</u> hours

Total at school	<u>66</u> hours
-----------------	-----------------

Occupational experience	<u>96</u> hours
-------------------------	-----------------

Total for module	<u>162</u> hours
------------------	------------------

Suggestions for Introducing the Module

The service department is an integral part of the agricultural machinery dealership. It, along with the parts department, is one of the main customer attractions to the dealership and is often the only department within the dealership with which the customer does business regularly. To the agricultural machinery dealer, the service department is the dealer's master salesman. The service department keeps the customer "sold" by reselling him time and time again on the dependability of the dealer's entire establishment. A good job of repairing, diagnosing trouble, and servicing agricultural machinery sells new and used goods for the future.

A person preparing for employment as a service department employee must understand thoroughly the function of the service department and the procedures employed in carrying out its business. He must understand dealership layout and equipment requirements, service selling, work scheduling and job ticketing procedures, service pricing, pre-delivery and delivery servicing, and warranty allowances.

Some activities to stimulate interest in the module are as follows:

1. Tour a local agricultural machinery service department, emphasizing the equipment and facilities used by service employees and the services rendered to customers. Have the local dealer make a comparison between the dollar volume of his service department and that of his equipment sales division.
2. Have a farmer speak to the class on the importance of the service department and the service he expects from the agricultural machinery service department.

Competencies to be Developed

- I. To develop an appreciation of the importance of the service department and the role service employees play in the total operation of the dealership

Teacher Preparation

Subject Matter Content

A good, well-managed service department builds the business of the dealership.

1. Efficient service brings customers in contact with new and used equipment and thus increases sales.
2. An efficient, dependable service department establishes dependable customers.
3. The service department attracts trade by developing customer confidence in the dealership.

Labor is the commodity sold in the service department of an agricultural machinery dealership.

1. It is bought and sold in the same manner as new and used equipment and repair parts.
2. Every job performed in the service department is a sale of labor.
3. Every minute spent by a mechanic or set-up man in the service department must be accounted for as either gain or loss.
4. Efficiency in the service department requires highly organized management with rigid control of the labor force and work to be done.

The service department is a very important segment of the total agricultural machinery dealership operation.

1. Service department labor revenue in the average agricultural machinery dealership accounts for five to seven percent of the total sales volume. Small as the figure is, in many cases it may make or break the dealership.

2. Relationships between the dealer and customer depend on efficient service department work.

Efficient service department labor does more than repair machines.

1. It develops customer confidence in the whole dealership.
2. It enables a dealer to hold his customers.

The following items have been identified as the chief factors causing inefficient service department operation:

1. Poor working conditions
2. Lack of common tools, special tools, and cleaning facilities
3. Inconvenience in obtaining replacement parts
4. Frequent interruptions of the work schedule
5. Lack of product service knowledge
6. Lack of planning and coordination by the chief mechanic or foreman
7. Lack of apprentices in training to replace retiring workers or to permit dealership expansion.

Competent personnel is the key to successful service department management.

1. A serviceman with low productivity ties up as much space and tooling equipment as a good serviceman. The efficiency, and, ultimately the profit possibilities, of such an employee are low.
2. Poor work turned out by service personnel in a dealership spoils customer confidence in the dealership and sends the customer elsewhere for service.
3. Through time allocated by the manager of the local agricultural machinery dealership, the skill level of the service department employee can be raised by his local manager's sending him to company-sponsored service schools.

A competent service department employee must be well-acquainted with his job responsibilities and capable of performing them with a high degree of speed and accuracy. He will be required to perform a variety of activities. He must be able to do the following:

1. Make general repairs on all agricultural machinery.
2. Handle agricultural machinery repairs on the farm
3. Make pre-delivery checks on all new machines.
4. Re-condition machines taken in trade-in
5. Pre-service demonstration units.
6. Take care of the service area and equipment
7. Maintain excellent customer relations.

Efficient service employees display the following personal attributes:

1. A pleasing personality
2. Courtesy when dealing with customers and other employees
3. A thorough knowledge of farm machinery
4. Dependability
5. Good, neat work habits
6. An aptitude for diagnosing machinery problems and making necessary corrections
7. Loyalty toward the dealership

The shop supervisor is directly responsible for conducting an efficient, orderly service department. His functions include:

1. Directing service personnel activities in the shop
2. Supervising, instituting, and scheduling mechanics training programs
3. Supervising housekeeping in the service department

4. Following the progress of each job assigned to each mechanic
5. Inspecting and checking work completed by the mechanics
6. Seeing that all new tractors and other new equipment are prepared properly before delivery to the customer
7. Directing the repairs and maintenance of all machines brought in by customers
8. Overseeing the re-conditioning, repairing, and handling of all used or traded-in pieces of equipment
9. Supervising the installation of additional attachments or equipment on new tractors and other machinery
10. Inspecting and recommending corrective measures for machinery being used by the customer while he is in the service department
11. Analyzing product problems, taking corrective action, and exerting control on warranty expenses
12. Referring employee problems to the management, in order to create better employer-employee relations

The degree of success the service department supervisor has in carrying out the above activities depends on his ability to lead and direct those who are working under him.

The service supervisor should exert leadership in the following ways:

1. Treat employees with consideration.
2. Be fair but firm.
3. Set a good example for other service personnel to follow.
4. Take his work seriously.
5. Make other people feel important.
6. Have drive, but do not drive other people.

7. Maintain loyalty to the dealer.
8. Like people and be friendly.
9. Be a good listener and welcome suggestions.

Suggested Teaching-Learning Activities

1. Show charts (as overhead transparencies, if possible) pertaining to the responsibilities of a service employee and shop supervisor.
2. Have each student develop a list of the functions carried out by an employee in each of the job classifications in the service department.
3. Bring an agricultural machinery dealer to the class to speak on the role of the service department in his dealership.
4. Bring a service employee to the class to explain his job responsibilities.
5. Set up interrogating panels composed of class members to quiz both the dealer and the service employee.
6. Have students visit an agricultural machinery dealership and observe the activities carried out in the service department.
7. Have students talk with farmers at the dealership about their machinery problems.

*The symbol T (teacher) or S (student) denotes those references designed especially for the teacher or for the student.

II. To understand service department layout and equipment requirements

Teacher Preparation

Subject Matter Content

The service department uses the largest amount of floor area in the agricultural machinery dealership. (Refer to Farm Power and Equipment Retailer's Handbook, pages 74-76.)

All the space allotted to the service department must be properly used to produce maximum profits for the dealership.

A well-laid-out service department usually has the following features:

1. Accessibility to all equipment and service areas
2. A good floor pattern for work being done in the service department
3. Work stalls that are sufficiently large and well-equipped to handle jobs coming into the service department
4. Areas large enough to service large equipment, such as combines
5. Good use of natural light
6. Work rooms for performing special jobs, such as paint room and diesel tune-up area
7. Service equipment located in areas where it can be easily used
8. Easy access to the parts department
9. A handy loading and unloading area, including a dock
10. Suitable clean-up facilities for employees
11. A service supervisor's desk and library area

Various service department layout patterns are used by agricultural machinery dealers. These patterns emphasize service department efficiency by making maximum use of the space available in the department. The following patterns are commonly used by agricultural machinery dealerships:

1. "U"-shaped
2. "O"-shaped
3. "T"-shaped
4. "I"-shaped
5. "L"-shaped

(See Service Center Management, page one, for examples.)

In the service department, specific well-defined areas are used to conduct certain service department activities. The areas are:

1. Work stalls
2. Welding area
3. Steam cleaning and painting area
4. Light workroom
5. Tool storage area
6. Parts cleaning area
7. Supervisor's desk area, which includes the library for the service department

(See Management Course in Dealer Service Operations, Section IV, page 5; and Farm and Power Equipment Retailer's Handbook, pages 442-448, for examples of the above.)

An efficient service department usually contains the following pieces of large equipment:

1. High and low speed grinders
2. Valve grinder
3. Air compressor
4. Steam cleaner
5. Drill press
6. Dynamometer

7. Industrial welder
8. Oxyacetylene welder
9. Painting equipment
10. Hydraulic press and puller set

In addition to the heavy equipment listed above, the well-equipped service department includes many smaller specialized tools and pieces of equipment. (See Farm and Power Equipment Retailer's Handbook, pages 436-440, for a suggested list of tools and equipment.)

Suggested Teaching-Learning Activities

1. Present to the class several local dealership building layouts, emphasizing the space used by the service department.
2. Present several patterns of service department layouts, emphasizing the areas in which the various service department activities are conducted.
3. Have the class visit a local agricultural machinery dealership and draw up a detailed floor plan of the service area arrangements with location of equipment. Have the supervisor of the service department discuss alternative and/or ideal service layouts with which he would like to work.
4. Have students find out the replacement value of the machines used in a service department of an agricultural machinery dealership.
5. Have some students visit other machinery dealerships individually to draw up floor plans of service area arrangements and location of equipment. Students should present the floor plans to the class for analysis of their differences and similarities and, ultimately, their efficiency.

Suggested Instructional Materials and References

Instructional Materials

1. Transparencies or plans of local dealership building layouts

2. Transparencies of service department layouts
3. Drawing materials for the student to make detailed drawings of service departments

III. To understand the selling of service:

Teacher Preparation

Subject Matter Content

The commodity for sale in the service department of an agricultural machinery dealership is labor.

Selling labor through service to the customer is the same as selling a tractor or piece of machinery. The customer must be made aware of the services available to him through the service department and the advantages of buying such service.

The customer purchases service from the agricultural machinery dealership for several reasons.

1. Inability to perform service jobs for himself because of lack of knowledge or skill
2. Lack of time to make repairs and/or needed adjustments on machinery
3. Belief that work done by trained, experienced persons will save money

In order to sell service, the dealer must follow these rules:

1. Take the initiative and ask farmers when they can spare the equipment for two or three weeks during slack periods of work.

2. Have a good sales-minded service supervisor supported by mechanics with good local reputations.
3. Have a completely equipped, clean, and well-arranged shop.
4. Use local advertising media to supplement personal calls to induce farmers to bring in repair work.
5. Charge reasonable rates.
6. Provide enough room in shop, tool, and paint rooms.
7. Maintain efficient work schedules.

The responsibility for developing and directing programs for selling service rests with the service department supervisor.

1. It is one of the activities normally associated with his job.
2. The selling program set up by the service department supervisor is aimed at preventive maintenance. It should
 - a. Identify sources of trouble and mechanical failure.
 - b. Inform the farmer about costs and inconveniences caused by such trouble or failure.
 - c. Present authentic and up-to-date information about corrective and preventive maintenance of agricultural machinery.
 - d. Inform customers of their potential problems and ways of solving them in the service department.
 - e. Present a plan of action to correct or prevent machinery problems.
 - f. Have a budget on which to operate and a schedule for advertising and promotion.

A variety of advertising media is used by agricultural machinery service supervisors in carrying out the above program.

1. Newspapers
2. Radio and T.V.

3. Direct mail advertising
4. Service sales through the sales department
5. Retail sales of parts and accessories
6. Displays
7. Customer days
8. Service specials

(See references listed for further information on each of the above.)

Successful service selling campaigns depend primarily on the following factors:

1. Proper timing
2. Use of a personalized approach in selling
3. Constant advertising throughout the year
4. Effective use of all advertising media
5. Ability of service department employees to carry out the services advertised

A very important, but often overlooked, item in selling service is maintaining a clean, neat, and attractive service department.

1. It enables service employees to do their best work, improves their efficiency, and raises their morale.
2. It impresses regular and prospective customers with the efficiency of the service department.
3. It develops customer confidence in the dealership.

Suggested Teaching-Learning Activities

1. After discussion of content materials in class, bring a service department supervisor to class to discuss service selling with the class. Use a questioning panel to stimulate discussion after his talk.

2. Have each student interview an above average farmer in the community to find out how often he takes his machinery to the local agricultural machinery dealer for repair, adjustment, and tune-up. Have each student report his findings to the class. As the reports are given, identify the common services used by all farmers.
3. Have each student select a shop item and set up advertisements using the following media: the newspaper, radio, direct mail, displays, and service specials.
4. Have students make a list of the ways they have seen agricultural machinery services advertised.
5. Invite a person from an advertising firm to discuss advertising of agricultural machinery with the class.

Suggested Instructional Materials and References

Instructional Materials

1. Materials for use in setting up service department displays
2. Sample advertisements of service selling from newspapers, radio, direct mail and service specials

References

1. Service Center Management, Selling Service Section, pages 1-5.
2. Management Course in Dealer Service Operations, Section IV, pages 1-3.
3. Farm and Power Equipment Retailer's Handbook, pages 408-411.

Suggested Occupational Experiences

1. Have students prepare displays of services in local dealerships.
2. In cooperation with a dealer and a local radio announcer, write a script for a spot announcement advertising services available at the agricultural machinery dealership.

3. Have students select a special service offered by a dealership and set up and direct a complete sales campaign for it.

IV. To understand work scheduling and job ticketing procedures in agricultural machinery dealerships

Teacher Preparation

Subject Matter Content

Scheduling service department work on an efficient, systematic basis is of utmost importance to the success of the department's operation. It is necessary to know what time is available at all times in order to schedule and complete service work quickly.

The service supervisor is responsible for seeing that time is used wisely. He uses a serviceman's schedule, which provides the following information:

1. Each service employee's number
2. Open hours on a daily basis
3. Forecast of work on a weekly basis

This schedule is valuable in exposing inefficiency in service department operation.

1. The service department supervisor can review the work schedule of each employee and check his progress.
2. The supervisor can check the progress of the entire department in terms of the goals set up for the week.
3. He can use the schedule to keep work available at all times and avoid time waste.
4. He can use it to schedule the right man for the right job, such as a skilled mechanic to overhaul a Diesel tractor, and a mechanic's helper to put new brushes in a generator.

(See references for examples of service department work schedules.)

The final and perhaps most important step in completing work in the service department is filling out the job ticket.

Often, important items don't get charged to the customer as a result of negligence on the part of the service employee who did the work. The job ticket provides the following information which should be carefully recorded when the customer brings the machine to the service department and immediately after the work on that machine has been completed:

1. Customer's name, address and phone number
2. Method of payment for work done in the service department—cash, charge, no expense
3. Complete description of the work to be done on the machine
4. Customer's signature authorizing the work to be done
5. Machine model, chassis, serial number, engine number, etc.
6. New parts put on the machine and their costs
7. Outside labor and materials used in repairing the machine and their costs
8. Amount of oil and grease used
9. Amount of labor and its cost

(For an example of the job ticket above, refer to Service Center Management reference.)

Service employees must complete job tickets with the utmost care. One of the biggest losses of profits in the service department results from incomplete charges on the job ticket.

The daily time ticket is used by dealers to determine accurately the amount of time spent by service employees in doing the work scheduled.

1. It provides the manager with a daily payroll form, if needed.
2. It provides the service employee with a daily summary to check his gross earnings if he is paid on an hourly or flat rate basis.

3. It provides the dealer with information to check the efficiency of his pricing system.

When a repair order describing the work to be performed is handed to the mechanic, the bottom perforation should be filled out showing

1. The repair order number
2. The operator number or description
3. The mechanic's number or name
4. The time the work was started and completed

When the daily time ticket is completed, it is glued to the back of the job ticket. The second copy goes to the service supervisor, and the third copy is kept by the service employee.

Suggested Teaching-Learning Activities

1. Set up examples of work scheduling situations and have each student schedule the work to be done. Provide him with a service department floor plan to use as he works out the work schedule. Have the student consider the following when setting up the schedule:
 - a. Number of service employees
 - b. Space available in the service department to carry out the work to be scheduled
 - c. Time requirements necessary to carry out the work to be scheduled
2. Set up examples of jobs which have been completed in the service department and have the students complete a job ticket on each job.

Suggested Instructional Materials and References

Instructional Materials

Work schedule forms and job tickets used by major agricultural machinery companies

References

1. Service Center Management, Scheduling Work and Job Tickets Sections.
2. Management Course in Dealer Service Operations, Section VII, pages 1-6.

Suggested Occupational Experiences

1. Supervise students in scheduling work to be done in the service department using required forms.
2. Assign each student a job to complete, such as installing new electric wiring on a tractor. Have him fill out a job ticket before starting the job, and a daily time ticket after completing it.
3. Send students on simple service calls. Have them complete field service reports upon return and give them to the service supervisor.

V. To understand service pricing

Teacher Preparation

Subject Matter Content

Two methods of pricing service work are used by agricultural machinery dealerships.

1. By the hour
2. By the job (flat rate)

Three factors are considered by agricultural machinery dealers in determining the price to charge for service work.

1. The costs involved in completing the job and the margin the dealer must charge to break even or show a profit on the job
2. The amount that should be charged to cover labor costs
3. The competition the dealer faces from other dealer service departments

Hourly service pricing is a predetermined charge per hour for the actual time to complete the work on the customer's machine.

1. This method requires a fixed hourly rate for services rendered.
2. The rate established by the dealer must cover the cost of the serviceman's time and operating and overhead costs. (See Farm and Power Equipment Retailer's Handbook, page 429, for examples of hourly rates.)

Flat rate pricing is based on the job instead of the time spent.

1. The price for the job is based on a time allowance predetermined for the job.
2. Job time is converted to service selling price by multiplying the average hours allowed by the service labor charge rate.
3. Pricing by the job encourages efficiency by emphasizing the number of jobs completed rather than the time to complete each of them.

Flat rate pricing has these advantages over hourly pricing:

1. Quick and easy estimating
2. One fair price for industrial jobs
3. Fairer prices on interrupted jobs
4. Jobs priced at their true value
5. Incentive to reduce job time
6. Recovery of tool investment
7. Fairer basis for paying service employees
8. Minimum supervision
9. Reduction of misunderstandings
10. Aid in promoting service
11. Aid in trade-in deals

12. Standardized basis for warranty
13. Increased shop earning capacity

Flat rate pricing schedules for use by agricultural machinery service departments in pricing service jobs have been developed and are available from Implement and Tractor Publications, Inc., and from the major line company offices. These sources of flat rate information give the following information:

1. The job number
2. A description of the job
3. Estimated time required to complete the job
4. Suggested price to charge the customer for work completed on each piece and make of machinery

The service employee should thoroughly understand when and how to use the flat rate manual when pricing service by flat rate.

Suggested Teaching-Learning Activities

1. Using a local dealership as an example, if possible, have students compute the total cost of operating a dealership service department and the hourly charge rate necessary to break even or make a profit. Use as reference page 6 in the Service Center Management Manual.
2. Have the student compare the cost of doing a job in the service department as computed by the hourly and flat rate methods.

Suggested Instructional materials and References

Instructional Materials

Implement and Tractor Flat Rate Manual

References

1. Farm and Power Equipment Retailer's Handbook, pages 427-435.
2. Service Center Management Manual, Flat Rate Section, pages 1-7.
3. Implement and Tractor Flat Rate Manual.

Suggested Occupational Experience

Have students price service jobs as they leave the service department. Have them compute the price both by the hourly and flat rate methods.

VI. To understand pre-delivery and delivery servicing

Teacher Preparation

Subject Matter Content

Pre-delivery and delivery servicing of agricultural machinery is a function of the agricultural machinery service department.

1. Proper pre-delivery and delivery service develops good customer relationships and builds customer confidence in the dealership.
2. The dealer has the satisfaction of knowing that each machine has been properly checked and is in top working condition when the machine is delivered to the customer.
3. Proper pre-delivery and delivery servicing prevents misunderstandings between the customer and the dealer that could arise because of incorrect operating and maintenance procedures on the farm.

It is important that service employees follow specific procedures when performing pre-delivery servicing and delivering new agricultural machinery. These procedures fall into specific areas of activity.

1. Receiving
2. Warehousing and storage
3. Preparing for delivery
4. Delivery

(See Service Center Management Manual for activities to be carried out in each area.)

Agricultural machinery is sent to the local agricultural machinery dealership in small units to lower freight costs, and to allow for limited storage space at the dealership.

Agricultural machinery dealers order their supply of tractors and other machinery well in advance of the time they are to be sold. When they arrive, they must be checked for damage in shipment and properly stored. Instructions for proper storage of each machine are provided in the operator's manual and storage instructions from the company branch house.

Special aids have been developed by some major-line agricultural machinery companies for carrying out pre-delivery and delivery service activities on new machines. These aids, supplied by the company, come in the form of a list of activities to be performed prior to and at the time of delivery of machines to customers.

1. This list identifies specific items that need to be checked at the dealership before the machine is delivered.
2. It notes specific maintenance and operative items to be discussed with the customer at the time of delivery.
3. It sets up a time for after-delivery inspection.

The operator's manual for each machine is the guide to proper pre-delivery service. The machine should be set-up and serviced according to the specifications prescribed in the operator's manual.

At the time the machine is delivered to the customer, the serviceman should try out the machine in the field. Any part of the machine that is not functioning properly can be identified and final adjustments made before leaving the customer's property. The serviceman delivering the machine must understand the machine and how it functions in order to avoid future problems arising from errors made in pre-delivery servicing and delivery of the machine.

State regulations should be carefully followed when hauling agricultural machinery to the farmer. These govern load-widths, total tonnage, speeds for traveling with a load, etc. These regulations, which vary from state to state, can be obtained from the state highway commission in each state.

Suggested Teaching-Learning Activities

1. Have students service a new tractor obtained from a local agricultural machinery dealership.

2. Have students set-up and service several agricultural machines, such as, corn planters, grain elevators, and hay balers. Require students to use the pre-delivery service forms and operator's manual for each machine.

Suggested Instructional Materials and References

Instructional Materials

1. Agricultural machinery pre-delivery and delivery check lists
2. Operator's manuals
3. A new tractor and several other new agricultural machines

References

1. Service Center Management Manual, Pre-delivery and delivery section, pages 1-5.
2. Management Course in Dealer Service Operations, Section VII, page 12.

Suggested Occupational Experiences

1. Have students pick up an order of new machines and machine parts at the company branch house.
2. Have students prepare for and store new machines received by the dealership.
3. Have students perform pre-delivery service and deliver new machines to the customer.

VII. To understand agricultural machinery warranty allowance

Teacher Preparation

Subject Matter Content

New and unused company machinery and parts are warranted to be free from defects in material and workmanship when they are sent to the agricultural machinery dealership by the company.

Under the warranty, the company is obliged to repair or replace any part or parts that prove to be defective because of defective material or workmanship at the factory.

As a representative of the company, the local agricultural machinery dealership replaces defective parts free of charge.

Warranty allowances are made by agricultural machinery dealerships on (1) parts, and (2) labor.

When a defect in materials and workmanship is found by the agricultural machinery dealer or by the customer, a warranty claim should be filed with the company branch house.

1. The agricultural machinery dealer must file the claim with the branch house.
2. The service employee must be able to detect unjust and unfair claims made by the customer.
3. The service employee must understand the function of the part in question thoroughly and be able to detect whether the defect is inherent in the part or was caused by improper maintenance or misuse by the customer.

The service supervisor is in charge of filing all warranty claims.

1. The claims must be filed within the time period allotted by the company for reporting all warranty claims.
2. Warranty claims should be filed on a daily basis to insure company consideration of the claim.
3. The warranty claim form should be filled out completely and details given whenever necessary.
4. The warranty claim and the defective part should then be sent to the company branch house.
5. When a freight bill and/or labor cost is involved, a copy of the freight bill and the job ticket signed by the customer must be attached to the warranty claim.

Suggested Teaching-Learning Activities

1. Have a service supervisor speak to the class on making warranty judgments.

2. Have students study parts with defects in materials and workmanship that have been returned to the company branch house for warranty adjustment.
3. Give each student a defective machine part and have him complete a warranty claim form for it.

Suggested Instructional Materials and References

Instructional Materials

1. Defective agricultural machine parts
2. Warranty claim forms supplied by the major-line agricultural machinery companies

References

1. Service Center Management Manual, Warranty Section, pages 1-9.
2. Management Course in Dealer Service Operations, Section VII, pages 7-10.

Suggestions for Evaluating Educational Outcomes of the Module

The following criteria should be used to evaluate the educational outcome of the module:

1. Student interest in the materials covered in this module
2. Changes in attitude on the part of the student toward his work
3. The extent of participation by each student in class activities
4. The ability of the student to perform the task assigned him on the job
5. The ability of the student to carry out assigned class activities
6. Evaluation of the quality of work done by the student on the job by the occupational experience supervisor and by his employer

AGRICULTURAL MACHINERY PARTS DEPARTMENT OPERATING PROCEDURES

Major Teaching Objective

To develop (1) an understanding of the operating procedures of an agricultural machinery parts department and (2) the ability to carry out the functions of a parts man.

Suggested Time Allotment

At school		
Class instruction	<u>20</u>	hours
Laboratory experience	<u>36</u>	hours
Total at school		<u>56</u> hours
Occupational experience		<u>78</u> hours
Total for module		<u>134</u> hours

Suggestions for Introducing the Module

The parts department is an extremely important part of the agricultural machinery dealership. It is one of the main attractions to the dealership and is many times the only department within the dealership with which the customer does business regularly. The parts department is the hub around which the dealership operates. It supplies the parts needed in the service department. It provides the assurance needed by a salesman as he makes his sales. He knows that, should his sale result in a complaint from the customer because of faulty parts, the parts man can correct the situation. Finally, it provides the dealer with 30 per cent of his margin on sales during the year.

A person preparing for employment as a parts man must understand thoroughly the function of the parts department and the procedures employed in carrying out its business. He must understand inventory control, receiving and binning procedures, parts selling, and the needs of the customer he is to serve.

Following are some suggested techniques for use in creating interest in the module:

1. Use thought questions.
 - a. What are parts and why are they important to the agricultural machinery dealer?
 - b. What are the advantages of an agricultural machinery dealer supplying machine parts?

- c. What is the parts department in the local agricultural machine dealership?
 - d. What kind of work does a parts man do in the local parts department?
2. Bring to class a part from a machine 15 years old and the same part from the same machine today. Show the class how these two parts have changed in terms of the number of parts involved in each. Example: A double disk opener on a corn planter 15 years ago and today. When these are presented to the class, show them in their original form and the torn down form.
 3. Bring a new machine before the class. Have the class estimate the number of parts on the machine. Tear it down and count the actual number of parts. Emphasize the changes that have occurred in the number of parts on agricultural machinery and how this has effected the parts department in the local agricultural machinery dealership. Also stress the relationship of parts to each other as the machine is being torn down and reassembled.
 4. Today a price tag is on everything. Secure an old parts catalogue and price list and compare prices of parts with those in a current parts price list and catalogue.

Competencies to be Developed

- I. To develop an appreciation of the importance of the parts department and the role the parts man plays in the total dealership operation

Teacher Preparation

Subject Matter Content

Replacement of parts is big business for dealers in agricultural machinery.

1. The sale of parts contributes a greater portion to the total margin per dollar of sales than any other department in the dealership.
2. Approximately one-fifth of the total sales of a dealership is derived from the sale of parts.

Parts Sales as Related to Total Sales

3. Returns on parts sales average 30 per cent over and above costs.

Parts Margins as Related to Total Operating Margins

The parts department increases business in other areas of the dealership.

1. Parts man identify potential sales for the dealer by keeping records of customers who are purchasing parts for old machines.
2. The parts department speeds up the work turned out by the service department by supplying parts when they are needed.
3. Through the sale of parts at the dealership, the parts department brings the customer in view of new machinery for sale by the dealer.

OFF
ED
333

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS - 1963

4. Competent parts men provide the customer with valuable advice on service and maintenance of agricultural machinery thus creating customer confidence in the dealer.
5. The dealer's hold on his trade and his ability to keep his customers depend more upon the manner in which he takes care of his parts department than upon any other single element of his business.

The parts man is one of the most important employees in the agricultural machinery dealership.

1. Because of his complete knowledge of the replacement part and its function in the complete machine, he is able to do a more effective job serving the customer.
2. He is able to convert a farmer's homespun language into a machine part or part number.
3. After identifying a part, he is able to locate a replacement quickly, either in the parts bins or in the parts catalogue.
4. A parts man must know that when a customer is asking for a new part, the associated parts on the machine may be worn also and may need replacing. He should suggest that the customer consider these replacements.

Suggested Teaching-Learning Activities

1. Using the agricultural census, have each student determine the number of agricultural machines on farms in the county and state in which the school is located.
2. Have each student interview several farmers in the community to determine the repair history of their farm machines. Determine the number and kinds of parts the farmer has purchased over the past two years.

3. Have a parts man from a local dealership speak to the class about the role of the parts department in the overall dealership operation.
4. Have a local owner or manager of a dealership talk on the importance and use of the parts department.

Suggested Instructional Materials and References

Instructional Materials

Transparencies of the graphs presented.

References

S*Farm and Power Equipment Retailers Handbook,
pages 371-378.

*The symbol T (teacher) or S (student) denotes those references designed especially for the teacher or the student.

Suggested Occupational Experiences

Observe a parts man at work noting the functions, jobs, and services he performs.

II. To understand the job requirements and personal characteristics needed by a parts man

Teacher Preparation

Subject Matter Content

The parts department is practically a complete business unit within the agricultural machinery dealership.

The key person within this unit is the parts man.

1. He must keep a supply of fast-selling parts on hand at all times.
2. He must estimate future parts requirements and purchase these parts in the most economical ways.

3. He must check incoming parts and properly store them.
4. He must advertise and display parts to increase their sales.
5. He must sell parts, collect the money for his sales, and account for the money.

In order for the parts man to perform these tasks successfully, he must possess specialized knowledge.

1. He must have a thorough knowledge of the parts he is handling.
2. He must have a thorough knowledge of the machines for which he is supplying parts.
3. He must have a knowledge of agricultural machinery business operating and management procedures.
4. He must be well acquainted with farming methods and problems, and know how farmers think.
5. This specialized knowledge will be provided in future modules in this course.

In addition to a specialized knowledge of his product and the people he serves, the parts man should possess the following personal characteristics and carry out the following tasks.

1. He must be patient with particular customers or with those who question prices.
2. He must be able to handle the trade in rush season without getting overtired, irritated, and rebellious.
3. He must drop routine tasks to give customers immediate attention.
4. He should not argue with customers or discuss politics and religion.
5. He must treat all customers alike.
6. He must be a good housekeeper.

3. He must check incoming parts and properly store them.
4. He must advertise and display parts to increase their sales.
5. He must sell parts, collect the money for his sales, and account for the money.

In order for the parts man to perform these tasks successfully, he must possess specialized knowledge.

1. He must have a thorough knowledge of the parts he is handling.
2. He must have a thorough knowledge of the machines for which he is supplying parts.
3. He must have a knowledge of agricultural machinery business operating and management procedures.
4. He must be well acquainted with farming methods and problems, and know how farmers think.
5. This specialized knowledge will be provided in future modules in this course.

In addition to a specialized knowledge of his product and the people he serves, the parts man should possess the following personal characteristics and carry out the following tasks.

1. He must be patient with particular customers or with those who question prices.
2. He must be able to handle the trade in rush season without getting overtired, irritated, and rebellious.
3. He must drop routine tasks to give customers immediate attention.
4. He should not argue with customers or discuss politics and religion.
5. He must treat all customers alike.
6. He must be a good housekeeper.

7. He must keep good written records. He should not try to keep the records in his head.
8. He should make the customers feel at ease.
9. He must develop a sense of selling.
10. He should report prospective buyers of implements and equipment to his employer.
11. He should report customers' complaints to the manager.
12. He should report competitive information that comes to him.
13. He should give new employees the advantage of his knowledge and experience, and not jealously guard it.

The parts man should continually increase his knowledge of the industry and people he serves.

1. He should subscribe to and read a good farm and a good trade magazine.
2. He should secure agricultural bulletins from the United States Department of Agriculture and state agricultural colleges when they relate to his job.
3. He should read newspaper and magazine articles on new methods of farming, new crops, crop conditions, feed and food supplies, and economic conditions.
4. He should talk to farm advisors, soil conservation service personnel, farm home administrators, vo-ag teachers, and agriculture specialists from various organizations.
5. He should observe the operation, whenever he has the opportunity, of machines in the field.
6. He should talk to owners of machines to secure information that cannot be obtained in any other way.

7. He should read advertising and operating literature.
8. He should study the operators' manuals for the machines the dealership is handling.

There are fundamental statistics and records associated with the parts business which are necessary to its successful and profitable operation. A parts man must have a thorough knowledge of these.

1. Parts purchases for the year to date compared with last year
2. Parts sales for year to date compared with last year
3. Parts inventory compared with same period last year
4. Parts turnover rate
5. Parts over-the-counter sales
6. Parts sales through service shop
7. Dollar parts sales by months for past five years to show seasonal sales pattern
8. Number of parts carried in stock
9. Number of active parts carried in stock
10. Premium transportation and communication expense incurred by not having parts in stock
11. Number and kind of machines in the trade territory to service
12. Number and kind of competitive machines being sold in the trade territory
13. Acreage and production of different crops grown in the trade territory or county
14. Farm income in the trade territory or county

Suggested Teaching-Learning Activities

1. Have students list those personal characteristics they feel a parts man should possess.
2. Bring an agricultural machinery dealer to the class to discuss what he looks for when hiring a parts man. Ask him to discuss what he expects of his parts men on the job.

Suggested Instructional Materials and References

Instructional materials

Overhead transparencies of the content included for this competency.

References

(See note to teachers in the final reference.)

Suggested Occupational Experiences

Have the student prepare for the dealer a written report on each of the following:

1. Comparison of purchases for the year to date with that of last year
2. Parts sales for the year to date compared with last year
3. Parts turnover rate to date
4. Number and kind of machines in the trade territory to service
5. Number and kind of competitive machines being sold in the trade territory

III. To understand inventory controlTeacher PreparationSubject Matter Content

Inventory control means efficient stock parts keeping.

1. It reduces capital investment by making smaller stock do the work of a larger one.

2. It keeps a better balance between obsolete and fast-moving parts.
3. It facilitates receiving and stocking, and reduces errors in ordering.
4. It aids in reducing errors of judgment in ordering.

An accurate, up-to-date parts inventory control system is a basic element in a good parts department.

1. It provides efficient service to customers.
2. Parts sales increase due to a reduction of lost sales.
3. Freight charges are reduced due to better use of pre-paid freight orders.
4. It insures an accurate surplus of parts return.
5. From the inventory control, trends and patterns in parts sales are identifiable, making it possible to accurately order and stock parts.
6. It provides an accurate inventory at all times.
7. It keeps investment in line and assures a desirable turnover of parts.

Inventory control record cards show all parts transactions and keep the parts inventory up to date. Inventory control record cards show:

1. The machine on which the part is used.
2. The substitute part number which identifies a replacement part.
3. Parts replaced.
4. List and net price of each part.
5. The order number and the date the order was placed with the branch house parts depot. The order and date should be the same. For example, if the order is placed on June 4 the order number would be 604. If the order is placed on October 14 the order number would be 1014.
6. The quantity of parts ordered.

7. When the order was received from the district parts depot.
8. The quantity sold, showing sales against the inventory.
9. A brief description of part.
10. The part identification by number.
11. The type of packaging used in shipment from the parts depot.
12. The inventory on hand at a given date.
13. The annual closing on-hand inventory.
14. The return sales, to show item as being returned by the customer.

(Refer to references for examples.)

A key factor in controlling the parts inventory is determining what parts to stock.

1. Too many items of a certain part add to the obsolete stock surplus and tie up capital in non-saleable parts.
2. Only parts in sufficient demand to keep the inventory turning over should be stocked.
3. Only parts sold at an annual rate of two or more pieces should be stocked.
4. Parts selling less than two pieces annually are considered non-stock items and are ordered special when needed.
5. The parts history on the previous model should provide an order pattern for a new machine.
6. Inventory control cards for parts selling below the minimum rate are marked non-stock and are removed from the inventory control card file.
7. If the demand for a non-stock item increases, the card should be placed back into the inventory control stock-card file.

The parts man must know how many items of a specific part should be ordered in order to insure a rapid parts turnover and to have on hand the parts needed by his customers when they need them.

1. He must think in terms of seasonal and non-seasonal items.
2. Non-seasonal parts.
 - a. The first step in determining the number of parts to order is that of setting maximum and minimum quantities of a part to maintain in stock.
 - b. These limits are determined by the dealer and the parts man on the basis of past parts sales and the anticipated volume of business for the coming year.
 - c. A 90-day maximum supply and 45-day minimum supply, a 120-day maximum and 60-day minimum, and a 60-day maximum and 30-day minimum supply are common limits set on quantities to maintain in stock by the dealer and parts man. (See International Harvester reference.)
 - d. These limits apply to parts that sell over a given dealer price.
 - e. Parts items which the dealer sells for less than this amount should be stocked in large quantities every four months.
 - f. Following is an example of how one company handles their parts stock replenishing:

	Supply Levels			
	60-day maximum 30-day minimum		90-day maximum 45-day minimum	
Past Annual Sales	Flag Points 45&15 Day Levels	Stock Order Qty.	Flag Points 60&15 Day Levels	Stock Order Qty.
84 Thru 89	11/4	7	14/4	10

From the past annual sales record on the inventory control record card the dealer and parts man found that a particular part sales for the last year was 86. They felt that (based on the anticipated sales),

they could increase the sale of this part to 95 during the present year. They decided to place this part on a 90-day maximum supply and 45-day minimum supply level. When their stock on hand reached a total of 14, the parts man knew he had a 60-day supply on hand and flagged the inventory record card indicating that on the next parts order he should purchase more of this part. Wanting to keep his supply from reaching the 15-day level, the parts man orders 10 new items to keep his supply at the 60-day level. (See reference - Dealer Development Manual, p. 56 & 57.)

- g. Some major line agricultural machinery companies use minimum as a basis for ordering parts.
- 1) A minimum stock figure is the lowest quantity an item should be allowed to reach before immediate action is taken to replenish stock.
 - 2) The minimum supply established by a dealership falls into two main categories.
 - a) Tractor
 - b) Harvesting, drying, seeding, and tillage parts
 - 3) The number of parts to replenish is calculated on the basis of previous sales, (level of supply to maintain), and use of a time factor to establish the minimums. (Example - Parts Purchase Control Procedure, p.10)
- h. The inventory control record card carries this information and at a glance the parts man can see when to reorder and can readily find the number to order.

3. Seasonal parts

- a. The distribution of seasonal stock parts is determined by the company district office in the majority of the major line companies.
- b. The quantity of parts to be ordered is determined by the on-hand quantity, the previous year's sales, and the anticipated demand.

The lost sales record reveals sales that could have been made if the parts were in stock. It shows

1. The time period when the sales were lost
2. The quantity of parts requested by the customer
3. The parts number
4. The customer's name
5. Whether the items called for were stock or non-stock items

DAILY LOST SALES RECORD

Location		Date	
Quantity	Part Number	Customer's Name	Non Stock Stock

The rate of turnover of parts reveals how well the parts man is using capital invested in the parts department. Some major line companies figure turnover at the end of the year and others at the end of the month.

Yearly approach

1. Turnover is the number of times the total value of the parts inventory is sold in one year's time.
2. Too high a turnover rate indicates too small a parts inventory or poor service.

3. Too low a turnover indicates too much capital tied up in obsolete stock, selling too many different items, or slow-moving items.
4. Computing turnover

Inventory at the beginning of the year	\$15,000
Inventory at the end of the year	\$17,000
Average inventory	\$16,000
$\$20,000$ (sales) divided by $\$16,000$ (average inventory) equals 1.25 (rate of turnover).	

Monthly approach

	<u>Month</u>	<u>Year to Date</u> (No. of Months)
1. PARTS SALES:		_____
(Counter)	_____	_____
(Internal)	_____	_____
TOTAL	_____	_____
2. COST OF SALES (65% of Sales):	_____	_____
<u>Turnover Rate</u>		
Cost of Sales, Last 12 Months	"A"	_____
Average Inventory, Last 12 Months	"B"	_____
Average Turnover Rate	(A÷B)	_____

Suggested Teaching-Learning Activities

1. Using the inventory control record cards received from the major line agricultural machinery companies, set up sample parts transactions having the students post these transactions on the record cards.
2. Set up an exercise using the various company systems of determining the number of parts to reorder.

Suggested Instructional Materials and References

Instructional Materials

Obtain from each major line handling agricultural machinery the following:

1. Inventory control

2. Lost sales records
3. Systems used by each company for determining how many parts to purchase.

References

1. Parts Sales Manual, pages M25-5-1 through M25-5-12.
- T 2. Parts Purchasing Control Procedure, pages 4-30.

(See note to teachers in the final reference)

Suggested Occupational Experiences

1. Set up an inventory control record card for new machines.
2. Enter quantities of parts received by the dealer in the record cards.
3. Flag cards for ordering of new parts.
4. Post the lost sales record.
5. Using the company system, determine the number of non-seasonal parts to order.

IV. To understand parts ordering procedures

Teacher Preparation

Subject Matter Content

All parts or assembly of parts are identified by the company with a number.

1. Once a number has been assigned to a part or assembly of parts it is used to identify that particular part or part assembly in all company dealings.
2. It gives a positive identification and eliminates the necessity of writing out a long description on records, bins, orders, sales slips, invoices, etc.

3. Each major agricultural machinery company has its own parts numbering system with which the parts man must become thoroughly familiar before he attempts to use the system.

All parts or assembly of parts for each machine are listed in the company parts catalogue.

1. The machines are listed by model numbers. These numbers are the same as in the owners manual for the machine.
2. In some instances where a machine does not have a model number; serial numbers are given.
3. Each parts and its associated parts are generally shown in diagrams with the part number below it.
4. The number in the parts catalogue is used when ordering special or stock parts.
5. It is important that the parts man understand the nature of the part when ordering so as to order an assembly or a specific part as necessary.
6. The parts book should be consulted when listing each part on the order and ordering special parts not already stocked.

It is important that the parts man use proper ordering procedures in order to maintain satisfactorily his parts stock supply. The following steps should be observed when ordering:

1. Be sure the part or part assembly is properly identified.
2. Consult the parts catalogue to get the correct number for each part.
3. List the order number clearly in the proper place. Be certain that the number is stated accurately on the order form.
4. List the parts number in numerical sequence. (See International Harvester and John Deere references for examples.)
5. Enter the order number and quantity ordered on the inventory control stock record.

6. Indicate the group, section, and bin number on the parts order.
7. Be sure that the order is properly identified so that the parts depot can easily recognize the type of order.
 - a. Stock order
 - b. Emergency order
 - c. Fill-in order
 - d. Special merchandising order
 - e. Quantity discount order

Suggested Teaching-Learning Activities

Set up sample parts orders. Have the students use the forms and parts books supplied by the major-line agricultural machinery companies to complete orders for the parts. When making out these sample orders require each student to follow the steps outlined in the content.

Suggested Instructional Materials and References

Instructional Materials

Obtain parts ordering forms and parts books from each of the major-line agricultural machinery companies.

References

- S "What is a Parts Number," pages 1-27.

(Teachers may be able to secure operational procedure manuals from other manufacturers by working with local dealers, branch managers or district representatives of these companies.)

Suggested Occupational Experiences

1. Set up the order for a special part or group of parts for a customer using the parts book to identify the part and locate the part number.

2. Set up an order to be sent to the district parts depot.
3. Set up a stock order of seasonal parts to be sent to the district parts depot. Include experience in determining the best method of shipment.

V. To understand parts receiving and order verification procedures

Teacher Preparation

Subject Matter Content

Carefully planned procedures for receiving parts orders are essential in order to avoid many future parts problems.

The following procedures should be followed in order to insure the proper delivery of parts.

1. Visually inspect the boxes, cartons, bags, etc., for any damages caused in shipping.
2. Before acknowledging receipt of the parts shipment, check the loading tally and the freight bill in order to:
 - a. Make sure the number of items received agrees with the number shown on the freight bill.
 - b. Make sure the weight shown on the tally agrees with the weight shown on the freight bill.
 - c. Check for correctness of name, address, and ship-to code.
3. Any discrepancies, shortages, or breakage should be noted on the freight bill before the parts man signs the shipment.
4. The dealers copy of the freight bill should be given to the bookkeeper for further audit and payment.

If damage occurred to the parts order in shipment, it requires immediate attention by the parts man.

1. The parts man should, after making a thorough inspection of the damaged merchandise, contact the carrier immediately and request the carrier to inspect the merchandise.

2. All items should be left just as they were when they arrived at the dealership.
3. After inspecting the damaged merchandise, the parts man should describe the damage and estimate its extent, in terms of dollars and cents.
4. The description of the damage and other delivery documents should be given to the dealer as evidence when filing a loss and damage claim with the company delivering the merchandise.

The contents of the order should be carefully checked before the parts are binned.

1. With every shipment of parts from the branch house there is a packing slip. The slip will be in a carton marked with a packing slip label.
2. The kind, quantity, and price of each item should be checked against the packing slip.
3. As the parts are checked against the packing slip, the section and bin number should be written on the parts identification tag.
4. The parts should then be placed in the bins and are ready for sale.

Immediately after the new shipment of parts has been binned, the receipts should be posted on the inventory control record cards.

1. Posting is done from the packing slip.
2. The total received is added to the quantity in the on-hand column.
3. The packing slip is filed and checked against the invoice when it arrives.
4. The packing slip and invoice are then filed for reference.
5. Any discrepancies in the packing slip and invoices should be reported immediately to the parts depot.

Suggested Teaching-Learning Activities

Set up example situations that will require the use of the forms listed under instructional materials. Require the student to work in different situations, using these forms.

Suggested Instructional Materials and References

Instructional Materials

1. Freight billing forms
2. Major-line agricultural machinery packing slips
3. Invoice forms
4. Loss and damage claim forms
5. Bill of lading

References

(See the note to teachers in the final reference.)

Suggested Occupational Experiences

1. Have students receive and verify shipments of parts from the parts depot following the procedures outlined.
2. Have students bin parts and post the inventory control record cards.

VI. To understand parts sellingTeacher PreparationSubject Matter Content

The parts sales unit is small and the costs of selling parts should be held at a minimum.

1. The sale should be handled quickly and efficiently to reduce the cost and save the customer time.
2. Parts displays increase sales and cut costs.

3. Space in the parts department must be used in the most efficient manner.
4. Stocks should be no larger than necessary to serve efficiently.

The parts man must use a variety of tools to sell his product.

1. Displays
2. Advertising
3. Sales of service shop work
4. Telephone
5. Promotion of early repairing
6. Parts selling while canvassing the country
7. Parts selling at farm sales
8. Selling related parts
9. Selling equipment and accessories not sold with the machine
10. Selling improvement and changeover packages
11. Selling parts by direct mail
12. Selling toys
13. Flat rate pricing and estimating

The service department of the dealership provides a natural opportunity for a large sales volume.

1. Tractor parts make up almost half of the average dealer's parts sales.
2. The parts man should suggest shop overhaul when customers purchase parts which should be replaced in the shop rather than on the farm.
3. The service department and the parts department should work together to sell more parts as they realize that the farmer is a prospect for labor saving, comfort producing, improved parts, attachments, and accessories that his machines do not have.

The parts man has more actual contact with the customer than any other employee in the dealership.

In order to do an effective job of serving the customer, the parts man must:

1. Have a thorough understanding of farming problems in the area.
2. Have a complete knowledge of the product he sells.
3. Pass this information to the customer.
4. Understand the application of equipment to the farmers' problems.
5. Have a good knowledge of farming practices in the area in which the dealership is located.
6. Be familiar with the services the customers require.
7. Have faith in the quality of merchandise he is selling.
8. Have confidence in the store he serves.

The parts man is also a salesman.

1. He sells what the product will do rather than the product itself.
2. He sells freedom from drudgery and a better life for the farmer and his family--not hydraulic equipment.
3. He sells riding comfort and safety--not tractor seats.
4. He sells engine care and lower upkeep costs--not hour meters.
5. He sells saving of power and fuel--not tractor tune-ups.
6. He sells continuous operation and saving of crops through the critical periods--not tractor overhauls.
7. He sells protection of engine and saving of repair bills--not oil filter elements.
8. He sells lower maintenance costs--not lubrication equipment.

9. He sells high-yielding, weed-free crops--not sweeps and shovels.
10. He sells accurate planting and higher yields--not seed plates.
11. He sells cleaner cutting and crop saving harvests--not cutting parts.

Suggested Teaching-Learning Activities

1. Bring a local parts man to the class to speak on parts selling.
2. Have each student develop a list of the undesirable and desirable characteristics of salesmen with whom they are acquainted.
3. Set up an example parts-selling situation and have each student indicate how he would approach and handle the situation.
4. Role play several parts-selling situations using members of the class to portray the characters in each situation.

Suggested Instructional Materials and References

Instructional Materials

Overhead transparencies to show the selling tools used by parts men and how the parts man sells his product.

References

(Teachers may be able to secure operational procedure manuals from other manufacturers by working with local dealers, branch managers or district representatives of these companies.)

Suggested Occupational Experiences

1. Have the student sell parts to the customer at the parts counter.
2. Have the student accompany the service man on service calls involving the supplying of parts.

VII. To display agricultural machinery parts effectively

Teacher Preparation

Subject Matter Content

Parts displays are an effective means of selling parts.

1. Displays impress the customer with the ability of the dealer to serve him.
2. Displays indicate the extensiveness of the parts department stocks.
3. Displays are inexpensive means of selling parts.
4. Customers have an opportunity to pick up items which they may need in addition to the specific part they are seeking.
5. Parts displays that feature an item and its associated parts are effective in satisfying the customer's needs.
6. Displays make the dealership more attractive to the customer.
7. Displays provide the dealer with an informal means of informing the customer concerning proper use of machines and machine parts.

When setting up effective parts displays, certain fundamentals should be followed.

1. Displays should feature rapid selling parts.
2. They must be attractive, arouse interest, and create a desire for ownership.
3. They must be coordinated with outside advertising and selling efforts.
4. The customer should have easy access to the parts on display.
5. Each display should be well lighted to attract as much attention as possible.
6. Each display should feature parts in quantity.

7. Displays should be set up so that they will not topple when parts are removed from them.
8. Parts sold from the display should be replenished daily.
9. Related parts should be displayed with the featured part and displayed in sequence.
10. The display area must be kept neat and clean at all times.
11. Seasonal parts should be displayed at least 30 days in advance of the season of use.
12. Displays should be timely.
13. When a display has spent its usefulness, it should be replaced with a display featuring new items.
14. Items should be placed in an attractive arrangement in the display.
15. If packaged items are on display, one package should be opened to show the contents of the packages.
16. Price information should be shown on all items on display.

Several types of displays lend themselves well for displaying agricultural machinery parts.

1. Islands and tables
2. Display boards
3. Window displays
4. Floor displays
5. Displays on machines
6. Wall displays
7. Displays on counters
8. Bin end and open counter displays
9. Service shop displays

A crucial factor in setting up effective parts displays is determining what parts to display. The following items should be considered when selecting those items to be displayed:

1. Parts for machines that will be used by the customer within the next four to six weeks
2. Related parts
3. Parts on which the dealer will receive a satisfactory sales margin
4. New items being introduced by the dealer
5. Machine accessories or other equipment

Suggested Teaching-Learning Activities

1. Use 35mm slides to show the types of displays. Good and poor displaying procedures should be emphasized as the slides are viewed by the class.
2. Using the display fixtures and parts identified under instructional materials, have each student set up parts displays. Have, if possible, several parts men from local dealerships constructively criticize each display. If parts men are unavailable, have the class do the criticizing.
3. Have each student visit local dealerships observing parts displaying procedures. After their visit, have them report both orally and in writing their observations.

Suggested Instructional Materials and References

Instructional materials

1. Teacher-made 35 mm slides of each of the types of displays identified in the content.
2. Island display table, display boards, window display materials, counter display materials.
3. Parts to be used in setting up displays.

References

1. Parts Sales Manual, pages M15-511 through M15-15-2.

(See the note to teachers in the final reference.)

Suggested Occupational Experiences

Have students set up each of the following displays in a local dealership.

1. Window display
2. Island and table displays
3. Floor displays
4. Display boards
5. Wall displays
6. Displays for special parts

VIII. To understand agricultural machinery parts advertising

Teacher Preparation

Subject Matter Content

One of the most effective means of parts selling is through advertising.

1. It makes calls on customers that the parts man does not have time to make personally.
2. It informs customers about new machines and parts available at the local dealership.
3. It increases a desire for ownership and, as a result, increases parts and new machinery sales.
4. It reminds the customer of the services available at the local dealership and suggests that he bring his machinery problems to the dealership for service.

Agricultural machinery parts are advertised through several media.

1. Direct mail
2. Newspaper ads

3. Radio spot announcements
4. Country road signs
5. Television advertisements
6. Handbills distributed to potential customers

The parts to be advertised by a dealer are generally the same as those displayed at the dealership.

Parts should be advertised well in advance of the season the item is to be used by the customer.

Advertising plans should be made well in advance of showing items to be advertised. Plans include media to be used and dates.

Suggested Teaching-Learning Activities

1. Have students list methods of advertising carried out by local agricultural machinery dealers.
2. Bring a member of a newspaper advertising staff to the class to speak on effective advertising.
3. Have each student select a parts item found in a parts department and lay out a series of advertisements using each of the media identified in the content.

Suggested Instructional Materials and References

Instructional Material

1. Local newspaper advertising of sales of agricultural machinery parts.
2. Sample letters and product information sent through the mail to customers
3. Sample radio and TV spot announcement scripts
4. Sample handbills to advertise agricultural machinery parts

References

Parts Sales Manual, pages M20-5-1 through M20-5-3.

Suggested Occupational Experiences

1. Select items to be advertised.
2. Develop an advertisement for a newspaper.
3. Set up and carry out the distributing of handbills advertising specific parts.
4. Plan an advertisement on a series of parts.
5. Select a series of parts to be advertised using the country road sign as the advertising media.
6. With a radio announcer and the dealer, plan a series of radio spot announcements advertising a particular part.

Suggestions for Evaluating Educational Outcomes of the Module

The following criteria should be used to evaluate the educational outcome of this module.

1. Student interest in the materials covered in this module
2. Changes in attitude on the part of the student toward his work
3. The participation by each student in class activities
4. The ability of the student to carry out assigned class activities
5. The ability of the student to perform the tasks assigned him on the job
6. Employers' evaluations of the quality of work done by the student on the job

Sources of Suggested References

AGRICULTURAL SALESMANSHIP

Major Teaching Objective

To develop the abilities needed to begin selling agricultural supplies and services effectively

Suggested Time Allotments

At school		
Class instruction	<u>30</u>	hours
Laboratory experience	<u>0</u>	hours
Total at school	<u>30</u>	hours
Occupational experience	<u>36</u>	hours
Total for module	<u>66</u>	hours

Suggestions for Introducing the Module

This module is designed to develop the abilities needed by employees to sell all types of agricultural supplies and services required by farmers, ranchers, and homeowners. The following suggestions are offered for introducing the module.

1. Explain to the students that every agricultural employee who deals with customers is, in a real sense, a salesman and needs the qualities of a good salesman. Becoming a good salesman can only be developed through experience. This module is intended to acquaint students with the fundamentals of salesmanship.
2. Have the students identify the firm or firms they or their parents like to do business with because of good sales practices. Avoid naming particular individuals but have the students list the sales practices and human or personality traits which bring satisfaction to the customers when they do business with particular firms. It will be natural for the class to recall instances of poor sales practices and the teacher should tactfully caution the students that, while "true to life" examples are desired, it is better to concentrate on the good sales practices than list the poor sales practices or human shortcomings which cause dissatisfaction when doing business with any certain firm.
3. Ask students to observe salesmen in a farm supply and service center, garden center, or agricultural machinery dealership and attempt to identify those characteristics which apparently are common to successful salesmen. Don't attempt to analyze these characteristics at this point.
4. Have students role-play the selling of a product in class. From the role-playing demonstration, identify with the students the

problems and questions which will be studied. Emphasize the difficulties likely to be encountered by an inexperienced salesman. An alternative procedure would be to have a tape recording of a person making a sale instead of having the students participate in role-playing.

5. Develop with the students the list of competencies to be studied. List these competencies on the chalkboard so students can get a general overview of the content of the module. The competencies included in this module are:

To learn how to meet the customer
 To learn how to present supplies and services to the customer
 To learn how to overcome resistance
 To learn how to close the sale

Selling is the key function of all business activity. This is as true in agriculture as in other areas. Selling is the act of assisting and persuading individuals or groups to make a buying decision which is to the mutual advantage of both the buyer and the seller.

Selling is really explaining to, persuading, and reminding the public of a particular business concern and of the opportunities and values to be gained from doing business with this concern.

The retailer's function is that of selling goods and services to the ultimate consumer. This is the final step in the distribution of agricultural goods and services.

Producing efficient salesmen is the purpose of this module. Efficient salesmen realize that customers are lost because of:

1. Poor service rendered
2. Discourteous treatment received
3. Indifferent attitude exhibited on the part of the salesman

The salesman must know the psychology of selling if he is to become a successful salesman. In other words, he knows that a customer buys primarily because of need and desire. These are influenced by reason, by emotion, or by a combination of these. A person may need something, but does not buy it until he desires it, i.e., he feels the need.

In summary, to be successful, the agricultural salesman must know the selling process, the merchandise itself, and the firm, as well as understand himself, his relations to the customer, and the customer.

Here is an opportunity for a salesman to (a) deal directly with the public, (b) help other people make decisions, (c) face something new everyday, (d) know that his worth is quickly recognized in terms of advancement, and (e) enjoy the prestige of big business. This big business is made up of

over 1,700,000 retail stores where Americans spend 70 per cent of the family income each year.

Good selling does not happen incidentally but is the result of sound training.

Successful selling produces a satisfied customer who in turn becomes the best form of advertising.

The good salesman must realize that everyone benefits from efficient selling. High sales volume not only insures the salesman's position, but also lowers the price of products or services to the customer.

Good selling awakens and satisfies human wants. Selling is a challenge and every customer is an opportunity for a salesman to get a positive reaction from the customer on five basic buying decisions, namely; the need, the thing, the source, the price, and the time. Selling is helping the customer to buy intelligently.

The customer will gain the most personal satisfaction from his purchase if the salesman makes sure that the product will best fit the customer's need. When the salesman demonstrates courtesy and a sincere interest to be of service, the result is a permanent customer.

Competencies to be Developed

I. To learn how to meet the customer

Teacher Preparation

Subject Matter Content

The impression of the agricultural business that the customer carries away often results from his first contact with the salesman. Appearance and actions play an important part in forming this impression.

A well-groomed salesman attracts customers and inspires their confidence. Undivided attention on the job is essential to good salesmanship.

A good approach presupposes a proper attitude toward the job. Love for one's work is expressed in the enthusiasm with which it is carried out. Enthusiasm is shown through words, actions, and expression. If the salesman is not interested in and enthusiastic about the merchandise, how can the customer be expected to develop much interest?

Salesmanship is demonstrated through promptness, alertness, and interest in the customer's problem.

Treat the customer like a guest. This means that good manners and courtesy are practiced at all times; that the house is in order, neat and clean; that the merchandise is conveniently located; and that the salesman is trained in the fundamentals of selling to maximize the opportunity of being of service to customers.

Points to be considered when meeting the customer:

1. The Preapproach Preparation

a. Information needed about the customer

- 1) Name - Address
- 2) Personal characteristics
- 3) Mental make-up
- 4) Hobbies and interests
- 5) Common interests
- 6) Buying habits or policies

b. Sources of this information

- 1) Participation in community activities and events
- 2) Chamber of Commerce information
- 3) Comments made by other members of civic clubs
- 4) A personal notebook on customers
- 5) Past sale records, credit department records
- 6) Interview with people in the community
- 7) Local newspaper

c. Check of facilities and surroundings

- 1) General appearance of the store
- 2) Lighting
- 3) Equipment
- 4) Merchandise arrangement
- 5) Personnel

d. Knowledge of benefits the customer will receive from merchandise sold

- 1) Design or appearance
- 2) Quality of the source - trade name
- 3) Composition and construction
- 4) Special features
- 5) Assortment of sizes, colors, and styles available
- 6) Service available

e. Preparation by the salesman

- 1) Neatness of appearance
- 2) Preparation of an appealing display arrangement
- 3) Knowledge of contents of the merchandise in stock
- 4) Knowledge of the contents of newspaper advertising being circulated
- 5) Knowledge of names, background, and interests of customers
- 6) Preparation of a few selling sentences
- 7) Knowledge of the competitor's product
- 8) Preparation of a record of common customer objections and development of methods of meeting them

2. Timing the Approach

a. Importance of the impression created by the salesman's appearance and actions

b. Suggestions for:

- 1) Promptness - clues for failure in being prompt:
 - a) Involved group conversations of salesmen
 - b) Stock duties
 - c) Timidity in approaching customers
 - d) Indifference to the needs of the customers
- 2) Alertness - based on accurate and careful observation; look for clues on:
 - a) How and when to greet the customer
 - b) When to present merchandise
 - c) How to talk about merchandise
- 3) Interest in customer's problem
 - a) Take all the time necessary to understand his problem
 - b) Probe to determine if problem is what customer first says that it is
 - c) Determine the procedure to be followed to assist the customer with his problem

3. The Proper Approach - Greeting the Customer

a. Types of salutations

- 1) Conventional
- 2) Question
- 3) Stating a fact about the merchandise

b. Elements of a salutation

- 1) Courteous
- 2) Short
- 3) Requires no mental decision
- 4) Affirmative
- 5) Emphasizes the desire to serve

c. Tone of voice - pleasant, enthusiastic, distinct, articulate, ordinary

d. Facial expressions

- 1) A pleasant smile
- 2) Cheerful expression

Explain what motivates customers to buy. Different physical and psychological factors, operating alone or together, motivate a customer to buy a product. Among them are comfort, pleasure, appetite, possession, fear, devotion, curiosity, ornamentation, imitation, construction, and loyalty.

Developing the proper attitudes necessary for success in meeting a customer is important if the student is to develop effective sales abilities. Among them are:

1. Developing professional feeling toward selling
2. Constant courtesy
3. Enthusiasm for selling
4. Interest in customer's problem
5. Willingness to develop self-confidence
6. Developing integrity
7. Developing sincere attitude of service
8. Appreciating proper psychology such as gaining the customer's attention and interest, creating a desire, and ending with desired action on the part of the customer

Suggested Teaching-Learning Activities

1. Arrange for the class to observe a successful agricultural salesman in action meeting a customer.
2. Develop with the students a list of personal appearance attributes of a good salesman in a farm supply or service center, garden center, or agricultural machinery dealership. (See page 301, Fundamentals of Selling.)
3. Develop with the students a list of the attitudes and actions of a good agricultural salesman.
4. Develop with the students a list of characteristics of an agricultural center or machinery dealership that attract customers.
5. Engage in role-playing, having students act out roles of salesmen and customers and demonstrate how to meet customers. Review each demonstration with the class as to what was done correctly or incorrectly.
6. Using role-playing, demonstrate how a salesman should greet a customer on a telephone.
7. Invite the manager of a successful agricultural business to discuss with the class the attitudes and actions exhibited by salesmen which have been observed to be most effective in meeting potential customers as well as those attitudes and actions which are detrimental to success when meeting customers.
8. Develop with the students a list of the types of customers they are likely to meet (decided customers, undecided customers, casual lookers) and bring out tips as to what would be the best way to meet each type. (See Fundamentals of Selling, pages 324-338.)
9. Prepare a list of greetings to use with customers.

Suggested Instructional Materials and References

Instructional Materials

1. Demonstration telephones-local telephone companies will often supply these for instructional purposes.
2. "The Approach," 10 minute film

References

- T*1. Fundamentals of Selling, Chapters 13 and 14.
2. Store Salesmanship, Chapter 2.

*The symbol T (teacher) or S (student) denotes those references designed especially for the teacher or for the student.

Suggested Occupational Experiences

1. Observe the salesmen in the training center and list the appearance, attitudes, and action attributes they have that make them an asset or liability to the business. If you have students in varying types of agricultural training centers, elaborate on common characteristics of successful sales employees in agricultural businesses.
2. Have the students analyze themselves regularly to see if they are developing desirable appearance and attitudes. Use the instruments available from each state's division of vocational guidance and testing.
3. See that the students have opportunities to serve customers at the training center. In the classroom, discuss difficulties the students have encountered in serving customers and discuss methods for correcting them in the future.
4. Have the student answer the telephone at the place of business.

II. To learn how to present supplies and services to the customer

Teacher Preparation

Subject Matter Content

Successful selling requires a careful presentation by the seller. A salesman must recognize the importance of each of the psychological steps in a sale. He must gain the attention, develop interest, kindle desire, and induce action on the part of the customer.

Attracting attention is one thing; developing interest is quite another thing. Attention is more or less involuntary.

Almost anything can attract attention; interest is the result of voluntary reaction on the part of the customer. Interest comes only when attention is prolonged voluntarily and is accomplished by concentration.

Next, one must combine the merits of the article with the needs or wants of the customer to kindle desire. Then, by demonstrating a complete understanding of the interest, needs, desires, and motivating factors that cause a customer to buy, the salesman will be able to make a successful sale. Sales are made by showing the farmer how to increase yields, make more profit, or reduce the labor required, etc. The teacher and the class can readily expand this list.

Draw attention of customers to a supply or service. It can be achieved in many ways.

- Reading an advertisement about a beef concentrate
- Seeing a new herbicide on a TV commercial
- Talking to a neighbor about his new 5-plow tractor
- Mailing a circular on early fertilizer purchase discount
- Meeting a new petroleum delivery truck on the road
- Hearing from a friend about the good service on baler repairs
- Reading in the newspaper about a new bulb shipment received at the garden center
- Viewing an attractive display of seed at the supply center

Developing interest in a product can be initiated by the customer, the salesman, or serviceman.

Customers can move from the attention, interest, and desire steps very rapidly at times with little or no encouragement. Example - the customer sees a new field sprayer just the size and kind for which he has a preference--the desire is developed. Often, however, the customer's interest in a product needs to be kindled. This can be done by:

- Talking to him about the new features on this planter
- Inviting him to a field day where the effectiveness of newly developed herbicides will be shown
- Showing him the results of this product in test trials
- Demonstrating how simple it is to mount this new corn picker
- Pointing out to the customer the number of people in the community who are already using this feed, lawn seed, or grease

Desire for a product may be obtained by relating it to a need of the customer.

- Explain how this feed will increase net income by improving an animal's rate of gain.
- Show him, with proof from variety trials, how the new oat variety will stand, thereby reducing all those combining problems.

Show him that the chemical weed spray will reduce cultivation, allowing time to get the hay harvested, go fishing, etc.

Sell the merits of the tractor seat, not its cost.

Provide appointments for the customer to try the product on a trial basis.

To be able to present items effectively, you will need to:

Know the features of the item

Be able to answer all questions about the item

Demonstrate its use, operation, value, advantages, and disadvantages

Suggested Teaching-Learning Activities

1. Have the students make a display of agricultural items in the classroom, or possibly make an attractive display of a product on a bulletin board.
2. Have students describe an attractive display to which they have recently been exposed. Try to list those features that made the displays attractive.
3. Visit an agricultural supply center, garden center, or machinery dealership and observe how they use displays, banners, etc., to attract attention.
4. Have the students give a presentation or demonstration that could be used to obtain interest in an agricultural business.
5. Through role-playing, have students show how they would relate a supply or service to a customer's needs. (Desire) This could also be effectively accomplished through demonstrations.

Suggested Instructional Materials and References

Instructional Materials

Gather needed supplies, wall charts, supply information sheets, empty product cartons, product bulletins, and samples so that the students can do the above activities effectively.

References

1. Fundamentals of Selling, Chapter 16.
2. Store Salesmanship, Chapter 3.

Suggested Occupational Experiences

Have students observe how effective salesmen show, explain, and demonstrate supplies or services.

Students should gain experience at the training centers by showing, explaining, and demonstrating supplies or services to customers.

III. To learn how to overcome resistance

Teacher Preparation

Subject Matter Content

It is natural for people to have sales resistance. Most of them did not come by the money in their possession easily. It is perfectly natural for people to want to get all that they can for the money spent.

Each sale has two sides. The customer must sacrifice something in order to get something else. Since one cannot have everything, each sale means a choice between one product and another product or one product and another form of pleasure.

The customer must decide which of the choices will give the most satisfaction or pleasure.

It is the salesman's job to convince the customer that his product or service will provide this pleasure, satisfaction, or need. If this cannot honestly be done, perhaps he should not make the sale at all. Anything else is high pressure selling that is unethical and cannot be classified as salesmanship. It will invariably lead to ill will and dissatisfaction.

There are several reasons why customers are resistant to purchasing. The first objection is rarely the actual objection. Identify the real reason for such resistance and try to explain away the objection. To do this you are going to need to be well informed on the supply or service. Types of objections are:

1. Need - Objections to need are overcome by stressing the usefulness and benefits of the product.
2. Quality - Objections to quality are overcome by:
 - a. Showing a better quality
 - b. Pointing out a specific feature
3. Source - Objections to the source are met by:
 - a. Providing names and experiences of satisfied customers
 - b. Providing information about the company or by reference to national advertising
 - c. Courteously straightening out misunderstandings
 - d. Asking for a fair trial of this new firm or by offering something another firm does not carry
 - e. Others correcting the shortcomings of the salesman if he is at fault
4. Price - Objections to price are overcome by:
 - a. Revealing hidden values - building up values
 - b. Emphasizing the quality or usefulness
 - c. Providing an article that is not as expensive and doesn't have as many selling points
 - d. Knowing competitor's products so that any question on different values can be explained
5. Time - Objections to time are overcome by:
 - a. Making a future appointment
 - b. Inviting the customer to look at additional merchandise
 - c. Continuing to show a positive interest in the customer whether the salesman is busy or not
 - d. Trying to handle objections promptly as they arise

- e. Not trying to close a sale until all bonafide objections have been satisfied. Make feelers during the sales presentation to preclude objections to a reasonable closing of the sale because of the time.
6. Thing - Objections to the thing are overcome by:
- a. Showing more suitable goods
 - b. Admitting the validity of objection but showing another feature to offset the objection
 - c. Admitting that the objection is reasonable but showing that it does not really apply
 - d. Changing the objection into a selling point in favor of the article
 - e. Avoiding:

Generalizations which mean nothing
 Contradiction of a customer's statement
 Display of a negative or discouraging attitude

Again, do not pressure customers to purchase; they are not likely to return if pressured.

Suggested Teaching-Learning Activities

1. Ask students to recall experiences of refusal to purchase an item a salesman was attempting to sell. List these on the board, then assign probable reasons for the refusal to buy (need - thing - quality - source - price - time). Have them suggest methods the salesman might have used to try and eliminate this resistance.
2. Have students list objections they would have to purchasing some of the supplies or services they are trying to sell in their occupational experience training centers. Work out methods of correcting these deficiencies or objections.
3. Have students visit neighborhood stores to find out what are the most common objections or items of sales resistance encountered.
4. Have students role-play the sale of a familiar product, emphasizing the overcoming of resistance exhibited by the student playing the part of the customer.

Suggested References

1. Fundamentals of Selling, Chapter 17.
2. Store Salesmanship, Chapter 4.

Suggested Occupational Experiences

The student should have experience in attempting to overcome the sales resistance of customers at the training center. Suggest that he report in class how he handled it. Discuss if he used the correct approach. Have his supervisor in the training center critique his performance.

IV. To learn how to close the saleTeacher PreparationSubject Matter Content

- To learn when to close a sale
- To learn methods of closing a sale
- To learn why salesmen fail
- To learn to stimulate buying
- To successfully complete the transaction

Obviously, closing the sale is the most important of all the steps in the buying process. Everything that has been done so far comes to naught, if the customer leaves without making a purchase. Closing starts at the beginning of the sales presentation and "trial" closes are appropriate as it proceeds.

Customers resent being hurried into making a purchase. The salesman must take an active part in inducing a favorable action on the part of the customer, but his attitude must be one of helping the customer in making a wise decision.

Sales are lost because the salesman fails to tailor the sales presentation to the individual needs and requirements of the customer.

A salesman is performing a useful service by offering suggestions to customers who are not aware of their needs or to customers who rely upon displays to remind them of what they came to purchase.

Anybody can sell a customer something he wants. It takes a salesman to sell the customer needed items of which he was unaware.

Closing the sale will be more or less automatic if the need for the article has been definitely established. One of a salesman's functions is to help the customer decide by making "trial" closures.

Don't trip on the last step. The time to close the sale is just after the customer has decided to buy.

Indications that the customer is making up his mind occur when the customer asks the salesman to repeat the advantages of each item and when he wants unwanted goods removed. This is when the salesman should repeat the advantages of the item in which the greatest interest was shown by the potential customer.

The decision to buy occurs after the following conditions have been met:

1. The customer has exhibited attention, interest, and desire in the product.
2. A relationship between need and the merchandise has been established.
3. All important objections have been overcome.
4. The price is low in comparison with value.
5. The product meets the customer's approval.
6. The customer has the power to make the purchase.

The above decision is reached by taking steps during the presentation to make buying "action" easy. Such steps include leading the customer to make a number of small favorable decisions himself, making these decisions progressively more forceful, seeking agreement more frequently as the presentation progresses, and narrowing the selection. This is done by concentrating upon items in which the customer is interested, by removing merchandise in which the customer is not interested, by repeating demonstrations in more detail, and by soliciting the opinion of others. Always ask for the order. Use the "choice" method in beginning the closing phase, i.e., 2 or 3 dozen.

Failure to close the sale may be due to:

1. Assuming that the customer is not going to buy
2. Hurrying the customer
3. Failing to help the customer decide

4. Stumbling over sales obstacles
5. Stressing the wrong selling points
6. Trying to force action
7. Being discourteous when the customer does not buy

When engaged in suggestion selling, the salesman must:

1. Make definite suggestions to the potential customer.
2. Give an acceptable justification for the suggestion made.
3. Demonstrate the merchandise thoroughly and unhurriedly.
4. Not overwhelm the customer with more facts, decisions, etc., than he can face comfortably

Sales are often increased by displaying related merchandise, handling larger quantities, comparing with higher priced merchandise, introducing new merchandise, developing "special" sales, demonstrating new uses for merchandise, and specializing in merchandise for special occasions.

When recording the sale, the salesman, in preparing the sales check, should:

1. Write legibly.
2. Be accurate with items, amounts, and price.
3. List the complete name and address if needed for files or for delivery.
4. Write down any special directions needed to help the customer.

When operating a cash register, make change accurately. Never put a bill away until the customer is satisfied that he has received the correct change. Use the right compartment for paper money and change. Also, learn to count out change properly.

Just because the register bangs shut does not mean that the sale is completed. A proper, courteous farewell often means repeat visits by the customer.

Give the customer a friendly farewell whether or not he makes a purchase and invite him back soon.

Suggested Teaching-Learning Activities

1. Demonstrate, by role-playing, the closing of a sale including:
 - a. Packaging or wrapping
 - b. Making out sales slips neatly and accurately
 - c. Operating the cash register
 - d. Making change (using real money is most effective)
 - e. Closing remarks

Considerable time should be allowed to do this until all students are able to do it correctly every time. Shortchanged customers do not return; undercharging customers costs salesmen their jobs.

2. Make tape recordings of all sales conversations of students; play the recording back to point out errors in technique and grammar which need to be corrected.

Suggested Instructional Materials and References

Instructional Materials

1. Standard cash register
2. Tape recorder
3. Books of sales slips
4. Money
5. Telephone

Reference

- T 1. Fundamentals of Selling, Chapter 18.
2. Store Salesmanship, Chapters 5, 6, and 7.

3. "Making the Sale," film, McGraw-Hill

Suggested Occupational Experiences

Have the students gain experience at the training center in closing sales, wrapping, making out sales slips, operating cash registers, and making change.

Suggestions for Evaluating Educational Outcomes of the Module

In the final analysis, the best evaluation of the module is the ability that the students exhibit in selling agricultural supplies and services. Different techniques may be used to determine this.

An evaluation check list completed by the cooperating supervisor in the occupational experience center may be used. Self-rating by the students may be used. Evaluation check lists completed by the former student's first employer upon follow up by the teacher may be used.

Such check lists should emphasize each of the competencies included in this module.

Sources of Suggested Instructional Materials and References

Instructional Materials

"Salesmanship Series," 16mm film, B and W, 1959.
New York: McGraw-Hill Book Company Inc., with titles as follows:

- "The Approach," 10 minutes, \$65.00 purchase price.
- "Making the Sale," 17 minutes, \$100.00 purchase price.

Note to Teachers: These films may be available for loan from libraries or audio visual centers. Other titles in the series which may be desirable to show after previewing but are not particularly applicable for this module are:

- "Prospecting," 10 minutes, \$65.00 purchase price.
- "The Pre-Approach," 10 minutes, \$65.00 purchase price.

HUMAN RELATIONS IN AGRICULTURAL OCCUPATIONS

Major Teaching Objective

To develop in the student an understanding of the qualities necessary for employment advancement in agricultural occupations

Suggested Time Allotments

At School	
Class instruction	<u>24</u> hours
Laboratory experience	<u>0</u> hours
Total at school	<u>24</u> hours
Occupational experience	<u>12</u> hours
Total for module	<u>36</u> hours

Suggestions for Introducing the Module

This module may be introduced by viewing the 35mm sound filmstrip, "Your Attitude is Showing."

Teachers, in preparing to teach this module, cannot "rush" through it. Competency III, especially, cannot be hurriedly taught.

The students need to understand how relations with people influence the selling process. Good selling is also "top notch" educating. Selling remains the most tangible link in the chain of supplying agricultural products to customers. Each link in the merchandising process depends on the ability of people to communicate and thus coordinate the business operations. The efficiency of a business enterprise is largely determined by the effectiveness of the relations existing between people in contact with the business or occupation. This is the reason why human relations in a business are so important. These relations depend on the sincerity and attitude of the persons employed in that business. Some companies find that two-thirds of all people fired are fired because of disloyalty to the firm or its managerial personnel.

A student who desires to become competent in an agricultural business needs to realize that his personal traits and ability to work effectively with others will determine his value to the business. This in turn will determine how well he will be paid for his duties and how rapid he will advance in his position.

There are four basic types of human relation situations that an employee in an agricultural occupation will encounter. They are:

1. Employer-employee relations
2. Supervisor-employee relations
3. Employee-employee relations
4. Customer-employee relations

The relationships between employees and employers will differ from business to business. Give the students an opportunity to suggest the human relationship characteristics that employers desire in employees. Do these give any clues as to why employees might be dismissed from their occupations? Does this suggest reasons why employees may terminate their employment voluntarily? Prepare for classroom distribution, the following table on which students may categorize their responses.

Reasons Why Employees Leave Their Jobs

<u>Student Reasons</u>	<u>Employer Reasons</u>
<u>Employees Quit</u>	
1.	1.
2. etc.	2. etc.
<u>Employees Dismissed</u>	
1.	1.
2. etc.	2. etc.

After the students have compiled their ideas on why employees are dismissed or have quit, invite local employers to speak to the class and have them give their reasons why employees are dismissed or why employees terminate their employment. A panel of employers will be more effective than a single employer.

When both lists are complete, note the number of instances in which the reason had to do with the personal relations of the employee. Discuss the symptoms of dissatisfied employees and employers. Relate these symptoms to real causes or personal problems in a business. The employers might be willing to relate incidents of personal problems that employees of their businesses might have experienced.

Supervisor-employee relations might be identical to employer-employee relations. Indeed, the supervisor might be the employer. In many businesses, however, employees are responsible for their activities to an individual who is not the employer. Discuss with the class how these relationships might differ from those with the employer. What are some of the problems that can develop when the employer and the supervisor are two different individuals? What should the supervisor expect from the employees for whom he is responsible?

Point out to the students that they must develop a harmonious working relationship with employees as well as with the employer or supervisor. Some employees can work with everyone; others cannot work with anyone. Identify with the class those human traits found in people that make them easy or difficult to work with. Successful employees may be invited to the class to discuss the problems they have encountered in working with other employees and the techniques they have discovered to be effective in helping them to "get along" with all employees. Do all employees need

the same kind of human relation traits? Would employees tend to have different reasons for dismissing employees than would employers or supervisors?

Employee-customer relations are important to anyone employed in agricultural business occupations. The salesman's dealings with the customer are the most critical link in the chain of merchandising products. Ask the class to give reasons why their parents purchased one product over another, or at one business rather than another. Point out that many products are purchased because the buyer appreciates the salesman's personal traits and abilities. These traits and abilities involve knowledge of the product sold, personal honesty, integrity, and courtesy.

Ask the class, "What agricultural commodities tend to be sold on the strength of the dealer's reputation? Why?" Suggest factors which influence the need for strong personal commitment between the buyer and the seller of the product. How does the salesman's age and knowledge of the product affect the personal relations between the sales employee and the customer? Why?

If two products have almost identical technical properties, the reason one sells and the other does not may be due to the salesman.

Product information and sales are beamed toward the personal needs of customers. During a sale, product information should be made directly applicable to the personal needs of the potential customer. Ask the students to list human needs of every person.

A. H. Maslow, as a "preface to motivation theory," has listed human needs from the most biological to the most social:

1. Those needs which are essential to sustaining life itself: needs for air, food, water, warmth, etc.
2. Those needs which are related to maintaining the physical safety of the individual, such as the need for defense against physical attack
3. The need to be loved, cherished, and aided by others
4. The need for esteem: the need to have worth and value as an individual, to respect and value oneself because one is respected and valued by others
5. The need for self-realization: the need to be creative and productive, to cope with life effectively, to work for and attain worthwhile objectives

Competencies to be Developed

- I. To identify particular occupations which offer the most promising employment opportunities for a particular person

Teacher Preparation

Subject Matter Content

Develop the idea that understanding people means being able to differentiate among the many beliefs, attitudes, and abilities which different persons have. People may look alike, but their thoughts and actions differ.

Discuss with the students the personal attributes needed by employees before they will be accepted as suitable individuals by their employers. What is meant by such terms as honesty, loyalty, cooperation, etc.? Have them develop in their minds individuals they know who possess these qualities. Are these qualities lacking in certain business employees with whom they are familiar?

In addition to being able to identify various degrees of characteristics in people, prospective agriculture business employees need to understand that all behavior is caused by something. Why do persons cheat? Steal? Why do people help their neighbors?

We should defer judging other people's behavior until we have some understanding of the reasons for their behavior. A direct application of this principle would be an employee who has difficulty getting along with another employee. An employee should attempt to understand why the other person behaves as he does. Once the employee has this understanding, he will be more capable of adjusting to the individual.

As an individual considers his environment and himself, he begins to make plans for the future. A person who does not plan his career can expect to be more directly influenced by his environment than the person who examines the various directions for his future and sets a goal. Many times a student can set his goal and change the environment to fit his objective more directly.

Consequently, we see students beginning to form habits and taking on definite personality characteristics. Teachers are in key positions to assist their pupils in evaluating their past experiences and present attitudes, and in projecting changes in them toward career development.

Test information provides a guide to career decision-making. It is only one of several sources of information. Others include parents' attitudes and personal considerations. Discuss the purpose of giving the following tests when planning a career:

The Aptitude Test
 Tests of Skills and Abilities
 Interest Inventory
 Personality Tests
 Intelligence Tests

Consult with the guidance counselor in the school system. Compile a folder for each student which contains test results and prepare an interview for each student with the guidance person.

After helping each student evaluate himself, the next step is the identification of occupations which offer prospective employment for that particular student.

Several films are listed in the references which offer a general description of career opportunities in agriculture.

Career information pamphlets are available from colleges of agriculture, which describe opportunities for young persons in agriculture. These pamphlets are listed in the references.

Place the following information in chart form on the chalkboard. The relationship between education and income is a dramatic one.

Median Annual Income for Male Persons, Fourteen Years Old
 and Over
 (Based on 1961 earning levels)

<u>Amount of Education</u>	<u>Median Income</u>
Less than 8 years	\$2,090
8 years	3,452
1-3 years of high school	3,865
4 years of high school	5,052
1-3 years of college	5,246
4 years of college	7,261
5 or more years	7,691

Present an outline of an occupational brief to the students.
The following is an example:

Job title
Basic qualifications (sex, age, marital status, military status)
Physical qualifications (health, travel, etc.)
Personal qualifications (interests, abilities)
Skills, knowledge, and abilities required
Wage, hours, conditions of work, employee benefits
Avenues of entry and promotion
Educational and training requirements

Several of the listed references provide forms for evaluating careers in agriculture.

Information about careers is available from several sources:

1. Your public or school library
2. Interviews with friends, relatives, neighbors
3. Personal visits to place of work
4. Observation of the jobs around you
5. Newspaper ads
6. Classes in occupations or social studies
7. Interviews in public employment offices
8. Vocational films
9. Government bulletins

Suggested Teaching-Learning Activities

Invite the local employment security officer to speak to the class to give information about the characteristics of people they place who are successful, about his own duties, and the kinds of information which may be secured from his office.

Ask the students in what ways the following factors could affect employment opportunities:

Physical condition (health and age)
Personal and home life (attitudes and beliefs)
Past experiences (school and work)
Mental abilities (recall and memory, ability to reason, ability to make decisions, rapidity of thought, and creativity)
Motor abilities (coordination, dexterity, reaction speed)
Knowledge and skills
Education
Character

Have students rate themselves on the following personality traits. Have the students ask themselves if they always, usually, or never have these personality traits:

Desirable Personality Traits

Accurate	Conscientious	Loyal
Agreeable	Dependable	Mature
Appreciative	Energetic	Patient
Alert	Enthusiastic	Realistic
Careful	Efficient	Responsible
Confident	Honest	Tactful
Cooperative	Kind	Tolerant

Objectionable Personality Traits

Antagonistic	Greedy	Sensitive
Argumentive	Inattentive	Sulky
Artificial	Militant	Timid
Boastful	Moody	Untrustworthy
Critical	Rebellious	Vague
Defensive	Sarcastic	Vulgar
Domineering	Selfish	Vicious

Have students report on the qualities they like in other people. Ask the students to evaluate themselves accordingly.

Ask students how their hobbies and outside interest can affect their success in working with people on the job they hold.

From these activities, students should be able to make up a "Personal Data Sheet." Forms for a data sheet vary from reference to reference. General categories might be:

- Personal information
- Job objective
- Education
- Work experience
- References

Develop a list with the students of what employees want from a job, i.e., recognition, a feeling of being useful, adequate wages, security, etc., and stress the point that much of this depends on their relations with others.

Discuss with the students how the personality traits and characteristics listed can influence their employment and chances for success. Point out that he, the student, is the only person

who can change these traits and characteristics. Such a personality profile should delineate those factors that will help or hinder the student in seeking employment.

Present the following on the chalkboard. Show how employee satisfaction is a direct result of matching employee needs with occupational expectations.

An Employee's Disposition

and Needs	+	result	Employee	Satisfaction
The Job	-----	in		or
Expectations				Dissatisfaction

For example, a person who likes to be with people, who is friendly and likes to discuss ideas, should not plan to become a truck driver. Why not?

Ask the students to list occupations that would be acceptable to an extrovert or to an introvert.

Ask the group to rate various volunteer members in the class on some personality test items. Compare the group's rating with the individual member's score. Point out that friends, relatives, and associates evaluate one's personal traits and characteristics. What other people think of you is going to have more influence than what you think of yourself. This has implications for ways to maintain morale in a work force.

Discuss the meaning of a person's "need-disposition." Do you think that a person who has always wanted to be a bookkeeper would be happy being a salesman in a feed store? Why?

Before the students go out on their occupational experiences, ask them to select occupations which are most likely to require their most outstanding abilities. These should be the job descriptions which offer prospective employment.

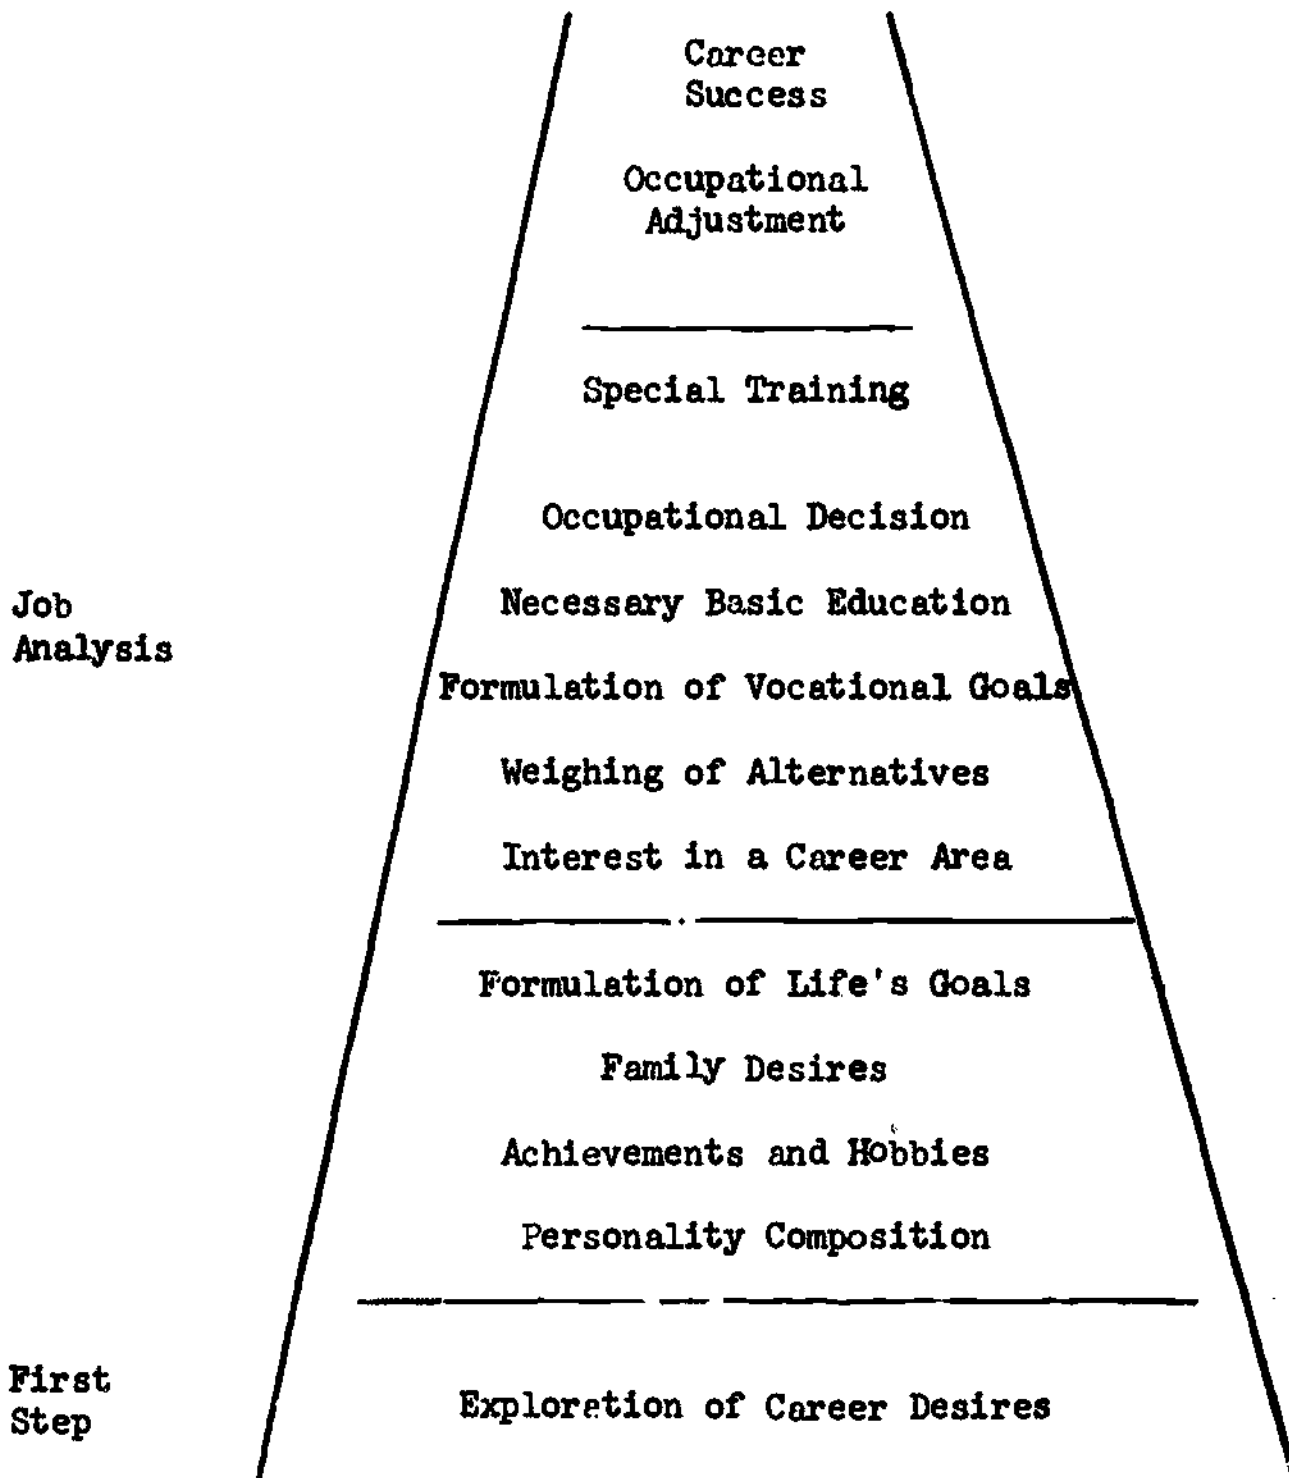

After the occupational experience on the job is completed, classify the discrepancies found between the requirements of the job and the student's qualifications for the job.

Ask the students to write a personality sketch of themselves and a job description of the position that they would like to be in ten years from now.

Below is a pyramid on building career success. It is suggested that this chart be duplicated, drawn on the chalkboard, or shown to the class with an opaque projector. Discuss with the class the sequence of events that lead to career success.

Building Career Success

Suggested Occupational Experiences

Ask students to prepare a detailed job description of the occupational position they are holding as a student trainee. Fill out in detail a list of the expected requirements of the job. Have them fill out the list at the close of the cooperative occupational experience. The cooperating employer should evaluate this list with the student.

Build into the program a variety of experiences for the student trainee on the job. For example, the student could spend one day with a selected employee from several different kinds of positions. The student trainee would then make out an occupational brief for that position.

Have the student do an occupational brief on a position in the business and compare the brief with the data sheet of the employee on the job.

II. To communicate effectively with a prospective employer

Teacher Preparation

Subject Matter Content

It doesn't do much good for the student to identify his strongest personal characteristics and to describe the job which would make maximum use of these characteristics unless he is successful in obtaining the position. Consequently, this section of the module concentrates on the employment interview. The employment interview is discussed in a number of references.

Perhaps the most fundamental of all human skills is the ability to communicate ideas, attitudes, and beliefs. This skill becomes

critical during an employment interview when time is short and the interviewee wants to make maximum use of all available means of communication.

During a conversation such as an employment interview, the communications process goes two ways. When words do not mean the same thing to the interviewer that they do to the interviewee, misunderstandings occur. Be precise with words!

Another opportunity for misunderstanding in an employment interview is the inattention of the receiver. To carry on an effective conversation, the listener must listen to what the speaker is saying. Many times during an employment interview, the interviewee will want to respond to what the interviewer is saying. Ask the students to list the number of ways a person might respond when wanting to agree with his prospective employer.

Example: A raised eyebrow, smile, nod of the head, etc.

Verbal communication is not the only important way to communicate with a prospective employer. A firm handshake can tell a lot about a person.

Preceding the employment interview, the student will write a letter of application. Discuss the purpose of a letter of application.

The letter of application is a personal sales letter. Its purposes are to:

1. Establish contact by indicating how the job became known to you.
2. Create interest by stating your personal qualifications, interests, and achievements.
3. Convince the employer that you are the man to fill the position by indicating that the job is interesting to you as a career or by indicating that you feel this is a stepping-stone to earning greater responsibility in the company.
4. Interest the employer to sufficiently generate action by including a list of references who know of your work and ability and who could vouch for your qualifications.
5. Interest the employer by requesting an interview to personally relate your qualifications.

6. Supply the prospective employer with enough information for him to arrange the all-important interview with you.

Letters of application should be typewritten, if possible; if not, write in ink. The letter should be written on a good grade of standard $8\frac{1}{2}$ x 11 bond stationery. Check the letter for misspelled words and grammatical errors. Neat and legible copy with no noticeable erasures or blots can create a good impression. Be sure to fold the letter correctly and to place it in an envelope of correct size.

The question of salary should be avoided until a prospective employer specifically requests you to state it. Your response could then be, "While it is difficult for me to say what salary I should receive, I would consider _____ per month a fair starting salary."

People communicate ideas and attitudes in a number of ways. How we look and dress reflects our attitude. A pair of shoes in need of a shine communicates much to a prospective employer.

How do we acquire the personal and social skills necessary for success?

The process of maturing and growing up has left its mark on each of us. A person once said, "We are a part of every person we meet." In a very real sense this is true. As we share experiences with others, we understand them better, and we learn what is expected of us. What is expected of us varies from place to place.

An employer hiring an individual to pick tomatoes by hand would not expect the same personal characteristics as he would in a prospective employee selling tomatoes and representing his business to customers.

The salesperson, representing the business and product to the customer, is the last link in a chain of employees. This customer-oriented employee, who automatically becomes associated with the business product, must be pleasing and acceptable to the buyer.

Impress upon the students that there are some personal characteristics which everyone demands--cleanliness as opposed to dirtiness, for example.

Invite the home economics teacher or other qualified persons to discuss with the students proper grooming, eating habits, how to make an introduction, etc.

Introductions are a means of making people feel comfortable. One person is introduced to the other such as, "Phyllis Lewis, have you met Bob Jones," or "Father, this is Bill Smith."

Rules for introductions are:

1. Present a younger person to an older person.
2. Present a boy to a girl or a man to a woman.
3. Present a less prominent person to one of greater importance.

Suggested Teaching-Learning Activities

Invite a student from whom you expect to receive a mediocre handshake to role-play being introduced to a prospective employer. Discuss the importance of a handshake in communicating an individual's personality.

Introductions can be important. For example, a prospective customer might want to meet the new school principal who happened to be in your store. The ability to introduce the prospective customer to the principal could mean a future sale.

After discussing the suggestions for writing a letter of application, ask the students to write a letter for a particular job description. Analyze the student letters and suggest changes for improvement.

Have each student prepare a personal data sheet describing his personal characteristics, job objectives, education, work experience, and references.

Set up a role-play phone conversation of a student requesting an appointment for an employment interview. Ask one student to be the employer and another to be the prospective employee. The class should "listen in" on the conversation and analyze the roles of the two persons. Rate them on politeness, articulateness of voice, comments, etc.

Role-play employment interviews with the students dressed appropriately. Tape record the sessions and play them back to the class. Discuss methods of improving the interviews.

Compare the effectiveness of a phone interview with that of a face-to-face interview in conveying impressions of personal characteristics, such as voice inflection, dress, use of English, etc.

Ask students to list items that they will want to learn from an employment interview.

List items the employer will want to know during an interview that a prospective employee should be prepared to discuss.

List the personal attributes that each channel of communication can best convey to a prospective employer.

Communicating Abilities and Attitudes

	<u>Personal</u>	<u>Social</u>
A written letter	(List characteristics you would want to convey. Example: accuracy, neat appearance, etc.)	
A face-to-face interview		
Indirectly through a reference		
Telephone conversation		

Ask students to list a number of different ways they can communicate their past experiences to an employer. Example: Letter of Application, Recommendations of Past Employers, etc.

Ask the class what factors influence the selection of a person for an employment reference?

Ask the students to rate themselves on the personal characteristics checklist. The list below was compiled from the results of hundreds of answers to the question: What physical traits keep people from presenting a good appearance and hence hurt their personalities? Place a check mark before each trait that applies to you:

- | | |
|--|---|
| <input type="checkbox"/> Dirty fingernails | <input type="checkbox"/> Unshined shoes |
| <input type="checkbox"/> Dirty hands | <input type="checkbox"/> Bad breath |
| <input type="checkbox"/> Beard | <input type="checkbox"/> Too few baths |
| <input type="checkbox"/> Yellow or unclean teeth | <input type="checkbox"/> Inappropriate clothes |
| <input type="checkbox"/> Pimples on face | <input type="checkbox"/> Awkward posture |
| <input type="checkbox"/> Dirty face | <input type="checkbox"/> Hair not combed |
| <input type="checkbox"/> Greasy hair | <input type="checkbox"/> Broken shoestring |
| <input type="checkbox"/> Dandruff | <input type="checkbox"/> Buttons missing |
| <input type="checkbox"/> Hair too long | <input type="checkbox"/> Clothes fitting poorly |
| <input type="checkbox"/> Soiled clothes | <input type="checkbox"/> Dirty handkerchief |
| <input type="checkbox"/> Baggy trousers | <input type="checkbox"/> Run-over heels |

Number of checks _____

Even one check may be the difference between employment and unemployment.

If you checked more than six, you are in pretty bad shape. Drastic action is necessary.

Look over the items that you checked. Each one is a personality defect in the eyes of other persons. Each defect can be eliminated.

Suggested Occupational Experiences

After preparing students in the classroom, send them for an interview with their prospective employment cooperators "on their own." Ask for a report on the interview from the cooperating employer. Timid students may require more attention before they are willing to "go it alone" during an interview.

Ask the students to report to the class on their general impressions of the interview.

During the cooperating employment experience, each employer should analyze the student's work record with the student trainee and teacher present. Note any improvements made in personal and social skills.

III. To understand complex problems of human relations found in a business by identifying the problems, analyzing the situations, and formulating possible solutions

Teacher Preparation

Subject Matter Content

Suggest to the class that there are two main categories of factors which affect their interpersonal relations on the job. The first is the kinds of tasks they are asked to do. Early in the module, emphasis was placed on identifying job skills which were compatible with the individual's wants or needs.

The second group of factors affecting personal relations on the job pertain to the environment. The attitudes of the other employees, the time requirements of the job, the freedom to be your own boss, etc., all affect an employee's relation to other persons. Although we study these categories of factors separately, in practice, they are almost impossible to separate.

One way to study interpersonal relations within agricultural businesses is to examine relationship among employees, between employees and customers, and between the employee and the supervisor.

If a student develops a concept, an idea, or expectation of the relationship which should exist within a business, he or she should be better prepared to cope with any eventuality when he or she actually becomes employed.

Consequently, this section of the module presents concepts of loyalty, honesty, etc. Invite student responses to the descriptions given, and suggest solutions or role-play the cases that follow a description of the concept.

Suggested Teaching-Learning Activities

Ask the students what factors would affect an employee's ability to get along with his supervisor. Discuss the effect of age, tenure, education, etc., on human relations in an agricultural business.

Ask students what a "boss" should expect from his employees. Ask students what an employee should expect from his boss. Use the case studies described on pp. 19-30 to illustrate the points brought out. Stress the completed involvement of human relations in these expectations.

The structure of a business (the line-staff relationship) has an effect on employees. Present the following diagram and ask the class to compare the relationships between employees A and B with those between B and C.

Line-Staff Relationships

_____ = Direct command relation

- - - = Informal communications

Present the following table to the class at the beginning of this section of the module. These are examples of human relations concepts that could be duplicated and passed out for class discussion:

Implications of Human Relations Concepts in Three Different Occupational Relationships

Relations with

<u>Concepts</u>	<u>The Customer</u>	<u>The Supervisor</u>	<u>Another Employee</u>
Loyalty			
Respect for Authority			
Willingness to Learn			
Cooperation			
Honesty			
Responsibility			
Leadership			
Morale			

Ask members of the class to describe the meaning of the concepts in these three different frames of reference. Most students will want to give an example of what the terms mean.

Ask students to describe the negative dimensions of the concepts.
Examples: A disloyal employee.

The following material in this module may be duplicated by the teacher and passed out to the students for discussion.

LOYALTY

An employee faithful to the supervisor and business firm who employ him will always be an asset. Many situations will occur which are difficult to anticipate. An employee will find it very difficult to hide his feelings about the people and organization for which he works. If he respects his superior and enjoys working for the agricultural business firm, he is likely to convey this attitude to his friends and prospective customers. Obviously, loyal members are highly desirable. The real problem comes in trying to define "loyalty" and to develop it in people.

Loyalty implies support of a cause, ideal, practice, or custom. It includes an element of faithfulness to a person or organization.

People live by faith and confidence in other people and organizations. As you drive down a street approaching an intersection, you believe the car on your right will stop at the stop sign. You expect the car to stop.

Loyalty in an agricultural business operates in much the same way as in faith on a highway. The supervisor or other person representing management expects employees to perform the tasks assigned to their specific occupation. In return, the business agrees to pay employees a salary. The employees become agents of the business during the working day. Whether or not this obligation to support the business extends into other parts of the day depends on how the employee feels about the business. If he has been treated fairly and honestly, he probably will continue to support the organization after working hours.

Loyalty takes time to mature and grow. It is the product of continued contact with a person or business over a length of time. New employees should not expect to receive it before proving themselves worthy of their supervisor's faith and confidence. Likewise, business firms must earn loyalty from their employees. The good will and loyalty which develop between a supervisor and employees or among employees are valuable commodities, which are not to be treated lightly.

The Case

Norman Jones, an employee in a farm supply store, has sold goods in this store for a number of years. He has come to know and to appreciate his co-workers and the manager of the business office. As far as he knows, the store has always attempted to give good service to its customers.

This afternoon, Wayne Wilson, ordinarily an intelligent and mild-mannered local farmer, came into the store very upset. An insecticide which he had purchased at the store and applied to his alfalfa had seriously damaged the crop. Wayne believed the store manager deliberately sold him the wrong kind of insecticide.

Wayne and a group of neighbors have been going together and ordering their protein supplement directly from a soybean processing plant. By ordering a carload and splitting it among one group, they can purchase the supplement much cheaper than the store can afford to sell it to them. Wayne believes this is the reason the store manager sold him the wrong insecticide for his alfalfa.

Wayne came up to the counter and demanded in a loud voice to see the manager. Norman looked for the manager but couldn't find him. Wayne did not want to wait, so he left the store mumbling to himself. When the manager came in, Norman related the story to him. They found the sales slip which gave the name of the insecticide which was sold to Wayne Wilson. It was appropriate for alfalfa. They read the instructions and decided that Wayne must have made the spray mixture too strong.

Since the agricultural business didn't want to offend a customer, the manager asked Norman to drive out to Wayne Wilson's farm and explain the situation to him. When Norman arrived at the farm, he found a neighbor of Wayne's helping him assemble some machinery. Norman carefully explained what must have happened, showing Wayne the sales receipt. Like most of us, Wayne did not want to admit the damage to his alfalfa was his fault. Wayne was critical of the store, and said, "The store manager deliberately gave me wrong information."

Assuming Norman is a loyal employee, what should he do?

Discuss the statement, "A loyal employee should endorse all business policies at all times." To what extent is this true?

RESPECT FOR AUTHORITY

Authority in agricultural businesses usually rests in administrative positions which are responsible for production processes. For example, in large businesses there may be a vice-president for sales, one for production, another for personnel, and so forth. Each man has the right to make decisions for his area of the business. Each person in an administrative position is usually responsible to the manager or president of the company. The top management position answers to the Board of Directors who have final control of the organization. Each person in a business forms part of a chain.

Authority is the power or right to give commands, take actions, or make final decisions.

In some businesses these lines of authority may be closely drawn with each person carefully guarding his own domain. Large-scale organizations controlling many sub-parts sometimes becomes bureaucratic. Much valuable company time and effort may be lost by employees fearful of petty jealousies and status-hungry co-workers. Most agricultural businesses are relatively small and uncomplicated. Yet, the concept of respecting your superior is an important one, even in a small business. Consider the following case.

The Case

Mr. Renolds is the owner and operator of a poultry farm. The largest enterprise on the farm is a flock of 25,000 laying hens. He produces, grades, packs, and delivers eggs under his own farm brand. He retails some eggs to customers who are willing to drive out to his farm, but most of his eggs are delivered to grocery stores and restaurants in an urban area.

Mr. Renolds spends most of his time delivering and selling eggs. He seldom directly oversees the work of five employees on the farm. Instead, he has appointed as foreman an employee who has been with him a long time, Tom Curtin. Tom makes all of the work assignments.

One of the men who had been working on the farm took another job. Mr. Renolds contacted the local vocational agriculture teacher and asked if any of the June graduates would like temporary or permanent work. He interviewed and consequently hired Bob Mix, an energetic young man with impressive grades and a desire to get ahead. After the interview, the vocational agriculture teacher congratulated him and told Mr. Renolds that he had hired someone with a great deal of initiative. Mr. Renolds replied that he was looking for that kind of person, because he was very dissatisfied with the amount and quality of work produced by his farm crew. He hoped Bob could improve the work output.

Bob had been working about a week when he discovered the problem mentioned by Mr. Renolds. He was hauling wood chips from a nearby sawmill. By 2:30 p.m. he had hauled three truck loads and was planning to get another when the foreman, Tom Curtin, came over to the truck and complimented him on his good day's work. Bob explained that he had time to get another load before 5 o'clock and planned to do so.

"Now, Bob, you are new on this job," was Tom's reply, "and out here on the farm we work with each other. Mr. Renolds leaves these kinds of decisions up to me. Nobody works too hard and

nobody accomplishes so much that he causes others to get fired. You are not going to haul another load of wood chips today!"

If you were Bob, what would you do?

WILLINGNESS TO LEARN

One of the few certainties of life is the likelihood of change. Everywhere we see new products and new techniques taking the places of old ones. Business firms spend a great deal of money on research to find new and better products.

Car manufacturers can change a design for a new model rather easily; people are much more difficult to change. Once ideas are entrenched and attitudes established, it is very difficult for individuals to accept new ones. Fixed patterns and habits always take precedence over new ones.

Since "things" change more easily than people, employers usually investigate a prospective employee's willingness to learn new ideas. A person who accepts inevitable changes that occur during the process of living will not spend as much time worrying about them as the individual who does not. Previously held assumptions need constant re-evaluation. Much energy is expended by frustrated dissatisfied employees. A willingness to change and learn new ways of doing things is a characteristic which we should all cultivate.

The Case

The Quick-Trim Landscaping Company is a large agricultural business which employs various teams of men to perform a variety of duties. The company has contracts for maintenance of cemeteries, parks, etc. It also establishes new lawns. Within each work team, some job tasks are more specialized than others. Alvin Myers, the foreman of one six-man work crew likes each man to be familiar with a variety of skills. When an individual is absent or is sick, another person from the same group can take over his responsibilities. These new skills are taught to the men during slack periods in certain seasons of the year.

Last week, Alvin asked Jake Hanson, one of the older employees in his group, to learn how to operate a surveyor's level. The instrument is used in determining field grades, drainage ditch routes, and selecting and checking the level of the seed bed on an area to be landscaped. Jake is a 35-year-old employee who is married and has two school-age children. He has very little initiative; in fact, he has had trouble keeping a job. He has been with the landscaping company for six months. So far, he hasn't had much to say, keeping to himself and doing only what

was asked of him. When Alvin asked Jake to use the level, he replied, "I'm not getting paid to run that thing and do that kind of work. I don't want anything to do with it."

How do you feel about Jake's comment?

COOPERATION

Whenever one human being finds himself in contact with another, either on the job, at school, or in the home, personal relations become a factor between the two personalities. Feelings and attitudes between persons affect the goals of the social group. In many cases, the goals of the social group--the church, the family or the business--can be attained only with the help of individual members. Agricultural businesses operate to make a profit for their stockholders and provide services to customers. Employees should accept these goals and work toward their accomplishment. Whenever you engage in a cooperative enterprise with others, you expect to lose a certain amount of individual freedom in order to benefit the group.

Cooperation means joint action with others in pursuit of common well being.

Cooperation in an agricultural business is similar to the activities of a football team. Each individual has a job to do. Without the efforts of the linemen, the quarterback or fullback could do little to advance the ball. Likewise, the salesmen must sell the products before a manager can show a profit. It takes the cooperation of all employees for a business to operate smoothly and efficiently.

The need for cooperation extends into every business firm. Each employee is a member of a team--a business team. He has responsibilities to fulfill which contribute toward the team goals. Many occupations in a business, such as the quality control personnel in a milk processing plant, are key positions. If the employees in these positions neglect their jobs, the entire business suffers because the quality of the product is lowered. To a greater or lesser extent, the business is affected when any employee does not perform his job adequately.

Cooperation doesn't just happen; it has to be encouraged. An employee who feels rejected by his employer or believes the business is taking advantage of him, is not likely to give up many personal privileges to contribute to company goals or policy. Fortunately, most people desire to belong to groups and want to get along with their fellow employees. Some of the most satisfying employment experiences come from the warm

personal friendships which develop between customers and employees, between the employee and the employer, or among employees. These feelings can be so strong that employees dislike being transferred from one location to another even within the same company.

Before two employees can cooperate on a mutual project, each person must respect the other. If this respect does not extend to the personality of the other individual, it must at least extend to the other person as a fellow employee. Any agricultural business employee should see himself and others as members of a team working toward a common goal.

A person exhibiting a cooperative attitude will contribute much as an employee to an agricultural business. He will not only aid the company directly by enthusiastically giving of himself, but he will inspire confidence in the company and cooperativeness in other employees.

The Case

The East Coast Farm Supply Company is a cooperative organization which has several branch offices throughout the state. These branch offices supply feed and fertilizer to commercial farms in their respective areas.

Mike Hanna is a high school student, who is working for the Long Valley branch office of the cooperative during the summer between his junior and senior year. He has performed several different jobs around the cooperative. This week he was driving a truck and spreading lime on a nearby farm. He had worked hard all week and was looking forward to the weekend, when he was approached by the manager of the cooperative and asked to continue spreading lime on Saturday. Mike checked with the other four truck drivers and discovered only two others had been asked to work during Saturday. In Mike's judgment, he was asked to work because he was the youngest and the newest employee in the business.

If you were Mike, what would you do?

HONESTY

All of us have an idea of what we mean by the word "honesty." If we were to ask each person in the room to give his definition of the term, we are likely to have as many definitions as people. Each definition would reflect the past experiences of the person. Since we have all had different experiences, each person's concept of honesty would be different. Sometimes we use different

standards to arrive at a definition of "honesty." Honest behavior for some persons means doing whatever works. A person who successfully gives a false statement in defending a friend, has a completely different belief about honesty than an individual who would never tell a lie, regardless of the situation. The same person may use a different standard for honest conduct depending on the situation.

Honesty is straightforwardness of conduct; it requires a sincere effort from each of us to maintain integrity, fairness, and truthfulness in all situations.

Since we do not always know other persons' past experiences and beliefs, we have to be tolerant of their actions. A person may commit a dishonest act unknowingly and be sorry for it later. American people have emerged from the peoples of many nations. Consequently, our society contains persons with vastly different values and ideals. When we see an act committed which we dislike or do not understand, we must try to comprehend why the person did it and attempt to persuade him to change.

The Case

The Cox Implement Company has been located in a small rural community of 2,550 population for about ten years. They sell a nationally advertised brand of agricultural tractors and machinery. Many times they are asked to service the machinery of other makes both in their shop and out on farms. To do this work, the owner and manager, Mr. Cox, employs five other persons in addition to himself.

Ron Thomas is a young man who has been employed by the company for only two weeks. He is a good mechanic. He has had five years' experience with an automobile garage in another town. It had been an unwritten policy among the employees at his previous place of employment to take company supplies if they needed them for their personal use. As far as Ron knew, no one had ever taken supplies or equipment to sell to other persons.

One day another employee, who had become a friend of Ron, saw him put a handful of bolts and nuts in his lunch box, apparently to take home. If you were the employee who saw Ron do this, what would you do?

RESPONSIBILITY

Like "honesty" and "loyalty," the term "responsibility" defies any kind of comprehensive and precise description. The actions of a "responsible" person vary with different situations. Many

factors influence the "total" personality: a person's previous experience, his attitude toward his supervisor, and so forth. It is difficult to predict responsible behavior because it varies with the motives and aspirations of persons.

A responsible person determines his own acts by carefully considering the consequences of his decisions.

An effective business organization must hire trustworthy and reliable employees, persons who feel some obligation to their job and desire to complete work assignments. Such "responsible" behavior is necessary for efficient operation of a business.

A responsible person is one who is capable of determining his own actions. Responsibility implies an ability to foresee the consequences of actions. When an employee is consistently late for work, or takes a "don't care" attitude toward his job, or behaves inconsistently so that he cannot be counted on to complete work assignments, we say he is irresponsible. A person who is not responsible for himself will be a liability to any business, regardless of the menial tasks he performs.

This instructional material is designed to develop responsibility in the reader by asking him to consider the consequences of his decisions. Learning how to make decisions will go a long way toward developing responsible employee behavior in an agricultural business.

A business firm hiring a large supervisory staff to make certain employees are doing their jobs is maintaining an expensive administrative structure.

The Case

Warren Smith is an employee at a feed store in a rural community. Many farmers in the area buy feed on credit. There are three employees in the office who do most of the sales work. The customers like the informal atmosphere of the business.

Warren usually locks the doors at closing time. This evening he noticed two sacks of feed to be on the loading dock next to the storage room. The storage room is locked and the other employees have left for the day. Warren examined the feed without finding any reasons for it to be outside.

What would a responsible employee do?

LEADERSHIP

In a democratic organization, members of a group select the persons to lead who best represent the majority's feelings and beliefs. The majority of the FFA members elect a chapter president. The person elected becomes an identified leader of the local FFA chapter. Members expect him to make suggestions and keep the FFA chapter moving toward its group goals. If he does this well, the leader is admired and respected. Sometimes group leaders are appointed to positions of responsibility. This often happens to committee chairmen. An appointed leader may act just as effectively as an elected leader.

Leaders are expected to act in behalf of the group they represent. For example, the person elected by FFA members to represent them on the student council should maintain the interests of the FFA organization. If a leader's personal interests conflict with the interests of the group he represents, he should resolve the problem. A group does not have the right to expect its representative to act against his own wishes. Many times, leaders will exhibit responsibility and seek to change the group's view. In fact, this is the value of leadership; to influence the group to action which they would not do without a leader. Some of our most important leaders in history have not agreed with the ruling majority. Columbus believed the world was round, but he had to sail across the ocean to prove it.

Leadership is exhibited by a person who directs, commands, or guides a group or activity. A leader often exerts influence by persuasive techniques rather than by force.

An important quality of leadership is accuracy. Few groups of individuals will follow a person with false ideas. If you desire to influence others, concentrate on facts and make definite statements only when you are certain you are right. A leader must accept responsibility for influencing other people. If a leader directs a group to take certain action, he is more responsible for the consequences of that action than are other members of that group. Many persons do not like to accept responsibility and shrink from tasks of leadership.

On the other hand, leaders are in the limelight and are usually respected. This characteristic of leadership draws some people who are self-centered. The self-centered individual usually does not make a good leader because he is more interested in himself than in the people he represents. Persons being led soon realize this and turn to someone who respects their interest.

A position of leadership satisfies the need for belonging in a human being. What can build more self-confidence than people asking you for help? Positions of leadership are likely to be held by people who are interested in serving others.

Leaders are often classified into two different groups--formal and informal. Formal leaders are those who are chairmen of committees, or presidents of organizations. Persons who hold office automatically have authority to influence other persons. Informal leaders usually come from members of the group. They are selected by other members and act to sanction or "O.K." proposals suggested by the group. Sometimes in a meeting you will notice other persons asking a particular individual to express his opinion on a proposal. If he agrees it is a good idea, the members are for it; if he does not, they are likely to turn it down. Informal leaders are present in every group. They are a very important influence in human relations, because they gain their good will not by the office they hold but by the willingness of the members to accept their advice. Sometimes the formal and informal leaders of a group are the same persons.

Leaders are found in all types of organizations. A group of businessmen in a civic organization directing a charity drive has leaders; so does a street gang in a large city. Qualities of leadership are varied and many, depending upon the kind of group being led. In the previous example members of the charity drive may respect law and order; a street gang usually does not.

Leaders of both groups, however, must know the members they lead. The leaders are aware of the goals and aspirations of the group. Persons who are successful directing groups soon develop skill in approaching individuals with requests. If the task is difficult or unpleasant, a leader must use all his knowledge about an individual to select an approach which will result in the person's agreeing to the request. Leaders who can gain members' consent on actions and retain the good will of the members are the most effective. To do this, a person must acquire a knowledge and understanding of human relations. This is one reason we are asking you to read this unit--to make you more effective in leading members of your group. By extending your influence with other people, you should be able to accomplish your goals.

The Case

Ron Thomas is an employee of the Cox Implement Company which sells tractors and farm machinery in a rural community. Ron is

the newest member of the five-man implement company employee team. He has been an employee for only one week. Naturally he wants to make a favorable impression on Mr. Cox and the other men working for him. Ron knows that his actions during the first few weeks on the job will establish his reputation at the business. He is eager to contribute to the employee team effort.

In order to get better acquainted with the men, Ron eats his lunch at the implement company. During a recent noon break, the employees and Ron were discussing a lift which one of the men was constructing to fit behind a tractor and operate off the hydraulic system of the tractor. The man responsible for the job was not present. The lift was half finished and the men were discussing how to brace it for maximum strength. Ron's past experience told him that one brace on the lift was incorrectly placed. The horizontal brace should have been a diagonal brace. This is an opportunity to exhibit leadership and show his fellow employees how much he knows about lift-construction.

What should Ron do?

MORALE

People act from their hearts as well as from their minds. Some persons are inclined to let their feelings decide issues rather than make a judgment on logical and careful thought. We sometimes characterize persons who let their feelings and emotions rule their actions as "impulsive" and "emotionally immature."

Morale is the prevailing mood and spirit which permits dependable performance and steady self-control. Someone has paraphrased it as "how I feel about my job at any given time."

Morale is a state of mind of employees, growing out of their work conditions. It includes employee feelings toward supervisors, the company, and other employees.

Each employee can contribute to the morale of the group by paying attention to good human relations principles. Fair and honest treatment of persons as individuals promotes trust and confidence in a group. If you inform people of decisions affecting them, it will dispel doubts and fear of the unknown. Abrupt treatment of groups of people creates suspicion and disregards individual differences.

Whenever possible, employees should be asked to help management plan business programs. It gives employees a feeling of belonging to the group. An orientation program ordinarily helps employees become familiar with their environment and gives them

a feeling of security. A counseling program which considers the talents of the employee and matches them with the position available, usually results in a satisfactory work experience for the company and the individual. A happy and satisfied person builds morale in the group. A bright and cheerful physical environment can set the tone for attitude in the group. When you are employed in an agricultural business, show other employees your appreciation by complimenting them for work well done. Sometimes a free and easy flow of informal communication can contribute more to good morale than any number of policy statements.

Morale is very difficult to talk about, because it can only be inferred from other persons' actions. You cannot see it, touch it, or taste it. But you can determine if it is present in a large quantity or in a meager amount. Consider the following case:

The Case

Mr. William Bond is owner and operator of a large rural feed and grain elevator. This elevator does considerable grinding, mixing, and selling of feed to the farmers in the area. In addition, farmers market their surplus grain through Mr. Bond's elevator. Mr. Bond has two supervisors working for him, one in charge of the feed activities and the other responsible for the grain operations. Four months ago, Joe Johnson, the feed supervisor, retired, and Mr. Bond hired a young man, Jess Smith, to replace him. Jess Smith was a farm boy who was an outstanding vocational agricultural student and had just recently graduated as the top student from a two-year post-high-school course in agricultural business.

Mr. Bond has been hearing comments that the men working under Jess Smith are dissatisfied. They feel that one of them should have been promoted to the position of supervisor, that Jess Smith is making too many changes in the operations, and they don't like the fact that this relatively inexperienced young man is receiving a higher salary than they are.

How should Mr. Bond view this dissatisfaction? What should Jess Smith do to improve the relations with his men?

Suggested Occupational Experiences

Whenever the opportunity presents itself, the cooperating employer should invite the trainee to analyze incidents occurring on the job and relate them to the expectations of management.

Suggestions for Evaluating Educational Outcomes of the Module

Evaluation of the instruction in this module can only come when the student actually applies for a job, is successful in the employment interview, and becomes a profitable employee. However, teachers must use more tangible short-term goals. Consequently, most of the time we resort to paper and pencil tests and demonstrations.

Each competency has been stated in a manner which can be demonstrated by the student. For example, competency number one may be tested by presenting the student with a particular set of personal abilities and asking him to select and justify a job which will make maximum use of those personal skills.

Hopefully, students have gained some insight into reasons for behavior. They should be able to answer the following questions:

Why do some customers purchase a new car every other year when their used one has less than 12,000 miles on it?

Why do some employees insist on going to your supervisor with problems that you could handle?

Why do some supervisors follow rules and regulations more closely than others?

The best criterion for competency two is a successful employment interview. Many check lists may be used for neatness of dress, evaluation of letters of application, personal data sheets, etc. If the instructor has concentrated on etiquette, perhaps a "formal" lunch is the best way to evaluate this instruction.

Competency three presents a problem for evaluation because it deals with the student's ability to solve problems. Perhaps the best way to test this ability is to present the student with a problem-situation, and ask him to solve it carefully, indicating each phase of the process. He should be able to:

- Identify the problem
- Formulate possible solutions
- Select the answer which best fits the situation
- Justify the selection of the solution

RE: (Author, Title, Publisher, Date) Module No. 6. "Metal Fusion and Fabrication Welding." The Center for Vocational and Technical Education, August, 1964.

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:

Agency The Center for Vocational and Technical Education
 Address 980 Kinnear Road, Columbus, Ohio 43212
 Limitation on Available Copies No Limit Price/Unit \$ 7.50/set
 (quantity prices) _____

(2) Means Used to Develop Material:

Development Group National Task Force
 Level of Group National
 Method of Design, Testing, and Trial Part of a funded project of the USOE, OE-5-85-009; materials based on research from state studies; see preface material in the course outline.

(3) Utilization of Material:

Appropriate School Setting Post high school
 Type of Program General post high school class in agricultural machinery
 Occupational Focus Agricultural machinery service occupations
 Geographic Adaptability Nationwide
 Uses of Material Instructor course planning
 Users of Material Teachers

(4) Requirements for Using Material:

Teacher Competency Background in agricultural machinery
 Student Selection Criteria Post high school, mechanical aptitude, high school background, goal in agricultural machinery service occupation.
 Time Allotment Estimated time listed in module. (P)

METAL FUSION AND FABRICATION
"WELDING"

Major Teaching Objective

To develop (1) an understanding of welding equipment and supplies and (2) the ability to perform welding skills required of agricultural mechanics.

Suggested Time Allotment

At school		
Class instruction	<u>12</u>	hours
Laboratory experience	<u>36</u>	hours
Total at school		<u>48</u> hours
Occupational experience		<u>0</u> hours
Total for module		<u>48</u> hours

Suggestions for Introducing the Module

History shows that the ability of a country or race of people to progress depends upon their ability to use and fabricate (fasten or put together) metals. A country's standard of living, and even its survival, depends upon how well its craftsmen can fabricate metals. In modern agriculture metal products are commonly used. Their fabrication is necessary to protect and maintain our high standard of living.

A person preparing for employment as an agricultural machinery mechanic must have an understanding of welding equipment and supplies, and be able to weld and fabricate metals. Welding may be used to repair broken machinery, to rebuild surfaces that have been worn or battered in use, and to make new parts to replace parts damaged beyond repair. Welding may also be used to fabricate many articles of general or special character.

Following are some suggested techniques for use in creating interest in the module:

1. Thought questions
 - a. What is welding?
 - b. What are the different methods of welding?
 - c. What are the advantages of the agricultural mechanic's possessing welding skills?
2. Demonstrate to the class the strength of a strong weld as compared to the strength of a poor weld.

3. Observe a piece of farm machinery and count the number of welds used in its construction.
4. Films

Magic Wand of Industry

Arc Welding at Work

Competencies to be Developed

- I. To understand the fundamentals and safe practices of welding

Teacher Preparation

Subject Matter Content

A knowledge of fundamental welding terms is necessary for selecting equipment and materials and for learning welding skills.

Welding is not a hazardous operation. In most instances personal injuries and property damage resulting from welding are caused by negligence on the part of the operator. Weldors can best protect themselves by acquiring a thorough knowledge of the operation of equipment when they first learn to weld.

This competency is intended to increase knowledge of fundamental welding terms and to develop an awareness of potential hazards of welding.

1. Fundamental terms of welding

	bc. Tee joint

2. Safe practices in welding

A properly installed welder will give safe, trouble-free service if a reasonable amount of care is used in its operation. However, very serious injuries are likely to occur unless safe practices are followed carefully.

a. Avoid shock hazards.

- 1) Be sure both arc welders and the power supply system are grounded. Do not ground the ground terminal to the welder frame.
- 2) Always open the main power switch before working on the welder.
- 3) Turn off the welder to adjust the current setting.
- 4) Do not operate arc welders in wet locations.
- 5) Keep cables, electrode holders, and connections in good condition.
- 6) Turn off machines when the job is finished.

b. Protect the eyes and skin. The intense light of the electric arc is very injurious, as are flying pieces of hot slag and metal.

- 1) Use a face shield with a suitable density color lens; never look at an electric arc with the naked eye.
 - a) A welding glass of shade 10 density is suitable for most arc welders.
 - b) A welding glass shade density of 4 or 5 is suitable for oxyacetylene welding.
- 2) Before striking an arc, make sure fellow workers are shielded or are looking the opposite direction.

- 3) Keep helmets and shields in excellent condition.
 - 4) Use clear goggles to protect eyes when chipping slag.
 - 5) Wear leather gloves to protect hands from rays and spatter.
 - 6) Wear long-sleeved shirts or jackets to protect the skin from arc-burn.
- c. Provide good ventilation.
- 1) Always ensure an adequate supply of fresh air. Use an exhaust fan.
 - 2) Do not inhale fumes from zinc or lead-coated metals. Weld these materials out-of-doors.
- d. Prevent burns from hot metal.
- Mark hot welds so that others will know they are hot.
- e. Prevent fires and explosions.
- 1) Keep combustible materials away from the welding operation.
 - 2) Keep heat away from gas cylinders.
 - 3) Do not weld on materials which have contained combustible materials.
 - 4) Use soap suds to check for oxygen and acetylene leaks. The soap used should not contain petroleum bases.
 - 5) Always keep oxygen and acetylene cylinders in an upright position. Keep them fastened to prevent being knocked over.
- f. Practice good housekeeping.
- 1) Electrode and rod stubs should not be allowed on the floor.
 - 2) Welding cables and gas hoses should be coiled neatly after each job.

Suggested Teaching-Learning Activities

1. Have students define fundamental welding terms.
2. Require students to become familiar with safety precautions pertaining to welding.
3. Demonstrate the proper electrical hookup of a welder.
4. Demonstrate the proper hose hookup of a gas welder.
5. Demonstrate proper handling of fire extinguishers.

II. To select and care for welding equipment

Teacher Preparation

Subject Matter Content

To qualify as an agricultural machinery mechanic and welder, one must know how to select and care for welding equipment and accessories.

Arc Welders are of two basic types: those that provide alternating welding current (AC) and those that provide direct welding current (DC).

The AC welder has a step-down transformer which steps the 240-volt-line voltage down and the amperage up so that the heat can be safely used for welding. The control for stepping up the

amperage, which varies on different makes of welders, is necessary to provide different degrees of heat for welding various thicknesses of metals.

A. Power line, B. Transformer, C. Ground, D. Wall outlet, E. Welder, F. Primary winding, G. Secondary winder, H. Ground cable, I. Electrode

The transformer-welder is popular for several reasons:

1. Low initial cost
2. Low operation and maintenance cost
3. Convenience to use
4. Lack of moving parts
5. Use of single-phase current
6. Quiet operation
7. No arc blow

The DC welder has some advantages over the AC machine: it may be used with a wider variety of electrodes; it is better for welding thin metal; and gas-engine-driven models furnish welding current where there are no electric power lines.

The source of DC welding current is usually a generator. The electric-motor generator welder is a self-contained machine that requires three-phase current. The line current runs the motor, which turns a generator to produce DC current. Portable DC welders have the generator powered by an engine.

Another type of DC welder does not use a generator but converts 240-volt AC line current into DC current by the use of a rectifier. The rectifier is made of silicon or selenium.

Still another type of welder is the universal welder, which combines both AC and DC. This type operates on single-phase 240-volt-line current and provides either AC transformed welding current or DC rectified welding current, thus providing the current best suited to the particular job.

The UL mark of the Underwriters Laboratory should appear on the name-plate of any welder purchased, showing that it will deliver its rated current and meet adequate safety standards.

All welders should be kept in a dry area, since dampness is harmful to transformer generator windings. Whenever a welder is installed, help or advice should be sought from the power-supplier or a competent electrician.

Standard accessories for the arc welder include a wire brush, an electrode holder, a head shield, and welding cables.

Other accessories are

1. Cable lugs
2. Ground clamps
3. Arc torch
4. Electrodes
5. Gloves
6. Aprons
7. Safety goggles
8. Chipping hammer
9. Tongs and pliers

Oxyacetylene welders are divided into two general classes, depending upon the level of acetylene pressure used. The injector type can use acetylene at pressure under one pound per square inch, whereas the medium-pressure type requires that acetylene be supplied at pressures from one to 15 pounds per square inch.

Pieces of equipment and accessories making up an oxyacetylene welder are

- | | |
|-----------------------|------------------------|
| 1. Oxygen cylinder | 3. Oxygen regulator |
| 2. Acetylene cylinder | 4. Acetylene regulator |

- | | |
|-------------------------------|---------------------|
| 5. Blowpipe (torch) | 9. Friction lighter |
| 6. Blowpipe tips (torch tips) | 10. Goggles |
| 7. Hose | 11. Wrenches |
| 8. Hose connections | 12. Gloves |
| | 13. Pliers |

Some general maintenance precautions of the oxyacetylene welder are as follows:

1. Use no oil on regulators under any circumstance.
2. Have equipment inspected at frequent intervals by a competent operator.
3. Do not use blowpipes, regulators, or other equipment in need of repair.
4. If orifices in the tips of nozzles become clogged, clean them with the proper size of twist drill tip cleaner or a soft brass or copper wire.
5. If leakage develops around the blowpipe stem, tighten the packing nut, and repack it if necessary.
6. If a valve does not shut off completely, clean the seat.
7. If a regulator creeps, have it repaired at once.
8. If the safety relief disk of the regulator ruptures, have a new one installed immediately.
9. Always maintain a gas-tight connection between regulators and cylinders.
10. When regulators are not to be used for several weeks or longer, relieve the pressure on the delivery-pressure valve seat.
11. Test hose frequently for leaks.
12. Do not repair hose with tape.

Suggested Teaching-Learning Activities

1. Have students identify major parts of an oxyacetylene welder.
2. Have students become familiar with welding equipment through reading assignments.
3. Have the class visit a local dealer or welding shop to identify different welding equipment.
4. Demonstrate the proper hookup of an oxyacetylene welder. Then have students demonstrate and practice hookup.

III. To identify metals commonly weldedTeacher PreparationSubject Matter Content

To use the welding procedure best suited to a job, the welder must first identify the metal to be welded, since procedures

vary with different metals. A practical identifying test must be simple and easy to make with ordinary equipment in the shop.

Metals can often be identified by their use or appearance, or by the spark test on a grinding wheel, the fracture test (observing if the metal bends prior to breaking), or the magnetic test.

The spark test is both simple and commonly used. Different kinds of iron and steel make different spark patterns when they are touched lightly to the grinding wheel. Cast iron gives off red sparks that travel in a straight line with clublike sparks at the ends. Mild steel gives off yellow sparks otherwise similar to those made by cast iron. Medium carbon steel gives off larger quantities of yellow sparks with explosive bursts or stars at the ends. High carbon steel gives off brighter and more explosive sparks.

When making spark tests, use a clean grinding wheel and touch each part of the metal to the wheel with approximately the same pressure. The metal being tested should be compared with known samples and the operator should stand to one side of the grinding wheel to see the spark pattern most easily.

Chart I

Kinds of Iron and Steel Used in Farm Machinery

	Mild and medium carbon steel	High carbon steel	Cast iron	Malleable iron
Tool or part	Blacksmith iron Pipe Machinery frames Forgings Bolts Rivets Sheetmetal Fenders	Plowshares Cultivator sweeps Harrow disks Rake teeth Gears Axles Shafts Springs Bearing races	Rough gears Sprockets Bearing brackets Mower wheels Cylinder heads Transmission cases	Beam brackets and castings subject to shock

The common nonferrous (not containing iron) metals used in farm machinery are aluminum, brass, copper, and pot-metal. With the exception of copper, they are difficult to weld unless the TIG process is used. Aluminum can be identified by its white color and light weight. Copper, which is for plumbing, gas lines, etc.,

is rust red in color and can be brazed with silver solder or bronze-welded. Brass which is used chiefly in the form of castings is yellow in color and is used to make valves and small plumbing fittings; it can be welded by the oxyacetylene process. Pot-metal resembles aluminum, but it is darker in color and heavier and very difficult to weld.

Suggested Teaching-Learning Activities

1. Have students clean and dress a grinding wheel.
2. Demonstrate metal identification by the spark test.
3. Have students identify metals by the spark test.
4. Have students identify metals by appearance only.
5. Have students identify ferrous from nonferrous metals by the magnetic test.
6. Have students identify nonferrous metals by color.
7. Have students identify high carbon metals from low carbon metals by the sound method.

Suggested Instructional Materials and References

Instructional materials

IV. To select the proper electrode

Teacher Preparation

Subject Matter Content

Matching arc welding electrodes with materials begins by identifying the metal to be welded. There are many different alloys of steel. The welder using Chart I can classify most of the iron or steel materials he welds, but he should check some metals further by the spark test and a known sample of metal. It may also be advisable to compare the spark from a weld bend of a particular welding electrode with the metal to be welded. If the sparks are identical, the metals should be alike.

Electrodes for Low and Medium Carbon Steels

Ten basic kinds of electrodes are available for welding low-to-medium carbon steel. All are shielded electrodes with heavy coatings of flux over a core wire of low carbon steel, but they differ in the type and combination of chemical substances in the coating.

Each substance in the flux has a particular function for the arc welding process, but the main objectives are (1) to stabilize the arc and (2) to protect the molten metal from the atmosphere. After the arc is started, current flows across the gap between the end of the electrode and the work. It does not jump the gap like a high-voltage ignition spark but is conducted by a mass of ionized gas coating which are vaporized by the heat of the arc. The nature of this gas determines the stability of the arc, or the ease of striking and maintaining it.

Arc stability is generally good when welding with DC current, which flows steadily in one direction. It is more a problem with AC welding, as the arc tends to be extinguished and restarted 60 times per second as the current alternates. Sodium compounds are generally used in the flux of DC electrodes; whereas potassium compounds are common in the flux of AC electrodes because potassium compounds ionize more easily. The arc stability problem is more acute with a farm-type AC welder that

may have a lower open-circuit voltage than an industrial-type AC welder. It is also troublesome when using low amperage to weld thin materials.

Classification of Electrodes

Even though the sparks from the bead of one type of electrode match the work, several other types may also be suited to the work. Choosing the electrodes most often used for farm welding is not difficult because almost all manufacturers make rods of the same types and use a standard numbering system. Because these types have been defined by the American Welding Society (AWS) and the American Society for Testing Materials (ASTM), the letters AWS followed by a number such as AWS-ASTM E6013 appear on every package of rods. The E stands for electrode and the 60 shows the tensile strength of the rod. If the third number were 2, the rod could be used in flat and vertical welding, but not for overhead. The number 3 signifies that the rod is designed for flat position only. If the third number is a "1" the rod can be used for all positions. The last digit quite often indicates the approximate penetration and 0 maximum. The last two digits, however, may be used in combination to mean entirely different things; therefore the manufacturer's recommendations for his rod should be referred to.

Identification by Color Code

Almost any manufacturer who sells an AWS E6013 rod also identifies it by a color code written by the National Electrical Manufacturing Association. The E6013 rod, for example, is marked with a brown dot of paint, called spot color, which is located on the side of the end which is gripped by the electrode holder.

1. Primary color is located on the end of the bare part of the electrode.
2. Secondary color is located on the side of the bare part of the electrode.
3. Group color is located on the flux coating near the bare end of the electrode.

4. Some manufacturers are stamping the AWS number on the flux coating.

Color Spots for Identifying Electrodes

In recent years rods with iron powder in the coating have been much used, but for farm use smaller amounts of iron powder actually make for better welding rods. Welding rods with considerable amounts of iron powder in the flux coating are not suitable for most farm-type AC welders because of the low open-circuit voltage design of the welding machine. Heavy coated (iron powder) E-6014 or E-6024 electrodes do not have the penetration or arc force compared to an E-6011, which has very little coating but a forceful arc. An E-6011 electrode is excellent for farm use because it will weld through paint, rust, light dirt, etc. It is easy to use for vertical or overhead welding.

Electrodes for Cast Iron Welding

Cast iron, because of its high carbon content and relative brittleness, requires special electrodes for welding. Two common types of cast-iron-welding electrodes are available, machinable and non-machinable.

Machinable cast iron electrodes have a high nickel content and produce a soft weld that can be drilled, filed, or otherwise machined after it cools. They are classified as E Ni and have an orange end, a blue spot, and a white group color. E Ni electrodes are relatively expensive in price per pound.

Non-machinable cast iron electrodes have a steel core wire with a special flux coating. During cooling, carbon migrates from the deposit, which becomes hardened in the cooling process. The weld, therefore, cannot be cut with a drill, a file, or any ordinary machine tool. These electrodes are classified E St and have an orange end, no spot, and no group color.

Comparing Electrodes from Various Manufacturers

A comparison chart with AWS numbers and brand names of electrodes made by various manufacturers aids in recognizing and comparing electrodes and reveals that manufacturers often have several electrodes for each AWS number. Specific information from a manufacturer should be obtained for detailed use characteristics.

In addition to this information, choice of the electrode should be finally determined by experience in working with different materials and actually trying different rods for different situations. Practice beads with any rod should be run before making the weld to see how it performs and to check the four fundamentals for getting a good weld. Good technique is just as important as matching the electrode with the material.

Ferrous Oxyacetylene Welding Rods

All-purpose mild-steel welding rods are used for welding all kinds of mild and low-carbon steel. They are satisfactory and probably better than other kinds for most farm machinery and shop welding. Flux is not needed in fusion welding steel.

Alloy-nickel cast-iron rods made strong, high-quality machinable welds on cast iron. Flux is needed for this welding process.

Nonferrous Welding Rods

These include, among others, the bronzes, copper, silver alloys, and aluminum. A suitable flux is required for each.

Bronze welding rods are used for steel, malleable iron, and cast iron. A good bronze rod has smooth-flowing qualities, makes deposits that are non-porous, and does not fume excessively during the welding operation.

Silver alloy rods are made of silver, copper, and phosphorus. They make strong welds in steel, copper, and brass. Sometimes they are called low-temperature rods because they melt at lower temperatures than other kinds of rods.

Welding Flux

When welding with cast iron and nonferrous rods, a welding flux must be used. For good quality work, always select a reliable flux recommended for the kind of work being done. The most commonly-used fluxes are bronze, cast iron, brazing, and aluminum.

Suggested Teaching-Learning Activities

1. Have students study reading assignments on electrode identification and selection.
2. Have students identify welding rods and fluxes and give uses of each rod or flux.
3. Demonstrate cross-reference charts and have students use them.
4. Have students explain the AWS classification system of electrodes.
5. Have students explain the NEMA color code system of electrode identification.

V. To become proficient in striking an arc, carrying a puddle, and re-starting the arc

Teacher Preparation

An experienced welder always checks the condition of his equipment before beginning to weld. The bench top must be clean, dry, and free from rust, grease, and paint to insure a direct flow of current.

To strike an arc, the electrode is moved at an angle to the plate in a striking motion similar to that used when striking a match. For the proper arc length, it should be drawn slowly to a height of about $3/16$ inch. This should give a sharp egg-frying sound. A too-short arc will cause the electrode to freeze to the metal and a too-long arc will give a humming sound and cause spatter and will finally go out.

The electrode is tipped about 15 degrees in the direction of travel, and held at 90 degrees to the metal being welded. Correct speed of travel is indicated by the size of the bead which should be about twice the diameter of the electrode being used.

The correct amperage setting must be made to obtain a proper bead with penetration and very little spatter. It depends upon thickness of the metal, size of the electrode and type of electrode being used. Always refer to electrode manufacturer's recommendation for correct amperage setting for the electrode and job.

To re-establish a bead, first strike the arc; then move the electrode to the crown of the crater and resume forward travel.

Suggested Teaching-Learning Activities

1. Familiarize the student with welding machines and equipment.
2. Demonstrate striking an arc, proper arc length, correct speed of travel, and width of bead.
3. Have students run several beads with correct arc length, current setting, speed of travel, and electrode angle.
4. Have students study reading assignments; then have them correct their errors.
5. Demonstrate the effects of various arc lengths, current settings, and speed of travel.

VI. To run a bead in a weaving motionTeacher PreparationSubject Matter Content

Running a bead with a weaving motion has many uses. It is used where a wider bead is desired than normally can be laid when running a straight bead and where finish passes are needed on flat welds and in padding or built-up repair jobs. The following are some different types of weaving motions:

Always remove slag when depositing a weld on top of another weld. The shape of the weld is determined by the closeness of the weaves.

Suggested Teaching-Learning Activities

1. Have students study text assignments.
2. Demonstrate different types of weaves to students.
3. Have students practice weaves.

Suggested Instructional Materials and References

Instructional materials

1. Welder and equipment
2. Steel plates 3/16 inch thick
3. E-6013 or E-6012 electrodes of 1/8 inch size

References

VII. To make a butt weld

Teacher Preparation

Subject Matter Content

Butt welds are one of the easiest kinds of welds to make. They are used in sheet steel (steel up to 1/8 inch thick) and in plate steel up to 1/4 inch. (Plate steel is thicker than 1/8 inch.) Beveling is required on plate thicker than 1/4 inch to ensure full penetration.

When welding two pieces together, always tack both ends prior to starting to weld to avoid metal expansion that pulls the pieces of metal apart. Long pieces should be tacked at 4-to-6 intervals.

Always make closely-fitted joints. Never space parts more than one-half their thickness. Always use a steel backing-strip when a joint cannot be closely-fitted. Weld on both sides of a joint for resistance to bending stresses.

Suggested Teaching-Learning Activities

1. Have students study text assignments.
2. Demonstrate butt welding to students.
3. Have students practice butt welding in flat and horizontal positions.

Suggested Instructional Materials and References

Instructional materials

1. Welder and equipment
2. Steel plates 3/16 inch thick
3. E-6013 or E-6012 electrodes of 1/8 inch size

References

VIII. To fillet weld in the flat and horizontal position

Teacher Preparation

Subject Matter Content

A fillet weld is made by one or more bends welded in the V groove where two surfaces meet at right angles.

Horizontal Fillet

Flat Fillet

Lap Fillet

Fillet welds may be used in any position. They are easiest to make when the metal is in the flat or horizontal position.

Suggested Teaching-Learning Activities

1. Have students study reading assignments.
2. Demonstrate fillet welding.
3. Have students practice fillet welding.

Suggested Instructional Materials and References

Instructional materials

1. Welder and equipment
2. Mild steel plates 3/16 inch thick
3. E-6013 or E-6012 electrodes of 1/8 inch 5/32 inch size

References

2. Modern Arc Welding.
3. The Farm Shop, pp. 142-143.

IX. To weld in the vertical position

Teacher Preparation

Subject Matter Content

Two methods are used to weld joints in the vertical position: welding up and welding down.

Vertical Up-Welding

Vertical up-welding is used whenever a strong, dependable weld with a deep penetration is desired on something that has to be welded with the joint running vertically in relation to the ground.

The problem, when welding vertical up, is to put the molten metal where it is wanted and make it stay there. Because gravity pulls the molten metal downward, making it drip, certain techniques must be followed:

1. Use a fast-freezing electrode (example: E-6011).
2. Put the electrode in the holder so that it sticks straight out the end.
3. When welding, have the electrode-holder slightly lower than the tip of the electrode.
4. Deposit the metal at the bottom of the two pieces to be welded together, working upward toward the top.
5. Before too much metal is deposited, move the arc $3/4$ inch upward with a slight wrist movement. This takes the heat away from the molten puddle and allows it to solidify.
6. During this entire process, look at the molten puddle, not the arc.
7. When bringing the arc down to deposit metal, make it very short in order to deposit metal as fast as possible; when lifting the arc, make it long or metal will be deposited all up and down the plate.
8. Make very slow movements. There are no fast movements in this technique.

Vertical Down-Welding

Vertical down-welding can be learned rapidly because there are only a few requirements.

1. Use an E-6011 electrode.
2. Put the electrode straight out of the holder.
3. Use thin (14 or 16 gauge) metal.

4. Hold the electrode in a 30-degree angle pointing upward.
5. Hold a short arc, but do not touch the metal.
6. Use up-and-down whipping motion to help prevent burning through on very thin metal.
7. Carefully watch the molten metal.

It is important to continue lowering the entire arm as the weld is made, so that the angle of the electrode does not change; and to move the electrode so fast that the molten slag does not catch up with the arc. Vertical down-welding gives thin, shallow welds. It should, therefore, never be used on heavy materials, where strong welds are required.

Suggested Teaching-Learning Activities

1. Have students study reading assignments.
2. Demonstrate vertical up-welding in various positions.
3. Demonstrate vertical up-welding in various position welds.
4. Have students practice vertical up-welding.
5. Have students practice vertical down-welding.

Suggested Instructional Materials and References

Instructional materials

1. Welder and equipment
2. Mild steel plate 3/16 inch thick

3. Metal of 14 or 16 guage thickness
4. E-6011 electrodes of 1/8 inch size

References

2. Arc Welding Lessons, pp. 162-171.
3. The Farm Shop, pp. 142-143.

X. To weld in the overhead position

Teacher Preparation

Subject Matter Content

Welding in the overhead position is difficult because the molten metal must be carefully controlled. Observe the following:

1. Use suitable electrodes (E-6010, E-6011, E-6012, E-6013).
2. Use small electrodes (1/8 inch) for most welding.
3. Use a short arc to make the metal hold. A long arc will cause molten metal to fall.
4. Take precautions to avoid injury from falling bits of hot metal and slag.

Suggested Teaching-Learning Activities

1. Have students read and study reading assignments.
2. Demonstrate overhead-welding.
3. Have students practice overhead-welding.

Suggested Instructional Materials and References

Instructional materials

1. Welder and equipment
2. Mild steel 3/16 inch thick

3. E-6010, E-6011, E-6012, E-6013 electrodes of 1/8 inch size

References

2. Arc Welding Lessons, pp. 176-183.

XI. To operate and maintain a carbon-arc torch

Teacher Preparation

Subject Matter Content

The carbon arc torch is an accessory to the arc welder and is useful in applying heat through radiation rather than by an arc formed when an electrode is used. It is used for brazing, hardsurfacing, and soldering, and in jobs requiring bending and shaping.

Arc torches are commonly equipped with carbon centers coated with copper. The sizes most frequently used are those with 1/4, 5/16, and 3/8 inch diameters. Carbons burn slowly while in use, but a good supply of each size should be kept on hand.

The carbons are held in the torch so that the tips meet on an angle. The carbons may be moved laterally through the holder-clamp and should extend through the clamp 2 inches. A means of bringing the tips together to start the arc is provided, and the space between the tips can be varied to produce a desirable flame.

Carbon life expectancy can be as much as 1½ hours on properly-adjusted carbons with correct amperage setting. Always refer to manufacturer's recommendations for amperage settings for the size of carbons being used.

Pointers for selecting and operating carbon-arc are

1. Follow recommended current settings for the size of carbons used.
2. Keep carbons in good condition by occasionally dressing the tips to the original shape.

3. Keep cables and other parts of the torch in good condition.
4. Do not use carbons less than 2 inches in length.
5. Make sure cable connections fit properly to the welder as recommended by the manufacturer.

Suggested Teaching-Learning Activities

1. Have students read and study reading assignments.
2. Explain how the carbon arc operates.
3. Use carbon with high heat setting to demonstrate effects of overheating.
4. Operate a torch, demonstrating the effects of narrow and wide tip settings.
5. Install a set of carbons in a holder, making the proper adjustments.
6. Demonstrate procedures of heating metal for bending.
7. Have students practice using and adjusting the carbon arc torch.

Suggested Instructional Materials and References

Instructional materials

1. Welder and equipment
2. Carbon arc torch
3. Carbons with $1/4$, $5/16$, and $3/8$ diameters
4. Metal for bending

References

1. Arc Welding Lessons, pp. 57-62.
2. Modern Arc Welding, p. 435.

XII. To operate and maintain an oxyacetylene torch, and to fusion-weld

Teacher Preparation

Subject Matter Content

An oxyacetylene welder is a precision piece of equipment. Safe habits in handling and using it should be established to protect the weldor and the equipment.

1. Attach regulators to cylinders.
 - a. Crack cylinder valves to blow out dirt.
 - b. Wipe valves with a dry, clean cloth.
 - c. Attach regulators and tighten them.
2. Connect hoses and turn on gases.
 - a. Connect green hose to oxygen regulator and torch.
 - b. Connect red hose to acetylene regulator and torch. (Oxygen has right-hand threads, acetylene has left-hand threads.)
 - c. Open cylinder valves slowly (oxygen all the way; acetylene $\frac{1}{2}$ turn).
3. Select the welding tip.
 - a. Select a tip according to the manufacturer's recommendation for the job.
 - b. Adjust tip on torch so that valves are on lower side of torch.
 - c. Tighten tip with wrench.
4. Adjust working gas pressure according to manufacturer's recommendation for the tip used.
5. Locate all gas leaks.
 - a. Locate gas leaks by using soap suds, or holding a finger over end of tip and submerging torch into water. Never use oil.

- b. Tighten leaking connections.
 - c. Replace or repair any items which persist in leaking.
6. Light the torch.
- a. Follow manufacturer's recommendations.
 - b. Incorrect working pressures cause most difficulties in handling the torch.
7. Adjust the flame.
- a. Adjust the flame by opening and adjusting the oxygen valve.
 - b. Too little oxygen gives a carbonizing flame; too much oxygen gives an oxidizing flame. A neutral flame is desired.

8. Avoid backfires and flashbacks.
- a. Improper handling of the torch causes backfire (flame going out with a loud snap).
 - b. Ways to prevent backfires:
 - 1) Operate torch at proper pressures.
 - 2) Keep tip cool.
 - 3) Keep tip clean.
 - c. Flashbacks is burning of the flame back into the torch. It may be followed by a hissing or squealing. Flashbacks are serious and endanger the safety of operators and equipment.
 - 1) If continued, return torch to manufacturer for repair.
 - 2) In case of flashback, turn off cylinders immediately to prevent an explosion.

Always shut down equipment when the job is completed. When equipment is left with gases turned on, leaks may develop and result in a fire or an explosion.

1. Shut off torch.
 - a. Close acetylene valve first.
 - b. Close oxygen valve last. This will extinguish any fire in torch.
2. Shut off gases.
 - a. Close acetylene valve on cylinder.
 - b. Close oxygen valve on cylinder.
 - c. Open acetylene torch valve and drain pressure.
 - d. Release acetylene regulator adjusting screw.
 - e. Close acetylene torch valve.
 - f. Open oxygen torch valve and drain pressure.
 - g. Release oxygen regulator adjusting screw.
 - h. Close oxygen torch valve.

Note: The above steps must be followed in the order listed to insure safety.

Fusion Welding with the Oxyacetylene Torch

In fusion welding, the metal edges are heated to the melting point and flowed together. A welding rod is used to add metal to the joint to strengthen it.

Forming and maintaining a molten pool is the first step in fusion welding. After this is mastered, the next step is to add metal from a welding rod. To carry a molten pool, one must first hold the torch at approximately 45 degrees with the surface of the work and inner cone about $1/8$ inch from the metal and move the torch in a circular motion. The welding rod is added with the

other hand and held at approximately 45 degrees to the surface of the metal and directed toward the flame.

After maintaining a molten pool and forming a bead by carrying the molten pool and adding the welding rod, the pieces of metal are ready to be welded together.

1. Butt welds

- a. Make plain butt joints in steel up to 1/8 inch thick; bevel edges on thicker pieces.
- b. Space pieces 1/2 thickness of metal apart to allow for heat expansion, and tack ends together.
- c. Arrange work so an air space is under the metal.
- d. Keep molten puddle running to both pieces and add rod to fill crack.
- e. Weld joints in metal thicker than 1/4 inch by two beads made progressively 1 inch at a time.

2. Fillet and lap welds

- a. The biggest errors in making these welds can be avoided by holding the torch at proper angles. The flame must be directed so that equal heat is applied on each piece of metal.
- b. Heat the lower plate almost to the melting point. Then weave torch to direct flame from one piece to the other, bringing both pieces to a molten pool at the same time.

3. Welding in the vertical and overhead position

- a. Start at bottom and weld upward for a vertical weld.

- b. Use a shallow puddle and lift flame at regular intervals to allow lower edge of puddle to solidify.
- c. Use less heat in overhead position than for similar job in the flat position.
- d. Always use correct angles of torch and rod, both always at 45 degrees with the surface of the work.

Suggested Teaching-Learning Activities

1. Have students study reading assignments.
2. Demonstrate proper setting-up of oxyacetylene equipment.
3. Demonstrate tip sizes and their uses.
4. Demonstrate proper setting of gas pressures.
5. Demonstrate proper flame adjustments.
6. Demonstrate various welding exercises.
 - a. Carry a molten puddle.
 - b. Add a rod to puddle.
 - c. Show various welds in various positions.
7. Demonstrate shutting down equipment.
8. Have students demonstrate some of the above exercises in class.
9. Have students practice all the above exercises.

Suggested Instructional Materials and References

Instructional materials

1. Oxyacetylene welder complete with all equipment
2. Mild steel rods 3/32 inch thick
3. Metal 1/8 inch thick

References

1. The Oxyacetylene Handbook, pp. 75-91, 187-210.

2. Smith's Short Course for Gas Cutting, Welding, Brazing.
3. The Farm Shop, pp. 168-174.

XIII. To hardsurface metals (ferrous)

Teacher Preparation

Subject Matter Content

Hard surfacing is overlaying a softer base metal with another metal of a high hardness characteristic to give the softer metal a longer usable life. Hardsurfacing metal provides durability of the base metal because of its hardness, abrasion resistance, impact resistance and decreased friction.

Using hardsurface powder is recommended for hardsurfacing of very thin edges, such as cultivator sweeps, where heat from electrode or flame using a rod might burn through.

1. The edge to be surfaced must be ground bright.
2. Apply surfacing powder.
3. Use a carbon arc torch, carbon in the electrode holder, or an oxyacetylene flame with a carbonizing flame (outer cone twice the length of the inner cone).
4. Melt the powder and sweat it to the metal. This is not a fusion process.
5. Be careful not to warp the metal.

Using Hardsurfacing Rods and Electrodes

Select the proper hardsurfacing rod or electrode; clean the metal to be surfaced, and apply surface with a long arc so that penetration will be shallow and the bead will be wide and thin. Deep penetration will reduce hardness of deposit.

Suggested Teaching-Learning Activities

1. Have students study reading assignments.
2. Demonstrate hardsurfacing with powder.

3. Demonstrate hardsurfacing with electrodes.
4. Have students practice hardsurfacing.

Suggested Instructional Materials and References

Instructional materials

1. Oxyacetylene welder and equipment
2. Arc welder and equipment
3. Hardsurfacing powder
4. Hardsurfacing electrodes
5. Metal to be hardsurfaced

XIV. To cut metal with an arc welder and an oxyacetylene welder

Teacher Preparation

Subject Matter Content

It is often necessary to cut metal. The hack saw, arc welder, or oxyacetylene torch is used for this job. The arc welder does not do a smooth job of cutting, but it is satisfactory in many cases since the rough areas may be ground off by a grinder. Cutting may be used also as a means of beveling a piece of iron for welding, gouging, chamfering, or piercing a hole.

Cutting with the Arc Welder

Usually an amperage setting of 140 and a 1/8 inch mild steel electrode will cut 1/4 inch plate. A 3/32 inch electrode and an amperage setting of 180 will cut steel over 1/4 inch thick. The electric arc actually burns away the metal.

Cutting is usually accomplished in the vertical or flat position. The arc is struck and the molten metal is raked away with the electrode.

To pierce a hole, hold a long arc with the electrode perpendicular over the spot where the hole is to be. When the metal is molten, push the electrode through the puddle. Give the molten metal a chance to fall through the hole, then circle around the edge of the hole until the desired diameter is reached. To pierce a hole through a heavy piece, place the metal in the vertical position to allow the metal to drip away freely while the electrode is bored through the metal.

Cutting with the Oxyacetylene Torch

Cutting is severing of metal with a torch through heating and the rapid oxidation of the metal with pure oxygen. This is a chemical process involving the chemical affinity of oxygen-heated metals. In addition, there is a noticeable mechanical erosion produced by the energy of the oxygen stream which washes away metal in the form of slag.

Adjust the oxygen and acetylene pressures according to the manufacturer's recommendations. Start the cutting torch like any other torch, but adjust it to a neutral flame by using the preheat oxygen valve. Heat the metal to a bright orange, then open the oxygen lever, and travel the torch in the direction or angle desired. To pierce a hole, heat metal to a bright orange, lift the torch slightly to prevent clogging the tip and open the oxygen lever, thus piercing a hole.

Suggested Teaching-Learning Activities

1. Have students study reading assignments.
2. Demonstrate cutting and piercing with the arc welder.
3. Have student demonstrate hooking up a torch and lighting and adjusting the flame.
4. Demonstrate cutting with the torch.

5. Have students practice cutting and piercing with both welders.

XV. To weld nonferrous metals and braze ferrous metals

Teacher Preparation

Subject Matter Content

Working and welding nonferrous metals with the arc welder is limited to brazing with the equipment studies in this module. Nonferrous arc welding is best accomplished with TIG arc welding equipment.

Aluminum, copper, and brass may be welded by the oxyacetylene process.

Welding Aluminum

Aluminum may be fusion-welded by using aluminum rods and flux. The metal must be clean and bright with no grease or oil present. Chemical cleaning or a 5% caustic soda cleaning may be necessary. Then rinse the metal in hot water, and dip it into a 10% solution of nitric acid and then a hot water bath.

Use a slightly carbonizing flame since oxygen is not wanted on aluminum because it interferes with the fusion process. Flux is used on the rod and the welding process is similar to that of ferrous metals. After the weld cools, remove flux with hot water.

Welding Copper and Brass

Copper and brass are most easily fastened by the soldering or brazing process. The fusion process is best used in TIG welding. The silver alloy and soldering methods are accomplished by using only enough heat to melt the silver alloy and flux or solder onto the joints to be fastened.

Brazing Ferrous Metals

Brazing is a process of joining metal by using a filler of nonferrous metal (brass), which has a lower melting point. Flux or a flux-coated rod is necessary for this process. The first step in brazing is to heat the base metal to a temperature which expands the pores, freeing impurities. The joint is then tinned by using the flux and rod, and the two pieces may be joined by bridging them together with the rod used for tinning. Heat for this process may be furnished by the carbon arc torch, a carbon in the electrode-holder, or the oxyacetylene flame. The important fact is not to overheat the metal; a bright orange to cherry-red color is enough heat.

Welding cast iron is discussed in The Farm Shop, pp. 153-155, 182-184.

Suggested Teaching-Learning Activities

1. Have students study reading assignments.
2. Review identification of
3. Demonstrate aluminum fusion process.
4. Demonstrate silver alloy brazing process of copper and brass.

5. Demonstrate soldering of brass and copper.
6. Demonstrate brazing of ferrous metals.
7. Have students practice the above exercises.

Suggested Instructional Materials and References

Instructional materials

4. The Farm Shop, pp. 153-155, 180-184.

XVI. To weld with inert gas

Teacher Preparation

Subject Matter Content

The inert-gas-shielded arc welding process is one of the newest methods of fusion welding. In it a shield of an inert gas protects the electrode and the weld puddle.

The gas shield is obtained by feeding an inert gas, such as argon or helium, around a single tungsten electrode through a confining cup. The arc is drawn between the work and the tungsten electrode. This electrode is run at a current density which causes it to be white-hot at the end, but not so hot as to melt and fall off. When the tungsten electrode is running

at the proper current density, a small ball forms at the end. This ball is steady and does not oscillate unless the current is too high; then it oscillates and falls off.

The tungsten electrode must be kept from oxidizing. Tungsten is ordinarily considered non-consumable, but about one-half thousandth of an inch of tungsten is used each time the arc is started. If the end of the tungsten is allowed to come in contact with air while it is hot, it may oxidize as much as 1/16 inch.

The welding torch and tungsten electrode are handled in somewhat the same manner as a gas welding torch. In many cases, filler metal may be added. Weld quality is high because the inert gas shield prevents oxidation and inclusion of gases or formation of water vapor in weld. The efficiency of the gas in shielding the molten metal makes possible welding virtually all of the commercially nonferrous materials.

The following table should be consulted when selecting current for inert-gas-shielded arc welding:

MATERIAL	ALTERNATING CURRENT	DIRECT CURRENT	
	With High Frequency Stabilization	STRAIGHT Polarity	REVERSE Polarity
Magnesium up to 1/8-in. thick	1	N.R.	1
Magnesium above 3/16-in. thick	1	N.R.	N.R.

Deoxidized copper up to 0.090 in.	2	1	N.R.

- Key:
1. Excellent operation---best recommendation
 2. Good operation---2nd recommendation
- N.R.: Not recommended
- * Use d.c.s.p. for 3/8 in. and thicker
- ** Inert-Gas process not always satisfactory for Monel

Suggested Teaching-Learning Activities

1. Have students practice striking an arc with an inert-gas-shielder welder.
2. Have students practice running beads and fusing together the following metals:
 - a. Magnesium
 - b. Aluminum
 - c. Stainless steel
 - d. Hard-facing
 - e. Silver
 - f. Brass alloys

Suggested Instructional Materials and References

Instructional materials

1. A welder with an inert-gas-shielded torch
2. Metal pieces of the above-named kinds

Reference

Modern Arc Welding, pp. 473-482.

Suggestions for Evaluating Educational Outcomes of the Module

The educational outcomes of the module should be evaluated according to attitudes and manipulative skills developed.

1. Manipulative skills

Each student should be required to perform suggested learning activities in each competency of the module. Welding is basically a skill developed by practice and experience. The teacher should observe the student closely in order to correct bad practices and to evaluate the student's accomplishments.

2. Attitudes

Attitudes should be evaluated according to student participation in class discussion, response to assignments, and performance of jobs.

AGRICULTURAL MACHINERY ASSEMBLY AND LUBRICATION

Major Teaching Objectives

To develop (1) an understanding of agricultural machinery assembly and lubrication procedures and (2) the ability to assemble and lubricate such machinery efficiently and correctly.

Suggested Time Allotments

At school	
Class instruction	<u>9</u> hours
Laboratory experience	<u>129</u> hours
Total at school	<u>138</u> hours
Occupational experience	<u>60</u> hours
Total for module	<u>198</u> hours

Suggestions for Introducing the Module

Assembly of agricultural machinery has become a very important function of the service department in the agricultural machinery dealership. Machines are sent from the branch house or factory in as many small components as possible. This is done to cut down on freight costs as well as machinery damages while in transit to the agricultural machinery dealership. These components are stored in the dealership's warehouse until they are to be assembled and sold. The set-up man must be able to identify each machine part and understand its function in the machine's overall operation if he is to assemble the new machine properly. When the machine is assembled, he must be able to adjust and lubricate it properly to insure its proper operation under field conditions.

Following are some suggested techniques for creating interest when teaching the module.

1. Show the class a torn down tractor engine fouled by sludge and varnish build-up which may have been caused in part by improperly selected lubricants.
2. Bring to class several new machine parts. Have the class attempt to identify the machine using those parts and describe the function of each in the machine's operation.
3. Reverse the action of a manure spreader. Have students attempt to identify why the machine is running backwards. Emphasize how just a switch in the position of one part can affect the entire operation of a machine.

Competencies to be Developed

- I. To understand the functions of lubricants for agricultural machinery and know how to select them properly

Teacher Preparation

Subject Matter Content

The factor that contributes most to the longevity of agricultural machinery is proper lubrication. It is important that agricultural machines be lubricated regularly and thoroughly. In order to lubricate agricultural machines properly, the person doing the lubrication must understand the reasons for using specific lubricants for different applications.

The primary reason for lubricating agricultural machines is to reduce the resistance (friction) between two moving parts which are in contact with each other.

Two types of friction develop in agricultural machinery, namely: (1) dry friction and (2) viscous friction.

The movement in different directions of two parts of a machine that are in contact with each other causes dry friction.

1. It is the purpose of the lubricant to separate these two parts with a thin coating or layer of oil or grease.
2. The oil or grease acts as a cushion between the two pieces of metal, reducing the amount of impact, friction, and wear.

Viscous friction refers to the friction that occurs between molecules of a lubricant.

1. Moving machine parts which float on a layer of oil or grease eliminate any part-to-part contact.
2. With proper lubrication, the energy required to operate the moving parts is greatly reduced.
3. The amount of molecular friction that develops depends upon the viscosity or grade of lubricant being used.
4. The lower the viscosity of the oil, the less the amount of friction which develops.

Lubricants used on agricultural machinery may be placed in three groups. They are:

1. Crankcase oil
2. Gear oil
3. Lubricating grease

Crankcase oil has five important functions to perform as a lubricant. They are:

1. To reduce friction and wear between surfaces
2. To remove heat caused by friction
3. To provide a seal against escaping gases
4. To keep the engine clean
5. To provide protection against rusting and attack by acids

Oils have been continuously improved to meet these demands. Most of this improvement has come about through the use of additives.

1. Oxidation and corrosion inhibitors have been added to oils to cut down on varnishes, sludges, and corrosive acids produced in the engine.
2. Detergent-dispersants have been added to give a cleaning action to oil.

When servicing a tractor for delivery to a farmer, the service man must decide what oils to use. He needs to know:

1. The oil grade or viscosity to use
2. The oil type to use (American Petroleum Institute-- API service classification)

Viscosity is a term used to describe how fluid an oil is, or its resistance to flow. The heavier the grade of oil, the higher is its viscosity. Oils come in two viscosity grades.

1. Single-viscosity (SAE: 5W, 10W, 20, 20W, 30, 40, 50)
2. Multi-viscosity (SAE: 5W-20, 5W-40, 10W-30, 20W-40)

The use of the right oil is important in maintaining overall machinery efficiency.

1. If too light a grade of oil is used, it may be forced out from between the bearing surfaces allowing direct part-to-part contact, and therefore, causing very rapid wear.
2. When too heavy a grade of oil is used, the engine has to produce extra power needlessly in order to circulate the oil; if tight fitting bearings are present, they will be poorly lubricated.

Temperature greatly affects the ability of an oil to flow.

1. Oils without additives tend to thicken and increase in viscosity as the temperature decreases.
2. The same oil must be able to lubricate an engine at a starting temperature of 0°F but still lubricate an engine with an internal temperature of 320°F.
3. The following table from an operator's manual illustrates proper selection of oil according to temperature ranges:

<u>Air Temperature</u>	<u>Single Viscosity Grade</u>	<u>Multi-Viscosity Grade</u>
Above 90°F	SAE 30	SAE 20W-40
32°F to 90°F	SAE 20W	SAE 10W-30
-10°F to 32°F	SAE 10W	SAE 10W-30
Below -10°F	SAE 5W	SAE 5W-20

The use of a multi-viscosity grade of oil has the following advantages over the use of single-viscosity grades of oil.

1. Safer engine operation over a wider range of temperature conditions is maintained.
2. Easier engine starting in cold weather is possible.
3. There is less chance of burning or scoring main bearings and connecting rod bearings during those critical first few seconds of operation after starting.
4. Less oil consumption will occur.
5. One multi-grade oil may serve the needs of several engines requiring different single-grade oils.

In addition to selecting the proper oil viscosity, it is important that proper type of oil be used to fit the conditions under which the engine operates. The American Petroleum Institute (API) has developed a set of crankcase oil specifications for classifying gasoline and diesel motor oils. They are:

1. ML (motor light)
2. MM (motor moderate)
3. MS (motor severe)
4. DG (diesel general)
5. DM (diesel moderate)
6. DS (diesel severe)

The operator's manual recommends the type of oil service classification and grade to be used for different engine operating conditions. These should be carefully followed.

Gear oils are primarily used in the transmissions and rear-axle housings of agricultural machinery. In many respects they are similar to heavy crankcase oils, but their functions are somewhat different. They are given different viscosity-grade numbers (SAE: 80, 90, and 140) and different API classifications to prevent their being confused with crankcase oils.

As tractor horsepower has increased, gears have been improved to meet increased pressure and greater work loads. Gears have become smaller and tooth pressure has increased. In addition to the rolling action which occurs between gear teeth, gears go through a wiping action that tends to wipe away the oil layer separating the two gear surfaces. Additives have been added to gear oils to meet the more severe operating conditions now encountered and to cut down on the wear of gears caused by these increasingly severe operating conditions.

Temperature affects the viscosity of gear oils in the same manner that it affects crankcase oils. Therefore, it is necessary to consider viscosity grade and type classification when selecting gear oils.

1. Gear oil of proper viscosity has enough body to hold moving surfaces apart.
2. If gear oil is too heavy, engine power is wasted; the oil may channel and provide little or no lubrication thus making gears very hard to shift.

3. If the gear oil is too light, the oil film becomes so thin that high points on the sliding surfaces contact and wear rapidly.

Gear oils, like crankcase oils, contain certain kinds of additives depending upon their service classification. These additives include:

1. Anti-oxidants
2. Rust preventatives
3. Foam inhibitors

Lubricating grease is basically a lubricating oil with a soap-type thickening agent added to give it consistency. Different types of grease are used on agricultural machinery as determined by the operating requirements of a particular piece of equipment.

1. Lime soap is used in chassis grease; this results in a water-resistant grease that can be used anywhere where high operating temperatures are not present.
2. Soda soap is used to form a semi-smooth grease and is often referred to as wheel-bearing grease.
3. Lithium soap combines the water resistance and heat resistance of the other greases to provide a multi-purpose lubricant that is suitable for all-round use on farm machinery.

Suggested Teaching-Learning Activities

1. Obtain from a local service manager the shop records of the last month's repair jobs caused in part by faulty lubrication practices.
2. When introducing this competency, pass empty cans of different brands and API classifications around the class and raise the question, "Which oil would you use?"
3. Heat SAE 10 and SAE 40 viscosity grade oils to 100° and pour both down a smooth inclined plate to illustrate different flow characteristics. Repeat demonstration with both oils chilled by placing in ice water. Repeat with a multi-viscosity grade oil.

4. Demonstrate the viscosity of oils using the Saybolt viscometer for measuring motor oil viscosities. Cover half of a piece of window glass (single strength) with a SAE 50 oil film leaving the other half free of oil. Using a wooden mallet have a student tap the oil-free section a good tap making sure it breaks the first time. Have the student hit the oil covered section with the mallet at the same intensity. Emphasize that the oil acted as a cushioning agent, and as a result the glass didn't break. Show the class worn engine and agricultural machinery parts caused by varnishing, sludge, and corrosive acids.
5. On a glass plate, place a sample of a lime soap, soda soap, and lithium soap grease. Apply heat under each sample of grease noting the breakdown of the grease samples.
6. Drain the soil out of a tractor needing an oil change. Run the used oil through a filter to show the sludge deposited on the filter.
7. Have each student place a smear of unused and used oil and grease on microscope slides. Have them observe under the microscope the differences between the unused and used samples.
8. Show the class samples of the different types of oils and greases.
9. Have students develop a chart showing oil grade (viscosity) and oil type (API service classification) for different engines and working conditions.
10. Mix graphite, dirt, and then water into a clean quart of oil to emphasize what oil looks like when these foreign materials are added.
11. Have students inspect the surface of a piece of metal under a microscope noting the roughness of the surface. Emphasize the role of the lubricant in keeping the rough surfaces apart.

Suggested Instructional Materials and References

Instructional Materials

1. Samples of oil and grease of different types and grades

2. Saybolt viscometer
3. A 12" x 18" piece of single-strength glass and a wooden mallet
4. Worn engine and machine parts
5. A double strength piece of glass 12" x 12"
6. Grease samples of each soap type
7. A strainer and filter pad
8. Microscope slide plates and a microscope (might be borrowed from the biology teacher)
9. Charts on the characteristics of oils and lubricants
10. Operator's manuals for machinery used in the laboratory
11. Empty oil cans of different brands marked with the various API service classifications
12. A piece of metal
13. Materials for demonstrating impurities in oils

Suggested Occupational Experience

Have students lubricate several new machines, using the operator's manual as the lubrication guide.

II. To (1) understand machinery assembly and adjustment and (2) develop the ability to assemble it

Teacher Preparation

Subject Matter Content

The operator's manual or assembly manual for each machine gives instructions for setting up and adjusting new agricultural machines. It provides the following information:

1. Proper operating instructions
2. Servicing requirements
3. Proper attachment, adjustment, and servicing of machine accessories
4. Machine assembly instructions
5. Machine specifications

It is important that the set-up man thoroughly understand the operation of the machine before he attempts to assemble and service it. The following procedure should be followed in setting up new agricultural machines.

1. Study carefully the operator's manual for the machine. Thoroughly understand its operation, adjustment, and servicing requirements.
2. Using the operator's manual as a guide, identify and collect the parts needed to assemble the machine.
3. Assemble the machine following the assembly instructions in the operator's manual.
4. Make all adjustments according to the specifications as listed in the operator's manual.
5. Properly lubricate the new machine.
6. Touch up any scuffs or chips in the paint caused in assembling it.

Suggested Teaching-Learning Activities

1. Have a local agricultural machinery dealer speak to the class on the importance of setting up machinery in his dealership. He should point out the correct procedures to use in assembling machinery.
2. Procedures outlined in the operator's or assembly manuals should be followed carefully in assembling the machines listed below. Have students assemble, adjust, and service these agricultural machines in the order indicated.
 - a. Spike-tooth harrow
 - b. Spring tooth harrow
 - c. Grain elevator
 - d. Flare-type grain wagon and running gear
 - e. Manure spreader
 - f. Disk plow
 - g. Moldboard plow
 - h. Row-crop planter
 - i. Grain drill
 - j. Row-crop cultivator
 - k. Baler
 - l. Corn or cotton picker
 - m. Combine
 - n. Loader

Suggested Instructional Materials and References

Instructional Materials

New unassembled agricultural machines

References

S Operator's manuals or assembly manuals

Suggested Occupational Experience

Have students set up machinery at the local agricultural machinery dealership under the supervision of the service department set-up men.

Suggestions for Evaluating Educational Outcomes of the Module

The following may be considered in evaluating the educational outcome of this module.

1. Student interest in the materials included in this module
2. The ability of the student to set up, adjust, and service new machines
3. The ability of the student to use properly the operator's manual in setting up new machines
4. Employer's evaluations of the quality of work done by the students on the job

MECHANICAL POWER TRANSFER SYSTEMS

Major Teaching Objective

To understand and apply the fundamentals and principles of mechanical systems of power transmission in agricultural machinery

Suggested Time Allotments

At school		
Class instruction	<u>24</u>	hours
Laboratory experience	<u>36</u>	hours
Total at school	<u>60</u>	hours
Occupational experience	<u>0</u>	hours
Total for module	<u>60</u>	hours

Suggestions for Introducing the Module

The whole spectrum of career opportunities in agricultural machinery occupations involves, to a certain extent, a knowledge of the fundamentals and principles of power transmission. Whether tractors or engines are used as stationary or portable power plants to drive or pull various types of equipment, the power delivered by the engine must be transmitted through some type of transmission system to the equipment performing the job. The power train of a tractor which transmits the power from the tractor engine to the wheels involves two or more methods.

Although hydraulic systems of transmitting power are used extensively on tractors and other farm equipment, mechanical systems remain the basic method of transmitting power from its source to its use.

The complexity of the construction of agricultural equipment makes it essential that a person desiring employment in this area have a knowledge and understanding of the fundamentals and principles involved in mechanical power transmission.

The following technique should be used to create interest in the module:

Bring before the class an item of equipment which operates through pulleys and belts from a stationary engine. Remove the pulleys and belts, start the engine, and ask students to explain why the item of equipment is not operating. Also bring a tractor and another item of equipment with a mounted engine before the class. Have the students examine each item of equipment and list the points or places through which power

is transmitted from the source to the use. Have a general discussion in which class members give their interpretation of how power is transmitted from its source to its use.

Competencies to be Developed

- I. To (1) understand the function of the clutch and to (2) identify its parts

Teacher Preparation

Subject Matter Content

The purpose of the clutch is to connect or disconnect a machine from the source of power, or, as is the case with a tractor, to connect or disconnect the engine to or from its load.

There are two basic types of clutches used on agricultural machines.

1. Friction
2. Positive

The friction clutch is used on tractors and machines with their own source of power, such as the self-propelled combine.

On tractors, clutches are of two types.

1. Dry
2. Wet

The dry-type clutch is equipped with a driving plate and a driven plate. The driving plate is lined with friction surfaces that are pressed against the driven plates when the clutch is engaged. These friction surfaces which are extremely smooth, increase the frictional surface of the plate.

The multiple-disc clutch, commonly used in crawler tractors, has many driving and driven discs and runs in oil. This type of clutch is called a wet-type clutch.

The two kinds of clutches most commonly used on the majority of row crop tractors today are:

1. Spring-loaded foot-operated clutch
2. Over-center hand-operated clutch

On the spring-loaded foot-operated clutch, spring pressure clamps the driven disc between the pressure plate and the flywheel. The foot pedal is used to disengage the clutch. The spring-loaded foot-operated clutch is composed of the following main parts:

1. Driven disc
2. Pressure plate
3. Pressure spring
4. Shift rod
5. Throw-out bearing

The over-center hand-operated clutch is operated by a hand lever and cam mechanism. The driving plate is attached to the flywheel. Drive plates drive the power shaft that supplies power to the transmission. When the driving clutch is engaged, the driven plate is forced against the driving plate by the yoke assembly. The over-center hand-operated clutch is comprised of the following main parts:

1. Driven plates
2. Driving plates
3. Yoke assembly for engaging the clutch
4. Clutch shift
5. Thrust plate
6. Clutch brake

The safety snap clutch is a friction-type clutch used on agricultural machinery. Two notched plates are pressed together by springs of sufficient force to permit power to be transmitted for normal predetermined working loads. In the event that an overload occurs on the clutch, it slips with a snapping action and prevents damage to the working unit. This type of clutch is commonly used on corn pickers, forage harvesters, and haying machines.

The positive clutch consists of two parts. Each part has jaws so shaped and placed as to lock together as a unit when they are engaged. They are used on machines transmitting light loads at slow speeds, such as planters and grain drills.

In the main, three types of positive-type clutches are used on agricultural machinery.

1. Ratchet-and-pawl
2. Overriding or overrunning
3. Belt tension
(See Farm Machinery and Equipment, pp. 42-44, for discussion of each of the above.)

Suggested Teaching-Learning Activities

1. Bring before the class a clutch of each type identified in the content and demonstrate how each one works.
2. Tour an agricultural machinery dealership to observe the use of clutches on agricultural machines.
3. Have students disassemble each type of clutch discussed in the content, learn its parts, and reassemble them.
4. Demonstrate the proper use of tools used in disassembling clutches.

Suggested Instructional Materials and References

Instructional materials

1. Clutches of the types identified in the content
2. Tools used in disassembling clutches

References

1. Farm Machinery and Equipment, pp. 41-44.
2. Modern Farm Power, pp. 160-164.
3. Machines for Power Farming, pp. 96-100.
4. Manufacturer's service manuals.

- II. To (1) understand the function of the transmission and to (2) identify its parts

Teacher Preparation

Subject Matter Content

The transmission is the speed-reducing mechanism on the tractor. It provides a mechanical means of

1. Transmitting power to the driven member of the machine
2. Increasing and decreasing speed or power of the machine
3. Controlling travel (forward or backward) of the machine

Speed reduction is accomplished through sliding (speed-changing) gears. The simple transmission is composed of the following parts:

1. Drive shaft
2. Gears
3. Transmission countershaft
4. Main shaft

The gears on the end of the drive shaft and the countershaft are in constant mesh. The gears located on the main shaft are moved into position with the gears on the countershaft to obtain the desired speed of travel. Figure 7-4 on page 101 of Machines for Power Farming illustrates the function of the transmission parts and the flow of power through the transmission. The gears on the main shaft are movable. By shifting these gears forward or backward on the main shaft, the flow of power and the speed at which the machine is operating can be changed.

Transmissions in tractors are designed for power. The only time speed is needed is when the tractor is operated in road gear. The gear ratio in a transmission is low in relation to speed, and high in relation to torque.

Tractors require different gear ratios to meet varying operating requirements. The two ways of referring to a

change from one gear ratio to another in a simple gear train are constant-mesh and sliding gear shifting.

Reverse speed is obtained by engaging the small pinion gear between the countershaft and the sliding gears.

Several types of transmissions are used in tractors.

1. Single shift
2. Dual shift

These types of transmissions include only gear transmissions in which one gear must mesh and slide into another in order to shift from one gear to another.

3. Shift-on-the-go

This type of transmission includes planetary gears. Gears are in constant mesh and are applied or released by a hydraulic clutch. Transmissions included in this type are

- a. Select-O-Speed
- b. Case-O-Matic
- c. Torque amplifier
- d. Power director
- e. Synchro-range
- f. Multi-power
- g. Hydra-power

These transmissions can be shifted from one speed to another while the tractor is in operation.

Suggested Teaching-Learning Activities

1. Using wall charts, teacher-made transparencies, and the reference illustrations, discuss the operation and parts of the various types of transmissions.

2. Demonstrate the operation of a simple transmission. Use a cutaway of an actual transmission for demonstrating this operation.
3. Demonstrate proper usage of transmission disassembly and repair tools.
4. Have students disassemble a simple transmission, learn its parts and their functions, and reassemble the parts.
5. Tour several agricultural machinery dealerships to study the types of transmission used on the tractors in each dealership.

Suggested Instructional Materials and References

Instructional materials

1. Charts, overhead transparencies, and cutaway models of transmissions
2. A simple transmission for each student

References

1. Transmission Theory.
2. Modern Farm Power, pp. 164-170.
3. Machines for Power Farming, pp. 100-104.

III. To (1) understand the functions of the differential and final drive and to (2) identify their parts

Teacher Preparation

Subject Matter Content

The purpose of the differential is to divide the power transmitted to the two rear wheels. This power should be divided equally when the tractor moves straight forward and unequally when the tractor turns.

The differential is made up of the following parts:

1. Transmission spline shaft
2. Bevel pinion gear on transmission shaft

3. Differential bevel pinion gears (spider gears)
4. Slide gears
5. Ring gear
6. Countershaft

The ring gear is driven by the bevel pinion on the transmission spline shaft. The differential bevel pinions are located on the sides of the ring gear and are mounted on the axle stubs. The spider and bevel pinion assembly makes the only connection between the ring gear and the two bevel side gears, which are keyed to the inner ends of the final drive countershafts. Both these bevel side gears are in constant mesh with the four differential pinions.

The entire differential assembly revolves when the tractor moves straight ahead. When one rear wheel meets additional resistance, for example, in turning, the differential pinions not only are carried around by the housing but also begin to rotate on their stub axles. The differential pinions then ride on one of the bevel gears and drive the others, thus driving one wheel faster than the other.

The purpose of the final drive is to reduce greatly the speed of the engine before it is applied to the drive wheels.

The final drive is made up of the following parts:

1. Pinion gear
2. Bull gear
3. Side gears
4. Axles
5. Shafts
6. Housing

The belt pulley on some tractors is placed at the rear of the tractor and is driven by the PTO shaft. It is usually placed on the right side near the center of the tractor.

The power flows through a set of bevel gears sitting at a right angle with the engine crankshaft to the pulley. It is driven by a bevel gear located on the transmission driving

shaft. A special clutch, or throw-out, permits the belt pulley to be kept out of operation.

Several types of PTO's are found on tractors.

1. **Constant-running.** With this type, the PTO will continue to run after the forward motion of the tractor is stopped.
2. **Independent.** With this type, the PTO can be stopped without having to stop the tractor.

Power from the engine is transferred to the machine through telescoping shafts and universal joints.

Suggested Teaching-Learning Activities

1. Using charts and projected diagrams, discuss with the class how the differential, final drive, belt pulley, and PTO on a tractor operate.
2. Using cutaways of actual models, demonstrate these tractor parts to the class.
3. Demonstrate proper usage of tools to repair these tractor parts.
4. Have the students disassemble these tractor units, study their parts, and reassemble them.
5. Tour agricultural machinery dealerships to observe the variations in application of these tractor units.

Suggested Instructional Materials and References

Instructional materials

1. Charts, cutaways, and enlarged views of the differential, final drive, belt pulley, and PTO of a tractor
2. A differential, belt pulley, and PTO for each member of the class

References

1. Machines for Power Training, pp. 104-109.
2. Modern Farm Power, pp. 170-173.
3. Manufacturer's service manuals

IV. To (1) understand the functions of the steering mechanism and brakes on tractors and to (2) identify their parts

Teacher Preparation

Subject Matter Content

The purpose of the steering mechanism on a tractor or self-propelled agricultural machine is to change the direction of the machine while it is in motion.

Two types of steering mechanisms are commonly used on wheel tractors.

1. Worm-and-lever
2. Worm-and-sector

On each type of steering mechanism, the sector or lever rides in the grooves of the worm gear, which is located on the steering shaft opposite the steering wheel. When the steering wheel turns, the lever or sector riding on the worm gear moves up or down. This movement, in turn, moves the pitman arm that is connected to the shaft running to the front wheel steering assembly and turns the wheels in the desired direction. (See Modern Farm Power, p. 191, for illustrations of the above types of steering mechanisms.)

In recent years, hydraulic principles have been applied to steering mechanisms to make machine steering easier. On most tractors, vane-type hydraulic power steering units are used. A positive displacement pump supplies the hydraulic oil to the power steering unit, and a valve arrangement directs the flow of oil to both sides of the steering cylinder.

Crawler tractors are steered by either a clutch-and-brake arrangement or a brake-and-differential-drive arrangement. (See Modern Farm Power, pp. 194-195, for illustrations of the above-mentioned crawler steering mechanisms.)

Brakes on a tractor serve several purposes: For turning and stopping the vehicle and for providing the tractor operator with a means of safely operating his tractor.

Three types of brakes are in common use on tractors.

1. Disk
2. External-band
3. Internal-expanding shoe

The disk type of brake is found either on the rear axle shaft or the differential shaft. Applying the brake causes the friction plate to be clamped between stationary plates. The friction plates are attached to the axle shaft or differential. When the stationary plate clamp is against the friction plate, the axle is stopped or slowed down. The disk-type brake is illustrated in Modern Power Farming on page 195.

The drum of the external-band type of brake is attached to the axle shaft or differential shaft and rotates with the axle. A band with a friction surface lining fits around the outside of the drum. When pressure is applied against the foot pedal of the brake, the linkage between the foot pedal and the bands tightens and clamps the external band against the drum, causing the tractor to slow down or stop. The external-band type of brake is illustrated on page 196 of Modern Power Farming.

The internal-expanding brake is located on either the axle or the differential shaft. It consists of a set of stationary brake shoes and a set of drums. When the brake is applied, the shoes are forced against the drums, causing the tractor to stop or slow down. See page 197 of Modern Power Farming for an illustration of the internal-expanding brake.

Suggested Teaching-Learning Activities

1. Using cutaways and mockups, demonstrate before the class how each type of steering mechanism and brake operates.
2. Have students disassemble each type of steering mechanism and brake, learn its parts, and reassemble them.
3. Identify and demonstrate special tools used in disassembling steering mechanisms and brakes.

Suggested Instructional Materials and References

Instructional materials

1. Cutaways and mockups of the steering mechanisms and brakes discussed in the content
2. Tools used in disassembling steering mechanisms and brakes

References

Modern Farm Power, pp. 190-196

V. To understand pulleys and belts as a means of power transmission

Teacher Preparation

Subject Matter Content

Because of their adaptability, belt pulleys and belts are used on many machines as a means of transmitting power. Power can be transmitted from less than a few feet to 100 feet or more. This system is used extensively on machines such as feed grinders, silage blowers, corn shellers, and irrigation pumps. Often tractors equipped with belt pulleys are used as stationary power units for belt-driven equipment.

There are two types of belts and pulleys.

1. V-belt
2. Flat belt

V-belts have gained in popularity during recent years. Advantages of a V-belt includes

1. It is simple and compact.
2. There is good pulley contact and very little slippage if the belt is given correct tension.
3. It cannot slip off pulleys.
4. Speeds can be changed without changing the entire pulley.

The flat belt pulley is usually "crowned"; that is, the diameter at the center of the pulley is a little greater than at the outer edges. The crown helps keep the belt aligned when the pulley is moving.

Belting materials are usually leather, canvas, or rubber. Leather is an excellent material but is expensive and must be kept dry. Canvas belting is durable and withstands exposure to moisture and oil, but stretches or shrinks under certain conditions. Rubber belting is used extensively on farm equipment but does not withstand oils and greases.

Pulleys may be constructed of a number of materials. Most, however, are made of wood, steel, cast iron, fiber, or paper.

Correct size and speed of pulleys is very important. Persons planning for employment in an agricultural machinery occupation must have an understanding of the basic laws of physics and mathematics relative to pulleys and belts and be able to apply this understanding to practical situations.

The following equation should be used, in determining pulley sizes and speed:

Equation 1 (To determine the size of pulley needed to give a machine the proper speed)

D = diameter of driver

S = speed of driver

d = diameter of driven pulley

s = speed of driven pulley

$$D \times S = d \times s$$

Example:

A 12-inch driver pulley on an agricultural machine that turns 800 r.p.m. is to operate a driven pulley at 2400 r.p.m. What size should the driven pulley be to operate at 2400 r.p.m.?

$$12 \times 800 = d \times 2400$$

$$d = \frac{12 \times 800}{2400} = 4 \text{ inches}$$

Often pulley belts wear or break on agricultural machines with pulleys of unequal sizes and must be replaced. The problem then is to determine the size of pulley with which to replace the worn or broken belt. The following methods should be used to determine the size of belt to use.

V-belt

The following formula should be used to determine the length of a V-belt.

$$L = 2C + 1.57 (D+d) + \frac{(D-d)^2}{4C}$$

L = length of belt

C = distance between centers of sheaves

D = outside diameter of large sheaves

d = outside diameter of small sheaves

$$L = (2 \times 15) + 1.57 (8'' + 6'') + \frac{(8'' - 6'')}{(4 \times 15)}$$

$$L = 30 + 21.98 + .03$$

$$L = 52.01'' \text{ or } 52''$$

Flat belts

The following method should be used to determine the size of flat belt needed.

1. Add together the diameters of the two pulleys.
2. Divide this sum by 2 and multiply the quotient by 3.
3. To this product, add twice the distance between the centers of the two pulley shafts.

Example:

1. $8'' + 4'' = 12''$
2. $2 \div 12'' \times 3'' = 18''$
3. $18'' + 18'' + 18'' = 54''$

Suggested Teaching-Learning Activities

1. Have students examine several pieces of equipment which use flat and V-belts.
2. Have students cut used flat and V-belts to study their construction.
3. Have students work the following problems. Emphasize the purpose involved in each problem.
 - a. To step up the speed of a pulley, using a large pulley to drive a small pulley.

- Pulley "a" is the driver pulley. How fast will pulley "b" turn?
- b. A 10" pulley running on the PTO shaft of a tractor is turning 540 r.p.m. The driven pulley on the machine is supposed to turn 1000 r.p.m. How large a driven pulley should be used to obtain a speed of 1000 r.p.m.?
 - c. To slow down the speed of a pulley, using a small pulley to run a large pulley. A 4" driven pulley is turning 1000 r.p.m. The driven pulley on the machine is supposed to turn 600 r.p.m.'s. How large a driven pulley should be used to obtain a speed of 600 r.p.m.? Assume that the pulley shafts are 15" apart, and determine the length of V-belt and flat belt needed to drive the driven pulley.

Suggested Instructional Materials and References

Instructional materials

1. Samples of belt materials
2. Several V-belt and flat belt pulleys of various sizes which can be mounted on axles

3. Belts of various lengths
4. Diagrams of various kinds of pulleys and belts
5. One or more pieces of agricultural equipment for student use

References

2. Farm Machinery and Equipment, pp. 26-31.
3. Farm Gas Engines and Tractors, pp. 404-445, 475-479.

Suggested Occupational Experiences

Have students determine size and install pulleys on agricultural machines at the agricultural machinery dealership.

VI. To understand sprocket wheels and chains as a means of power transmission

Teacher Preparation

Subject Matter Content

Sprocket wheels and chains are positive means of power transmission. They are satisfactory even when the driving and the driven parts of the machine are several feet apart or when considerable speed reduction is desired.

Advantages of the sprocket and chain method of power transmission include:

1. Because it is positive, there is no slippage.
2. It can be coupled and uncoupled easily.
3. Chains absorb shock.
4. A small variation in the distance between sprocket centers is not harmful.

Types of chains include:

1. Detachable-link or hook-link chain
2. Pintle chain

3. Roller chain

4. Silent chain or chain belt

The detachable-link or hook-link and the roller are the two types of chains commonly used on agricultural equipment.

The roller-link chain is used for light work and medium speeds.

The pintle chain is used for heavy-duty and slow-speed work.

The roller chain, used for heavy-duty work, is also used extensively in the final drives of tractors, trucks, and self-propelled machinery.

The silent chain is a special type of chain, with the characteristics of a flexible metal corrugated belt. It is used for high-speed light work in engines, such as driving the cam shaft.

Suggested Teaching-Learning Activities

1. Have students examine various types of chains and sprockets.
2. Have students determine sizes of sprockets needed on a piece of equipment, according to varying requirements and uses of the machine.
3. Have students replace sprocket wheels and repair chains on agricultural machines.

Suggested Instructional Materials and References

Instructional materials

1. Several sizes of sprockets
2. Several lengths of chains for students to use with the various sizes of sprockets.
3. Samples of each type chain
4. One or more pieces of agricultural equipment for student use
5. Pictures and diagrams of chains and sprockets and their uses

References

1. Farm Machinery and Equipment, pp. 31-34.
2. Farm Gas Engines and Tractors, pp. 482-483.

VII. To understand gears and gearing as a means of power transmission**Teacher Preparation****Subject Matter Content**

Gears, like sprockets and chains, are a positive means of power transmission. Positive power transmission means there is no slippage, as often occurs with pulleys and belts.

Gears and gearing are restricted primarily to the transmission of power from one part of a machine to another part of the same machine. Gears are also used extensively as a means of reducing or increasing speed of various parts of a machine.

Gears and gearing often are a more expensive means of power transmission than sprockets and chains, since the complete system may need to be replaced when repairs are needed.

Gears may be classed according to the following types:

1. Spur gear

The shafts of spur gears are parallel, and their teeth are arranged so that their axes of rotation are parallel to the axes of rotation of the gears with which they mesh.

SPUR GEAR

2. Beveled gear

The teeth of beveled gears are arranged so that the shafts of the two gears meshed are at right angles, or nearly so. Beveled gears are used where power must be transmitted around corners. They are used extensively for differential pinion and axle gears in tractors.

BEVEL SPUR GEAR

3. Worm gear

Worm gears consist of two parts, the worm and the sector.

An advantage of the worm gear is that it permits a large speed variation between the driving and driven members of the machine. Disadvantages include:

- a. Usually it will not operate in a reverse manner.
- b. Its efficiency is lower than that of other types of gears.
- c. Continuous lubrication is necessary during operation.

WORM GEAR

4. Hypoid gear

Hypoid gears are similar to spiral bevel gears except that the teeth have a distinct curvature. There is greater contact between the teeth and they operate under extreme pressure. Teeth contact is below the center line of the ring gear in tractors.

HYPOID GEAR

5. Helical gears

The teeth of helical gears are curved so as to remain in mesh or in constant contact longer than straight teeth. They may be of the spur gear type or the beveled gear type.

HELICAL GEAR

Agricultural machines require different gear ratios to meet varying operational requirements as demonstrated by the involvement of a transmission in the power train of a tractor. It is the function of the transmission to vary the speed, either up or down, at which the tractor is to operate. The

speed changes are made by bringing into contact gears of different sizes to transmit the power coming into the transmission. A large driving gear drives a smaller gear to increase the speed or amount of power. To reduce the amount of speed or power, a small gear drives a large gear. The relationship of gear sizes to each other is known as the gear ratio and is measured by measuring the circumferences of the two gears. An easy way to determine gear ratio is shown below.

There are 15 teeth on the small gear and 25 teeth on the large gear. The gear ratio is 5 to 3.

Suggested Teaching-Learning Activities

1. Have students study each type of gear listed in the content and be able to identify each gear upon sight.
2. Using agricultural machines, show students where each type of gear is used and demonstrate how it works in motion.
3. Using a tractor transmission, have the students determine the gear ratio when the tractor is engaged at each speed. After the students have determined the gear ratios, operate the tractor, noting the differences in speed caused by each gear ratio.

Suggested Instructional Materials and References

Instructional materials

1. Examples of each type of gear listed in the content
2. Pictures and diagrams of gears and gearing
3. Several pieces of equipment for students to disassemble or examine, including power train of a tractor
4. Tractor with transmission exposed to study gear ratios

References

VIII. To understand the relationship of bearings to power transmission in agricultural machinery

Teacher Preparation

Subject Matter Content

Bearings are used in farm machinery to hold in position the various power transmitting parts and are designed to reduce the amount of resistance between these parts as much as possible.

Two types of bearings are used in agricultural machines.

1. Friction
2. Anti-friction

In friction bearings, the turning part is supported by and in direct contact with the inside surface of the bearing. The insert in the connecting rod coupling is an example of a friction-type bearing. Friction bearings are usually made of cast iron, bronze, or babbitt.

In anti-friction bearings, balls and rollers are placed between the moving part and the bearing. The rollers or balls turn with the moving part, reducing friction and wear on the moving part.

Several types of anti-friction bearings are used on agricultural machinery.

1. Ball
2. Roller

Ball bearings are more versatile than other types of rolling bearings. They operate with less friction, and may be used at higher speeds. In the diagrams on page 4 of Ball and Roller Bearings, the construction of a ball bearing is illustrated.

Several types of ball bearings are used on agricultural machinery.

1. Internal self aligning
2. Single row drop groove
3. Loading groove
4. Single row angular contact
5. Double row deep groove
6. Double row angular contact
7. Ball thrust
8. Sealed, prelubricated
(See Ball and Roller Bearings, pp. 5-7, for a discussion of each of the above.)

Roller bearings use small cylindrical rollers that reduce friction. Roller bearings are particularly useful where the bearing is subjected to high pressure because of its larger bearing surface.

As is the case with ball bearings, several types of roller bearings are used on agricultural machinery.

1. Spherical
2. Straight
3. Spherical thrust
4. Tapered

5. Needle

6. Thrust

(See Ball and Roller Bearings, pp. 7 and 8, for examples and a discussion on each of the above listed bearings.)

Proper removal and installation of ball and roller bearings is of utmost importance if the bearing is to function properly and if damage to the moving part to which it is attached is to be avoided. Procedures for removing and installing bearings are illustrated in Ball and Roller Bearings, pp. 11-14, and 18-21.

Suggested Teaching-Learning Activities

1. Using overhead transparencies made from the diagrams Ball and Roller Bearings, discuss the various types of roller and ball bearings.
2. Show students where each type of bearing covered in the subject matter content is used on agricultural machinery.
3. Have students disassemble each type of bearing covered in the content and study its construction.
4. Demonstrate the use of bearing removal and installation tools and have each student use these tools in removing and installing bearings.

Suggested Instructional Materials and References

Instructional materials

Suggestions for Evaluating Educational Outcomes of the Module

The following criteria should be used to evaluate the educational outcomes of this module:

1. Student interest in the material covered in this module
2. Student participation in class activities
3. The ability of the student to carry out the teaching-learning activities
4. The ability of the student to use the special tools identified in the teaching-learning activities

HYDRAULIC POWER TRANSFER SYSTEMS

Major Teaching Objective

To understand basic hydraulics and its application to agricultural machinery

Suggested Time Allotments

At school

Class instruction	<u>90</u> hours
Laboratory experience	<u>120</u> hours

Total at school 210 hours

Occupational experience 60 hours

Total for module 270 hours

Suggestions for Introducing the Module

The application of hydraulic principles to agricultural machinery operation has become increasingly more important in recent years. The size, weight, and complexity of modern agricultural machinery requires a much more powerful and flexible means of control. These machines are required to perform more jobs requiring more power to conduct them. Hydraulic principles have provided agricultural machinery designers with a practical means of meeting new demands placed on agricultural machinery.

Modern hydraulic systems on many types of agricultural machines seem complicated, and some are. Actually, the fundamental design is quite simple.

A person planning to work as an agricultural machinery mechanic must thoroughly understand basic hydraulic principles and systems and their application to agricultural machinery. He must also be able to recognize types of hydraulic pumps and valves and their parts and functions (cylinders, seals and packings, and lines and fittings) if he is to repair and service hydraulic systems on agricultural machinery properly.

The study of hydraulic transmissions has been omitted from this module. Due to the degree of specialization in this field, industry representatives felt that training in this area could best be provided through their service schools.

The following are suggested techniques for use in creating interest in the module:

1. Place various hydraulic system parts around the classroom and have the students attempt to identify them. Emphasize the need for being able to identify parts of the hydraulic system in order to work effectively on hydraulic systems.

2. Bring several agricultural machines before the class that have faulty hydraulic systems. Have students attempt to locate the source of the problem in each system.
3. Demonstrate before the class how a small piston can increase the output force of a hydraulic system. Have students attempt to explain how this phenomenon takes place.

Competencies to be Developed

I. To understand hydraulic terminology

Teacher Preparation

Subject Matter Content

The following terms should be thoroughly understood as they relate to hydraulic systems:

- | | |
|-----------------------------------|------------------------------------|
| 1. Actual size | 31. G.P.M. |
| 2. Aeration | 32. High pressure |
| 3. Ambient temperature | 33. Horsepower |
| 4. Atmospheric pressure | 34. Hydraulics |
| 5. Back pressure | 35. Inertia |
| 6. Baffle | 36. Knock out valve |
| 7. Bernoulli's principles | 37. Line |
| 8. Bleed-off | 38. Liquid |
| 9. Breather | 39. Low circulating pressure |
| 10. By-pass of filter | 40. Minimal size |
| 11. By-pass | 41. Motion |
| 12. Cavitation | 42. Neutral |
| 13. Chamber | 43. Non-position displacement pump |
| 14. Check valve | 44. Operator |
| 15. Circuit | 45. Pascal's law |
| 16. Components | 46. Pipe |
| 17. Control valves | 47. Positive displacement |
| 18. Cylinders | 48. Power point |
| 19. Displaced oil | 49. Power |
| 20. Feather | 50. Pressure |
| 21. Filter | 51. Pressurized |
| 22. Flexible hose | 52. Proportional type filter |
| 23. Float | 53. PSI |
| 24. Fluids | 54. Pump |
| 25. Force | 55. Quantity of flow |
| 26. Four-way valve | 56. Rate of flow |
| 27. Four-way four position spool | 57. Relief valve |
| 28. Four-way three position spool | 58. Reservoir |
| 29. Friction | 59. Resistance |
| 30. Full-flow filter | |

60. R.P.M.	69. Valve
61. Sealed system	70. Velocity
62. Spool	71. Vent
63. Static pressure	72. Viscosity index
64. Strainer	73. Work
65. Surge	74. Energy
66. Tubing	75. Pressure drop
67. Two-way valves	76. Compressibility
68. Vacuum	77. Oscillation

Suggested Teaching-Learning Activities

Success in teaching this competency will depend on the teacher's ability to create interest in understanding these terms. Demonstration of the meaning of the terms, when possible, will provide the stimulus for this interest.

The majority of these terms can be demonstrated by using the hydraulic demonstration unit referred to in the suggested instructional materials.

Suggested Instructional Materials and References

Instructional materials

1. Hydraulic demonstration unit
2. Pumps, lines valves, etc., to demonstrate terms

Reference

- S*1. Hydraulic Theory, Section I

*The symbol T (teacher) or S (student) denotes those references designed especially for the teacher or for the student.

II. To understand principles of hydraulic operation

Teacher Preparation

Subject Matter Content

The word hydraulics is a term applied to a science that deals with the physical behavior of liquids. Included in these liquids

are oils used in present day hydraulic systems. The study of hydraulics include

1. The laws of floating bodies
2. The flow of liquids under various conditions
3. Ways of directing the flow of liquids to useful ends

In order to understand the physical behavior of liquids, the physical properties of liquids must be thoroughly understood. These include

1. Shapelessness
2. Incompressibility
3. Density
4. Specific gravity

Liquids have no outer form of their own. They quickly conform in shape to their containers. They can be led almost anywhere in a pipe or a hose by means of gravity or by applying force to them.

Even though liquids have no shape of their own, they are even less compressible than most solids. When a force is applied to a confined liquid, it exhibits substantially the same effect of rigidity as a solid. This rigidity can be combined with fluidity to transmit a force.

Example--A force of 15 pounds on . cubic inch of a particular fluid will decrease its volume by only 1/20,000. It would take a force of over 32 tons to reduce it 10 per cent.

Pressure set up in a liquid acts equally in all directions. The shape of the container in no way alters pressure relations.

Example--See figure 10. p. 10.

Pressure due to the weight of a liquid depends upon the vertical height of liquid from a given level to the surface of the liquid. The vertical distance between two horizontal levels in a liquid is known as the head of the liquid. (Refer to Basic Hydraulics, p. 9.)

Density refers to weight of fluid per unit of volume.

Example--Water weighs 62.4 pounds per cubic foot. A certain oil might weigh 55 pounds per cubic foot.

Specific gravity of a substance is the ratio of the weight of a unit volume of that substance, its density, to the weight of the same volume of some standard substance, measured under standard pressure and temperature conditions.

1. Water is the standard used for liquids and solids.
2. The weight of water is 62.4 pounds per cubic foot.
3. The weight of a given oil might be 55 pounds per cubic foot.
4. The specific gravity of the oil is computed in the following manner: $55/62.4 = .881$ specific gravity.

By confining the fluid and adding pressure, the above principles can be applied to agricultural machinery.

Pressure is defined as force divided by the area over which it is distributed.

Example--See Basic Hydraulics, figures 10 - 12, pp. 10-12.

When two pistons are used in a hydraulic system, two basic rules always apply.

1. The force acting on each piston is directly proportional to its area, and the magnitude of each force is the product of the pressure and its area.
2. The distance the receiving piston is moved is inversely proportional to the area of the exerting piston.

Example--See Basic Hydraulics, figure 12, p. 12.

To understand the work output of a hydraulic system, an agricultural mechanic must understand input and output relations of a hydraulic system.

1. An increase in output force over input force is accompanied in exactly the same ratio by a decrease in the distance moved.

2. An increase in force can be obtained only by a proportional decrease in the distance the fluid is moved.
3. A distance increase can be obtained only at the expense of a force decrease in the same ratio.
4. In any hydraulic system, the input force multiplied by the distance through which it moves is always exactly equal to the output force multiplied by the distance through which it moves.
5. The total output in all forms always exactly equals the total energy input.
6. All of the above factors are subject to frictional losses.

When studying the working relations of a hydraulic system, one must understand the terms work and energy as they relate to hydraulic systems.

1. The amount of work done is the product of the force multiplied by the distance through which it moves.
2. Energy includes work and all the forms into which work can be converted or forms which can be converted into work.

In all working parts of hydraulic systems friction is present as the parts operate.

1. Work done against friction in a hydraulic system produces heat.
2. Heat produced in the hydraulic system is a form of energy dissipation causing a change in the input-output relationship.

In order to understand hydraulic systems in agricultural machinery in action, one must become acquainted with the characteristics of liquids in motion. Among these characteristics are

1. Volume and velocity of flow
2. Steady and unsteady flow
3. Streamline and turbulent flow

4. Force and energy changes
5. Relations of different kinds of energy to each other

Volume of flow refers to the amount of fluid that passes a given point in a hydraulic system in a given length of time. The rate of speed at which the fluid is moving forward at a particular point in the hydraulic system is called velocity of flow. It is expressed in such terms as 100 cubic feet per minute, or 100 gallons per minute or hour (G.P.M.).

A single continuous stream of fluid is known as a steady flow. When this continuous stream is interrupted by increasing or decreasing the volume of fluid passing a given point in the system, unsteady flow develops. The unsteadiness of flow is temporary, however, since it occurs during the time the rate of flow is increasing or decreasing to the new rate of flow. After it reaches this new level, a steady flow is re-established.

Streamline flow of hydraulic fluids refers to the action of fluid particles as they move straight forward without crossing the paths of other particles and without bumping into other particles. Streamline flow is accomplished under the following conditions:

1. When the fluid is flowing at low velocities
2. When the fluid is flowing through tubes or lines with small diameters

Turbulent flow of hydraulic fluid occurs when colliding fluid particles cause swirls, eddies, and cross-motions to develop in a hydraulic line. Turbulence in a hydraulic system is caused by the following:

1. Increases in the velocity of the fluids
2. Narrowing of the fluid passageway
3. Roughness of the inside of the hydraulic line
4. Dirt in the fluid
5. Degree of curvature of bends in the line
6. Friction in the hydraulic line

Five physical factors act upon the fluid in a hydraulic system.

1. Gravity
2. Atmospheric pressure
3. Specified applied forces
4. Friction
5. Inertia

Inertia is that property possessed by all forms of matter which makes the matter resist being moved if it is at rest and, likewise, resist any change of motion if it is moving.

- a. To overcome this resistance to movement, some force must act on the object.
- b. A direct relationship develops between the magnitude of the force exerted and the inertia against which it acts. This force depends on two factors.
 - 1) The mass of the subject to be moved
 - 2) The rate at which the velocity of the object is changed

All of the physical actions of liquids in all agricultural machinery systems are determined by the relationships of these five factors to each other.

Suggested Teaching-Learning Activities

1. Through the use of the hydraulic demonstration unit, demonstrate shapelessness and incompressibility of hydraulic fluids.
2. Have students measure the amount of pressure exerted on a piston using the following hydraulic cylinders:
 - a. A cylinder with an exerting piston of the same size
 - b. A cylinder with a smaller initiating piston
 - c. A cylinder with multiple pistons of different sizes

3. Have students work the following problems:

- a. How much pressure is exerted on piston "b" in illustration No. 1?

Illustration No. 1

- b. Piston "a" in Illustration No. 2, is the initiating piston and has an area of 3 square inches. Sixty pounds of pressure is applied to piston "a."

- 1) How much pressure is exerted on piston "b," whose area is 9 square inches?
- 2) How much pressure is exerted on piston "c," whose area is 7 square inches?
- 3) How much pressure is exerted on piston "d," whose area is 4 square inches?

Illustration No. 2

- c. If the initiating piston has an area of 3 square inches in Illustration No. 3, how much pressure is exerted on piston "b," whose area is 12 square inches.

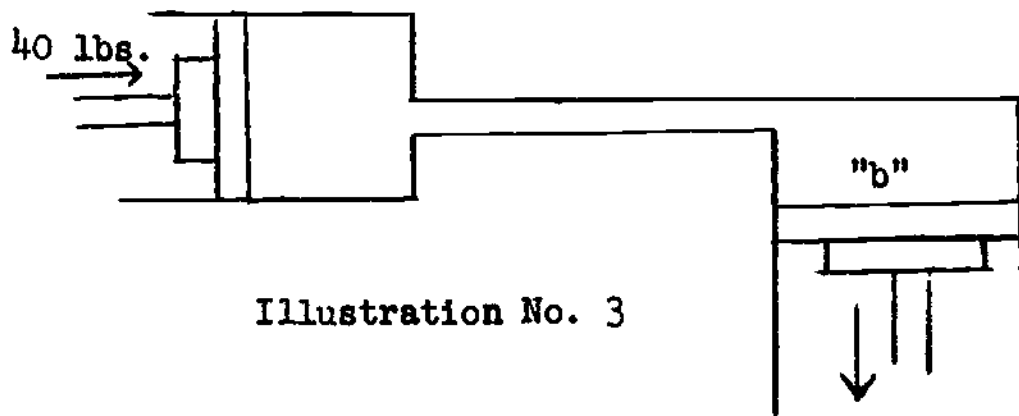

Illustration No. 3

- d. What is the pressure exerted on the bottom of a container by a column of liquid 200 inches high, if it's cross-section area is 60 square inches and it weighs .06 pounds per cubic inch?
- e. What is the weight of a column of oil 40 inches high if it's cross-section area is 20 square inches and weighs .06 pounds per cubic unit?
- f. A hydraulic jack has a single output piston with an area of 50 square inches. The area of the input is 10 square inches. If a force of 10 pounds is exerted on the input piston, how much force will be exerted on the output piston?
- g. If the input in problem "f" is moved downward 5 inches, how far will the output piston be moved?

Suggested Instructional Materials and References

Instructional materials

1. A simple hydraulic pump for disassembly
2. Three different types of pumps for use in determining the amount of pressure exerted on the receiving piston

References

- S 1. Hydraulics, pp. 3-6
- S 2. Basic Hydraulics, pp. 1-45

III. To understand the basic hydraulic system

Teacher Preparation

Subject Matter Content

Hydraulics, pp. 6-10

Hydraulic Theory, pp. 28-34

Hydraulics should be used as a basic reference and the materials followed in the order they are presented in the reference. The materials in Hydraulic Theory should be used to supplement Hydraulics.

Suggested Teaching-Learning Activities

1. Using charts, graphs, and mockups, show the components of the basic hydraulic system and its operation.
2. Have students disassemble a simple hydraulic system to identify the parts and their functions.
3. Using a plastic model of a simple hydraulic system, demonstrate to the class how the system operates. As the system is demonstrated, restrict the output of the pump to cause the relief valve to operate.

Suggested Instructional Materials and References

Instructional materials:

1. A simple hydraulic pump for each student
2. A plastic model of a simple hydraulic system

References

1. Hydraulics, pp. 6-10
2. Hydraulic Theory, pp. 28-34

- IV. To (1) identify various types of hydraulic pumps and (2) understand how they operate

Teacher PreparationSubject Matter Content

Hydraulics, pp. 10-17

Hydraulic Theory, pp. 37-46

Hydraulic Fundamentals, pp. 10-13

Basic Hydraulics, pp. 186-270

Hydraulics should be followed as the basic reference and the materials covered in the order they are presented. The other three references listed above should be used to supplement Hydraulics.

Suggested Teaching-Learning Activities

1. Using charts, models, and mockups, discuss and identify the parts and functions of each of the kinds of hydraulic pumps.
2. Have students disassemble each kind of pump, identify its parts and reassemble it.
3. Using machinery brought to the school shop or available at local agricultural machinery dealerships, show the class examples of machines on which each type of hydraulic pump is used.
4. Demonstrate the use of high pressure gauge to check maximum pressure from the setup.
5. Using a flowmeter, check the output of the pump.
6. Adjust pressure relief valve to show the various pressures obtainable from a setup.
7. Demonstrate how a plugged filter or screen on the intake of the pump will diminish the volume output of the pump.

Suggested Instructional Materials and References

Instructional materials

1. Charts, models and mockups of the different kinds of hydraulic pumps discussed in the content
2. Hydraulic pumps of each type discussed in the content

References

1. Hydraulics, pp. 10-17
2. Hydraulic Theory, pp. 37-46
3. Hydraulic Fundamentals, pp. 10-13
4. Basic Hydraulics, pp. 186-270

Suggested Occupational Experience

Have students repair several hydraulic pumps in the service department of a local farm machinery dealership.

- V. To (1) identify various types of valves used in hydraulic systems and (2) understand their functions

Teacher PreparationSubject Matter Content

Hydraulic Machinery, pp. 25-32

Hydraulics, pp. 17-24

Hydraulic Fundamentals, pp. 14-16

Basic Hydraulics, pp. 92-152

Hydraulic Machinery and Hydraulics should be followed as the basic references for teaching this competency and the materials covered in the order they are presented. The other two references should be used to supplement Hydraulic Machinery and Hydraulics.

Suggested Teaching-Learning Activities

1. Have students disassemble and identify the parts of each of the valves identified in the content.
2. Have students hook up each type of valve to a hydraulic line and observe how it functions.
3. After the class has completed the above activities, place various valves and valve parts around the classroom and have the students identify them.
4. Show the class examples of worn valves, pointing out the causes for their wear.

Suggested Instructional Materials

Instructional materials

Valves of each kind identified in the content

References

1. Hydraulic Machinery, pp. 25-32
2. Hydraulics, pp. 17-24
3. Hydraulic Fundamentals, pp. 14-16
4. Basic Hydraulics, pp. 92-152

Suggested Occupational Experience

Have students locate valves that are working improperly on hydraulic systems.

Have students replace worn-out valves on hydraulic systems.

- VI. To (1) understand hydraulic cylinders and (2) develop the ability to maintain them

Teacher Preparation

Subject Matter Content

Hydraulic Machinery, pp. 20-24

Hydraulics, pp. 24-28

Hydraulic Theory, pp. 55-56

Hydraulics should be followed as the basic reference and the materials covered in the order they are presented. The other two references should be used to supplement Hydraulics.

Suggested Teaching-Learning Activities

1. Using charts and models, demonstrate to the class how a cylinders works and how cylinders differ.
2. Demonstrate with actual models the differences between the types of cylinders identified in the content.
3. Bring several hydraulic cylinders to class that are malfunctioning in different ways. Have students locate

the trouble causing the malfunctioning and correct it.
(Possible causes of cylinder malfunctioning are given on pp. 22-23 of Hydraulic Machinery.)

4. Use a power steering pump on a tractor to demonstrate pump, cylinders, etc.

Suggested Instructional Materials and References

Instructional materials

1. Charts and models of the different types of hydraulic cylinders
2. Hydraulic cylinders that are not operating properly

References

1. Hydraulic Machinery, pp. 34-43
2. Hydraulics, pp. 24-28
3. Hydraulic Theory, pp.55-56

Suggested Occupational Experiences

1. Have students test hydraulic cylinders for leaks, and other malfunctions.
2. Have students correct malfunctions in hydraulic systems brought to a local agricultural machinery dealership for repair.

- VII. To (1) recognize various types of packings, seals, lines, and fittings, and (2) understand how they are used on agricultural machinery and hydraulic systems

Teacher Preparation

Subject Matter Content

Hydraulics, pp. 28-31

Hydraulic Machinery, pp. 34-43

Basic Hydraulics, pp. 67-90

Hydraulics should be followed as the basic reference and the materials covered in the order they are presented in the reference. The other two references should be used to supplement Hydraulics.

Suggested Teaching-Learning Activities

1. Have students identify various types of tubing, packings, and seals used in several agricultural machinery hydraulic systems.
2. Have students replace worn-out tubing, packings, and fittings on hydraulic systems on agricultural machines.

Suggested Instructional Materials and References

Instructional materials

1. Various samples of different types of tubing, packings, and seals used on agricultural machinery hydraulic systems
2. Agricultural machinery hydraulic systems with worn tubings, packings, and seals
3. New hydraulic tubings, packings, and seals

References

1. Hydraulics, pp. 28-31
2. Hydraulic Machinery, pp. 34-43
3. Basic Hydraulics, pp. 67-90

VIII. To understand types of hydraulic systems used on agricultural machinery

Teacher Preparation

Subject Matter Content

Hydraulics, pp. 35-38

Hydraulic Theory, pp. 57-65

Hydraulics should be followed as the basic reference and the materials covered in the order they are presented. The materials in Hydraulic Theory should be used to supplement those in Hydraulics.

Suggested Teaching-Learning Activities

1. Have available for the class a tractor with a hydraulically-controlled implement attached. Disassemble the hydraulic system, identifying each part and explaining its function to the class.
2. Have students disassemble several types of hydraulic systems studied in the content. Have them identify each part of the system and reassemble it.
3. Have students visit a local agricultural machinery dealership and identify the types of hydraulic systems used on the agricultural machinery at the dealership.

Suggested Instructional Materials and References

Instructional materials

1. A tractor with a hydraulically-operated implement attached
2. Charts and diagrams of hydraulic systems
3. Several hydraulic systems covered in the content

References

1. Hydraulics, pp. 35-38
2. Hydraulic Theory, pp. 57-65
3. Machines for Power Farming, pp. 109-115

IX. To understand hydraulic system troubles

Teacher Preparation

Subject Matter Content

Hydraulics, pp. 33-35

Suggested Teaching-Learning Activities

1. Bring to the class a ruptured line, an exploded cylinder, and a collapsed suction hose. Explain to the class the causes of these defects. Point out the different amounts of pressures created by various makes of tractors and their relationships to these problems.
2. Bring to the class several agricultural machines whose hydraulic systems are not operating properly. Have the students determine what is wrong in each system and correct it.
3. Demonstrate to the class what happens to a hydraulic line when the wrong size of pump is used in a hydraulic system.
4. Demonstrate what can happen when cotton braid base is used instead of wire braid base under high pressure.

Suggested Instructional Materials and References

Instructional materials

1. A ruptured hydraulic line, an exploded cylinder, and a collapsed suction hose
2. Several agricultural machines with hydraulic systems that are not working properly
3. A hydraulic system and several hydraulic pumps of different sizes

References

Hydraulics, pp. 33-35

X. To understand the types and qualities of hydraulic oilsTeacher PreparationSubject Matter Content

Hydraulics, pp. 41-43

Hydraulic Theory, pp. 24-28

Hydraulic Fundamentals, pp.23-34

Hydraulic Machinery, pp. 49-69

Hydraulics should be followed as the basic reference and the materials covered in the order they are presented. The other three references should be used to supplement Hydraulics.

Suggested Teaching-Learning Activities

Demonstrate the following before the class:

1. Pour point
2. Effects of foaming
3. Sludge deposits
4. Aniline point
5. Viscosity
6. Oxidation of hydraulic oil

Suggested Instructional Materials and References

Instructional materials

1. Saybolt meter
2. Test tubes for demonstrating pour point
3. A hydraulic system with oil that foams badly and has a build-up of sludge
4. Test tubes, hydraulic oils, aniline dyes, and gas burner

References

1. Hydraulics, pp. 41-43
2. Hydraulic Theory, pp. 24-23
3. Hydraulic Fundamentals, pp. 23-34
4. Hydraulic Machinery, pp. 49-69

- XI. To (1) understand hydraulic system trouble shooting procedures and (2) be able to locate failures in hydraulic systems

Teacher Preparation

Subject Matter Content

Operation and Care of Hydraulic Machinery, pp. 84-91

Hydraulic Fundamentals, pp. 39-40

Hydraulic Fundamentals should be followed as the basic reference in teaching this competency. The materials should be covered in the order they are presented.

Suggested Teaching-Learning Activities

Using the trouble shooting chart in Hydraulic Fundamentals, pp. 39-42, have students trouble shoot several faulty hydraulic systems on agricultural machines.

Suggested Instructional Materials and References

Instructional materials

Several faulty hydraulic systems

References

1. Hydraulic Fundamentals, pp. 38-40
2. Operation and Care of Hydraulic Machinery, pp. 84-91

Suggested Occupational Experience

Have students trouble shoot several hydraulic systems at local agricultural machinery dealerships.

Suggestions for Evaluating Educational Outcomes of the Module

The educational outcome of the module should be evaluated according to the following criteria:

1. Changes in student understanding of hydraulic principles as they relate to agricultural machinery

2. Ability of the student to diagnose hydraulic system problems and correct them (Each student should be required to trouble shoot a hydraulic system and correct any problems encountered.)
3. Student interest in the materials covered in this module
4. Changes in attitude on the part of the student toward his work
5. Changes in student understanding of agricultural machinery hydraulics, as determined by the difference in scores in pre- and post-tests in hydraulics.

ADJUSTMENT, MAINTENANCE, AND REPAIR OF TILLAGE,
PLANTING, SPRAYING, AND FERTILIZING MACHINERY

Major Teaching Objective

To (1) understand tillage, planting, fertilizing, and spraying machinery and their parts, and (2) the ability to adjust, repair, and maintain these machines.

Suggested Time Allotment

At School

Class instruction	94 hours
Laboratory experience	<u>188</u> hours

Total at school 282 hours

Occupational experience 142 hours

Total for module 424 hours

Suggestions for Introducing the Module

One job activity of mechanic's helpers and mechanics is adjusting, repairing, and servicing agricultural soil tillage, crop planting, fertilizing and crop spraying machines, both in the service department of the local agricultural machinery dealership and in the farmer's field. These employees, as well as the parts man, must know the types of these machines, their functions (including how they work in relation to a particular type of soil and crop), and their repair and maintenance.

Because of the diversity among machines used in various parts of the country, that serve the same purpose and the design differences developed by the major line agricultural machinery manufacturers, the operator's and service manuals should be used as the basic references for this module. All adjustments and repairs should be made according to specifications and procedures outlined in these manuals. The information in each competency provides the necessary background to make these adjustments and repairs.

The following techniques should be used to create interest in the module:

1. Locate machines in the community that are out of adjustment and in need of repair. Take students on a tour of the farms where they are, and demonstrate operation of these machines. Have students attempt to identify what part or parts are out of adjustment and how they should be properly adjusted.

2. Place parts from several machines around the classroom and have students attempt to identify them.
3. Place a relatively simple tillage machine before the class that is completely out of adjustment and in need of a number of repairs. Have each student attempt to diagnose what repairs and adjustments need to be made on the machine.

Competencies to be Developed

- I. To understand how to use operator's and service manuals when adjusting, maintaining, and repairing agricultural machinery

Teacher Preparation

Subject Matter Content

For each machine that an agricultural machinery manufacturer builds, he develops and supplies the purchaser with an operator's manual that gives information concerning the following:

1. Machine specifications
2. Lubrication
3. Operation
4. Adjustment
5. Trouble shooting
6. Attachments
7. Setting-up instructions
8. A description of the machine, the function it is to perform, and design to perform this function

The specifications given for a particular machine vary among the major line agricultural machinery manufacturers, but generally include the following information:

1. Type of machine
(Example--pull-type, self-propelled, mounted)
2. Weight, length, and width of machine
3. Lifting controls

4. Dimensions of moving parts
5. Safety clutches
6. Number and types of bearings

Proper lubrication is essential to long life and trouble-free operation of the machine. The following information is provided concerning lubrication of each machine.

1. Intervals at which lubricants should be applied
2. Recommended oils and greases to be used
3. Pictures and diagrams showing grease fittings
4. Pictures and diagrams showing the location of pre-lubricated sealed-type ball bearings and oil-less plain bearings

When servicing a machine, lubrication procedures should be studied thoroughly and followed carefully.

To make any adjustment on an agricultural machine, a mechanic or mechanic's helper must understand thoroughly the operation of each part of the machine. This information is given in the operator's manual in the section entitled "operation," which provides such information as

1. A description of how the machine is designed to work
2. The source of power and how the machine is attached to it
3. An identification of the processes the machine is designed to carry out and how the machine performs these functions
4. Maximum and minimum speeds at which the machine is designed to perform
5. An identification of each part in the machine and a description of how each part operates
6. Information to be used when servicing each machine part

Closely associated with the operation of an agricultural machine and of equal importance is proper adjustment, which is also covered in detail in the operator's manual. It should be thoroughly understood by the person making adjustments on machines in the agricultural machinery dealership. The adjustments to be made on a machine are presented and described in the same manner as are the items under the section entitled "operation."

In the trouble shooting section of the operator's manual, problems that may develop as a result of improper adjustment are identified and remedies suggested.

The agricultural machinery manufacturer develops at the same time, the operator's manual for the purchaser to use, and a service manual for the local agricultural machinery dealership to use. This manual describes in detail the disassembly, inspection, repair, and reassembly procedures to follow in making repairs on the machine. When repairing a machine, the procedures outlined in this manual must be carefully followed in order to insure proper and efficient repairing of the machine.

Suggested Teaching-Learning Activities

1. Demonstrate the use of the operator's and service manuals in making adjustments and repairs on an agricultural machine.
2. Have students lubricate, adjust, and make minor repairs on several comparatively simple (disk plow, row-crop planter) agricultural machines using the operator's and service manuals as guides. Emphasize proper use of these manuals at all times.
3. Have a lubrication specialist from a major line oil company speak on and demonstrate use of oils and greases on agricultural machinery.

Suggested Instructional Materials and References

Instructional materials

1. Operator's manuals
2. Service manuals
3. Machines needing adjusting and repairing

References

S*1. Operator's manuals

2. Service manuals

"The symbol T (teacher) or S (student) denotes those references designed especially for the teacher or for the student.

II. To understand the relationship of soil tillage methods to the soil

Teacher Preparation

Subject Matter Content

The primary function of all tillage machinery is to pulverize, aerate, and loosen the soil in preparation for planting a crop. In addition, soil tillage machines level and smooth fields, compact the top soil, and kill weeds that have started to grow before the crop is planted.

The degree to which these activities are performed on the soil and tillage machines that are selected to perform these activities is dependent on several factors.

1. Soil type
2. Erosiveness of the soil
3. Moisture availability during the growing season
4. Crops to be planted

The type of soil influences greatly the type of tillage treatment necessary to develop a well-pulverized seedbed that will produce a high-yielding crop. Soils are grouped on the following basis:

1. Sandy
2. Sandy loam
3. Loam
4. Silt loam

5. Clay loam
6. Clay
7. Heavy clay

The amount and depth of tillage necessary to prepare a good, firm seedbed varies according to the soil type. Because of the coarse texture of sandy soils, less tillage is required to loosen and aerate the soil, and machines that penetrate the soil at comparatively shallow depths are used. On heavy, compactable soils, such as clay or clay loam, more extensive tillage is required to develop a good, firm, permeable seedbed; and machines that penetrate the soil at a depth of 6" or more are used.

Another factor closely associated with the type of soil which also places limitations on the method and extent of tillage, is the susceptibility of the soil to erosion.

Two elements are responsible for causing soil erosion.

1. Wind
2. Rain

Soils that are susceptible to erosion due to high winds and rain require different tillage practices than soils in areas not so susceptible to these hazards. In areas where erosion by wind is a problem, farmers stir the subsurface avidly turning under the top soil as much as possible. In areas where erosion by rainfall is a problem, farmers turn the soil as deeply as possible to increase the permeability of the soil.

The major elements determining the physical condition and productivity of the soil are texture and structure of the soil, which tillage practices break down, thus making the soil more susceptible to erosion. This fact is illustrated in the following table.

<u>Surface Condition</u>	<u>Runoff Percent</u>	<u>Erosion per Acre Ton</u>
Surface fine and moist	75	12
Surface fine and dry	66	7
Surface cloddy	26	2.4

In many areas of low annual rainfall, conservation of soil moisture is of utmost importance in avoiding crop failure. Here tillage of the soil must be held at a minimum to avoid undue moisture losses. In areas where adequate rainfall prevails, the soil must be thoroughly pulverized to absorb rainfall and retain moisture for crops. In these areas unplowed soil loses most of the rainfall by runoff. Usually in these areas the humidity is so high that it is necessary to plow deep enough to bury insects and plant diseases that build up in crop residue on top of the soil.

The crop to be planted also influences the soil tillage methods to be used. Some crops need a firm, deep seedbed to develop the root system needed for maximum growth; whereas others do well in a shallow seedbed. Pulverizing the soil aerates it and enhances the activity of microorganisms and bacteria, causing rapid oxidation and decay of crop residues. Stirring the soil also aids in the nitrification and liberation of plant nutrients within the soil. The effects of various tillage practices on crop growth is pointed out in the following tables.

Table 1 - Effect of tillage treatments on corn yield, stand, height

Tillage treatment	Yield 14-year	Plants (7-year average)	Height (10-year average)
	Bu.	Hundreds	In.
1. Standard plow	53.4	117	60.6
2. Prairie breaker	54.5	114	57.4
3. Rotary tillage	46.9	107	56.0
4. Surface and sub- surface tillage	44.7	95	50.5
5. Surface tillage only	40.2	92	50.4
6. Standard plow plus mulch	54.9	129	63.2

Table 2 - The effect of tillage treatments on wheat and hay yields.

Tillage treatment	<u>Yields per Acre</u>		Hay* 3-year Average lb.
	Wheat		
	<u>9-year average</u>		
	Stalks removed bu.	Stalks left bu.	
1. Standard plow	27.2	21.6	3,870
2. Prairie breaker	28.6	22.9	3,870
3. Rotary tillage	26.7	24.6	3,890
4. Surface and sub- surface tillage	23.9	23.0	4,210
5. Surface tillage only	23.8	21.7	3,840
6. Standard plow plus mulch	16.8	11.8	3,830
Average	24.5	20.9

*First cutting only.

Source - Ohio Agricultural Experiment Station Research Circular #30.

Suggested Teaching-Learning Activities

1. Have the local soil conservation specialist speak to the class on the relationship of soil tillage methods to the soil.
2. Take a field trip to fields in the community affected by soil erosion problems. Stress the relationship of these problems to the tillage methods applied to the soil.
3. Bring soil samples to class and have students learn to identify them.
4. Take a plow or any other soil tillage machine to fields with different soil types and affected by different climatic conditions. Have students observe how the machines work in each field.

5. Have students select a field in the community and trace the tillage practice on that field. Have students note the condition of the field in terms of erosion and soil structure breakdown and relate these conditions to the tillage history of the field.

Suggested Instructional Materials and References

Soil samples of each type identified in the subject matter content

Reference

Profitable Soil Management, pp. 195-309.

III. To select and use proper lubricants for agricultural machines

Teacher Preparation

Subject Matter Content

If the person being taught this module has not been taught the competency on understanding agricultural machinery lubrication included in the module on "Agricultural Machinery Assembly and Lubrication," he should be taught that competency at this time.

IV. To (1) identify types and parts of primary soil tillage machines and understand their functions and to (2) adjust and repair these machines

Teacher Preparation

Subject Matter Content

Machines that are used to break and loosen the soil for a depth of 6 to 36 inches to prepare a suitable seedbed are primary tillage machinery. These machines are designed to carry out the following functions:

1. Create a deep seedbed physically, chemically, and biologically fitted to the growth of crops.

2. Add humus and fertility to the soil by covering and burying crop residues so they can be incorporated into the soil.
3. Prevent and destroy weeds or other unwanted vegetation
4. Leave the soil so that air will pass through it freely
5. Leave the soil in such condition as to retain moisture
6. Destroy insects, as well as their eggs, larvae, and breeding places
7. Leave the surface so as to prevent erosion by winds and water

Included in the primary tillage machine group are moldboard, disk, and chisel plows.

In order to understand the operation of primary tillage machines, it is necessary that the mechanic be able to identify the machine parts and understand their functions.

Moldboard plow

<u>Part</u>	<u>Function</u>
Beam	The frame that holds the plow bottoms in the correct position
Frog	That part of the plow to which all other bottom parts are bolted
Share	That part of the plow bottom that cuts the underside of the furrow slice away from the land
Moldboard	Turns the furrow slice on edge
Landside	The long flat metal piece which absorbs the side forces created when the furrow is turned and levels the plow bottom into a free floating position

Bottom	Lifts, turns, and pulverizes the soil
Coulters	The round disk blade used for cutting the earth and trash ahead of the plow

Several types of moldboards are built by manufacturers of agricultural machinery. Each type has been designed to perform a specific function. These are:

1. Stubble
2. General purpose
3. Breaker
4. High-speed

Three materials are used in the manufacture of moldboards.

1. Soft-center steel
2. Crucible steel
3. Chilled cast iron

Soft center steel moldboards are used under most conditions because of their ability to scour. Steel plows are used most in the Middle West because of their wear-resistant qualities. Chilled plows are better for sandy, gritty, and gravel soils. The share of moldboard plows, which provides the cutting edge, is made of plain crucible steel, soft-center steel, chilled cast iron, and cast iron.

Several types of moldboard plows are produced by agricultural machinery manufacturers for use by farmers. These are:

1. Trailing
 - a. Regular -- one to eight bottoms
 - b. Two-way -- one to four bottoms
 - c. Middlebreakers -- one to four bottoms

2. Mounted
 - a. Regular -- one to five bottoms
 - b. Two-way -- one to two bottoms
 - c. Middlebreaker -- one to four bottoms
3. Self-steering
 - a. Steerable -- over five bottoms
 - b. Non-steerable -- one to five bottoms

The depth that a plow penetrates the soil and the width of the furrow are determined by the suction created by the share. Common degrees of suction used on most plows are

1. Regular-suck (3/16")
2. Deep-suck (5/16")
3. Double-deep-suck (3/8")

Shares with a regular-suck are best suited for light, easy-to-penetrate soils. Shares with a deep-suck are built for soil that is dry and hard, and the double-deep-suck is used in stiff clay soils, gravel land, and other soils where penetration is difficult.

The depth that a plow penetrates the soil is determined by the landside. The plow bottoms level off when the heel of the landside contacts the furrow sole.

The factors of major concern to the mechanic in adjusting a plow to operate properly are these:

1. Proper draft
2. Proper hitching

Draft is the amount of resistance that a plow creates to the source of power. Draft should be kept as light as possible in order to conserve tractor power. Draft on a plow is caused by several factors.

1. Soil condition
2. Topography

3. Adjustment of the plow
4. The hitch to the tractor
5. Depth and rate of plowing
6. Sharpness of the shares, coulters, and jointers

The following table illustrates the amount of draft exerted on a plow bottom in the various soil types

<u>Soil</u>	<u>Resistance</u> (pounds per square inch)
Sandy	3
Sandy loam, moist	3-4
Sandy loam, dry	4-6
Silt loam, moist	5-6
Silt loam, dry	6-7
Clay loam, moist	6-7
Clay loam, dry	7-8
Heavy clay, dry	9-10
Heavy clay sod	10-1

The two types of draft that work on a plow should be thoroughly understood and adjusted if the plow is to function properly.

1. Vertical
2. Horizontal

On trailing plows the vertical line of draft is a straight line from the draft center of the plow to the tractor drawbar looking at the plow from the side. The draft center of the plow is a point near the top of the share and about 2 inches from the land-side. It is located below the beam if one bottom is used, halfway between the beams if two bottoms are used. (Refer to Machines for Power Farming, p. 166, for example.)

Tendencies of the plow to ride out of the ground or the rear of the plow to bob out of the ground are symptoms of improper vertical draft adjustment. These problems can be corrected by raising or lowering the plow drawbar to align with the vertical line of draft.

The horizontal draft line is a straight line from the draft center of the plow to the tractor drawbar looking down on the plow. The draft center for the plow is halfway between the draft center of the two outermost shares and halfway between the rear wheels of the tractor. Ideally the plow draft center and the tractor pull center should be in line if the plow is to function at its best.

The easiest way to make a horizontal adjustment is to make the tread of the tractor wheels fit the trailing plow. In the event that the two centers cannot be lined up, an adjustment halfway between these two points should be made. Unevenness of furrow slices and hard-steering of the tractor are indications of improper horizontal draft adjustment. (Example--Machines for Power Farming, p. 167.)

Often it is necessary to adjust the clearance under the landside and between the landside and furrow wall. These adjustments are given in Farm Machinery and Equipment, p. 101.

The draft on mounted plows is adjusted hydraulically from the tractor. Any adjustments that are needed should be made according to the manufacturers specifications as set down in the service manuals.

Mounted plows are also classified according to the type of hitch used to attach them to the tractor. These include:

1. Single-point hitch, free floating; rear-mounted
2. Three-point, free floating, variable-pitch, rear mounted
3. Hydraulically supported three-point suspended
4. Hydraulically suspended free-floating three-point variable pitch

On the single-point hitch free floating, rear-mounted plow, the plow beam extends to a point ahead of the tractor rear axle. The height of the hitch point is adjusted manually or hydraulically. The weight of the plow causes the plow bottom to enter the ground as it is lowered into the ground. As the plow moves

forward, the suction created by the share and the weight of the soil being moved causes the plow to penetrate the soil until the heel of the landside comes into contact with the furrow. The depth of penetration is determined and regulated by the height of the hitch point.

The three-point, free floating, variable pitch, rear-mounted plow uses three links for connection to the tractor. The upper link adjusts the plow for deep or shallow plowing. The other two links are non-adjustable. The plow enters and penetrates the soil in the same manner as the single-point-hitch-type plow.

The hydraulically supported three-point suspended plow is supported during plowing and moved by hydraulically controlled linkage. This linkage holds the plow up, but does not force it into the soil. When soil resistance increases, the upper attaching link pushes against a spring controlling a hydraulic mechanism that raises the plow. The increase in weight on the rear tractor tires caused by the plow rising increases the traction on the tractor wheels.

The landside does not function as far as downward forces go, but it does absorb the side thrusts of the plow.

The hydraulically suspended, free floating three-point variable-pitch plow combines the features of the other three plows. The plow bottoms enter the soil and come to the correct depth after the landside makes contact with the furrow sole. From this point, the plow is free floating. The depth of penetration of the bottoms is controlled by adjusting a crank which points the bottoms up or down.

The following attachments are available for the moldboard plow.

1. Trash cover boards
2. Jointers
3. Weed rods

Disk plows

The disk plow has one or more rolling cutters. It creates no suction, as a moldboard plow does, and depends on weight and disk angle for penetration. Its maintenance cost is low, and its parts last a long time.

The disk plows work well under the following adverse conditions:

1. Wet, sticky, non-scouring gumbo, hardpan or black waxy soil
2. Soils containing large stones or rocks
3. Dry, hard soil
4. Rooty, stumpy soil
5. Abrasive soils

The three main types of disk plows are

1. Direct-mounted
2. Semi-mounted
3. Trailing

Direct-mounted plows are attached to the tractor by one-, two-, or three-point hitch linkages and can be raised or lowered hydraulically. They usually are rear-mounted and have a rear wheel to absorb the side thrust.

Semi-mounted disk plows are attached to the tractor drawbar or by a special drawbar. They are raised by moving a lever at the front of the plow. A long rod which extends to the tractor drawbar is used to steer the rear wheel.

Trailing disk plows have three wheels for support and can be pulled by any make of tractor. The front wheel performs the following functions:

1. Helps lift the plow
2. Turns sideways for steering the plow
3. Absorbs some of the side thrusts

The rear wheel is non-steering, but it absorbs thrusts and lifts the rear part of the plow.

The draft created by a disk plow is usually about the same as that of the moldboard plow; but since the disk plow is often heavier than the moldboard plow, its draft is usually greater.

The disk plow is comprised of the following parts:

1. Disk blades
2. Standards and clamps
3. Bearings
4. Beams and frames
5. Lifting and steering mechanisms
6. Wheels

Three types of adjustments are common to all types of disk plows.

1. Cutting angle adjustment
2. Width-of-cut adjustment
3. Vertical adjustment of the disk blade

Disk blades will not cut if they roll straight ahead, but must work at an angle. This angle is measured between a perpendicular line from the line of travel, to the axle line of each disk blade. The cutting angle of the disk plow can be changed by either of two methods.

1. Pivoting the beam
2. Pivoting the blade and standard
(See Machines for Power Farming, p. 199-200.)

Two adjustments can be made to adjust the width-of-cut made by the plow.

1. Front disk blade cut adjustment
2. Cutting width adjustment
(See Machines for Power Farming, p. 201-202.)

The vertical adjustment or position of the disk blades, also called the tilt or slant, directly affects the degree of penetration of the plow, in relation to the amount the disk is inclined from the vertical position. Two methods can be used in tilting the disk.

1. Standard-to-beam method
2. Standard-to-bearing method
(See Machines for Power Farming, pp. 201-202.)
3. Chisel plow
(Refer to references for this material.)

Suggested Teaching-Learning Activities

1. Demonstrate how primary tillage machines used by farmers in the area work in the soil. After showing the proper operation of each machine, throw it out of adjustment and have students observe the results. Have students study each machine part to learn its functions.
2. Bring examples of all hitches discussed in the content before the class. Have students study their construction and operation.
3. Bring to class primary tillage machines in need of adjustment and repair of each type discussed in the content. Follow the procedure below when making the needed adjustments and repairs.
 - a. Operate the machine in the field and note any malfunctions in operation.
 - b. Inspect the machine, noting worn and broken parts or parts out of line or adjustment.
 - c. Following the operator's and service manuals, make the necessary repairs and adjustments.
 - d. Lubricate the machine for field operation.
 - e. Test the machine in the field and make adjustments necessary for proper operation.

Suggested Instructional Materials and References

Instructional materials

Demonstration machines of each type identified in the content

References

2. Machines for Power Farming, pp. 151-224.
3. Operator's manuals
- d. Service manuals

Suggested Occupational Experience

Following the procedures outlined in the teaching-learning activities, have students adjust, repair, and lubricate primary tillage machines at the local agricultural machinery dealership.

- V. To (1) identify the parts and types of secondary soil tillage machines and understand their functions and to (2) adjust, repair, and lubricate these machines

Teacher Preparation

Subject Matter Content

Machines that stir the soil at comparatively shallow depths are classified as secondary tillage machines. Included in this group are the various types of harrows, rollers, and pulverizers, and tools for mulching and fallowing. These machines are designed to perform the following:

1. Improve the seedbed by greater pulverization of the soil
2. Conserve moisture through summer-fallow operations by killing weeds and reducing evaporation
3. Cut up crop residue and cover crops and mix vegetable matter with the top soil

4. Break up clods, firm the topsoil, and put it in better tilth for seeding and germination of seeds
5. Destroy weeds on fallow lands
6. Fill in air spaces and level the ground

Several types of harrows are made by agricultural machinery manufacturers for farm use.

1. Disk harrows
2. Spring-tooth harrows
3. Spike-tooth harrows

The disk harrow mixes the soil, breaks up clods, levels the lands, aerates the soil, and kills weeds. It works somewhat like a moldboard plow, for it raises the earth and pushes it to one side.

In operation, the disk harrow is balanced. The side forces are balanced: one-half of the disk blades are placed with their concave cutting faces in one direction and the other half in the opposite direction.

The depth of penetration of the disk blades is controlled in the following way:

1. Using a heavy or light harrow
2. Adding weights to the harrow
3. Using few or many disks per harrow
4. Exerting hydraulic forces, up or down
5. Using transport and depth regulating wheels
6. Using dull or slump disk blades
7. Using smaller or larger disks
8. Using cutout or notched disks
9. Adjusting the angle of the disk gangs

Disk type harrows are grouped into two main types.

1. Regular
2. Offset

The regular type disk harrow is grouped according to the type of action created by the disk.

1. Single-action
2. Double-action

A single-action disk usually consists of two assemblies of disks, called gangs, which are joined together by a common shaft or bolt through their centers and all rotate together. The two gangs are set at angles to each other and the line of pull, and the soil and other field materials are always moved outward from the harrow center.

In recent years a new development in disk harrow design has separated disk harrows into other classifications.

1. Rigid
2. Flexible

A group of two or more disks that rotate in the same direction is referred to as a gang. The disks are held together by a shaft, either round or square, called the arbor bolt, and held apart by spacers. The disks, shaft, and spacers turn together.

The two-section type with one section trailing behind the other is the double-action or tandem-type disk harrow. It is called a double-action plow because

1. It has two sections
2. The rear section turns back the furrows created by the front section. The gangs of the first section turn the soil to the left, and the rear section turns the soil to the right.

Disk harrows vary in size. Several systems are used by manufacturers of the machines to classify them by size.

1. Width of cut
2. Diameter of the disk blades
3. Number of disks

The disks used to turn the soil on a disk harrow are similar to those of the disk plow. Several types of harrow disks are available for use on the disk harrow. Common types are

1. Plain
2. Crimped disk
3. Auburn
4. Scalloped

A disk plow usually has two or three bearings per gang. These may be of either the friction or anti-friction type. The latter are used more because they decrease replacement costs by lessening wear on machine parts.

The spring-tooth harrow is one of the most useful machines available to farmers. It is a drag-type harrow capable of doing the following:

1. Level and smooth the soil
2. Work well in rough, stony soils
3. Remove plant growth from the soil without cutting it up
4. Break the soil crust and penetrate as deep as seven inches
5. Pull weed roots to the surface where the sun dries and destroys them
6. Mix trash and stubble
7. Tend to aerate and warm the soil by stirring it

There are two main types of spring-tooth harrows.

1. Lift
2. Trailing

The lift type is built to be raised by the hitch that is a part of the tractor.

The harrow teeth are made from spring steel which has been forged and rolled to shape and then oil tempered. Their variables in thickness are determined by the toughness of the work that is to be done, but the average thickness is 5/16 inch.

Two main types of teeth are used on spring-tooth harrows.

1. Those with the end of the tooth sharpened
2. Those having reversible parts

The spring tooth harrow is made up of the following parts:

<u>Part</u>	<u>Function</u>
Harrow teeth	To prepare land for seed
Tooth bar	To support the harrow teeth
Tooth bar standards	To provide clearance for the tooth bar over soil and trash
Tooth clamps	To attach the teeth to the tooth bar
Frames	To support the harrow teeth, standards, and other parts
Shoes	To come in contact with the ground
Tooth penetration levers	To set the depth at which the machine is to operate

Another drag-type harrow is the spike-tooth harrow. It is often called the peg-tooth harrow. It is designed to do the following:

1. Smooth and compact the topsoil
2. Fill large air spaces left from plowing
3. Break up lumps and clods
4. Finish the ground just before planting
5. Cover small seeds broadcast over the surface
6. Break crust and destroy small weeds
7. Cultivate small plants

The two main types of spike-tooth harrows are

1. Rigid
2. Flexible

The rigid harrow has one-piece end rails holding the teeth bars, which make all the teeth cut the same depth. The flexible harrow has jointed end rails, which allow the individual tooth bars to rise vertically to go over obstructions.

The spike-tooth harrow is made up of the following parts:

1. Spike teeth
2. Tooth bars
3. Tooth clamps
4. Frame

Several spike-tooth harrow rigid-frame and tooth bar arrangements are in use. They include

1. Closed square-end harrow
2. Open-end harrow
3. Curved-end-type harrows
(See Machines for Power Farming for discussion of each type)

The rotary shredder is a popular American tillage machine because of its wide range of functions. It cuts, shatters, tears, chops, mows, pulverizes, spreads, and mulches.

Rotary shredders use high speed revolving flails, blades, or hammers to carry out these functions. On some shredders the flails, blades, or hammers travel about 9000 feet per minute.

Two types of machines are made by agricultural machinery manufacturers.

1. Trailing
2. Mounted

About half of the machines have a long horizontal shaft with attached flails or hammers. This arrangement gives a hammer mill effect and permits the shredding of stalks and trash into small pieces. The other machines have a short vertical or horizontal shaft called a spindle. One end of the spindle is driven directly from the tractor PTO, and the other end has a plate or hub which carries the cutting knives. The spindle knife cutter has a propeller-like appearance, as seen from the soil side. (See Machines for Power Farming, p. 264.)

Several types of cutting assemblies are used on rotary shredders.

1. Rotor or cylinder cutters
2. Vertical or horizontal spindle cutters
3. Knives for rotary cutters

Rotor or cylinder cutters have a long axle that operates parallel to the ground. The flails which are attached combine with it to constitute the rotor. The rotor may operate with or against the direction of travel, but the operation against the direction of travel is most desirable because the machine does a better job of cutting weeds and pulverizing trash.

Flails consist of a hammer and a length of chain. The hammers weigh the same, but the chains are of different lengths, causing the machine to do a better job of flailing. The hammers usually take on the shape of a "T" or a "Y". On some machines, flails are used in combination with a shear bar. The flails cut the vegetation against a shear bar and pulverize the materials after they are cut.

On vertical and horizontal spindle cutting machines the horizontal spindle travels above and parallel to the rows. As many as five spindles may be used, thus providing a closer cut. Shredders operating with a type of rotor assembly are most useful on rough, hilly ground.

The rotary shredder is driven from the PTO shaft of the tractor. The direction of the drive is changed by a set of bevel gears carried in the housing of the shredder. The vertical-spindle cutters are driven directly from the bevel gears. The vertical spindle passes through a bearing attached to the top of the plate of the shredder and the cutter hub is attached to the lower end of the spindle. A shear pin is used as a safety feature in case the cutters hit something solid.

Soil pulverizers are machines used to put finishing touches to the seedbed. They pulverize lumps and clods, pack the soil particles after plowing or harrowing, aid in holding moisture, and eliminate air pockets.

Soil pulverizers consist of an axle between two bearings spaced evenly with wheels or sprockets. The wheels are made of cast iron and are constructed with a rim on the hub to keep dirt out of the wheel cylinder.

Soil pulverizers, similar to disk harrows, are of two types.

1. Single section
2. Double section

Because its axles are supported by a hinged bearing housing, the double section pulverizer, or tandem type, provides a finer seedbed and more flexibility.

Several types of wheels are used as soil pulverizers. Some of these types may be used at the same time, depending on the function desired.

1. Plain ridge
2. Serrated ridge
3. Wavy ridge
4. Sprocket

When plain ridge wheels are the only wheels used on the machine, it packs the soil. With the addition of sprocket wheels, the machine pulverizes and packs at the same time.

The soil pulverizer is comprised of the following parts:

1. Wheels
2. Sprockets
3. Frame
4. Bearings

Suggested Teaching-Learning Activities

1. Have students disassemble each type of tillage machine discussed in the content and learn its parts. Point out to the students the materials used in constructing each part and the function of each part in the total operation of the machine.
2. Demonstrate proper and improper operation of each of the tillage machines identified in the content under field conditions.
3. Bring to the class secondary tillage machines of each type studied to be adjusted and repaired. Follow the procedure below when correcting the faults.
 - a. Operate the machine in the field to discover any malfunctions in operation.
 - b. Inspect the machine, noting worn and broken parts and parts that are out of line or adjustment.
 - c. Following the operator's and service manuals, make the necessary repairs and adjustments.
 - d. Lubricate the machine for field operation.
 - e. Test the machine in the field and make all adjustments necessary for proper operation.

Suggested Instructional Materials and References**Instructional materials**

1. Machines for disassembly
- b. Machines for use in demonstrating proper and improper field operation

References

1. Farm Machinery and Equipment, pp. 145-166
2. Machines for Power Farming, pp. 227-277
3. Operator's manuals
4. Service manuals

Suggested Occupational Experience

Have students adjust, repair, and lubricate secondary tillage machines at the local agricultural machinery dealership following the procedure outlined in the teaching-learning activities.

- VI. To (1) identify the parts and types of cultivating machines and understand their functions and to (2) adjust and repair these machines

Teacher Preparation**Subject Matter Content**

Cultivation requires a tool to stir the surface of the soil to a shallow depth in such a manner as to destroy young weeds and promote crop growth. Weed control cultivation may start on the prepared seedbed prior to planting or after planting, before the emergence of the plants. Usually cultivation begins soon after emergence of the young crop seedlings, as weeds generally emerge about the same time as the crop.

Cultivating machines are designed to perform the following functions on the soil:

1. Retain moisture by
 - a. Killing weeds
 - b. Loosening mulch on surface
 - c. Retaining rainfall
2. Develop plant food .
3. Aerate the soil to allow oxygen to penetrate soil
4. Promote activity of microorganisms in the soil

Several types of cultivators are used by farmers, the type and size depending upon the acreage, kind of crop, soil type and condition, rainfall, type of farming practiced, and kind of power available.

1. Mounted
 - a. Central-forward mounted
 - b. Central-forward and rear-mounted
 - c. Rear-mounted
2. Trailing
3. Lift up or mounted tiller
4. Dragbar
5. Rigid-frame

The dragbar type allows the cultivator teeth to rise over uneven surfaces; whereas on the rigid-frame type the teeth or standards are fastened directly to the frame and are inflexible on uneven surfaces.

The "business end" of the cultivator, those parts that engage and work the soil, are referred to as steels, points, or teeth. More specifically, they are referred to in the following manner:

1. Sweeps
2. Shovels
3. Spikes
4. Disks
5. Knives and hoes

Within each type, manufacturers have designed and built items to perform specific functions.

Sweeps

Use

Blackland sweeps	For use on sticky, blackland soil
Mixed-land sweeps	For high-speed cultivation on most other soils
Planter sweeps	Have prominent wings for clearing beds for planting
Plowing sweeps	For use in blank listing, bursting, and bedding
Duckfoot sweep	For use on deep-rooted weeds, fallowing, and stubble mulching

Shovels

Spear point	For use in working beds and flat land
Irrigation shovel	For cultivating irrigated land
Chisel-tooth shovel	Use for close, deep cultivation and breaking of hard-pan
Turn shovel	For farrowing

Knives and hoes	<u>Use</u>
Round-turn knife	For cultivating such crops as sugar beets
Square-turn knife	For flat cultivation on beds on flat land
Crescent hoes	For tilling the side of beds of beets and vegetables
Flat hoes	For use when flat work is desirable on such crops as cotton and corn
Mulch hoes	For cutting through fibrous soil without choking off
Furrowers	For digging furrows and trenches

The standards on the cultivator connect the points with the frame of the cultivator. Several types are used on cultivators, each of which is built to perform differently and to conform to the type of farming prevalent in the area.

1. Stiff
2. Spring-trip
3. Friction-break
4. Flexing
5. Regular or high clearance
(See Machines for Power Farming, pp. 381-382, for a discussion of each type.)

Like cultivator standards, several types of cultivator frames have been built by agricultural machinery manufacturers, the main ones of which are

1. Front-mounted cultivator gangs
2. Rear-mounted tool bar
3. Mounted-frame cultivator or field tiller
4. Wheel-mounted frame or carrier

5. Carrier-type field cultivators
6. Dragbar
(See Machines for Power Farming, pp. 383-385.)

A variety of attachments have been developed for use on cultivators.

1. Rotary hoes
2. Disk hillers
3. Fertilizer application attachments
4. Seeders
5. Weeder-mulchers
6. Row-crop thinners

In recent years the rotary hoe has been popular as a cultivating tool, because it performs some rather specific functions of soil tillage.

1. It breaks up crusted soils to allow the crop seedling to come through the ground.
2. It up-roots small weeds and exposes weed seedlings to the drying effect of the sun.
3. It aerates and mulches the top soil, thus improving plant growth.
4. If pulled in reverse, it gives a treading action that smashes and pulverizes clods and trash.

As is the case of most other machines, rotary hoes are of either the mounted or trailing type. The hoes are made up of gangs, usually two per section, consisting of an axle and digger wheels.

Diggers are of several types, depending on the type of soil on which they are to be used and the degree of soil penetration desired. They are made of small, angle irons curved and sharpened at one end.

Suggested Teaching-Learning Activities

1. Have students disassemble each type of cultivating machine discussed in the content and learn its parts and their functions. Point out to the students the materials used in constructing each part and the function each part plays in the total operation of the machine.
2. Demonstrate proper and improper operation of each type of cultivating machine under field conditions.
3. Bring to the class cultivating machines that are in need of adjustment and repair. Follow the procedure below when making the needed adjustments and repairs.
 - a. Operate the machine in the field to discover any malfunctions in operation.
 - b. Inspect the machine, noting worn and broken parts and parts that are out of line or adjustment.
 - c. Following the operator's and service manuals, make the necessary repairs and adjustments.
 - d. Lubricate the machine for field operation.
 - e. Test the machine in the field and make any adjustments necessary for proper operation.

Suggested Occupational Experience

Have students adjust, repair, and lubricate cultivating machines at the local agricultural machinery dealership, following the procedure outlined in the teaching-learning activities.

- VII. To (1) identify the parts and types of crop planting machines and understand their functions and to (2) adjust and repair these machines

Teacher Preparation

Subject Matter Content

The purpose of the crop planter is to sow seeds in rows or beds, on flat land and in trench bottoms efficiently and in correct amounts at the proper depth.

There are two types of crop planting machines.

1. Row-crop
2. Drill

Row-crop planters are further divided into two large groups.

1. Those that drill seed only
2. Those that drill and plant in check rows

Planters, like other machines, are of the mounted or trailing type. The mounted type may be further divided according to the means of attachment to the tractor.

1. Front-mounted
2. Rear-mounted
3. Semi-mounted
4. Unit runner

With the exception of the unit runner type, almost all planters use a clutch to drive the seed plates, which in turn are driven by the drill shaft. The clutch action permits intermittent movement of the drill shaft so that seeds for hills can be accumulated in the shank valves.

Row-crop planters are made up of the following units.

1. Hopper and seeding mechanisms
2. Hopper-to-opener assemblies
3. Drive and checking devices
4. Fertilizer and other attachments

Four basic hoppers are used on row-crop planters.

1. Single seed
2. Reverse-feed cotton
3. Richmond
4. Duplex

The hopper most commonly used to plant row crops is the Richmond type. It consists of the following parts:

1. Bottom
2. Filler plate
3. False ring
4. Knockout pawl
5. Hopper ring gear
6. Pinion gear
7. Seed plate

Several terms are used to describe the part that leads from the hopper to the furrow openers. Among these are boat, post, shank, and flexible ribbon tube. The furrow openers are held in place by a standard.

Two types of shanks are used on row-crop planters.

1. Those held rigidly in place by the front frame members
2. Those that are free to float with the contour of the field

Some are plain. When this type of planter is used, the seed is dropped directly from the hopper to the soil. Others are valved to form a "V" for the seed to fill in and then release to the soil.

The purpose of the furrow opener is to open the soil at a desired depth for the seed to be sown. Several types of furrow openers are used on row-crop machines, such as

1. Variable-depth
2. Constant-depth
3. Curved runner
4. Fully curved runner
5. Stub runner
6. Shovel
7. Single-disk
8. Curved double-disk
9. Coulter double-disk

To be in an atmosphere conducive to good germination, the seed must be properly covered. The row-crop planter has a variety of furrow coverers to provide this environment.

1. Open-center press wheel
2. Rubber-tired press wheels
3. Zero-pressure rubber tires
4. Disk coverers
5. Blade coverers
6. Shovels
7. Knife blade

Fertilizer sowing attachments have been developed for use on row-crop planters. These attachments have two types of feeding mechanisms.

1. Star or spur wheel type
2. Plow type
(See Machines for Power Farming, pp. 340-341.)

The primary purpose of the grain drill is to sow grain in correct amounts and at proper depths. It also pulverizes and firms the soil.

Several types of grain drills have been developed to meet the varying needs of the farmer.

1. Plain
2. Fertilizer
3. Surface
4. Deep-furrow

The plain drill is used primarily for planting grain crops. It is not well adapted to planting grass seed or applying fertilizer. The fertilizer drill sows all the seed that the plain drill plants and also drills or broadcasts fertilizers. The other two types sow the seed at different depths in the soil. The plain or fertilizer type drills can be of either the surface or deep-furrow type.

Several devices are used on grain drills to feed the seed into the seed tube. These devices are

1. Double-run seed feeding device
2. Fluted-roll feeding device
(See Machines for Power Farming, pp. 350, 352.)

When the double-run feeding device is used, the rate of flow can be controlled in the following way.

1. Select the size of the feed wheel recommended on the drill charts for a certain seeding rate.
2. Change the speed of the wheel by changing gears and sprockets or both.

3. Change the position of the feed gate in the cup.
4. Use reducers below the feed wheel.

The rate of seed flow on the fluted-roll devices is regulated by

1. Moving the fluted rolls endways
2. Adjusting the gates or latches to one of three positions
3. Changing the speed of the feed shaft

Rolling furrow openers are most commonly used as grain drills. Essentially they are disks or coulters that cut trash and lumps and open the soil for seed placement. Several varieties of furrow openers are used on grain drills.

1. Single disk with open-delivery boot
2. Single disk with closed-delivery boot
3. Double-disk coulters
4. Double-disk curved-blade

Furrow openers are guided and pulled by dragbars or drawbars. Their purpose is primarily to

1. Pull and space openers
2. Absorb side thrusts occurring when the openers strike obstructions

After the seed has been sown, seed coverers cover it. These coverers are of several types.

1. Drag chain
2. Drag weights
3. Weighted steel fingers
4. Press wheel attachments

The coverer is attached immediately behind the furrow opener.

A variety of attachments have been developed for use on the grain drill. These are identified and discussed in the operator's manuals for the specific machines. Two of the most important attachments, however, the fertilizer and grass seeding attachments, are discussed in Machines for Power Farming, pp. 363-366.

Sowing seed in proper amounts is a primary function of both the row-crop and drill-type planters. These machines should be checked and calibrated if they are sowing seed improperly. The following techniques should be used when calibrating planting machines:

Row-crop planter

The calibration procedures below use corn as the example crop. The operator's manual gives the specifications to be used when calibrating for other crops.

Step 1: Check planter parts.

Carefully check the power train from the ground drive wheels to the seed plate. Loose or worn sprockets, gears, and chains can affect metering accuracy, particularly on the seed-plate drive and the power train from the drill shaft to the hopper. Replace worn cut-off pawls, knockout pawls, and hopper bottom rings. When replacing worn pawls, check for weak springs.

Step 2: Select proper population for fertility level.

For any field with the proper fertility level, there is a population of stalks at harvest that give the maximum yield of corn. The following table shows the number of kernels to plant for the desired number of stalks per acre at harvest.

Expected yeild per acre	Kernels planted per acre	Stalks at harvest per acre
75 bushels	13,300 kernels	12,000 stalks
100 bushels	16,500 kernels	14,000 stalks
125 bushels	20,000 kernels	17,000 stalks
150 bushels	25,000 kernels	20,000 stalks

Step 3: Read the owner's manual carefully.

The owner's manual tells how to adjust the corn planter to obtain the correct population. It is also an excellent guide for determining the speed of the planter for a given planting rate.

Do not exceed the maximum planting speed recommended in the manual. When this speed is exceeded, the seed plate turns too fast for accurate planting and uniform kernel spacing.

By using seed plates with more cells than the standard 16-cell plate, a faster speed can be used and obtain the same planting rate. The manual will indicate whether plates with more than 16 cells can be obtained for the planter.

Step 4: Match seed to seed plate.

It is desirable to have an average of 100-percent or slightly higher cell fill. A 100-percent cell fill means that, on the average, one kernel is dropped from each cell. If, for example, 16 kernels are dropped in one turn of a 16-cell seed plate, the cell fill is 100 percent. If 12 kernels are dropped, the cell fill is 75 percent. If 20 kernels are dropped, the cell fill is 125 percent. For best results and to avoid damage to the seed as it passes through the hopper mechanism, the cell fill should be 100 percent or slightly higher, up to a maximum of 105 percent.

To be certain that the cell fill is accurate, seed plates should be matched to the seed. These can be matched either on a seed-corn test stand or by a calibration run on the open ground in a lane or barnlot where all the kernels can be counted. Whichever method is used, check the rate at field speed and desired planting rate.

In selecting the correct seed plate, begin with the seed plate recommended on the bag of seed corn. Small variations between seed plates of the same size and seed corn of the same grade can result in serious planting errors. Remove any rust, seed treatment, or rust preventative from cells before making the test.

Step 5: Adjust planter for desired planting rate.

Using the owner's manual and the table below, set the planter to plant the number of kernels desired.

Spacing of Kernels for Planting Rates of	Row Spacing			
	36 inches	38 inches	40 inches	42 inches
12,000 per Acre	14.5	13.7	13.1	12.4
14,000 per Acre	12.4	11.8	11.2	11.7
16,000 per Acre	10.9	10.3	9.8	9.3
18,000 per Acre	9.7	9.2	8.7	8.3
20,000 per Acre	8.7	8.2	7.8	7.5
24,000 per Acre	7.3	6.9	6.5	6.2
28,000 per Acre	6.2	5.9	5.6	5.3

Step 6: Calibrate in a barnlot or roadway before planting.

Planting speed can cause a wide variation in planting rates. For this reason, final calibration must be made at planting speed on a roadway or barnlot where all of the kernels can be counted over a short distance. Leave the planter in a raised position and use a wire or string to engage the seedplate drive. The following table shows how far to drive for various row spacings. Each row is 1/200 of an acre. To obtain the planting rate per acre, count the kernels from each row and multiply by 200.

	36	38	40	42
Row spacing	inches	inches	inches	inches
Distance to Drive	72	69	66	63
	feet	feet	feet	feet

**Kernels to count for
planting rates of**

12,000 per Acre	60	60	60	60
14,000 per Acre	70	70	70	70
16,000 per Acre	80	80	80	80
18,000 per Acre	90	90	90	90
20,000 per Acre	100	100	100	100
22,000 per Acre	110	110	110	110

Determine the planting rate for each of the planter rows and list these rates separately, in order to determine whether one of the hoppers is giving a poor drop of the seed. If all of the planter parts seem to be functioning properly and the seeding rate is higher than the rate for which the planter is adjusted, then a smaller seed plate should be used. If the planting rate is not high enough to match the adjusted rate on the planter, a larger seed plate should be used.

To get an accurate measure of the planting rate, make all of the calibration runs at planting speed. The planting rate in these calibration runs will probably be slightly higher than the field rate, even when the seed is perfectly matched to the seed plate. This is due primarily to the reduced slippage of the drive wheels on the smooth surface.

In making the calibration run, allow a few hundred extra kernels to compensate for the difference between the calibration rate and field rate. Suppose that it is desirable to calibrate a planter at 5 miles per hour to drop 18,000 kernels, and it was found that after making a few calibration runs the planter was dropping 18,500 kernels. In the field, this planting rate will be reduced to 18,000 or slightly less, and should be satisfactory.

Step 7: Make a field check.

When the planter has been calibrated to plant a given number of kernels per acre on a roadway or barnlot, the serviceman can be fairly confident that the planter will give approximately the desired planting rate. As a final check, however, dig out several kernels along the row and make an estimate of the average kernel spacing. By checking this spacing with the desired rate, he can determine the accuracy of calibration and make whatever adjustments are necessary on the planter.

How to determine field speed

In planting corn, you must know how fast the planter is moving, especially if granular or liquid chemicals are being applied at the same time. Field speed can be determined in the following way:

1. Carefully mark off a distance of 176 feet in the field.
2. Check the number of seconds required to drive between the markers with a stop watch or watch with a sweep second hand.
3. Divide the time in seconds into 120 for speed in miles per hour.

The chart below lists the time in seconds for speeds up to 7 miles per hour.

Time to Drive 176 Feet	Speed
120 seconds	1 mile per hour
60 seconds	2 miles per hour
40 seconds	3 miles per hour
30 seconds	4 miles per hour
24 seconds	5 miles per hour
20 seconds	6 miles per hour
17 seconds	7 miles per hour

Source of the above listed steps is University of Illinois, College of Agriculture, Circular 840.

Grain drill

1. Adjust the rate of seeding control for the desired amount of seed per acre.
2. Place canvas under furrow openers after the drill is in gear.
3. Jack up the wheels and lower the furrow openers after placing the drill in gear.
4. Place a sufficient quantity of seed in the drill to plant desired acreage (1/10 to 1/4 acre recommended).
5. Compute the number of times the wheels must be turned to plant 1/4 acre.

Example:

- a. $\frac{43560 \text{ sq. ft. per acre}}{\text{Width of drill}}$ Equals feet traveled per acre
- b. $\frac{\text{Feet traveled per acre}}{\text{Circumference of wheel}}$ Equals revolution of wheel for one acre
- c. $\frac{\text{Revolutions traveled per acre}}{4}$ Equals revolution of wheel for 1/4 acre

6. Turn drill wheel desired number of times to plant 1/4 acre.
7. Weigh seed deposited and multiply by 4 to convert to one acre basis. If the required amount of seed was not deposited, adjust according to the type of drill.

In adjusting the fluted type grain drill, first set the feed shaft and gates according to the size of seed being sown. Rate of seeding is set by adjusting the feed shaft shifter, of which there are two in drills having more than 8 disks--one for each half of the drill. Both must be kept in the same position on the feed index plate, which is provided with a row of notches.

The internal double run type feed consists mainly of a feed wheel and a feed gate. The wheel is smaller on one side for planting oats, barley, treated wheat, and other grains. The adjustable gates regulate the size of feed openings. In either situation, adjust to make up the difference in the previous setting and the calibrated amount. Then start the procedure from the beginning.

Suggested Teaching-Learning Activities

1. Have students disassemble each type of crop planting machine discussed in the content and learn its parts and functions. Point out to the students the materials used in constructing each part and the function each part plays in the total operation of the machine.
2. Demonstrate proper and improper operation of each type of crop planting machine under field conditions.
3. Bring a row crop plate hopper before the class and demonstrate what happens when the wrong plates are used to plant a certain crop.
4. Bring to the class crop planting machines that are in need of adjustment and repair. Follow the procedure below when making the needed adjustments and repairs.
 - a. Operate the machine in the field to discover any malfunctions in operation.
 - b. Inspect the machine, noting worn parts and parts that are out of line or adjustment.
 - c. Following the operator's and service manuals, make the necessary repairs and adjustments.
 - d. Lubricate the machine for field operation.
 - e. Test the machine in the field and make any adjustments necessary for proper operation.
4. Have students calibrate both a row crop planter and a grain drill.

Suggested Instructional Materials and References

Instructional materials

1. Row crop planters and grain drills for disassembly
2. Machines for use in demonstrating proper and improper field operation
3. Machines needing calibration

References

1. Farm Machinery and Equipment, pp. 167-208.

3. Operator's manuals
4. Service manuals

Suggested Occupational Experience

Following the procedures outlined in the teaching-learning activities, have students adjust, repair, and lubricate crop planting machines at the local agricultural machinery dealership.

VIII. To (1) identify the parts and types of sprayers and understand how they function and to (2) adjust and repair these machines

Teacher Preparation

Subject Matter Content

In order to understand spraying machines and their adjustments, the serviceman must understand the reasons for using sprays, the purposes for their use, and the type and compositions of sprays.

Most pests that menace farmers and ranchers can be grouped into four major areas.

1. Weeds
2. Insects and insect-like creatures
3. Diseases
 - a. Bacteria
 - b. Viruses
 - c. Fungi
4. Nematodes

One must know something of the characteristics of these pests to control them effectively with chemicals.

The basic characteristics of weeds important to chemical eradication programs are

1. Life span of the plants
2. Method of reproduction
3. Type of leaf structure

Weeds are generally classified by life span.

1. Annuals
 - a. Complete life cycle in one year
 - b. Reproduce only by seed
 - c. Broad-leaved plants
2. Biennials
 - a. Complete life cycle in two years
 - b. Reproduce only by seed
 - c. Broad-leaved plants
3. Perennial
 - a. Live three or more years
 - b. Reproduce by seed or vegetatively
 - c. Blade or broad-leaved plants

Annuals and biennials can be controlled by eliminating seed production; but since perennials can reproduce by seeds, roots, rhizomes and/or stolens, they create more difficult control problems.

Insects that are troublesome to plants can best be catalogued as follows for chemical control. Certain pests that are not true insects, such as lice, mites, spiders, and ants, are included here because the damage they inflict and their control are similar to characteristics of insects.

1. Chewing insects, surface, or boring
 - a. Root
 - b. Foliage
 - c. Flower
 - d. Seed or fruit
2. Sucking insects
 - a. Foliage
 - b. Flower
 - c. Seed or fruit

Seed insects may be insects that attack the seed

1. In the soil at planting
2. On the maturing plant
3. In storage

Plant diseases can be classified as bacteria, viruses, and fungi. All of these are serious pests to modern agriculture.

Bacterial diseases of plants attack most types of field and horticultural plants. These are one-celled microscopic organisms of a low form of plant life. They gain entrance to plants through wounds and natural openings and attack all parts of a plant. The types of damage can be classified as follows:

1. Galls abnormal growths on a plant part
2. Wilts normally congest the vascular system and affect the entire plant
3. Cankers tissue destruction, causing leaf or tissue lesions
4. Rots fleshy part of plants, (stems, fruit and others) become soft and slimy

5. Abnormal growth
 - a. Dwarfing
 - b. Deformed parts
 - c. Color changes

Virus diseases are also common to plants. They are frequently transmitted by insects and can attack nearly all plant parts. In plants, "yellows" and wilts are common problems. Little is said about this group of diseases since chemicals available to control or treat them are limited. Chemicals can be used to control the insects that cause and spread the disease.

Many plant diseases are caused by fungi, a low form of plant life. Most fungi develop threadlike structures inside and/or on the surface of the plant that interfere with proper plant growth and development. The various fungi may attack several crops or only specific plants; they may attack specific plant tissue or various plant parts. Fungi can be classified as follows:

1. Scabs
2. Rots
3. Rusts
4. Smuts
5. Molds
6. Powder mildews
7. Blights
8. Leaf spots

An increasingly serious pest in crop production in many areas of the United States is the nematode. It is a small roundworm that lives in the soil and frequently enters the plants through the roots. It lives on the plant juices and creates the following types of problems:

1. Galls or knots on roots
2. Stunts or deforms plant growth
3. Causes injury which permits disease to attack plants

Nematodes are not insects, even though they do cause insect-like damage, and are not controlled effectively by insecticides.

The pests discussed on the preceding page are considered undesirable for one or more of the following reasons:

1. They reduce yields of crops or livestock.
2. They compete for food, water, space, and sunlight.
3. They destroy feed, clothing, buildings, and other facilities.
4. They cause or transmit disease.
5. They cause poisonous or toxic conditions.
6. They are an annoyance to man and/or animal.
7. They lower the quality of desired products.

Pesticides can be divided into major categories much like the pests themselves.

1. Herbicides for weeds
2. Insecticides and miticides for insects
3. Bactericides and fungicides for diseases
(There are no effective chemicals for the control of viruses.)
4. Rodenticides for rodents
5. Nematocides for nematodes
6. Molluscicides for mollusks

Herbicides are classified into three types, depending on their effects on plants.

1. Contact
 - a. Kill part of plant covered by chemical
 - b. Little or no movement of chemical in the plant

- c. Effective on annuals and will not kill roots of biennials or perennials
 - d. Examples: D N B P and P C P
2. Growth regulators (systemic herbicides)
- a. Absorbed by foliage or roots
 - b. Translocated to all plant parts
 - c. Chronic; kills slowly
 - d. Overdose on leaves may kill cells and prevent translocation
 - e. Effective against annuals, biennials, and perennials
 - f. Examples: 2, 4-D, M C P A, and Atrazine
3. Soil sterilants
- a. Prevent growth of all green plants
 - b. Varying residual toxicity

Herbicides may be selective or non-selective. A selective herbicide is toxic only to specific plant species; whereas a non-selective herbicide is toxic to all plant species. The ideal herbicide is one that is nearly non-selective; that is, it controls all plants except the desired plant species.

Selective herbicides react differently on various plant species. These factors, which may work independently or in combination with others to control weeds selectively, are

1. Amount of chemical applied
2. Time of application
3. Method of application
4. Chemical and physical properties of the herbicides
5. Genetical or physical properties of the plant

Insect control can be achieved by several methods, of which chemical control is one. Chemical control requires

1. Use of the correct chemical
2. Application of it at the correct time
3. Correct application methods

The four common ways in which insecticides work to kill or control insects are

1. Stomach poisons
2. Contact poisons
3. Repellants
4. Attractants

Stomach poisons must enter the digestive tract of the insect before they are effective. For insects with chewing mouth parts, applying the poison to the surface on which the insect feeds is adequate. Before stomach poisons can work on insects having sucking or syphoning mouth parts, systemic poisons are needed. These are chemicals that become part of the plant or animal tissues from which the insect extracts the juices on which it lives.

Contact poisons are chemicals that can enter the insect by means other than the digestive tract. They may enter through surface tissues or the respiratory tract. These chemicals are most frequently used against insects with sucking mouth parts, although they are generally as effective on insects with chewing mouth parts. Fumigates normally act as contact poisons.

Chemical insect repellants actually do not kill most insects, although they may injure certain types. They are used to keep insects from harming or causing annoyance in a particular place.

An insect attractant, or lure, is a material whose vapor, when reaching the insect, draws the insect to it. There are basically three types of attractants: sex, food, and oviposition lures. These lures may be of synthetic or natural origin. Sex lures seem to be the most effective, but much more research is needed before this method of controlling insects becomes of widespread value.

There are many chemical insecticides available, some for general uses and others for specific uses.

1. Arsenicals
 - a. Stomach poison
 - b. Reduction of their importance by newer chemicals
 - c. Examples: lead arsenate, paris green, white arsenic
2. Fluorine compounds
 - a. Stomach poison
 - b. Commonly used to control animal insects
 - c. Examples: sodium fluoride, cayloite
3. Chlorinated hydrocarbons
 - a. Large groups of synthesized insecticides
 - b. Stomach poisons; some contact toxicity
 - c. Hazardous to use
 - d. Examples: aldrin, dieldrin, chlordane, lindane, toxophene, methoxychlor, DDT
4. Phosphates
 - a. Generally more hazardous to use
 - b. Contact or stomach poison
 - c. Examples: parathion, malathion, systox, diazinon, phosdrin
5. Nicotine compounds
 - a. One of the older insecticidal materials
 - b. Deadly stomach poison
 - c. Examples: nicotine sulfate (Black Leaf 40), nicotine bentonite

6. Oil sprays
 - a. Used alone or as carriers of other insecticides
 - b. Contact poison
 - c. Petroleum oils the source
7. Mercury compounds
 - a. Extremely toxic
 - b. Stomach poison and repellent
 - c. Examples: calomel, corrosive sublimate
8. Pyrethrum
 - a. One of the oldest and safest materials
 - b. Botanical insecticide; derived from genus chrysanthemum
 - c. Contact poison
 - d. Examples: pyrethrum, allethrin
9. Rotenone
 - a. Botanical insecticide; derived from the derris or timbo plant
 - b. Contact poison
 - c. Toxic to animals; very toxic to fish
10. Phenothiazine and Piperazine
 - a. To control internal parasites of livestock

Disease pests are controlled with bactericides and fungicides. There are no effective chemicals on the market for the control of plant viruses; but because certain viruses are transmitted by insects, insecticides that control insects indirectly can control these virus diseases. Fumigation of seed beds has reduced virus diseases in some plants, but it is questionable whether fumigation kills the virus organisms, kills the insects that transmit the virus, or causes the wounds which permitted the virus to attack. Sulfa drugs and antibiotics control certain viruses in livestock.

Plants of nearly all species are attacked by fungi. Seeds, roots, stems, leaves, flowers, and fruit parts--all are susceptible to fungi infection. Considerable progress has been made to control these diseases by the development of resistant varieties and improved cultural practices. Even so, the only practical means of controlling fungi on many plant species is by a sound fungicide program. As with other pesticides, the chemical to use and the time and method of application are critical for most fungi diseases. Frequently several applications of fungicides must be made.

There are five basic types of fungicides.

1. Sulfur and sulfur compounds
 - a. Lime-sulfur is common
 - b. Tends to be caustic to plants when
 - 1) Heavy applications are used
 - 2) Humidity is high
 - 3) Temperature is high
 - c. Should be finely ground
2. Copper compounds
 - a. Bordeaux mixture: one of the early fungicides
 - b. Several other copper compounds
3. Formaldehyde
 - a. Highly poisonous and irritating
 - b. Used to treat seed and fumigate storage buildings and soil
4. Mercurial compounds
 - a. Used for seed treatment
5. Organic compounds
 - a. More effective than older materials

- b. Most important group of present-day fungicides
- c. Seven major groups of organic fungicides
- d. Examples: ferbam, nabam, thiram, captan, gylodin, bioguin, choronil

Nematocides are used to control nematodes, a type of roundworm that generally live in the soil and cause damage to seeds, seedlings, roots, and occasionally to above-ground parts such as mum plants. Control is generally accomplished by fumigation. There are four basic materials used.

- 1. Methyl biomide
- 2. Chloropicrin
- 3. Dichloropropene
- 4. Ethylene dibromide

These materials are effective in controlling other pests at the same time they are controlling nematodes. Soil should have a temperature above 55°F. and good tilth at time of fumigation.

Pesticides are available in three basic physical forms--solid, liquid, and gas. Each has specific purposes, requires different application methods, and has specific advantages and disadvantages.

There are different forms of pesticides available as solids.

- 1. Dust, the common type of solid pesticide, has the following characteristics:
 - a. Lighter than liquids
 - b. Less work in preparation for application
 - c. Difficulty in obtaining even application
 - d. May lose effectiveness faster than sprays
 - e. Impossibility of manufacturing certain pesticides (example, oils)

- f. Danger of dust and vapor drift
 - g. Examples of the use of dust
 - 1) Seed treatment to control fungus
 - 2) Seed flats to control damping off
 - 3) Vegetables and fruit dusted by airplane
 - 4) Power dusters mounted on tractors to dust fruit trees
 - 5) Hand dusters for home gardeners, some with CO₂ rechargeable
 - 6) Dusting livestock for mites, lice, grubs, and other pests
 - 7) Aerosol bombs for moth-proofing
2. Granules: a solid type pesticide
- a. Small, free-flowing particles
 - b. Often mixed or combined with a carrier to provide enough bulk for even distribution
 - c. Applied by hand or mechanical spreaders
 - d. Applied as granules; no water needed
 - e. Fall or roll off leaves, preventing plant injury
 - f. Difficult to apply as uniformly as sprays
 - g. Examples of the use of granules
 - 1) Insecticides used to control soil root worms
 - 2) Systemic herbicides applied to soils
 - 3) Insecticides that catch in corn whorls for corn borer control
3. Baits: grain mixtures, pellets, cubes
- a. Various solid forms; not dusts or granules
 - b. Placed by hand where pests are located
 - c. May be used with bait boxes
 - d. Act as stomach poisons

Liquid materials are the most common form of pesticides. These materials are available in the following forms:

1. Wettable powders
 - a. Sold as powders or dusts
 - b. Mixed with water for application
 - c. Indissoluble powders; stay in suspension
 - d. Agitation required with some to maintain suspension
 - e. Improper suspension can cause
 - 1) Nozzle clogging
 - 2) Uneven application
 - f. Suspension partially maintained by wetting agents
 - g. Many available as wettable powders
2. Emulsions
 - a. Oil base or oil-like pesticides
 - b. Mixed with water for application
 - c. One liquid mixed in another, each maintaining its own identity
 - d. May require agitation to prevent separation
 - e. Generally has a "milky" color
 - f. Suspension facilitated by emulsifying agents
3. Salts
 - a. Sold as dry materials; dissolve in water
 - b. Become homogeneous mixture of the water and salt
 - c. Clear spray; may be colored, not cloudy
 - d. Salt inseparable from water by mechanical means
 - e. Assurance of uniform spray

4. Solutions

- a. Sold as clear liquids; may be colored
- b. Become homogeneous mixture with water
- c. Inseparable materials
- d. Assurance of uniform spray

Some types of pesticides are sold as gases, and are used as fumigants to control nearly all types of pests. Certain solid and liquid materials also vaporize and are used as fumigates.

Several factors influence the time to apply chemical pesticides. Under conditions when these factors tend to conflict with each other, judgment is needed to determine the most appropriate time to apply them. Factors governing timeliness of application are

- 1. Based on pest prevention rather than cure
- 2. Applied before the pest can do damage
- 3. Residue remains on or in edible products
 - a. Chemical residue may be harmful to
 - 1) Humans
 - 2) Animals
 - 3) Subsequent crops
 - 4) Beneficial flora
 - b. Residue must be removed or destroyed in processing.
- 4. They should be applied when the pest is most susceptible
- 5. They should be applied at a time least damaging to other plants and animals
- 6. They should be applied at a time when least damage will result to beneficial organisms or to the environment

In the 1952 U. S. Department of Agriculture Yearbook, the function of a sprayer is defined in the following manner:

The main function of a sprayer is to break the liquid into droplets of effective size and distribute them uniformly over the surface or space to be protected. Another function is to regulate the amount of insecticide to avoid excessive application that might prove harmful or wasteful.

Materials used in insecticide, fungicide, herbicide, and defoliant sprays usually fall into three groups.

1. Inorganic compounds
2. Organic compounds
3. Oils

Several types of power sprayers have been developed to apply these sprays. The National Sprayer and Duster Association classified them in the following manner:

1. Hydraulic
 - a. Multiple-purpose
 - b. Small general use
 - c. High-pressure, high volume
 - d. Low-pressure, low volume
 - e. Self-propelled, high clearance
2. Hydro-pneumatic
3. Blower
4. Aerosol

The most powerful sprayers are the hydraulic sprayers. The pressure created by the pump forces the liquid through the nozzle, which breaks the liquid into small droplets.

The typical hydraulic sprayer is made up of the following parts:

1. Pump
2. Tank
3. Agitator
4. Sprayer framework
5. Combined pressure regulator and relief valve
6. Pressure gauge
7. Strainers
8. Screen
9. Control valves
10. Piping and fittings
11. Distribution system
12. Power source
(See diagram in Farm Machinery and Equipment, p. 242.)

In the main, positive displacement pumps are used on most hydraulic sprayers. The speed at which these pumps operate determines their discharge capacity. The following types of pumps are used on hydraulic sprayers:

1. Reciprocating
2. Piston
3. Plunger
4. Rotary
5. Diaphragm

Nozzles break the spray liquid into the desired size of droplets. Several types of nozzles made by manufacturers are designed for applying certain types of sprays and making certain application patterns. Three principle application patterns are used to apply sprays.

1. Hollow cone
2. Solid cone
3. Flat-fan

The selection of the proper nozzle should be based on the following factors:

1. Type of spray job
2. Amount of spray to be applied per acre
3. Row spacing and the number of nozzles used per row
4. Nozzle spacing if complete coverage is desired
5. Spray pattern desired
6. Approximate speed of travel
7. Approximate pressure to be used in spraying

The arrangement of the nozzles can be altered by using pendants, nozzle drops, or drop extensions. These arrangements are described in Farm Machinery and Equipment, pp. 246-247.

Hydro-pneumatic sprayers do not have a pump. The spray liquid is carried in a pressure tank and the spraying pressure is developed by means of an engine-powered air compressor.

Blower sprayers are a comparatively new type sprayer. They are used for treating large acreages of fruit trees, vegetables, and certain other crops. These machines operate in the following manner: a blast of air carries the chemical from the machine to the foliage to be treated; the spray liquid is forced under low pressure into the airstream in small droplets by a group of nozzles on shear plates. (See Farm Machinery and Equipment, p. 253, for example.)

The amount of spray applied to a given area depends on three factors.

1. Forward speed of the sprayer
2. Number of nozzles
3. Rate of discharge of spray

As a sprayer is made ready for use under field conditions, it should be checked for correct rate of application. The operation is called calibration. The essential steps in calibrating sprayers are presented in Farm Machinery and Equipment, pp. 255-258.

Suggested Teaching-Learning Activities

1. Collect samples or have the students collect samples of the various forms of pesticides, dusts, granules, wettable powders, salts, oils, solutions, gases, and other types of pesticides. Suggest that less toxic materials be collected and that they be kept in safe storage.
2. Demonstrate in small amounts the mixing of various pesticides to show emulsions, solutions, and dissolving of salts. Point out the cloudy or milky emulsions and clear solutions. Demonstrate the effectiveness of wetting agents and emulsifiers.
3. Demonstrate the need for good timing in using herbicides for weed control. With the same material at the same rate, treat an area of weeds at emergence, at rapid growth stage, and at full bloom, and note the variation in effectiveness.
4. Through field trips and laboratory or field demonstrations, acquaint the students with common pesticide applicators used in your area.
5. Develop several problems with common pesticide products used in your area to give the students experience in calculating active ingredients and amount to apply per acre.
6. Give students the opportunity to clean dust, granular, and spray applicators properly.

7. Arrange a field trip(s) so that students may observe a commercial operation in application of pesticides.
8. Bring several types of sprayers before the class. Disassemble each simultaneously, pointing out the differences in construction. Have students study these differences and learn the parts of each type.
9. Under field conditions, demonstrate proper and improper adjustment of several types of sprayers.
10. Bring to class examples of each type of spray discussed in the content. Have students compare them.
11. Bring to the class sprayers in need of adjustment and repair of as many types as possible. Follow the procedure below when making the needed adjustments and repairs.
 - a. Operate the machine in the field to discover any malfunctions in operation.
 - b. Inspect the machine, noting worn and broken parts and parts that are out of line or adjustment.
 - c. Following the operator's and service manuals, make the necessary repairs and adjustments.
 - d. Lubricate the machine for field operation.
 - e. Calibrate the machine.
 - f. Test the machine in the field and make any adjustments necessary for proper operation.

Suggested Instructional Materials and References

Instructional materials

1. Machines for disassembly
2. Machines for use in demonstrating proper and improper field operation

References

1. Farm Machinery and Equipment, pp. 237-268.
2. Machines for Power Farming, pp. 398-424.
3. Operator's manuals
4. Service manuals

Suggested Occupational Experience

Have students adjust, repair, and calibrate sprayers at the local agricultural machinery dealership, following the procedure outlined in the teaching-learning activities.

- IX. To (1) identify the parts of fertilizer applying machines and how they function and (2) adjust and repair these machines

Teacher Preparation

Subject Matter Content

In order to understand fertilizer machines, the functions of their parts and make proper adjustments and repairs on these machines, an agricultural machinery service employee must be familiar with the types of fertilizer these machines are designed to apply to the soil.

There are three groups of soil nutrients: (1) primary, (2) secondary, and (3) micro or trace nutrients.

1. Primary plant nutrients (N, P₂O₅, K₂O). They are called primary because soils normally cannot provide them in the large amounts needed for healthy growth.
 - a. Nitrogen (N)
 - 1) Gives dark green color to plants
 - 2) Promotes rapid growth
 - 3) Improves quality and protein content

- b. Phosphorus (P) is expressed in fertilizer as available phosphate (P_2O_5).
 - 1) Stimulates early root development and growth
 - 2) Hastens maturity, promotes seed production
 - 3) Improves winter hardiness of legumes
 - c. Potassium (K) is stated in terms of potash (K_2O).
 - 1) Increases vigor and disease resistance
 - 2) Aids in food formation
 - 3) Stiffens straw and stalk parts
2. Secondary plant nutrients (Ca, Mg, S) are required by plants in substantial quantities. Soils are adequate in some areas and lacking in others.
- a. Calcium (Ca)
 - 1) Promotes early root formation and growth
 - 2) Encourages seed production
 - 3) Neutralizes poisons produced in plants
 - b. Magnesium (Mg)
 - 1) Maintain chlorophyll and photosynthesis
 - 2) Formation of sugar, fats, and oils
 - 3) Plays a part in translocating food within the plant
 - c. Sulfur (S)
 - 1) Is essential ingredient in protein
 - 2) Maintain dark green color
 - 3) Promotes module formation on legumes
3. Micro-nutrients (B, Cu, Fe, Mn, Mo, Zn, Cl) are required by plants in trace amounts. Sandy soils, peats and mucks are most often deficient in them.
- a. Boron (B)
 - 1) Increases yield and quality
 - 2) Is associated with calcium utilization

- b. Copper (Cu)
 - 1) Important in citrus and vegetable production
- c. Iron (Fe)
 - 1) Is associated with formation of chlorophyll
 - 2) Aids in plant respiration
- d. Manganese (Mn)
 - 1) Accelerates germination and maturity
 - 2) Aids in photosynthesis
- e. Molybdenum (MO)
 - 1) Is used by legumes in nitrogen fixation
- f. Zinc (Zn)
 - 1) Is necessary for chlorophyll formation
 - 2) Is vital as a growth regulator
- g. Chlorine (Cl)
 - 1) Functions not understood

Excessive amounts of minor nutrients can be as harmful as inadequate amounts. Micro-nutrients are usually deficient in the following types of soil.

- 1. Muck and peat soils
 - a. Boron
 - b. Copper
- 2. Alkaline soils
 - a. Iron
 - b. Manganese
 - c. Zinc
- 3. Acid soils
 - a. Molybdenum

The three major plant foods are nitrogen, phosphorus, and potassium.

Nitrogen is an abundant, inert gas found in the atmosphere. Before it can be used by most plants, it must be combined with oxygen or hydrogen.

Three groups of nitrogen-carrying materials are used in the fertilizer industry.

1. Inorganic nitrogenous materials
 - a. Sulfate of ammonia
 - b. Anhydrous and liquid ammonia
 - c. Nitrate of soda
 - d. Ammonium nitrate
 - e. Ammonium phosphate
 - f. Calcium nitrate
 - g. Nitric phosphates
 - h. Nitrate of potash
2. Natural organic nitrogen materials
 - a. Plant and animal by-products
 - b. Guano
3. Synthetic organic nitrogen materials
 - a. Urea
 - b. Calcium cyanamid

When making adjustments on fertilizer machines either in the agricultural machinery service department or in the field, it is important that the service employer understand the nature of these fertilizers and their methods of application.

1. Anhydrous ammonia

a. Toxic, hazardous gas, difficult to store and handle

- 1) Can cause serious burns
- 2) Can cause death by asphyxiation
- 3) Is flammable and explosive
- 4) Is stored in steel tanks with a strength of 265 pounds per square inch

b. Anhydrous ammonia

- 1) Is 99.5% ammonia, 81.8% nitrogen (82%)
- 2) Is 5% water
- 3) Weighs 5.14 pounds at 60°F.

c. Application

- 1) Applied "into" soil at a depth of 4-8 inches depending on soil conditions
- 2) Is applied under pressure
- 3) Rate of application controlled by valves
- 4) Requires special handling and application equipment

d. Retention and behavior in soil

- 1) Little or no loss under normal soil conditions
- 2) Some losses in exceptionally sandy, dry, or wet and cloddy soils
- 3) Retention of ammonia on clay and organic particles in the soil
- 4) May make clay stiffer and more compact, but probably not enough to be significant
- 5) Increases pH in zone of application, improves solubility of phosphate slightly
- 6) Less leaching than with nitrates

2. Ammonium nitrate

a. Solid chemical compound containing 33.5% nitrogen

- 1) Water soluble, quick acting
- 2) Approximately one-half of the nitrogen is in nitrate form and one-half in the ammonia form

- b. Has an affinity for moisture, will cake
 - 1) Has protective covering to decrease absorption of water
 - 2) Store in water proof bags
 - c. Safety precautions with ammonium nitrate
 - 1) Don't smoke or expose to open flames
 - 2) Keep away from steam pipes, electrical wiring, and combustible materials
 - 3) Store in well ventilated building
 - 4) Clean up and discard spilled material
 - 5) Promptly destroy empty bags
 - d. Application with a dry fertilizer applicator, surface or subsurface
 - e. Retention and behavior in soil
 - 1) Rapid solubility, rapid uptake by plants
 - 2) Possible leaching of nitrate portion
 - 3) Reduces pH slightly
3. Nitrogen solutions
- a. Nitrogen materials that dissolve in water
 - 1) Ammonium nitrate
 - 2) Urea
 - 3) Ammonia
 - b. Low pressure and non-pressure type
 - 1) Free ammonia in low pressure type
 - 2) Crystallization (salting out) problem in cool weather (See table)

Total Nitrogen Available in Solution	Composition of Liquid Nitrogen by Percent				Total Composition by Percent	Crystallization Temperature (°F)
	Free Ammonia	Ammonium Nitrate	Urea	Water		
41.0%	22.2	65.0		12.8	100	21°
41.0	19.0	58.0	11.0	12.0	100	7°
32.0		44.3	35.4	20.3	100	32°
20.0		57.3		42.7	100	42°
20.0	24.3			75.7	100	-70°

c. Storage and application

- 1) Non-pressure, no special storage problems
- 2) Low pressure, in sealed tank with pressure gauge
- 3) Corrosive to steel; aluminum or fiber glass tanks recommended
- 4) Possible to apply certain non-pressure fertilizers to soil surface
- 5) Necessity of putting low-pressure fertilizers into the ground

4. Ammonium sulfate

- a. Dry material containing 21% nitrogen, 24% sulfur
- b. Does not absorb water or cake
- c. Leaves acid residue, lowering soil pH
- d. Should be applied to land in bands or broadcast, surface or subsurface

5. Ammonium phosphates

a. Types

- 1) Mono-ammonium phosphate containing 11 to 16% nitrogen
- 2) Di-ammonium phosphate containing 16 to 21% nitrogen

- b. Dry material fertilizers, well suited for top
: dressing grasses and legumes
 - c. Lower: the soil pH
6. Aqua ammonia
- a. 20-26% nitrogen, ammonia dissolved in water
 - b. Similar to anhydrous ammonia, less hazardous
 - c. Must be pumped, does not supply its own pressure
 - d. Is applied two or more inches deep with special
equipment
7. Sodium nitrate
- a. 16% nitrogen, mined or manufactured
 - b. Dry material, applied in bands or broadcast, surface
or subsurface
 - c. Rapidly available, water soluble
 - d. Slight increase in soil pH
 - e. Absorbs water; should be stored in dry place in
water-proof bags, will cake
 - f. Should not be used on heavy clay soils possessing
a high pH; may produce a "black alkali" condition
8. Calcium nitrate
- a. 16% nitrogen, dry material
 - b. Absorbs water, store in dry place in water-proof bags
 - c. Slight increase in soil pH
9. Nitric phosphates
- a. 12-20% dry material

10. Natural organic nitrogen materials
 - a. Largely insoluble in water, 2-9% nitrogen
 - b. Nitrogen released slowly as organic matter decomposes
 - c. Favored in some lawn fertilizers
 - d. No danger of leaching
 - e. Relatively high priced
11. Urea
 - a. Dry material, containing 46% nitrogen
 - b. Water soluble, favored for foliar spraying
 - c. Urea combined with formaldehyde is slow releasing (urea-form)
12. Cyanamid
 - a. Dry material, 21-22% nitrogen
 - b. Water soluble

Characteristics of the major phosphorous fertilizers and their use must be understood. Most of the phosphorus in soils is in a comparatively insoluble form. Even soluble phosphates are often transformed into less soluble phosphates called "fixed" in many soils. The type of phosphorus to use and method of application are important factors to consider. In general, more phosphorous fertilizer should be added than is required by the growing crop. However, this additional phosphorus is held in the soil for succeeding crops.

1. Rock phosphate
 - a. Relatively insoluble, slowly available to crops
 - b. Can raise the phosphorus level in soil
 - c. Effectiveness improved by fine grinding
 - d. Best results on acid soils high in organic matter

2. Superphosphate

- a. Most widely used source of phosphorus
- b. Does not change pH of soil
- c. Phosphorus is soluble in soils
- d. Two types of superphosphate
 - 1) Single strength, 18-20 percent phosphoric oxide
 - 2) Triple superphosphate, 40-50 percent phosphoric oxide; often called double, treble, or concentrated superphosphate

3. Ammonium phosphates

- a. Contain nitrogen and 15-33 percent phosphate
- b. Phosphorus nearly all water soluble
- c. Commonly used in complete fertilizers
- d. Common types
 - 1) Mono-ammonium phosphate--48%, trade name Ammo-phos A
 - 2) Di-ammonium phosphate--48-53%, trade name Ammo-phos B
 - 3) Ammoniated superphosphate--18-20%
 - 4) Ammonium phosphate-nitrate--15%
 - 5) Ammonium phosphate sulfate--20-39%

4. Nitric phosphates

- a. Contain nitrogen plus 10-22 percent phosphate
- b. Relatively new material, increase in use

5. Liquid phosphoric acid

- a. As indicated, a liquid, 52-54% phosphate
- b. Used in irrigation water or directly sprayed on soil
- c. Lowers pH on alkaline soils
- d. Superphosphoric acid, 75% phosphate

- e. More costly than other recommended phosphorous fertilizers
 - f. Strong acid; should be handled with care
6. Colloidal phosphate
- a. Trade mark for a low-grade rock phosphate or phosphatic clay
 - b. Relatively insoluble, seldom recommended
7. Calcium metaphosphate
- a. Is 62-65 percent available phosphate in acidic soils
 - b. Not recommended on alkaline soils; is insoluble

Other phosphorous fertilizers are available, but in limited or local areas. Their value should be determined by their solubility and relative price as compared to the more common, recommended phosphate fertilizers.

The characteristics of the various potash materials in soil fertility are similar.

1. Muriate of potash (potassium chloride)
 - a. 50-62% potash, water soluble
 - b. Most common source of potash fertilizer
2. Sulfate of potash (potassium sulfate)
 - a. Contains less chlorine than muriate and is favored by tobacco growers
 - b. 50% potash, water soluble
3. Nitrate of potash (potassium nitrate)
 - a. Contains nitrogen plus 45% potash
 - b. Little commercial importance, imported from Chile

Potassium-magnesium sulfate

- a. Contains magnesium and 22% potash, both water soluble
- b. Sold under trade name "Sulpo-mag"

Soils contain large quantities of potassium, but it is largely unavailable to plant growth. Liming increases the availability of potassium and also reduces potassium leaching.

Fertilizers are sold in three forms -dry, liquid, and gaseous. Gaseous ammonia is the only gaseous fertilizer. They may be brought materials, containing only one major nutrient, mixed fertilizers containing all three major nutrients of nitrogen, phosphorus and potassium. Over 60% of all fertilizers sold are dry fertilizers. Dry fertilizers can be granulated, mixed, chemically blended, or made as a combination of the three.

1. Granulated fertilizers are converted into granules of uniform size, each containing the ingredients in the same proportion. This is called pelleting.
2. Chemically blended materials chemically react to form materials of homogenous composition. These are then made into granules.

Fertilizers differ in their grade analysis. The common classifications are

1. Ordinary grade, containing a total value of less than 20 percent nitrogen, phosphate, and potash
2. High grade, containing 20-30 percent total plant food, such as 6-12-12
3. Concentrated grade, containing over 30 percent total nutrients, such as 12-12-12

The trend is to concentrated grade fertilizers for several reasons.

1. Economical transportation, handling, bagging, and storage
2. Reduced salt toxicity and less material needed to supply the needed amount of plant food

Lower grade fertilizers, however, generally contain more secondary and trace-elements and have a better physical condition. Concentrated liquid fertilizers are more likely to crystallize or "salt out."

As the agricultural machinery service employee makes adjustments and repairs on fertilizing machines, he will be confronted with many questions concerning the content of fertilizers. He should understand the composition of commercial fertilizer well enough to answer these questions. He should know

1. The meaning of the numbers on a bag of fertilizer.
2. Fertilizer ratios
3. How to compare values of various fertilizers
4. How to change plant food percent to elemental percent

The numbers on the bag refer to the percent of the three primary plant nutrients--nitrogen, phosphorus, and potassium--in that order in the bag, and is the guaranteed analysis. A 6-24-12 fertilizer contains

1. 6 percent nitrogen (N)
2. 24 percent available phosphoric oxide (P_2O_5)
3. 12 percent soluble potash (K_2O)

This would be a 42 unit ($6 + 24 + 12$) fertilizer and has a 1-4-2 ratio, determined by dividing all the numbers by the smallest. A 4-16-8 fertilizer would have the same 1-4-2 ratio but would contain 28 units of fertilizer. Assuming a customer wanted to apply 300 pounds of 3-16-8 per acre, but found that it was not available, 200 pounds of 6-24-12 would supply the same amount of primary nutrients; 12 pounds of nitrogen, 48 pounds of phosphoric oxide, and 24 pounds of potash.

Mixed fertilizers often contain secondary or trace elements in addition to the primary elements. When a certain level is guaranteed, the amount must be stated on the bag. A popular grade in the orange country is 4-6-8-3-1-1 $\frac{1}{2}$, with the last three numbers standing for magnesium, manganese, and copper. Where the amount is not guaranteed, just the fact that the nutrient is added is sufficient. In certain areas 0-15-45 B is a popular alfalfa fertilizer, with the B indicating that boron is added. Other fertilizers are sold as trace element fertilizers as "5-20-20 with trace elements added."

The principal ratios and grades of mixed fertilizer sold in the United States are listed below. These make up over seventy percent of the mixed fertilizer tonnage used annually.

<u>Ratio</u>	<u>Grades</u>
1-2-2	5-10-10; 6-12-12; 8-16-16
1-4-4	4-16-16; 3-12-12; 5-20-20; 6-24-24
1-1-1	12-12-12; 10-10-10; 8-8-8
1-2-3	5-10-15; 4-8-12
1-2-1	5-10-5; 10-20-10
1-4-2	6-24-12
1-3-3	3-9-9
0-1-1	0-20-20
0-1-3	0-10-30; 0-15-45; 0-12-36

Several types of machines have been developed to apply fertilizers.

1. Granular
2. Gas and liquid

Granular fertilizer applicators are manufactured in a variety of types. These include

1. Attachments for row-crop planters
2. Attachments for grain drills
3. Attachments for cultivators
4. Attachments for chisel plows
5. Machines that broadcast fertilizer

Fertilizer attachments used on a row-crop planter are of two types, based on the type of feeding mechanism.

1. Star or spur wheel type
2. Plow type
(See Machines for Power Farming, pp. 340-341.)

A separate compartment for applying fertilizer is used on grain drills. The fertilizer granules are placed in a hopper similar to the seed hopper. The star finger feed wheels, driven by two bevel gears, moves the fertilizer granules to a special shed at the front of the hopper. This shed is made up of a series of removable back plates that cover the fertilizer drop openings.

(See Machines for Power Farming, pp. 363-365.)

On cultivators and chisel plows, the fertilizer granules are fed into a metering device from a hopper similar to a row-crop planter hopper. From the metering device, the fertilizer is dropped into feeder tubes that place the fertilizer in the furrow left by the cultivator or chisel shovels.

The end-gate trailing type of fertilizer distributor is the most commonly used broadcast applicator. The fertilizer granules are placed in a hopper where it is fed into the fertilizer drop openings by a rotor in the bottom of the hopper. An agitator is used to keep the fertilizer from bridging in the hopper and to break down any lumps or clods that may be in the fertilizer. Some broadcasters use a scattering board to broadcast the fertilizer more thoroughly. This board is located directly below the fertilizer drop openings in the bottom of the hopper. (See Machines for Power Farming, pp. 283-286.)

With the advent of gas and liquid fertilizers came the development of new and different types of fertilizer applicators. These applicators force the gas or liquid into the soil under high pressure. They are equipped with a tank, pressure hoses, carrying tubes, and shovels for opening the soil. The carrying tubes are connected to a small pipe welded to the rear side of the chisel knives or shovels. As the shovels enter and penetrate the soil to the desired depth, the gas or liquid fertilizer is forced out through the pipe into the soil.

Gas and liquid fertilizer applicators can be calibrated to control the amount of fertilizer being applied. This procedure is outlined and discussed in Farm Machinery and Equipment, pp. 284-286.

Suggested Teaching-Learning Activities

1. Using fertilizer applicators discussed in the subject matter content, demonstrate how each machine works in the soil. After demonstrating proper operation of each type of machine, throw the machines out of adjustment and have the students observe the results.
2. Have students disassemble each type of fertilizer applicator discussed in the content and learn their parts. Point out to the students the materials used in constructing each part and the function each part plays in the total operation of the machine.

3. Bring to the class fertilizer applicator machines that are in need of adjustment and repair of each type discussed in the subject matter content. Follow the procedure below when making the needed adjustments and repairs.
 - a. Operate the machine in the field, noting any malfunctions in operation.
 - b. Inspect the machine, noting worn and broken parts and parts that are out of line or adjustment.
 - c. Following the operator's and manufacturers manuals, make the necessary repairs and adjustments.
 - d. Lubricate the machine for field operation.
 - e. Test the machine in the field and make any adjustments necessary for proper operation.

Suggested Instructional Materials and References

Instructional materials

1. Machines for disassembly
2. Machines for use in demonstrating proper and improper field operation

References

1. Machines for Power Farming
2. Farm Machinery and Equipment
3. Operator's manuals
4. Manufacturer's service manuals

Suggested Occupational Experience

Have students adjust, repair, and lubricate fertilizer applicators at the local agricultural machinery dealership under the supervision of a skilled mechanic, following the procedure outlined in the teaching-learning activities.

- X. To prepare and paint tillage, planting, spraying, and fertilizing machines after they have been repaired

Teacher Preparation

Subject Matter Content

If the person being taught this module has not been taught the competency on preparing and painting the tractor in the module on "Tractor Repair," he should be taught that competency at this time. The procedures to be followed when painting these machines are the same as those to follow when painting a tractor.

Suggestions for Evaluating Educational Outcomes of the Module

The following criteria should be used to evaluate the educational outcome of this module,

1. Attentiveness in class and participation in laboratory activities
2. The ability of the student to use the operator's and service manuals
3. The ability of the student to perform the repair and adjustment activities on machines. As a final outcome it is suggested that each student completely recondition a machine in need of repairs and adjustment.
4. Employers evaluation of the ability of the student to adjust, repair, and service machines in his dealership.

ADJUSTMENT, MAINTENANCE, AND REPAIR OF CROP HARVESTING MACHINERY

Major Teaching Objective

To develop (1) an understanding of crop harvesting machines and their parts, and (2) the ability to adjust, repair, and maintain these machines.

Suggested Time Allotments

At school		
Class instruction	45	hours
Laboratory experience	<u>150</u>	<u>hours</u>
Total at school		<u>195</u> hours
Occupational experience		<u>105</u> hours
Total for module		<u>300</u> hours

Suggestions for Introducing the Module

Crop harvesting machines are the reapers of the farmer's toil. They are extremely important to him. They must operate properly and efficiently if he is to maximize his profits and minimize his expenses. In relying heavily on these machines to bring in his crop, he is also relying heavily on the service department of the agricultural machinery dealership and its employees to keep these machines functioning properly. In order to keep these machines functional, these employees must know the types and functions of harvesting machines, their relationship to the crop they are designed to harvest, and how to adjust and repair them when they need it.

Diversity in types of machines used to harvest crops in various parts of the country exists. Different features exist on the same machine because of design differences developed by major line agricultural machinery manufacturers. Some harvesting machines are built to different degrees of specialization. Therefore, it was deemed most wise to use the operator's and manufacturer's service manuals as the basic repair and adjustment references. Only those machines used in all parts of the country have been included in this module. The subject matter content presented in each competency provides the necessary background information needed to understand how and why to make these adjustments and repairs. The fact that certain machines have been omitted from this module doesn't mean that they should not be studied. These machines should be studied during training schools held by the manufacturer after the student has been employed.

The following techniques should be used to create interest in the module.

1. Identify machines on farms in the community that are out of adjustment and are in need of repair. Take students on a tour

of these farms and demonstrate the operation of these machines. Have students attempt to identify what part or parts are out of adjustment and how they should be properly adjusted.

2. Place parts from several machines around the classroom and have students attempt to identify them.
3. Using a panel composed of a farmer, agricultural machinery dealership manager, and a mechanic, discuss the importance of proper adjustment and repair of crop harvesting machines.

Competencies to be Developed

- I. To understand how to use operator's and service manuals when adjusting, maintaining, and repairing agricultural machinery

Teacher Preparation

Subject Matter Content

If the person being taught this module on "Adjustment, Maintenance, and Repair of Crop Harvesting Machinery" has not been taught the competency on using operator's and service manuals included in the "Adjustment, Maintenance, and Repair of Tillage, Planting, Spraying, and Fertilizing Machinery," they should be taught that competency at this time.

- II. To select and use proper lubricants for agricultural machines

Teacher Preparation

Subject Matter Content

If the person being taught this module on "Adjustment, Maintenance, and Repair of Crop Harvesting Machinery" has not been taught the competency on understanding agricultural machinery lubrication included in the module on "Agricultural Machinery Assembly and Lubrication," they should be taught that competency at this time.

- III. To (1) identify the parts of hay harvesting machines and understand their functions and (2) adjust and repair these machines

Teacher Preparation

Subject Matter Content

An understanding of the operation of hay harvesting machinery is of utmost importance to a farm machinery mechanic and mechanic's

helper. These machines are used in all parts of the country and agricultural machinery service employees will be required to service and repair these machines each year.

The common hay harvesting machines include mowers, hay conditioners, rakes, and balers.

Mowers, in the main, are used to cut native grasses and other hay crops.

There are several types of mowers determined by the manner in which they are attached to the tractor

1. Trail
2. Integral rear-mounted
3. Side-mounted or central-mounted

The above types of mowers can be further divided according to whether they are of the pitman or pitmanless type of mower.

The pitmanless mower knife is driven by either single or double counterbalance wheels permitting a smoother, faster knife speed. (See reference Farm Machinery and Equipment, pages 293 and 294, for an example of a pitmanless mower.)

The pitman on the pitman type mower is a rigid connecting link between the source of power and the mower knife. It connects rotary motion into straight-line motion. (See reference Machine for Power Farming, pages 237 and 238, for a discussion of the pitman and its function.)

A mower is made up of the following parts:

<u>Part</u>	<u>Function</u>
Frame	That part that supports the drive and cutter bar mechanism
Drag bar	That part that extends from the frame to the yoke
Yoke	The part to which the cutter bar is hinged
Pullbar	That part of the mower that keeps the yoke and cutter bar forward as they drag on the ground

<u>Part</u>	<u>Function</u>
Cutter bar knife	That part which actually cuts the hay
Knife bar	That part of the cutter bar which supports the knife
Knife sectors	The triangle shaped pieces on the knife
Guards	The pointed parts on the cutter bar that parts and guides the hay to the knife sectors
Ledger plate	That part that is riveted to the guard and forms one half of the cutting unit
Wearing plate	That part which supports the rear side of the knife
Knife chips	Those parts that hold the knife sections down close to the ledger plate
Grass hand and stick	Those parts which divide and rake the cut hay away from the cutter bar
Inside and outside shoes	Those parts which support the inner and outer end of the cutter bar when in operation

Several adjustments are common to all mowers. These include:

1. Angle of cut
2. Load or cutter bar adjustment
3. Register
4. Guard alignment
5. Cutter bar tilt

These adjustments should be made according to the specifications set down in the operator's and manufacturer's service manual for the machine needing adjustment.

Hay conditioners prepare hay for storage or feeding by means of crushing, flailing, or crimping.

The three types of conditioners commonly used to prepare or condition hay are:

1. Smooth roll
2. Corrugated roll or crimper
3. Flail type

In the smooth-roll type, the hay is picked up and fed through two rollers where it is completely crushed. The rollers may be either both rubber or one rubber and the other steel.

The corrugated roll or crimper type conditioner is usually equipped with either two malleable iron rolls, tapered flutes that mesh together, or slotted bar rolls. As the hay passes through the rolls, it is crimped at regular intervals but not completely crushed.

On the flail type conditioner the shear bar is removed and the swinging hammers or knives partially chop the hay.

Modern agricultural hay loaders and balers require that the hay be in a loose, fluffy, continuous windrow before these machines are able to carry out their phase of the hay harvesting operation. In many cases the hay is moved into windrows immediately after it has been cut, requiring turning in order for the hay to come out properly. The side-delivery rake was developed to meet these requirements.

Several types of side-delivery rakes are commonly used today. The type of rake is determined by the type of reel construction used on the rake. Reel types are:

1. Cylindrical reel
2. Parallel bar
3. Side-stroke
4. Finger-wheel

Each type of rake given above is discussed in the reference Farm Machinery and Equipment, pages 302-306.

The purpose of the hay baler is to pick up hay from a windrow and compress it into a bale.

Two types of balers used to bale hay are:

1. Pickup automatic self-tying balers which make rectangular bales
2. Pickup automatic baler making round bales

Four processes involved in making a bale with a baler are:

1. Pickup
2. Feeding
3. Compressing
4. Tying

The usual type of pickup mechanism on the baler consists of a drum or cylinder with spring steel teeth. The cylinder rotates in the opposite direction of the motor of the baler, lifting the hay and moving it into the machine.

At least four main methods of feeding the hay into the compressing chamber are commonly used on balers. They are:

1. Auger and packer fingers
2. Spring teeth and feeder arms
3. Auger and feeder head
4. Carrier-roller feed

The feeding mechanism on the baler feeds the hay into the compressing chamber where the hay is pressed into a bale. The compressing mechanism is composed of five parts:

1. Plunger
2. Bale chamber
3. Tension bars or rails
4. Retaining plates
5. Metering wheel

On the rectangular bale, the plunger is a rectangular framework that pushes against the hay as it is fed into the compressing chamber. The plunger has a set of knives along the side of the

plunger that is situated next to the feeding mechanism. These knives shear off the hay as it is fed into the compressing chamber making a neat, smooth bale.

The bale chamber is the long rectangular box into which the plunger forces the hay. The tension bars or rails are located in the chamber and offer resistance to the plunger action making a tight bale.

The retaining plates are located in the compressing chamber just out of reach of the plunger. They prevent the bale from moving back toward the plunger after each compression stroke.

The metering wheel is located on the compressing chamber and has spokes that make contact with the hay. As the hay moves through the compressing chamber, it turns the metering wheel. After making a complete turn, the metering wheel engages the tying mechanism.

The last function performed by the baler before it releases the bale is that of tying the bale. The tying function is described on pages 482 and 484 of Machines for Power Farming and 309-311 of Farm Machinery and Equipment.

On the round baler, the hay is fed into a series of rolling belts. The lower set of belts rotate in the opposite direction from that of the upper series of belts. The hay is turned in a circular motion forming a round bale. After the bale becomes so large, it trips the trip rollers and releases the bale. (See Farm Machinery and Equipment, page 312, for an illustration of how the roller baler operates.)

Suggested Teaching-Learning Activities

1. Have students disassemble each type of hay harvesting machine discussed in the content and learn their parts. Point out to the students the materials used in constructing each part and the function each part plays in the total operation of the machine.
2. Demonstrate proper and improper operation of each of the hay harvesting machines under field conditions.
3. Bring to the class hay harvesting machines that are in need of adjustment and repair of each type discussed in the subject matter content. Follow the procedure below when making the needed adjustments and repairs.
 - a. Operate the machine in the field noting any malfunctions in operation.

- b. Inspect the machine noting worn and broken parts and parts that are out of line or adjustment.
- c. Following the operator's and manufacturer's service manuals, make the necessary repairs and adjustments.
- d. Lubricate the machine for field operation.
- e. Test the machine in the field and make any adjustments necessary for proper operation.

Suggested Instructional Materials and References

Instructional materials

1. Machines for disassembly
2. Machines for use in demonstrating proper and improper field operation and in need of repair and adjustment

References

1. Machines for Power Farming, pp. 427-491.
2. Farm Machinery and Equipment, pp. 289-315.
3. Operator's manuals
4. Manufacturer's service manuals

Suggested Occupational Experiences

Have students adjust, repair, and lubricate hay harvesting machines at the local agricultural machinery dealership under the supervision of a competent mechanic following the procedure outlined in the teaching-learning activities.

- IV. To (1) identify types and parts of forage harvesting machinery and understand their functions and (2) adjust and repair these machines

Teacher Preparation

Subject Matter Content

The primary purpose of forage harvesting machinery is to chop field crops and place the chopped crop in a wagon. Two types

of forage harvesters have been developed to accomplish this purpose.

1. Field chopper
2. Flail chopper

The field chopper is by far the most versatile of the two types. This versatility comes from its ability to be adapted to a variety of crop or forage production methods. For example, a unit has been developed for use in harvesting row crops, a unit for picking up forages in the windrow, etc. (See Farm Machinery and Equipment, page 32, for examples of unit attachments for the forage chopper.)

There are three types of field choppers used by farmers.

1. Tractor-drawn
2. Tractor-mounted
3. Self-propelled

The basic unit of the field chopper is made up of the following parts:

1. Wheels
2. Axle
3. Frame
4. Cutter head
5. Blower
6. Feeding mechanism

This unit is powered through the PTO and the tractor. The power from the PTO shaft is carried to the basic unit through the PTO shaft in the harvester.

Three processes are involved in the operation of the forage harvester.

1. Cutting and feeding
2. Chopping
3. Blowing

The feeding and cutting mechanism will vary according to the type of unit attachment that is being used on the harvester. If a row crop unit is being used, an oscillating sickle is used to sever the plants. The plants are moved back toward the chopping unit. If a broadcast unit attachment is used, a mower-like cutter bar cuts the crop. A reel is used to throw the severed plant against an apron which carries the forage back to an auger. The auger in turn carries the material to the chopping unit. If a windrow pick-up is used, revolving fingers lift the forage from the windrow and move the hay to the auger. The auger in turn moves the forage to the chopping mechanism.

Two principle types of cutter heads are used on forage harvesters.

1. Flywheel
2. Cylinder

The flywheel-type cutter head performs two functions, chopping and blowing. The blower paddles are separate from the cutter knives. As the wheel turns, the knives cut the forage and the blower paddles blow the chopped forage up and out of the blower spout.

The cylinder type of cutter head has knives designed to both cut and blow, however, some require a blower to force the chopped forage out of the harvester. (See Farm Machinery and Equipment, page 322 for an illustration of both types of cutter heads.)

The flail type harvester uses free-swinging chains, hammers, or knives to sever the plants through a beating or cutting action. The chopped hay is drawn into the blower fan and blown through the blower spout into the wagon.

Suggested Teaching-Learning Activities

1. Have students disassemble each type of forage harvesting machines discussed in the content and learn their parts. Point out to the students the materials used in constructing each part and the function each part plays in the total operation of the machine.
2. Demonstrate proper and improper operation of each of the types of forage harvesting machines under field conditions.

3. Bring to the class forage harvesting machines that are in need of adjustment and repair. Follow the procedure below when making the needed adjustments and repairs.
 - a. Operate the machine in the field noting any malfunctions in operation.
 - b. Inspect the machine noting worn or broken parts and parts that are out of line or adjustment.
 - c. Following the operator's and manufacturer's service manuals, make the necessary repairs and adjustments.
 - d. Lubricate the machine for field operation.
 - e. Test the machine in the field and make any adjustments necessary for proper operation.

Suggested Instructional Materials and References

Instructional materials

1. Machines for disassembly
2. Machines for use in demonstrating proper and improper field operation and the need of repair and adjustment

References

1. Machines for Power Farming, pp. 492-515
2. Farm Machinery and Equipment, pp. 317-328
3. Operator's manuals
4. Manufacturer's service manuals

Suggested Occupational Experiences

Have students adjust, repair, and lubricate forage harvesting machines at the local agricultural machinery dealership under the supervision of a competent mechanic following the procedures outlined in the teaching-learning activities.

- V. To (1) identify the parts of grain harvesting machines and understand their functions and (2) adjust and repair these machines

Teacher Preparation

Subject Matter Content

The principal grain harvesting machine in use today is the combine. The combine harvests, threshes, and cleans grain all in one operation.

There are two types of combines in use on farms today.

1. Pull type
2. Self-propelled

The pull type is drawn by a tractor. The smaller pull type combines are powered by the PTO of the tractor, whereas the larger combines are powered by an auxiliary engine mounted on the combine.

Self-propelled combines are powered by industrial-type engines and are operated by one man. They are provided with a gear-shift to give desired field and road speed. The combine is steered by a large steering wheel that turns the rear wheels. The travel and operation of the combine is controlled by a transmission and separator clutch. The cutter bar and platform can be raised or lowered to meet changing field conditions from a lever located on the steering shaft. The wheels are adjusted hydraulically to conform to the slope of the land which keeps the threshing, separating, and cleaning units level insuring proper machine action.

The combine performs the following functions.

1. Cutting the standing grain
2. Feeding the cut grain to the cylinder
3. Threshing the grain from the stalk or stem
4. Separating the grain from the straw
5. Cleaning the grain by removing chaff and other foreign matter
6. Elevating the grain from the combine to the holding bin and from the holding bin to the truck

The cutting mechanism cuts the standing grain. The cutting mechanism consists of two parts.

1. Cutter bar
2. Reel

The cutter bar severs the grain heads from the plant and the reel sweeps the heads back onto a canvas or auger table. The knife in the cutter bar extends the full width of the cutter bar and is powered by the rocker arm pitman. The knife sections are serrated.

The reel is located above the cutter bar. It may have as many as six wood bats on the reel to sweep the grain into the elevating platform. It can be adjusted to the height of the crop and on some of the late model machines this adjustment is made through the use of hydraulic cylinders. Common cutting and feeding mechanisms used on combines are illustrated below.

Cutting and feeding mechanism using a feeding auger, feeding beater, and undershot feeder

Cutting and feeding mechanism
using a feeding auger and feeding beater

Cutting and feeding mechanism
using a feeding auger and undershot feeder

The cutting and feeding mechanism is made up of the following main parts:

1. Cutter bar: The cutter bar works like a series of shears running through the field to cut the grain. This is accomplished by knife sections reciprocating (working back and forth) over ledger plates which are held in place by guards. Hold down clamps, wearing plates, and shims are used to keep the knife flat on the ledger plates.

The sickle bar is usually driven by a pitman drive assembly.

Power will usually be supplied to the pitman crank by means of a series of belts and chains.

2. Reel: The reel slats gather in the crop, hold it until it has been cut by the knife, and then move it onto the platform. The reel must be square, level, and at the proper height and position to feed the grain uniformly and steadily. The reel may be ground driven or power driven.
3. Platform: The platform holds the cutter bar and feeding mechanisms.
4. Cutting platform auger: The cutting platform auger moves the cut grain to the center of the platform where the retractable auger fingers feed the grain into the feeder conveyor or the feeder beater depending on the design of the combine.
5. Retractable finger feeder beater: In some combines the cutting platform auger is followed by a retractable finger feeder beater which moves the grain into either the feeder conveyor or into the threshing unit.
6. Feeder conveyor: The feed conveyor or feed rake, as it is sometimes called, is designed to feed the grain in a steady even flow into the threshing unit. Proper feeding into the threshing unit will cause less clogging.
7. Feeder beater: Some models of combines will have a feeder beater which takes the grain from the feed conveyor and feeds it uniformly into the threshing unit.

The function of the threshing mechanism of the combine is to thresh the grain from the heads. This is done by passing the grain between a rapidly revolving cylinder and a stationary surface. Underneath is the concave. The rubbing action on the grain caused by the bars on the cylinder passing over the concave channel bars causes the grain to be removed from the head.

Threshing Mechanism

The design of some of the parts shown on this diagram will vary according to the type of combine. Some combines will not have a separate shelling plate and may not have finger grates.

The main parts of the threshing mechanism are:

1. **Cylinder:** The cylinder will have either bars or spikes that will cause the rubbing of the grain against the concave.
 - a. **Rasp bar cylinder:** The cylinder bars are rasp shaped as shown in the illustration.
 - b. **Rub bar cylinder:** The cylinder bars are angle shaped and faced with rubber.
 - c. **Spiked tooth cylinder:** The cylinder has spikes instead of bars. This type is not suited for corn harvesting.

The following diagrams illustrate the types of cylinders mentioned on the preceding page:

Rasp bar cylinder

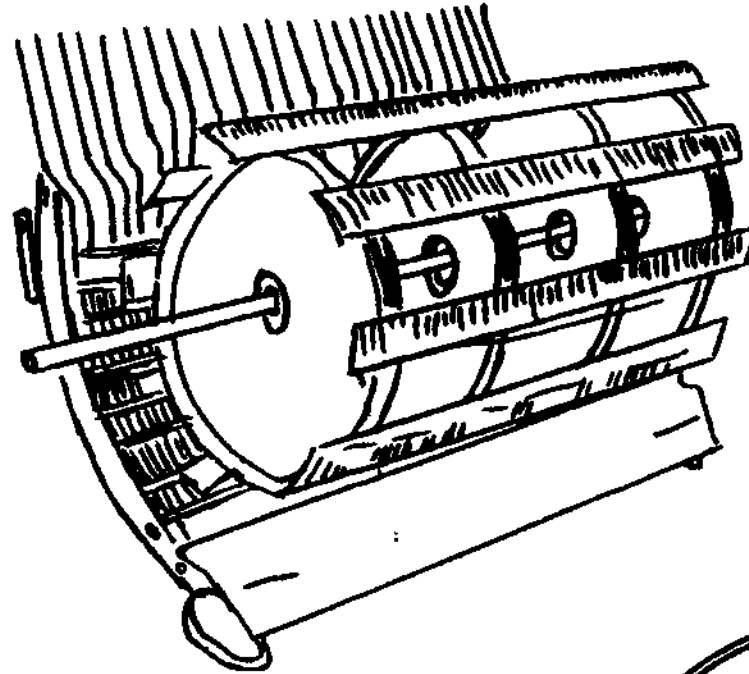

Rub bar cylinder

Spiled tooth cylinder

The following diagrams illustrate the types of cylinders mentioned on the preceding page:

Rasp bar cylinder

Rub bar cylinder

Spiled tooth cylinder

2. **Concave:** The concave is the stationary part that the cylinder works against in the threshing action. It is the rubbing action between the cylinder bars and the concave bars that removes the seed from the head or pod. Except for the Allis-Chalmers combine, the concave is a grate composed of rods and bars or wires. It is at the concave grate and finger grate that as much as 90% of the grain is separated from the straw or husk. The separated grain falls through the grate onto the shoe pan where it is delivered to the cleaning unit. The straw and the remaining grain passes on into the separation mechanism.

Concave

3. **Cylinder beater:** The beater behind the cylinder slows down the material coming from the cylinder, tears apart the straw, and delivers the material to the straw rack or the straw walker as it may be called. The beater helps in cleaning the straw from the cylinder thus preventing cylinder wrapping and feed back.
4. **Shelling plate:** The shelling plate is an adjustable plate located where the cut grain is fed into the cylinder concave unit. Much of the threshing can be done here.

Some combines will not have an adjustable shelling plate, but will have a feed plate fastened to the front of the concave.

The separating mechanism agitates the straw after it comes from the threshing unit. This shakes out the loose grain remaining in the straw and delivers it to the cleaning unit. Since the threshing unit separated up to 90% of the grain, only about 10% remains to be separated in this unit. The straw is carried out of the combine by the rack.

There are several designs used to collect the grain from the straw rack and concave grate. These are illustrated below.

Separating mechanism using straw rack return pan under the straw rack

Separating unit using straw rack return pan and grain conveyor

Separating unit which uses a grain return conveyor under the straw rack

Separating mechanism which uses a grain return pan under the straw rack. A cleaning fan is also used in the separating section of this combine.

The main parts of the separating mechanism are:

1. Concave grate and finger or cell grate which has been described in the threshing unit.
2. One-piece straw rack: The straw rack is a one-piece unit with risers pointed toward the rear of the combine. The straw rack is mounted on cranks located at the front and rear, which give it an oscillating motion. As the rack moves rearward and upward, the straw is tossed up and to the rear. As the rack returns forward and downward, the straw stays in mid-air for a short time and then falls onto a section of the rack nearer the end of the combine. In this way the straw moves step by step out of the combine. This tossing action causes the grain to be separated from the straw.

One-piece straw rack

Walker type straw rack

3. Walker type straw rack: Some large combines may use a walker type straw rack which operates on the same principle as the rack. The straw walker has three or more narrow sections placed side by side. Each section is mounted on multiple throw cranks located at the front and rear. The crank throws for each section are equally spaced around the circle of rotation; thus, the sections do not operate as a unit as the rack does.
4. Grain return pan: The grain return pan is located under the straw rack. It catches the grain as it falls through the rack and moves forward to the grain pan. The straw walker usually has a return pan under each unit.
5. Grain return conveyor: In place of the grain return pan some combines will use a conveyor to catch the grain and move it forward.
6. Grain pan: The grain pan is usually located under the forward part of the straw rack behind and below the cylinder. Its function is to catch the grain from the concave and cylinder grates and from the grain return pan or conveyor for delivery to the cleaning unit.
7. Grain conveyor: Some combines will use a conveyor in place of the grain pan to collect and deliver grain to the cleaning unit.
8. Check flaps or curtains: The check flaps or curtains deflect the straw and grain onto the rack as the full length of the rack is used for separation. They should not be in the way of the straw as the rack moves it to the rear.

The function of the cleaning mechanism is to separate the clean grain and send it to the grain tank, return the tailings (partially threshed heads) to the cylinder for rethreshing, and move the remaining material out of the combine. This is accomplished by means of gravity and air blast.

Cleaning unit

1. **Adjustable chaffer:** The adjustable chaffer acts as a sieve. It is made up of a series of cross pieces mounted on rods and fastened together so they can be moved at the same time to adjust the size of the openings.

Side and flat views of the chaffer showing how the lips may be adjusted to control the amount and kind of materials passing through.

Partial views of two types of adjustable chaffer sieves

2. **Chaffer extension:** As the name suggests, this is an extension of the chaffer. In addition to having adjustable lips, the chaffer extension will also swing up and down on the end of the chaffer. The unthreshed portions of grain heads fall through the chaffer extension into the tailings auger and the bulky material passes over the chaffer extension and out of the combine.
3. **Sieve:** The sieve is like the chaffer except that the lips and openings are smaller. The final job of cleaning is done here. The material that is too large to pass through the sieve is carried over the tailings auger and returned to the cylinder for rethreshing.
4. **Special chaffer and sieve equipment:** Many combines will have special screens available for some crops that are difficult to clean.
5. **Cleaning fan:** The fan furnishes a blast of air. The strength of the air blast is controlled by the speed of the fan and by shutters in the air intake. The direction of the air blast is controlled by windboards. The function of the air blast is to keep the material "alive" on the chaffer and sieve. The air blast should be

strong enough to lift the chaff slightly off the chaffer and sieve, but not strong enough to blow grain out of the combine.

6. **Clean grain auger and clean grain elevator:** The clean grain auger collects the cleaned grain and augers it to the clean grain elevator which delivers the clean grain to the grain tank.
7. **Tailings auger and tailings elevator:** The tailings auger collects all of the material which comes off the lower sieve plus any material which falls through the extension chaffer.

8. **Tailboard:** The tailboard keeps the unthreshed material from being carried out of the rear of the combine while still allowing the chaff to be blown out. It may be raised or lowered as needed.

The following illustrations and description show the operation of the combine and the flow of the grain through it.

FLOW OF MATERIALS THROUGH THE COMBINE.

CUTTING

The adjustable reel positions the crop for cutting. The auger moves the grain to the elevator.

FEEDING

The elevator feeds the grain uniformly to the cylinder.

THRESHING and SEPARATING

The cylinder and concave thresh the grain and separate it up to 90% from the straw.

SEPARATION

The separation of grain from straw is completed on the rack.

CLEANING

Forced air and the shaking action of sieves used to clean the grain.

GRAIN TANK

To receive and hold grain while combine is operating.

UNLOADING

Auger and to remove grain from tank.

Combine Operating Cycle

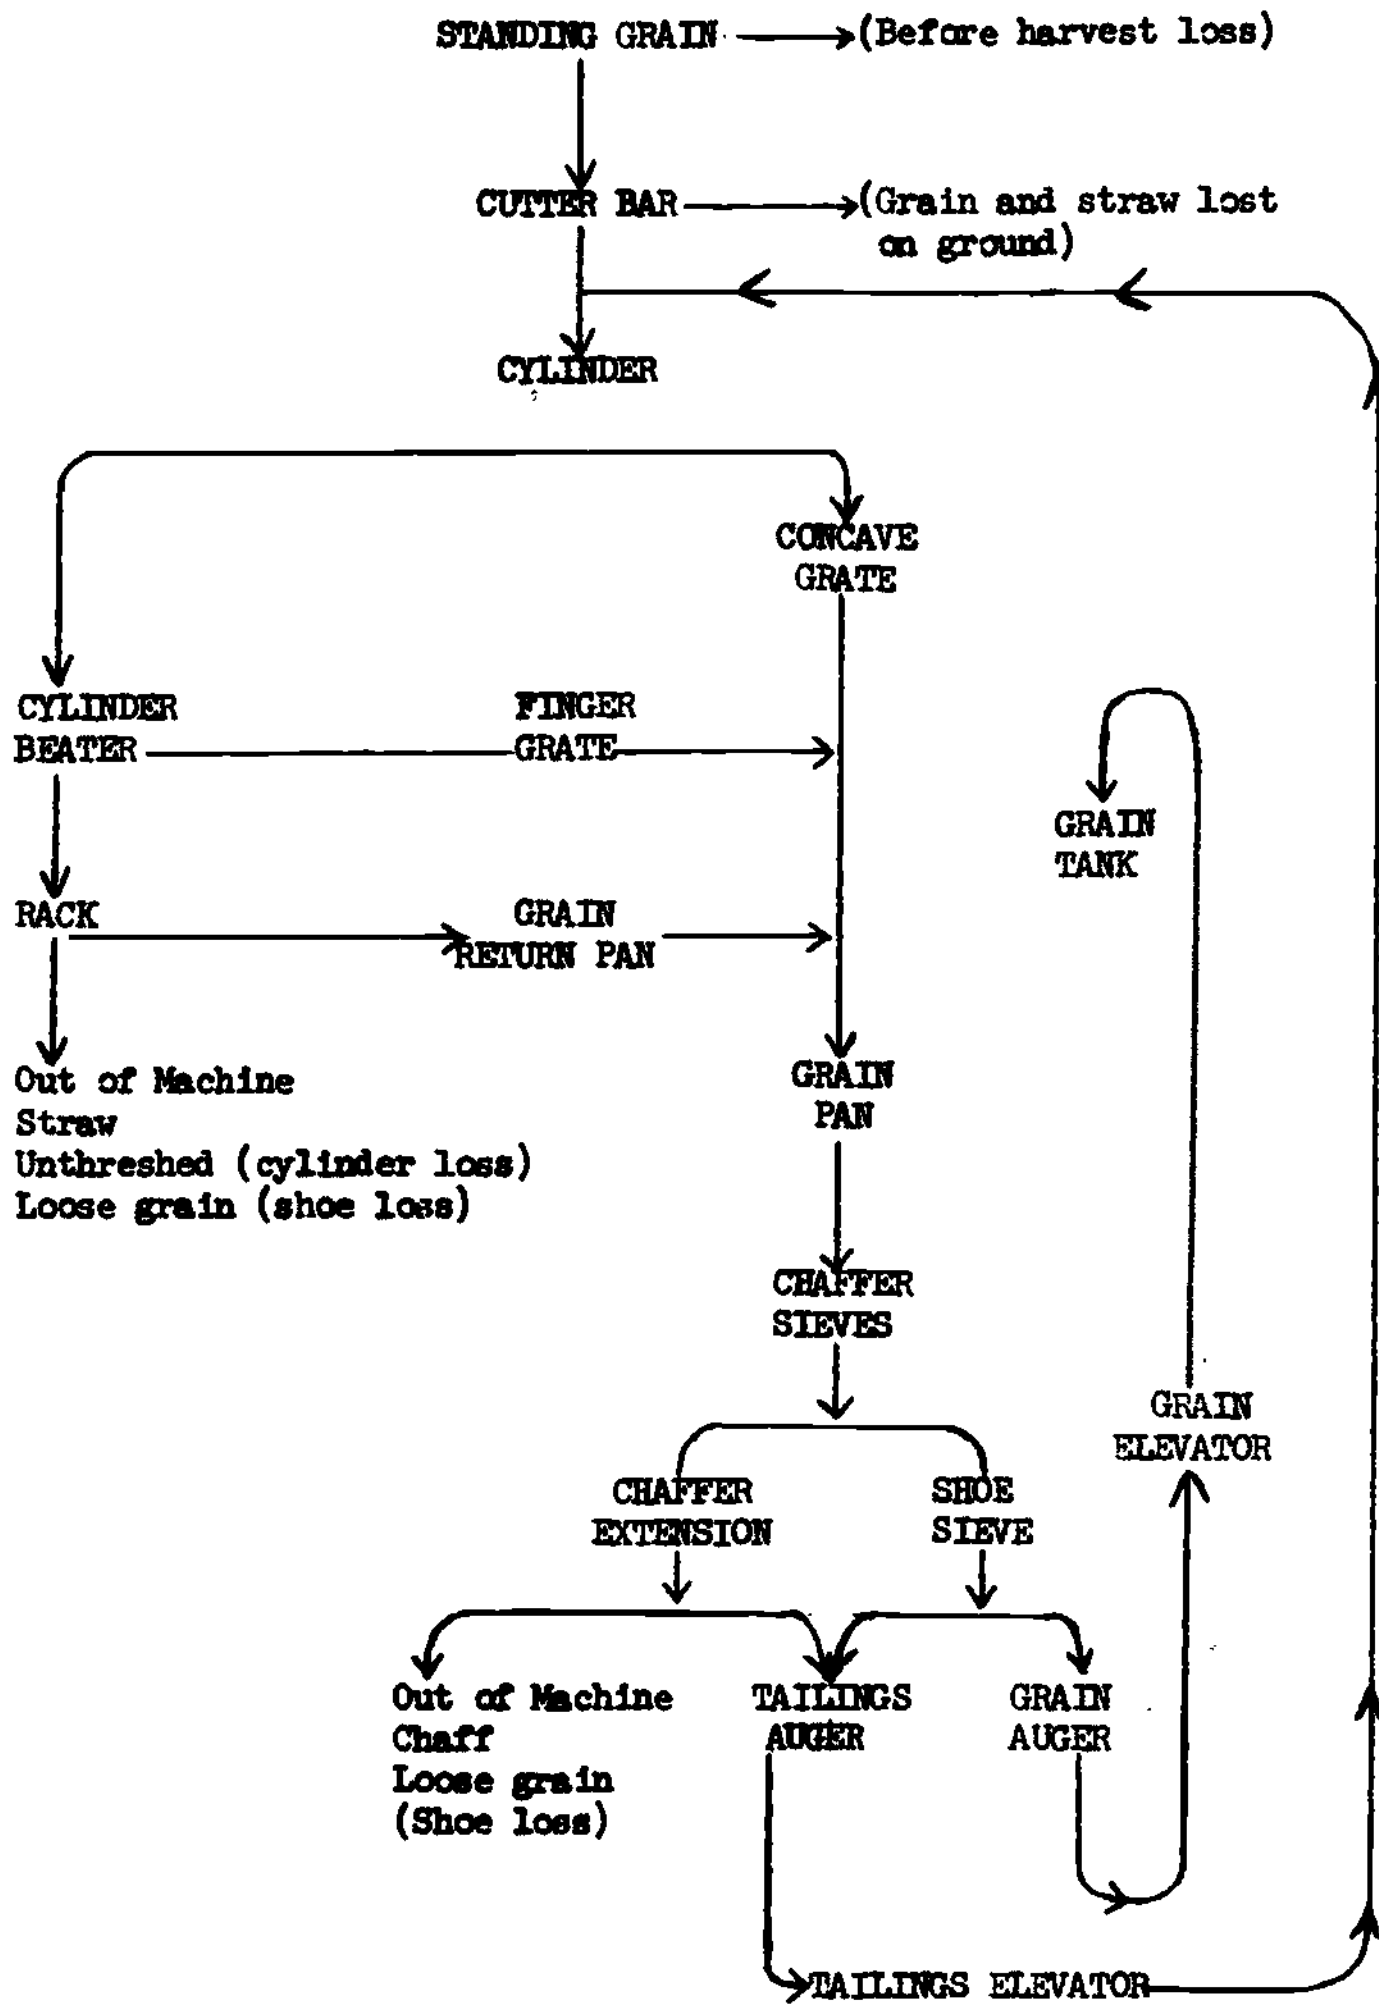

Courtesy International Harvester Company

The Combine Operating Cycle

The reel (1) momentarily holds the crop against the guards until the knife (2) cuts the stems, and then it sweeps the cut material onto the platform. The platform auger (3) delivers the cut grain to the feeder (4) which carries the cut grain to the cylinder (5). The grain is rubbed out of the head between the rotating cylinder (5) and the concave grates (6). The cylinder beater (7) strips the cylinder, continues separating loose kernels of grain through the finger grate (8) then moves the material onto the straw rack (9) where final separation takes place. The adjustable cylinder beater check flap (10) regulates the flow of material over the racks. The grain pan (12) catches the grain separated at the concave, cylinder beater grate, and return from the straw racks and delivers it to the chaffer (11). The cleaning fan (15) supplies the wind blast which is the medium of separation. The shoe and sieve (13) operates in the direct opposite to the grain pan and chaffer which assures double action cleaning (as the grain pan and chaffer moves forward, the shoe and shoe sieve move toward the rear.) The shoe sieve (13) is where the final cleaning takes place. The threshed grain falls through the chaffer and shoe sieve, and into the grain trough (14) where it is moved to the grain elevator by the grain auger. The grain elevator conveyor chain then delivers the clean grain to the grain tank. Unthreshed heads will move rearward across the chaffer and shoe sieve and drop into the tailings return auger trough (16). From this point, the unthreshed heads are returned by the tailings elevator to the cylinder for rethreshing.

COMBINE FLOW CHART

The combine can be converted from small grain to shelled corn harvesting by exchanging the small grain cutting and feeding unit for the corn head attachment.

The corn head snaps the ears from the stalks and feeds them into the cylinder for shelling in the manner illustrated below.

Corn head attachment using a conveyor to feed material into the cylinder

Corn head attachment using augers
to feed material into the cylinder

The corn head operates somewhat differently than the corn picker. The stalks of corn are pulled straight down through the stalk rolls. Snapping bars or stripper plates snap the ears off at the shanks. This action is illustrated on the following page.

Since the ears do not come in contact with the rolls, as in the picker, there is much less shelling in this area.

From the snapping mechanism, the ears are then fed into the cylinder for shelling.

The ears are fed into the threshing unit where they are shelled by the rubbing action of the rotating cylinder against the concave.

A variety of problems are common to all combines. On the following page these problems are identified and possible ways of correcting them are shown.

Suggested Teaching-Learning Activities

1. Bring a combine before the class disassembled to the point where all the movable parts can be seen, but yet, still functional. Demonstrate the operation of these parts before the class.
2. Have students disassemble a combine completely and learn its parts and their functions.
3. Demonstrate proper and improper combine operation under field conditions.
4. Bring to the class several combines of different makes that are in need of adjustment and repair. Follow the procedure below when making the needed adjustments and repairs.
 - a. Operate the machine in the field noting any malfunctions in operation.
 - b. Inspect the machine noting worn and broken parts and parts that are out of line or adjustment.
 - c. Following the operator's and manufacturer's service manual, make the necessary repairs and adjustments.
 - d. Lubricate the machine for field operation.
 - e. Test the machine in the field and make any adjustments necessary for proper operation.

- VI. To (1) identify types and parts of corn harvesting machines and understand their functions and (2) adjust and repair these machines

Teacher Preparation

Subject Matter Content

The purpose of corn harvesting machines is to remove the corn ears from the standing stalks.

Three kinds of machines have been developed to perform this function.

1. Corn snapper
2. Corn picker
3. Corn picker-sheller

The corn snapper is the simplest machine in that it only snaps the ears from the stalk, but does not remove the husks from around the ears. The corn picker is the most commonly used corn harvesting machine. It snaps the ear from the stalk and removes the husks from the ears. The fairly new corn harvesting machine is the picker-sheller. It performs both the snapping and husking activities and, in addition, shells the corn.

The types of pickers are classified by the way they receive power.

1. Pull-type -- tractor-drawn and driven by the PTO
2. Mounted-tractor -- mounted and driven by the PTO
3. Self-propelled -- driven by its own source of power

The corn picker is composed of several mechanisms that perform specific functions.

1. Gathering mechanism
2. Snapping mechanism
3. Husking mechanism
4. Cleaning mechanism
5. Shelling mechanism

The purpose of the gathering mechanism is to gather and guide the corn stalks into the snapping rolls. The gathering mechanism is made up of the following parts.

1. Points
2. Gathering chains
3. Dividers

The Gathering Mechanism

1. Gathering points (Courtesy of John Deere Co.)
2. Gathering chains
3. Divider

The gathering points direct the stalks into the throat of the gathering mechanism and up to the gathering chains. The gathering chains pull the stalks into the snapping rolls.

The snapping mechanism removes the corn ears from the corn stalk. This function is performed by two long, closely spaced rolls. The rolls slant upward and turn toward each other at a high speed. The snapping rolls are equipped with spiral lugs which grip onto the corn stalks and pull them down through the rolls. As the stalks are pulled down through the snapping rolls, the corn ear is pinched off the stalk and conveyed on to the husking rolls. The following illustrations show the gathering and snapping mechanisms and the parts breakdown of the snapping rollers.

GATHERING AND SNAPPING MECHANISMS

After the ears have been snapped from the stalks, they are conveyed to the husking rolls. The husking rolls operate in pairs. One roll is usually rubber or rubber coated and the rolls rotate toward each other, similar to the action of the snapping rolls. The rolls are corrugated allowing the rolls to grasp and pull the husks from the ear. The husking mechanism of a corn picker is illustrated below.

Two types of husking rolls are commonly used on corn pickers.

1. Continuous or combination

This type of husking roll is a continuation of the snapping roll. (See Farm Machinery and Equipment, page 347, for an illustration of this type of husking roll.)

2. Separate husking rolls (Illustrated above)

The corn ears are held against the husking rolls by a pressure plate allowing for a good clean job of husking with a minimum of shelling of kernels from the cob.

The cleaning mechanism on the corn picker consists of ejecting rolls and augers that remove trash and husks from the husking rolls, and discharge it to the ground and a fan that delivers a blast of air to blow off loose husks, leaves, pieces of stalks, and other trash.

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963

As the husking rolls remove the husks from the ear, kernels may be shelled from the cob. These kernels drop onto the corn saver and are elevated into the wagon. The corn saving mechanism consists of a screen and a chain carrier. The chain carrier rakes off husks and trash keeping the screen clear.

The picker-sheller type of corn picker has an added mechanism, the shelling mechanism. Its function is to shell the corn ears as they come from the husking rolls. The shelling mechanism consists of a peg-studded cylinder that rotates inside a cylindrical screen. The shelled corn drops through the holes in the screen onto a set of sieves that agitate. The trash that comes through the cylindrical screen is blown away by a blast of air created by a fan located below the cylinder. The shelled corn falls through the sieves into the auger where it is augered into the wagon.

Suggested Teaching-Learning Activities

1. Bring a corn picker before the class disassembled to the point where all the movable parts can be seen, but yet, they are still functional. Demonstrate the operation of these parts before the class.
2. Have students disassemble completely a corn picker and learn its parts and their functions.
3. Demonstrate proper and improper corn picker operation under field conditions.
4. Bring to the class several combines of different makes that are in need of adjustment and repair. Follow the procedure below when making the needed adjustments and repairs.
 - a. Operate the machine in the field noting any malfunctions in operation.
 - b. Inspect the machine noting worn and broken parts and parts that are out of line or adjustment.
 - c. Following the operator's and manufacturer's service manuals, make the necessary repairs and adjustments.
 - d. Lubricate the machine for field operation.
 - e. Test the machine in the field and make any adjustments necessary for proper operation.

VII. To prepare and paint crop harvesting machines after they have been repaired

Teacher Preparation

Subject Matter Content

If the persons being taught this module has not been taught the competency on preparing and painting crop harvesting machines included in the module on "Tractor Repair," they should be taught that competency at this time. The procedures outlines in that competency apply to painting crop harvesting machines as well as tractors.

Suggestions for Evaluating Educational Outcomes of the Module

The following criteria should be used to evaluate the educational outcome of this module.

1. Attentiveness in class and participation in laboratory activities
2. The ability of the student to use the operator's and manufacturer's service manuals
3. The ability of the student to perform the repair and adjustment activities on machines. As a final outcome, it is suggested that each student completely recondition a machine in need of repair and adjustment.

4. Employers evaluation of the ability of the student to adjust, repair, and service machines in his dealership

**ADJUSTMENT, MAINTENANCE, AND REPAIR OF
SMALL GASOLINE ENGINES**

Major Teaching Objective

To develop the ability to adjust, maintain, and repair small gasoline engines effectively.

Suggested Time Allotment

At school

Class instruction 40 hours

Laboratory experience 68 hours

Total at school 108 hours

Occupational experience 0 hours

Total for Module 108 hours

Suggestions for Introducing the Module

The extensive use of small gasoline engines makes necessary the ability of many employees in agricultural machinery business to adjust, maintain, and repair small internal combustion engines. This is especially true for those employed as service supervisors, machinery mechanics, and machinery mechanics' helpers. The effective and efficient employee in this area has a thorough understanding of the nomenclature of small engines, an understanding of the relationship of the components to each other, a knowledge of tools common to this segment of mechanics, and the ability to apply these understandings and knowledge to practical situations.

The following may be used in creating interest in the module. Bring to class several different makes of small gasoline engines, selected on the basis of their operating efficiency. Before the class, start these engines to demonstrate their various operating speeds. Have the class attempt to determine why these engines run at different speeds. Point out that the differences in running speeds of the various engines are probably due to malfunctions that could probably be corrected with adjustment. As the students progress through the module, have them check these motors until they have identified the reasons they run at different speeds.

The teacher should impress upon the students that employers are expecting an increasingly higher degree of speed and efficiency from employees in the performance of their jobs. This demands the development of performance skills as well as understandings.

Competencies to be Developed

I. To understand small gasoline engine nomenclature

Teacher Preparation

Subject Matter Content

A knowledge of the nomenclature of small gasoline engines and the function of each part is essential. The components of small gasoline engines vary according to manufacturers, but the following are applicable in most cases.

1. Main engine components
 - a. Crankcase and cylinder block
 - b. Cylinder head
 - c. Spark plug grounding switch
 - d. Crankcase breather
 - e. Bearing plate
 - f. Valves, springs, and keepers
 - g. Tappet cover plate
 - h. Governor control lever
 - i. Governor weight assembly and shaft
 - j. Valve tappets
 - k. Spark advance weight and spring
 - l. Cam gear
 - m. Engine base
 - n. Cam shaft and plug
 - o. Governor crank assembly
 - p. Governor lever assembly
 - q. Throttle link
 - r. Governor control rod
 - s. Main bearings
 - t. Piston, ring and pin assembly
 - u. Connecting rod and oil slinger
 - v. Crank shaft
 - w. Reduction gear assembly

2. Air, fuel, and exhaust system components
 - a. Fuel tank
 - b. Fuel tank outlet
 - c. Exhaust outlet and muffler
 - d. Carburetor lower body
 - e. Carburetor upper body
 - f. Throttle
 - g. Butterfly (choke and/or throttle)
 - h. Idle valve

- i. Needle valve
- j. Idle adjustor screw
- k. Throttle lever
- l. Choke lever
- m. Float
- n. Air cleaner

3. Ignition system components

- a. Engine flywheel
- b. Magneto (on magneto type)
- c. Magneto armature (on magneto type)
- d. Ignition coil (magneto and battery type)
- e. Bearing plate
- f. Breaker box cover and stop switch assembly
- g. Breaker points
- h. Point gap adjusting cam
- i. Condenser
- j. Breaker base
- k. Breaker shaft
- l. Spark plug
- m. Flywheel housing
- n. Distributor (on battery type)
- o. Battery (on battery type)

Below is an exploded view of a sample single cylinder--four cycle engine illustrating its major components.

Suggested Teaching-Learning Activities

1. At the beginning of the class, place several small gas engine parts around the classroom and have each student attempt to identify them.
2. Demonstrate the terms work, torque, and horsepower to the class as they are being discussed. As these terms are being demonstrated, have the students compute work done, the amount of torque created, and the amount of horsepower created.
3. As the engine components are being discussed, have each student dismantle a small gasoline engine and identify on his engine the parts being discussed.
4. After all terms have been discussed by the teacher, tear a small gasoline engine down completely and have students identify the parts.
5. Supply students with a list of terms common to the language associated with small gasoline engines. Have students define the terms they know and find the definitions of those they do not know. Other terms may be added to the list in the content.

Suggested Instructional Materials and References

Instructional materials

1. Overhead transparencies, preferably overlays, of the illustrations presented in the content
2. A fulcrum, a 1" x 4" x 5' board, and four 2" x 4" x 8" bricks for demonstrating work, torque and horsepower
3. A small gasoline engine for each member of the class and the instructor
4. Several small gasoline engine parts
5. A set of tools for each student to use when tearing down his engine

II. To understand combustion principles of internal combustion engines

Teacher Preparation

Subject Matter Content

The information presented in General Theories of Operation, pp. 3-10 should be used as the main reference in teaching this competency and supplemented with the following materials. The information should be presented to the class in the order that it is presented in this module.

The principle upon which internal combustion engines operate is simple but understood by relatively few outside the field of engine mechanics.

The internal combustion engine is a machine for converting potential chemical energy into mechanical power.

The essentials for combustion are

1. Fuel
2. Air
3. Ignition
4. Compression

The process by which internal combustion engines convert chemical energy into mechanical power involves four events

1. Intake
2. Compression
3. Power
4. Exhaust

Small gasoline engines are designed as

1. Four-stroke cycle engines. Four strokes (up or down movement of the piston) are required to complete the four events (intake, compression, power, and exhaust) involved in converting potential chemical power into mechanical power. One event is conducted with the completion of each stroke of the piston. (Refer to reference General Theories of Operation pp. 4 and 5.)

2. Two-stroke cycle engines. Engines of this design require only two strokes of the piston to complete the four necessary events (intake, compression, power, and exhaust). On most small engines, the upward stroke of the piston draws a fuel-air mixture already in the cylinder above the piston. The downward stroke provides the power and exhausts the burned fuel-air mixture at the same time. (Refer to reference All About Small Gasoline Engines, p.14.)

Suggested Teaching-Learning Activities

1. Use cutaway models of four-cycle and two-cycle small engines to demonstrate the internal engine operating principles of each type.
2. After discussing the items in the subject matter content, show the movie, "The ABC of Internal Combustion".

Suggested Instructional Materials and References

Instructional materials

1. Overhead transparencies illustrating the principles of internal combustion engines
2. A small engine with a cutaway view of the combustion chamber, piston, valves, etc.
3. "The ABC of Internal Combustion"

References

1. Small Engines Service Manual, pp. 2-4.
2. All About Small Gas Engines.
- S*3. General Theories of Operations, pp. 3-10.

III. To understand ignition principles of small gasoline engines

Teacher Preparation

Subject Matter Content

The information present in General Theories of Operation pp. 19-24 should be used as the main reference in teaching the competency and supplemented with the following materials. The information presented in this reference should be presented to the class in the order that it is presented in these materials.

The two types of ignition systems used on small gasoline engines are magneto systems and battery systems.

1. Magneto ignition utilizes the principle of electro magnetic induction and produces electrical energy through the use of a dynamo or generator. The two main types are low tension and high tension magnetos. A typical magneto ignition system consists of the following major components:
 - a. Impulse coupling
 - b. Coil
 - c. Magnetic rotor
 - d. Frame laminations
 - e. Breaker points
 - f. Breaker arm
 - g. Condenser
 - h. Spark plug
 - i. Flywheel
2. In engines with multiple cylinders, the magneto system may also include
 - a. Distributor rotor
 - b. Distributor gear

- c. Distributor pinion
 - d. High-tension lead rod
3. A battery ignition system depends upon a storage battery as its source of electrical energy. A typical battery ignition system consists of
- a. Ignition coil
 - b. Condenser
 - c. Distribution system
 - 1) Cap
 - 2) Rotor seal
 - 3) Dust seal
 - 4) Weight spring
 - 5) Advance weight
 - 6) Weight base and shaft
 - 7) Bushing
 - 8) Coupling
 - 9) Grease cup
 - 10) Switch
 - 11) Wiring
 - 12) Spark plugs

Suggested Teaching-Learning Activities

1. Using overhead transparencies, charts, diagrams and teacher-made mock-ups, discuss the principles involved in ignition systems of small engines.
2. Have students define
 - a. Vacuum advance
 - b. Armature
 - c. Spark advance
 - d. Normal spark plug
 - e. Cold spark plug
 - f. Hot spark plug
 - g. Spark plug fouling

- h. Spark plug gaps
 - i. Primary winding
 - j. Secondary winding
 - k. SAE
3. Have each student carefully and completely disassemble both a magneto and a battery ignition system. Be sure the students mark each part to make certain it can be reassembled correctly.
 4. Following the operator's manual to determine proper settings for plugs, points, etc., have students reassemble the torn down ignition systems.
 5. Disassemble both a magneto- and battery-type ignition system and have the students identify each part.
 6. Have students trouble shoot the ignition system of at least one engine that performs improperly.
 7. Have students place a volt meter on the hot point of the engine magneto or battery to measure the voltage produced. Then place the volt meter on the plug to measure the amount of voltage going into the plug. Point out to the class that the coil is responsible for the increase in voltage.

Suggested Instructional Materials and References

Instructional materials

1. Overhead transparencies, charts, and diagrams of small gas engine electrical systems
2. Display boards showing ignition system parts
3. One small engine per student
4. A cross section of a coil
5. A magneto and battery of the type used in small gasoline engine ignition systems
6. Various types of spark plugs used in small gasoline engines

References

1. All About Small Gas Engines, pp. 182-220.
2. Briggs and Stratton Repair Instructions II, pp. 13-22.
3. General Theories of Operation, pp. 19-24.
4. Small Engines Service Manual, pp. 5-14, 24-29.

IV. To understand combustion principles of small gasoline engine systems

Teacher Preparation

Subject Matter Content

The information present in General Theories of Operation pp. 10-19 should be used as the main reference in teaching the competency and supplemented with the following materials. The information presented in this reference should be presented to the class in the order that it is presented in these materials.

Small engine fuel systems consist primarily of a fuel tank and carburetor.

The primary function of the fuel tank is storage for fuel which is supplied to the carburetor through a fuel line.

The primary function of the carburetor is to produce and supply to the engine a mixture of fuel and air on which the engine operates.

The primary function of the air cleaner is to remove foreign particles from the air so that the air entering the carburetor will be clean.

1. Operation of carburetors, involves several principles. Carburetor designs are complicated, but the principle of carburetion is relatively simple. Air and fuel flow into a cylinder of an engine because of the difference between the pressure within the cylinder and atmospheric pressure outside the cylinder.

Principles of operation involve the following:

- a. Venturi is the basic principle used in modern carburetors. This principle depends on the fact that gas or liquid flowing through a constricted section in a passage undergoes an increase in speed and a reduction in pressure as compared to its speed and pressure prior to and after passing through the restricted section.
- b. Air bleeding is the principle used in modern carburetors because it reduces the amount of fuel drawn from a carburetor jet, and it assists in atomization of fuels necessary for efficient combustion.
- c. Fuel and air mixtures (the ratio of fuel and air) are determined by these factors:
 - 1) Weather (temperature)
 - 2) Speed of engine
 - 3) Load on engine
- d. The level of fuel in the main discharge nozzle must be maintained at a fairly constant level to meet the varying demands of the engine. When the level becomes too low, the engine fails to operate, or to operate properly, because of an inadequate supply of fuel.
- e. To assure dependability, many carburetor designs include a second or compensating nozzle. In combination with the main nozzle, the two give a substantially constant mixture.

An Elementary Carburetor With Major Components Identified

2. Carburetors are grouped according to design and type. Design, as used here, refers to air entrance into the carburetor.

Basically, there are three carburetor designs.

- a. Updraft is the design by which air enters the bottom of the carburetor and must lift the fuel by air friction.
- b. Downdraft is the design by which the carburetor is placed above the engine; air enters the top, passes downward, mixes with the fuel, and then passes into the manifold and into the engine.
- c. Crossdraft or side outlet is the design by which air enters the side, mixes with the fuel in horizontal mixing tube, and passes into the manifold, which may be built into the engine block. This design is used on most lawn mowers.

3. Basically, there are three types of carburetors.

- a. Float type is used primarily with overhead fuel tanks. The level of fuel in the carburetor is controlled by a float which operates a valve that regulates the flow of fuel into the bowl of the carburetor.

- b. Suction type is above the fuel tank and has a fuel pipe extending down into the fuel tank. Fuel is sucked into the carburetor when the movement of the piston in the cylinder creates a vacuum reducing the atmospheric pressure in the carburetor below that in the fuel tank.
 - c. Floatless (diaphragm) type serves a dual function by also serving as a fuel pump. This type maintains a constant level of fuel and operates satisfactorily when tilted to acute angles.
4. Air cleaners supply clean air to the carburetor. Unclean air is likely to reduce efficiency of the engine, and is also very detrimental to the life of the engine.

Air cleaners are simple, and are easily maintained. The three basic types are

- a. Oil-bath cleaners
 - b. Oil-foam cleaners
 - c. Dry-element cleaners
5. Carburetor trouble shooting is necessary, since an efficient small engine mechanic must be aware that complete failure of an engine to operate seldom originates in the carburetor. Skill in recognizing carburetor malfunction should be developed through recognizing the following signs and following the proper procedures.

- a. Engine fails to operate

Before examining the carburetor, check the ignition, compression and supply of fuel. If these prove satisfactory, examine the carburetor and make corrections through the following steps:

- 1) Examine choke to see that it is operating properly.
- 2) Check the flow of fuel to the carburetor. Fuel flow may be restricted by clogged lines or vapor lock.
- 3) Check for air leaks where the carburetor is fastened to the manifold.
- 4) Check for worn linkage
- 5) Check for dirt in the carburetor.

- 6) Check for incorrect fuel level.
- 7) Check for worn parts.
- 8) Check for maladjustment.

Adjustments should be made according to the manufacturer's recommendations provided in the operator's manual.

b. Engine operates, but performance is poor.

Poor performance often results from too lean a mixture and may be remedied by checking and correcting the following possible causes:

- 1) Air leakage at carburetor or manifold
- 2) Clogged fuel lines
- 3) Defective fuel pump
- 4) Incorrect fuel level
- 5) Clogged fuel screen
- 6) Dirt in carburetor jets and passage
- 7) Damaged or wrong-size main metering jet
- 8) Worn idle needle valve and seat
- 9) Loose jets
- 10) Defective gaskets
- 11) Worn throttle shaft
- 12) Leaking vacuum lines to accessory equipment

c. Engine operates but idles poorly.

This condition may be caused by defective ignition, leaking engine valves, uneven engine compression, or faulty carburetor condition. The carburetor should be checked for the following:

- 1) Incorrect adjustment of idle needle valve
- 2) Incorrect float level
- 3) Sticking float needle valve
- 4) Air leaks at carburetor and manifold
- 5) Defective gaskets
- 6) Clogged idle discharge holes
- 7) Loose jets in carburetor
- 8) Leaking vacuum lines to accessory equipment

Suggested Teaching-Learning Activities

1. Demonstrate to students the principles of carburetion by using a simple atomizer or hand sprayer and candle.

2. Tear down a carburetor. As the principles of operation are discussed, show the class the carburetor part involved in making the principle turn into a function.
3. Attach a fuel meter in the gas line between the gas tank and the carburetor. Demonstrate to the class the increase in gas flow to the carburetor as the speed of the engine increases or slows down as a result of pull on the engine.
4. As the types and designs of carburetors are discussed in class, show the class an actual carburetor of each type and design. Disassemble each carburetor and show the class how each differs.
5. Have students disassemble, examine, clean, and adjust several carburetors on several different types of small gasoline engines.
6. Have students disassemble, examine, clean, make necessary maintenance repairs, and reassemble each type of air cleaner.
7. Foul up the carburetor system on several small gasoline engines. Have students trouble shoot these systems using the procedures outlined.

Suggested Instructional Materials and References

Instructional materials

1. Overhead transparencies, preferably overlays in color, illustrating fuel systems, their function, and operation
2. Charts illustrating carburetors, their major components and their functions
3. A disassembled carburetor mounted on a display board to present an exploded view
4. An atomizer or simple hand sprayer and candle
5. A carburetor of each type and design
6. A carburetor for each student
7. An air cleaner for each student

References

1. All About Small Gas Engines, pp. 137-151.
2. Briggs and Stratton Repair Instructions II, pp. 23-40.

4. Small Engines Service Manual, pp. 14-19, 29-31.

V. To understand the small gasoline engine running gear and its related parts

Teacher Preparation

Subject Matter Content

The heavy work load placed on the running gear necessitates its proper adjustment and maintenance to prevent excessive major repairs. The actual work produced by an engine is done by its running gear.

The main components of the running gear of a small engine are

1. Pistons, pins, and rings
2. Connecting rods
3. Crank shaft and cam gears
4. Lubricating system pump or splasher
5. Engine bearings
6. Engine valves and springs and retainers
 - a. Intake
 - b. Exhaust

(See Small Engine Service Manual, page 57, for a cutaway view of the running gear and its related parts.)

Related components are

1. Cylinders
2. Head

3. Frame
4. Base
5. Flywheel

A thorough knowledge of proper adjustment of running gear parts and of diagnostic procedures is necessary to overhaul a small engine effectively.

Conditions which result from improperly adjusted or defective running gear components and related parts are

1. High oil consumption
2. Loss of power
3. Engine overheating
4. Excessive engine noise
5. Engine failure to operate

A single defect can cause any one of the above conditions to exist, but in many cases the condition is caused by a combination of defects. Proper diagnostic procedures do not stop upon the location of one defect but demand close examination for all defects which may produce the condition. Careful study of materials related to the particular make of engine which are supplied by the manufacturers is essential for effective results.

Excessive friction causes rapid destruction of running gear parts. This cannot be eliminated, but it can be reduced to a minimum by the proper use of friction-reducing lubricants. Engine oil has five main functions.

1. It reduces friction which results in reduced wear.
2. It serves as a cushion between shafts and bearings.
3. It serves as a coolant.
4. It helps to keep the interior of the engine clean.
5. It seals power between piston rings and cylinder walls.

Engine oils are classified according to viscosity and the American Petroleum Institute (API) service classifications. Viscosity

refers to the weights or thickness of the oil and API service classifications refer to the quality of the oil. API service classifications are

1. Service ML (Motor Light)
2. Service MM (Motor Moderate)
3. Service MS (Motor Severe)
4. Service DG (Diesel General)
5. Service DM (Diesel Moderate)
6. Service DS (Diesel Severe)

An oil may meet the specifications for all grades and be labeled as such.

Additives, as detergents, are often used with engine oils to give them more cleaning ability.

Suggested Teaching-Learning Activities

1. Using overhead transparencies, charts, and diagrams, familiarize students with the running gear components and related parts, their functions, and the relationship of the various parts to each other.
2. Have students disassemble and reassemble the running gear of a small gasoline engine.
3. Have students accurately perform the following activities:
 - a. Grind valves
 - b. Seat valves
 - c. Replace all running gear bearings
 - d. Replace piston rings
 - e. Hone a cylinder
 - f. Resize a cylinder and insert a sleeve
 - g. Adjust or repair lubricating system

- h. Replace gaskets
 - i. Reassemble and properly adjust each part
4. Have a lubricant specialist speak to the class to explain types and grades of engine oil.

Suggested Instructional Materials and References

Instructional materials

- 1. Overhead transparencies, charts, diagrams, and mockups of the running gear and its related parts
- 2. One small gasoline engine per student
- 3. A set of tools for each student
- 4. A clear plastic model of an engine
- 5. Samples of oils and other lubricants used in small engines
- 6. Operators' manuals
- 7. Special equipment needed to carry out the jobs listed under item 3 of the teaching-learning activities

References

- 1. All About Small Gas Engines, pp. 39-136.
- 2. Small Engines Service Manual, pp. 53-57.
- 3. Briggs and Stratton Repair Instructions II, pp. 41-59.
- 4. Gulf Farm Tractor Guide, pp. 12-18.

VI. To understand small gasoline governors and cooling systems

Teacher Preparation

Subject Matter Content

The purpose of the governor is to maintain, with certain limits, a desired engine speed under varying loads.

Governors may be either mechanical or velocity types. The three basic designs of governors are classified according to the force upon which they operate.

1. Engine speed governor operates by weights which tend to fly outward as the speed of the engine increases. The action involves the movement of a rod attached to the throttle to open or close the throttle.
2. Velocity governor operates by the velocity of the gas going through the manifold. This passage through the manifold acts on a spring-loaded floating obstruction in the shape of a ball or disk attached to the throttle.
3. Vacuum governor operates on the intake manifold vacuum. This vacuum decreases as the engine load increases and increases as the engine load decreases.

The purpose of the governor is to maintain a desired engine speed under varying loads. It must serve as an automatic means of opening and closing the throttle. When the load is increased, the engine speed tends to decrease, so the throttle must be gradually opened in order to maintain the desired speed. The opposite is true when the load is decreased.

Exploded View of a Typical Governor
Used on Many Small Engines.

The purpose of the cooling system is to regulate the temperature of the engine. Engines will not operate efficiently if they are too cool. Engines operate most efficiently at a temperature of

about 200 degrees F. If the temperature exceeds this, the engine may be damaged.

Basically, there are two types of cooling systems used on small engines.

1. Air
2. Water

Air-cooled engines are used almost exclusively for small machinery. Water-cooled engines may be used on small machinery but are used primarily on larger machinery. The typical water-cooled engine is much more rugged in construction than the smaller air-cooled engines, which are usually lighter in weight.

The principles of operation of air-cooled and water-cooled engines are basically the same. Heat created by the burning fuel in the combustion chamber is transferred to the water or air as it flows around the cylinder walls. This constant transfer of heat helps maintain the desired engine temperature. Approximately one-third of the heat created by the burning fuel must be removed by the cooling system. A defective cooling system will cause much damage to the engine.

Periodic checking and servicing is essential to a properly-maintained cooling system. Servicing an air-cooled system involves two basic activities.

1. Keeping all air passages around the engine free of dirt and foreign matter
2. Checking to make certain the fins on the flywheel are in good condition

Suggested Teaching-Learning Activities

1. Using overhead transparencies, models, mockups, etc. show the parts of a governor, explain their functions, and identify the air flow in the engine cooling system.
2. Have students remove the governor from a small gasoline engine, disassemble it, reassemble it, properly adjust it, and replace it on the engine. Repeat this operation on a different type of governor.
3. Using a clear plastic model of a small gasoline engine, force chalk dust through the cooling system to show how the air enters, circulates through, and leaves the engine.

4. Have students clean and service the cooling systems on several types of small gasoline engines.
5. Have students bring several small gasoline engines to the shop that need repairing and have students overhaul them using the Small Engines Service Manual and Briggs and Stratton Repair Instructions II as guides.

Suggested Instructional Materials and References

Instructional materials

1. Overhead transparencies, charts, etc.
2. Disassembled governors mounted on a display board.
3. Small engines with both types cooling systems
4. A clear plastic model of a small gasoline engine
5. A small gasoline engine for each student

References

All About Small Gas Engines, pp. 97-100, 113-114.

Suggestions for Evaluating Educational Outcomes of the Module

Educational outcomes of this module should be evaluated by the abilities and attitudes developed by the students.

1. Ability of students to repair small engines should be evaluated by assigning each student to an engine that needs several adjustments and repairs. Observation of the procedure followed by the student, his ability to use the necessary tools for the job, and the thoroughness and effectiveness of the job done will indicate his level of proficiency.
2. Evaluate student attitudes according to
 - a. Interest of students
 - b. Extent of participation in class activities

TRACTOR TUNE-UP AND MAINTENANCE

Major Teaching Objective

To understand a systematic procedure to follow and be able to effectively tune and maintain a farm tractor.

Suggested Time Allotments

At school		
Class instruction	24	hours
Laboratory experience	<u>48</u>	<u>hours</u>
Total at school		<u>72</u> hours
Occupational experience		<u>0</u> hours
Total for module		<u>72</u> hours

Suggestions for Introducing the Module

A person preparing for employment as a mechanic, mechanic's helper, or service supervisor in an agricultural machinery business must be able to effectively tune and maintain a farm tractor. An efficient employee in these occupations will have an understanding of the importance of a properly tuned tractor, will have an effective systematic procedure to follow in "checking out" a tractor, and will possess the technical knowledge and abilities necessary to make the needed adjustments.

Competition is keen in many areas of the farm machinery service business and the progressive employer will be interested in only the efficient employee.

The following technique should be used to create interest in the module.

Bring a small tractor before the class. Alter the electrical system so that the tractor won't start and set the idling jet on the carburetor to a very slow idle. Demonstrate to the class that the tractor won't start. Give the students an opportunity to find the trouble. Show them how a simple little malfunction of the electrical system can keep the engine from functioning. Once the tractor is running and the idling difficulty is identified, have the student attempt to correct it. Emphasize how simple it is to make tune-up adjustments and how important it is to have a thorough understanding of the engine, its parts, and their functions, in order to be able to perform proper tune-up and maintenance.

Competencies to be Developed

I. To understand the economic importance of a properly tuned tractor

Teacher Preparation

Subject Matter Content

Studies conducted by agricultural engineers have shown that most farm tractors are not operating at the power and efficiency of which they are capable. Often this is caused by tractors which have not been properly tuned being delivered to farmers. To eliminate this situation, it is necessary that many persons planning an occupation in an agricultural machinery dealership possess the competencies needed to properly adjust and tune a tractor.

Studies have shown that proper tuning of the average farm tractor increased its horsepower eleven per cent. Fuel use efficiency was increased fourteen per cent for a saving of about five gallons per day on a fifty horsepower tractor while being used for plowing.

Implement companies are well aware of the need for adequately trained employees. Often implement companies are blamed for tractor troubles that could have been prevented by properly tuning and adjusting the tractors before delivery.

Suggested Teaching-Learning Activities

1. Have students develop graphs showing performances of properly adjusted tractors as compared with tractors not properly adjusted.
2. By the use of a gasoline flow meter, demonstrate to students the difference in fuel consumption when the tractor engine is properly timed and not timed and when the carburetor is properly adjusted and not adjusted.
3. By use of a dynamometer, demonstrate the difference in horsepower in properly and improperly tuned engines.
4. Have a local farm machinery service manager bring to the class the past month's service records of customers to illustrate a comparison of the average cost of tune-up and maintenance and the total value of the equipment that was serviced. Have him point out the savings that could have

been made by more timely maintenance. Have him point out instances where a mechanic's inability to perform proper maintenance and tune-up has resulted in additional service calls and lack of confidence in the dealership.

5. The governor on the tractor motor must be properly adjusted before any adjustment can be made while under test by the dynamometer. Show the difference between improper speed of engine and horsepower compared to proper speed of engine and horsepower.

Suggested Instructional Materials and References

Instructional Materials

1. Charts and graphs depicting the increased cost in operating an improperly tuned tractor
2. A gasoline flow meter to be used in determining the rate of fuel consumption
3. Dynamometer

- S 2. Gulf Farm Tractor Guide, page 1.
- T 3. "Nebraska State Test Chart for P.T.O. Speed, Fuel Compression and Horsepower."
- S 4. Implement and Tractor Tune-up Specifications.

*The symbol T (teacher) or S (student) denotes those references designed especially for the teacher or for the student.

II. To understand the construction and major components of a farm tractor

Teacher Preparation

Subject Matter Content

The ability to adjust and tune a tractor without an understanding of its construction, major components and their relationships to each other is very unlikely. Persons performing this type of service must have this understanding to develop and follow a systematic method of checking the components to make proper adjustments.

Tractors are composed of hundreds of parts. The smaller parts are built into major systems or assemblies such as:

1. Engine and accessories
2. Power train
3. Brakes
4. Steering mechanism
5. Chassis and related parts
6. Cooling system
7. Ignition system
8. Fuel system
9. Lubrication system

All farm tractors, except some experimental models, have internal combustion engines as the source of power.

Major assemblies of engines and their components are:

1. Engine
 - a. Cylinder block and cylinder head
 - b. Pistons and rings
 - c. Connecting rods
 - d. Rocker arm assembly

- e. Oil pan, oil pump, and oil filter
- f. Valves and valve springs
- g. Camshaft and camshaft gear
- h. Crankshaft
- i. Flywheel
- j. Timing gear
- k. Main bearings

2. Engine accessory systems

- a. Electrical and ignition system
 - 1) Battery
 - 2) Generator and charging circuit
 - 3) Ignition circuit (spark plugs and glow plugs, coil, distributor, magneto, cranking motor)
- b. Fuel, air, and exhaust systems - gasoline
 - 1) Air cleaner
 - 2) Fuel tank
 - 3) Fuel line, cutoff valve, strainer and filter
 - 4) Fuel pump - only for tractors that do not have the fuel tank located above the engine
 - 5) Carburetor
 - 6) Manifold, muffler, and exhaust
 - 7) Governor
- c. Fuel, air, and exhaust systems - diesel
 - 1) Air cleaner
 - 2) Fuel tank
 - 3) Fuel lines and filter
 - 4) Fuel injectors
 - 5) Fuel injection pump
 - 6) Manifold, muffler and outlet pipe
 - 7) Governor
- d. Fuel, air, and exhaust systems - LP Gas
 - 1) Air cleaner
 - 2) Fuel tank, valve, and line
 - 3) Fuel filter
 - 4) Carburetor
 - 5) Pressure regulators and vaporizer
 - 6) Manifold, muffler, and exhaust pipe
 - 7) Governor
- e. Cooling systems
 - 1) Radiator, hose, and pressure cap
 - 2) Water pump

- 3) Thermostat
- 4) Fan

f. Power train

- 1) Clutch
- 2) Transmission
- 3) Differential
- 4) Final drive or driving axles

g. Brakes

- 1) Pedals or levers
- 2) Drums
- 3) Bands
- 4) Shoe assemblies
- 5) Disk assemblies
- 6) Rods
- 7) Hydraulics
- 8) Power brakes

h. Steering mechanisms

- 1) Steering shaft
- 2) Bolster
- 3) Axle
- 4) Radius rod
- 5) Spindles
- 6) Tie rods
- 7) Drag link
- 8) Gears
- 9) Hydraulic and power steering

i. Chassis, wheels, and lights

- 1) Chassis frame
- 2) Front and rear lights
- 3) Wheels and tires

Suggested Teaching-Learning Activities

1. Have students develop written reports on a general type tractor construction, naming assemblies and systems and stating functions of each system. Also have students list how systems vary according to types of tractors.
2. Have students identify major components on a diagram of a general type tractor
3. Disassemble the major systems of a tractor to the extent that the components as listed in the content may be seen and studied by the students. Reassemble the components explaining the function of all components in a system.

Suggested Instructional Materials and References

Instructional Materials

1. Overhead transparencies and chart diagrams of cross section view of a tractor showing its assemblies and systems
2. Overhead transparencies and chart diagrams of exploded view of tractor systems showing major components of each system
3. A tractor

III. To adjust valves in tractor engines

Teacher Preparation

Subject Matter Content

High speeds, high temperatures, and increased compression place severe demands on engine valves. Improperly adjusted valves reduce the efficiency of the engine and accelerate wear thereby causing the need for early overhaul. When properly adjusted:

1. Valves last longer.
2. The engine uses fuel more efficiently.
3. The engine starts more easily.
4. Maximum power is produced.
5. The engine is less likely to overheat.
6. Smooth engine operation is provided.

Terms such as "tappet adjustment," "valve clearance," "valve spacing," and "valve lash" - all refer to valve clearance adjustments.

A properly adjusted valve will usually have a clearance of .006 inch to .030 inch between the valve stem and the rocker arm when the valve is closed. This varies according to the manufacturer and whether the engine is hot or cold. When performing engine tune-up jobs, it is advisable to follow suggestions in the operator's manual provided by the manufacturer.

Steps in the procedure listed should be followed when making valve clearance adjustments for valve-in-head engines.

1. Check operator's manual to determine whether engine should be hot or cold to make valve adjustments.
2. Remove tractor parts that interfere with removal of valve cover.
3. Clean dirt from valve cover and from around spark plugs.
4. Remove nuts or cap screws that hold valve (rocker-arm) cover.
5. Carefully remove valve cover to protect gasket.
6. Disconnect the center terminal wire to the distributor on spark ignition engines and shut off the fuel supply on diesel engines. This is a safety precaution.
7. Check cylinder head for tightness.
8. Slowly turn crankshaft until piston in number 1 cylinder is at top dead center (TDC) of compression stroke.
9. Visually inspect all parts making sure that all parts getting oil are not sludged.
10. Select the feeler-gauge thickness recommended by the manufacturer.
11. Check clearance by inserting gauge between valve stem and rocker arm of intake and exhaust valves. If clearances are correct on both, proceed with step 14.
12. Loosen adjusting-screw lock nut on valve rocker arm.

13. Turn adjusting screw with screwdriver until feeler guage will just slip in and out of the gap.
14. Hold adjusting screw with screwdriver and tighten lock nut with wrench. Then re-check.
15. Determine which cylinder fires next.
16. Crank engine until next cylinder in firing order is on compression. (TDC)
17. Adjust valves following same procedures as on number 1 cylinder and proceed in same manner with remaining cylinders.
18. Start engine and check lubrication of rocker arm.
19. Reassemble gasket, cover, etc.

Suggested Teaching-Learning Activities

1. Have students become familiar with instructions in operator's manuals through reading assignments and question and answer periods.
2. Demonstrate to students a procedure for determining when a piston is at TDC on the compression stroke.
3. Demonstrate to the class how the firing order may be determined and have a class member repeat the demonstration to be critiqued by other class members.
4. Have students give reasons for proper valve adjustments and list step by step the procedure to follow in adjusting valves.
5. Have students list ways of determining whether valve adjustment or overhaul is needed.
6. After having one student attempt to adjust valves in a late model engine using an out-of-date service manual as a guide, follow through step-by-step with the possible consequences of such a procedure to impress upon all students the necessity for keeping up-to-date in maintenance procedures.

Suggested Instructional Materials and References

Instructional Materials

1. Tractor engines
2. Operator's manuals
3. Overhead transparencies and diagrams of piston and crankshaft positions of cylinders and valves
4. Tools necessary for the competency

References

1. Tractor Maintenance: Principles and Procedures, pages 34-42.
- S 2. Farm Tractor Tune-Up and Service Guide.
- S 3. Operator's manuals for tractors.
- S 4. Tractor Maintenance and Tune-Up, pages 7-10.

Suggested Occupational Experiences

Have students follow the recommended procedure for adjusting valves on at least two engines.

IV. To adjust and tune tractor electrical and ignition systems

Teacher Preparation

Subject Matter Content

The electrical system of a gasoline tractor provides ignition which is one of the three essentials for combustion. Ignition in a diesel engine is provided by the high temperature generated during the compression stroke.

Properly tuned ignition systems add efficiency and life to the operation of the tractor. A systematic approach to adjusting and tuning the ignition system includes cleaning, "checking out," and adjusting each major component. (Refer to illustration 63, page 33 in the reference entitled "Electrical.")

The purpose of the battery is to convert chemical energy into electrical energy. An unclean and corroded battery becomes weak and dead much more quickly than one kept in proper condition.

Procedure for testing, cleaning, and servicing batteries:

1. Check battery with a voltmeter or hydrometer to determine the degree of charge of the battery.

BATTERY SPECIFIC GRAVITY CHARGE

State of Charge	Specific Gravity Temperate Climates
Fully Charged	1.275
75%	1.250
50%	1.225
25%	1.200
Discharged	1.175

2. Disconnect cable and ground strap from battery terminals if they are corroded.
3. Clean cable clamps and battery posts with wire brush and sandpaper.
4. Remove loose dirt and corrosion particles.
5. Brush a soda and water mixture on top of battery, on posts, and on clamps.
6. Wash away residue with clean water.
7. Repeat steps "5" and "6" until there is no further foaming.
8. Dry top of battery with a clean cloth or install corrosion inhibitor belt disks under clamps.
9. Apply a coating of light grease to posts and cable clamps.
10. Reconnect cable and ground strap.

The generator is the source of power in battery-type tractor electrical systems. It is usually belt driven and located at the front of the tractor.

The starter or "cranking motor" is used for starting the motor and is located on the side next to the flywheel housing.

Some tractor manufacturers are installing alternators in place of generators on their tractors. The difference between them is that the generator develops direct current which is suitable for direct use by the battery and electrical equipment on the tractor. The alternator develops alternating current which must be "rectified" -- changed to direct current -- before it can be used. Servicing an alternator is considered more technical than the term "tune-up" usually implies. The following procedure should be followed in maintaining and checking the starter and generator.

1. Wipe dirt from starter or generator housing.
2. Remove cover band.
3. Check brushes for wear and binding action.
4. Inspect for thrown solder.
5. Replace worn brushes.
6. Check brushes for binding action in holder.
7. Check electrical connections for tightness.
8. Inspect commutator for wear and roughness.
9. Remove dirt and glaze from commutator surface.
10. Set and seat new brushes on commutator.
11. Blow dust from commutator, brush holders and casing.
12. Replace band.
13. Polarize the generator before starting the engine.
14. If the generator needs reconditioning, proper methods should be used in the reconditioning process. Included in this process should be that of turning on a lathe, polishing and under-cutting the mica.
15. Check starter bendix drive and lubricate with light out.

Generator polarity refers to the direction of current flow from the generator to the extended circuits. Failure to polarize the generator in agreement with the battery may result in burned cut-out relay points, a discharged battery, or serious damage to the generator.

Gasoline engines used in tractors depend upon electricity to ignite the fuel and air mixture in the combustion chamber. Ignition takes place when a spark occurs in the combustion chamber. The spark takes place when electricity jumps across the gap between the electrodes of a spark plug. The spark must occur at the proper time in the combustion chamber so that the burning fuel can exert pressure on the piston to cause the crankshaft to rotate.

The electrical circuit which provides the spark at the spark plug is known as the ignition circuit. (Refer to Ford Tractor: Shop Manual for diagram of electrical system.)

Spark plugs provide the spark in the combustion chamber to ignite the fuel-air mixture.

Tests have shown that properly conditioned spark plugs may increase horse power of an engine by as much as 8.6 per cent. Tests have also shown that properly conditioned spark plugs may decrease fuel consumption by as much as 6.1 per cent.

In the same tests it was found that new spark plugs increased horsepower 21.5 per cent and decreased fuel consumption 14.2 per cent.

Spark plugs vary in type and size according to:

1. Engine design
2. Kind of fuel used
3. Engine operating conditions

(Refer to examples in Modern Farm Power, page 111 and Farm Tractors: Basic Principles, Operation, and Maintenance, pages 54-55.)

Conditioning spark plugs should be done according to the following procedure:

1. Disconnect spark plug wires from plugs.
2. Loosen plugs one or two turns, then remove dirt.

3. Remove each plug and arrange so each plug can be identified with its cylinder.
4. Check the condition of each plug. Plugs that are worn should be replaced with new ones.
5. Remove oily deposits from plugs.
6. Clean threads with a wire brush.
7. Remove deposits from plugs.
8. Blow loose material from plugs.
9. File electrodes on plugs until both have flat surfaces.
10. Determine proper spark gap spacing.
11. Regap plugs and check using the proper sized wire feeler guage.
12. Replace plugs with gasket and tighten with fingers.
13. Completely tighten plug with a spark plug socket wrench or torque wrench to specifications.
14. Check connections and insulation on spark plug wires when reattaching them to spark plugs.
15. Check polarity of spark at spark plug.
16. A dynamometer check should be made after each adjustment to observe what is happening to the horsepower output of the engine.

Glow plugs are used to aid starting and provide a fast "clean up" of the exhaust in diesel engines. It is important that all glow plugs function properly to eliminate misfiring during warm up.

Faulty plugs, when the tip is burned away or when the sheath is ruptured, should be replaced.

Coils are used in ignition systems to increase the voltage of the electrical current needed to provide the spark in the combustion chamber. Coils will increase current from 6 or 12 volts up to 25,000 volts. Relatively little adjustment is needed for proper maintenance of coils.

Maximum performance and efficiency of an engine can be attained only if the spark occurs in the right cylinder at the right time. This is the function of the distributor which includes a cam that opens and closes the points and a rotor and cap which distributed the spark to the correct cylinder. This function is performed only if the ignition timing is correct.

Servicing the distributor and timing the ignition system are usually considered as tune-up jobs. (Refer to the reference entitled Farm Tractors: Basic Principles, Operation, and Maintenance, pages 48 and 49 for an example of a distributor.)

1. Servicing the Distributor

a. Checking the condition of the distributor

To perform this operation follow this procedure:

- 1) Remove dirt from outside surface of distributor cap.
- 2) Remove cap and clean inner surfaces. Leave wires connected.
- 3) Check distributor cap for chips, cracks, and carbon paths which indicate cross arcing.
- 4) Remove distributor arm (rotor) and clean.
- 5) Remove dust cover, if one is used, and check condition of felt seal.
- 6) Check the centrifugal-advance mechanism.
- 7) Check condition of breaker points. If the contact points are rough but show only slight pitting and metal deposit, smooth with an ignition file. If points are badly pitted and worn, replace them with a new set.
- 8) Check condenser to make sure it is working properly. An improperly working condenser will cause a cone shaped deposit of metal on one point and a cone shaped pit on the other.

If this condition is existing, check tightness of the screw that holds the condenser. If the screw is tight, check the condenser with a condenser tester to determine whether it should be replaced.

b. Replacing breaker points

- 1) Remove breaker arm and spring.
- 2) Remove stationary breaker point and bracket.

- 3) Clean, then lubricate cam with special cam lubricant or with petroleum jelly or multi-purpose grease.
- 4) Install new points in reverse order.

c. Adjusting breaker points

- 1) Turn engine until cam opens breaker points to widest position.
- 2) Check points for proper spacing. Check operator's manual for correct spacing. This may vary from .015 to .026 inch.
- 3) Loosen lock screw on bracket that provides adjustment.
- 4) Adjust points for proper spacing and alignment.
- 5) Lock breaker points in position with lock screw.
- 6) Recheck gap between points and wipe points clean.

d. Reassembling the distributor

- 1) Lubricate wick in center of cam shaft.
- 2) Reassemble distributor in reverse order from that outlined in "checking the condition of the distributor."
- 3) Check condition of wires leading to spark plugs and to ignition coil.

2. Timing the Ignition - Spark Ignition Engines

Timing the engine may be done by two methods:

- a. The breaker point method
- b. The timing light method

The timing light method is the most accurate. Proper timing means that the ignition is set so the distributor will supply a spark to each cylinder at a time when the fuel will burn with greatest efficiency.

a. Timing by the breaker point method

- 1) Locate timing marks on flywheel or fan pulley.
- 2) Loosen or remove spark plug from number one cylinder.
- 3) Remove distributor cap.
- 4) Crank the engine until number 1 cylinder starts compression stroke. Watch which way the distributor rotor is turning.

- 5) Continue to rotate slowly until proper marking appears on flywheel or fan shaft pulley. Check operator's manual for marking to indicate top dead center (TPC) for number on cylinder.
- 6) Remove rotor and dust cap.
- 7) Note if breaker points are just starting to open. If breaker points are just starting to open, the timing is satisfactory and the distributor may be reassembled. If points are closing, continue with remaining steps.
- 8) Loosen clamps that hold distributor to engine block.
- 9) Turn the distributor slowly in the direction the rotor normally turns. This step is to make sure the breaker points are completely together.
- 10) Turn distributor body slowly in opposite direction until points start to open.
- 11) Tighten clamps that hold distributor body and reassemble distributor.
- 12) Tighten number one spark plug and attach spark plug wire.
- 13) Start the engine to see that it operates satisfactorily.
- 14) If you removed a cover from over the timing hole, replace it.

b. Timing by the timing light method

- 1) Locate timing marks on flywheel or fan pulley.
- 2) Connect timing light as recommended by manufacturer.
- 3) Determine from the operator's manual what timing mark to use with light.
- 4) Chalk the timing mark so it is easy to see.
- 5) Start engine and run at speed recommended in operator's manual.
- 6) Direct timing light at markings on the flywheel or on fan pulley.
- 7) Loosen clamps that hold distributor.
- 8) Turn distributor body slightly until timing mark is opposite pointer.
- 9) Tighten distributor and remove timing light.
- 10) Replace cover over timing hole if one was removed.

Magnetos are self-contained assemblies which are driven by the engine and supply high voltage current to the spark plugs.

Magnetos contain a coil, condenser, points, distributor, cap, and rotor. Magnetos with a spring loaded drive turn quickly at slow speeds when a cylinder is to fire, thus generating more voltage and resulting in a better spark while starting the engine.

Maintenance procedures for magnetos are very similar to those for battery powered ignition systems.

Suggested Teaching-Learning Activities

1. Have students prepare an engine electrical system from spare parts using cutaway components and then explain and trace the operation of the electrical system.
2. Have students diagram an engine electrical system showing each major assembly and component.
3. Have students list conditions which may cause fouling or failure of the assemblies of the electrical system.
4. Demonstrate to students a procedure for tuning the electrical system.
5. Have students develop a check list of trouble shooting procedures for an electrical system.
6. Have students trouble shoot and service a tractor's electrical system that has been incorrectly serviced by the instructor.
7. Have students practice installing and timing magnetos where interchangeable with battery system.

Suggested Instructional Materials and References

Instructional Materials

1. An engine electrical system mounted on a display board
2. Overhead transparencies listing the steps to follow in maintaining and tuning the electrical system

3. Electrical systems for students to use
4. Charts and diagrams of exploded views of the components of an electrical system
5. "Electrical System," University of Nebraska Filmstrip

References

7. Farm Tractor Tune-Up and Service Guide.
8. Modern Farm Power, pages 102-130.
9. Farm Tractors: Basic Principles, Operation, and Maintenance, pages 46-55.

Suggested Occupational Experiences

Each student should service at least one complete electrical system following procedures listed in the content. Students should make note of problems encountered and present these to the class.

- V . To maintain and adjust tractor air, fuel, and exhaust system

Teacher Preparation

Subject Matter Content

Studies have shown that properly maintained air cleaners may lower fuel consumption by as much as 22.5 per cent. Horsepower

has been increased by as much as 27 per cent as a result of a properly cleaned and adjusted air cleaner.

Two common types of air cleaners used on tractors are:

1. Dry type
2. Oil bath type

To clean and service the oil bath air cleaner the following procedure should be used:

1. Remove oil cup and screen tray.
2. Inspect center tube and lower filter element.
3. Remove dirt from center pipe.
4. Clean dirt from lower filter (Do not try to remove a permanently installed filter element,)
5. Clean shell and upper metal-wool filter.
6. Drain filter body and screen for several minutes. (Diesel engine air cleaner filter screens must be completely dry before reinstalling if washed in a volatile solvent to prevent the possibility of the engine "running away.")
7. Clean the screened air intake, cap, or precleaner.
8. Reassemble filter parts.

Dry type air cleaners are now being used on many new tractors. The efficiency of this type cleaner is outstanding. Also the expense and mess of cleaning and replacing the oil in the oil-bath type are eliminated.

Dry type air cleaners should be serviced by the following procedure:

1. Stop engine if it is running.
2. Squeeze dust unloader if one is on the air cleaner.
3. Remove hood or grill if necessary to provide access to air cleaner unit.

4. Wipe off dust accumulated around end of cleaner where element will be removed.
5. Loosen hand screw or clamp that holds the end cap on the end of the cleaner and remove cap.
6. Clean the area around the element and clean the dust cup and baffle on air cleaners having end cups.
7. Remove filter element from cleaner.
8. Check condition of rubber gasket on end of filter element.
9. Clean filter element by:
 - a. Tapping to loosen dust so it can be shaken out, or
 - b. Use compressed air and blow from inside to outside, or
 - c. Rinse in warm water and a low sudsing detergent.
10. Allow element to dry if washed.
11. Inspect element for damage.
12. Replace element in the cleaner and complete job by following procedure in reverse order from that used in removing the filter element.

The purpose of tractor fuel systems is to supply fuel to the engine.

Properly adjusted fuel systems result in an increase in horsepower and may result in a reduction in fuel consumption.

Servicing and tuning the fuel system for gasoline engines include several activities, following the manufacturer's recommendations, namely:

1. Servicing the sediment bowl, fuel filter, and fuel line:
 - a. Close valve(s) on fuel supply line.
 - b. Loosen nut that holds sediment bowl in position.
 - c. Remove sediment bowl.

- d. Remove sediment bowl gasket.
 - e. Remove strainer.
 - f. Wash strainer unless it is a disposable type.
 - g. Clean sediment bowl.
 - h. Open fuel valve and allow fuel to flow through to clean line between sediment bowl and tank.
 - i. Reinstall gasket, strainer, and sediment bowl.
 - j. Tighten nut that holds sediment bowl in position.
 - k. Open fuel valves and check for leaks.
2. Preparing for carburetor adjustment:
- a. Determine if carburetor is equipped with a screen.
 - b. Close valve on fuel line and disconnect line at carburetor.
 - c. Remove screen from carburetor (if applicable).
 - d. Clean the screen and reassemble.
 - e. Start engine and check for air leaks around manifold connections and carburetor gaskets.
3. Adjusting idling speed screw:
- a. Start engine and warm to operating temperature.
 - b. Set speed control lever at closed position.
 - c. Locate idling speed adjustment.
 - d. Adjust screw to normal idling speed.
4. Adjusting the idling fuel-air mixture:
- a. Set speed control lever at idling position.
 - b. Locate idle-mixture adjusting screw.
 - c. Turn idle-mixture screw clockwise slowly until engine begins to "roll" or slow down.

- d. Turn adjusting screw back slowly until engine runs smoothly.
5. Adjusting the load fuel-air mixture:
 - a. Run engine at full throttle either with or without load.
 - b. Turn load adjusting screw clockwise until engine begins to lose power.
 - c. Turn adjusting screw counter clockwise until engine gives off black smoke from exhaust.
 - d. Turn screw clockwise until engine runs smoothly and at full speed.
 - e. Check carburetor adjustment by accelerating engine quickly while under load.

Too lean a mixture will cause the engine to back fire and too rich a mixture will produce dark colored smoke.

LP Gas Fuel System

Fuel systems for LP Gas engines are basically the same as for gasoline engines with three or four exceptions. Main differences in a gasoline system and an LP Gas system are that the gas system has a different fuel filter, a vaporizer, and a regulator. The LP Gas carburetor does not have a float because the fuel enters the carburetor as a gas rather than as a liquid.

Servicing and adjusting LP Gas fuel systems should be according to procedures suggested by the manufacturer.

Fuel systems for some makes of diesel tractors are very complicated. For that reason it is advisable that servicing, other than servicing the fuel filters and bleeding the fuel lines, be left to mechanics highly skilled in this area.

Clean fuel, free from moisture and foreign matter, is essential for proper functioning of a diesel fuel system; therefore, filters must be carefully serviced regularly.

To replace fuel filters or to clean permanent type filters follow this procedure:

1. Turn off fuel supply at tank.
2. Clean outside of filter body and engine area around filter. Wipe dry.
3. Drain fuel from filter.
4. Remove old filter.
5. Wash filter as described under fuel systems for gasoline engines.

6. Clean inside of filter bowl (unless it is a self-contained type).
7. Reinstall cleaned filter or new disposal filter element.
8. Complete the filter assembly and tighten it.
9. Replace the drain plug or tighten the drain valve.

Servicing filters usually results in considerable air being left in the filter body and fuel line. Air in the filter and fuel line may cause an air lock when starting the engine. To prevent this condition, the fuel lines should be bled to remove the air.

The procedure that follows is about the same for bleeding first, second, and third stage filters.

1. Open the fuel tank, shut-off valve at the bottom of the tank.
2. Open the drain cock at the bottom of the fuel filter base. Close the drain cock when the fuel begins to flow.
3. Open the bleed screw at the top of the filter cover to release air that may be trapped. After a solid flow of fuel appears, tighten the bleed screw.

Servicing the manifold, muffler, and exhaust pipe usually is limited to checking for leaks and restrictions and cleaning drain holes on horizontal mufflers. Poor engine performance and burned valves will result from restrictions in the exhaust system.

Servicing the manifold includes removing the manifolds from the engine for thorough cleaning. Deposits of gum may be found inside the intake manifold as well as carbon deposits inside the exhaust manifold. They should be soaked in a good solvent to loosen gum and carbon deposits then dried thoroughly before being reinstalled.

The purpose of a governor on an engine is to automatically regulate the throttle so as to maintain a uniform rate of engine speed regardless of the load.

An improperly adjusted governor causes a loss of horsepower and may cause an increase in fuel consumption.

Governed engine speed, linkage, and other adjustments vary according to engine manufacturer; therefore, it is best to follow the recommendations of the manufacturer found in the service or operator's manual.

Suggested Teaching-Learning Activities

1. After demonstrating proper service techniques, have a student in the class redemonstrate proper technique to the entire class.
2. Have students trouble shoot and service an air, fuel, or exhaust system that has been deliberately "fouled up" by the teacher.
3. Have students report on principles and functions of air, fuel, and exhaust systems.
4. Have students identify major components of air, fuel, and exhaust systems.
5. Have students give reasons for steps suggested in procedures in content.

Suggested Instructional Materials and References

Instructional Materials

1. Charts and diagrams of air, fuel, and exhaust systems
2. Overhead transparencies, preferably overlays, of air, fuel, and exhaust systems. The overlays should be in colors to better illustrate the principles involved and the functions of the parts.
3. One of each type air cleaner
4. Tractors for demonstrations and laboratory experiences for students
5. A set of necessary tools for each student
6. "Fuel System & Fuel Storage," University of Nebraska Filmstrip.

References

1. Tractor Maintenance: Principles and Procedures, pages 53-66, 93-98, 115-117, 126-127.

2. Tractors and Crawlers, pages 144-146.
3. Farm Tractors: Basic Principles, Operation, and Maintenance, pages 31-34.
4. Ford Tractor: Shop Manual, pages 85-149.

Suggested Occupational Experiences

1. Have students completely service and adjust the air, fuel, and exhaust systems on at least two gasoline and two diesel tractors.
2. Have students report to the class on problems encountered.

VI. To maintain and adjust the tractor cooling system

Teacher Preparation

Subject Matter Content

The purpose of the cooling system is to help dispel the excess heat energy from the engine. Only about one-third of the potential heat energy in the tractor engine is turned into useful power and heat. The rest of the heat must be dispelled or the engine will be destroyed. This is accomplished through the exhaust system.

Overheating an engine is likely to cause sticking and burned valves, a cracked engine or block, or excessive engine knock.

There are two types of water cooling systems used on tractors, namely:

1. Thermo-siphon
2. Forced circulation

Three conditions which develop in cooling systems but which can be controlled through proper maintenance are:

1. Mineral deposits
2. Rust
3. Galvanic corrosion

FREEZING PROTECTION TABLE

Cooling System Capacity in Quarts	"PERMANENT" ANTIFREEZE REQUIRED												
	1	2	3	4	5	6	7	8	9	10	11	12	13
	(Degrees F.)												
5	16°	-12°	-62°										
6	19°	0°	-34°										
7	22°	7°	-17°	-54°									
8	23°	11°	-7°	-34°	-69°								
9	24°	14°	0°	-21°	-50°								
10	25°	16°	4°	-12°	-34°	-62°							
11	26°	18°	8°	-6°	-23°	-47°							
12		19°	10°	0°	-15°	-34°	-57°						
13		21°	13°	3°	-9°	-25°	-45°	-66°					
14			15°	6°	-5°	-18°	-34°	-54°					
15			16°	8°	0°	-12°	-26°	-43°	-62°				
16			17°	10°	2°	-8°	-19°	-34°	-52°				
17			18°	12°	5°	-4°	-14°	-27°	-42°	-58°			
18			19°	14°	7°	0°	-10°	-21°	-34°	-50°	-65°		
19			20°	15°	9°	2°	-7°	-16°	-28°	-42°	-56°		
20				16°	10°	4°	-3°	-12°	-22°	-34°	-48°	-62°	
21				17°	12°	6°	0°	-9°	-17°	-28°	-41°	-54°	-68°
22				18°	13°	8°	2°	-6°	-14°	-23°	-34°	-47°	-59°
23				19°	14°	9°	4°	-3°	-10°	-19°	-29°	-40°	-52°
24					15°	10°	5°	0°	-8°	-15°	-24°	-34°	-46°

Adjust and maintain the cooling system through the following procedure:

1. Check radiator air passages to make sure they are free of foreign materials.
2. Check hose and hose clamps.
3. Check fan belt to make sure it is not broken or slipping. If the belt is slipping, it may be tightened by shifting the position of the generator, if it is driven by the fan belt, or by changing the position of an adjustable sheave on the fan pulley.
4. Check for external leaks other than those caused by loose hose clamps.
5. Flush cooling system if rust shows in the coolant. If a commercial flushing compound is to be used follow the instructions on the container.
6. Refill with coolant. Use clean soft water and add rust inhibitor or new antifreeze.
7. Change the antifreeze each year. Engine gases escape through the walls of the engine into the coolant changing the antifreeze into an acid.

Suggested Teaching-Learning Activities

1. Have students learn the components of cooling systems.
2. Have students list advantages and disadvantages of the two types of water cooling systems.
3. Have students report on causes of fouled cooling systems.
4. Demonstrate the difference in "boiling off" rates between alcohol and ethylene-glycol antifreeze with the resultant difference in protection levels.
5. Have students list several kinds of antifreezes and give good and bad points about each.
6. Attach a hose to the bottom of a five-gallon pail. Fill the pail half full with antifreeze and test for acidity with litmus paper. Attach the other end of the hose to the exhaust of a tractor engine. Start the engine forcing the exhaust fumes through the antifreeze.

Allow the engine to run about eight minutes. Then shut off the engine and let the antifreeze cool. After the antifreeze has cooled to normal temperature, test it again with the litmus paper.

7. Demonstrate by placing clean iron in an old anti-freeze solution that rust-inhibitive qualities are lost after prolonged usage.
8. Demonstrate how to check old thermostats for reliability.
9. Prepare a chart showing the amount of excessive cylinder wear, fuel consumption, and power loss caused by too low an engine operating temperature using the following data:

For a 60-hour gasoline engine test -

Operating temperature					
	40° F	100° F	140° F	160° F	180° F
Fuel consumption					
	3.8 gph	3.5 gph	3.2 gph	2.9 gph	2.8 gph
Cylinder wear					
	.008"	.002"	.001"	.0005"	.0003"
Power					
	26 hp	27.2 hp	28.5 hp	29 hp	29.5 hp

Suggested Instructional Materials and References

Instructional Materials

1. Charts on cooling system
2. Samples of flushing compounds and antifreezes.
3. Tractors for demonstrations and experiences
4. Charts - The Engine Cooling System
5. "Cooling System," University of Nebraska Filmstrip.

References

1. Tractor Maintenance: Principles and Procedures, pages 105-111.

2. Farm Tractors: Basic Principles, Operation, and Maintenance, pages 58-65.
3. Tractors and Crawlers, pages 172-174.
4. Farm Tractor Tune-up and Service Guide.

Suggested Occupational Experiences

1. Have students completely service at least one cooling system.
2. Have students report unusual findings to the class.

VII. To maintain and adjust the power train

Teacher Preparation

Subject Matter Content

The power train of a tractor is considered to be the parts to the rear of the tractor engine that transmit engine power to the rear wheels or power take-off shafts.

Power trains vary in design according to manufacturers; therefore, it is advisable to follow procedures suggested by manufacturers when adjusting the power train. However, all manufacturers include basic components that are similar in design.

The clutch is a device for disconnecting the tractor engine from its load while starting and idling. Clutches are either hand or foot operated. Regardless of the type used, the principle of operation is the same.

To adjust foot-operated clutches follow this procedure:

1. Determine from the operator's manual how much free travel is needed. This varies from $\frac{1}{2}$ inch to $1\frac{1}{2}$ inches.
2. Check clutch pedal for free travel.
3. Locate means provided for clutch adjustment.
4. Adjust linkage until clutch pedal has sufficient free travel.
5. Tighten locknut so that it holds adjustment securely.

To adjust hand-operated clutches follow these steps:

1. Check clutch-lever action to determine if adjustment is needed.
2. Disengage the clutch.
3. Place gear shift lever in neutral.
4. Remove hand hole cover on housing.
5. Turn clutch by hand until locking mechanism is on side next to hand hole.
6. Loosen lock and tighten collar one notch at a time or as recommended by operator's manual.
7. Check clutch lever for proper operation.
8. Replace lock pin and make certain it is properly seated.
9. Replace hand hole cover.

Servicing the remainder of the power train is limited primarily to the drive mechanism. Tests have shown that changing oil properly and at proper intervals in the transmission, final drive, and other parts of the drive train increases the life and efficiency of the tractor and reduces maintenance cost by as much as 5 per cent. Servicing the drive trains should be done in the following manner:

1. Drive the tractor until gear oil is thoroughly heated.
2. Place the tractor on a level surface.
3. Remove the drain plug(s) and clean, if of the magnetic type.
4. Replace the transmission oil filter, if the tractor has a filter.
5. Replace the drain plug(s).
6. Refill with the amount, type, and grade of lubricant recommended by the operator's manual.
7. Flush and drain gear case(s) with flushing oil on diesel fuel.

OF
ED
333

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS - 1963

8. Clean filler plug and surrounding area.
9. Refill with proper type and grade of gear lubricant.
10. Replace filler plug(s).
11. Clean breather(s).

Suggested Teaching-Learning Activities

1. Have students list faulty mechanical or operational conditions which may develop due to an improperly serviced power train.
2. Have students diagram and label components of a power train.
3. Have students determine kinds of lubricants to be used in servicing the power train.
4. Have students list reasons for properly adjusting clutches.
5. Show students worn out clutch assemblies caused by improper adjustment or lack of attention.
6. Demonstrate proper clutch adjustment technique on cutaway clutch assemblies to more clearly present the necessity for proper clutch adjustment.
7. Demonstrate with a cutaway differential housing and one differential gear operated by an electric motor why the proper grade and type of lubricant is needed to furnish proper protection.

Suggested Instructional Materials and References

Instructional Materials

1. Charts and diagrams of power trains of different makes of tractors
2. Tools needed for this activity
3. Tractors
4. Cutaway models of power trains

References

1. Tractor Maintenance: Principles and Procedures, pages 71-75, 117-121.
2. Tractors and Crawlers, pages 178-245.
3. Farm Tractor Tune-Up and Service Guide.

Suggested Occupational Experiences

1. Have students adjust hand operated and foot operated clutches.
2. Have students service the power train components of a tractor.

VIII. To adjust tractor brakes

Teacher Preparation

Subject Matter Content

Brakes on tractors are used for stopping and for assistance in making short turns.

Three types of brakes used on tractors are:

1. External band brakes (external contracting)
2. Shoe brakes (internal expanding)
3. Disc brakes (mechanical, hydraulic and power)

To adjust mechanical brakes follow this procedure:

1. Check to see what provision is made for brake adjustment.
2. Jack up rear of tractor until both rear wheels clear the ground.
3. Release brake lock(s).
4. Complete the preliminary arrangements for adjustment of first brake.

5. Tighten adjusting screw, adjusting rod, or adjusting nut.
6. Complete reassembly, or tightening of locknuts, to maintain adjustments.
7. Adjust second brake in the same manner as the first one.
8. Check to make certain that the brakes are equalized.
9. Lower tractor from jack(s).

Hydraulic brakes do not require the same adjustments as mechanical brakes. Procedures listed in the operator's manual should be followed if air bleeding is necessary.

Suggested Teaching-Learning Activities

1. Show students examples of brake failures caused by different conditions.
2. Demonstrate the necessity for equalizing brake adjustments by driving a tractor with unequalized brakes on dry pavement. Show the difference in brake drum temperatures at the end of the demonstration.
3. Develop a clipping file of farm accidents caused by brake failures and present to the class.
4. Have students list types of brakes and give advantages of each.
5. Have students list reasons for keeping brakes properly adjusted.

Suggested Instructional Materials and References

Instructional Materials

1. Charts and diagrams of brake systems
2. Tractors for demonstration and practice
3. A set of tools for each student necessary for the activity
4. Overhead transparencies of brake systems

References

1. Tractor Maintenance: Principles and Procedures, pages 66-71.
2. Tractors and Crawlers, pages 248 - 261.
3. Farm Tractor Tune-Up and Service Guide

Suggested Occupational Experiences

Have students adjust at least two types of brakes.

IX. To maintain and adjust steering mechanisms and wheels

Teacher Preparation

Subject Matter Content

Steering mechanisms vary in design. Maintenance and adjustments on steering mechanisms should be according to the recommendations of the manufacturers. Maintenance and adjustments usually consist of lubricating properly and tightening connections.

Operator's manuals for the make of tractors used in the laboratory should be secured and followed in developing this competency.

Servicing tractor wheels includes several activities. These activities are:

1. Checking wheel alignment (for standard type tractors)
2. Checking tires
3. Servicing front wheel bearings

Proper front wheel alignment reduces tire wear and makes steering easier. Proper toe-in is $\frac{1}{8}$ inch to $\frac{1}{4}$ inch. This means the total distance between the centerlines at the front of the tires should be $\frac{1}{8}$ to $\frac{1}{4}$ inch less than the total distance between the centerlines at the rear of the tires.

Example of Checking Toe-In

Toe-in adjustment is made by adjusting the clevis on the end of the tie rod.

Properly inflated tires last longer and help the tractor deliver satisfactory drawbar pull.

Tire inflation should be checked by the following procedure:

1. Remove valve cap and check pressure with guage. If pressure is checked with valve stem in the top position, add $1/2$ pound per foot of liquid height.
2. Add air (or deflate) as needed to secure proper pressure.
3. Wash guage with clean water after using on tires containing calcium-chloride solution.
4. Replace valve cap.

Tires should also be checked for cuts, breaks, nails, stones, etc.

Much damage may result if grit and dirt particles are allowed to enter the bearings. Proper servicing helps prevent this condition.

Some tractors are equipped with grease fittings for gun lubrication. This type should be greased daily so the new grease

will work out around the dust seal and remove grit and dirt particles. These bearings should be thoroughly cleaned and repacked at least once a year.

Bearings on tractors without grease fittings must be serviced more frequently. To service this type bearing, follow this procedure:

1. Raise front wheels off the ground.
2. Clean dirt from wheel and hub cap and remove hup cap.
3. Remove cotter pin and adjusting nut.
4. Remove thrust washer and outer bearings.
5. Pull wheel off the spindle.
6. If the inner bearing remained in the hub, remove it.
7. Wash bearings thoroughly in a good grade solvent.
8. Remove all solvent from bearings and other washed parts, or else use gasoline and let parts air dry.
9. Examine bearings for wear.
10. Examine grease-retainer ring and seal. Replace if damaged.
11. Clean hub, hub cap, and spindle.
12. Pack each bearing with grease.
13. Replace inner bearing and grease-retainer seal if removed originally.
14. Coat spindle and inside of hub with grease.
15. Position wheel on spindle and install outer bearing.
16. Install thrust washer and slotted adjusting nut.
17. Turn wheel and tighten castellated nut until wheel just begins to drag, then back off the amount recommended by the operator's or service manual; or, tighten castellated nut to proper torque with torque wrench.

18. Lock nut with cotter pin.
19. Replace hub cap.

Suggested Teaching-Learning Activities

1. Have students develop a table of operating pressures for farm tractor tires.
2. Have students report on different types of tractor tires which should be installed for different soil or use.
3. Prepare a collection of sections of tire carcasses showing the following conditions:
 - a. Weather checking caused by over-inflation or long exposure to sunlight
 - b. Sidewall buckling and cord injury caused by under-inflation
 - c. Diagonal or "x"-type breaks caused by over-inflation
 - d. Tread-wiping caused by excessive operation on pavement
4. Develop a collection of wheel bearing assemblies ruined by:
 - a. Lack of grease
 - b. Excessive tightening of the castellated nut
 - c. Dirt and grit accumulated because of worn out grease seals or because of lack of attention to cleanliness when packing the bearings
 - d. Not removing solvent from bearings and races before repacking thereby preventing the grease from adhering to the metal surfaces
5. Make a toe-in calibration adjustment bar out of 1/2" pipe or hardwood and a chalk holder to demonstrate toe-in measurements.
6. Have students report on different types of front wheel assemblies and type of bearings used on tractors.

Suggested Instructional Materials and References

Instructional Materials

1. Charts and diagrams of steering mechanisms and wheel and bearing assemblies
2. Tractors
3. Tools for student use necessary for this competency

References

1. Tractors and Crawlers, pages 102-118.
2. Tractor Maintenance: Principles and Procedures, pages 28-32, 99-104.

Suggested Occupational Experiences

1. Have students align front wheels on a tractor.
2. Have students check and service tires on a tractor.
3. Have students clean and service front wheel bearings on at least one tractor.

X. To select and use proper lubricants for tractors

Teacher Preparation

Subject Matter Content

If the person being taught this module on "Tractor Tune-up and Maintenance" has not been taught the competency on understanding agricultural machinery lubrication included in the module on "Agricultural Machinery Assembly and Lubrication," he should be taught that competency at this time.

Suggestions for Evaluating Educational Outcomes of the Module

The educational outcomes of this module should be evaluated according to attitudinal changes and manipulative skills developed.

1. Manipulative skills

It is suggested that each student be required to perform a complete engine service tune-up, check and adjustment of those systems usually included in a tune-up and service operation. The teacher should observe the performance of each student to evaluate the student's accomplishments. Also, it is suggested that the student use a dynamometer in performing the tune-up operation. The use of the dynamometer should be demonstrated thoroughly to the student prior to this activity.

A suggested sequence for the servicing and tune-up of a gasoline tractor:

- a. Remove spark plugs, inspect, then clean and regap or replace them as necessary.
- b. Test engine compression.
- c. Adjust valve clearance.
- d. Remove distributor, disassemble, clean, recondition, and relubricate.
- e. Regap breaker points or replace if necessary.
- f. Inspect distributor rotor, cap, and ignition cables.
- g. Clean fuel sediment bowl and screen.
- h. Remove and clean crankcase oil pan and the oil pump screen.
- i. Check carburetor fuel level.
- j. Adjust carburetor fuel level, recondition or replace float valve assembly as necessary, and replace the bowl gasket.
- k. Inspect the air cleaner and connections.
- l. Remove and wash air filter screens and cup and replace hose if necessary.
- m. Install the spark plugs with new gaskets.
- n. Check and correct ignition timing.
- o. Cover the radiator and run the engine until it reaches normal operating temperature.

- p. Adjust carburetor idle mixture and idle speed of the engine.
- q. Check main fuel adjustment screw setting of the carburetor.
- r. Adjust fast idle governed speed.
- s. Check cooling system for pressure build-up at the radiator cap, coolant flow, and inspect the condition of the cap, upper and lower hoses, and the radiator core.
- t. Flush the cooling system, clean the radiator fins, and replace hoses as necessary.
- u. Inspect and adjust both fan and generator belts as necessary.
- v. Inspect and adjust brakes.
- w. Inspect and adjust clutches.
- x. Inspect and service tires.
- y. Check toe-in of front wheels.
- z. Inspect and make necessary corrections in lights.

2. Attitudes

Attitudes should be evaluated according to:

- a. Student participation in class discussions
- b. Student response to assignments made
- c. Carefulness and thoroughness of jobs performed

GASOLINE TRACTOR ENGINE SYSTEMS

Major Teaching Objectives

To understand the principles of operation and the components and their functions of the various systems of a gasoline tractor engine

Suggested Time Allotments

At school	
Class instruction	<u>18</u> hours
Laboratory experience	<u>24</u> hours
Total at school	<u>42</u> hours
Occupational experience	<u>0</u> hours
Total for module	<u>42</u> hours

Suggestions for Introducing the Module

It is highly important for those preparing for employment in an agricultural machinery service occupation to understand the construction and principles of operation of tractor gasoline engines.

Competition is keen in many areas of agricultural machinery service because buyers and users of agricultural machinery are demanding first-class service. Employers, therefore, are interested only in efficient employees.

The following techniques should be used to create interest in the module:

1. Bring a small tractor before the class. Remove the rotor button and ask a student why the engine will not run. Replace the rotor button and close the air intake (air cleaner) and ask another student to explain the reason the engine will not run. Involve students in a discussion of the principles of internal engine combustion. Also review the history of the development of internal combustion engines.
2. Place various parts of the gasoline engine system around the classroom and have students attempt to identify them. As the instruction in this module progresses, refer to the parts placed before the class for identification.

Competencies to be DevelopedI. To understand the principles of operation of gasoline enginesTeacher PreparationSubject Matter Content

The basic principles of internal combustion engines were first put forth by a Frenchman named DeRochas in 1862. Experimentation was carried out as early as 1678 by Hautefeuille, of France, to devise a heat engine that would utilize heat to produce continuous power. This particular engine used gun powder but did not prove practical. In 1680, a Dutchman named Huygens exhibited in Paris an engine with a cylinder and piston. This engine also operated on explosive powder.

Experiments on internal combustion engines continued, but it was 1876 before the first successful internal combustion engine on the four-stroke-cycle principle was patented by Dr. N. A. Otto, a German. In 1878, Dugald Clerk, an Englishman, patented a two-stroke-cycle engine.

Internal combustion engines generate power by utilizing force created by the combustion of fuel and air. Combustion is the chemical action of oxidation. When this occurs in the internal combustion engine, the process is very rapid and produces great quantities of heat, expanding the gases which produce great pressures. It is the pressure of expansion that the engine converts to mechanical energy at the crankshaft.

Internal combustion engines may be four-stroke-cycle engines or two-stroke-cycle engines. The four-stroke-cycle engine is the most common type found in farm tractors. A stroke is the movement of the piston from Top Dead Center (TDC) or Head Dead Center (HDC) to Crank Dead Center (CDC). A stroke may also be defined as one half a revolution, or 180 degrees crankshaft travel, or the movement of the piston from its highest position in the cylinder to its lowest position in the cylinder.

The action which takes place in a complete cycle involves

1. Intake
2. Compression
3. Power
4. Exhaust

In a four-stroke-cycle engine, four up-and-down movements of the piston are required to complete the necessary actions. In a two-stroke-cycle engine only two up-and-down movements are needed to complete the necessary actions of intake, compression, power, and exhaust.

Sequence of Operations--
Four Cycle Spark-Ignition
Engine

Suggested Teaching Learning Activities

1. Use cutaway engines to demonstrate movement of pistons, valves, etc., in a four-stroke-cycle engine and a two-stroke-cycle engine.
2. Use transparencies and motion pictures to illustrate principles of internal combustion engines.
3. Have students make sketches illustrating the different strokes of the four- and two-stroke-cycle engines.

Suggested Instructional Materials and References

Instructional materials

1. Cutaway engines, four-stroke-cycle small engines and two-stroke-cycle small engines
2. Charts depicting the principles of internal combustion engines
3. Motion pictures and transparencies depicting principles of internal combustion engines

*The symbol T (teacher) or S (student) denotes those references designed especially for the teacher or for the student.

II. To understand the construction and major components of a tractor gasoline engine

Teacher Preparation

Subject Matter Content

Gasoline engines are composed of many small parts. Each part serves a specific function or, in some cases, several functions. The efficient tractor mechanic must have a thorough understanding

of the many parts of a gasoline engine and the functions they perform.

Because of the peculiar function of each part, each falls into a natural group, referred to as an assembly or a system.

Gasoline engine parts may be grouped into the following systems:

1. Stationary parts
 - a. Cylinder block
 - b. Cylinder head
 - c. Crankcase
 - d. Oil pan
 - e. Cover
2. Moving parts
 - a. Pistons and rings
 - b. Connecting rods and wrist pins
 - c. Crankshaft
 - d. Main bearings
 - e. Flywheel
 - f. Camshaft and camshaft gear
 - g. Valves
 - h. Rocker arm assembly
 - i. Oil pump and accessories
3. Electrical system
 - a. Battery
 - b. Generator and charging circuit
 - c. Ignition circuit (distributor, coil, spark plugs, breaker points, condensor, and magneto)
 - d. Cranking motor

4. Fuel, air, and exhaust systems
 - a. Air cleaner
 - b. Fuel tank
 - c. Fuel line, cut-off valve, strainer, and filter
 - d. Fuel pump (only in tractors that do not have the fuel tank located above the engine)
 - e. Carburetor
 - f. Manifold, muffler, and exhaust pipe
 - g. Governors
5. Cooling system
 - a. Radiator, hose, and pressure cap
 - b. Water pump
 - c. Thermostat
 - d. Fan

Suggested Teaching-Learning Activities

1. Have students make reports on gasoline engines, naming assemblies and systems, the components of each, and the function of each component.
2. Disassemble a gasoline engine so that the components listed in the content may be seen and studied by the students. Reassemble the components, explain the function of each, and give the relationships of all components in a system.

Suggested Instructional Materials and References

Instructional materials

1. Overhead transparencies and charts of cross section views of gasoline engines
2. Overhead transparencies and diagrams of exploded view of each gasoline engine system
3. Tractor engines

References

1. Tractors and Crawlers, pp. 140-176.
2. Modern Farm Power, pp. 20-30.

III. To understand the stationary parts of a tractor gasoline engine

Teacher Preparation

Subject Matter Content

The stationary parts are those major parts of the engine which do not move.

The cylinder block is the basic frame of the engine. It supports all the components in relation to one another and maintains them in alignment. The most important requirement of the cylinder block is rigidity. In most cases, tractor engines are made of cast iron alloy.

Cylinder blocks may vary in design. They may be of the integral bore type; this is, the cylinder bore is machined directly into the material of the block. It may have separate and removable cylinder sleeves. The removable sleeve may be of the wet type (the coolant comes in direct contact with the outer surface of the sleeve), or it may be of the dry type (the sleeve or liner is inserted in the bore and is not in direct contact with the coolant).

Valve-in-block engines have the valve seats, ports, and guides in the block casting with their respective water jackets; whereas, the I-head engine block has only the cylinder bore water jackets.

If the block skirt extends only to the center line of the crankshaft main bearing, it is known as a "short skirt." If it extends below the center line of the crankshaft main bearing, it is known as a "deep skirt."

Many engine blocks may have oil galleries cored in. Others may have steel tubes inserted to act as galleries; whereas, others may have oil lines and fittings to carry oil to the various parts.

As a rule, the cylinder head is made of the same material as the cylinder block. It serves as a cap and is attached to the top of the engine block and covers the upper cylinder openings, thereby forming a combustion chamber.

The crankcase is the lower part of the cylinder block; it confines the lubricating oil near the engine's moving parts in the four-cycle engine. It also supports the crankshaft and camshaft bearings.

The oil pan serves as a reservoir to hold the crankcase lubricant and seals the lower part of the engine in the four-cycle engine.

Various types of covers are used on the timing train, the valve train, and sometimes on other components or inspection-holes. They are usually made of stamped steel.

Suggested Teaching-Learning Activities

1. Have students disassemble and examine several gasoline engines and the stationary parts to observe the various designs.
2. Have students label drawings of stationary engine parts.
3. Have students prepare and present written reports on function, designs, construction materials, etc., of stationary parts.

Suggested Instructional Materials and References

Instructional materials

1. Tractor engines
2. Overhead transparencies and diagrams of stationary engine parts

References

1. Modern Farm Power, pp. 21-22.
- S 2. Ford Tractor Shop Manual.

IV. To understand the moving parts of a tractor gasoline engine

Teacher Preparation

Subject Matter Content

The moving parts of the engine that receive the gaseous energy produced in the combustion chamber and deliver it to the output end of the engine in the form of useful power are referred to in this module as the moving parts.

1. **Pistons and rings**

Cylinders are sealed and the gaseous pressure transmitted to the connecting rod by the piston and its rings.

The top section of the piston is the crown, and the lower section is the skirt.

The upper set of rings, compression or power rings, are carried by the crown of the piston. The lower set of rings, oil control rings, are carried by the skirt of the piston.

2. **Connecting rods and wrist pins**

A connecting rod is a bar or strut with a bearing at each end. The purpose of the connecting rod is to transmit the piston thrust to the crankshaft.

The connecting link between the connecting rod and the piston is the wrist pin.

There may be three arrangements of wrist pins.

- a. The wrist pin is secured in the piston, and the bearing is held in the connecting rod end.
- b. The wrist pin is fastened to the connecting rod, and the bearing is part of the piston.
- c. The wrist pin is free and bears against bearings in both the piston and the connecting rod.

3. **Crankshafts**

Crankshafts deliver force to the transmission and power train as a result of the thrust from the connecting rod.

Some crankshafts are designed with counterweights opposite the crank pins. These relieve the load on the main bearing by offsetting the inertia forces.

4. Bearings

The purpose of bearings is to support rotating shafts and other moving parts that transmit power from one engine part to another.

Bearings reduce the friction between the moving surfaces by separating them with a film of lubricant and carry away the heat produced by unavoidable friction.

5. Flywheels

The flywheel is a heavy wheel or disk attached to the crankshaft. Through rotation, the flywheel acquires kinetic energy. It stores additional kinetic energy when it speeds up and gives back that energy when it slows down.

The main purpose of the flywheel is to reduce the speed fluctuations of the crankshaft, caused by the difference in the amount of energy exerted on the piston during the power stroke and during the compression stroke.

Single-cylinder engines require larger flywheels than multi-cylinder engines, because energy variations during a complete cycle are greater in single-cylinder engines.

6. Camshaft and gear

The camshaft is a loosed shaft which provides eccentric action for opening the valves. It is driven from the crankshaft by a timing gear or through a timing chain.

7. Valves

The purpose of valves is to open and close ports in the combustion chamber. Since there are two ports for each cylinder, there must be two valves. The intake valve allows the fuel-air mixture to enter the chamber when the valve is open. Exhaust valves open to allow burned gases to escape from the combustion chamber into the exhaust system. Both valves are closed on the compression and power strokes.

8. Rocker arm assembly

The purpose of the rocker arm assembly is to actuate the valves at the proper time. The rocker arm assembly is actuated by the camshaft and consists of valve lifters, push rods, rocker arms, rocker arm shaft brackets, rocker arm shaft and accessory parts.

9. Oil pump and accessories

The oil pump is located in the oil pan. Its function is to provide engine lubrication. Pumps are of three types: vane, piston, and gear. Because of their long life and trouble-free operation, gear pumps are used in most engines.

In many engines, oil filters are located between the oil pump and the engine parts to remove abrasive particles.

Suggested Teaching-Learning Activities

1. Demonstrate the action of the running gear through the use of engine cutaways.
2. Have students disassemble an engine and study each part of the running gear and its function.
3. Have students label diagrams of running parts of an engine, giving the function of each part and its relationship to other parts.

Suggested Instructional Materials and References

Instructional materials

1. Tractor engines
2. Overhead transparencies and diagrams of running gear parts
3. Engine cutaway of running gear

References

1. Tractors and Crawlers, pp. 140-144.
2. Modern Farm Power, pp. 23-27.

V. To understand the electrical systemTeacher PreparationSubject Matter Content

The electrical system of a gasoline tractor provides ignition, which is one of the three essentials for combustion. The electrical system also provides power for easy starting and for accessories, such as lights. Knowledge of the electrical system is essential in trouble shooting and in proper tune-up of the tractor engine.

The generator is the source of power in battery-type tractor electrical systems. Usually belt-driven, it is located at the front of the tractor.

The main components of the generator include pole shoes, armature, commutator, brushes, and housing.

Some tractor manufacturers are installing alternators in place of generators on their tractors. The generator develops direct current, which is suitable for direct use by the battery and electrical equipment on the tractor; and the alternator develops alternating current, which must be "rectified" (changed to direct current) before it can be used.

Generators may vary in design, according to electrical requirements. Types include

1. Third brush generator
2. Shunt generator
3. Interpole generator
4. Bucking field generator
5. Split field generator

All DC generator systems include a cut-out relay (automatic switch) to disconnect the generator output circuit when the voltage of the generator is lower than the voltage of the battery.

2. Cut-off valve, strainers, and filters

The cut-off valve closes the fuel line when repairs are made on the fuel system. The strainers remove the small particles of foreign matter before they pass into the carburetor. The sediment bowl collects the large particles of dirt and water.

3. Fuel pump

A fuel pump is necessary on tractors that do not have the fuel tanks located above the engine or that do not have gravity pressure sufficient to supply the engine requirements.

4. Carburetor

The purpose of a carburetor is to mix air and fuel in certain definite proportions so as to form an efficient combustible mixture.

There are three basic types of carburetors used at present.

- a. Suction type
- b. Float type
- c. Diaphragm type

5. Intake manifold

The purpose of the intake manifold is to distribute the air-fuel mixture to the cylinders. It consists of passages from the carburetor to pairs of cylinders or, in some cases, to each cylinder.

6. Air cleaners

The carburetor air-intake system is part of the fuel system. It consists of a pre-cleaner, a cleaner, and a passage or duct to the carburetor.

The two common types of air cleaners used on tractors are

- a. Dry type
- b. Oil bath type

An ignition circuit provides the spark in the combustion chamber to ignite the fuel at the proper time. The major components on farm tractor engines include spark plugs, an ignition coil, and a distributor or a magneto.

1. Spark plugs

The spark plugs are installed in the engine combustion chambers. The spark which "jumps" between the terminal of the spark plug ignites the air-fuel mixture.

Spark plugs are usually classed as hot, cold, or standard.

Cutaway View of a Spark Plug

2. Ignition coil

Coils are used in ignition systems to increase the voltage of the electrical current needed to provide the spark in the combustion chamber. Coils increase the current from 6 to 12 volts to as much as 25,000 volts.

Cutaway View of a Typical Ignition Coil

3. Distributor

A distributor has parts of two separate electrical circuits, a low-voltage circuit and a high-voltage circuit. The low-voltage, or primary system, consists of the source of current, a switch, a set of breaker points, a breaker cam, a condenser, a primary coil, and the wiring to make the circuit complete. The high-voltage, or secondary system, consists of the secondary, the spark distributor, the spark plugs, and the wiring to make the circuit complete. Also, most systems include a mechanism for advancing the timing of the spark.

Cutaway View of a Distributor

4. Magneto

Magnetos are self-contained assemblies which are driven by the engine and supply high voltage current to the spark plugs.

Magnetos contain a coil, a condenser, points, a distributor cap, and a rotor. Magnetos with a spring-loaded drive turn quickly when a cylinder is to fire, thus generating more voltage and resulting in a better spark while starting the engine.

5. Starting motor

The starting motor, or starter, which is found on most tractors, is a series-wound 6-, 12-, or 24-volt direct-current motor mounted near the flywheel of the tractor.

Suggested Teaching-Learning Activities

1. Have students disassemble and study an electrical system.
2. Have students diagram an engine electrical system, showing each major assembly and component.

3. Using electrical circuit parts, have students put together an ignition system typical of that used on a tractor engine. Have students measure the amount of voltage of the battery, and then of one of the plugs. Emphasize that the increase is due to the function of the coil.

Suggested Instructional Materials and References

Instructional materials

1. The electrical system of an engine mounted on a display board
2. Electrical systems for students to use
3. Overhead transparencies, charts, and diagrams showing exploded views of the components of an electrical system

References

2. Modern Farm Power, pp. 102-130.
- S 3. Electrical Systems.

VI. To understand the fuel, air, and exhaust systems

Teacher Preparation

Subject Matter Content

The purpose of tractor fuel systems is to supply fuel to the engine. The fuel system on most tractors with a spark-ignited engine consists of fuel tank, fuel line, cut-off valve, strainers and filters, fuel pump (unless the fuel tank is located above the engine), carburetor, and intake manifold.

1. Fuel tank

The fuel tank serves as a reservoir for the storage of fuel. On most tractors the fuel tank is located above the engine, and the fuel flows to the carburetor by the force of gravity. Some tanks have built-in filters and strainers to prevent dirt from entering the tank with the fuel.

2. Cut-off valve, strainers, and filters

The cut-off valve closes the fuel line when repairs are made on the fuel system. The strainers remove the small particles of foreign matter before they pass into the carburetor. The sediment bowl collects the large particles of dirt and water.

3. Fuel pump

A fuel pump is necessary on tractors that do not have the fuel tanks located above the engine or that do not have gravity pressure sufficient to supply the engine requirements.

4. Carburetor

The purpose of a carburetor is to mix air and fuel in certain definite proportions so as to form an efficient combustible mixture.

There are three basic types of carburetors used at present.

- a. Suction type
- b. Float type
- c. Diaphragm type

5. Intake manifold

The purpose of the intake manifold is to distribute the air-fuel mixture to the cylinders. It consists of passages from the carburetor to pairs of cylinders or, in some cases, to each cylinder.

6. Air cleaners

The carburetor air-intake system is part of the fuel system. It consists of a pre-cleaner, a cleaner, and a passage or duct to the carburetor.

The two common types of air cleaners used on tractors are

- a. Dry type
- b. Oil bath type

Cutaway View of an Oil Bath Type Cleaner

7. Exhaust system

Exhaust systems pipe the exhaust gases away from the engine. Most systems consist of an exhaust manifold to receive the gases from the cylinders, a muffler to reduce the engine noises, and an exhaust pipe to conduct the exhaust gases out of the way of the cylinder.

8. Governors

The purpose of a governor on an engine is to regulate the throttle automatically so as to maintain a uniform rate of engine speed regardless of the load. The fly-ball or flyweight type of governor is the most common type found on tractors.

Suggested Teaching-Learning Activity

Have students thoroughly disassemble and examine a complete fuel, air, and exhaust system. In the process, they should learn each of the assemblies and the components of each assembly.

Suggested Instructional Materials and References

Instructional materials

1. Tractors for students to use in learning the fuel, air, and exhaust systems
2. Charts and diagrams of air, fuel, and exhaust systems
3. Overhead transparencies, preferably overlays of air, fuel, and exhaust systems

References

1. Tractors and Crawlers, pp. 144-158, 174-176.
2. Modern Farm Power, pp. 51-66, 83-91, 92-101.
3. Fuel Systems and Fuel Storage.

VII. To understand the cooling systemTeacher PreparationSubject Matter Content

Only about one-third of the heat energy of fuel is converted into mechanical energy and leaves the engine in the form of brake horsepower. Thus, about two-thirds of the heat energy of fuel shows up in hot exhaust gases, friction heat, and heating of the walls of the combustion chamber.

The purpose of the cooling system is to remove the unwanted heat from the engine.

Almost all tractor engines are provided with a liquid cooling system. The two types used on tractors are

1. Forced-circulation system
2. Thermo-siphon system
 - a. Forced-circulation system

This system incorporates a pump to assist the circulation and a thermostat to control the temperature of the coolant by controlling the flow of the coolant.

b. Thermo-siphon system

This system differs from the forced-circulation system because a pump is not used to force the circulation of the coolant; but rather the circulation is caused by the difference in the temperature of the coolant in the radiator and in the engine.

Both systems consist of radiator and fan. The purpose of the radiator is to expose the coolant to the air in such a way that an effective heat exchange may take place. The fan increases the flow of air through the radiator so that the heat is removed more rapidly than would be the case if there were no fan.

Pressure caps are used to allow pressure in the radiator to equalize with outside pressure upon cooling and consequent contraction of the coolant. This eliminates the danger of the radiator tank collapsing.

Diagram of Cross Section of a Forced-Circulation Cooling System

Diagram of Cross Section of a Thermo-Siphon Cooling System

Suggested Teaching-Learning Activities

1. Have students disassemble and examine a cooling system.
2. Have students learn the components of cooling systems.
3. Have students list advantages and disadvantages of the two types of liquid cooling systems.

Suggested Instructional Materials and References

Instructional materials

1. Tractor and other cooling systems for student use
2. Charts, diagrams, and overhead transparencies on cooling systems.

References

1. Tractors and Crawlers, pp. 172-174.

Suggestions for Evaluating Educational Outcomes of the Module

The educational outcome of the module should be evaluated according to knowledge gained by each student and by attitudinal changes.

The following criteria should be used:

1. Student interest in the material covered in the module
2. Student participation in class and laboratory activities
3. Quality of reports presented by students
4. Student performance at the end of the module, compared with performance at the beginning

Total for module 54 hours

Suggestions for Introducing the Module

Until recent years farm tractor power has been limited primarily to gasoline engines. With improvements in diesel engines and with farming requiring heavier power units, diesel engines are fast gaining in popularity for use on the farm.

For this reason, it is highly important for those planning careers in the agricultural machinery field to have an understanding of the construction and principles of operation of a diesel engine. Also, persons planning for employment in the field of agricultural machinery should have a knowledge of the economics involved in diesel engines as compared with gasoline engines.

The following technique should be used to create interest in the module:

Bring before the class both a gasoline and a diesel tractor engine. Have students identify on each engine the fuel system, governing system, lubricating system, and the cooling system. Emphasize the difference in systems and construction of the two engines.

Competencies to be Developed

I. To understand what a diesel is and how it works

Teacher Preparation

Subject Matter Content

The essential feature of the diesel engine is the compression of a charge of air producing a temperature beyond the self-ignition point of the fuel, and the subsequent injection of fuel, and instantaneous ignition of the fuel in this highly compressed hot air.

A diesel engine is a machine which produces power by burning fuel in a body of air which has been compressed by a moving piston.

To understand what a diesel engine is, one must have a knowledge of the principles of operation of the engine. Actions that take place inside the engine are referred to as basic actions and occur in the following order:

1. Air is drawn into the cylinder.
2. Air is compressed to a high pressure, causing its temperature to rise.
3. The fuel is injected into the cylinder in the form of a fine spray. Fuel in the form of a spray produces a "homogeneous" mixture of fuel and air.
4. Combustion occurs immediately after fuel is injected into the cylinder because the temperature of the air is high enough, sometimes as high as 1,000 degrees F., to ignite the fuel. Combustion produces an expansion of the gaseous mixture, which pushes on the piston and causes the engine to produce mechanical power.
5. Having lost their pressure, the gases are exhausted.

The diesel engine introduces fuel into its combustion chamber by means of an injector after air alone has been squeezed to about one-sixteenth of its original volume by the piston (16 to 1 compression ratio).

The fuel charge is forced into the combustion chamber by the injector action through a number of tiny holes, each approximately .005 inches in diameter, and at pressures of 10,000-20,000 pounds per square inch. This produces a fine mist or spray, and the atomizing effect aids in vaporizing the fuel and mixing it more intimately with the air present.

At the 16 to 1 compression ratio, compression pressures in the diesel combustion chamber reach 500-800 pounds per square inch with accompanying high temperatures of approximately 1000° F.

This "heat of compression" spontaneously ignites the fuel injected. The diesel method of ignition simply utilizes a law of nature - when air is compressed, its temperature rises in proportion to the compression ratio. The same result may be noticed to a lesser degree when using a hand air pump to inflate a tire or a basketball.

Up and down movements of the piston in the cylinder are known as strokes. During a stroke one or more events or actions occur. The strokes described above are known as:

1. Intake
2. Compression
3. Power
4. Exhaust

In a four-stroke-cycle engine one event occurs during each stroke and four strokes are required to complete a cycle. In a two-stroke-cycle engine more than one event occurs during a stroke and only two strokes are required to complete a cycle.

Although the outward appearance of a diesel tractor may not be greatly different from that of a gasoline tractor, there are a number of differences in the engine.

1. Diesel engines do not have ignition systems.
2. Diesel engines draw only air into the cylinder on the intake stroke.
3. Diesel engines use much greater compression ratios.
4. Diesel engines use less volatile, heavier liquid fuels.
5. Diesel engines use fuel pumps and injectors instead of carburetors.
6. Diesel engines are heavier than gasoline engines of the same size.

Suggested Teaching-Learning Activities

1. Through the use of charts, diagrams, and teacher-made mockups, illustrate the up and down movements (strokes) in the cylinder of both a two-stroke-cycle and a four-stroke-cycle diesel engine.
2. Bring a cutaway model of a diesel engine before the class and demonstrate the four-stroke cycle.
3. Bring gasoline and diesel engines of comparable size before the class and point out the differences in the two engines.

4. Have students survey their local communities to determine the extent to which diesel engines are used on farms.

Suggested Instructional Materials and References

Instructional Materials

1. Charts, diagrams, and mockups of the stroke action in both types of diesel engines
2. A cutaway model of a diesel engine
3. A gasoline engine
4. A diesel engine

References

*The symbol T (teacher) or S(student) denotes those references designed especially for the teacher or for the student.

II. To understand the structural parts of a diesel engine

Teacher Preparation

Subject Matter Content

In general, the engine structure includes those parts which are fixed and have as their main function holding the engine together. Its primary job is to support and keep in line the moving parts, which resist the forces set up by the operation of the engine. The engine structure also supports auxiliary systems and provides jackets and passages for cooling water, a pump for lubricating oil, and a protecting enclosure.

The two kinds of forces acting on the structure are:

1. Firing pressures, which act on the cylinder heads and crankshaft bearings
2. Inertia forces, which are caused by motion of the pistons, connecting rods, and crankshaft

Frame designs of diesel engines vary, since they may be of either vertical design or horizontal design. Vertical frames may be of the automotive design used for smaller, stationary engines or A-frame design used for large engines. Also the frame may be either two-piece or three-piece, depending upon its design, which may be determined by its size and use.

The two-piece vertical frame construction is the most widely used. The lower part, or bedplate, of the two-piece frame forms the base, supports the main bearings, encloses the lower part of the crankcase and cylinder block.

Most designs include all cylinders in a single block; however, some designs cast cylinders individually.

Frames for horizontal engines are constructed very much like those of vertical engines. They are usually in two parts.

Resistance to wear and cooling is the prime requirement of cylinders of diesel engines. To build up resistance, the cylinder is fitted with a sleeve or liner, which may be either the "dry" or the "wet" type. The main difference between "wet" liner and a "dry" liner is that the "dry" liner makes metal-to-metal contact with the cylinder casting which contains the water jacket. The "wet" liner does not make metal-to-metal contact with the cylinder casting and its outside surface is wetted by the cooling water. "Wet" cylinder liners are used most commonly in tractor engines.

Since cylinder heads of diesel engines must be stronger and more carefully cooled than gasoline engine cylinder heads, a more complicated structure is required. Thus, many large engines use individual cylinder heads.

Suggested Teaching-Learning Activities

1. Show students a dry and wet type sleeve.
2. Bring a cutaway model of a diesel engine before the class, identify the various parts of the engine structure, and explain the function of each part.
3. Bring before the class two diesel engines, one of the vertical design and the other of the horizontal design. Explain the differences in the construction of each type engine.

4. Have each student team draw a diesel engine, identifying the following:
 - a. Engine design
 - b. Type of cooling
 - c. Type of cylinder sleeves
 - d. Number of structural parts

Suggested Instructional Materials and References

Instructional Materials

1. Charts of the types of engine designs
2. A cutaway model of a diesel engine
3. A vertical design and a horizontal design diesel engine
4. Diesel engines for disassembly

References

Diesel and High-Compression Gas Engines. pp. 147-155.

III. To understand the function of the running gear and its parts

Teacher Preparation

Subject Matter Content

The moving parts of the engine that receive the gaseous energy produced in the combustion chamber and deliver it to the output end of the engine in the form of useful power are referred to as the running gear.

The piston and its rings seal the cylinders and transmit the gaseous pressure to the connecting rod.

The top section of the piston is referred to as the crown and the lower section as the skirt. The shape of the crown is determined by the design of the combustion chamber.

Piston connection to connecting rods may be according to two designs.

1. Trunk piston--This design is used in most engines. The connecting rod acts directly on the piston. The side thrust caused by this design causes the piston to press against the cylinder wall, first on one side and then on the other, causing considerable wear near the middle of the stroke.
2. Cross head piston--The connecting rod does not act directly on the piston in this design, since the crosshead and crosshead guides prevent this action. (Example: See Diesel and High Compression Gas Engines, page 160.)

The advantages of a crosshead are:

1. Easier lubrication
2. Uniformly distributed clearance around the piston
3. Simpler piston construction because the wrist pin and its bearings are eliminated

Even though crosshead designs offer advantages over trunk piston design, they are offset by disadvantages such as added weight and height and need for more careful adjustment.

Piston rings serve several important purposes and are classified according to the service they perform.

1. Compression rings--Usually numbering four to six, they are located in the crown of the piston. They serve two main purposes.
 - a. They seal the space between the piston and the liner.
 - b. They transmit heat from the piston to the water-cooled cylinder liner.
2. Seal rings--As the face of the compression ring or the cylinder bore wears, the gap at the joint of the ring becomes larger. To reduce compression loss from leakage through the gap, special seal rings are used. Seal rings are also located on the top portion of the piston, below the compression rings.

Usually one or two, occasionally three, oil control rings are located near the bottom of the piston skirt. These rings scrape off, on the downstroke, most of the lubricating oil splashed on the cylinder wall by the crankshaft and connecting rod, and ride over the remaining oil film on the up stroke.

Oil control rings prevent surplus oil from being carried into the combustion chamber. This surplus oil is only partially consumed, leaving a carbon deposit. Oil rings also allow sufficient oil to be carried to the upper part of the cylinder liner during the upstroke to lubricate the piston surface and the compression rings.

A connecting link between the connecting rod and the piston is known as the wrist pin. There may be three arrangements of wrist pins.

1. The wrist pin is secured in the piston and the bearing is held in the connecting rod end.
2. The wrist pin is fastened to the connecting rod and the bearing is part of the piston.
3. The wrist pin is free and bears against bearings in both the piston and the connecting rod.

Crankshafts deliver force to the transmission and power train as a result of the thrust from the connecting rod.

Some crankshafts are designed with counterweights opposite the crank pins. These relieve the load on the main bearing by offsetting the inertia forces.

The purpose of bearings is to support rotating shafts and other moving parts and aid in transmitting loads from one engine part to another.

Bearings reduce the friction between the moving surfaces by separating them with a film of lubricant and carry away the heat produced by unavoidable friction.

The flywheel is a heavy wheel or disk attached to the crankshaft. Through rotation, the flywheel acquires kinetic energy. It stores additional kinetic energy when it speeds up, and it gives back that energy when it slows down.

The main purpose of the flywheel is to reduce the speed fluctuations of the crankshaft that are caused by the difference in the amount of energy exerted on the piston during the power stroke and the compression stroke.

Single-cylinder engines require larger flywheels than multi-cylinder engines, because energy variations during a complete cycle are greater in single-cylinder engines.

Suggested Teaching-Learning Activities

1. Bring before the class several types of each kind of ring. Explain the advantages and disadvantages of each.
2. Bring a piston with rings to the class and point out the crown, skirt oil rings, compression rings, and seal rings.
3. Measure cylinder wear on new and old cylinders.
4. Using a cutaway model of an actual diesel tractor engine, demonstrate to the class the function of the connecting rods, the wrist pins, the crankshaft, and the flywheel.
5. Have the diesel engine running gear completely disassembled. Have students reassemble it and replace it in the engine.
6. At the end of the discussion of the running gear, lay out the parts of the running gear and have students identify them.

Suggested Instructional Materials and References

Instructional Materials

1. Various types and kinds of rings
2. A piston complete with rings for a diesel engine
3. Two diesel engines, one using cross head pistons and the other using truck pistons
4. A cutaway model of a diesel engine
5. Diesel engine running gear parts

References

Diesel and High Compression Gas Engines, pp. 156-177.

IV. To understand the diesel air intake and exhaust system

Teacher Preparation

Subject Matter Content

The main purpose of the air intake and valve systems is to charge the cylinder with air and remove the products of combustion (the burned gas).

In four-cycle engines, separate piston strokes fill and discharge the cylinders. The only additional parts needed are valves and actuating gear to control the flow of air and exhaust gas.

In two-cycle engines, fresh air must be forced in to push out the exhaust gas and charge the cylinder. This is the function of the scavenging system.

Components of the air intake and valve systems and their functions are:

1. Valves--Valves control the admission of the air charge in four-cycle engines, the discharge of exhaust gases in all four-cycle and many two-cycle engines, the admission of fuel in some engines, and the admission of compressed air for starting many large engines.
2. Valve actuating gear--The function of the valve actuating gear is to cause and control the opening and closing of the intake and exhaust valves. The actuating gear may also actuate the fuel injection valves, the fuel pumps, or the air starting valves.

Valve actuating gear usually consist of:

- a. Camshaft drives
- b. Camshafts
- c. Pusher rods and rockers

3. Superchargers--The purpose of the supercharger is to force more air into the cylinder so that more fuel can be burned and the engine output boosted.

Superchargers are usually either the positive displacement rotary blower type or the centrifugal blower type.

4. Scavenging systems--In two-cycle engines the pressure of the incoming air charge must be used to scavenge or push out the exhaust gases during a short period of time when the piston is near the bottom of its stroke.

The three basic methods of supplying the incoming air charge at the low pressure needed to accomplish this are:

- a. Crankcase scavenging
- b. Power piston scavenging
- c. Pump or blower scavenging

Suggested Teaching-Learning Activities

1. Lay out various parts of the air intake system and have students attempt to identify them.
2. Through the use of pictorial diagrams in wall chart form and strip films, demonstrate the various parts of the air intake system.
3. Bring several types of superchargers to class to familiarize the students with them and their functions.
4. Have students disassemble an air system on a diesel engine. Have students identify the parts and observe how they function in the motor. Included in the system should be valves, valve actuating gear, superchargers, scavenging systems, camshaft, and drive.

Suggested Instructional Materials and References

Instructional Materials

1. Parts of a diesel air intake and exhaust system
2. Strip films and charts of the air system in diesel motors

3. Several diesel motors for students to disassemble
4. A . . . charger of each type

References

Diesel and High-Compression Gas Engines, pp. 178-205.

V. To understand diesel fuel systems

Teacher Preparation

Subject Matter Content

The heart of the diesel engine is the fuel injection system. The function of the fuel injection system is to deliver fuel to the combustion chamber. In doing so it must:

1. Meter or measure the correct quantity of fuel to be injected
2. Time the fuel injection
3. Control the rate of fuel injection
4. Atomize, or break up, the fuel into fine particles
5. Properly distribute the fuel in the combustion chamber

Most modern diesels use mechanical or solid injection instead of the original air injection method. Pumps and spray valves are the basic elements of solid injection systems. The three main classes of solid injection systems are:

1. Common rail
2. Individual-pump
3. Distributor systems

"Diesel Fuel Systems"

Diesel Fuel System

Diagram of a diesel fuel system showing several in-line filters and traps for the removal of foreign material and moisture from fuel.

There are two designs of the common rail or header systems.

1. Cam-operated spray valve design--This design uses a single pump which supplies high-pressure fuel to the "common rail" connected by tubing to spray valves (fuel nozzles). The spray valves are mechanically operated by cam action and control the metering and timing. (Example: See Diesel and High-Compression Gas Engines, p. 209.)
2. Self-actuated spray valve design--A cam-operated fuel injector and a spring-loaded nozzle perform the functions of the fuel-needle valve. This is the chief difference between the self-actuated spray valve design and the cam-operated spray valve design. (Example: See Diesel and High-Compression Gas Engines, p. 210.)

In the individual pump system of fuel injection the pump performs the major job. The functions of the pump are:

1. To raise the pressure of the fuel
2. To meter the charge
3. To time the injection

(Example: See Diesel and High Compression Gas Engines, diagram 3, p. 212.)

Distributor injection systems may be either high-pressure or low-pressure.

In this system the fuel is metered at a central point and then directed by the distributor to each cylinder in the proper firing order. (Example: See Diesel and High-Compression Gas Engines, diagram 4, p. 214, and diagram 5, p. 215.)

An important part of the fuel assembly of a diesel engine is the fuel filter system. The number of filters used ranges from one to three. Filters are usually referred to as:

1. First stage (primary or auxiliary), which removes most of the water and coarse material

"First Stage Fuel Filter Assembly"

First Stage Fuel Filter Assembly

- | | |
|-------------------------|-----------------------------|
| 1. Vent Plug | 10. Element Plate Oil Seal |
| 2. Vent Plug Washer | 11. Spring Washer |
| 3. Filter Head Assembly | 12. Element Tension Spring |

| 7. Snap Ring | 16. Drain Plug |
| 8. Gasket-Element End | 17. Oil Seal Retainer |
| 9. Element Lower Plate | 18. Center Bolt |

2. Second stage (intermediate or final if only two are used), which removes the finer particles and a small amount of water

"Second Stage Fuel Filter Assembly"

Second Stage Fuel Filter Assembly
 1. Filter Head 3. Filter Base Assembly
 2. Filter Element 4. Element Seal

3. Third stage, which (if used) removes any remaining small particles

Although combustion chambers are not a part of the fuel system, they are closely related to it and must be understood to know a diesel engine fully.

The entire job of vaporizing, mixing, and igniting fuel takes place inside the cylinder in an extremely short time. In order for this job to be performed properly and efficiently, the combustion chamber must be designed for the most efficient performance possible.

Successful combustion depends upon:

1. Fine atomization
2. High temperature for prompt ignition
3. High relative velocity between fuel and air particles
4. Good mixing of fuel and air particles

Combustion chamber designs vary according to manufacturers but basically can be grouped as:

1. Open chambers--This design, because it is simple, is used primarily in engines which do not run at high maximum speeds and through a wide speed range.
2. Special design chambers--Special design chambers are necessary in engines that run at high maximum speeds and through a wide speed range. Because speed changes unbalance the correct proportioning of spray, incomplete combustion and a smoky exhaust result. Special design chambers may be grouped in four main classes.
 - a. Turbulence chambers
 - b. Precombustion or antechambers
 - c. Air cells
 - d. Energy cells

It is very important that the proper fuel be used in a diesel tractor engine. If the fuel is not of the proper specification, damage to the engine will result. Manufacturers of diesel engines list in the ~~Operator's~~ manual, for each machine they make, the type of fuel to be used in their engines. The recommendations of the manufacturer should be followed when selecting diesel fuels.

Mechanics and mechanics' helpers should understand all the properties of diesel fuel in order to provide long, trouble-free operation of the engine. If a diesel engine doesn't operate satisfactorily, check the fuel properties. Two standard grades of diesel fuel are distilled by manufacturers.

1. Number One Diesel Fuel (No. 1-D)
2. Number Two Diesel Fuel (No. 2-D)

The following factors affect the burning of fuel and ultimately the efficiency of operation of the diesel engine.

1. Cetane rating--Cetane rating is a measure of the self-ignition and burning qualities of diesel fuel. If a fuel has the proper cetane rating for the engine it is to be used in it will:
 - a. Cause easier starting

- b. Produce less smoke
- c. Reduce fuel knock

The most satisfactory cetane rating for diesel engines is between 40 and 60.

2. Volatility of fuel--The volatility of a fuel has reference to the ease at which the fuel will change into a vapor or gas.
3. Carbon residue--Carbon residue is the carbon deposit left after all the good qualities in the fuel have burned. This residue forms on all parts of the engine that come in contact with it.
4. Viscosity--The viscosity of the fuel has reference to the length of time it takes for a fuel to flow through the orifice in the injector nozzle tip.
 - a. Most fuels have different viscosity rates because of the size of the injector orifice and the size of the engines.
 - b. Diesel fuels must have more lubricating qualities than other fuels because the injector and injector pump are lubricated through the fuel.
 - c. Proper viscosity provides a better spray pattern.
5. Sulphur content--The sulphur content has reference to the amount of non-combustible materials in the fuel, that, when burned, form gases that mix with water in the cylinder and form a corrosive liquid. This corrosion causes the engine parts to gum up and work improperly.
6. Ash content--When a fuel burns, a certain amount of non-combustible ashes are left in the cylinder. These ashes take on the form of an abrasive in the cylinders.
7. Water and sediment content--Water and sediment can cause serious damage to the fuel system of a diesel engine.
 - a. It may cause the fuel system parts to rust.
 - b. It may interfere with proper injector lubrication.
 - c. It may cause plugging of nozzle tips.

8. Flash point--Fuel flash point refers to the lowest temperature at which the fuel vapor will ignite. The compression ratios of diesel engine systems are higher than those for spark ignition systems. This is necessary because the compressed air serves to ignite the fuel in the compression chamber. The average compression ratio for diesel tractors is approximately 16.3 to 1.
9. Pour point--Pour point is the point at which the fuel oil congeals or solidifies by cooling. If a fuel oil does not have the correct pour point in cold weather it will not move into or through the injector lines, injector, and the injector pump.
10. Cloud point--At some temperature slightly above the pour point diesel fuel becomes cloudy due to the formation of wax crystals. The temperature at which this begins to occur is called the cloud point. Since the wax crystals cause clogging of fuel filters and supply lines, and since this occurs at temperatures above the pour point, the cloud point may be an even more important consideration as a fuel specification than the pour point. The cloud point also depends on the hydrocarbon composition of the fuel. Cloud points usually occur from 8 to 10 degrees Fahrenheit above the pour points, but cloud points as high as 15 or even 20 degrees above the pour points are not uncommon.

Suggested Teaching-Learning Activities

1. Bring a diesel motor before the class. Call attention to the fuel system. Disassemble and discuss the fuel system part by part.
2. Have the class compare the following diesel engine fuel systems:
 - a. Cam-operated valve design
 - b. Self-activated spray valve design
 - c. Individual pump system
 - d. High-pressure distributor system
 - e. Low-pressure distributor system

3. Have students replace the fuel filter in several diesel engines. Call to their attention the construction of the filter and parts associated with it.
4. Have students observe the types of combustion chambers mentioned in the content in diesel motors.
5. Have students disassemble and study the parts of the fuel pump.
6. Bring to the class several fuel injectors. Have students disassemble them and become familiar with the parts of each one.
7. Demonstrate pour and cloud points by heating and cooling diesel fuel samples in a test tube.
8. Visit a local agricultural machinery dealership and observe calibration testing of fuel pumps.
9. Have students check injector nozzles for proper spray pattern.

Suggested Instructional Materials and References

Instructional Materials

1. Diesel motors
2. Fuel filters
3. Fuel pumps
4. Fuel injectors

VI. To understand the auxiliary systems of a diesel engine

Teacher Preparation

Subject Matter Content

An understanding of diesel engines is not complete without a knowledge of the auxiliary systems.

Auxiliary systems include:

1. Governing system
2. Lubricating system
3. Cooling system

The purpose of a governing system is to maintain a constant engine speed automatically even under varying loads.

The basic principle which makes a governing system work is that any change in load immediately causes a change in speed. To keep the engine running at a steady speed, the flow of fuel must be regulated in such a way that the power developed is just equal to that needed at the desired speed. The governor does this by noting a change in engine speed and then adjusting the rate of fuel flow to meet the needs of the engine to maintain a steady speed.

Governors may be either:

1. Mechanically operated
2. Hydraulically operated

Governors which are mechanical or hydraulic may vary in design and function and may be classed as:

1. Constant speed
2. Variable speed
3. Speed-limiting
4. Load-limiting
5. Pressure-regulating
6. Torque-converter
7. Overspeed trip

(Example: See Diesel and High-Compression Gas Engines, diagram 7, p. 278.)

An essential system for the operation of an engine is the lubricating system.

The function of the lubricating system is to keep all moving parts properly lubricated. To do this, the lubricating system must:

1. Maintain an oil film between the shafts and bearing surfaces at the main, crankpin, and wrist pin bearings
2. Maintain an oil film for the camshaft, valve gear, and engine auxiliaries
3. Provide oil film between the piston and the cylinder wall

Most diesel engines have a pressure-circulating lubricating system. The design of the system varies according to the engine size and design.

The main components and their functions of a typical lubricating system are:

1. Sumps (wet or dry)--The purpose of the sump is oil storage. In many designs it is part of the crankcase. In other designs the oil storage is outside the engine itself and is known as a dry sump.
2. Main pump--Usually this is mechanically driven and forces oil under pressure to the lubricating piping of the engine.

The auxiliary pump is usually driven by an electric motor. It lubricates cylinder and bearing surfaces before the engine reaches necessary speed and after it is shut down.

The purpose of the oil strainer is to prevent dirt passing into the engine.

The function of the oil cooler is to maintain the temperature of the oil within desired limits.

Only about one third of the heat energy of the fuel is converted into mechanical energy and leaves the engine in the form of brake horsepower. Thus, about two-thirds of the heat energy of the fuel shows up in hot exhaust gases, friction heat, and heat in the walls of the combustion chamber.

The purpose of the cooling system is to remove the unwanted heat from the engine.

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963

**Heat Input and Disposal in a Diesel Engine
(Three-Quarters to Full Load)**

<u>Thermal Transfer</u>	<u>BTU per BHP-Hr.</u>	<u>Per Cent</u>
Heat input	7,367	100.0
Heat disposal:		
Useful work	2,544	34.6
To cooling water and lubricating oil	2,194	29.8
To exhaust gases	2,259	30.6
Lost by radiation	370	5.0
Total heat disposal	7,367	100.0

Cooling systems vary according to engine size and design. Classes of cooling systems are:

1. Open cooling system
2. Steam systems
3. By-pass systems
4. Closed cooling systems

The closed cooling system is used on diesel engines in the same way that it is used on other farm machinery. It uses a water to air (radiator) type heat exchanger.

51

Suggested Teaching-Learning Activities

1. Through the use of charts, pictorial diagrams, and cutaways, explain how the governing, lubricating, and cooling systems of a diesel engine function.
2. Have students disassemble and become acquainted with the types of governors mentioned in the content.
3. Have students trace the lubrication system of a diesel tractor.
4. Through the use of a cutaway model of a diesel engine, demonstrate how the lubrication, governing, and cooling systems function.

Suggested Instructional Materials and References

Instructional Materials

1. Charts, pictorial diagrams, and cutaways of governing, lubricating, and cooling systems
2. A governor for each student
3. A diesel motor
4. A cutaway model of a diesel engine

Suggestions for Evaluating Educational Outcomes of the Module

The educational outcomes of the module should be evaluated according to knowledge gained by and attitudinal changes in each student.

The following criteria should be used:

1. Student interest in the materials covered in the module
2. Student participation in class and laboratory activities
3. Student performance at the end of study of the module as compared with their performance at the beginning

TRACTOR REPAIR

Major Teaching Objective

To develop (1) an understanding of the procedures to follow in overhauling a tractor and (2) the ability to disassemble, repair, reassemble, and tune the tractor for field operating conditions

Suggested Time Allotments

At school

Class instruction	<u>168</u> hours
Laboratory experience	<u>336</u> hours

Total at school	<u>504</u> hours
-----------------	------------------

Occupational experience	<u>250</u> hours
-------------------------	------------------

Total for module	<u>754</u> hours
------------------	------------------

Suggestions for Introducing the Module

The most important job responsibility of the agricultural machinery mechanic is repairing the tractor. To do this, he must understand the function of each part in the tractor and follow a systematic procedure. He must understand the various units on a tractor, their purpose, and the operation. Above all, he must be able to disassemble, diagnose troubles, make repairs, reassemble the unit, and get the tractor to function properly under field conditions.

Outlined in this module are the general steps or procedures to follow when making repairs common to all makes and models of tractors. For specific adjustments the manufacturer's specifications should be consulted and the adjustments made accordingly. If the repair procedure outlined in this module is not applicable to a tractor, follow the manufacturer's repair procedure.

Some classroom time should be devoted to discussion and study of each step in repair procedures, but the greatest part of the time should be allotted to student repair of tractors in the shop.

After each student has completely overhauled his first tractor, have him overhaul another tractor of the other kind (diesel or gasoline). With the second overhaul, he should develop sufficient understandings and abilities for a marketable skill in tractor repair.

Competencies to be Developed

I. To determine the extent of repair needed by a tractor

Teacher Preparation

Subject Matter Content

A tractor should be thoroughly tested to determine the extent of overhaul needed before any disassembly of the engine is begun. Tests provide valuable clues to possible internal malfunctions of the engine or other parts. As these tests are made record all observations.

1. Field tests. When operating the tractor under load observe the following:
 - a. Oil pressure activity. A low pressure reading may indicate any of the following:
 - 1) Loose rod or main bearings
 - 2) Bad oil pump
 - 3) Loose camshaft bearing
 - b. Blow-by through breather. Excessive blow-by means that the engine may have any of the following malfunctions:
 - 1) Worn rings
 - 2) Hole in piston
 - 3) No ring tension on cylinder wall
 - 4) Excessively high water temperature
 - c. Operating water temperature. High operating water temperature suggests:
 - 1) Bad thermostat
 - 2) Flugged radiator fins or internal tubes
 - 3) Blown head gasket allowing compression vapors to escape into the engine coolant
 - 4) Internal crack in engine block or head
 - d. Excessive noise or knock. Excessive noise in an operating engine suggests:
 - 1) Loose rod bearings, which knock when the engine is free running.
 - 2) Loose main bearings, which knock under load.
 - 3) Poor detination timing

e. Excessive blue or black smoke coming from the exhaust pipe. A black smoke indicates that the fuel mixture is too rich with fuel. This problem can be eliminated by tuning up the fuel system. A blue smoke indicates that oil is getting by the rings into the cylinder and burning with the fuel. Excessive blue smoke coming from the exhaust pipe suggest:

- 1) Worn or plugged oil rings
- 2) Fouled valve guide, which causes the engine to smoke after long periods of idling

2. Laboratory test. The best method of testing a tractor engine and clutch in the laboratory is by using a dynamometer. All findings should be recorded on the dynamometer test sheet.

3. Compression test. A compression test reveals malfunctions in the compression chambers of the engine and their associated parts. The following procedures should be followed when making a compression test on a gasoline or a diesel engine.

Gasoline engine compression test

- a. Remove all spark plugs.
- b. Insert compression gauge in the spark plug openings.
- c. Crank engine, turning it over five times.
- d. Read the compression gauge, noting the compression developed in each cylinder. All cylinders develop a compression within 10 pounds per square inch of each other and within the manufacturer's specifications.
- e. Put oil in cylinders to determine whether the low compression is caused by valves or rings.
 - 1) The oil seals up bad rings and compression readings increase.
 - 2) If two adjacent cylinders have low compression, insert spark plug in one and check the other cylinders with the compression gauge. An increase in compression indicates a blown head gasket between cylinders.

Diesel engine compression test

- a. Remove fuel line from the number die injector.
- b. Remove attachment nuts on injector and then the injector.

- 1) When removing the injector, use a crowfoot bar to pry injector out of the head. Be extremely cautious not to damage the nozzle end of the injector. If the nozzle end is bumped, the small orifices in the tip will close.
 - 2) Wrap the injector in a soft cloth to protect it while it is out of the engine.
- c. Insert compression gauge of suitable capacity for a maximum compression of 1000 p.s.i. The reading should be about 500 p.s.i.
 - d. Start engine and let idle at the speed recommended by the manufacturer and read the gauge. Compare reading with the specifications set up by the manufacturer.
 - e. Install the injector, reversing the order outlined in the procedure above.
 - f. Using the procedure outlined above, test the compression in all cylinders.
 - g. Check the running heat efficiency of the engine under load.

This check is made by placing heat chalk on the exhaust opening on each cylinder. The chalk turns color if the cylinder is operating with proper heat efficiency. The injector and valves must function properly and proper compression must develop in the cylinder in order to get a proper color reading. Color reading guides are available in most diesel repair shops.

4. Visual inspection. The following observations should be made and noted when testing the tractor in the field and in the laboratory:
 - a. External oil leaks
 - b. Broken parts
 - c. Loose bolts

Suggested Teaching-Learning Activities

1. Have students observe several diesel and gasoline tractors needing overhauling, in operation in the field.

Vary the amount of load that these tractors operate under, and have the class observe what happened and record their observations. At this time discuss with them the possible repairs needed.

2. Bring these tractors into the school laboratory and have students run a compression test on them and test them with a dynamometer. Have students record their findings.

Note. For best results, have enough tractors so that only two students are working on a tractor. Assign students to tractors to be tested, and require them to stay with these tractors until they are completely overhauled.

Suggested Instructional Materials and References

Instructional materials

1. Dynamometer
2. Compression gauge
3. Spark plug wrench
4. Crowfoot bar
5. Heat chalk

References

1. Manufacturer's service manuals

Suggested Occupational Experience

Have students run field, laboratory, and compression tests on machines considered for overhaul at a local agricultural machinery dealership. Have them diagnose the malfunctions in the tractors and suggest repairs.

II. To prepare a tractor engine for repair

Teacher Preparation

Subject Matter Content

Thorough cleaning is the first step in preparing an engine for overhaul. The best method is steam cleaning; but if this is

not possible, clean the engine with a mixture of one part "Gunk" concentrate (a cleaning compound made for dirty engines) with four parts kerosene. Paint the engine with this mixture and allow it to soak for 20 minutes; then wash it off with a spray of water.

After the engine has been thoroughly cleaned, follow these steps to prepare it for overhaul:

1. Remove engine accessories. These include the hood, shrouds, radiator shell and grill.
2. Drain the coolant from radiator and block into a clean container and inspect it for rust particles and other foreign particles.
3. Remove all radiator clamps and hoses, noting those that need to be replaced. Record this information on the reconditioning sheet.
4. Remove the radiator holding bolts and the radiator.
 - a. Check the radiator for bent fins, external leakage, and corrosion build up inside the radiator.
 - b. If the radiator needs repair, send it to a radiator shop.
5. Remove external engine parts.
 - a. Battery clamp and battery
 - 1) Remove battery cables removing the ground cable first.
 - 2) Inspect cables and note condition.
 - 3) Using a hygrometer and voltmeter, test the battery and recharge it, if necessary.
 - b. Starter
 - c. Water manifold and thermostat
 - 1) Check thermostat and note its condition
 - d. Carburetor (gasoline engine only)
 - 1) Remove linkage.
 - 2) Turn valve on gas tank off and remove gas line.
 - 3) Remove air cleaner base and note its condition.

e. Governor.

Diesel engines do not have the same type of governor as gasoline engines. Omit this step on the diesel engine.

- 1) Disconnect linkage and oil line.
- 2) Remove bolts around the housing.
- 3) Slip governor unit from housing.
- 4) Check spring for tension.

f. Intake and exhaust manifold

g. Air cleaner

- 1) Check condition of air cleaner. An excessively dirty cleaner may suggest possible clues to causes of internal malfunctions.

h. Spark wires, spark plugs, and distributor

A diesel engine has a different type of fuel and ignition system. The following procedures should be followed when removing the injector and injector pump:

1. Injector

a. Turn fuel valve off at tank.

b. Remove fuel lines from injectors.

- 1) All fuel lines from pump to injectors must be removed at each end.
- 2) Remove line bracket.
- 3) Be careful not to bend lines.

c. Remove injector.

- 1) Remove hold-down nuts.
- 2) Use crowfoot bar to pry injector out.
- 3) Remove injector, being careful not to bump the nozzle tips.
- 4) Wrap injector in a soft cloth to avoid damage to the nozzle tips while they are out of the engine. Always remove the injector before removing the head.

2. Injection pump

a. Locate marks used in timing pump.

- b. Rotate engine until marks are in proper position and the number one cylinder is on the compression stroke.
- c. Remove throttle and stop linkage attached to pump.
- d. Remove fuel lines.
- e. Remove primary fuel line from pump.
- f. Remove bolts holding the pump to the block.
- g. Remove oil line that runs from the pump to block.
- h. Remove pump.
- i. Any calibration of the pump must be made on a test stand. Most dealers do not do this job but send pumps to special diesel repair shops. Some pumps, however, may be calibrated on the engine, operating at maximum load and using a ball fuel meter or dynamometer to measure fuel consumption.
- j. Three types of injection pumps have been developed for use on diesel engines.
 - 1) Roasa master
 - 2) Boash
 - 3) Simms

Manufacturer's specifications should be followed when overhauling these pumps.

- k. Clean injection pump screen which is located on head of pump.
 - 1) Remove plug.
 - 2) Remove screen and "o" ring.
 - 3) Wash in solvent and blow dry with compression.
 - 4) Install screen on plug and ring.
 - 5) Install injection pump in head.

Suggested Teaching-Learning Activities

- 1. Demonstrate the cleaning and disassembly procedures outlined in the subject matter content. Emphasize proper procedures and tool usage.

2. Have students thoroughly clean their assigned tractors and remove all accessories.
3. Have students remove the external engine parts on their tractors according to the procedures outlined in the subject matter content above.

Suggested Instructional Materials and References

Instructional materials

1. Tractor for student use
2. Complete tool kits
3. Demonstration tractor
4. Steam cleaner

References

1. Manufacturer's service manuals
2. Steam cleaner instructions

Suggested Occupational Experiences

1. Have students do the following at a local agricultural machinery dealership:
 - a. Steam clean a tractor.
 - b. Remove all tractor accessories.
 - c. Remove all tractor external parts.

III. To repair a tractor engine

Teacher Preparation

Subject Matter Content

After thorough testing and removal of all accessories and external parts, the engine is ready to be overhauled. A mechanic should learn well the following procedure, which outlines a complete engine overhaul, before he accepts employment and proceeds to overhaul a tractor engine in an agricultural machinery dealership.

Disassemble the engine in the following manner, and make observations of worn parts, and other faults.

1. Valve cover

- a. Remove valve cover by taking out four attachment bolts. Make sure that the area around the cover is clean and dirt free before the cover is removed.

2. Rocker arm assembly

- a. Oil must flow to the rocker arm assembly through an oil line or stud which retains this assembly. Locate the flow openings and check to see if they are plugged.
- b. Remove the oil line.

3. Push rods

4. Head nuts or capscrews.

These are special nuts or capscrews of high strength steel. Under no circumstances should nuts or capscrews of any other material be used for this purpose.

5. Remove head

- a. Visually inspect the head, noting the following:

- 1) Condition of valves
- 2) Condition of headgasket
- 3) Condition of top of piston

- a) Excessive carbon indicates bad rings.
- b) Piston loose in cylinder

- 4) Pitting in the piston top and cylinder wall

Pitting is caused by water entering the combustion chamber through the head gasket or a crack in the head or sleeve.

5) Taper of the cylinder wall

The taper of the cylinder is checked by a dial indicator or inside micrometer. Measure the diameter of the cylinder where the top ring travels and above the piston when at bottom dead center. By subtracting the latter measurement from the former the amount of taper can be determined. Compare the taper with maximum taper given in the manufacturer's specifications for the tractor.

6) Check cylinder for being out of round.

To check a cylinder for being "out of round," use the same tools as those used to check taper.

6. Remove valves from head and determine condition.

- a. Place head on work lead.
- b. Using suitable valve compressor, compress spring and cap and remove the two locks located on the end of the valve stem.
- c. Release valve compressor.
- d. Remove spring and valve cap. Some engines may have rotating valve caps on the exhaust valves. These caps allow valves to rotate, thus keeping the seat clean and free of carbon. Also, some engines may be equipped with two valve springs on each valve, allowing more positive valve seating.
- e. Remove valves.
 - 1) Visually inspect each valve for excessive burning.
 - 2) Check valve stem for sticking in the guide, which is caused by carbon in the guide. The guide should be cleaned or replaced.
 - 3) Check the valve seat for burning or cracks.

At this point in the overhaul procedure, study all observations made to determine whether a complete overhaul is necessary or whether reconditioning of the valves would bring the compression back to within manufacturer's recommendations. If the tractor needs a complete overhaul, follow these procedures:

1. Remove the engine block from the tractor mounting.
 - a. Drain oil from the oil pan by removing the plug in the bottom of the pan.
 - b. If necessary, remove the front axle and axle support, which is bolted to the engine block.
 - 1) Disconnect the front axle wishbone supports and steering linkage.
 - 2) Place safety jack under the transmission to support the engine while removing the front axle and wheels.
 - 3) Remove bolts around the rear engine bell housing. Usually there are one or two line-up pins in the rear bell housing which often stick and need to be freed by prying the engine away from the transmission.
 - c. Attach engine lifting straps to the block so that when the engine is lifted from the mountings it will be balanced. Use short cap screws to replace the head studs or capscrews.
 - d. Hook sound chain falls on hydraulic lifting crane to engine strap and remove the engine block from its mountings.
2. Place engine on an engine stand and fasten it down tightly. If an engine stand is not available, lay the engine block on its side on a workbench.
3. Remove oil pan.

Take off capscrews around the oil pan, and check it for sludge deposits in the bottom.
4. Remove oil pump.
 - a. Remove oil pump screen and pick-up tube. In some cases this tube may be a part of the pump.
 - b. Remove locks on safety wire from the capscrews or nuts which hold the oil pump in place.
 - c. Turn the pump housing back and forth until it comes free.

5. Remove fly wheel.
 - a. Remove pressure plate.
 - 1) Remove capscrews on the pressure plate evenly.
 - 2) Be prepared to catch the pressure plate and clutch disk, as they drop when the last cap-screw is removed.
 - b. Remove flywheel nut locks and nuts.
 - 1) It may be necessary to lay a 2" x 4" block of wood, 12" long, beside the crankshaft to keep the crankshaft from turning during removal of flywheel nuts.
 - 2) Tap flywheel off with a soft mallet hammer.
 - 3) Because of the weight of the flywheel, be careful not to drop it while removing from the engine.
6. Check the flywheel starter ring gear for missing teeth and slippage on the flywheel, and record findings.
 - a. Remove ring gear from the flywheel, cutting halfway through the ring gear with a cutting torch and splitting the remainder with a chisel, or cutting halfway through with a 1/4" drill and splitting the remainder with a chisel.

Be extremely cautious to avoid cutting with the torch or drilling into the flywheel.
 - b. Install new ring gear.
 - 1) Lay ring gear on flat fire bricks that completely support it.
 - 2) Use a torch to heat ring gear to 360° or until it turns a dark straw color.
 - 3) Quickly place ring gear on flywheel and let cool into place.
7. Remove pistons.
 - a. On engines with sleeves, install a short capscrew and large washer at the top of each sleeve to hold sleeve while removing piston.

- b. Cut ridge frame cylinder with a suitable ridge removing tool. Follow manufacturer's instructions for using the tool to remove the cylinder ridge.
 - c. Rotate crankshaft until the number one piston is at the bottom of its stroke.
 - d. Remove lock nuts on cotter pins from connecting rod.
 - e. Mark rod cap with a center punch on both halves to make certain it is installed in the same position it was before disassembly. Also, notice whether mark is on the crankshaft side, and record observation.
 - f. Remove connecting rod nuts.
 - g. Remove rod cap.
 - 1) Inspect insert for excessive wear, pitting, and corrosion.
 - 2) Remove upper insert bearing.
 - h. Push piston out of cylinder.
 - i. Throw inserts away and reinstall cap on rod.
 - j. Repeat steps a through i to remove the remaining pistons.
8. Inspect pistons, pins, and connecting rods.
- a. Clean piston.
 - 1) Remove old rings.
 - 2) Remove carbon from the piston top with a scraper.
 - 3) Remove carbon from ring bands with a broken ring.
 - 4) Do not use a wire brush for cleaning these parts.
 - 5) Clean oil groove and oil return holes. The oil return holes should be cleaned with a drill bit of the same size as the oil return holes so as not to enlarge the holes.
 - 6) Using a micrometer, check the size of the pistons against manufacturer's specifications, and determine whether they are within limits. A micrometer check also reveals whether the pistons are standard or oversized.

- 7) Compare ring band of piston with that of a new ring and check it with a feeler gauge. Insert ring in groove. Check the distance between the ring edge and groove wall. Check size of gap with manufacturer's specifications for maximum allowance clearance. These measurements, along with visual inspection and piston size, indicate whether the piston should be replaced.

b. **Inspect connecting rod.**

Put the connecting rod cap in place on the rod with punch marks lined up and rod nuts torqued to manufacturer's specifications. Using an inside micrometer, check whether the inside of the rod is out-of-round and the connecting rod opening is within manufacturer's specifications. If the measurements are not within specifications, install a new rod or recondition the old rod at a machine shop.

c. **Check wrist pin.**

- 1) **Remove wrist pin from rod.**
 - a) Mark piston and rod with a center punch to make sure they are reinstalled in the same position they were before disassembly.
 - b) Remove snap rings on lock bolts that retain pin in the piston.
 - c) Using a brass punch, drive the pin out of the rod. Some pistons require that the wrist pin be pressed out. This is a job for a machinist who has a special piston holder and press.
- 2) Using a micrometer, check pin to see whether it is within manufacturer's specifications.
- 3) Check inside of the rod bushing with a telescopic gauge and outside micrometer to determine whether the opening is within manufacturer's specifications.
- 4) Record all measurements in order to determine what parts should be replaced or reconditioned.

9. Check cylinder for taper and being out-of-round.

These checks are made with an inside micrometer or dial indicator. If the taper is not within specifications or the cylinder is out-of-round, install new sleeves or rebore the cylinders.

10. Remove crankshaft.

- a. Before removing crankshaft, check end play. One bearing, usually the center or rear bearing, controls the end play with a thrust ring built on the insert or a separate ring. Locate the thrust bearing, and pry crankshaft forward. Insert feeler gauge in the opposite side and measure the gap. Record the gap and check it against manufacturer's specifications. If a new bearing is needed, it may be obtained in oversize thrust to take up for wear on the crankshaft flange.
- b. Remove front crankshaft pulley.
 - 1) Remove set screw, nut, or retaining bolt from the pulley.
 - 2) Using a suitable puller, remove crankshaft pulley.
 - 3) Be careful to fit puller jaws on the solid part of the pulley.
 - 4) Check pulley for cracks and excessive wear on the sealed surface.
- c. Remove timing cover.
 - 1) Remove all cap screws and nuts on the retaining cover.
 - 2) Pry cover off.
 - 3) Notice if the crankshaft end-play adjusting set-screw is built into the retaining cover.
- d. Check backlash between camshaft and crankshaft gear with dial indicator.
 - 1) Mount dial indicator on front of engine with needle resting on camshaft gear teeth.
 - 2) Rotate camshaft back and forth without moving the crankshaft. Take dial reading and compare with manufacturer's specifications listed as camshaft gear backlash. If backlash is excessive, new gears are needed.

- e. Check timing marks on the camshaft and crankshaft gears. The marks must line up before disassembly and at reinstallation.
 - f. Mark main bearing cap in relation to block. Be careful to put caps back in the same position and place when reinstalling them.
 - g. Remove main bearing capscrew or nuts. Some nuts or capscrews have locks, and others are self-locking.
 - h. Remove main bearing cap by tapping it with a soft mallet hammer. Inspect the insert bearing for pitting, grooving, and excessive wear. At this point it may be necessary to remove the rear main oil seal retainer and seal.
 - i. Remove crankshaft. Try to keep it standing on end to avoid possible warping.
 - j. Reinstall main caps on block and tighten them to prevent damage to the caps.
11. Check the crankshaft.
- a. Using a micrometer, check each journal for the following:
 - 1) Out-of-round condition
 - 2) Excessive wear
 - 3) Taper of journal
- Micrometer readings should be recorded and compared with manufacturer's specifications.
- b. Check rear oil seal surface.
 - c. Check straightness of crankshaft.
 - 1) Using two "V" blocks, rest the number one journal on one block and the rear main journal on the other block.
 - 2) Set dial indicator needle to ride against the center main bearing and rotate shaft. Record the dial reading. If the reading is excessively high, a new crankshaft or regrinding of the old one, is needed. Compare the dial readings with the manufacturer's specifications to determine whether to replace, regrind, or reuse the crankshaft.

12. Remove cylinder sleeves.
 - a. Use a suitable puller to pull sleeves out of the block. Sometimes wet sleeves may be driven out of the block with a hard wood block.
 - b. Remove the capscrews that hold the sleeve in place. If the engine does not have sleeves, have the cylinder rebored at a local machine shop.
13. Remove camshaft.
 - a. Remove retaining bolts behind cam gear.
 - b. Slip camshaft out of the block . It is not necessary to remove the gear from the camshaft unless the gear needs replacing, in which case it must be done in a press.
 - c. Be careful not to let the camshaft lobes scrape on the cam bushing when slipping it out of the block.
 - d. Check camshaft with a micrometer to determine the bearing journal and lobe sizes, and compare these measurements with the manufacturer's specifications.
14. Remove valve lifters and check them for excessive wear and pits in the flat surfaces.
15. Remove camshaft bushing.
 - a. Use a suitable driver plug fitted to the cam bushing and drive out all bushings.
 - b. Camshaft bushings, the heart of good oil pressure, should be replaced on all overhauls.
16. Clean engine block.
 - a. Soak block in cleaner tank and wash with hot water.

Blow out all oil passages with air. If steam cleaner is available, steam the block and force steam through the oil passages.
 - b. The block should be cleaned after the cylinders have been rebored.

- c. Using 80 grit sandpaper, sand the top of the block and the base where the sleeves are installed. Caution: the cylinder must be clean around the top flange and at the bottom where the "O" rings seal.
- d. Check block for cracks.

Up to this point in the overhaul procedure, disassembly of the engine and inspection of its parts, has been emphasized. The emphasis now turns to the installation of new parts and reassembly of the engine. The following procedure should be followed in reassembling the engine and installing parts:

1. Install camshaft bushings.
 - a. Coat the surface of the bushings with light number 10 oil and install them in the block with a driving plug.
 - b. Make sure that the oil holes in the bushing align with the oil holes in the block.
2. Install cylinder sleeves.
 - a. Before installing "O" rings on the sleeve or in the block, try each sleeve in the block to make sure it falls into place without having to be forced.
 - b. Install "O" rings on sleeve or in the block, using the lubricant recommended by the manufacturer.
 - c. Push sleeve into place with hand or a light tap of a soft mallet hammer.
 - d. Check protrusion of sleeve above block to make sure that it comes within the manufacturer's specifications. Shims may be added under sleeve flange to increase the protrusion.
3. Coat valve lifters with number 30-weight oil and install them in the block.
4. Install camshaft.
 - a. Coat bearings with number 30-weight oil.
 - b. Slide the camshaft through each bearing. Do not let lobes slide on the bushings.

- c. Check for free rotation of the camshaft. If it does not rotate freely, the bushings have been improperly installed.
 - d. Install camshaft retaining bolts, and check end play of shaft with dial indicator to compare with manufacturer's specifications.
5. Install crankshaft.
- a. Remove main cap.
 - b. Install new bearing inserts in the block and cap. Make certain that the two bearing halves are installed opposite each other.
 - c. Coat bearing with 30-weight oil.
 - d. It may be necessary to install one-half of the rear main oil seal.
 - 1) Coat back of seal with aviation sealer.
 - 2) Soak inside with 30-weight oil.
 - 3) Push into channel.
 - e. Place crankshaft in the block. Make certain that the camshaft and crankshaft gear timing marks are in line.
 - f. Install main bearing caps.
 - 1) Place plastic gauge strip on the bearing and install the cap.
 - 2) Align marks on caps with marks on the block.
 - 3) Install main bearing bolts and locks.
 - 4) Torque bolts down, 20 pounds at a time, to manufacturer's specifications.
 - 5) Remove cap and read plastic gauge on the bearing. This indicates the bearing clearance. If too much clearance is read, oversized bearings are needed.
 - g. Check crankshaft end-play.
6. Install front timing cover.
- a. Install front crankshaft seal in cover.

- 1) Coat outside of seal with aviation sealer.
 - 2) Coat inside with number 30-weight oil.
 - 3) Tighten all bolts uniformly.
7. Install crankshaft pulley.
- a. Coat pulley seal surface with 30-weight oil.
 - b. Make sure inside of pulley is clean. If it is not, use sandpaper to clean and clear it.
 - c. Use a block of wood and hammer to tap the pulley into the crankshaft and install retainer.
8. Install pistons on connecting rod.
- a. Read manufacturer's instructions for installing rings.
 - b. Check rings for size.
 - 1) Insert rings in cylinder and measure end gap with feeler gauge. All rings except the oil rings, must be checked.
 - 2) Check manufacturer's specifications to be within clearance limits. If ring end clearance is inadequate, it should be filed.
 - c. Check piston cylinder clearance.

Insert piston into cylinder and check side clearance to be within manufacturer's specifications.
 - d. Assemble connecting rod and piston.
 - 1) Have the pin and bushing fitted at a machine shop that has honing and aligning equipment.
 - 2) Install piston and rod together, making sure the mark on top of the piston is toward the front of the engine and the mark on the rod is in proper relation to the camshaft.
 - 3) Install locks on pins.
 - 4) Caution: follow manufacturer's guide for locating piston to rod alignment.

9. Install piston and connecting rod in the sleeve.
 - a. Install rings on the piston with a recommended ring expander.
 - 1) Carefully place each ring on the piston with the top marking up.
 - 2) Make sure rings are in the right grooves.
 - 3) Follow ring manufacturer's specifications for installing rings on piston.

Example:
 - a) Oil ring should be installed in the bottom groove with the bevel toward the top.
 - b) The scrapper ring must be installed in the second groove with the outside notch down.
 - c) The compression ring must be installed in the top piston groove with the inside notch up.
 - b. Remove rod cap.
 - c. Cover piston and rings with number 30-weight oil.
 - d. Place ring compressor around piston and compress rings. Note: Follow the manufacturer's specifications for the type of compressing tool to use.
 - e. Slide skirt of piston into sleeve, making sure the notch or arrow is toward the front of the block.
 - f. Tap piston into sleeve with hammer handle. Only light pressure is needed to force the piston out of the ring compressor. Make sure the connecting rod aligns with the crankshaft as the piston is tapped into the cylinder. Be careful not to scratch the crankshaft journals.
 - g. Install rod bearing and check.
 - 1) Coat the upper half of the bearing insert with 30-weight oil and insert in the connecting rod.
 - 2) Push connecting rod with piston attached down onto crankshaft.
 - 3) Install lower half of bearing insert into the cap and cover with oil.
 - 4) Place a strip of plastic gauze on the insert in the cap.

- 5) Install cap on connecting rod.
 - 6) Tighten rod bolts or nuts according to manufacturer's specifications.
 - 7) Remove rod bolts or nuts and read the plastic gauge. Compare these clearance readings with the manufacturer's specifications. If the clearance is greater than those prescribed by the manufacturer, use oversized bearings and repeat steps five and six.
 - 8) Install lock nuts and bend metal locks around nuts.
 - 9) This procedure should be used when installing all rod bearings.
10. Overhaul and install the oil pump.
- a. Disassemble oil pump.
 - 1) Remove gear from pump, using suitable puller.
 - 2) Remove all parts from pump and clean them thoroughly.
 - 3) One should install an oil pump overhaul kit, which includes new gears, shaft, gasket, and pressure regulating valve, when overhauling an oil pump.
 - 4) Install new pump parts.
 - a) Check backlash between gears.
 - b) Check gear-to-housing clearance.
 - c) Check gear end clearance.
 - d) Compare these findings with manufacturer's specifications. If the readings are higher than those set down in the manufacturer's specifications, replace the housing.
 - 5) Install pump into the block, torque bolts to manufacturer's specifications, and lock with wire or metal locks.
 - 6) Fill oil pump inlet tube with number 30-weight oil to aid in priming the pump.
11. Install oil pan.
- a. Coat block with aviation sealer and stick gasket to it.
 - b. Install pan and tighten bolts. Do not tighten bolts too tight, as they will break the gasket.

12. Recondition cylinder head.**a. Clean head.**

- 1) Using a 1/4 hp. drill with a wire brush, remove carbon from the head.
- 2) Use a carbon scraper to remove excess carbon that cannot be removed with a wire brush.
- 3) Clean around valve seats.
- 4) Wash the head in a cleaning solution and then hot water.

b. Remove and replace valve guides.

- 1) Drive guides out of head with a suitable guide driver and hammer.
- 2) Using emery paper, clean hole in head where guides are inserted.
- 3) Wipe guides and blow area around guide holes clean with compressed air.
- 4) Coat guide with number 10-weight oil and drive in place with driver and hammer.
- 5) Follow manufacturer's specifications for length of guide protrusion.

c. Grind valve seats.

- 1) Select valve guide pilot to fit guide.
- 2) Select a stone to fit the valve seat outside diameter and the degree of angle on the seat.
- 3) Set grinder on the seat and reface the seat.
 - a) Make sure the seat is within allowable limits for width of seat.
 - b) If the seat is too wide, use a 15° and 75° stone to narrow the seat.

d. Using a straight edge, check the head for warp.**e. Reface valves.**

- 1) Clean valves with wire brush.
- 2) Using a micrometer, measure the valve stem for comparison with the manufacturer's specifications.
- 3) Set valve grinding machine for proper valve face angle.

4) Reface all valves.

Check valve head thickness after grinding to be certain it is within manufacturer's specifications.

5) Resurface valve stems on grinding machine.

6) Place valve in the head and check margin of seat on valve face with bluing. Grind seat to bring it within manufacturer's specifications, and allow proper valve seating.

7) Check valve springs.

- a) Using a valve spring tester, check spring length and the tension at a given length.
- b) Compare these measurements with the manufacturer's specifications and replace valve springs not within manufacturer's limits.

8) Coat valves and stems with number 30-weight oil and place in the head.

9) Install valve spring and keeper.

- a) Check valve spring to see if there is any difference in the top and bottom by checking for coils being close together.
- b) Install valve seals on stem of valve if recommended by the manufacturer.

f. Clean and check energy cells.

Note: Some diesel engines use what is called an "energy cell" or "precombustion chamber" to increase combustion efficiency.

1) Remove cell from head.

- a) Remove bolts from cell.
- b) Remove bolts from cell hold-down bars.
- c) Remove bars and caps.
- d) Remove cell with the necessary special puller and slide hammer, and check for burnt tips and enlarged hole. Keep all cells and caps together.
- e) Soak cell in carbon remover, wash, and blow dry with compressed air.
- f) Lap the cap and cell on a special lapping tool.

- g) Clean hole in head and check for burnt places where cell may leak. If the cell has been leaking, replace the compression.
- h) Replace any burnt cell.
- i) Assemble and install in reverse order, following the procedure outlined by the manufacturer.
- j) Torque nuts and hold-down bar to manufacturer's specifications.

13. Install head on block.

- a. Install a new head gasket.
- b. Coat gasket with a recommended gasket sealer.
- c. Install all head bolts and snug them down.
- d. Use torque wrench to finish tightening head bolts. Follow manufacturer's sequence for torquing head bolts.

14. Install push rods.

Make certain that each rod is set in the valve-lifter socket.

15. Recondition rocker arm assembly.

- a. Remove all arms from shaft.
 - 1) Remove cotter pin and washer.
 - 2) Note where oil holes are in respect to the shaft.
- b. Resurface all rocker arms on valve refacing machine.
- c. Check rocker arm shaft with micrometer for excessive wear and compare with manufacturer's specifications.
- d. Clean shaft internally to keep sludge from plugging oil holes.
- e. Assemble rocker arms and shaft.

16. Install rocker arm assembly on head.
 - a. Fit all rocker arm balls into socket of push rod.
 - b. Make sure oil feed stud on line is in the proper place.
 - c. Back up adjusting screws.
 - d. Tighten rocker arm assembly to head.
17. Adjust valves.

They should always be adjusted cold before starting engine.
18. Install valve cover.

Coat valve cover with sealer and stick gasket to it. Do not coat the other side of the cover gasket.
19. Overhaul and install distributor (gasoline tractor only).
 - a. Remove distributor cap.
 - 1) Check for cracks, corrosion on points, and other signs of wear.
 - 2) Remove rotor and inspect.
 - b. Remove points.

Check conditions of points.
 - c. Remove condensor.

Test condensor on tester.
 - d. Remove point plate.
 - e. Check spark advance weights for sticking.
 - f. Check spark advance spring tension.
 - g. Check distributor shaft and bushing for excessive wear.
 - h. Assemble in reverse order.

- i. Lubricate advance weights with number 10-weight oil.
 - j. Install new points and condenser.
 - k. Adjust the distributor to the manufacturer's specifications on high cam and lubricate cam with distributor cam grease.
 - l. Install rotor and cap.
20. Install and time distributor. See "Tractor Tune-Up and Maintenance" module for procedure.
21. Install spark plug wires.
- a. Check spark plug wires for cracks and bad insulation.
 - b. Check terminals, making certain that they fit tight in the distributor cap and on the spark plug.
 - c. Check the spark plug firing order.
 - 1) Remove the spark plug in the number one cylinder.
 - 2) Rotate crankshaft until the number one piston is almost at the top of the compression stroke.
 - 3) Insert spark plug.
 - 4) Install the wire on the spark plug and in the distributor cap wire plug opening which the rotor in the distributor points to.
 - 5) Install the remaining wires in rotation, running them to the plugs according to the firing order.
 - 6) The cylinders are numbered starting with the first cylinder, which is the closest to the radiator, and counting back.
22. Install injector pump (diesel tractor only).
- a. Rotate engine to bring the number one cylinder to the top of its compression stroke.
 - b. Line up crankshaft pulley on flywheel timing marks.
 - c. Turn the injector pump to proper timing mark and slide it into the block, meshing the gear on the pump with the gears on the crankshaft.

- d. Recheck alignment of all markings.
 - e. Reassemble all parts in the reverse order.
23. Overhaul and install water pump.
- a. Remove fan from the pump.
 - b. Remove fan hub and pulley with a pulley puller and mark the position of the hub on the shaft.
 - c. Remove rear pump cover.
 - d. Remove pump impeller from shaft.
 - e. Remove seal assembly.
 - f. Remove snap ring and then shaft and bearing from the pump housing.
 - g. Clean housing with a scraper and sand paper and blow clean with compressed air.
 - h. Install new water pump kit.
 - 1) Using soft hammer, tap shaft and bearing into housing, and install snap ring.
 - 2) Install new seal in the pump impeller.
 - 3) Press impeller into place on the shaft. Do not tap on the shaft or seal, as it will break the seal.
 - 4) Press fan nub onto shaft in its original position.
 - 5) Install gasket and rear pump cover.
 - 6) Install a new pump gasket.
 - 7) Install pump on engine.
24. Overhaul and install generator.
- a. Overhaul generator.
 - 1) Remove and inspect generator cover.
 - 2) Remove terminal wire from armature brush holder.
 - 3) Remove wire from field to armature brush.
 - 4) Remove long bolts from the commutator end-frame, and remove frame and generator brushes.

- 5) Remove field housing from pulley end-frame. Remove the pulley by removing the attachment nut and pressing the shaft from the pulley.
 - 6) Remove pulley key and top armature shaft from the bearing.
 - 7) Remove bearing from frame and check, clean, and repack it with grease. Clean generator parts in cleaning solution, wash with water, and blow dry with air under low pressure.
 - 8) Check commutator end-frame bushing and armature shaft for excessive wear. Replace bushing, if necessary.
 - 9) Check armature.
 - a) Grawler test
 - b) Induction test
 - c) Light short test
 - 10) Check field coil.
 - a) Light continuity test
 - b) Light short test
 - 11) Turn commutator on metal turning lathe and undercut mica. Smooth commutator with fine sandpaper.
 - 12) Install new brushes and make certain they fit properly against the commutator.
 - 13) Assemble the generator, reversing the disassembly order outlined above.
- b. Install generator on engine.
- 1) Install new fan belt and tighten. (Refer to "Tractor Tune-up and Maintenance" module, p.10.)
 - 2) Polarize generator. (Refer to "Tractor Tune-up and Maintenance" module, p.10.)
25. Overhaul and install starter.
- a. Remove starter and inspect its parts.
 - b. Remove screws holding field wires to brush holders.
 - c. Remove end-frame bolts and frame. Center punch housing for use in aligning the frame and housing.
 - d. Remove bolts from drive-end frame and remove the frame.

- e. Remove armature from field housing.
 - f. Remove and inspect drive mechanism.
 - 1) Check for broken spring.
 - 2) Check for sheared drive bolt.
 - 3) Check for untrue gear teeth.
 - 4) Check for sticking screw mechanism caused by heavy grease, oil, or rust.
 - 5) Clean parts, install new parts, as needed, and lubricate with 10-weight or a lighter oil.
 - g. Check field coils.
 - 1) Use light test for continuity.
 - 2) Use light test for detecting a short.
 - h. Check armature.
 - 1) Use grawler test.
 - 2) Use light test for shorts.
 - 3) Use grawler test for induction.
 - 4) Turn commutator on metal lathe. Do not undercut the mica on a starter commutator.
 - i. Check end-frame bushing for excessive wear, and replace if necessary.
 - j. Check armature lamination for wear, which would suggest worn bushings.
 - k. Seat new bushings on commutator.
 - l. Reassemble starter, and install on the engine.
26. Install water manifold.
- a. Check thermostat.
 - 1) Place the thermostat in a pan of water.
 - 2) Heat the water with a torch.
 - 3) Note the temperature of the water when the thermostat opens.
 - 4) Check this temperature reading with the manufacturer's specifications for temperature at which the thermostat should open. If the thermostat does not open within manufacturer's specifications, replace it with a new one.

- b. Install thermostat in the head, with coil toward the block.
 - c. Install water manifold gasket and water manifold on the head.
27. Install intake and exhaust manifold.
- a. Scrape and sand head and manifold gasket surfaces.
 - b. Install gasket on head.
 - c. Install manifold.
 - d. Torque bolts uniformly to meet manufacturer's specifications.
- 27A. On diesel engines the manifold heater must be cleaned and adjusted at this stage in the overhaul procedure.
- a. Remove heater from manifold.
 - b. Check for burnt insulator material that may be shorting heater element.
 - c. Check insulated bolts.
 - d. Check element for burnt spots.
 - e. Check element for proper ground.
 - f. Reassemble element and install in the manifold.
 - g. Test the heater element.
 - 1) Connect manifold to the positive post of a 1250 battery.
 - 2) Connect insulated terminal to negative post. Wait 60 seconds and check the element. It should be red hot.
28. Overhaul and install fuel injectors (diesel only) .
- a. Remove injectors and attach to pump injector tester.
 - 1) Note pressure build-up until the injector injects fuel.
 - 2) Keep hands away from the injector nozzle, as the fuel is under high enough pressure to penetrate the skin.

- 3) Watch spray pattern.
- 4) Check injector to see if it will hold pressure to within 300 lbs. of pop-off without leaking at tip.

b. Clean injector.

- 1) The injector should be cleaned and reset according to the procedures outlined by the manufacturer.
- 2) Cleanliness is of utmost importance here because all parts are built with close tolerance.

c. Install injector after overhauling the engine.

d. Using a piece of dowl stick wrapped in a soft cloth, wipe the injector hole clean.

e. Place a new copper gasket on the injector and install the injector in the head.

f. Tighten the injector hold-down nuts uniformly, according to manufacturer's specifications.

g. Install fuel lines.

Note: The following procedure should be carried out after the fuel filters are cleaned.

h. Bleed injector.

- 1) Loosen all injector lines at the injector and set the throttle to start.
- 2) Crank engine until fuel leaks from lines.
- 3) Close all lines and start engine.
- 4) Loosening one line at a time, let all air out of the line.

29. Overhaul and install governor (gasoline tractor only).

a. Clean governor.

b. Disassemble unit and check for the following:

- 1) Worn linkage
- 2) Worn weight pins
- 3) Worn and flat spots on weight balls
- 4) Worn bearing, bushing, and shaft
- 5) Worn and broken thrust bearing
- 6) Tension on governor spring

- c. Reassemble entire unit.
 - d. Install new gasket, using aviation sealer to seal gasket to housing, and install the governor on the engine.
30. Overhaul and install carburetor.
- a. Disassemble entire carburetor.
 - 1) Remove screw around the float, and split carburetor.
 - 2) Remove float by slipping pin out of bracket.
 - a) Check float for dents.
 - b) Shake float to see if there is fuel inside it.
 - 3) Remove float needle valve assembly, seat, and seat gasket.
 - a) When installing the seat, make sure the new seat gasket is in place.
 - b) Needle, seat, and gasket should always be replaced for good fuel regulation.
 - 4) Remove all jets.
 - 5) Soak all parts in a carburetor cleaning solution for one hour.
 - 6) Wash with hot water, and blow dry with compressed air.
 - b. Assemble carburetor.
 - 1) Install carburetor overhaul kit.
 - 2) Install jets in the lower and upper carburetor housing.
 - 3) Install float seat in upper carburetor housing.
 - 4) Install float and pin. Adjust float according to manufacturer's specifications.
 - 5) Reassemble remaining parts.
 - 6) Check choke butterfly to see that the anti-flooding valve is operating properly.
 - 7) Preset all outside adjustments to manufacturer's specifications.

- c. Install new carburetor flange gasket.
 - d. Install carburetor on the engine.
 - e. Start engine and set the carburetor for maximum R. P. M.'s by adjusting the governor spring according to the manufacturer's specifications.
31. Set spark plug gap and install spark plugs.
- a. Measure the spark gap with a feeler gauge. Compare this gap with the manufacturer's specifications and adjust with a bending tool.
 - b. Attach spark plug wires.
32. Install oil filter.
- a. Install gasket on oil filter bracket, using aviation sealer and bolt filter to block.
 - b. Soak oil filter element in either number 10- or number 20-weight oil and install filter in bracket.
33. Remove, clean, and install fuel filters (Diesel tractors only).
- a. Remove primary fuel filter element. This is the filter closest to the tank.
 - 1) Turn fuel off at tank.
 - 2) Remove cap screw from top of bracket.
 - 3) Remove fuel filter cup.
 - 4) Remove element from filter cup.
 - 5) Wash filter cup in diesel fuel.
 - 6) Install new elements in filter cup.
 - 7) Fill filter cup with clean diesel fuel.
 - 8) Install filter cup in bracket, and install on the engine.
 - b. Bleed filter.
 - 1) Loosen bleed screw on the top of the filter. Turn fuel on and open bleed screw until air bubbles cease.
 - 2) Tighten bleed screw.

c. Clean secondary filter.

- 1) Turn fuel valve off.
- 2) Disconnect fuel lines.
- 3) Remove filter from bracket.
- 4) Remove fuel line fittings from old filter.
- 5) Discard old filter.
- 6) Reinstall fuel line fittings in new filter, using aviation sealer on fittings.
- 7) Reassemble secondary filter.
- 8) Turn fuel valve on.
- 9) Loosen bleed screw in the top of the filter and let the air out of the filter cup.

Suggested Teaching-Learning Activities

1. Identify and demonstrate special tool usage before the class.
2. Using charts, overhead transparencies, and other instructional materials, discuss with the class each step in the overhaul procedure.
3. Following the engine repair procedure outlined in this module, have students repair the engines on their respective tractors.

Suggested Instructional Materials and References

Instructional materials

1. Special tools used in repairing tractor engines
2. Charts, overhead transparencies, and other instructional materials pertaining to the content
3. A tractor for each two students

References

1. Farm Tractor Guide.
2. For Better Diesel Engine Overhaul.
3. For Better Gasoline Engine Overhaul
4. Implement and Tractor Service Manual
5. Manufacturer's service manuals.

6. Perfect Circle Service Manual.
7. Piston Rings, Pistons, and Cylinders.

Suggested Occupational Experience

Have students overhaul a tractor engine at a local agricultural machinery dealership under the supervision of the head mechanic. Have them parallel their work on the engine at the agricultural machinery dealership with their classroom study and repair procedures.

IV. To repair a tractor clutch

Teacher Preparation

Subject Matter Content

1. Check the clutch plate.
 - a. Inspect lining for wear.
 - b. Check plate and hub for cracks.
 - c. Inspect shock springs for breakage.
 - d. Inspect spline in hub for wear.
2. Check pressure plate.
 - a. Check plate for cracks.
 - b. Inspect for burnt spots.
 - c. Check for broken springs.
 - d. Check fingers for wear.
 - e. Disassemble pressure plate and check the tension on all springs. Following the manufacturer's specifications, make the above checks and repairs, and reassemble.
 - f. Install new pilot bearing on bushing on crankshaft. Grease inside of bushing with a small amount of wheel bearing grease after installing in the crankshaft.

3. Install flywheel on the crankshaft and torque bolts to manufacturer's specifications.
4. Install clutch.
 - a. Place clutch disk against the flywheel.
 - b. Insert clutch aligning tool in clutch and pilot bearing.
 - c. Place pressure plate against the flywheel and install special shoulder capscrew.
 - d. Torque capscrews to manufacturer's specifications.
 - e. Remove aligning tool.
 - f. Check fingers to be certain that they are the right distance from the clutch hub. Follow the manufacturer's specifications to adjust the clutch fingers.
5. Install new throw-out bearing on transmission main shaft tube.
 - a. Lubricate tube with small amount of grease.
 - b. Check throw-out bearing return spring for breaks and twists.

Suggested Teaching-Learning Activities

1. Identify and demonstrate special clutch tool usage before the class.
2. Using charts, overhead transparencies, and other instructional materials, discuss with the class each step in the repair procedure outlined in the content.
3. Following the clutch repair procedure in this module, have students repair the clutches of their assigned tractors.

Suggested Instructional Materials and References

Instructional materials

1. Special tools used in repairing clutch
2. Charts, overhead transparencies, and other instructional materials pertaining to the content

3. A tractor for each two students

References

1. Implement and Tractor Service Manual.
2. Manufacturer's service manuals.

Suggested Occupational Experience

Have students overhaul a tractor clutch at a local agricultural machinery dealership under the supervision of the head mechanic. Have them parallel their work on the clutch there with their classroom study and repair procedures.

V. To repair a tractor transmission

Teacher Preparation

Subject Matter Content

Before beginning any major overhaul of the transmission, study the manufacturer's trouble shooting service guide and attempt to diagnose trouble in the transmission.

Common transmission troubles include:

1. Locking into gear
2. Slipping out of gear
3. Oil transfer from one compartment to another
4. Missing gear teeth
5. Excessive noise caused by loose bearings or excessive end play

For repair, follow these procedures:

1. Remove transmission from the differential.
2. Remove external parts from transmission.
 - a. Battery and box
 - b. Brake and clutch pedals

- c. Steering mechanism
 - d. Platform
3. Drain out transmission oil.
 4. Remove PTO shaft.
 - a. Remove bolt from PTO bearing cover.
 - b. Use bar to pry PTO shaft and bearing out of the transmission housing.
 - c. Inspect PTO bearing and shaft.
 - 1) Remove snap ring from shaft.
 - 2) Using press or puller, remove bearing from shaft.
 - 3) Check PTO seal located in the cover, and replace if necessary.
 - a) Use punch and hammer to remove seal.
 - b) Coat inside of new seal with aviation sealer. Using a flat plate, press seal into cover. Coat inside of seal with grease.
 - 4) Check PTO bearing.
 - a) Wash bearing in cleaning solution and blow dry with compressed air.
 - b) Lubricate bearing with number 10-weight oil and rotate with hand. If bearing does not have a smooth, quiet roll, replace it.
 - 5) Check PTO shaft.
 - a) Shaft must be straight.
 - b) Spline should be in good condition.
 - c) Seal surface should be smooth.
 - d) Reassemble PTO.
 5. Remove transmission shifting cover.
 - a. Remove bolts around cover and lift cover off.
 - b. Check and repair cover.
 - 1) Follow manufacturer's recommended procedure for repairing the transmission cover.

- 2) Check for excessive wear on shifting forks, rails, and lever, shifter pins, cup and snap ring.
- c. Loosen set screws holding rail to fork.
- d. Check for worn or weak detent pins and springs, and bent or sprung shifting fork.
6. Remove bolts around rear transmission housing, separating transmission from differential. At this point it may be necessary to remove brakes if they are mounted on the transmission.
7. Remove internal parts of the transmission, following the manufacturer's recommendations found in the index under "Transmission Overhaul."
 - a. Remove transmission input shaft.
 - 1) Check gear teeth for chips, excessive wear, and pitting.
 - 2) Check ball bearing.
 - a) Wash the bearing and blow dry with compressed air.
 - b) Lubricate it with clean oil.
 - c) Rotate bearing, checking for smoothness of roll and noise.
 - d) Check bearing for excessive end play.
 - e) Check all other ball bearings in the transmission in the same manner.
 - b. Remove and check the output shaft.
 - 1) Inspect the third and fourth shifting collar for excessive teeth radius.
 - 2) Check the sliding gear for excessive teeth wear and radius, chipped or broken teeth, and pits in the teeth.
 - c. Remove and check the idler gear and shaft.
 - 1) Check idler gear and shaft.
 - a) Using a micrometer, measure the shaft for excessive wear. Compare findings with the manufacturer's specifications for shaft size.

- b) Using the outside micrometer and telescopic gauge, check the wear on the internal bushing of the reverse idler gear.
 - c) Check the teeth on the idler gear for pitting, chipping or cracking, and excessive radius.
- d. Remove countershaft gear assembly..
- 1) Remove shaft that runs through the housing and countershaft gear assembly.
 - a) Drive shaft out with a brass rod or punch.
 - b) Lift assembly out of housing.
 - c) Check countershaft assembly.
 - Check gears for pitting, chipping, and excessive radius on the teeth.
 - Check countershaft bearing.
 - Check countershaft for excessive wear.
 - d) Using a micrometer, measure all thrust washers for thickness, and compare these thicknesses with the manufacturer's specifications.
- e. Replace all seals.
- f. Reassemble transmission. Follow the manufacturer's procedure for assembling the transmission and adjusting all bearings and end play.
- g. Install transmission cover.
- 1) Make sure all forks fit over their respective gears.
 - 2) Tighten bolts.
- h. Install all other transmission parts.
- i. Fill the transmission with the oil recommended by the manufacturer.

Suggested Teaching-Learning Activities

1. Identify and demonstrate special transmission tool usage before the class.
2. Using charts, overhead transparencies, and other instructional materials, discuss with the class each step in the repair procedure outlined in the content.
3. Following the transmission repair procedure in this module, have students repair the transmissions of their assigned tractors.

Suggested Instructional Materials and References

Instructional materials

1. Special tools used in repairing transmission
2. Charts, overhead transparencies, and other instructional materials pertaining to the content
3. A tractor for every two students

References

1. Implement and Tractor Service Manual.
2. Mechanics Study Guide No. 5 -- Transmission Theory.
3. Manufacturer's service manuals.

Suggested Occupational Experience

Have students overhaul a tractor transmission at a local agricultural machinery dealership under the supervision of the head mechanic. Have them parallel their work there with their classroom study and repair procedures.

VI. To repair tractor brakes**Teacher Preparation****Subject Matter Content**

1. Jack the tractor up and remove the rear wheels.
2. Place safety jack under the differential housing.
3. Remove brake drum.
 - a. Remove screws holding the drum to the axle hub and remove drum.
 - b. Remove the large nut that holds the wheel hub to the axle. Use a wheel puller to remove the hub from the axle.
4. Inspect the brake assembly.
 - a. Check brake linings for wear.
 - b. Check for oil leakage into brakes.
 - c. Check to see if linkage is worn or frozen.
 - d. Check the brake drum for scarring. If scarred, it may have to be turned on a metal lathe to be renewed.
 - e. Check brake return springs for rusting and breakage.
5. Remove brake shoes and replace linings.
 - a. Use a small punch to remove rivets.
 - b. Clean shoes and rivet new linings to the shoe with a rivet set or rivet machine.
6. Install a new oil seal if the old seal is leaking oil into the brake assembly.
7. Reassemble brake parts and reinstall the tractor wheels.
8. Adjust the brakes.

9. Follow the manufacturer's recommended procedure for overhauling brakes that are located on the transmission. Use the procedure outlined above for inspecting these brakes.

Suggested Teaching-Learning Activities

1. Identify and demonstrate special brake tool usage before the class.
2. Using charts, overhead transparencies, and other instructional materials, discuss with the class each step in the repair procedure outlined in the content.
3. Following the brake repair procedure in this module, have students repair the brakes on their assigned tractors.

Suggested Instructional Materials and References

Instructional materials

1. Special tools used in repairing brakes
2. Charts, overhead transparencies, and other instructional materials, discuss with the class each step in the repair procedure outlined in the content.
3. A tractor for every two students.

References

1. Implement and Tractor Service Manual .
2. Manufacturer's service manuals.

Suggested Occupational Experience

Have students overhaul a set of tractor brakes at a local agricultural machinery dealership under the supervision of the head mechanic. Have them parallel their work there with their classroom study and repair procedures.

VII. To repair and adjust the final drive**Teacher Preparation****Subject Matter Content**

1. Jack up the tractor and remove the rear wheels.
2. Place safety jacks under the differential housing.
3. Remove the housing and gears.
 - a. Drain the oil from the final drive pans.
 - b. Remove final drive pan.
 - c. Remove the cap on the inner stub axle.
 - 1) Remove the bolts holding the cap. Knock the cap out by driving on the stub axle.
 - 2) Note the number of shims on the cap used to adjust the bearings. Keep these with the cap.
 - 3) Inspect bearing cup in the cap for wear and pitting.
4. Remove the stub axle.
 - a. Remove the snap ring along the side of the gear that holds the gear in position on the stub axle.
 - b. Drive axle out of the housing.
 - c. Remove roller bearing from the axle with a bearing puller. Pull only on the inner race of the bearing.
5. Remove bowl gear.
6. Remove outside upper axle cap.
 - a) Note the number of shims on the cap for adjusting bearings. Keep these with cap.
 - b) Pull axle away from the differential.
7. Remove housing.
 - a. Remove bolts holding the final drive housing to the differential housing.
 - b. Pull the final drive housing away from the differential housing.

8. Check housing, bearings, axle, and gears.
 - a. Check housing for cracks.
 - b. Check bearings.
 - 1) Remove bearings.
 - 2) Wash the bearings and blow dry with compressed air.
 - 3) Inspect all bearing rollers, noting any pits or burnt spots.
 - 4) Inspect the inner race on roller bearings by holding bearing up to the light and observing the race as the bearing rotates. Note any pits, chips, or cracks on the rollers.
 - 5) Check all bearing cups for pits, chipping, color, or excessive groove wear in cups.
 - c. Check stub axle.
 - 1) Check spline or keyway for excessive wear.
 - 2) Check bearing surface for bearing scars.
 - d. Check bowl gear and axle gear for teeth worn to a sharp edge, internal spline wear, and chipped teeth.
9. Install housing on differential.
 - a. Install a new gasket.
 - b. Install new axle seal in housing and coat the inside of the housing with grease.
10. Install stub axle.
 - a. Drive stub axle through bowl gear with new seals installed.
 - b. Install snap rings.
 - c. Install inside axle cap with shims and coat bearing with grease.
 - d. Tighten bolts.
 - e. Rotate gear. If bearings are too tight, add more shims. If bearings are too loose, remove shim. There should be a slight drag on the gear rotation.

- f. If stub axle has adjustable nut under the cap, adjust in the same manner as the front wheel bearing is adjusted.
11. Install upper axle in housing.
 - a. Coat bearing with grease.
 - b. Install upper outside axle cap with shims. Shift transmission into neutral position and rotate bowl gear. Remove shims under cap until the drag slightly increases on bowl gear rotation.
 12. Install new oil pan gasket.
 13. Install oil pan.
 14. Fill final drive pan with the kind of oil recommended by the manufacturer.

Suggested Teaching-Learning Activities

1. Identify and demonstrate special final drive repair tool usage before the class.
2. Using charts, overhead transparencies, and other instructional materials, discuss with the class each step in the repair procedure outlined in the content.
3. Following the final drive repair procedure in this module, have students repair the brakes on their assigned tractors.

Suggested Instructional Materials and References

Instructional materials

1. Special tools used in repairing final drives
2. Charts, overhead transparencies, and other instructional materials pertaining to the content
3. A tractor for every two students

References

1. Implement and Tractor Service Manual.
2. Manufacturer's service manuals.

Suggested Occupational Experience

Have students overhaul the final drive on a tractor at a local agricultural machinery dealership under the supervision of the head mechanic. Have them parallel their work there with their classroom study and repair procedures.

VIII. To repair and adjust the differentialTeacher PreparationSubject Matter Content

1. Remove external parts.
 - a. Jack tractor up and remove rear wheels.
 - b. Place safety jacks under the transmission housing.
 - c. Drain oil from the differential.
 - d. Remove rear fenders.
 - e. Remove tractor seat.
2. Split differential.
 - a. Remove axle.
 - 1) Remove brake drums.
 - 2) Remove bolts around the back plate.
 - 3) Remove axle by tapping on the axle flange.
 - b. Remove axle.
 - 1) Remove upper outside axle bearing cap.
 - a) Remove bolts around cap.
 - b) Pry cap out of housing.
 - c) Pull axle out of differential.
 - c. Remove bolts around housing of differential and split differential into halves.

3. Remove ring gear carrier.
 - a. Remove cover on rear of differential housing.
 - b. Mark caps that hold the ring gear carrier in the housing and remove bolts.
 - c. Tap caps off with a soft mallet hammer and remove the ring gear carrier. Keep matching bearing cups and cones together.

4. Check axle and pinion gears.
 - a. Mark carrier halves for alignment.
 - b. Remove bolts holding carrier together and split the carrier into halves.
 - c. Remove pinion and axle gears from shaft.
 - d. Inspect thrust washers for excessive wear, splitting, and breaks.
 - e. Inspect gear and shaft for excessive wear on teeth, chipped teeth, pitted teeth, inside gear wear, and crossshaft wear.
 - f. Install new thrust washer and assemble carrier.
 - g. Torque carrier bolts to the manufacturer's specifications.

5. Remove ring gear from carrier.
 - a. If the ring gear is bolted to the carrier, remove nut locks and bolts.
 - b. Remove gear from carrier.
 - c. If ring gear is riveted to carrier
 - 1) Use cutting torch to cut off rivet beads.
 - 2) Cut rivet beads at the ring gear if ring gear is to be discarded, or cut rivets at the carrier if carrier is to be discarded.
 - 3) Use punch and hammer or press to push rivets out of the carrier.

- 4) Remove ring gear.
 - 5) When assembling carrier and ring gear, replace rivets with special bolts and nuts and torque to manufacturer's specifications. Be sure to install locks on nuts.
6. Remove tapered roller bearings from carrier.
 - a. Use puller or press to remove bearings.
 - b. Inspect bearings. Follow the procedure outlined under step 8 in competency VII.
 - c. Press bearing on carrier.
 7. Remove pinion gear from differential housing.
 - a. Remove bolts from pinion retainer cap.
 - b. Using a hard wood block 2" x 2" x 2' and a hammer, drive pinion out of housing.
 8. Inspect pinion gear and bearing.
 - a. Remove large nuts from pinion shaft.
 - b. Press double tapered roller bearing from the pinion shaft.
 - c. Inspect bearing. Follow procedure outlined in step 7, competency VII.
 - d. Inspect pinion gear for chipped or pitted teeth and excessive wear on the teeth.
 9. Press bearings on pinion shaft and lubricate with gear oil.
 10. Adjust bearings with large nut on pinion shaft.
 - a. Adjust to a slight drag.
 - b. Install second nut to lock first nut into position.
 11. Install pinion in housing.

12. Install ring gear in housing.
 - a. Adjust ring carrier bearings.
 - 1) Tighten bearing adjuster. Push against bearing cups and tighten to get slight drag on bearings.
 - 2) Adjust ring gear to pinion back lash.
 - a) Tighten adjuster on one side and loosen the other side to move the ring gear closer to the pinion. Reversing this procedure moves the ring gear away from the pinion.
 - b) Place dial indicator needly on the ring gear teeth and rotate ring gear back and forth without turning pinion. Note the dial reading and compare it with the manufacturer's specifications. Change reading by moving ring gears closer to or farther away from the pinion.
 - c) Lock cap.
13. Install new gasket.
14. Reassemble differential, sealing all parts as they are assembled.

Suggested Teaching-Learning Activities

1. Identify and demonstrate special differential repair tool usage before the class.
2. Using charts, overhead transparencies, and other instructional materials, discuss with the class each step in the repair procedure outlined in the content.
3. Following the differential repair procedure in this module, have students repair the differential on their assigned tractors.

Suggested Instructional Materials and References

Instructional materials

1. Special tools for repairing differentials
2. Charts, overhead transparencies, and other instructional materials pertaining to the content
3. A tractor for every two students

References

- 1. Implement and Tractor Service Manual.
2. Manufacturer's service manuals.

Suggested Occupational Experience

Have students overhaul the differential on a tractor at a local agricultural machinery dealership under the supervision of the head mechanic. Have them parallel their work there with their classroom study and repair procedures.

IX. To repair the power steering units

Teacher Preparation

Subject Matter Content

1. Check and repair power steering unit. Check for the following minor items that hinder proper unit operation:
 - a. Oil in reservoir
 - b. Bad filter
 - c. Loose drive belt
 - d. Plugged air vent in reservoir
 - e. Collapsed intake hose
 - f. Plugged intake hose
2. Check hydraulic pump for maximum pressure.
 - a. Remove pressure line from the hydraulic cylinder.
 - b. Connect pressure gauge to line.
 - c. Start engine and run at a fast idling speed. Turn steering wheel and note the gauge reading. Check manufacturer's specifications for maximum pump pressure. If satisfactory, connect the line to the cylinder again.

- d. Remove the line from the opposite end of the cylinder and repeat the test in step c. A low pressure indicates a worn pump or faulty check valve.
3. Install a pump kit. This kit includes gears, bearings, seals, and "O" rings.
4. Check pump if pressure is low.
 - a. Remove lines to pump.
 - b. Remove bolts holding pump to block and remove pump.
 - c. Disassemble pump. If it is a gear pump, check for worn gears, drive gear slippage and shaft due to sheared key or broken gears, worn housing, and too much clearance between gear teeth.
5. If the pump is the vane type, check for:
 - a. Vanes for shortness
 - b. Scarred and sticking vanes
 - c. Worn housing
 - d. Worn bearings
6. Remove and inspect check valve.
 - a. Remove large plug.
 - b. Remove spring and valve.
 - c. Check spring tension on spring tester and compare with manufacturer's specifications.
 - d. Check valve for groove in the seat.
 - e. Check valve for sticking in housing.
7. Reassemble parts.
8. Remove and check hydraulic cylinder.
 - a. Disassemble hydraulic cylinder according to the manufacturer's specifications.
 - 1) Check piston cups for breaks or splits.

- 2) Check the "O" ring.
 - 3) Check for split piston packing.
 - 4) Check inside of cylinder for scores that cut piston cup or packings.
 - 5) Reassemble parts, installing complete new gas-kets and "O" rings.
9. Check control valve.
- a. Remove control valve from the tractor.
 - b. Disassemble valve control.
 - 1) Look for flat or broken "O" rings.
 - 2) Check for scored valve piston and housing.
 - 3) Check for sticking valve.
 - c. Reassemble and install new "O" rings.

Suggested Teaching-Learning Activities

1. Identify and demonstrate special power-steering repair tools before the class.
2. Using charts, overhead transparencies, and other instructional materials, discuss with the class each step in the repair procedure outlined in the content.
3. Following the power steering procedure in this module, have students repair the power-steering unit on their assigned tractors.

Suggested Instructional Materials and References

Instructional materials

1. Special tools for repairing power steering units.
2. Charts, overhead transparencies, and other instructional materials pertaining to the content.
3. A tractor for every two students

References

1. Implement and Tractor Service Manual.
2. Manufacturer's service manuals.

Suggested Occupational Experience

Have students overhaul the power steering unit on a tractor at a local agricultural machinery dealership under the supervision of the head mechanic. Have them parallel their work there with their classroom study and repair procedures.

X. To prepare and paint the tractor after it has been repairedTeacher PreparationSubject Matter Content

A steam cleaner should be used to remove grease, oil, dirt, and foreign materials from the outside surfaces of the tractor. The manufacturer's instructions for use of the steam cleaner and the recommended cleaning solution to use should be carefully followed when using the steam cleaner. Caution should be exercised to avoid letting steam come in contact with hydraulic lines, pressure bases, etc.

1. Remove all parts that would make it difficult to remove the paint from behind them.
2. Before sanding the tractor surface, cover all openings and other parts that are in danger of being damaged by the dust from the sander.
3. Sand the surface of the tractor.
 - a. Using a power disk sander, sand all surfaces with #60 or #80 grit sandpaper.
 - b. Use #30 grit sandpaper to remove heavy rust. However, if a rust inhibiting primer is used, it isn't necessary to sand down to bright metal.
 - c. Wipe or wash off the sanded surfaces.
4. Prime base metal.
 - a. Use a fish oil base rust inhibitive primer on soundly rusted metal and zinc chromate primer on clean metal.
 - b. Strain primer before placing it in the spray paint gun.

- c. Apply primer evenly on all surfaces avoiding build-ups that will cause the primer to run. If runs develop sand them off and reprime.
 - d. Sand all primed surfaces with #220 sand paper after the primer has dried.
5. Cover all parts that should not be painted or that should be painted a different color with masking tape or masking cream.
 6. Move tractor into a suitable dust-free paint room or paint area.
 7. Wipe off all surfaces to be painted with enamel thinner. This step will aid in knitting the primer coat and the fresh paint.
 8. Mix paint according to the manufacturer's directions on the paint can. If the paint needs to be thinned use the thinner recommended by the manufacturer of the paint.
 9. Apply a light first coat of paint to all and let dry.
 10. Using a fine sandpaper, roughen up all painted surfaces. Wipe or blow-off all sanded surfaces.
 11. Apply the second coat of paint.
 12. Following the above procedures, paint all parts that have been removed or are to be painted a different color.
 13. When the paint has dried thoroughly, install parts that were removed earlier.
 14. If runs or sags occur in the paint, sand them off, reprime the sanded area, and repaint.
 15. After the paint has thoroughly dried, install duals. Follow the instructions on the duals when installing on the tractor.
 16. If problems develop in applying the paint caused by the spraying outfit, consult the operator's manual to correct these problems.
 17. After the tractor has been painted, clean the paint gun in a recommended cleaner and wipe all parts dry.

Suggested Teaching-Learning Activities

Have students prepare their tractors for painting and paint them, following the steps outlined in the subject matter content.

Suggested Occupational Experiences

Have students prepare their tractors for painting and paint them at a local agricultural machinery dealership.

Suggestions for Evaluating Educational Outcomes of the Module

The following criteria should be used to evaluate the educational outcomes of this module:

1. How efficiently the student performs the overhaul tasks in his tractor.
2. The quality of work done by the student
3. The understanding the student has of the nature of the work to be done
4. The ability of the student to use references in carrying out his overhaul tasks
5. The ability of the student to detect malfunctions in the tractor
6. The aggressiveness of the student in carrying out overhaul procedures
7. The cleanliness of the student in overhaul procedures
8. The running efficiency of the overhauled tractor under load, as measured by the dynamometer.

Content of a Course for
Several Levels of Employment in

AGRICULTURAL MACHINERY--SERVICE OCCUPATIONS

Teaching Modules Making Up This Course

Note: It is not implied that the sequence in which the modules are presented below is the order in which they are to be taught.

1. Organization and Management of Agricultural Machinery Dealerships
2. Agricultural Machinery Service Department Operating Procedures
3. Agricultural Machinery Parts Department Operating Procedures
4. Agricultural Salesmanship
5. Human Relations in Agricultural Occupations
6. Metal Fusion and Fabrication Welding
7. Agricultural Machinery Assembly and Lubrication
8. Mechanical Power Transfer Systems
9. Hydraulic Power Transfer Systems
10. Adjustment, Maintenance, and Repair of Tillage, Planting, Spraying, and Fertilizing Machinery
11. Adjustment, Maintenance, and Repair of Crop Harvesting Machinery
12. Adjustment, Maintenance, and Repair of Small Gasoline Engines
13. Tractor Tune-up and Maintenance
14. Gasoline Tractor Engine Systems
15. Diesel Engine Systems
16. Tractor Repair

Publications on Off-Farm Agricultural Occupations
Available From
The Center for Research and Leadership Development
in Vocational and Technical Education
The Ohio State University
980 Kinnear Road
Columbus, Ohio, 43212

This publication is one of a series relating to Off-Farm Agricultural Occupations developed at The Center for Vocational and Technical Education under a grant from the Division of Adult and Vocational Research, U. S. Office of Education. Each of these publications was designed for a specific purpose. However, they are designed to complement and reinforce each other. It is suggested that persons using any of these materials will want to familiarize themselves with the other publications in this series. Following is a complete listing of this series.

1. Policy and Administrative Decisions in Introducing Vocational and Technical Education in Agriculture for Off-Farm Occupations
2. Vocational and Technical Education in Agriculture for Off-Farm Occupations
3. Summary of Research Findings in Off-Farm Agricultural Occupations
4. Planning and Conducting Cooperative Occupational Experience for Off-Farm Agriculture
5. Occupational Guidance for Off-Farm Agriculture
6. Horticulture - Service Occupations
(Course outline and twelve modules)
7. Agricultural Supply - Sales and Service Occupations
(Course outline and twelve modules)
8. Agricultural Machinery - Service Occupations
(Course outline and sixteen modules)
9. Agricultural Chemical Technology
(Course outline and nine modules)

PREFACE

This publication is one of a series developed by a national task force at The Center for Vocational and Technical Education to assist state and local vocational education leaders in developing programs to prepare youth and adults for employment and/or advancement in off-farm agricultural occupations.

This project had its origins in the National Research Coordination Conferences on Off-Farm Agricultural Occupations sponsored by The National Center for Advanced Study and Research in Agricultural Education and the Agricultural Education Branch of the U. S. Office of Education in May of 1963 and January of 1964. These conferences were designed to assist states in undertaking studies of off-farm agricultural occupations training needs.

Subsequently, the Center was given a grant by the Bureau of Adult and Vocational Research to synthesize these studies, develop needed instructional and program materials, and conduct training conferences on their use.

The task force of 30 people from 16 states has included personnel with a wide range of backgrounds and responsibilities in agricultural education, vocational education, agricultural technology, and agricultural industry. Several project advisory meetings were held to secure needed counsel from diverse, but relevant groups and to help the task force maximize the potential benefits and uses of these materials.

Primary leadership for the development of this publication was provided by Mr. Alan Kahler. Assisting him on the project were Mr. V. B. Hairr, Mr. Earl Scott, and Mr. Martin Rehmert.

In developing these instructional materials, prime consideration was given to the data revealed by the studies of agricultural business and employee training needs conducted in several states. Current and projected employment opportunities dictated the areas in which instructional materials were developed. In addition, these studies identified those occupations which require knowledge and skill in agriculture. They also contributed to the development of the publication series through the identification of specific competencies needed by individuals for entry and persistence in agricultural occupations.

Members of the task force were aided in the development of these publications through personal visitations to outstanding existing off-farm agricultural occupational programs. Frequent consultations with trade association educational committees and agricultural industry leaders concerned with personnel development were helpful

in further "keying" these materials to employment needs. Existing materials were carefully reviewed and evaluated in terms of their utility in the preparation of these workers and, when suitable, were recommended as a part of these publications. References are also made to other instructional materials and sources designed to aid teachers and supplement and reinforce project materials.

Following the first draft of each publication by the Center, copies were sent to a wide range of knowledgeable individuals for review and evaluation. Reviewers included experienced teachers in vocational agriculture and other vocational services, college and university specialists in the appropriate subject-matter area, supervisory and research personnel, and agricultural business and industrial leaders. Many of their comments and suggestions were incorporated into the revision. However, the final responsibility for the content rests with the project staff.

It should be recognized that these materials are still developmental in nature. Although considerable time and effort have been expended to bring them to this stage of development, it is recognized that they are not the final answer in planning and conducting off-farm agricultural education programs. We hope that the experiences gained through the utilization of these materials during the coming year will assist us in their further refinement.

Your attention is directed to the evaluation form which accompanies each module. Persons using these materials are asked to complete the form and return it to the Center. We believe these evaluations, based on actual experiences, will provide a valuable basis for further improvement and will help identify voids in existing materials.

ROBERT E. TAYLOR
Director
The Center for Research and
Leadership Development in
Vocational and Technical Education

Introduction

Programs in vocational agriculture are being expanded and new programs are being developed at the post-high school level throughout the nation, to train persons for occupational entry and advancement in the agricultural machinery service occupations. Research indicates that many occupational opportunities exist in the agricultural machinery industry. According to the 1965 Farm Fact Book, the average farm size has increased in all states. The size of the commercial farm will probably continue to increase. As commercial farms become larger and their methods of production more technical in nature, they will require a wider variety of services from agricultural machinery dealerships in order to function efficiently. The need for competent employees in the agricultural machinery industry is further exemplified by the interest which has developed on the part of employers in hiring competent people to fill positions in the service occupations in their dealerships.

The Vocational Education Act of 1963 has made it possible to establish programs for preparing personnel for jobs in the agricultural machinery service occupations. In order to prepare workers to assume these positions in the local agricultural machinery dealership requiring knowledge and skill in agriculture, it is necessary to have programs established to provide the appropriate classroom, laboratory, and occupational experience to develop the competencies workers need to be successful on the job. Herein lies the opportunity and challenge for those entrusted with programs at the high school and post-high school levels to prepare service workers for jobs in agricultural machinery dealerships.

The materials presented in this area were developed to aid teachers who are offering programs for employees of agricultural machinery businesses. These materials should be considered developmental in nature and persons who use them should integrate them carefully into a well-planned program supplementing them with other appropriate materials.

Enclosed with these materials are evaluation forms which will be used to guide the improvement of future publications. Please fill out an evaluation form following completion of each module. This will assist in a systematic evaluation of materials developed at The Center.

AGRICULTURAL MACHINERY--SERVICE OCCUPATIONS

Purpose of Course

To develop the competence needed at the post-high school level for occupational entry and advancement in service occupations in agricultural machinery dealerships.

Occupations or Levels of Employment for Which Course Is Intended

Agricultural machinery set-up man
Agricultural machinery mechanic's helper
Agricultural machinery mechanic
Agricultural machinery parts man
Agricultural machinery service supervisor

Suggested Time Allotments

(See Table on Page 4 and time suggestions for each module.)

Persons to be Served

1. Farmers who have left the farm seeking employment elsewhere
2. High school graduates desiring employment in the agricultural machinery service occupations who did not receive training for these occupations in high school
3. High school graduates who need a higher degree of competence for occupational entry into these occupations
4. High school dropouts who are capable of mastering the skills, abilities, and understanding necessary for occupational entry in the agricultural machinery service occupations and who show an earnest desire for such employment
5. Unemployed persons capable of carrying out the responsibilities of these jobs and who show an earnest desire for occupational entry in the service occupations in agricultural machinery dealerships
6. Persons presently engaged in these occupations desiring to update their understandings, skills, and abilities

Supporting Education Needed

Due to the difference in the educational backgrounds of the people for whom this course is intended, probably no specific course should be required before a person is allowed to enroll in the course. Desire for occupational entry and potential ability for carrying out the functions of

these occupations should be considered the prerequisites for enrolling in the course. Most students will likely be deficient in mathematics, communications, and reading comprehension. Instruction that will correct these deficiencies should be offered concurrently with instruction in the modules making up the course in agricultural machinery. Care should be exercised to make certain that these courses develop those abilities, skills, and understandings needed by agricultural machinery service employees.

The mathematics instruction course should include the use of fractions, decimals, ratios, areas, percentages, measurements, etc. Instruction should be centered around situations that an agricultural machinery service employer will confront in his job. The following problems illustrate the proper approach to teaching mathematics to support this course.

1. The diameter of the two pulleys connected by a belt are, respectively, 15 and 8 inches. The smaller pulley makes 600 r.p.m. How many r.p.m. is the larger pulley turning?
2. A mechanic overhauling an engine checked a shaft for wear. Using a micrometer observe the following setting on the micrometer of ten measuring the shaft. What was the thickness of the shaft?

The instruction in communications should include study of proper use of forms used by the agricultural machinery dealer, conversational speech, letter writing, describing part failures on machines, etc.

The specific supporting competencies to be taught concurrently with the modules will be dictated by the deficiencies of the group enrolled in the course.

Suggestions for Introducing the Course

At the first class meeting the instructor should give the enrollees a broad overview of the course and develop enthusiasm on the part of the enrollee for the course. The instructor should discuss with the enrollees the following items during this meeting.

1. Why the course is needed
2. What the course is to do
3. The major areas to be dealt with in the course
4. How the course will benefit the enrollee and why the major course areas are important in the course

5. How the teaching will be done -- the class schedule, the occupational experiences to be provided at the school and on the job
6. The role of the classroom instructor
7. What is expected of the student
8. What level of occupations and the level of employment that the course may lead to through proper study, training, and application
9. Job possibilities upon completion of the course

It is important that all these points be made clear to the enrollees, and that they accept them as being important. Opportunities for enrollees to discuss these points and to ask questions are essential. The idea of cooperation and working together should be emphasized at the first class meeting. It is usually good to get into the course itself during the first class period. The extent of this work may be limited, but the important thing is to begin-- and to make an effective beginning!

Modules Needed in Each Occupation or Level of Employment
and
"At School" Time Allotments*

Teaching Modules:	Agricultural Machinery Set-up Man	Agricultural Machinery Mechanic's Helper	Agricultural Machinery Mechanic	Agricultural Machinery Service Department Manager	Agricultural Machinery Parts Man

16. Tractor Repair			504	504	
TOTAL "At School" Time	276	846	1698	1698	1092

*Time is stated in clock hours.

Nature of the Course

This course is a vocational technical education program in that it is specialized education for work in a particular non-professional occupation or cluster of occupations. The course is designed for use in junior or community colleges, vocational schools, technical institutes, and branches of universities serving areas usually larger than local school districts. The area school program is discussed in detail in the publications entitled, "Vocational and Technical Education in Agriculture for Off-Farm Occupations," and "Policy and Administrative Decisions in Introducing Vocational and Technical Education in Agriculture for Off-Farm Occupations."

The course is designed to develop the degree of competency needed for initial employment in the various service occupations in agricultural machinery dealerships. The course is not intended to develop the degree of competence needed by the highly skilled employee in any of the service occupations. Further training in special schools conducted by the agricultural machinery companies for which the enrollee is employed may be necessary to develop higher degrees of skill.

The course is so designed that part of the preparation for these occupations can be carried out in the high-school vocational agriculture program. The high-school vocational agriculture program can provide adequate training for gainful employment at the set-up man and mechanic's helper levels of employment. Training for occupational entry as a parts man, mechanic and service department manager should be provided at the post-high school level in area vocational schools. If part of the instruction is provided at the high-school level and part in the area school, the two programs should be coordinated to provide the best possible total educational program, thus eliminating waste and frustration. In addition to preparing set-up men and mechanics' helpers, the high-school vocational agriculture program can provide instruction in production agriculture and mechanics basic to all the agricultural machinery service occupations.

Two approaches should be considered in providing this training in the area school; and if it is necessary, both may be taken at the same time. First, instruction can be provided daily for those who are able to attend classes daily. Second, classes could be scheduled in the evening for those who are employed during the day at other jobs. These persons desire to prepare themselves for occupational entry in new occupations. Those presently employed in these occupations who desire to update their skills and abilities may attend night classes. The approach used in the area school will be dictated by the needs of the group the course is to serve. It is important for those who administer the course to realize that the responsibility of the area school is to provide educational opportunities for persons 16 years of age to 60 years of age, and that their programs should satisfy the needs of people of all ages with all types of educational backgrounds.

Use of the Course Materials

This course is made up of sixteen modules. Each module is a complete, self-contained part of the course that may or may not be taught in the sequence given in the course outline. Not all modules may be needed to meet the needs of the students to be taught. The experience and educational background of the students will dictate the modules that should be included in the course.

Each module consists of (1) a major teaching objective, (2) a suggested time allotment for school instruction and occupational experience, (3) an introduction to the module, (4) the competencies to be developed, (5) suggested instructional materials and references for use in teaching the module, and (6) suggestions for evaluating the educational outcomes of the module.

For each competency four kinds of information is included: (1) subject matter content, (2) suggested instructional materials and references, (3) suggested occupational experience needed to develop each competency, and (4) suggested teaching-learning activities.

The subject matter content provides an overall view of the important aspects of each competency that should be stressed by the teacher. It may include charts, tables, graphs, drawings, etc. The content may be in topical outline or paragraph form. The subject matter content as included in each competency is not complete enough for all lesson preparation. The teacher must use the references at the end of each competency and other references to supply the additional information that he needs to teach.

Under the section entitled "Suggested Instructional Materials and References," are listed materials that may be used by the instructor in developing the competency. These are suggestions, and should help the instructor identify other materials and references that could be used in teaching.

Specific activities that may help the teacher to develop the competence of his students are listed under "Suggested Teaching-Learning Activities." In the main, these activities emphasize student involvement in carrying out the activity. Since new materials are continually becoming available, the instructor should supplement each list with new strip films, movies, etc., that he is familiar with which will improve his instruction. In the modules emphasizing machinery and tractor adjustment, maintenance, and repair, the teaching-learning activities provide the basic instruction needed to develop the competence of the student. Care should be exercised, however, to avoid making the course a classroom teacher-centered learning situation.

Under suggested occupational experience, activities are identified that should be carried out on-the-job at the agricultural machinery dealership. These will further implement or put the final touches on

the development of the competency. These activities are just as important to effective teaching as is the subject matter content and the teaching-learning activities. Care should be exercised to make certain that there is a high correlation between what is being taught in the classroom and shop and the learning activities of the student at the agricultural machinery dealership.

Adapting the Course to the Needs of the Enrollee

Due to the difference in the educational background, age, and experiences of the people for whom the course is intended, the course pursued by the enrollees will vary. The course will need to be more basic in nature for the individual that may not have completed high school. For those who are presently employed in agricultural machinery service occupations who desire to update their skills and abilities, the course would be more specialized in nature. It will be necessary for the person setting up the course to group the enrollees according to their instructional needs, determine the content of the course needed by the enrollees, and set up a program to fit these needs. The modular concept upon which this course has been developed provides this flexibility.

Courses should be scheduled so as to make the most efficient use of teacher time and school facilities and yet provide the level of instruction to which the student is entitled. Using the modular concept, this can readily be accomplished. Students planning on occupational entry in several different occupations could be brought together and taught at the same time. For example, students training to be mechanics and set-up men could be taught agricultural machinery salesmanship at the same time. Students of other courses could also be included in this class. When necessary, the trainees may be divided into separate classes for more specific training.

Cooperating with Representatives of Industry

It is imperative that local industry representatives be involved in the organization and implementation of this program. These people when formed into and used as an advisory council can provide valuable assistance in advising on course content, equipment needed in the instructional program, training stations for the enrollees, and help in the placement of enrollees after completing the course. Relationships should be established with the agricultural machinery dealers' association, and where possible, with major-line company officials. These relationships will help the instructor place the enrollees at the time of graduation.

Providing Supervised Occupational Experience

Supervised occupational experience is an integral part of this course. Experience gained while on the job cannot be duplicated in the

classroom or the school shop. The occupational experience program should if at all possible, be carried on at the time the student is attending classes. The classroom instruction should be supplemented on the job. In the event that occupational experience cannot be provided concurrently with the class instruction, other provisions should be made to provide this experience. If this approach is used, experience to be provided on the job should be highly correlated with the classroom instruction. If the occupational experience is to be provided during the summer months, extreme care should be exercised to avoid making the program merely a summer work program that is aimed only at helping the agricultural machinery dealer out during his busy season.

Careful attention should be given to the selection of training centers that are to provide these experiences. They should be agricultural machinery dealerships that can provide an atmosphere conducive to learning and that will create a strong desire in the student to become a part of the agricultural machinery industry. The manager of the dealership must be sympathetic to the program and provide capable and responsible employees to work with the trainee. It may be necessary for the instructor to educate the managers of the training centers to the objectives of the program, and their responsibilities in providing the best possible training program for the trainee. Providing supervised occupational experience for off-farm occupations in agriculture is discussed in detail in the publication entitled, "Planning and Conducting Cooperative Occupational Experience in Off-Farm Agriculture," available from the Center for Vocational and Technical Education.

Providing Competent Instructors

Due to the technical nature of the content included in this course, teachers and area school administrators may need to solicit the help of industry people to teach part of the course. Only individuals who are considered highly competent as mechanics, parts men, or service department managers should be selected to fill these positions. It should be realized, however, that these people will not be proficient in the method of teaching. Having little or no training in this area, they will need a great deal of help as they teach. If possible, they should be trained in the method of teaching prior to their beginning to teach. However, if this is impossible, they should be given short-course instruction in the method of classroom teaching as they teach the course, and should work closely with a qualified teacher to develop this skills in this area.

Selection of Enrollees

Applicants for the course should be highly screened to make sure that the right people are enrolled. Desire for occupational entry and potential ability for carrying out the functions of these occupations should be considered when screening applicants. A battery of tests

should be administered to each applicant and should be analyzed by a person competent in this field. Included in this battery of tests should be interest inventories, aptitude tests, and achievement tests. When an individual is analyzed in this manner, a clearer picture of the whole individual will emerge, and a decision concerning his potential ability and interests can be made more wisely. Data received through the battery of tests should be combined with information received through personal interview and from those who are well acquainted with the individual. Selection of the individuals should be based on this information.

The Setting for the Development of the Course

It was a growing awareness of the urgent need for more definite information on the requirements for occupational education involving competencies in agriculture that brought state leaders in agricultural education and representatives from the United States Office of Education together at planning conferences at the then National Center for Advanced Study and Research in Agricultural Education at The Ohio State University in May, 1963, and January, 1964. At these planning conferences, procedures were outlined for use in investigating off-farm occupations in agriculture. In January and April, 1965, advisory conferences were held at the National Center to preview preliminary research reports. As a result, the Center was urged to develop curriculum guides and course materials that would implement these findings. Due to the magnitude and variety of occupations found to involve competencies in agriculture, it was recommended that the National Center prepare course materials in four areas; namely, ornamental horticulture at the high-school level, agricultural supply--sales and service at the high school and post-high school level; agricultural mechanization at the post-high school level and agricultural chemicals at the technician level.

As a result of the action of these conferences and the receipt of a grant from the Division of Adult and Vocational Research of the U.S. Office of Education, selected persons were brought to the Center to develop program guides and course materials in the areas identified.

The selection of the areas in which to develop course materials, the occupations for which the courses were to be developed, and the content of the courses and the modules were determined by the research reported to the Center by the states. In the agricultural mechanization area, studies revealed that the largest number of employment opportunities, as well as those presently employed, were in the agricultural machinery industry. Findings further revealed that in this industry over 50 per cent of the opportunities for employment and the number presently employed are in the service occupations. Data presented on the following page are typical of the findings of the states concerning the employment opportunities in the agricultural machinery industry.

<u>Level of Employment</u>	<u>IOWA (Statewide)</u>		<u>OKLAHOMA (Statewide)</u>	
	<u>Presently Employed</u>	<u>Increase in Five Years</u>	<u>Presently Employed</u>	<u>Increase in Five Years</u>
Managers	1,064	139	363	31
Department Managers	244	53	35	22
Sales	745	170	202	167
Clerical	632	70	72	19
Service	<u>3,574</u>	<u>518</u>	<u>1,233</u>	<u>887</u>
Total	6,260	959	1,905	1,125

After reviewing the data, it was decided by the staff members at the Center that the most logical selection of an area in which to develop course materials in the agricultural mechanization area was in the agricultural machinery service occupations.

The studies reported to the Center by the states were again the bases to identify the competencies that persons employed in the agricultural machinery service occupations needed in order to effectively perform their jobs. The state studies also helped identify the degree of proficiency needed in the competencies for initial employment. A summary of their findings are presented in the publication entitled, "Summary of Research Findings in Off-Farm Agricultural Occupations," available from the Center for Vocational and Technical Education.

Involvement from Industry and Agricultural Educators in the Development of the Course

Throughout the development of the course, personnel from the agricultural machinery industry were consulted for advice and suggestions as to content for the course (and modules), the time that should be spent in each module, and ways of implementing the needed instruction. The persons consulted included parts men and mechanics employed in agricultural machinery dealerships, agricultural machinery dealership managers, branch house representatives and major-line agricultural machinery company officials.

As each module was developed, it was submitted to industry representatives for preliminary evaluation. The suggestions made by these people were incorporated into the modules. The modules were then submitted to selected people who are recognized authorities in the field of agricultural machinery for a final review. Among these people were

agricultural engineers; agricultural educators; agricultural machinery parts men and mechanics at the local, district, and national levels; agricultural machinery dealership managers; instructors in area schools; and others who were capable of rendering a critical evaluation of the modules.

The following list of persons evaluated selected modules of the course materials within their area of specialization. Their comments and constructive criticisms aided materially in strengthening the value of these materials. However, the final responsibility for the course rests with personnel at the Center who developed these materials.

Mr. Robert Alfred
Parts Distributor
Massey-Ferguson, Inc.
Columbus, Ohio

Mr. R. C. Belt, Manager
R. C. Belt, Inc.
Washington Court House, Ohio

Mr. George B. Blum, Jr.
Assistant Professor of Agricultural
Engineering
North Carolina State University
Raleigh, North Carolina

Mr. S. E. Boggs
District Service Manager
Allis Chalmers Manufacturing Co.
Columbus, Ohio

Mr. Joseph Bradley
Bradley Implement Company
Algona, Iowa

Professor C. L. Bundy
Teacher Educator in
Agricultural Education
Iowa State University
Ames, Iowa

Dr. R. W. Canada
Professor of Agricultural Education
Colorado State University
Ft. Collins, Colorado

Mr. Richard Carr
District Service Manager
John Deere Company
Columbus, Ohio

Mr. L. A. Coomer
General Supervisor
Farm Equipment Service
180 North Michigan Avenue
Chicago, Illinois

Mr. Ray Cunningham
Assistant District Service
Manager
International Harvester Co.
Columbus, Ohio

Mr. Emory H. Dixon
Educational Consultant
Hobart Welding School
Troy, Ohio

Mr. Raymond C. Dunlavy
Supervisor of Training
Hobart Brothers Welding School
Troy, Ohio

Dr. Lewis Eggenberger
Teacher Educator
Agricultural Education
Department
Texas Technological College
Lubbock, Texas

Professor J. M. Farc
Agricultural Engineering
Department
North Carolina State University
Raleigh, North Carolina

Mr. Alfred Fozer
Field Engineer
The Lincoln Electric Company
Columbus, Ohio

Mr. Cliff Gerstenberger
Secretary-Treasurer
Iowa Retail Farm and Power
Equipment Association, Inc.
Des Moines, Iowa

Mr. L. L. Gibbons
Professor of Industrial Education
Colorado State University
Ft. Collins, Colorado

Dr. Jerry Halterman
Instructor in Agricultural
Engineering
Modesto Junior College
Modesto, California

Mr. G. E. Henderson
Southern Association for
Agricultural Engineering
and Vocational Agriculture
University of Georgia
Athens, Georgia

Mr. Ivan Winland
 Coordinator
 Jefferson Area Schools
 Jefferson, Ohio

Mr. James W. Zepplin
 Wausau Technical Institute
 Wausau, Wisconsin

Suggestions for Evaluating the Course

The following criteria should be used in evaluating the effectiveness of the course.

1. Number of enrollees completing the course who have been employed in the agricultural machinery service occupations for which they were trained
2. Number of persons employed in the service occupations a year or more after completion of the course
3. Acceptance of the course by present and future employers
4. Employer evaluations of the quality of work done by employees who have completed the course
5. Number of students who are continuing their training after employment
6. Reaction of enrollees toward the course of study

7. Enrollment trends in the course
8. Reasons given by enrollees who terminated their employment
9. Ability to place students after completing the course
10. Number of former students who have advanced to a higher level of employment
11. Social mobility of the enrollee after completion of the course
12. Parental evaluation of the course
13. School administration of the cour

Suggested Instructional Materials and References for the Course

1. "A Day to Remember," 16mm film, 28 minutes. Available from the John Deere District Branch Houses.
2. "A Step Ahead--In Careers in Agriculture," 16mm film, 14 minutes. Your Local New Holland Machinery dealer.
3. "Arc Welding at Work," 16mm film. General Electric Company, Schenectady, New York. Free.
4. "Arc Welding Electrode Selection," 16mm film, 20 minutes. Hobart Technical School, Troy, Ohio. Free.
5. "Ball Bearing Maintenance." Nt Departure, Division of General Motors, Bristol, Connecticut.
6. "Causes and Cures of Common Welding Troubles," slides (12). Hobart Technical School, Troy, Ohio. Price: \$1.25.
7. "Dynamic Careers Through Agriculture," 16mm film, 28 minutes. Farm Film Foundation, 1425 H Street, Northwest, Washington, D. C., 20005.
8. "Factors to Consider in Selecting Electrodes," Chart 35" x 28" Hobart Technical School, Troy, Ohio. Price: \$1.25.
9. "Farm Tractor Maintenance," filmstrip set. University of Nebraska, Agricultural Education Department, College of Agriculture, Lincoln, Nebraska.
10. "Getting Along With Others," 16mm film, 29 minutes. Business Education Films, 5113 - 16th Avenue, Brooklyn, New York.
11. "Good and Bad Weld Plastic Replicas," set of 10. Hobart Technical School, Troy, Ohio. Price: \$6.

12. "Learning Arc Welding Skills," Set of three filmstrips, 136 frames. Lincoln Electric Company, P. O. Box 3035, Cleveland, Ohio, 44117. Price: \$5.00.
13. "Magic Wand of Industry," 16mm film, 25 minutes. Lincoln Electric Company, Cleveland, Ohio. Free.
14. "Quite Naturally," 16mm film. The Timken Roller Bearing Company, Canton 6, Ohio.
15. "Your Attitude is Showing," sound filmstrip, 12 minutes. Charles Stedman, Teacher-Trainer in Distributive Education, University of Pittsburgh, Pittsburgh, Pennsylvania.
16. Opaque Projector
17. Movie Projector
18. Combination filmstrip and slide projector

University of Idaho
Moscow, Idaho

Gary R. Smith
Highland High School
Pocatello, Idaho

FOREWORD

The council for Distributive Teacher Education was organized in 1961. Membership in the organization consists of teacher educators and other distributive education personnel with an interest in advancing distributive teacher education. The primary interests of the Council are research and publication.

This library list for distributive teacher education was developed with the hope that it will be valuable to institutions preparing teacher coordinators and others who will teach distributive subjects on the secondary and adult levels. In order to facilitate the collection and use of the distributive education materials listed in the bibliography, street addresses have been included where known. This information is enclosed in parentheses and follows the standardized listing. While most listings are arranged according to subject matter, some materials, such as the publications from the U. S. Office of Education, are listed according to the publisher for the sake of brevity and convenience.

This report was compiled by Kenneth A. Ertel, Teacher Educator for Distributive Education, University of Idaho, Moscow, Idaho, and Gary R. Smith, Coordinator of Distributive Education, Highland High School, Pocatello, Idaho. It was edited by the charter president of CDTE and published through the courtesy of the Idaho State Board for Vocational Education. Requests for copies should be addressed to the authors.

INTRODUCTION

The purpose of this bibliography is to make available a list of library materials for the use of distributive teacher educators who prepare teachers of high school cooperative part-time classes, of pre-employment classes, of junior college or mid-management classes, and of adult preparatory and extension classes. The teacher educator must also provide teachers with the background to organize and administer adult distributive education programs.

The teacher of distributive education must translate the subject matter content of the field of distribution, including marketing and management, into a classroom presentation designed to enhance learning. The teacher must have substantive background in the discipline of distribution, the subject matter content inherent to employment in the distributive field. This background must necessarily involve a strong program in business administration and marketing. Therefore, a special section of recent literature in the areas of marketing, merchandising, retail store operation and supervisory management is included. The list is limited to these areas since this is the apex of a business administration program leading toward teacher education for distribution.

The qualified teacher of distribution must have the tools of teaching, including a philosophy of and an understanding of both secondary and adult education. This presumes a background of special and professional education courses designed to provide competencies

as a teacher of distribution. Therefore, a section of materials relevant to such courses as Methods and Materials in Distributive Education, etc., and the professional education materials related to this area are included.

An orientation to philosophy and practice is developed in the section on vocational education.

This suggested list of library materials may prove helpful to those distributive teacher educators who are concerned with providing a library of suitable materials for preparing distributive education teacher coordinators and other professional personnel. The list is in no way all-inclusive and undoubtedly will need continuing revision. Suggestions and comments will be most important in helping to maintain a comprehensive list of library materials.

Many excellent state publications were not listed as they are included in the Distributive Education Bibliography published by the University of Texas. There has been no attempt to include articles in current periodicals which are, for the most part, listed in the Business Education Index. Suggested high school texts and library lists are likewise omitted inasmuch as they are included in A Library for Distributive Education published by Ohio State University.

The assistance of staff members of the College of Business Administration and the College of Education, University of Idaho, for their efforts in evaluating the selected library materials is deeply appreciated.

DISTRIBUTIVE EDUCATION - PROFESSIONAL

PRESENT CONCEPTS AND PHILOSOPHY
of

Suggestions For Using The Student Study Guide

Fundamentals Of Plant Identification

The student study guide on plant identification has been developed for use with the slide series, "Some Fundamentals Of Plant Identification." * Not included in the study guide is the section on flower characteristics of plants.

Write in spaces are provided throughout the guide for listing the names of plant characteristics. Those marked by a letter are individual characteristics, and those marked by a number are leaf characteristics or an entire plant.

It is suggested that the student first become familiar with the plant characteristics and later list the names of plants that have certain characteristics as outlined in the guide. The reference, "An Aid To The Identification Of 60 Ohio Plants," * and the slide series, "Some Common Crop And Weed Plants Of Ohio," * should be helpful in determining many of the plants and their characteristics.

This study guide should become a part of the student's notebook, and should serve as a basic reference in plant identification.

*Available from the Ohio Vocational Agricultural Instructional Materials Service.

Fundamentals Of Plant Identification

A Student Study Guide

Crop and weed plants are divided into two general groups: Dicotyledons (Dicots) and Monocotyledons (monocots)

Some of the general characteristics of the Dicot group are:

a. _____

Leaf Types

Sketches 1 through 7 show different leaf types. In the numbered blank below each leaf type sketch write the name of the leaf type.

The lettered blanks are for plant characteristics. Write the name of the characteristic in the correct blank.

1 _____

2 _____

3 _____

Leaf Types

4 _____

5 _____

6 _____

7 _____

For each of the sketches a few to several different plants will have these leaf types. In the spaces below write the plant names to correspond with the sketch number. (example -- 2 red clover)

1 _____

2 _____

3 _____

4 _____

5 _____

6 _____

7 _____

Leaf Shapes

Sketches 8 through 13 show different leaf shapes. Write the correct name of the leaf shape below each sketch.

8 _____

9 _____

10 _____

11 _____

12 _____

13 _____

In the spaces below write the plant names with leaf shapes as shown in the sketches.

8 _____

9 _____

10 _____

11 _____

12 _____

13 _____

Leaf Margins

Sketches 14 through 19 show different leaf margins. Write the correct name of the leaf margin below each sketch.

14 _____

15 _____

16 _____

17 _____

18 _____

19 _____

In the spaces below write the plant names with leaf margins as shown in the sketches.

14. _____

15. _____

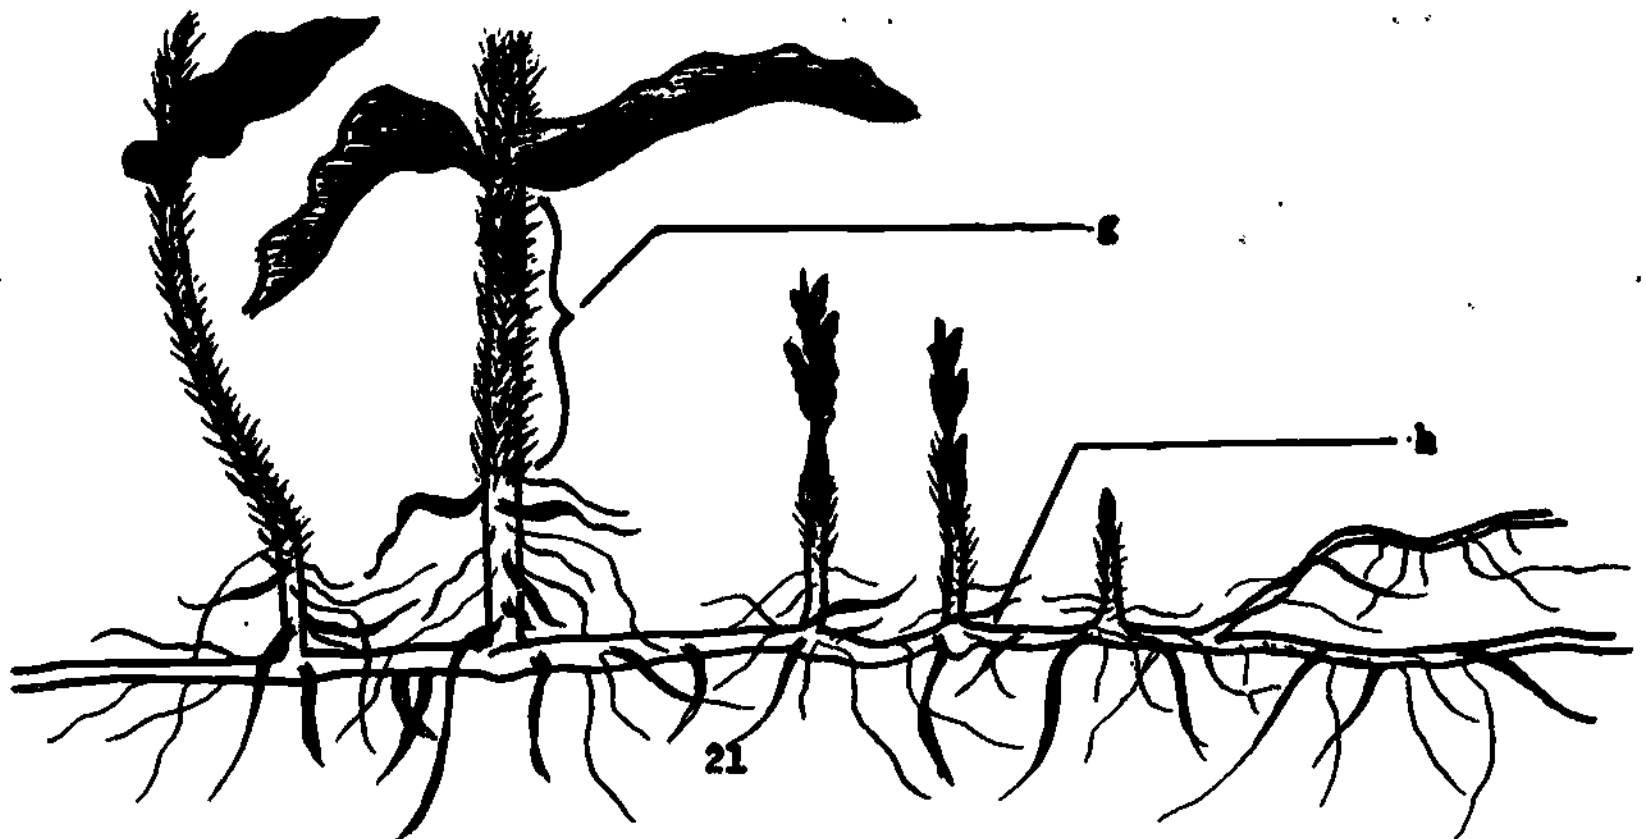

16. _____

17. _____

18. _____

19. _____

Some other plant characteristics are shown in sketches 20 and 21. Write the name of the characteristic in the blank provided.

Plants that have the characteristic as shown in sketch 20 are:

Plants that have the characteristic as shown in sketch 21 g are:

Plants that have the characteristic as shown in sketch 21 h are:

Some of the general characteristics of the Monocot plants are:

1. _____

The sketches below describe three types of Monocot plants, in the blanks provided write the name of each type.

22 _____

23 _____

24 _____

In the sketch below is shown a grass plant, in the blank spaces provided write in the names of the plant parts.

25 A Grass Plant

Sketches 26 and 27 show some characteristics of grass plants that will be helpful in identification. Write the name of the characteristic in the blank provided.

26

27

Grass plants that have the characteristic as shown in sketch 25 l are:

Grass plants that have the characteristic as shown in sketch 26 p are:

Grass plants that have the characteristic as shown in sketch 26 q are:

The characteristic as shown in sketch 27 r is helpful in identifying the following grass plants: (list plants that have this characteristic)

***** KEY*****

FUNDAMENTALS OF PLANT IDENTIFICATION - a student study guide

Page 1

- | | | | |
|----|---------------------------------|----|--------------------|
| a. | broad leaves, net veined leaves | 1. | simple |
| b. | petiole | 2. | trifoliate |
| c. | stipules | 3. | pinnately compound |
| d. | leaflet | | |
| e. | tendrils | | |

Page 2

- | | | | |
|----|------------|----|--|
| 4. | sessile | 1. | many plants have simple leaves not necessary for students to list them all, but to list plants with leaf types in 2 and 3. |
| 5. | perfoliate | 2. | All of the clovers; alfalfa, lespedeza, soybeans |
| 6. | whorl | 3. | hairy vetch, wild carrot, birdsfoot trefoil (with 1 pair of leaflets at the base of the petiole). |
| 7. | digitate | 4. | sessile (without petiole) blackeyed Susan, peppergrass. |
| | | 5. | perfoliate (joined at the base) corn cockle. |
| | | 6. | whorl (not common) based leaves on chicory. |
| | | 7. | digitate - not common |

Page 3

- | | | | |
|-----|--|-----|---|
| 8. | sagittate (arrow shaped) | 8. | hedge bindweed |
| 9. | lanceolate (lance shaped) | 9. | curled dock (also crimped leaf edges) |
| 10. | cordate (heart-shaped) | 10. | buckwheat, wild buckwheat, velvet weed, annual morning glory. |
| 11. | ovate (egg-shaped) | 11. | common plantain, rough pigweed, leaflets of red, white and alsike clover, and soybean leaflets. |
| 12. | spatulate (spoon shaped) | 12. | leaflets of sweet clover, alfalfa, birds-foot trefoil and lespedeza, jurslane |
| 13. | liastate (arrow shaped, with protruding basal lobes) | 13. | field bindweed, sheepsorrel. |

Page 4

- | | | | |
|-----|---|-----|--|
| 14. | entire | 14. | leaflets of red clover, birdsfoot trefoil lespedeza and soybenas; buckwheat, sheep sorrel, wild buckwheat, smart weed, milk weed, purslave, field birdsweed, annual morning glory, common and buckhorn plantain. |
| 15. | serrate (saw-toothed) | 15. | leaflets of alfalfa (tips only), sweet and alsipe clover; giant ragweed, fleabane lamb's quarters, wild mustard, peppergrass. |
| 16. | dentate | 16. | winter cress, rough pigweed, chicory (some). |
| 17. | pinnately lobed | 17. | small ragweed, Canada thistle, chicory (some), horse nettle, jimson weed, wild mustard, winter cress. |
| 18. | scallop - (not shown in slide series) | 18. | velvet weed, ground ivy. |
| 19. | palmately lobed | 19. | giant ragweed. |

Page 5

- 20f. stolon
- 21g pubescence
- 21h rhizome

Plants with characteristics as shown in 20f - white clover, ground ivy - grass plants - crabgrass and nimble will.

Plants with characteristics as shown in 21g - red clover, hairy vetch, soybeans, giant ragweed, fleabane, blackeyed Susan, velvet weed, milkweed, ground ivy, morning glory, buckhorn, corn cockle, mustard, rough pigweed.

Plants with characteristics as shown in 21h - sheepsorrel, Canada thistle, common milkweed, field and hedge bindweed.

ACKNOWLEDGEMENT

This course of study is designed for the vocational agriculture student of Texas who is enrolled in a Cooperative Part-time Training Program in Agriculture.

Much of the material for this course was prepared by J. T. Wiggs, Vocational Agriculture Teacher of Wills Point, Texas, who assisted at the Teaching Materials Center for a four-week period during the summer of 1966.

Members of the staff of the Teaching Materials Center contributed also to the preparation of the course of study.

Several sections of the materials are based upon work produced at the Center for Research and Leadership Development in Vocational and Technical Education at The Ohio State University, Columbus, Ohio.

John Holcomb, Coordinator

Assignment Sheet
for
AGRICULTURAL SALES AND SERVICE

- UNIT:** Agricultural Salesmanship
- TOPIC:** Introduction, Agricultural Salesmanship
- OBJECTIVE:** To develop an understanding of the importance of salesmanship in agricultural business.
- REFERENCES:** Required:
1. Information Sheet, "Agricultural Salesmanship"
- Supplemental:
2. Feed and Farm Supplies, The University of Texas, Division of Extension, Distributive Education Division, Austin, Texas
 3. Salesmanship Fundamentals, Ernest and Davall, 2nd edition, McGraw-Hill Book Co., New York, N. Y.
 4. Let's Analyze and Sell, The University of Texas, Division of Extension, Distributive Education Division, Austin, Texas
- QUESTIONS
or
ACTIVITIES:**
1. Name and give an example from your experience of three reasons customers fail to buy.
 2. What are the main differences between need and desire for a product?
 3. What six things must the agricultural salesman know to be successful?
 4. Give five principal advantages of agricultural sales as a career.
 5. What is one of the best forms of advertising?
 6. Who benefits from efficient selling?

UNIT: Agricultural Salesmanship
TOPIC: Introduction, Agricultural Salesmanship
(Assignment Sheet continued)

7. Good selling does two things connected with human wants. What are the two?
8. What five basic decisions are made by a customer before purchasing an item?
9. What product should be sold to a customer?
10. Give two things that help to make permanent customers.
11. Give a good short definition of "selling".

Information Sheet
on
AGRICULTURAL SALESMANSHIP

Selling is the key function of all business activity. This is as true in agriculture as in other areas. Selling is the act of assisting and persuading individuals or groups to make a buying decision which is to the mutual advantage of both the buyer and the seller.

Selling is really explaining to, persuading, and reminding the public of a particular business concern and of the opportunities and values to be gained from doing business with this concern.

The retailer's function is that of selling goods and services to the ultimate consumer. This is the final step in the distribution of agricultural goods and services.

Efficient salesmen realize that customers are lost because of:

1. Poor service rendered
2. Discourteous treatment received
3. Indifferent attitude exhibited on the part of the salesman

The salesman must know the psychology of selling if he is to become a successful salesman. In other words, he knows that a customer buys primarily because of need and desire. These are influenced by reason, by emotion, or by a combination of these. A person may need something, but does not buy until he desires it, i. e. , he feels the need.

In summary, to be successful, the agricultural salesman must know the selling process, the merchandise itself, and the firm, as well as understand himself, his relations to the customer, and the customer.

Here is an opportunity for a salesman to (a) deal directly with the public, (b) help other people make decisions, (c) face something new everyday, (d) know that his worth is quickly recognized in terms of advancement, and (e) enjoy the prestige of big business. This big business is made up of over 1,700,000 retail stores where Americans spend 70 percent of the family income each year.

Agricultural Salesmanship
(Information Sheet continued)

Good selling does not happen incidentally, but is the result of sound training.

Successful selling produces a satisfied customer who in turn becomes the best form of advertising.

The good salesman must realize that everyone benefits from efficient selling. High sales volume not only insures the salesman's position, but also lowers the price of products or services to the customer.

Good selling awakens and satisfies human wants. Selling is a challenge and every customer is an opportunity for a salesman to get positive reaction from the customer on five basic buying decisions, namely; the need, the thing, the source, the price, and the time. Selling is helping the customer to buy intelligently.

The customer will gain the most personal satisfaction from his purchase if the salesman makes sure that the product will best fit the customer's need. When the salesman demonstrates courtesy and a sincere interest to be of service, the result is a permanent customer.

Assignment Sheet
for
AGRICULTURAL SALES AND SERVICE

UNIT: Agricultural Salesmanship

TOPIC: Meeting the Customer

OBJECTIVE: To develop an understanding of the importance and techniques in making a good impression with customers.

REFERENCES: Required:

1. Information Sheet, "Meeting the Customer"

Supplemental:

2. Let's Analyze and Sell, The University of Texas, Division of Extension, Distributive Education Division, Austin, Texas.
3. Feed and Farm Supplies, The University of Texas, Division of Extension, Distributive Education Division, Austin, Texas.

QUESTIONS
or
ACTIVITIES:

1. Why is the first contact with a customer very important?
2. Why should a salesman be well-groomed?
3. Why should a salesman like his work?
4. Give three "earmarks" of good salesmanship.
5. Give a short description of the proper way to treat a customer.
6. Select one of your classmates that you know well and fill out the "information needed about a customer" given in part 1-a of the information sheet you are using.
7. How could you secure the information you gave in question 6 if you did not know the person well, and if he were an adult?

UNIT: Agricultural Salesmanship
TOPIC: Meeting the Customer
 (Assignment Sheet continued)

8. Pick a store (not the one in which you work) in which you purchased something recently and give your impressions about these characteristics of the store:
 - a. Was the store neat and attractive? What made it appear that way?
 - b. Was the store well-lighted?
 - c. Did the equipment (not the merchandise) look good to you? Why or why not?
 - d. Was the merchandise arranged in a manner you understood, or was it confusing to you? Why?
 - e. Did the person who "waited upon you" have a pleasing appearance? Briefly describe him as he appeared that day.
9. Pick an item from the store in which you work or plan to work and give from memory these characteristics of the product:
 - a. Why is it designed as it is?
 - b. The trade name
 - c. How it is constructed or manufactured
 - d. Its special features
 - e. In what other forms it is available
 - f. What help the store can give if something "goes wrong" with the product
10. Now pick an item your family purchased recently from another store and give the same information as you gave in No. 9 from memory about it.
11. List the preparation a salesman needs to make before he is ready to make a sale.
12. What may cause a salesman to fail to be prompt in greeting a customer?
13. How does the salesman find out about a customer's problem?
14. Give three examples of proper methods of greeting a customer.
15. Give the elements of a good salutation to a customer.
16. Name 11 physical and physiological factors that cause a customer to want to buy a product.
17. Give eight good attitudes for salesmen.

Information Sheet
on
MEETING THE CUSTOMER

The impression of the agricultural business that the customer carries away often results from his first contact with the salesman. Appearance and actions play an important part in forming this impression.

A well-groomed salesman attracts customers and inspires their confidence. Undivided attention on the job is essential to good salesmanship.

A good approach presupposes a proper attitude toward the job. Love for one's work is expressed in the enthusiasm with which it is carried out. Enthusiasm is shown through words, actions, and expression.

Salesmanship is demonstrated through promptness, alertness, and interest in the customer and his problems.

Treat the customer like a guest. This means that good manners and courtesy are practiced at all times; that the house is in order, neat and clean; that the merchandise is conveniently located; and that the salesman is trained in the fundamentals of selling to maximize the opportunity of being of service to customers.

Points to be considered when meeting the customer:

1. The preapproach Preparation

a. Information needed about the customer

- (1) Name - Address
- (2) Personal characteristics
- (3) Mental make-up
- (4) Hobbies and interests
- (5) Common interests
- (6) Buying habits or policies

b. Sources of this information

- (1) Participation in community activities and events
- (2) Chamber of Commerce information
- (3) Comments made by other members of civic clubs

Meeting the Customer
(Information Sheet continued)

- (4) A personal notebook on customers
- (5) Past sale records, credit department records
- (6) Interview with people in the community
- (7) Local newspaper

c. Check of facilities and surroundings

- (1) General appearance of the store
- (2) Lighting
- (3) Equipment
- (4) Merchandise arrangement
- (5) Personnel

d. Knowledge of benefits the customer will receive from merchandise sold

- (1) Design or appearance
- (2) Quality of the source - trade name
- (3) Composition and construction
- (4) Special features
- (5) Assortment of sizes, colors, and styles available
- (6) Service available

e. Preparation by the salesman

- (1) Neatness of appearance
- (2) Preparation of an appealing display arrangement
- (3) Knowledge of contents of the merchandise in stock
- (4) Knowledge of the contents of newspaper advertising being circulated
- (5) Knowledge of names, background, and interests of customers
- (6) Knowledge of the competitors product
- (7) Preparation of a few selling sentences
- (8) Preparation of a record of common customer objections and development of methods of meeting them

2. Timing the Approach

a. Importance of the impression created by the salesman's appearance and actions

b. Suggestions for:

- (1) Promptness - clues for failure in being prompt:

Meeting the Customer
(Information Sheet continued)

- (a) Involved group conversations of salesmen
 - (b) Stock duties
 - (c) Timidity in approaching customers
 - (d) Indifference to the needs of the customers
- (2) Alertness - based on accurate and careful observation;
look for clues on:
- (a) How and when to greet the customer
 - (b) When to present the merchandise
 - (c) How to talk about merchandise
- (3) Interest in customer's problem
- (a) Take all the time necessary to understand his problem
 - (b) Probe to determine if problem is what customer first says that it is
 - (c) Determine the procedure to be followed to assist the customer with his problem
3. The Proper Approach - Greeting the Customer
- a. Type of salutations
 - (1) Conventional
 - (2) Question
 - (3) Stating a fact about the merchandise
 - b. Elements of a salutation
 - (1) Courteous
 - (2) Short
 - (3) Requires no decision
 - (4) Affirmative
 - (5) Emphasizes the desire to serve
 - c. Tone of voice - pleasant, enthusiastic, distinct, articulate, ordinary
 - d. Facial expressions
 - (1) A pleasant smile
 - (2) Cheerful expression

Meeting the Customer
(Information Sheet continued)

Different physical and psychological factors, operating alone or together, motivate a customer to buy a product. Among them are comfort, pleasure, appetite, possession, fear, devotion, curiosity, ornamentation, imitation, construction, and loyalty.

Developing the proper attitudes necessary for success in meeting a customer is important if the student is to develop effective sales abilities. Among them are:

1. Developing professional feeling toward selling
2. Constant courtesy
3. Enthusiasm for selling
4. Interest in customer and his problems
5. Willingness to develop self-confidence
6. Developing sincere attitude of service
7. Developing integrity
8. Appreciating proper psychology such as gaining the customer's attention and interest, creating a desire, and ending with de-
action on the part of the customer

Material for this Information Sheet was taken from Module 4, Agricultural Supply, Sales and Service Occupations, The Center for Research and Leadership Development in Vocational and Technical Education, Columbus, Ohio.

Information Sheet
on
PRESENTING SUPPLIES AND SERVICES TO CUSTOMERS

Successful selling requires a careful presentation by the seller. A salesman must recognize the importance of each of the psychological steps in a sale. He must gain the attention, develop interest, kindle desire, and induce action on the part of the customer.

Attracting attention is one thing; developing interest is quite another thing. Attention is more or less involuntary. Almost anything can attract attention; interest is the result of voluntary reaction on the part of the customer. Interest comes only when attention is prolonged voluntarily and is accomplished by concentration.

Next, one must combine the merits of the article with the needs or wants of the customer to kindle desire. Then, by demonstrating a complete understanding of the interest, needs, desires, and motivating factors that cause a customer to buy, the salesman will be able to make a successful sale. Sales are made by showing the farmer how to increase yields, make more profit, or reduce the labor required, etc.

The attention of customers to a supply or service may be secured in many ways.

Reading an advertisement about a beef concentrate
Seeing a new herbicide on a TV commercial
Talking to a neighbor about his new 5-plow tractor
Mailing a circular on early fertilizer purchase discount
Meeting a new petroleum delivery truck on the road
Hearing from a friend about the good service on baler repairs
Reading in the newspaper about a new bulb shipment received at the garden center
Viewing an attractive display of seed at the supply center

Developing interest in a product can be initiated by the customer, the salesman, or serviceman.

Customers can move from the attention, interest, and desire steps very rapidly at times with little or no encouragement. Example - the customer sees a new field sprayer just the size and kind for which he has a preference--the desire is developed. Often, however, the customer's interest in a product needs to be kindled. This can be done by:

Presenting Supplies and Services to Customers
 (Information Sheet continued)

Talking to him about the new features on this planter
 Inviting him to a field day where the effectiveness of newly developed herbicides will be shown
 Showing him the results of this product in test trials
 Demonstrating how simple it is to mount this new corn picker
 Pointing out to the customer the number of people in the community who are already using this feed, lawn seed, or grease

Desire for a product may be obtained by relating it to a need of the customer,

Explain how this feed will increase net income by improving an animal's rate of gain.

Show him, with proof from variety trials, how the new oat variety will stand, thereby reducing all those combining problems.

Show him that the chemical weed spray will reduce cultivation, allowing time to get the hay harvested, go fishing, etc.

Sell the merits of the tractor seat, not its cost.

Provide appointments for the customer to try the product on a trial basis.

To be able to present items effectively, you will need to:

Know the features of the item

Be able to answer all questions about the item

Demonstrate its use, operation, value, and advantages

Material for this Information Sheet was taken from Agricultural Supply - Sales and Service Occupations, Module 4, The Center for Research and Leadership Development in Vocational And Technical Education, Columbus, Ohio.

Information Sheet
for
OVERCOMING CUSTOMER RESISTANCE

It is natural for people to have sales resistance. Most of them did not come by the money in their possession easily. It is perfectly natural for people to want to get all that they can for the money spent.

Each sale has two sides. The customer must sacrifice something in order to get something else. Since one cannot have everything, each sale means a choice between one product and another product or one product and another form of pleasure.

The customer must decide which of the choices will give the most satisfaction or pleasure.

It is the salesman's job to convince the customer that his product or service will provide this pleasure, satisfaction, or need. If this cannot honestly be done, perhaps he should not make the sale at all. Anything else is high pressure selling that is unethical and cannot be classified as salesmanship. It will invariably lead to ill will and dissatisfaction.

There are several reasons why customers are resistant to purchasing. The first objection is rarely the actual objection. Identify the real reason for such resistance and try to explain away the objection. To do this you are going to need to be well informed on the supply or service. Types of objections are:

1. Need - Objections to need are overcome by stressing the usefulness and benefits of the product.
2. Quality - Objections to quality are overcome by:
 - a. Showing a better quality
 - b. Pointing out a specific feature
3. Source - Objections to the source are met by:
 - a. Providing names and experiences of satisfied customers
 - b. Providing information about the company or by reference to national advertising

**Overcoming Customer Resistance
(Information Sheet continued)**

- c. Courteously straightening out misunderstandings
 - d. Asking for a fair trial of this new firm or by offering something another firm does not carry
 - e. Others correcting the shortcomings of the salesman if he is at fault
4. Price - Objections to price are overcome by:
- a. Revealing hidden values - building up values
 - b. Emphasizing the quality or usefulness
 - c. Providing an article that is not as expensive and doesn't have as many selling points
 - d. Knowing competitors product so that any question or different values can be explained
5. Time - Objections to time are overcome by:
- a. Making a future appointment
 - b. Inviting the customer to look at additional merchandise
 - c. Continuing to show a positive interest in the customer whether the salesman is busy or not
 - d. Trying to handle objections promptly as they arise
 - e. Not trying to close a sale until all bonafide objections have been satisfied. Make feelers during the sales presentation to preclude objections to a reasonable closing of the sale because of the time.
6. Thing - Objections to the thing are overcome by:
- a. Showing more suitable goods
 - b. Admitting the validity of objection but showing another feature to offset the objection

**Overcoming Customer Resistance
(Information Sheet continued)**

- c. Admitting that the objection is reasonable but showing that it does not really apply
- d. Changing the objection into a selling point in favor of the article
- e. Avoiding:

Generalizations which mean nothing
Contradiction of a customer's statement
Display of a negative or discouraging attitude

Again, do not pressure customers to purchase; they are not likely to return if pressured.

Information Sheet
on
AGRICULTURAL SALES AND SERVICE

Obviously, closing the sale is the most important of all the steps in the selling process. Everything that has been done so far comes to naught, if the customer leaves without making a purchase. Closing starts at the beginning of the sales presentation and "trial" closes are appropriate as it proceeds.

Customers resent being hurried into making a purchase. The salesman must take an active part in inducing a favorable action on the part of the customer, but his attitude must be one of helping the customer in making a wise decision.

Sales are lost because the salesman fails to tailor the sales presentation to the individual needs and requirements of the customer.

A salesman is performing a useful service by offering suggestions to customers who are not aware of their needs or to customers who rely upon displays to remind them of what they came to purchase.

Anybody can sell a customer something he wants. It takes a salesman to sell the customer needed items of which he was unaware.

Closing the sale will be more or less automatic if the need for the article has been definitely established. One of the salesman's functions is to help the customer decide by making "trial" closures.

Don't trip on the last step. The time to close the sale is just after the customer has decided to buy.

Indications that the customer is making up his mind occur when the customer asks the salesman to repeat the advantages of each item and when he wants unwanted goods removed. This is when the salesman should repeat the advantages of the item in which the greatest interest was shown by the potential customer.

The decision to buy occurs after the following conditions have been met:

1. The customer has exhibited attention, interest, and desire in the product.

Agricultural Sales and Service
(Information Sheet continued)

2. A relationship between need and the merchandise has been established.
3. All important objections have been overcome.
4. The price is low in comparison with value.
5. The product meets the customer's approval.
6. The customer has the power to make the purchase.

The above decision is reached by taking steps during the presentation to make buying "action" easy. Such steps include leading the customer to make a number of small favorable decisions himself, making these decisions progressively more forceful, seeking agreement more frequently as the presentation progresses, and narrowing the selection. This is done by concentrating upon items in which the customer is interested, by removing merchandise in which the customer is not interested, by repeating demonstrations in more detail, and by soliciting the opinion of others. Always ask for the order. Use the "choice" method in beginning the closing phase, i. e., 2 or 3 dozen.

Failure to close the sale may be due to:

1. Assuming that the customer is not going to buy
2. Hurrying the customer
3. Failing to help the customer decide
4. Stumbling over sales obstacles
5. Stressing the wrong selling points
6. Trying to force action
7. Being discourteous at any point in the process

When engaged in suggestion selling, the salesman must:

1. Make definite suggestions to the potential customer.
2. Give an acceptable justification for the suggestion made.
3. Demonstrate the merchandise thoroughly and unhurriedly.

**Agricultural Sales and Service
(Information Sheet continued)**

4. Not overwhelm the customer with more facts, decisions, etc., then he can face comfortably

Sales are often increased by displaying related merchandise, handling larger quantities, comparing with higher priced merchandise, introducing new merchandise, developing "special" sales, demonstrating new uses for merchandise, and specializing in merchandise for special occasions.

When recording the sale, the salesman, in preparing the sales check, should:

1. Write legibly.
2. Be accurate with items, amounts, and price.
3. List the complete name and address if needed for files or for delivery.
4. Write down any special directions needed to help the customer.

When operating a cash register, make change accurately. Never put a bill away until the customer is satisfied that he has received the correct change. Use the right compartment for paper money and change. Also, learn to count out change properly.

Just because the register bangs shut does not mean that the sale is completed. A proper, courteous farewell often means repeat visits by the customer.

Give the customer a friendly farewell whether or not he makes a purchase and invite him back soon.

**QUESTIONS
or
ACTIVITIES:** In the information sheet accompanying this topic are four check sheets.

Your assignment is to fill out each check sheet, making two marks in each item.

The first mark, a small "x", is your evaluation of a salesman from whom you recently made a purchase. If you wish, use a different salesman for each sheet.

The second mark, a small "o", is your own performance in the place in which you work. Use any customer contact during the past two weeks, and use a different one for each sheet, if you wish, but make an honest appraisal of your performance.

Check Sheet -- Customer Approach

	Did so effectively	Did so partially	Did not	Could have
1. APPROACHED CUSTOMER PROMPTLY				
a. Was on the lookout for customers				
b. Stopped what he was doing				
c. Approached the customer mentally and physically				
2. WELCOMED THE CUSTOMER				
a. Smiled				
b. Used appropriate approach				
c. Treated the customer as a guest				
3. HELPED TO START CONVERSATION				
a. Adapted himself to situation				
b. Made comment about merchandise				
c. Anticipated customer's interest				

COMMENTS:

**Agricultural Sales and Service
(Information Sheet continued)**

Check Sheet -- Holding Customer's Interest

	Did so effectively	Did so partially	Did not	Could have
1. STUDIED THE CUSTOMER				
a. Did not jump at conclusions concerning customer's interest				
b. Sized up what would interest customer				
c. Made positive statements to reveal customer's interest				
d. Determined customer's buying motive				
e. Stimulated customer's want or desire for the merchandise				
2. DISPLAYED MERCHANDISE EFFECTIVELY				
a. Made merchandise stand out				
b. Handled merchandise appreciatively				
c. Appealed to customer's senses				
d. Showed merchandise in good light, at eye level, on all sides				
3. STRESSED CUSTOMER BENEFITS				
a. Showed customer how he would gain				
b. Showed customer how he would be served				
c. Showed customer benefits of owning				
d. Stressed to customer how merchandise would meet his problems				
e. Gave selling points convincingly				
4. USED DEMONSTRATION				
a. Encouraged customer to handle merchandise				
b. Interpreted value of merchandise in terms of dollars invested				
c. Dramatized features of merchandise				
d. Used showmanship advantageously				
e. Secured customer's participation				

**Agricultural Sales and Service
(Information Sheet continued)**

Check Sheet -- Meeting Objections

1. **Allowed customer to state objections**
 Let customer object fully
 Did not interrupt
 Understood customer
 Removed one objection at a time
 Did not argue

2. **Was prepared to meet objections**
 Did not hesitate
 Had right complete answers
 Concentrated on what was coming next
 Retained control of situation
 Discovered real, underlying objection

3. **Anticipated Objections**
 Welcomed customer objections
 Created customer confidence
 Convinced customer he needed merchandise
 Convinced customer he could afford merchandise
 Convinced customer his selection was wise

4. **Turned objections into selling points**
 Used customer's own objections to heighten interest
 Clarified objections
 Translated objections into reasons
 Used objections to clinch a sale
 Used objections to establish customer confidence

- Supplemental:
- 2 Merchandising Products Used in the Farm Business,
Ohio State University, Columbus, Ohio 43210
- QUESTIONS
or
ACTIVITIES:**
- 1 a Give five reasons why management must have records.
b Which of the five is most important? Why?
 - 2 What does an "operating statement" show?
 - 3 How does a "balance sheet" differ from an "operating statement"?
 - 4 Where does management get the "figure" for the operating statement and balance sheet?
 - 5 Why are cash registers balanced daily?
 - 6 Why are "merchandise purchases" not the total cost of the merchandise sold?
 - 7 What are two good reasons for having periodic records of "stocks and inventories"?
 - 8 If the firm in the "statement of operations" had received \$1000 less during this year for storage and handling (with all entries being the same), what would have been the gross margin?

UNIT: Business Procedures
TOPIC: Importance of Accurate Records
(Assignment Sheet continued)

9. Where, in the "statement of operations" do you think these items are included?
 - a. Wages paid a Co-Op Vocational Agriculture student?
 - b. The electricity bills?
 - c. A radio "commercial" for the firm?
 - d. The sacks for small items of merchandise?
 - e. The decrease in value of a delivery pick-up?
10. In the "sample balance sheet" why is there no entry under "accumulated depreciation" for land?
11. If on December 30, 1965, this firm had paid an additional \$5000 of its "accounts payable", how would these four numbers have been changed?
 - a. Cash on hand and in bank?
 - b. Total assets?
 - c. Accounts payable?
 - d. Total liabilities?

Information Sheet
on
IMPORTANCE OF ACCURATE RECORDS

Most people are familiar with the sales ticket and some of the other ordinary papers used in conducting business. These papers and procedures are so important in helping to make an operation successful that they need considerable attention.

To understand the importance of these items, an overview of the entire records of a business is necessary. Management of a business, to be successful, needs records of the business as a whole, and of each department, in order to:

1. Know the financial picture of the business at any given time.
2. Give proper information to board of directors, stockholders, and others involved.
3. Satisfy legal requirements.
4. Plan desirable changes in management and procedures.
5. Prepare state and federal tax returns.

One record needed by management is an "operating statement." It is sometimes called a "statement of operations" or a "profit and loss statement." These are prepared either annually, biennially, quarterly, or monthly, whichever is desired. The operating statement summarizes the receipts and expenses for a given period of time and shows the profit or loss for that period. Many businesses have this statement broken down by departments in order to ascertain the profit or loss of each department.

The other standard overall record used by businesses is the "balance sheet". The balance shows the financial condition of the business at a given time, but generally on the last day of the period covered by the operating statement. The balance sheet lists the assets, liabilities, and net worth of the business. The liabilities and net worth show the methods of obtaining capital for the business. The sum of the liabilities and net worth must "balance" with the assets of the business at any given time.

The balance sheet and the operating statement make up the financial report for a business. (Note attached sample forms.)

Importance of Accurate Records
(Information Sheet continued)

The daily, weekly and monthly records all help contribute to the final make-up of the "balance sheet" and "operating statement".

A record of "cash sales" for the period desired (day, week, month, or quarter, must be secured. In addition, the cash register must be balanced daily to be sure that all cash is accounted for and that all records are correct.

"Charge sales" must be correctly made and entered in appropriate ledgers, according to the policies of the particular business.

Records must be made of all "merchandise purchases," including the cost of transportation and other incidental expenses.

Periodic records of "stocks and inventories" must be made, both for knowing the business' financial condition, and also for determining stock needs and sales.

In addition to those items directly concerned with sales, the costs of payroll, property expense taxes, supplies, services, advertising, interest, depreciation, losses and legal costs must be paid before any profit is returned to the business.

TOPIC: Sales Tickets

OBJECTIVE: To develop an understanding of the necessity for completeness and accuracy in sales tickets and skill in their completion.

REFERENCES: Required:

Information Sheet, 920-III-2

QUESTIONS
or
ACTIVITIES:

1. Secure 10 sales tickets of the type or types used in the place of business in which you are employed.

Attach the first to a sheet of paper, and letter each part of the ticket in a manner similar to the sample in Information Sheet, 920-III-2. Letter the parts in the order in which you would fill out the ticket. Then, on another sheet of paper, give the reason or the use for each part represented by a letter.

2. In making change, the salesman uses the _____ denomination of bills and coins possible.
3. A numerical file accounts for _____ sales tickets.
4. A record of the customers' business is provided by sales tickets in the _____ file.
5. Completely make out 9 sales tickets with at least 5 items each without repeating the same item,

Texas Education Agency
Texas A&M University

Information Sheet
on
SALES TICKETS

The heart of the accounting system is the billing of merchandise to customers. This is necessary to provide accurate records of transactions. Many businesses have triplicate sales tickets, one for the customer and two for the office files. Sales tickets need to be numbered consecutively in advance for filing and checking purposes and to avoid loss of merchandise through carelessness. Sales tickets will provide the company with the following:

1. Information necessary to make an analysis of the day's business.
 - a. Amount of cash taken in. This also serves as a check on the cash that should be in the cash register at the close of the day's business.
 - b. The amount of merchandise sold
 - c. The amount of sales tax collected
2. Information needed for the accounts receivable ledger for the customers who charged their purchases
3. A record of each transaction for future reference. After the information contained on the sales ticket has been recorded in the proper journals, the two copies should be filed as follows:
 - a. One in a numerical file. Since all sales tickets are accounted for in this file, a sales person cannot accept cash from a customer, prepare a sales ticket, give the customer his copy, destroy the office copies and keep the money.
 - b. One in a client file. This will serve as a record of the customers' business.

Many factors are important in the preparation of the sales ticket:

1. In spite of the importance of sales tickets, many mistakes are made in their use. Some common mistakes are as follows:

Sales Tickets
 (Information Sheet continued)

(Use examples to show how important common mistakes are to the net profit of a business, e g , how much more is needed in sales to make up for an order for a ton of feed not filled)

- a. The ticket cannot be read
 - b. Some merchandise is not billed when sold
 - c. Price list and discount policies are not followed
 - d. Mistakes in arithmetic
 - e. Employees do not keep all of their sales tickets
2. Although each business will have its own procedure for completing sales tickets, the following shows one procedure to follow in making out a sales ticket correctly: (A sample sales ticket is included)
- a. Enter the correct date
 - b. Write the customer's correct name and address. If a partnership, it should be noted. The name and address becomes absolutely necessary if the purchase is charged.
 - c. Give a complete description of each article sold. Quantity and unit should be thought of as one item (for example, 100 lbs. of fertilizer or 10 gals. of insecticide). The description should clearly designate the type of merchandise being sold, and not merely be a commodity classification. For example, 100# calf manna, not 100# feed (On sales tickets, pounds are usually indicated by #) This is necessary for checking price and for inventory controls. Show the price per unit for all merchandise (Some sales tickets will have a column heading marked "price") Bill all merchandise at the retail price. If the customer is entitled to a discount because of volume, damage, etc. this amount is deducted from the retail price. Extensions must be mathematically accurate and legibly written
 - d. Make a sub-total of the extension

Sales Tickets
(Information Sheet continued)

- e. Calculate the sales tax on all taxable items, and enter under the first total. (Sales tax policies will vary according to state laws.)
- f. Next, calculate any delivery, mixing, grinding, or shelling charges, and enter under the sales tax calculations.
- g. Add the extension column to obtain the grand total of charges for the sale.
- h. Check the block on the ticket to indicate the method of payment (cash, check, charge, returned, account).
- i. If settlement is to be made by a check larger than the ticket, total, it is necessary to note both the amount of the check on the face of the sales ticket, and the change to be given. A similar calculation is recommended when a large bill is given in payment.
- j. Get the signature of the person receiving the merchandise when the settlement is other than cash.
- k. When a customer pays on account, make out a sales ticket and mark the items for which he is paying (for example, fertilizer, feed, balance on note, etc.).
- l. In all cases where an employee ruins a ticket for any reason, the word "void" should be written across the front of the ticket, and the original placed with the other tickets. Sales tickets must be numbered consecutively. Each ticket must be accounted for at the end of the day's business.
- m. The salesman initials the ticket in the appropriate block.

Properly prepared sales tickets giving full information about the transaction provide the manager with the information he needs in conducting the business. Sales tickets may prevent many misunderstandings with customers when a transaction is questioned.

Sales Tickets
(Information Sheet continued)

Making change following a purchase can be done accurately by using the following procedure:

1. Count from the cost of the purchase to the total amount of payment. For example, if the cost is \$2 98 and a \$5 bill is tendered, count "\$2.99, \$3.00, \$4.00, \$5.00."
2. Use the largest denomination of coins and bills possible in making change.
3. Positively identify the amount (e. g. \$5, \$10, etc.) of a bill or check and lay it on top of the cash drawer until after the change is given in order to avoid mistakes.
4. If in doubt as to the correct change, or if payment is by check, the computation should be made with pencil and paper.
5. Use a flannel board and proportionately enlarged coins and bills to bring the class into a discussion and demonstration on the change-making process.

Information Sheet
On
CREDIT

The capital required to finance modern farming operations is so great that most farmers must either borrow money to pay for their purchases, or charge their purchases, making use of credit plans made available by businesses.

Credit is a very useful tool in conducting business. A vast majority of business done anywhere in the world proceeds with little transfer of actual cash. The retailer buys from the wholesaler or the distributor on credit just as the farmer buys on credit from the farm supply store.

Credit may be extended for only a short time (30 days or less, the same as cash) in which case the business establishment may do the financing. Credit may be extended for several months or longer, in which case a credit institution such as a bank or loan association will usually finance the purchase. Large amounts are secured by credit instruments such as commodity notes and mortgages.

Each business will establish credit policies. These policies will state the conditions under which credit will be extended, the maximum credit to be allowed, and the payment plans and penalties.

11. What are feed "turn over" goals higher than hardware?

Texas Education Agency
Texas A&M University
(cooperating)

Information Sheet
on
DETERMINING SELLING PRICE

The original cost of merchandise is the actual purchase price, including the cost of transportation. The selling price must include the original cost plus merchandising costs, overhead costs, and a reasonable profit.

The overhead costs may reflect some, or all, of the following conditions:

1. Merchandise may become obsolete before sold.
2. Merchandise becomes shop-worn.
3. Some merchandise will be overstocked and will not sell.
4. The price of merchandise may drop before the stock is sold.
5. Interest on investment in inventory items.
6. Insurance on inventory items.
7. The cost of warehousing the merchandise
8. Delivery costs (to the customer)
9. Taxes on the merchandise carried in inventory
10. Theft of merchandise
11. Shrinkage of merchandise
12. Damage to merchandise in stock
13. Wages and salaries
14. Office and accounting expenses

Overhead costs may be grouped into areas of fixed costs (insurance, interest, taxes, etc.) which will be constant per \$1,000 of inventory, and variable costs (raw materials, product containers, packaging materials etc.) which change according to volume of business done, and the expenses of doing this business.

Determining Selling Price
(Information Sheet continued)

Some companies may find the annual cost of keeping items in stock as low as 10% of value while other companies may need an increase in cost of 15% or more in order to pay the expense of just keeping stock on hand.

In addition to overhead costs, some companies may provide free services to their customers. Services like mixing or spreading fertilizers will also increase the costs of doing business.

A graph may help explain the need for increasing the volume of business in order to cover both fixed and variable expenses and make a profit;

BREAK-EVEN CHART

Determining Selling Price
(Information Sheet continued)

The merchant must determine a selling price for his products that is high enough to cover the cost of the item, overhead expenses, service costs, and allow a reasonable profit.

There are two terms used to describe the difference between the merchant's cost of an item and his selling price.

1. "Markup" - The amount added to the cost to make the selling price. As a percentage, it is the relation of the amount of markup to the cost. For example,

$$\begin{array}{r} \text{Cost} \quad \text{Markup} \quad \text{Selling Price} \\ 20 \quad + \quad 5 \quad = \quad \$25 \\ \text{The markup is 25\% of the cost.} \end{array}$$

Example:

Merchant purchases vegetable dust	\$1.00
Merchant prices vegetable dust at	1.25
Cash markup.25
Percent markup.	

$$\frac{\text{Cash markup}}{\text{Purchase price}} = \frac{.25}{1.25} = 25\%$$

2. "Gross margin" - Is determined by dividing the markup by the selling price.

Example:

Merchant purchases vegetable dust	
from wholesaler for.	\$1.00
Merchant prices vegetable dust at	1.25
Cash markup.25
Percent gross margin	

$$\frac{\text{Cash markup}}{\text{selling price}} = \frac{.25}{1.25} = 20\%$$

Markup and gross margin are often confused. They are always the same in dollars and cents; but never the same in percentage because markup is figured on cost and margin on selling price.

Examples of the gross margins and markups used by one farm supply business to cover their expenses and to secure a reasonable profit is as follows:

Determining Selling Price
(Information Sheet continued)

	<u>Percent Gross Margin</u>	<u>Percent Markup</u>
Fertilizer	12.0 %	13.6%
Grain	6.0 %	6.4%
Hardware	33.3 %	50.0%
Commercial Feed	18.0%	22.0%

A rule of thumb that may be used to determine gross margin is as follows: in order to make a large enough profit to remain in business, the number of times an item turns over in stock during the year times the gross margin should equal 100.

Example: Refer to the vegetable dust used in the illustration for markup and gross margin.

Vegetable dust turnover 5 times in stock during the year.

$$\begin{aligned}
 5 \times X \text{ (gross margin)} &= 100 \\
 5X &= 100 \\
 X &= 20\% \text{ gross margin}
 \end{aligned}$$

The suggested turnover goals for one business are as follows:

Feed 15	Seed 8-10	Farm equipment 3
Fence 4	Oil & grease 4	Building material 4
Paint 4	Tires & tubes 4	Electrical merchandise 4
Hardware 3	Miscellaneous	Farm supplies, general 4
Machinery 4	merchandise 4

Information Sheet
on
BUSINESS RECORDS: ORDERING AND RECEIVING MERCHANDISE

In purchasing and receiving merchandise in a business, the following are typical procedures and business forms used:

1. A decision is made on the type, amount, and cost of merchandise to be ordered, and the company from which it is to be ordered.
2. A purchase order is completed.
3. Company policy usually assigns the responsibility in ordering merchandise to specific employees. Duplicate records or purchase orders are kept in order to check them against the materials, the invoice, and bill of lading when merchandise is received. Note specifically on the sample purchase order the complete items, including the company's order number.
4. When the shipment is received, a "receiving record" or "receiving report" are typical forms used to record the receipt of merchandise. Other similar records may be used.
5. The receiving record must be a complete record of the merchandise received, including its condition when received. The primary use of a receiving record is to check incoming merchandise against invoices and bills of lading.
6. Commercial carriers, such as railroads and trucking companies, will charge for hauling the products from the originating point to the delivery point. Prior to placing the order, an agreement should be made on who pays the delivery charges, the shipper or the receiver. Freight may be prepaid or sent C. O. D.
7. Forms used by the carriers are called "bills of lading" or "shipping records". An employee should know how to receive merchandise. He should understand the forms used.
8. The final business form to be considered in the ordering and receipt of merchandise is the "invoice". An invoice is a bill or statement due a company for merchandise delivered. Since

**Business Records: Ordering and Receiving Merchandise
(Information Sheet continued)**

the payment for goods is made from the invoice, it must be accurate. The invoice should be checked against all previous papers--the purchase order, the receiving record, and the bill of lading. All businesses have an established policy as to the checking of invoices for payment. The discount terms must appear on the invoice and be used in computing the amount to be paid.

Information Sheet
on
INVENTORIES

An inventory is a correct count of a concern's merchandise, including its value. An inventory is necessary for several reasons:

1. An accurate account of value is necessary for year-end or periodic analysis of the business.
2. Periodic merchandise counts enable the business to determine the freshness of its stocks, and to decide whether some items are obsolete.
3. Inventory counts will show the extent to which items are moving. They will show whether items are overstocked or understocked.
4. Physical count inventories are necessary to determine possible losses. (These are different than book inventories.)

Businesses will use inventories in additional ways. "Inventory control" is a system of keeping on hand adequate amounts of any given merchandise. A business needs to be sure that the customers' needs are met, but does not want to have surplus, outdated merchandise on hand which frequently may be in poor condition.

There are several types of inventories:

1. Perpetual inventories

Many businesses have some or all of their stock listed so that they know at any given time the number of items of merchandise on hand. This is done by systematically adding the purchases to the inventory, and by subtracting the sales taken from the daily sales slips or totals which are then subtracted from these inventories. This results in maintaining a "book" inventory level as purchases and sales are made. To be sure it is correct, periodic physical counts must be made and checked against the perpetual inventory.

Inventories
(Information Sheet continued)

2. Physical inventory

The physical inventory is an actual count of all merchandise on hand at a given time. This must be done at the end of the fiscal year, and is of considerable value at other times during the year. Procedures in making the count will vary but will include many or all of the following procedures:

- a. Arrange stock in an orderly fashion.
- b. Check stock for condition; count only that which is salable.
- c. Count and record every item, listing the cost price unless the particular business prefers that the selling price be used.
- d. Keep inventories separate for different departments and types of goods.
- e. Compute totals.

Businesses will have special forms used for taking the inventory. These forms may include:

1. Location of merchandise
2. Department to which merchandise is charged
3. Names of persons taking the inventory
4. Information concerning the age and/or quality of merchandise

Information Sheet
on
RECEIVING AND STORING MERCHANDISE

One of the important functions of any agricultural business is the receipt and storing of merchandise. To properly receive merchandise, whether it be feed, fertilizer, chemicals or miscellaneous merchandise, several steps must be followed:

1. A definite plan must be used in unloading, moving, and storing items. This involves consideration of who does the work, how various types of merchandise must be handled (by hand, fork lift, etc.), and how and where it is to be stored.
2. Damage or breakage must be determined as the unloading proceeds. Both damage and breakage must be noted on the receiving form. Damaged merchandise must be destroyed, returned, or kept and sold at a reduced price. The person in charge should determine, at the time of unloading, whether there is any shortage.
3. The possibility of shortage must always be checked by exact count or weight at the time of receiving the merchandise. The quantity of goods received must always agree with the goods signed for on the bill of lading, or other shipment record.
4. Policies vary on checking goods against the invoice to check against substitutions. Invoices may be with the goods or they may arrive before the goods. The person checking the shipment should be sure that the merchandise received is in accord with the purchase order before signing the delivery slip. Many businesses will use a duplicate copy of their purchase order to check against merchandise received.
5. The quality of the merchandise, insofar as it can be determined by visual examination or by approved testing procedures, should be checked at the time of arrival. Quality must be checked against what was ordered to be sure it meets the standards specified in the order.
6. The employee who receives the merchandise will usually sign for it. He will also complete a receiving report for his business. Note on the receiving report form the fact that accurate count, condition of merchandise, description of merchandise as well as other pertinent facts, are listed.

Information Sheet
on
STOCKING AND MERCHANDISE PLANNING

Businesses have numerous decisions to make in determining the quantity of any certain item to order. The quality of stock and time to order are also important. Some factors which businesses must keep in mind in ordering supplies are:

1. Will this merchandise have a slow or fast turnover?
2. Will it keep if some remains unsold?
3. What will be the probable demand for this product this year or this season?
4. When will the demand come?
5. How long will it take to get replacement merchandise?
6. How much money may we have tied up in inventory stock?
7. Where can we secure quality merchandise at the lowest cost?

Although only certain employees will have the responsibility of ordering stock, all employees must be responsible for calling attention to low stocks and for keeping the stock neat and orderly.

An employee should know the exact location of merchandise. He should have a good working knowledge of the amount of a product on hand at a given time in relation to the probable demand.

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

- UNIT:** Introduction to Fertilizers
- TOPIC:** Importance of Fertilizers in Modern Farming
- OBJECTIVE:** To develop an understanding of the importance of fertilizers in modern farming.
- INTRODUCTION:** The farmer who consistently produces high crop yields usually provides plenty of plant nutrients for the crops he is trying to produce. Soil fertility is one of the greatest factors in high yields. It is just as important to keep a plant fed as is the case with animals. Some soils are naturally fertile or productive and others will not produce plants profitably without being aided by the application of fertilizers or other soil amendments. No matter how poor a soil is, its productivity can be increased by the addition of water, organic matter, soil amendments, and/or fertilizers.
- REFERENCES:** Required:
1. The Fertilizer Handbook, National Plant Food Institute, pp. 13, 212-215.
 2. Managing Southern Soils, Vanderford, pp. 217-218.
 3. Using Commercial Fertilizer, McVickar, pp. 13-16.
 4. Our Land and its Care, National Plant Food Institute, Washington D. C. pp. 20, 42-43.
- QUESTIONS
or

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

UNIT: Introduction to Fertilizer

TOPIC: What is Fertilizer?

OBJECTIVE: To develop an understanding of the meaning of the term "fertilizer".

INTRODUCTION: Growing plants, just like animals, must have food for growth and development if their yield is maintained at the proper level. This food for plants is made up of certain chemical elements. A full understanding of the componets in various types of fertilizer will help the fertilizer sales and serviceman be of better service to the customers.

REFERENCES: Required:

1. The Fertilizer Handbook, National Plant Food Institute, pp. 63-108; 13-38.
2. Using Commercial Fertilizers, McVickar, pp. 13-16.

QUESTIONS

or

ACTIVITIES:

1. What is a fertilizer?
2. What is a plant nutrient?
3. Name the three most essential plant nutrients.
4. How many chemical elements are considered essential to plant growth?
5. Name ten of the above chemical elements.
6. Can all plant food elements be used in their elemental (most simple) form?

UNIT: Introduction to Fertilizers
TOPIC: What is Fertilizer?
(Assignment Sheet continued)

7. Why is the amount of plant food in a given weight of fertilizer only a portion of the total amount of fertilizer in that amount?
8. What are "straight" or fertilizer materials?
9. What is a "unit" of plant food?
10. What is a "complete" fertilizer?
11. What is a "mixed" fertilizer?
12. In what order is the percent of the three primary plant foods listed when speaking of fertilizers?

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

- UNIT. Introduction to Fertilizers
- TOPIC: How Fertilizers are Made
- OBJECTIVE: To develop an understanding of how fertilizers are made
- INTRODUCTION: The manufacture of fertilizer in the United States has its beginning with the production of superphosphate from bones in a small plant in Baltimore in 1849. Today the manufacture of fertilizer is one of the largest units in the chemical industry. An understanding of the history and the other later developments in the making of fertilizers is very important.
- REFERENCES: Required:
1. The Fertilizer Handbook, National Plant Food Institute, pp. 73-82.
 2. Our Land and its Care, National Plant Food Institute, pp 26-34; 50-53.
 3. What is Fertilizer?, pamphlet, National Plant Food Institute
- QUESTIONS
or
ACTIVITIES:
- 1 When was fertilizer manufacturing started in the United States and what nutrient was produced?
 2. Of what nutrient do we have an almost inexhaustible supply on hand?
 - 3 What is the basic "building material" for all nitrogen fertilizers?
 - 4 Name five sources of nitrogen.
 - 5 What are two organic sources of nitrogen?

UNIT: Introduction to Fertilizers
TOPIC: How Fertilizers are Made
(Assignment Sheet continued)

6. What is phosphate largely derived or made from?
7. Which state supplies most of phosphate rock?
8. What state furnishes the largest amounts of potash?
9. Which chemical potash material furnishes most of the potash fertilizer?
10. Where do we get most of our materials for secondary and micro nutrient fertilizers?
11. What development in recent years in fertilizer production was primarily for saving labor?

FERTILIZER SALES AND SERVICE

- UNIT:** Soils and Soil Problems
- TOPIC:** The pH Range and its Relation to Crop Production
- OBJECTIVE:** To develop an understanding of the pH range of soils and its relation to crop production.
- INTRODUCTION:** One of the major soil characteristics that may determine whether a soil is satisfactory is the soil reaction or the pH range. This is the degree of acidity or "sourness" or alkalinity or "sweetness" of a soil. Most all plants will make better growth and production within a certain range of soil reaction or pH.
- REFERENCES:** Required:
1. The Fertilizer Handbook, National Plant Food Institute, pp. 15-27.
 2. Our Land and its Care, National Plant Food Institute, pp. 18-19.
 3. Soil Reaction (pH) Ranges, L-164, Texas Agricultural Extension Service.
- QUESTIONS
or
ACTIVITIES:**
1. What is pH range?
 2. How many divisions are on a pH scale?
 3. What pH ranges indicate acid or "sour" soils?
 4. What pH range is neutral?
 5. What pH range indicates alkaline or sweet soils?
 6. Why are soils in humid areas like the south either acid or sour?

UNIT: Soils and Soil Problems

TOPIC: The pH Range and its Relation to Crop Production

(Assignment Sheet continued)

7. Which general groups of plants are more sensitive to pH range?
8. Is the availability of plant nutrients altered by the pH range?
9. What soil amendment is used to reduce or increase pH range more than other amendments?
10. What pH range is most desirable for the following crops:
 - a. Corn
 - b. Cotton
 - c. Bermuda grass
 - d. Grain sorghum
 - e. Peaches

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

UNIT: Functions of Plant Food Elements

TOPIC: Functions of the Micro Nutrients

OBJECTIVE: To develop an understanding of the functions of the micro nutrients or trace elements.

INTRODUCTION: The micro nutrients are so-called because they are required in small quantities. The micro nutrients are adequate in some soils but sandy soils sometimes are deficient. Though they are micro nutrients, or trace elements, when a soil is deficient in any one micro nutrient, the plants still suffer and production is reduced. A knowledge of these elements is important to fertilizer users.

REFERENCES: Required:

The Fertilizer Handbook, 4th edition, National Plant Food Institute, pp. 41-43

QUESTIONS
or
ACTIVITIES:

1. What are the micro nutrients commonly called?
2. Name the micro nutrients and give the functions of each.

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

- UNIT:** Functions of Plant Food Elements
- TOPIC:** Nutrient Deficiency Signs in Plants
- OBJECTIVE:** To develop an understanding of nutrient deficiency signs in plants.
- INTRODUCTION:** Plants, like people and animals, need not only enough food, but they need a balanced diet, and when any one of the plant foods are deficient, the plant suffers, the yield is reduced, and profits are lost. A knowledge of the signs that plants indicate will help to correct deficiencies, maybe not on the present crop, but on future crop or plant production.
- REFERENCES:** Required:
1. The Fertilizer Handbook, 4th edition, National Plant Food Institute, pp. 43-52
 2. Our Land and Its Care, 4th edition, National Plant Food Institute, pp. 35-39
- QUESTIONS
or
ACTIVITIES:**
1. Name two general types of deficiencies that occur in plants. Define each.
 2. Name the deficiency signs in crops for the 3 primary nutrients.
 3. Name the deficiency signs for the secondary nutrients.

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

UNIT: Functions of Plant Food Elements

TOPIC: Plant Growth and Nutrient Uptake

OBJECTIVE: To develop an understanding of plant growth and uptake of nutrients.

INTRODUCTION: An understanding of how plants grow and utilize their nutrients will help a person know how to deal with soil and plant problems. The study of the absorption and utilization of these nutrients are vital and definitely affect the fertility program of crops.

REFERENCES: Required:

1. Crop Production in The South, Klingman, pp. 13-35
2. The Fertilizer Handbook, 4th edition, National Plant Food Institute, pp. 57-58

QUESTIONS
OR
ACTIVITIES:

1. Why is it important to understand how plants grow?
2. How are plants like people and animals?
3. What is photosynthesis?
4. What is food?
5. Name 3 food elements used for growth and energy.
6. What is diffusion?
7. What is respiration in plants? Where does it occur in a plant?

UNIT: Functions of Plant Food Elements
TOPIC: Plant Growth and Nutrient Uptake
(Assignment Sheet continued)

8. Why is water absorption important to a plant?
9. What is the chief water absorbing part of the plant?
10. Name 3 ways water is lost from a plant.
11. How do the factors influencing rapid plant growth influence nutrient absorption by a plant?
12. The plant has a system of veins to move water, nutrients, and foods. What are they called?

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

UNIT: Functions of Primary Plant Foods

TOPIC: Plant Food Removed by Crops

OBJECTIVE: To develop an understanding of the loss of plant food from the soil by removing or harvesting crops.

INTRODUCTION: Every time a crop is harvested from the soil, it carries with it great quantities of plant food nutrients. This plant food must be replaced or the fertility of the soil is greatly depleted. The yield and the quality of future crops, as well as the profit, will suffer. It is important to understand the extent to which plant food is removed by certain crops, to be able to adequately maintain a good fertility level.

REFERENCES: Required:

1. The Fertilizer Handbook, 4th edition, National Plant Food Institute, pp. 52-55
2. Our Land and Its Care, 4th edition, National Plant Food Institute, pp. 24-25

**QUESTIONS
or
ACTIVITIES:**

1. How much plant food must be returned each year, just to "hold your own" in soil fertility?
2. Why does more plant food need to be replaced than is actually carried off?
3. How much plant food, per acre, is carried off of the soil by a 150 bushel to the acre corn crop?
4. How much plant food, per acre, is carried off of the soil by a cotton crop 1500 lbs. of seed and lint?
5. How much plant food is contained in 1000 lbs. of fat cattle (live weight)?

Texas Education Agency
Texas A&M University
(cooperating)

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

- UNIT:** Principles Involved in the Use of Fertilizers
- TOPIC:** The Economic Principles of Fertilizer Use
- OBJECTIVE:** To develop an understanding of the economic principles involved in the use of fertilizers
- INTRODUCTION** High yields of a good quality crops are very essential for a successful farming program. Many times, the difference in profit and loss may depend upon adequate plant food applied correctly. The same principles of economic fertilizer use apply to the use of any item worth money, such as land, labor or chemicals. It will pay to add fertilizer as long as the cost of applying the fertilizer is lower than the added returns. An understanding of some of the factors of economics involved in the use of fertilizer will help to get more from your fertilizer dollar.
- REFERENCES** Required.
1. The Fertilizer Handbook, 4th edition, National Plant Food Institute, pp 133-137.
 2. Our Land and Its Care, 4th edition, National Plant Food Institute, pp 60-70
 3. Using Commercial Fertilizers, McVickar, pp 113-116
- QUESTIONS or ACTIVITIES**
1. What three ways can the use of fertilizer result in greater profits?
 2. What percent of the production from major crops comes from fertilizer?
 3. Where does it pay to use fertilizer?
 4. Name five fixed costs of crop production?
 5. How are fixed costs of crop production and fertilizer costs related?

Texas Education Agency
Texas A&M University
(cooperating)

Assignment Sheet
in
FERTILIZER SALES AND SERVICE

- UNIT:** Principles Involved in the Use of Fertilizers
- TOPIC:** Soil Factors that Affect the Response to Fertilizers
- OBJECTIVE:** To develop an understanding of the soil factors that affect the response to fertilizer.
- INTRODUCTION:** It is well known that various soil and soil conditions greatly influence the response to fertilizers. This is because of their chemical composition, which causes them to respond differently to the same fertilizer application. A knowledge of some of these factors is important to profitable production.
- REFERENCES:** Required:
1. The Fertilizer Handbook, 4th edition, National Plant Food Institute, pp. 133-172.
 2. Using Commercial Fertilizers, McVickar, pp. 119-124.
- QUESTIONS
or
ACTIVITIES:**
1. Name four soil factors that influence the response to fertilizer.
 2. Why is it important to know something about soils when using fertilizer?
 3. How does organic matter improve response to fertilizer?
 4. How does the condition of a soil influence its response to fertilizer?
 5. Does the availability of plant nutrients change with the pH range in a soil?

Texas Education Agency
Texas A&M University
(cooperating)

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

- UNIT:** Principles Involved in the Use of Fertilizers
- TOPIC:** Ratios and Minimum Grades of Fertilizer
- OBJECTIVE:** To develop an understanding of the fertilizer ratios and minimum grades.
- INTRODUCTION:** The grade or analysis of a fertilizer is designated by three numbers listed in the order of nitrogen, phosphorous, and potash. The three numbers give the guaranteed analysis of the three primary food nutrients. These are expressed in percentage, by weight. The ratio in which these are mixed together determines the grade ratio. An understanding of these grade ratios will help in making the decision as to which fertilizer will give best results.
- REFERENCES:** Required:
1. The Fertilizer Handbook, 4th edition, National Plant Food Institute, page 73,
 2. Our Land and It's Care, 4th edition, National Plant Food Institute, pp. 56-57.
 3. Using Commercial Fertilizer, McVickar, pp. 92-94.
- QUESTIONS
or
ACTIVITIES:**
1. What is the grade of a fertilizer and how is it expressed on a sack of fertilizer?
 2. What is the ratio of fertilizer?
 3. What is a "complete" fertilizer?
 4. What is an "incomplete" fertilizer?
 5. Are the percentages expressed on a bag, indications of the pure plant food form?

Texas Education Agency
Texas A&M University
(cooperating)

Assignment Sheet
in
FERTILIZER SALES AND SERVICE

UNIT: Principles Involved in the Use of Fertilizers

TOPIC: Calculations for Recommendations

OBJECTIVE: To develop an understanding of the factors involved in calculating fertilizer recommendations.

INTRODUCTION: Most soil tests are returned to the person who sent the sample, expressing the fertilizer needs such as 30-60-30 per acre. The particular need may not be met in a given fertilizer. Calculations must be understood to be able to determine what plant food will be used to meet the needs as prescribed.

REFERENCES: Required:

1. The Fertilizer Handbook, 4th edition, National Plant Food Institute, pp. 82-88.
2. Our Land and Its Care, 4th edition, National Plant Food Institute, pp. 56-57.

Supplemental:

3. Soil Test Report - Texas A&M University, Agricultural Extension Service, Form D-5145.

QUESTIONS
or
ACTIVITIES:

1. How can you determine the fertilizer to buy for the soil test recommendation?
2. What fertilizers could you use to supply a 40-0-0?
3. Give one fertilizer and amount that would supply a 30-60-30.
4. Give a fertilizer and amount that would supply a 40-60-0.
5. What ratio is a 30-60-30?

UNIT: Principles Involved in the Use of Fertilizers
TOPIC: Calculations for Recommendations
(Assignment Sheet continued)

6. What ratio is a 40-60-0?
7. Give an example of a 1:2:1 ratio fertilizer.
8. How much nitrogen is in an 80 lb. sack of 20-0-0?

Texas Education Agency
Texas A&M University
(cooperating)

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

- UNIT:** Methods of Applying Fertilizers
- TOPIC:** Principles Involved in Fertilizer Placement and Use
- OBJECTIVE:** To develop an understanding of the various principles involved in the proper placement and utilization of fertilizers.
- INTRODUCTION:** To get the maximum results from fertilizer, it must be used properly. The method of applying a fertilizer may sometimes affect the yield of a crop as much as the amount that is applied. The primary aim in applying fertilizers should be to get the proper amount of fertilizer in the soil where it will do the most good. To meet this goal, a thorough understanding of the placement principles are vitally important.
- REFERENCES:** Required:
1. The Fertilizer Handbook 4th Edition, pp. 101-108, National Plant Food Institute
 2. Out Land and It's Care, 4th Edition, pp. 48-49, National Plant Food Institute
 3. Methods of Applying Fertilizer, National Plant Food Institute
 4. Using Commercial Fertilizers, McVickar, pp. 136-156
- QUESTIONS
or
ACTIVITIES:**
1. Name 10 principles of fertilizer placement and use.
 2. What is the primary aim in fertilizer placement?
 3. How does irregular fertilizer distribution lower the efficiency of fertilizer?
 4. Are nutrient elements in a dry soil used by the plant?
 5. How does fertilizer applied too close to seed or young seedlings, damage the plants?

UNIT: Methods of Applying Fertilizers

TOPIC: Principles Involved in Fertilizer Placement and Use

(Assignment Sheet continued)

6. What two ways are nutrients lost when fertilizer is applied on the surface?
7. Does texture of soils affect frequency of application or amount of fertilizer to use?
8. Why is phosphorous usually placed close to the plant?
9. Name three reasons why localized placement of fertilizer, near the seed, is desirable.
10. What are three nutrients that can be absorbed by spraying on leaves?

Texas Education Agency
Texas A&M University
(cooperating)

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

UNIT: Methods of Applying Fertilizers

TOPIC: Common Methods of Applying Fertilizers

OBJECTIVE: To develop an understanding of the common methods of applying fertilizers.

INTRODUCTION: How a fertilizer is applied is probably as important as the amount that is applied. There are a number of methods of applying both dry and liquid fertilizers. A number of factors should be understood to more efficiently apply the fertilizer that is needed. The method used will depend upon the crop, the soil, climatic conditions, date and the rate of application, the equipment available, and the kind of fertilizer being applied.

REFERENCES: Required:

1. The Fertilizer Handbook, 4th Edition, National Plant Food Institute, pp. 101-108
2. Out Land and Its Care, 4th Edition, National Plant Food Institute, pp. 46-49
3. Methods of Applying Fertilizer, National Plant Food Institute

**QUESTIONS
or
ACTIVITIES:**

1. Name three general forms in which fertilizers are applied.
2. Name six factors that determine the method to use in applying fertilizer.
3. What are eleven common methods of applying fertilizer?
4. What two forms of fertilizer may be applied by airplane?
5. What two developments have aided in the application of nitrogen fertilizers?

Texas Education Agency
Texas A&M University
(cooperating)

Assignment Sheet
for
FERTILIZER SALES AND SERVICE

UNIT: Methods of Applying Fertilizer

TOPIC: Time of Fertilizer Application

OBJECTIVE: To develop an understanding of the time of applying fertilizers.

INTRODUCTION: The plants that are deficient or soils that are deficient can use the nutrients any time moisture and climatic conditions are favorable for plant growth and absorption. However, some fertilizers will greatly influence the efficiency of fertilizer application and utilization.

REFERENCES: Required:

1. The Fertilizer Handbook, 4th Edition, pp. 101-108, National Plant Food Institute
2. Our Land and Its Care, 4th Edition, page 47, National Plant Food Institute
3. Methods of Applying Fertilizers, National Plant Food Institute

QUESTIONS
or
ACTIVITIES:

1. During what months is most of the fertilizer sold and placed?
2. What disadvantage is this concentration of usage?
3. Does the seasonal operation of fertilizer plants make the fertilizer more expensive?
4. What are the advantages to the farmer in buying fertilizer during slack periods?
5. What storage facilities are necessary for keeping fertilizer on hand?
6. What are the disadvantages of storing fertilizer?
7. What is one disadvantage of early application?

**Selection and Maintenance of Fertilizer Equipment
(Information Sheet continued)**

- 2 Well coated with grease on all moving parts
- 3 Completely inspected and reconditioned
4. Stored in a clean dry shed

At the beginning of the following season, before using the fertilizer applicator, the operator should.

1. Remove the grease coating with a solvent or kerosene
- 2 Check to see that all moving parts move freely
3. Check all operating adjustments
- 4 Lubricate the implement thoroughly

Consulting the operator's manual on the particular type of fertilizer application equipment will give specific instructions on problems, care and operation

Material for this Information Sheet was partially taken from Agricultural Supply - Sales and Service Occupations, Module 9, Ohio State University, Columbus, Ohio

Texas Education Agency
Texas A&M University
(cooperating)

Information Sheet
on
SELECTION AND MAINTENANCE OF FERTILIZER EQUIPMENT

The fertilizer distributor, to maintain maximum results, must not only put on the desired amount of fertilizer per acre, but also place the desired amount for each plant in the correct place. In brief, the fertilizer equipment must:

1. Provide even distribution
2. Apply fertilizer properly

A wide variety of application equipment exists because of:

1. Types of fertilizer materials used
2. Varying rates of application needed
3. Varying placements desired
4. Areas to be fertilized

There are several systems of fertilizer application

1. Applying fertilizer alone
2. Applying fertilizer and seed in one operation
3. Tilling and applying fertilizer in one operation
4. Applying fertilizer through irrigation systems
5. Applying fertilizer by plane

Types of fertilizer application equipment comes in the following general types

1. Hand operated machines
 - a. With wheels
 - b. Without wheels
2. Broadcasters
 - a. Full width trailers

Selection and Maintenance of Fertilizer Equipment
(Information Sheet continued)

- b. Trucks, trailers, tractors, and wagons with spreading attachments, such as:
 1. Rotary fans
 2. Full width hoppers
 3. Augers
3. Row distributors and drills
4. Machines with fertilizer attachments, such as:
 - a. Drills
 - b. Planters
 - c. Tillage equipment
5. Liquid and gaseous fertilizer equipment:
 - a. Anhydrous ammonia
 - b. Low pressure solutions
 - c. Non-pressure solutions
 - d. Foliar sprays

When selecting and buying fertilizer application equipment the following factors are important:

1. The applicator should be flexible in operation to meet the requirement of most fertilizer applications.
2. The applicator should be easy to fill and carry a large load.
3. The applicator should apply large and small amounts accurately and be easily adjusted.
4. The applicator should correctly place the fertilizer.
5. The applicator should be of sturdy construction, easy to maintain, and resist corrosion.
6. The applicator should be easily emptied and cleaned.

Since fertilizer applicators are used only for a few days in the year, they seldom wear out. The major damage to applicators is done by rust, corrosion and decay. To guard against these enemies, the fertilizer applicators should always be:

1. Thoroughly cleaned, including washing, before storing

for
FERTILIZER SALES AND SERVICE

- UNIT:** Regulations and Control
- TOPIC:** Regulations Controlling Fertilizer Manufacture and Use
- OBJECTIVE:** To develop an understanding of the regulations controlling fertilizer manufacture and use.
- INTRODUCTION:** Each state has a system of inspection and control of fertilizer manufacture, designed to protect the farmers as well as the manufacturers of fertilizer products. By careful sampling, testing, and inspecting, these agencies afford adequate protection to the farmers and manufacturers against an inferior product.
- REFERENCES:** Required:
1. "Texas Commercial Fertilizer Control Act of 1961", MP-513. Texas Agricultural Extension Service
 2. "Rules and Regulations" adopted by the Texas Feed and Fertilizer Control Service, MP-552, Texas Agricultural Extension Service
 3. Our Land and It's Care, 4th Edition, National Plant Food Institute, pp. 59
- QUESTIONS
or
ACTIVITIES:**
1. What organization controls fertilizer manufacture, sale and distribution in Texas?
 2. Name three things that all states require of fertilizers.
 3. What is a "commercial fertilizer"?
 4. Can "commercial fertilizers" include animal excretions?
 5. What is a fertilizer material?
 6. Define a "mixed" fertilizer.
 7. What are "specialty" fertilizers used for?

UNIT: Regulations and Control

TOPIC: Regulations Controlling Fertilizer Manufacture and Use
(Assignment Sheet continued)

8. Define "grade" of fertilizers.
9. What is a "bulk" fertilizer?
10. Name five things each fertilizer registration request must include.
11. How is an inspection fee determined and on what basis is it paid?
12. Can fertilizers contain pesticides or fungicides?

for
AGRICULTURAL SALES AND SERVICE

UNIT: Agricultural Salesmanship

TOPIC: Introduction, Agricultural Salesmanship

1. a. Poor service rendered
b. Discourteous treatment received
c. Indifference on the part of the salesman
(Personal experiences may be varied)
2. Need - may or may not be recognized by the customer. It is based upon reason.
Desire - is a feeling of need. It may not be based upon reason.
3. a. The selling process
b. The merchandise
c. The firm
d. Himself
e. His relation to the customer
f. The customer
4. a. Deals directly with the public
b. Helps others make decisions
c. Something "new" every day
c. Success is quickly recognized
d. Enjoys high prestige
5. A satisfied customer
6. Everyone; the salesman, the firm, the customer and the public
7. a. Awakens human wants
b. Satisfies human wants
8. a. His need
b. The product needed
c. The source (firm or store)
d. The price
e. The time

UNIT: Agricultural Salesmanship
TOPIC: Introduction, Agricultural Salesmanship
(Answer Sheet continued)

9. The product that best fits his needs
10. a. Courtesy
b. Sincere interest
11. Helping the customer to buy intelligently

AGRICULTURAL SALES AND SERVICE

UNIT: Agricultural Salesmanship

TOPIC: Meeting the Customer

1. The first contact gives the customer a lasting impression of the salesman and the business.
2. A well-groomed salesman
 - a. Attracts customers
 - b. Inspires customer confidence
3. Enthusiasm is difficult if the job is unpleasant.
4.
 - a. Promptness
 - b. Alertness
 - c. Interest in the customer and his problems
5. The customer should be treated as a guest.
6. Exercise in recognition of personal characteristics
7.
 - a. Participation in community activities
 - b. Chamber of Commerce information
 - c. Comments made by others
 - d. A personal notebook on customers
 - e. Past sales records
 - f. Questions asked others
 - g. Newspapers
8. Exercise in customer impressions. Depends upon the student's observations.
9. Exercise in product knowledge. Check for extent of knowledge.
10. Exercise in product knowledge, designed to make student aware of customer knowledge of produce.

UNIT: Agricultural Salesmanship
TOPIC: Meeting the Customer
(Answer Sheet continued)

11. a. Good appearance
 b. Stock displayed attractively
 c. Knowledge of merchandise
 d. Knowledge of firms advertising
 e. Knowledge of customer
 f. Selling sentences
 g. Knowledge of competitor's product
 h. Possible customer objections and methods of meeting them
12. a. Discussions with other employees
 b. Stock duties
 c. Timidity in approaching customers
 d. Indifference to customer needs
13. a. By taking the time to let the customer express the problem
 b. By asking questions to determine if the customer understands the problem
 c. By suggesting a procedure that will assist with the problem
14. Examples of
 a. Conventional - "May I help you, Mr. Jones (or sir)"
 b. Question - "Is this cold weather affecting your milk production, Mr. Brown?"
 c. Stating a fact about merchandise - "We've surely been selling a lot of that feed, Mr. Smith"
15. a. Courteous
 b. Short
 c. Requires no decision
 d. Affirmative
 e. Emphasizes the desire to serve
16. a. Comfort
 b. Pleasure
 c. Appetite
 d. Possession
 e. Fear
 f. Devotion
 g. Curiosity
 h. Ornamentation
 i. Imitation
 j. Construction
 k. Loyalty
17. a. Professional feeling toward selling
 b. Courtesy
 c. Enthusiasm
 d. Interest in the customer and his problems
 e. Willingness to develop self confidence
 f. Integrity
 g. Desire to be of service
 h. Appreciation of psychology

TOPIC: Presenting Supplies and Services to Customers

1.
 - a. Attention
 - b. Interest
 - c. Desire
 - d. Action
2. Attention may be involuntary. Interest is a voluntary reaction.
3. A combination of the needs or wants of the customer with the merits of the merchandise.
4.
 - a. Desire for increased yields
 - b. Desire for more profits
 - c. Desire for less difficult workOthers acceptable
5.
 - a. Newspaper advertising
 - b. TV or radio advertising
 - c. Talk with a neighbor
 - d. Direct mail circulars.Others acceptable
6. Student activity . He should include:
 - a. Attention step
 - b. Interest step
 - c. Desire step
7.
 - a. Know the features of the product
 - b. Be able to answer questions about the product
 - c. Be able to demonstrate the product, including its advantages

for
AGRICULTURAL SALES AND SERVICE

UNIT: Agricultural Salesmanship

TOPIC: Closing the Sale

1. When the need for the merchandise has been definitely established.
2. That of helping the customer make a wise decision.
3. When the customer is not aware of his needs or not well aware of product choices.
4. Immediately after the customer decides to buy.
5.
 - a. The customer has exhibited attention, interest, and desire for the product.
 - b. The relationship between the need and the product has been established.
 - c. Objections have been overcome.
 - d. The price is acceptable.
 - e. The product is approved by the customer.
 - f. The customer has the "power" (ability) to make the purchase.
6. Giving the customer a small decision to make, based upon the major decision to buy.
Example:
"Do you prefer the red or the green?"
"Would you prefer sacks or paper bags?"
7.
 - a. Assuming failure in the beginning
 - b. Hurrying the customer
 - c. Failing to help the customer decide
 - d. Failing to overcome obstacles
 - e. Stressing the wrong selling points
 - f. Trying the force the customer
 - g. Discourtesy at any point
8.
 - a. Write legibly
 - b. Accuracy
 - c. Name and address completed
 - d. Special directions noted

TOPIC: Importance of Accurate Records

1. a. (1) To know the financial status of the business
(2) To give proper information to company officers and stockholders
(3) To satisfy legal requirements
(4) To plan for desirable change in management and procedures
(5) To prepare tax returns

b. To plan for desirable change in the business
2. Profit or loss for a stated period of time
3. A balance sheet shows all assets and liabilities. The two always are equal.
4. All daily records of the firm, including sales tickets, invoices of purchases, and other records.
5. To be sure that this part of the firms' records are correct for the day.
6. Because transportation and many other items of expense are involved in the true "cost" of the merchandise to the firm
7. a. To assist in determining the firms' financial condition
b. To plan for purchases of stock
8. \$103,048.16
9. a. Salaries and wages
b. Heat, power and water
c. Advertising
d. All other expenses
e. Depreciation
10. Because the land did not become less valuable
11. a. \$23,173.70
b. \$305,444.24
c. \$ 10,649.42
d. \$305,444.24

Answer Sheet
for
CREDIT

1. a. Merchants or dealers
b. Individuals
c. Commercial banks
d. Insurance companies
e. Federal Land Banks
f. Production credit associations
2. Productive credit is used to make more money.
Consumptive credit is used in a manner that is not designed to produce extra income.
3. a. The moral responsibility of the customer
b. History of debt repayment
c. The financial status of the customer (his repayment capacity)
4. a. Large amounts of cash are unnecessary.
b. A cancelled check serves as a receipt.
c. Risk of theft is small.
5. a. Write plainly, in ink.
b. Completely fill the space for the amount of the check that is written.
c. Numbers following the "dollar sign" should be placed as close as possible.
d. Never erase on a check.
e. The purpose should be placed on the check.
6. (Activity)
(Examine check for proper execution)
7. The amount shown is paid by a third party, previously arranged and shown on the draft.
8. A written promise to pay a specific amount at a specific future date.
9. A written claim against property, guaranteeing the payment of a debt.

for
AGRICULTURAL SALES AND SERVICE

UNIT: Business Procedures

TOPIC: Determining Selling Price

1. a. Merchandising costs
b. Overhead
c. Profit
2. a. Interest on investment
b. Insurance
c. Warehousing
d. Taxes
e. Office and accounting expenses
3. a. Drop in price
b. Theft
c. Damage
4. Fixed costs
5. Fixed expenses will increase little with increased volume; variable costs will increase more, but opportunities for total profits become greater.
6. The amount that is added to the cost to arrive at the selling price.
7. a. \$3.00 b. 30% ($3.00 \div 10.00 = 30\%$)
8. The gross margin is obtained by dividing the markup by the selling price (not the cost).
9. $\$3.00 \div \$13.00 = 23\%$
10. Number of times an item "turns over" per year times gross margin should equal 100.
11. Feed is consumed, requiring more frequent purchase.

FERTILIZER SALES AND SERVICE

UNIT: Introduction to Fertilizers

TOPIC: Importance of Fertilizers in Modern Farming

1.
 - a. Increase yields
 - b. Increase profits
 - c. Improve soils
2. Both require food for growth and development.
3.
 - a. Air
 - b. Water
 - c. Soil
4.
 - a. Erosion
 - b. Harvested crops
 - c. Leaching
5.
 - a. Kind of soil
 - b. Cropping sequence
 - c. Farm income
 - d. Soil test recommendations
6. 1945 - 234,000 tons
1964 - 1,336,000 tons
7. 86.1 million dollars
8. Yes, a soil is limited to the element that is lowest in its soil.

FERTILIZER SALES AND SERVICE

UNIT Introduction to Fertilizer

TOPIC What is Fertilizer?

1. A substance which contains one or more of the chemical plant food elements in forms that can be absorbed by plants and which promote growth.
2. Chemicals contained in fertilizer and essential to plant growth.
3.
 - a. Nitrogen
 - b. Phosphorous
 - c. Potash
4. Sixteen
5.
 - a. Nitrogen
 - b. Phosphorous
 - c. Potash
 - d. Calcium
 - e. Magnesium
 - f. Sulphur
 - g. Chlorine
 - h. Copper
 - i. Manganese
 - j. Zinc
6. No
7. To be available to growing plants, plant food elements must be associated with certain other elements in the form of specific chemical compounds.
8. Nutrient-bearing chemical compounds
9. One percent of a ton or 20 lbs.

UNIT: Soils and Soil Problems

TOPIC: Taking and Using Soil Samples to Determine Fertilizer Needs

1. A chemical analysis of a soil
2.
 - a. PH (acidity or alkalinity)
 - b. Available phosphate
 - c. Available potash
 - d. Nitrogen
 - e. Available calcium
 - f. Soluble salts
 - g. Recommendations for correcting soil deficiencies
 - h. Organic matter
3.
 - a. Study instructions
 - b. Scrape away litter on surface and take sample to depth of two to six inches
 - c. Use an auger or soil probe
 - d. Thoroughly mix sample
 - e. Sample each field or area of different characteristics
 - f. Stay out of odd places
 - g. Take soil 2 or more spots in field
 - h. Clean tools before using on other samples
 - i. Fill out information sheet
 - j. Number sample and keep record
 - k. Lime or fertilize as recommended
4. Activity
5. Activity

FERTILIZER SALES AND SERVICE

UNIT: Soils and Soil Problems

TOPIC: Interpretation of Soil Test Results

1.
 - a. Soil reaction (pH)
 - b. Organic matter
 - c. Predicted nitrogen level
 - d. Available phosphorous
 - e. Available potash
 - f. Available calcium
 - g. Soluble salts (salinity hazard)

2.
 - a. Soil reaction (pH) - Acidity or alkaline range
 - b. Organic matter - Percent of organic matter in sample
 - c. Predicted nitrogen level - Possible level of nitrogen in soil
 - d. Available phosphorous - Amount of phosphorous available to plants
 - e. Available potash - Amount of potash available to the plant
 - f. Available calcium - Amount of calcium available to the plants
 - g. Salinity hazard (soluble salts) - level of salt build up that may be hazardous to plant growth

3. Yes

4. Available calcium, pH with amount of clay and amount of organic matter.

5. Pounds of actual plant food

6. Plants, like animals have better growing conditions that favor production. Some plants do better on acid soils or "Sour" soils and others do better on alkaline or "Sweet" soils.

7. Acid - 4.5 for extremely acid to 6.5 for slightly acid
Neutral - 7.0
Alkaline - 7.0 - slightly alkaline to 9.1 and up for very strongly alkaline

Texas A&M University
(cooperating)

Answer Sheet for Test
on
INTERPRETATION OF SOIL TEST RESULTS

1.
 - a. Soil reaction or pH
 - b. Available phosphorous
 - c. Nitrogen level
 - d. Available potash
 - e. Organic matter

2. Each plant grows better in a certain pH range.

3.
 - a. Available calcium
 - b. Amount of clay
 - c. Amount of organic matter
 - d. pH range

4. Pounds of actual plant food per acre

5. 200 pounds of a 20% nitrogen fertilizer per acre or the equivalent.
(20% x 200 = 40 lb.)

Answer Sheet
for
FERTILIZER SALES AND SERVICE

UNIT: Soils and Soil Problems

TOPIC: The pH Range and its Relation to Crop Production

1. The degree or scale of sourness (acid) or sweetness (alkaline) in the soil.
2. Fourteen (0 - 14)
3. Below 7.0
4. 7.0
5. Above 7.0
6. Because of losses by leaching and crop harvest of such as calcium, magnesium and potassium.
7. Flowers and shrubs
8. Yes
9. Limestone
10.

a. Corn	- 6.0 - 7.5
b. Cotton	- 6.0 - 8.0
c. Bermuda grass	- 5.5 - 7.5
d. Grain sorghum	- 5.5 - 7.0
e. Peaches	- 6.0 - 7.5

Texas Education Agency
Texas A&M University

for
FERTILIZER SALES AND SERVICE

UNIT Soils and Soil Problems

TOPIC Liming of Soils

1 Limestone

- 2 a Physical
b Chemical
c Biological

- a Physical - produces better soil structure, influences growth and organic matter.
b. Chemical - neutralizes soil, makes phosphorous more available. decreases toxic substances and adds calcium and magnesium to the soil
c. Biological - stimulates growth and activity of helpful soil organisms, such as bacteria and fungi.
3. Any material containing calcium or magnesium (or both) and capable of neutralizing acidity.

- 4 a Ground agricultural limestone
Ground dolomitic limestone
b Precipitated (builders lime) lime
c Hydrated lime
d Oyster shell

- 5 a Neutralizing soil acids and toxic materials
b Making other nutrients available
c. Supplying calcium and magnesium
d Help beneficial organisms in soil
e. improve physical conditions of soil
f. Prevention of diseases

6 Sandy soils

UNIT: Soils and Soil Problems

TOPIC: Correcting Alkaline and Saline Soils

1. a. Saline - Increase the salt content of the solution in the soil.
b. Alkali - A condition where excessive amounts of sodium have replaced calcium and magnesium in the soil.
2. a. Saline
b. Saline - alkali
c. Non-saline alkali
3. a. Low rainfall and high evaporation
b. Inadequate drainage
c. Poor irrigation practices
d. Use of poor quality irrigation water
4. Reduces the amount of water absorbed by the roots and a direct toxic or poisonous action on plants.
5. Adequate underground drainage
6. Presence of sodium in amounts sufficient to interfere with plant growth of most crop plants.
7. Application of chemical soil amendments which either supply or release calcium.
8. a. Soluble calcium salts
b. Low soluble calcium salts
c. Acids or acid forming materials
9. A soil test

FERTILIZER SALES AND SERVICE

UNIT: Functions of Plant Food Elements

TOPIC: Functions of Primary Plant Foods

1. Plants use nitrogen, phosphorous and potash in large quantities.
2. Functions of nitrogen:
 - a. Gives dark green color to plants
 - b. Promotes rapid growth
 - c. Increases yields of leaf fruit or seed
 - d. Improves quality of leaf crops
 - e. Increases protein content
 - f. Feeds soil micro-organisms
3. Functions of phosphorous:
 - a. Stimulates early root formation and growth
 - b. Gives rapid and vigorous start to plants
 - c. Hastens maturity
 - d. Stimulates blooming and aids seed formation
 - e. Gives winter hardiness to fall grains and hay crops
 - f. Important to germinating seedlings
4. Functions of potash:
 - a. Imparts increased vigor and disease resistance to plants
 - b. Aids in protein production
 - c. Produces strong stiff stalks
 - d. Increases plumpness of seeds
 - e. Improves quality of fruit
 - f. Essential to formation of starches, sugars and oils
 - g. Aids development of root crops
 - h. Aids in formation of red color in fruit and leaves
 - i. Stiffens stalks

**Answer Sheet
for
FERTILIZER SALES AND SERVICE**

UNIT: Functions of Plant Food Elements

TOPIC: Functions of Secondary Foods

1. The plant uses less amounts of these than the primary elements.
2. Calcium
Magnesium
Sulphur
3. Functions of Calcium:
 - a. Promotes early root formation and growth
 - b. Improves general vigor and growth
 - c. Facilitates improvement in soil structure
 - d. Neutralizes poisons in the plant
 - e. Encourages grain and seed production
 - f. Increases calcium content of food and feed crops
 - g. Helps correct some soil acidity problems

Functions of Magnesium:

- a. Essential part of chlorophyll
- b. Necessary for sugar formation
- c. Helps regulate uptake of other plant foods
- d. Acts as carrier for phosphorous
- e. Promotes formation of oils and fats
- f. Helps correct some soil acidity problems

Functions of Sulphur:

- a. Essential part of protein
- b. Helps maintain dark green color
- c. Promotes nodule formation in legumes
- d. Stimulates seed production
- e. Encourages vigorous plant growth
- f. Helps correct soil alkalinity

FERTILIZER SALES AND SERVICE

UNIT: Functions of Plant Food Elements

TOPIC: Functions of Micro Nutrients

1. Trace elements

2. Boron

- a. Increases yield or improves quality of fruit or vegetables
- b. Important to seed production
- c. Associated with calcium utilization and sugar transfer within plants
- d. May cause barren stalks in corn if deficient

Copper

- a. Needed to reduce wilting
- b. Seed setting is aided

Zinc

- a. Needed for chlorophyll production

Iron

- a. Essential in forming chlorophyll production

Molybdenum

- a. Influences utilization of nitrogen

Manganese

- a. Accelerates germination and maturity
- b. Increases availability of calcium and magnesium and phosphorous
- c. Aids in chlorophyll production

Chlorine

- a. Affects quality of tobacco, potatoes and other crops

FERTILIZER SALES AND SERVICE

UNIT: Functions of Plant Food Elements

TOPIC: Nutrient Deficiency Signs in Plants

1. a. Acute deficiencies - Usually shows abnormalities in the plant.
b. Hidden Hunger - Goes unseen until color indication or reduced plant yields gradually show.

2. Nitrogen

- a. Sickly, yellowish green color
- b. Slow dwarfed growth
- c. Drying or "firing" of leaves, starting at bottom of plant

Phosphate

- a. Purplish leaves, stems and branches
- b. Slow growth and maturity
- c. Small slender stalks in corn
- d. Low yield of grain, fruit or seed

Potash

- a. Lower leaves scorched or burned on margins and tips.
- b. Mottling, spotting, streaking or curling of leaves, starting at lower level on plant.
- c. Premature loss of leaves and small "knotty" poorly opened bolls on cotton
- d. Poor root development and falling down, prematurely, in corn

3. Calcium

- a. Young leaves in terminal bud have a "hooked" appearance, and die back at tips and along margins.
- b. Leaves have a wrinkled appearance
- c. Young leaves, sometimes, remain folded.

Sulphur

- a. Young leaves light green in color
- b. Short, slender stalks, yellow in color
- c. Slow, stunted growth

UNIT: Functions of Plant Food Elements
TOPIC: Nutrient Deficiency Signs in Plants
(Answer Sheet continued)

Magnesium

- a. General loss of green color, starting at bottom leaves and moving up
- b. Cotton leaves turn purplish-red between green veins
- c. Weak stalks with long branched roots
- d. Definite and sharply defined series of yellowish-green, light yellow, or even white streaks throughout entire leaf of corn
- e. Leaves curve upward along margins

4. Boron

- a. Cracked stem on celery
- b. Brown rot of cauliflower
- c. Dry rot of sugar beets
- d. Heart rot of turnips
- e. Yellow top of alfalfa
- f. Corky cone of apples
- g. Lack of seed in corn and cotton

Manganese

- a. Pale green to yellow and red colors between green veins of leaves on tomatoes and other vegetables
- b. "Grey speck" in oats
- c. Chlorosis, or bleaching of leaves in leafy plants

FERTILIZER SALES AND SERVICE •

UNIT: Functions of Plant Food Elements

TOPIC: Plant Growth and Nutrient Uptake

1. Helps to produce better crops at lower cost
2. The leaves, flowers, roots and stems are vital parts to plant life just as hearts, lungs, and stomachs are to people. Both plants and people are made up of cells.
3. To combine or put together carbon dioxide and water by chlorophyll (green color) in the presence of light
4. Any substance which can be used as a source of energy for carrying on the life process
5.
 - a. Carbohydrates
 - b. Fats
 - c. Proteins
6. The process of a gas or substance moving from an area of high concentration to area of lower concentration
7. The release of chemical energy. Occurs in the plant cell.
8. Cells need water to divide and function properly.
9. The root hair
10.
 - a. Transpiration
 - b. Bleeding
 - c. Guttation
11. The same conditions that increase or decrease cell growth and activity increases or decreases the nutrients that are absorbed by plants.
12. Vascular bundles

FERTILIZER SALES AND SERVICE

UNIT: Functions of Primary Plant Foods

TOPIC: Plant Food Removed by Crops

1. The amount removed each year by the crop harvested
2. Plant food is lost in 3 ways other than crop harvest:
 - a. Erosion or leaching
 - b. Plant foods are sometimes "fixed" in soil
 - c. Current fertility level is usually below that required for economic production.
3. 135 pounds of nitrogen
53 pounds of phosphate
40 pounds of potassium
2 pounds of calcium
8 pounds of magnesium
10 pounds of Sulphur
. 1 pound of Boron
. 06 pound of copper
. 09 pound of manganese
. 15 pound of Zinc
4. 40 pounds of nitrogen
20 pounds of phosphate
15 pounds of potassium
2. pounds of calcium
4 pounds of magnesium
2 pounds of sulphur
. 06 pounds of copper
. 11 pounds of manganese
. 32 pounds of zinc
5. 27 pounds of nitrogen
17 pounds of phosphate
2 pounds of potassium

for
FERTILIZER SALES AND SERVICE

UNIT: Methods of Applying Fertilizers

TOPIC: Principles Involved in Fertilizer Placement and Use

1.
 - a. Adequate amounts of plant nutrients, applied properly in the correct place
 - b. Bad distribution lowers efficiency.
 - c. Nutrients are not absorbed by plants in dry soils.
 - d. Fertilizer placed too close, damages plants or seeds.
 - e. Fertilizer applied on the surface is easily lost.
 - f. Coarse texture soils should have less amounts applied at a time, but more frequent applications.
 - g. Early stimulation of seed is important..
 - h. Localized placement, near seed, is desirable.
 - i. Placing fertilizer too far from seed or plants may retard them until they grow to the plant food.
 - j. Some fertilizer elements may be sprayed on leaves.
2. Placing or applying of fertilizer in the proper amount in the soil where it will do the most good.
3. Some plants get too much and others not enough.
4. No
5.
 - a. Injure roots
 - b. Impair germination
6.
 - a. Erosion
 - b. Leaching
7. Yes
8. Phosphorous moves very little from placement.
9.
 - a. Restricted contact of fertilizer with soil lessens the fixing of phosphate.
 - b. Necessary plant food placed within reach of plant
 - c. Fertilizer placed in band near row does not furnish nutrients to weeds growing in middle.
10.
 - a. Zinc
 - b. Manganese
 - c. Copper

TOPIC. Fertilizer Application Equipment

1. a. Apply in proper place
b. Distribute fertilizer evenly
2. a. Types of fertilizer materials used
b. Various rates of application
c. Different placement desired
d. Areas to be fertilized
3. a. Applying fertilizer alone
b. Applying fertilizer and seed in one application
c. Tilling and applying fertilizer in one operation
d. Applying fertilizer in irrigation systems
e. Applying fertilizer by air
4. a. Hand operated machines, wheeled and without wheels
b. Broadcasters
 1. Full width trailers
 2. Trucks, trailers, tractors, and wagons with spreading attachments such as:
 - a. Rotary fans
 - b. Full width hoppers
 - c. Auger spreader tubes
- c. Row distributors and drills
- d. Machines with fertilizer attachments, such as:
 1. Drills
 2. Planters
 3. Tillage equipment
- e. Liquid and gaseous fertilizer equipment
 1. Anhydrous ammonia
 2. Low pressure solutions
 3. Non-pressure solutions
 4. Foliar sprays
- f. Airborne fertilizer equipment

UNIT Methods of Applying Fertilizer
TOPIC Fertilizer Application Equipment
(Answer Sheet continued)

5.
 - a. Applicator must be flexible in operation to meet the need of most fertilizer applications.
 - b. Should be easily fitted and carry large load.
 - c. Should be able to apply large and small amounts accurately and be easily adjusted.
 - d. Should place fertilizer correctly.
 - e. Should be of sturdy construction, easy to maintain and should resist corrosion.
 - f. Should be easy to empty and clean.

6.
 - a. Thoroughly clean and wash before storing
 - b. Coat all moving parts with grease
 - c. Inspect and maintain in good condition
 - d. Store in clean dry shed

7.
 - a. Remove grease coating with kerosene
 - b. Check to be sure all parts are moving freely
 - c. Check all operating adjustments
 - d. Lubricate thoroughly

8.
 - a. Wet, soggy areas
 - b. Terrain where ground application is not possible

UNIT: Regulations and Control

TOPIC: Regulations Controlling Fertilizer Manufacture and Use

1. Texas Feed and Fertilizer Control Service, Texas A&M University, College Station, Texas
2. (a) Registration of brands and grades of fertilizer
(b) Guarantee of percent of (N) Nitrogen, (P₂O₅) Phosphorous, and (K₂O) Potash
(c) Penalty for failure to meet the guarantee
3. Mixed fertilizer and/or fertilizer materials intended for use as an ingredient or component of a mixture, designed or represented for use in promoting plant growth.
4. No
5. Any solid or non-solid compound which contains any essential plant nutrient element in a form available to plants and used primarily for promoting plant growth
6. A solid or non-solid product which results from the combination, mixture, or simultaneous application of two or more fertilizer materials
7. Lawns, shrubbery, flowers, golf courses, parks, cemeteries, greenhouses, or nursery
8. Percent of total nitrogen phosphorous and potash guaranteed in a commercial fertilizer
9. A lot of any commercial fertilizer which is not in a closed container at the time it passes into possession of the consumer
10. a. Name and address of the person responsible for distributing commercial fertilizer
b. The brand and grade
c. The guaranteed analysis listing minimum percent of plant nutrient
d. Sources from which the plant nutrients are derived
e. Copies of all printed material covering the sale and distribution

UNIT Regulations and Control

TOPIC Regulations Controlling Fertilizer: Manufacture and Use

THE pH RANGE AND ITS RELATION TO CROP PRODUCTION

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks with the proper words or statements.

1. Soil reaction or pH is the range of _____ or _____ of a soil.
2. The pH scale runs from _____ to _____.
3. Sour or acid soils run from _____ to _____.
4. Southern humid soils are usually more _____ because the loss of some elements by _____ and crop _____.
5. The _____ of some nutrients is changed by the _____ range.

CORRECTING ALKALINE AND SALINE SOILS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks with the proper word or statement.

1. The two kinds of soluble salts affecting the soil are _____ and _____.
2. The four things that usually cause soluble salts to occur are:
 - a. _____.
 - b. _____.
 - c. _____.
 - d. _____.
3. The two ways salinity affects plants are:
 - a. _____.
 - b. _____.
4. The usual method of reclaiming alkali soils is by _____ soil amendments.
5. The most accurate means of determining saline or alkaline problems is by a _____.

Instructions

The form on the reverse side is for the purpose of providing information on curriculum material submitted to the ERIC Clearinghouse on Vocational and Technical Education. The form, as submitted, will appear on microfiche with the publication and the ERIC Resume; thus, typing is necessary. Instructions for providing information on the form are explained below. Please provide as much information as possible.

The person, agency and address should be provided in the memorandum heading. A bibliographic citation for the material being submitted should also be given.

- (1) The name and address of the source where materials may be ordered should be included, regardless of authorship of the material. Limitations on the availability of copies should be listed, as well as the price per unit and quantity prices. If source does not wish to service orders for this material, please mark ERIC Only in the space designated for Agency.

- (2) Means used to develop material should include:

Development Group -- the individual or group principally responsible for the material's development. (e.g., individual authorship; development committee of teachers, supervisors, teacher educators; R & D project)

Level of Group -- level of the group which developed the material. (e.g., local, state, regional, national) In the case of individuals, list their titles.

Method of Design, Testing, and Trial -- methods used in designing, testing, and trying the material prior to its final publication. (e.g., designed by subject matter specialists and teacher educators from the results of industry survey, tested on a small group, refined, and pilot tested in ten schools)

- (3) Utilization information should include:

Appropriate School Setting -- the type of school for which the material was designed. (e.g., community college, technical institute, area vocational high school)

Type of Program -- the nature of the educational program for which the material was designed. (e.g., high school class, rehabilitation, retraining)

Occupational Focus -- the occupational focus to which the material is directed, whether a specific job or an occupational cluster.

Geographic Adaptability -- the limitations of the material related to geographical regions. (e.g., Southeastern United States, Western United States, Minnesota, etc.)

Uses of Material -- the specific uses for which the material was designed. (e.g., course planning, lesson planning, student reading)

Users of Material -- the person for whom the material was designed. (e.g., teacher, student)

- (4) Requirement information should include:

Teacher Competency -- the subject matter specialization, level of training and experience required of the teacher in order to use the material.

Student Selection Criteria -- the age, sex, grade level, aptitude, prerequisite training, and employment goals of the students.

Time Allotment -- the amount of time required for use of the material in total clock hours.

Supplemental Media -- the media, either necessary or desirable, which is available for use with the material. Please list the source, including name and address, where the material may be obtained.

- (5) Please list other information on a separate sheet. This might include unique aspects of the material not provided for in other categories on the form.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Introduction to Horticulture

TOPIC. Horticulture as an Industry

OBJECTIVE To become aware of the importance of Horticulture and to develop an understanding of the fields of study involved

INTRODUCTION. Horticulture is an important branch of agriculture. The first definition of horticulture limited the field to cultivation of gardens. Flowers, vegetables, fruits and ornamentals that were grown primarily in gardens soon acquired the name of "horticultural plants" in contrast to "field crops" such as corn and cotton. We now think of horticulture as the production of flowers, vegetables, fruits, and ornamentals in the garden on a large scale basis. It also includes the many services which are auxiliary to the production and marketing of horticultural crops.

REFERENCES Required

- 1 Information Sheet, "Horticulture as an Industry"

QUESTIONS
or
ACTIVITIES

- 1 With what type of crop is the olericulturist concerned?
- 2 With what type of crop is the pomologist concerned?
- 3 What four major types of crops are included in horticulture?
- 4 In which group of fruits do grapes belong?
- 5 In which group of fruits do apples belong?
- 6 What caused the expansion of vegetable growing?

Information Sheet
on
HORTICULTURE AS AN INDUSTRY

There are three major fields of horticulture. Floriculture is the cultivation and management of ornamental and flowering plants. Landscaping has also become an important function of the floriculturist. Pomology is the science and practice of fruit growing. Olericulture is the production, processing and distribution of vegetable crops.

Floriculture was well developed thousands of years ago by the civilizations of Asia. Their beautiful gardens required much knowledge and skill. A landscape designer must have a knowledge of the principles of design along with a thorough understanding of plants. Plant breeding has become very popular in the floriculture field. Patience and care are needed in this tedious task of developing new and improved plants.

Pomology is a very demanding field. Fruit trees are under constant attack from diseases and insects. The fruit producer must be able to control these pests effectively. The pomologist also has to have a thorough understanding of plant growth. There is a great deal of specialization in the field of fruit growing. Many choose to work only with citrus, others concentrate on small fruits such as grapes, and still others deal with deciduous tree fruits such as apples. There are countless jobs to be found in the field of pomology.

Olericulture is a gigantic enterprise that is quite distinct from any other phase of plant production. The annual farm value of vegetable crops in the United States is well over a billion dollars. The big expansion in the vegetable industry was due primarily to an increase in production of out-of-season vegetables in the South and West. The production, processing, and marketing of this huge crop requires a great number of personnel.

As we can readily see, horticulture is a giant industry. If you are interested in plant growing and are willing to work hard in gaining new knowledge, a good future awaits you.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Introduction to Horticulture

TOPIC: Exploring Occupational Opportunities

OBJECTIVE: To develop an understanding of the requirements of some specific occupations and to determine the factors to consider in selecting an occupation

INTRODUCTION: This lesson is designed to help you decide upon an occupation in the field of horticulture. In this lesson we will explore only five major occupations, all of which are available to cooperative part-time students in agriculture. In addition, instructional materials have been prepared for these occupations to assist you in developing into a skilled worker with potential for advancement in your chosen occupation. In recent years the need for trained workers in these occupations has increased greatly. If you like the work and apply yourself on the job and in your studies a world of opportunity awaits you.

REFERENCES: Required

1 Information Sheet, "Exploring Occupational Opportunities"

Supplemental

2 Handbook of Agricultural Occupations", Hoover

QUESTIONS

or

ACTIVITIES:

1. List the steps of advancement in a horticulture career
2. If possible, what is the best way to answer self appraisal questions concerning a certain job?
3. If you wanted a horticultural job which allowed you to work both inside and outside, which would you choose?
4. Prepare a list of businesses in your community which raise or sell horticultural products
5. Study the 18 factors to consider in selecting a job and be prepared to apply these factors in selecting your occupation

Information Sheet
on
EXPLORING OCCUPATIONAL OPPORTUNITIES

The selection of a vocation in horticulture is similar to that of other fields. Basic questions arise in the mind of the person who is trying to select a vocation. These questions or factors must be dealt with before a satisfactory selection can be made. The following list points up some of these questions.

Factors One Should Consider in Selecting a Job

- 1 What is the nature of the work? What kind of jobs will I be expected to do?
- 2 Does the occupation require chiefly mental or physical effort? Will my health allow me to do this work?
- 3 Is the work inside or outside work, or both?
- 4 What are the working conditions? With whom will I be working?
- 5 What personal qualifications are required for entry into the occupation?
- 6 What are the educational and training requirements for the job?
- 7 Is there opportunity for doing a variety of jobs?
- 8 Will the work require considerable travel and time away from home?
- 9 What financial earnings can one expect?
10. Are any fringe benefits provided by the business?
- 11 Is there a great deal of risk involved in performing the job?
- 12 What security and benefits are offered in the occupation?
- 13 Are there opportunities for advancement and self-betterment?
14. Is the employment on a regular or seasonal basis?
- 15 Does one work regular hours? Eight, ten, or twelve hour day? Day or night shift?
16. Is there stability of residence or must one make frequent moves?
- 17 Will the job necessitate that one get along well with others or will one work pretty much alone?
- 18 How much personal expense is involved in clothing, transportation and meals?

Another very important question in the selection of a vocation is that of advancement. Usually a person who cannot advance in his chosen field will become unhappy and fail to do his best. This question should be investigated before choosing a vocation in the field of horticulture.

The opportunity for advancement is fairly good in this field. The following sketch demonstrates an example of the possible steps in the advancement of the horticulturist who applies himself to his work.

Advancement in Horticultural Occupations

- | | |
|-------------------------|---------------------|
| 1 Laborer | 3 Assistant Manager |
| 2 Foreman or Supervisor | 4 Manager or Owner |

Exploring Occupational Opportunities (Information Sheet continued)

As you can see from this example, application, education and experience can determine the speed and degree of advancement

Probably the most important question of all is, "am I personally suited for a career in horticulture"? It can only be answered after you have investigated the field and have a good knowledge of what it is and what it offers. The answer probably lies in self appraisal

This self appraisal can be achieved by asking yourself the following questions.

- 1 Do I prefer working with things?
- 2 Do I prefer working with facts, figures, and ideas?
3. Do I have a love for growing things?
- 4 Do I like to work with people?
- 5 What kind of work experiences have been most enjoyable to me?
- 6 What kind of work would I like to be doing five, ten, or fifteen years from now?
- 7 Will my health permit me to make the choice I want?

Probably the best way to determine the answer to these questions is by actually working on a job for a while. However, this cannot always be done. Circumstances do not always permit this

There are other good ways to determine some answers. Your fondness for certain subjects in school, your interest in certain activities, study of the field of horticulture, talks with your teachers, guidance counselors and others may indicate interests and abilities that will help you to partially answer the questions. Such things as cooperativeness, willingness to work, dependability, willingness to assume responsibility, resourcefulness and self-reliance are all basic qualifications that you will need in ornamental horticulture as well as other occupations

A close look at some of the jobs in horticulture will reveal many opportunities and requirements. As you look at each job try to decide if you are interested and qualified

Job Title - Greenhouse Worker

Job Description

A greenhouse worker grows plants in an artificially heated glass or plastic greenhouse. The plants grown may be vegetables or flowers, and the work may include the propagation of trees or ornamental shrubs from seeds or cuttings. Greenhouse specialties include producing out-of-season vegetables such as tomatoes, cucumbers, or leaf lettuce, producing cut flowers or pot plants, growing bedding plants for sale, or starting plants for outdoor nursery beds. In many cases a greenhouse is a part of a nursery operation. In such cases, a worker may be performing the duties of a nursery worker as well as

Exploring Occupational Opportunities
(Information Sheet continued)

those of a greenhouse worker. An employee in the greenhouse screens, mixes, sterilizes soil, and places it in growing containers. He sows seeds, starts cuttings, and transplants seedlings and plants. He waters, feeds, weeds, thins, prunes, and sprays growing plants. He may control the greenhouse temperature and humidity. He also maintains the greenhouse structure and equipment. He should know the names and the culture of the plants with which he works.

Job Title - Nursery Worker

Job Description

A nursery worker grows seedlings and plants for landscaping, fruit farming, and forest replanting. He may work in one of several kinds of nurseries. Some nurseries specialize in producing fruit trees and small fruit transplants, some in ornamental trees and shrubs, and some in forest replanting materials. Some nurserymen operate greenhouses and produce their own seedlings and plants from cuttings. Some produce planting stock of two or more major lines of plants, trees, or shrubs.

A nursery worker prepares seedbeds, plants seedlings, weeds, cultivates, fertilizes, waters, prunes, and performs other cultural practices such as spraying and grafting. He digs, grades and packs plants for shipment. He may cut, lift, and lay sod. He transplants shrubs and trees, and in a tree nursery, gathers and processes forest tree seeds. He helps with the maintenance and repair of buildings and equipment.

A nursery employee assists customers in selecting plants for home landscaping. He also makes recommendations on maintenance to the customer and may work at a nursery where he will be required to make periodic checks on customer's lawns and to maintain the beauty of the landscape.

Job Title - Garden Center Employee

Job Description

A garden center employee performs many jobs including caring for ornamental plants, moving plants and supplies into selling areas, arranging plants and supplies for display purposes, and selling the various products handled by the garden center. A garden center may be part of a large retail store, a part of a nursery or greenhouse operation, or a retail establishment separate from any other business.

Exploring Occupational Opportunities
(Information Sheet continued)

The work of a garden center worker includes cleaning, stocking, and arranging garden supplies on shelves, counters, and in windows. He cares for ornamental plants by watering, feeding, trimming, spraying, and controlling temperatures. The worker unloads and unpacks supplies as they arrive from wholesalers, loads orders on trucks, makes deliveries, and loads orders into customer's cars. He gives information to customers on care of plants, care of lawns, plant varieties, and merits of different garden supplies and equipment.

Job Title - Assistant Groundskeeper

Job Description

An assistant groundskeeper cares for the area surrounding an industry or business, church, school, airport, apartment building, private estate, cemetery, or shopping center. The employee plants and cares for lawns and ornamental plants. The work involves mowing grass, reseeding, controlling weeds, and planting and spraying ornamental plants. He rakes and disposes of leaves and other refuse. Year-round employment is provided through maintenance and repair of walks, drives, and equipment. The work may also involve making minor repairs to buildings.

Job Title - Parks and Landscape Employee

Job Description

A parks and landscape employee performs the work necessary for proper maintenance of landscapes and park area.

The work of this occupation includes mowing grass, trimming, the edges of walks and driveways, planting, pruning and caring for trees, shrubs, hedges, lawns, and flower beds; controlling insects, diseases, and weeds; and caring for the soil. The work may also include such jobs as removing trash or snow, maintenance of swimming pools, care of boating facilities, general maintenance of buildings and equipment, and repair of roadways and drives.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classification

TOPIC: Introduction

OBJECTIVE: To develop an understanding of the importance of studying the properties and life phenomenon exhibited by a plant

INTRODUCTION: There are over 350,000 different kinds of plants in the world. No one person can know all of them, but he can learn the characteristics that are common to all of them. Without a knowledge of botany a plant grower is lost. If he does not know how plants grow, how can he possibly be successful in raising them?

REFERENCE: Required
Crop Production in the South, Klingman, pp. 13-19

QUESTIONS
or
ACTIVITIES.

1. What is botany?
2. How many different kinds of plants are known to exist?
3. Name two carbohydrates.
4. What is the major difference between plants and animals other than the ability to move and to think?
5. What was the wrong conclusion that Van Helmont made after his experiment concerning plant growth?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classification

TOPIC: Photosynthesis

OBJECTIVE: To learn how plants produce their food.

INTRODUCTION: Van Helmont failed in his experiment to determine why plants grow. He thought that water alone was responsible for the growth. Van Helmont did not know about photosynthesis; so his conclusion was wrong.

REFERENCES: Required:
Crop Production in the South, Klingman, pp. 19-24

QUESTIONS
or
ACTIVITIES:

1. What does photo mean?
2. Define synthesis.
3. What is a more complete definition of photosynthesis?
4. What is a calorie?
5. What is a molecule?
6. What is the term used to describe the movement of gas or liquid from an area of high concentration to an area of low concentration?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Growth and Classification

TOPIC: Respiration

OBJECTIVE. To learn about the process of respiration and to study its relation to photosynthesis.

INTRODUCTION. All cells must carry on respiration in order to stay alive. Most of us understand less about the process of respiration in the plant as compared to our knowledge of respiration in the animal. Yet the processes are very similar in the animal and plant cell.

REFERENCE. Required:
Crop Production in the South, Klingman, pp 29-32

- QUESTIONS
or
ACTIVITIES
- 1 Define respiration
 - 2 What two materials are formed when food is decomposed with the addition of oxygen?
 - 3 How much do the chemical equation for photosynthesis and respiration differ?
 4. What gas do plants release at night?
 - 5 What are the raw materials needed for respiration?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growth and Classification

TOPIC Water Absorption and Loss - Nutrient Absorption - Movement of
Water and Nutrients in the Plant

OBJECTIVE To understand how water and nutrients are absorbed by the plant - to
understand how water is lost - and to study the transportation system of the plant

INTRODUCTION One of the necessary functions of plants is to absorb water and nu-
trients from the soil. For proper management, one must understand these absorp-
tion processes and also the transporting of these materials by the plant.

REFERENCES Required
Crop Production in the South Klingman pp. 32-35

- QUESTIONS
or
ACTIVITIES
1. What will happen to a plant if its inside pressure is greatly re-
duced?
 2. What is the term used to describe cells that are filled tight and
result in plants standing straight?
 3. Explain how an over supply of fertilizer around a plant's roots
affect its water absorption process.
 4. What is transpiration?
 5. What are nutrients?
 6. What two conductive tissues make up a vascular bundle?
 7. Explain why girdling a tree causes it to die.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growth and Classification

TOPIC: Plant Food

OBJECTIVE. To learn the different plant foods and their functions.

INTRODUCTION A food is any substance which can be used as a source of energy for carrying on the life processes. To really understand plant growth, one must understand the basis for life --- food

REFERENCE Required.
Crop Production in the South, Klingman, pp. 24-29

- QUESTIONS
or
ACTIVITIES.
- 1 What is food?
 2. What are the 3 foods used for energy and growth?
 - 3 What elements make up carbohydrates?
 - 4 What is the primary function of fats?
 - 5 Where in the plant are fats most commonly found?
 6. What is the process called by which hydrogen is added to oils?
 - 7 What are the components of protein?
 - 8 What 4 elements make up around 97% of the dry weight of most plants?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Growth and Classification

TOPIC The Plant Kingdom

OBJECTIVE. To become familiar with the system used to classify plants

INTRODUCTION People in West Texas may call a certain plant "dove weed" while an East Texas farmer may call it "croton" Names vary with localities. The only way to solve this problem was to develop a unified method of classification

REFERENCE Required.
Crop Production in the South, Klingman, pp 35-40

QUESTIONS
or
ACTIVITIES

- 1 What is taxonomy?
- 2 What are the four divisions of plants?
3. In which division do we find most of the disease causing plants?
- 4 What are some examples of beneficial bacteria?
- 5 What plant causes smut, rust, mildew, and scab?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing, Maintaining and Using Structures that Aid Plant Growth

TOPIC: Types of Greenhouses

OBJECTIVES To learn how greenhouses are constructed, used, and maintained.

INTRODUCTION Greenhouse production of horticultural plants is an enormous industry. Driving a few miles across Texas, one can usually count several greenhouses that are in full operation. It is interesting to note the various shapes of these structures and the different materials used in construction.

REFERENCES Required:
Flower and Plant Production in the Greenhouse. Nelson, pp 19-32

- QUESTIONS
or
ACTIVITIES
- 1 What are the two most used materials for greenhouse coverings?
 - 2 What time of year is best for repairing or replacing slipped or broken glass?
 - 3 What properties should an ideal greenhouse plastic possess?
 - 4 What are some of the advantages and disadvantages of polyethylene and vinyl?
 - 5 How is the ventilation problem handled in greenhouses where there are no ventilators?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing, Maintaining, and Using Structures that Aid Plant Growth

TOPIC Size and Arrangement of Greenhouses

OBJECTIVE To learn how to select the proper size and arrangement before constructing the greenhouse

INTRODUCTION A careful study of greenhouse arrangement should be made before construction begins. The bench arrangement for the crops to be grown should be considered first. Then the greenhouse that fits this arrangement should be built. If these factors are done in reverse and a structure is erected before working out bench plans, many inconveniences and headaches will be the result.

REFERENCE Required
Flower and Plant Production in the Greenhouse, Nelson, pp 33-38

QUESTIONS
or
ACTIVITIES

- 1 What should be considered first in deciding the size and type of greenhouse?
- 2 Why should boiler rooms be centrally located?
- 3 What are the requirements of good greenhouse benches?
- 4 What is the best height for pot plant benches?
- 5 What should be the minimum depth of cut flower benches?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Constructing, Maintaining, and Using Structures that Aid Plant Growth

TOPIC Cooling the Greenhouse

OBJECTIVE To learn the different methods of cooling the greenhouse and how to use these methods most effectively

INTRODUCTION The weather in Texas during the summer months is usually very hot. This presents a problem to the greenhouse owner. A successful producer must have an effective cooling system or he may well lose every plant he owns.

QUESTIONS
or
ACTIVITIES

- 1 What is the oldest and most conventional type of greenhouse heating system layout?
- 2 What are the two sources of heat used in this system?
- 3 Where are the coldest spots in a greenhouse?
- 4 What are the two classifications of heaters according to the type of heating unit?
- 5 What are the two classes of heaters based on direction of air flow?

Information Sheet
on
HEATING THE GREENHOUSE

A dependable heating system is second only in importance to the efficient design and structural soundness of a greenhouse. Any heating system employed in a greenhouse must be economical, efficient, and of sufficient size to maintain desirable greenhouse temperatures during anticipated extremes in outdoor temperatures.

An important consideration for any greenhouse operation is to operate the heating system at the lowest possible cost consistent with maintaining the temperature desired. This requires that the heating system be designed correctly for the purposes intended, that it be operated properly, and that careful and intelligent maintenance of the system be provided.

GREENHOUSE HEATING DESIGN STANDARDS

The standard practice followed in the past has been to specify the design of a greenhouse heating system on the basis of a requirement to maintain a given temperature within the greenhouse at some given outdoor winter temperature. It is comparatively simple to specify such a differential.

Today the temperature required for the production of various crops grown in the greenhouse is general knowledge and is usually readily available.

Recorded temperatures in historical records in nearly every climatic area are available and will provide considerable information on the outdoor winter temperatures, including both the extreme winter temperatures that have occurred in that particular area and those that should be considered in regard to the type of design that is economically feasible for the greenhouse heating system.

The acceptable standard for the design of a greenhouse heating system should go beyond this basic requirement, however. A clarification of the greenhouse temperature requirements of the crop to be grown is very necessary.

Greenhouse temperature requirements for the crop should not mean the temperature prevailing in the aisle space.

The common practice that now prevails in determining the temperature requirements of the crop is to measure the temperature at the point where the crops are growing. One of the requirements of a well-designed greenhouse heating system should be the provision of a uniform temperature within allowable variations throughout the plant-growing area.

These requirements are rather complex and the average greenhouse operator is usually not well enough versed in heat engineering to make sure he is going to have the type of heating system that meets his requirements. In most cases he does not have the skill, nor the time to plan such a system and he should depend upon someone well versed in this field.

Heating The Greenhouse (Information Sheet continued)

The most logical approach to the installation of a modern up-to-date, economical and dependable greenhouse heating system is to seek the knowledge and experience that is available from a dependable greenhouse manufacturer. Heating greenhouses is a specialized field which varies greatly from heating standards used for other type buildings.

The National Greenhouse Manufacturers Association, a newly formed organization comprised of most of the major greenhouse manufacturers in the country has recognized this need on the part of the average greenhouse operator, and has been spending considerable time, effort, and funds and utilizing the best knowledge and experience available from its various member organizations, to establish standards of design that will insure the greenhouse owner of the proper installations to meet his particular requirements.

GREENHOUSE HEATING LAYOUTS

Pipe Coil Systems

The most conventional and the oldest type greenhouse heating system layout and the one most commonly accepted by greenhouse growers is the pipe coil system.

This system employs the use of standard pipe which carries either steam or hot water. The pipes are laid out around the greenhouse in various patterns to distribute the heat.

In recent years the use of extended surface pipe has been introduced. This pipe is commonly referred to as "finned pipe". This uses the extended surface or fins on the pipe for greater heat transfer from any given length of pipe. The pattern of behavior, however, is similar to that of plain pipe coils, which makes the layout patterns fall into the same category.

The proper layout of a pipe coil heating system is dependent upon an understanding of the basic laws of natural air movement to insure uniform temperature distribution throughout the greenhouse. Any pipe coil system supplies the heat from a concentrated heat source in the immediate area of the pipe, and depends upon convection currents of air moving past the pipe to pick up this heat and convey it to all parts of the greenhouse.

The coldest spots in the greenhouse are the gable ends and the exterior side walls, so pipe coils are suspended in these areas. The warm air emitted from the pipe coils rises and sweeps along the glass, counteracting the rapid loss of heat through the glass. This movement sets up the basic convection pattern of warm-air movement throughout the greenhouse for uniform heat distribution.

ED 333

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS - 1963

Heating The Greenhouse
(Information Sheet continued)

A finned pipe has the concentrated heat effect of several lines of bare pipe so that any restriction of air movement or reduction of temperature difference is magnified

Unit Heater Systems

In recent years the use of unit heaters for heating greenhouses has increased considerably. Most of these unit heaters are so designed that they not only take care of the heating requirements but air movement as well.

One reason for the increase in popularity of unit heaters has without a doubt been the increasing interest in air movement within greenhouses. Many greenhouse operators are of the opinion that the movement of air in the plant zone in the greenhouse (providing that the air moves at a low velocity) has the effect of preventing the building of excess humidity within the foliage that leads to the development of certain conditions. Air movement brings in and replenishes the supply of carbon dioxide. At the present time also, there is considerable interest in installations to activate air movement and break up air stratification.

Many types of unit heaters are available. Basically they all contain some type of heating device and a fan to force the air across the heating surface and out into the area to be heated.

These heating units are classified as direct-fired or indirect-fired dependent upon the type of the heating unit. Direct-fired units are those which contain a combustion unit right in the unit itself in which fuels such as oil or gas are burned. Then this type of unit is used for greenhouse heating the combustion chamber should be totally enclosed and should be vented to the outside air for the products of combustion.

Indirect-fired unit heaters utilize steam or hot water circulated through coils as the heating elements.

Unit heaters are also classified according to the direction of air flow. This flow is designated as vertical blow or horizontal blow.

In vertical blow heaters the shaft is vertical and the fan blade is horizontal and the warm air is blown downward. Deflectors suitable for this purpose spread the air out in a horizontal direction in a complete circle. Normally these units are mounted up near the peak of the sidewalls. This of course is against the natural direction of warm air flow, and the distance of flow is limited. Frequently the warm air does not move down along the side walls where it is required. When this type of unit heater is installed a line or two of perimeter piping along all walls exposed to the outside should be installed to insure uniform heat distribution.

Heating The Greenhouse (Information Sheet continued)

In narrow greenhouses coils located on the side and end walls may be sufficient to provide the uniformity needed. In wider houses however, additional piping is required across the house.

Experience over the years has proven that pipe coils suspended overhead provide the uniform temperatures required.

The standard practice followed is to suspend the pipe coil overhead, with one line of pipe running lengthwise over each bench. The coil should be placed high enough so that the tips of the tallest plant to be grown will not come in direct contact with the pipes. The rule of thumb standard used by most greenhouse operators is to suspend one third of the number of lines of pipe required overhead and one third of the number along each side. In general this has given a satisfactory uniform heat distribution.

An older method of installation, still preferred by many commercial growers, is to distribute the cross house piping by installing the pipe lines under the benches. Such installations keep the soil in the benches warmer, and for this reason may be desirable for those crops which require warm soil for optimum growth.

The amount of heat provided by a pipe coil depends in part upon the temperature difference between the air and the pipe surface and the rate of air movement past the pipe. These basic facts should always be kept well in mind when pipe coils are suspended along greenhouse side walls. The pipe should be suspended far enough away from the wall so that air can move up freely on both sides of the pipe. When side benches are installed in the greenhouse they should be spaced at least six inches from the wall to allow free upward movement of the warm air without "boxing" it in under the bench.

The bottom pipe of a pipe coil should be placed a minimum distance of four to six inches above the ground to permit the free flow of the cooler air in and under the coil. A pipe buried in the ground or covered with soil is practically ineffective as a heating unit.

When pipe coil heating systems are installed it is usually necessary to stack the pipes vertically to obtain the necessary number of coils. This installation makes each pipe less effective than it would be if installed separately or alone. This, of course, results in less temperature difference between the air and the pipe surface for transmitting heat. Therefore, when the pipes can be spaced as far apart as possible in the coils this reduction of heating effect can be kept at a minimum.

When finned, or extended surface pipe is installed these rules of spacing, height of pipe from the ground surface and spacing of side benches from the walls become even more important.

Heating The Greenhouse (Information Sheet continued)

In horizontal blow heaters the shaft is horizontal and the fan blades are in a vertical position. The air is blown out of the face of the heater in a horizontal direction. When several of these units are used in the same greenhouse they should be mounted so they are suspended overhead near the side walls of the greenhouse. The units on one side should face toward one end and those on the other side should face toward the opposite end. This will establish a pattern of air movement around the greenhouse. Adjustable horizontal louvres should be installed on the face of each heater so the direction of air movement can be adjusted upward or downward to prevent direct drafts or air blasts on the plants and to provide proper warm-air distribution.

Temperature control with unit heaters in the greenhouse is normally accomplished by leaving the fans operating continually and turning the heat on and off so that there is a continuous movement of air. Whenever the fans are operated only intermittently when the fans are off the air can become stratified. This will result in conditions detrimental to good plant growth.

Automatic Control Systems

The trend toward the use of automatic controls in greenhouse operations to reduce costs and increase efficiency has led to the wide-spread adoption of automatic controls on greenhouse heating systems.

Automatic systems also perform better than manual controls since they control temperature constantly rather than intermittently.

To perform the job effectively, however, the control system must be properly designed to fit the individual heating system or they may do more harm than good. Therefore, in any installation the location of automatic valves and thermostats should be left to the discretion of a greenhouse engineer who has the competence to adjust the controls to the system being employed.

HEATING ACCESSORIES

The accessories installed are important features in properly operating and maintaining an efficient heating system.

Pipe hangers should be installed so that the proper grade can be maintained in the pipes to prevent pockets or sags that reduce the flow of steam or hot water.

Traps of the proper size and located in the correct place are essential to the efficient operation of a steam heating system.

Heating The Greenhouse
(Information Sheet continued)

Air vents must be strategically located in the system to prevent air locks.

The more extensive the heating system the more the list of accessories could be extended. When automatic controls are used the importance of proper accessories and their location increases.

EFFICIENCY AND MAINTENANCE

Unless a sound, sensible and almost constant program of proper maintenance is installed as soon as a greenhouse is put into operation, all of the time and money invested in the design and the installation of an efficient greenhouse heating system may be lost. Maintenance of heating systems is an item of greenhouse operation that is most often neglected. Traps must be kept in working order, pipe hangers kept tight to prevent pipe sagging and air vents must be kept cleaned out or operating costs will increase and the heating system will become very inefficient. A sound maintenance program should be instituted in the overall greenhouse operation program and should be adhered to in a very consistent manner.

HORTICULTURAL OCCUPATIONS

UNIT. Plant Growing Media

TOPIC. Origin, Composition, and Importance of the Soil

OBJECTIVE To develop an understanding of how soil is formed, what it is made up of, and its importance to horticultural plants

INTRODUCTION: From ancient times man has strived to understand more about soil. No doubt the reason for this is that man's very existence depends upon the soil. Look around you. Probably you will see that not many items in your room came from anywhere other than the soil. Even this sheet of paper you are now reading is a product of the forestry industry which depends on soil for tree growth.

Once we take time to learn how soil is formed, what it is made up of, and how it affects plants, we can do a better job of making it work for us.

REFERENCES: Required.

QUESTIONS

or

ACTIVITIES:

1. Name the three layers of soil
2. What causes these three horizons to develop?
3. Which of the three layers is usually darker in color?
4. When does young soil begin to collect its plant nutrients?
5. What factors are responsible for the difference in soil colors?
6. What three components does a good soil provide to plants?
7. What are the three types of soil in regard to particle size?
8. Which is the largest of the three soil particles?
9. What governs the rate of soil development?
10. What is organic matter?

Information Sheet
on
ORIGIN COMPOSITION AND IMPORTANCE OF SOIL

The climate especially rainfall and temperature indirectly controls the rate of soil development. The climate acts slowly taking thousands of years for the soil to reach a stage of balance with its environment.

A soil that has reached this degree of development usually has three distinct layers of horizons. As you dig downward in soil you can notice differences in color, structure and texture of the soil. This is especially noticeable along road cuts.

The topsoil is the first layer. It is usually richer and is of greater importance to plant growth. This layer contains most of the organic matter and is usually darker in color.

Next, we come to the subsoil. This layer does not contain as many nutrients as topsoil, but it is still important because of root development.

The third layer is the parent material and is generally less important to plant growth. It usually is below the area of heavy root growth and is seldom tilled.

These three layers are developed from weathering or wearing down of rocks. Wind, water, and ice break and crush the rocks. Eventually a small plant begins to grow in this young soil. When the plant dies, it decays and gives the soil its first nutrients.

Other plants begin to grow and finally a rich soil is developed. Once the soil becomes productive, it provides three important components to a plant. These are fertilizer elements, air for the roots, and an adequate water supply.

You have noticed probably that there are several different soil colors. These are caused by different amounts of air being present as the soil is formed, the amount of organic matter, decayed plant or animal matter, and the types of rocks from which the soil is formed.

You may have also noticed the different textures in soil. This is caused by the size of the soil particles. Sand is the largest and therefore is coarse to the touch. Silt and clay are the other two with clay being the smallest. It feels like flour when rubbed between the fingers.

HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC Soil Moisture

OBJECTIVE To understand the importance of moisture to plants and how this moisture becomes available from the soil

INTRODUCTION Soil moisture can be a limiting factor in plant growth. No matter how many minerals the soil contains, it will not be productive unless it holds an adequate supply of water for optimum, best plant development. It should be kept in mind that too much moisture can be as harmful as too little. By learning more about soil moisture, one can use his knowledge to change the environment of plants in small areas such as in the horticulture industry.

QUESTIONS
or
ACTIVITIES

- 1 What part of the plant takes in water from the soil?
- 2 The process by which water leaves the plant in the form of vapor is called what?
- 3 What material helps soil hold water?
- 4 When is water holding capacity of vital importance?
- 5 What affects the speed at which capillary water can move through the soil?
- 6 Why does it harm soil to work it when it is wet?
- 7 What can be added to soil to make it hold more water?
- 8 Why will overwatering a plant kill the root system?
- 9 What happens to rainfall which falls to the earth's surface?

Information Sheet
on
SOIL MOISTURE

The moisture in the soil represents an important part of the plant environment. It is common knowledge that many plants tend to wilt when lacking in water. If water is not supplied to the plants soon after the wilting point is reached, they often die. Water is used by the plant in many ways. The needed water is taken from the soil by the roots. If plants are to remain healthy and grow well, water must be made constantly available to the plants. The type of soil in which the plants grow has a definite influence upon the frequency of watering.

Soil water is very important

- 1 Large amounts of water lost by plants in transpiration must be replaced.
(Transpiration - loss of water in the form of vapor)
- 2 Water acts as a solvent for dissolved minerals
- 3 Water affects soil aeration (Movement of air through the soil.)
4. Water affects soil temperature

What happens to rain which falls to the earth's surface?

- 1 Runs off
- 2 Soaks in
- 3 Evaporates

Water absorption is very important to the growth of plants

Rain water is absorbed and rapidly passes downward through a porous soil. When the upper surface of the subsoil has a slope, much of the water flowing over its surface seeps out of the hillsides in springs and quickly contributes to stream flow.

Why do different soils have different capacities to hold or "soak up" water? When organic matter is used up, soil packs together. Thus a cloddy soil has fewer air spaces, its particles do not cling together in granules, and the lack of organic matter means that it weighs more than an equal volume of crumbly soil from a well-managed plot.

A crumbly soil can take in water faster than a cloddy one, and it can hold more water. The thoroughly decomposed soil organic matter (humus) in a crumbly soil, can hold lots of water. Organic matter acts as a sponge in holding water. In addition, to the water held by the organic matter itself, is the water held in the pores between the soil particles and between the soil granules. Hundreds of very fine soil particles are glued together by the organic matter to form granules or crumbs.

The increased water-holding capacity of soils high in organic matter under natural conditions makes a big difference in the intake of water. This is extremely important during droughty seasons.

Soil Moisture (Information Sheet continued)

Moisture moves through the soil in all directions even against gravity by capillary movement. This movement is caused by the attraction water molecules have for each other as well as the attraction between water molecules and soil particles. Water molecules cling together and form droplets in the air or on a greasy surface where there is nothing to interfere. But when a drop of water falls on soil particles, it spreads out as a thin film over the soil particles, because the attraction between the soil particles and the water molecules themselves. Water that moves through the soil in this way is known as capillary water.

How far and how fast capillary water will move in a soil depends on the size of the soil particles and the condition of the soil. If the spaces around the soil particles are large, the attraction between the water molecules and the soil particles will not be enough to overcome the weight of the water and it will not rise too much. The movement that does take place however, will be rapid because there is little friction. This is true in sandy soils.

In fine-textured soils, the particles are closer together and the attraction between soil and water is greater. Water may be expected to rise more slowly, but higher in soils of fine texture.

Under field conditions, moisture moves from wetter soil to drier soil. The difference is not always great, therefore, capillary water moves slowly and not far. Even so, even moisture moves a short distance to the roots of growing plants to make it an important plant-soil relationship.

Much soil moisture can be lost when capillary water moves to the surface and evaporates.

All living cells carry on respiration. Roots are made of living cells. In order for respiration to occur, oxygen must be present. Oxygen is normally formed in the air occupying the pore space of soils having good aeration. As water fills the pore space of these soils, however, the air is forced out (no two things can occupy the same space at the same time) and consequently, the supply of oxygen in the soil is lost. This means that root cells die and the root system decays away.

Some principles of understanding of soil-water relationships for the horticulture service worker:

- 1 Many soils cannot be worked when wet except at the expense of desirable soil structure. This is more true for heavy clay-like soils, and is less important for sandy soils. Structure is the arrangement of the soil particles.
- 2 Plants can be easily overwatered or underwatered. Sandy soils require more frequent waterings than heavy clay soils especially during periods of prolonged sunny days.
- 3 If soils do not have desirable moisture-holding capacities, they should be modified to make them more desirable.

Soil Moisture
(Information Sheet continued)

- 4 It is more critical to overwater plants growing in heavy soils during periods of prolonged cloudy weather than it is to overwater plants growing in light soils, during this type of weather condition Soil type and the amount of sunlight affect plant-watering practices
- 5 Loose, porous soils having a good structure soak up and hold more water than hard, compact soils This has an important influence on plant-watering practices
- 6 Overwatering causes decreased aeration and subsequent root decay and death of the plant
- 7 Underwatering causes wilting, dehydration, and subsequent death of the plant.

HORTICULTURAL OCCUPATIONS

UNIT Plant Growing Media

TOPIC Soil Mixtures

OBJECTIVE To learn some of the most widely used soil mixtures and to become familiar with the methods used to produce soil mixes for growing horticultural plants.

INTRODUCTION. Not all plants grow best in the same type of soil mixture. Water-holding capacity, aeration, and drainage of the soil often determines a plant's value. By studying the different types of soil and how to increase their productivity, we can grow healthier and more profitable plants.

REFERENCES Required

1 Information Sheet. "Soil Mixtures"

Supplemental

QUESTIONS
or
ACTIVITIES.

- 1 What are the advantages of mixing organic matter and other soil "lightening" materials with loam soils?
- 2 Name the characteristics of an ideal soil mix
- 3 Why is soil screened before mixing?
- 4 What equipment is required for large scale mixing operations?
- 5 What would be a good mixture for general container-grown nursery stock?

Information Sheet
on
SOIL MIXTURES

The Significance of Soil Mixtures

- 1 Loam soils by themselves are generally unsatisfactory for growing plants for various reasons
 - a Often "heavy"
 - b Often poorly aerated
 - c Often tend to become sticky after watering
 - d Often have a low moisture-holding capacity
 - e Often tend to shrink upon drying
- 2 Advantages of incorporating organic matter and soil "lightening" materials with loam soils include
 - a Better aeration
 - b Greater ease of working
 - c. Better drainage
 - d Better moisture-holding capacity

Some Typical Soil Mixtures:

- 1 For potting rooted cuttings and young seedlings:
 - 1 or 2 parts sand
 - 1 part loam soil
 - 1 part peat moss (or leaf mold)
2. For general container grown nursery stocks.
 - 1 part sand
 - 2 parts loam soil
 - 1 part peat moss or leaf mold
 - 1/2 part dried or well-rotted manure
- 3 For plants which do best under acid soil conditions:
 - 2 parts sand
 - 2 parts loam soil
 - 2 parts peat moss
 - 1 part leaf mold
 - 1/2 dried or well-rotted manure
- 4 The University of California (U C) mix
 - 50% sand
 - 50% peat moss
 - Fertilizer additives (a or b)
 - a If the mix is to be stored for an indefinite period before using. This furnishes a moderate supply of available nitrogen, but the plants will soon require supplemental feeding. To each cubic yard of the mix add:

4 oz potassium nitrate	2-1/2 lb. single superphosphate
4 oz potassium sulfate	7-1/2 lb dolomite lime
2-1/4 lb calcium carbonate lime	

Soil Mixtures

Information Sheet continued

- b If the mix is to be planted within one week of preparation, This furnishes available nitrogen as well as moderate nitrogen reserve For each cubic yard of the mix add
- 2-1/2 lb horn and hoof or blood meal (13% nitrogen)
 - 4 oz potassium nitrate
 - 4 oz potassium sulfate
 - 2-1/2 lb single superphosphate
 - 7-1/2 lb dolomite lime
 - 2-1/2 lb calcium carbonate lime
- 5 In making the U C mix for
- a Bedding plants and nursery container-grown stocks use --75% sand, --25% peat moss
 - b Potted plants use --50% sand, --50% peat moss
- This mixture, including the fertilizer, can be safely sterilized by steam or chemicals without resulting in the subsequent harmful effects to the plants that often occurs when other soil mixes are sterilized

The Ideal Soil Mix has These Characteristics .

- | | |
|------------------------|-----------------------------------|
| a Uniformity | e. Good moisture retention |
| b Freedom from disease | f No shrinkage |
| c Low soluble salts | g Ease of preparation and storage |
| d Good drainage | h Complete availability |

Equipment Used in preparing Soil Mixtures includes

- | | |
|--|----------------|
| 1 Soil screen (may be a powered rotary screen) | 4 Scoop shovel |
| 2 Soil shredder (either gas or electric powered) | 5 Cement mixer |
| 3 Wheel barrow | 6 Water hose |

Steps in Preparing Soil Mixture:

- 1 Screen the soil to make it uniform and to eliminate large particles
- 2 Slightly moisten extremely dry materials (especially peat)
- 3 Mix smaller quantities by putting the ingredients in a pile in layers, and turn the pile with a shovel until uniformity of the mixture is attained
- 4 For large scale mixing operations, use a power driven cement mixer or shredder.
- 5 Prepare the mixture at least one day in advance of use so that the moisture will tend to become equalized throughout the mixture The soil mixture should be slightly moist at the time of use so that it forms a ball when squeezed in the hand at the time of use

- 8 What is a mulch?
- 9 What is the disadvantage of straw mulch?

Information Sheet
on
MULCHES AND THEIR USE

The landscape or greenhouse worker needs to know how to use mulching materials. What kinds of materials are used as mulches? Which kinds of materials make the best mulches? What are mulches used for? How deep should mulches be applied? When should mulches be applied? A mulch is any material applied to the surface of a soil primarily to conserve moisture, maintain a uniform temperature, and to help control weeds.

Effects of mulches in soil mix

- Dilutes the soil and usually increases root growth
- Promotes soil granulation
- Improves and stabilizes structure (surface mulch)
- Affects soil pH slightly
- Adds some fertilizer materials
- Leads to nitrogen deficiency in cases where carbonaceous materials are added
- Serves as food to micro-organisms
- Introduces weed seeds in the soil in some cases

Two basic kinds of mulches

- Inorganic or processed
- Organic

Inorganic or processed mulch material

- 1 Aluminum Foil - Used to some extent in vegetable planting. Research work shows that growth of plants is increased markedly.
- 2 Asphalt - A light spray is used commonly by landscape contractors to hold soil in place on steep banks.
- 3 Asphalt Paper - May be used but hard to keep in place. Can become unsightly.
- 4 Crushed Stone - Gravel Chips - Pebbles - This is a common mulch in areas where organic mulch is scarce. Good in plantings for effect. May be colored to blend in with the features of the home, patio or landscape.

Black Polyethylene - Becoming a popular mulch especially in areas which are not part of the foundation planting. This mulch is used in commercial vegetable plantings.

Organic Mulch Material

- 1 Crushed Corncobs - Excellent mulch material. May be colored for use in landscape plantings. Usually quite inexpensive. Additional nitrogen should be applied.
- 2 Corncobs (whole) - Used to limited extent in farm gardens where the material is available. Can be used in utility gardens where appearance is not the main objective.
- 3 Lawn Clippings - This material is used to a limited extent. It should be applied loosely because it mats. Heat must be produced during decomposition.
- 4 Leafmold - Obtained from compositing fallen leaves in the fall of the year. This partially decomposes by the spring. Good mulch but hard to apply evenly and is not particularly neat looking.

Mulches and Their Use (Information Sheet continued.)

- 5 Leaves - Used rather extensively in areas with many trees. The most inexpensive material available.
- 6 Peanut Hulls - Can be obtained in some garden centers or in areas where peanuts are processed. This is an excellent mulch and usually quite attractive.
- 7 Peat Moss - This is probably the most common mulch. It is quite rich looking when used correctly. The cost of this material is usually prohibitive when large areas are mulched.
- 8 Sawdust - Very commonly used in areas where readily available. Nitrogen deficiency is almost certain if fertilizer is not applied regularly. Reports of toxic materials have not been substantiated by experiment stations.
- 9 Shredded Bark - In recent years, this material has become a popular item in garden stores. The material makes an excellent mulch and is very attractive in landscape plantings. Shredded bark lasts as long or somewhat longer than peat moss and adds valuable organic matter to the soil.
- 10 Straw - Used for winter protection and as a summer mulch. This material is highly inflammable so should not be used where a cigarette could be carelessly flipped into the material.
- 11 Wood Chips or Wood Shavings - In recent years this material has become available in large quantities. Wood chips decompose slowly and may be the cause of nitrogen deficiency if additional fertilizer is not applied.

When to Apply Mulch

The time to apply mulch to the garden on established plants is in mid-spring when the soil has warmed up sufficiently for active root growth. If it is applied before this time, the mulch will keep the ground too cool and root growth may be slow. If you are applying mulch to newly planted material, do so after the plants are put into place and watered in well. If you are planting material in the late summer or early fall, apply the mulch immediately after watering so that the soil temperature will be kept warmer in the cool nights of autumn. It is important that there is sufficient root growth in fall planted stock so that the material does not heave due to freezing and thawing during the winter months.

How Deep to Apply Mulch

For best results, the mulch should be at least 2-3" deep over the whole area during spring, summer and early fall. Tender plants which need winter protection may require an additional 1-2" during the winter months around the crown or base of the plant. In the spring this additional material should be fanned out away from the stems or crowns of the plants before additional material is added for summer mulching.

TOPIC Fertilizer Nutrients

OBJECTIVE. To learn about the fertilizer requirements of plants, the function of different minerals, and how to apply these minerals

INTRODUCTION Many of the materials used for mulching require an addition of fertilizer to reduce the chance of nitrogen deficiency or starvation of the growing plant material. Whodchips, sawdust, crushed corncobs and shredded bark need additions of nitrogenous fertilizers. A report from the U S D A suggests that 1/2-1lb of ammonium nitrate or ammonium sulfate be added to each bushel of mulch material added to the plants. Remember, without the proper amounts of fertilizer, a lot of hard work can go to waste. Plants can not thrive with an improper balance of nutrients

Fertilizer Nutrients
(Information Sheet continued)

HOW PLANT NUTRIENTS AFFECT PLANTS

Nutrient & Chemical Symbol	Form in Which Available to Plants	Role in Plant Growth	Deficiency Symptoms
Nitrogen(N)	NH_4^+	Gives dark green color to plants	A sickly yellowish green color
	NO_2^-	Induces rapid growth Improves quality of leaf crops	A distinctly slow and dwarfed growth
	NO_3^-	Increases protein content of food and feed crops A constituent of all proteins (Note an over abundance of nitrogen leads to rank vegetative growth and tends to retard the date of plant maturity.)	Drying up or firing of leaves which starts at the bottom of the plants and proceed upward. The firing starts at top of the bottom leaves and proceed downward the center along the mid-rib.
Phosphorus (P)	PO_4^- HPO_4^- H_2PO_4^-	Stimulates easy root formation and growth. Gives a rapid and vigorous start to plants Hastens maturity Stimulates blooming and aids in seed formation Essential to the transformation of insoluble carbohydrates to soluble carbohydrates a constituent of all proteins	Purplish leaves, stems, and branches. Slow growth and maturity
Potassium (K)	K^+	Imparts increased vigor and disease resistance to plants. Increases plumpness of grain and seed Essential to the formation and transfer of starches, sugars, and oils Imparts winter hardiness	Mottling, spotting, streaking or curling of leaves. Leaves are scorched or burned on the margins and tips. Firing starts at tip of leaf and proceeds down.

Fertilizer Nutrients
(Information Sheet continued)

Nutrient & Chemical Symbol	Form in Which Available to Plants	Role in Plant Growth	Deficiency Symptoms
Calcium(Ca)	Ca ⁺⁺	Promotes early root formation and growth Improves general plant vigor Influences the intake of other plant nutrients.	Young leaves in terminal bud become hooked in appearance and then die at the tips and along the margins Leaves have a wrinkled appearance In cases the young leaves remain folded. There is a light green band along the margin of the leaves. Roots are short and much branched.
Magnesium(Mg)	Mg ⁺⁺	A component of the chlorophyll molecule Essential to the formation of fats, aids in the transport of phosphorous from older or younger parts of the plant Essential to fruit production Influences uptake of other plant nutrients Plays a role in the translocation of starch	A general loss of green color which starts in the bottom leaves and later moves up the stalk The veins of the leaf remain green The plant stem is slender and weak with long branched roots Leaves are mottled or chlorotic with dead spots The leaf tips are turned or cupped upwards
Sulfur(S)	SO ₄ ⁼ SO ₃ ⁼	Essential to the formation of proteins Essential to all divisions and fruit development Promotes root growth. Stimulates seed production Encourages more vigorous plant growth	The young plant leaves are light green in color and have even lighter veins The stalks are short and slender Plant growth is slow and stunted. Fruit is immature and light green in color

Fertilizer Nutrients
(Information Sheet continued)

Nutrient & Chemical Symbol	Form in Which Available to Plants	Role in Plant Growth	Deficiency Symptoms
Boron(B)	BO_3^-	A deficiency of this nutrient is associated with a decreased rate of water absorption and translocation of sugars in plants	The young leaves of the terminal bud become light green at the base, with final breakdown here. In later growth the leaves become twisted and the stalk finally dries back to the terminal bud
Iron(Fe)	Fe^{++} Fe^{+++}	Essential to chlorophyll production acts as an electron carrier in enzyme systems which bring about oxidation reduction reactions in plants. Essential to the synthesis of proteins contained in chloroplasts	The young leaves are chlorotic with the principal veins remaining green. The stalks are short and slender
Zinc(Zn)	Zn^{++}	Zinc is believed to be concerned with the formation of some growth hormones and in reproduction processes of certain plants. The element also functions in enzyme systems which are necessary for important reactions in plant metabolism	Generalized leaf spots which rapidly enlarge involving areas between veins and eventually involving secondary and even primary veins. The leaves are thick and the stalks have shortened internodes.

Fertilizer Nutrients
(Information Sheet continued)

Nutrient & Chemical Symbol	Form in Which Available to Plants	Role in Plant Growth	Deficiency Symptoms
Manganese(Mn)	Mn ⁺⁺	This element functions in enzyme systems which are necessary for important reactions in plant metabolism. The element is also essential for certain nitrogen transformations in plants	Spots of dead tissue are scattered over the leaf. The smallest veins tend to remain green producing a checkered effect.
Molybdenum (Mo)	Mo ₄	Acts as an electron carrier in enzyme systems which bring about oxidation reduction reactions in plants. Oxidation reduction reactions are essential to plant development and reproduction and do not take place in the absence of micro-nutrients. The element is also essential to certain nitrogen transformations in plants	

If plant nutrient elements are to be available to plants, three basic conditions must be met

1. The nutrient must be in a chemical form that the plant root can absorb.
2. The nutrient must be in a position where it can be absorbed by the plant root.
3. The nutrient must occur in the soil in proper proportions.

Soil fertility then, does not depend only upon the supply of nutrients in the soil, but upon the form in which the nutrients are found.

Some fertilizers harm seeds and foliage if the material is placed in direct contact with them. Inorganic fertilizers harm plant foliage more than organic fertilizers. Often organic fertilizers are called non-burning fertilizers.

Fertilizer Nutrients

(Information Sheet continued)

If you are to avoid harming seeds and foliage with fertilizers:

DO NOT

- 1 Apply dry fertilizers (particularly inorganic fertilizers when the foliage is wet).
- 2 Plant seeds directly on a band or layer of fertilizer.
- 3 Spill the container of fertilizer contents and fail to remove the material from the foliage by scattering or leaching (Many times lawn spreaders are filled on the lawn and spillage is not properly cared for. It is best to fill the spreader on the sidewalk.)

DO

1. Fertilize just before a rain. (Lawns for example)
- 2 Place the fertilizer below and to the side of the seed
3. Mix fertilizer materials thoroughly in the soil before planting

Fertilizers can be applied to the soils of the greenhouse or the landscape as:

- 1 Liquid fertilizers
 - a Hozon proportioners or fertilizer injectors (foliar or base application)
 - b Applied in water solution with a sprinkling can (foliar application)
 - c. Applied as a water solution around the base of the plant
2. Dry fertilizers
 - a Broadcast over the soil surface by means of a spreader.
 - b Broadcast over the soil surface by hand (for small quantities). This is not the most accurate method for applying fertilizers. however.
 - c. Deep drilling
 - d. Side dressing
 - e Banding along the row

Supplemental

2. Soil, 1957 Yearbook of Agriculture, U S D A

QUESTIONS
or

ACTIVITIES

- 1 Name three small forms of plant life that are found in the soil.
- 2 How much of the soil consists of organisms?
- 3 What damage to plants can a nematode cause?
- 4 What harm to a plant may fungus cause?
- 5 In what way do bacteria help supply the plant with fertilizer nutrients?

Information Sheet
on
SOIL ORGANISMS

Small plant life in the soil may be bacteria, fungi, or algae. The small animals in the soil include one-celled animals, and tiny, round worms called nematodes. The larger animals in the soil include worms, ants, snails, spiders, and insects. Some of these animals, especially the earthworms, help to make the soil better by burrowing through the soil, mixing it and making it possible for water and air to move easily through the soil. Also, some of the organisms in the soil are able to take nitrogen from the air and change it into a form that plant roots can absorb. Other organisms in the soil are not so helpful and actually do harm to plants by eating parts of the plant and causing various plant diseases.

Soil organisms make up about 1/1000 of the weight of an acre foot of soil. The living things in the soil use soil minerals for living activities. The minerals available to the plant then, are those that remain after the soil organisms have consumed a certain quantity for their life processes.

THE SIGNIFICANCE OF SOIL ORGANISMS

Organism	Major Activity	Beneficial to Plant Growth	Harmful to Plant Growth
Earthworm	Mixes soil, increases the availability of plant nutrients. Especially nitrogen. Increases aeration. Promotes drainage.	X	
Nematode	Penetrates plant tissue, especially roots, and causes extensive damage.		X Only about 50 of the thousands of nematodes known are harmful to plants.
Algae	Aid bacteria and fungi in the decomposition of plant tissue, in making nutrients available to plants, and in the synthesis of humus.	X	

Soil Organisms
Information Sheet continued

Organism	Major Activity	Beneficial to Plant Growth	Harmful to Plant Growth
Fungi	Decompose organic residues Promotes the formation of humus Causes many plant diseases	X	X
Actinomycetes	Decompose organic matter releasing plant nutrients especially nitrogen Causes plant disease	X	X
Bacteria	Decomposes organic matter releasing plant nutrients; convert nitrogen from the air into a form available to plants only certain bacteria are able to do this. Cause many plant diseases	X	X

The soil organisms which are beneficial to plant growth can be encouraged by adding organic matter lime, and moisture to the soil

The soil organisms harmful to plants need to be controlled. It has been estimated that the yearly loss in farm crops in the United States is five billion dollars. The cost of pesticides and required application of these expenditures is used to control harmful soil organisms.

Basically there are three ways to control soil organisms which are harmful to seeds and plants:

- 1 Soil sterilization with steam
- 2 Soil fumigation or drenching with chemicals
- 3 Seed treatment

UNIT Plant Growing Media

TOPIC Soil Sterilization

OBJECTIVE To learn the advantages and disadvantages of steam sterilization (pasteurizing) and chemical treatment

INTRODUCTION. The soil organisms harmful to plants need to be controlled. It has been estimated that the yearly loss in farm crops in the United States is five billion dollars. The cost of pesticides and required application equipment amounts to almost \$350 million a year. A considerable amount of these expenditures are used to control harmful soil organisms.

QUESTIONS
or
ACTIVITIES.

- 1 Why are soils treated?
- 2 What are four sources of steam?
- 3 Why will soil that is too dry heat up slowly?
- 4 What is used to measure the soil temperature?
- 5 How can ammonia build-up in the soil affect plants?
- 6 What are the seven factors to consider when fumigating soil?
- 7 What are the three precautions to observe in using soil fumigants?
- 8 What is the cheapest method of sterilizing soil?

Information Sheet
on
SOIL STERILIZATION

This control measure is highly effective and is widely used in the greenhouse for controlling the various soil-borne pests. Steam sterilization is also used to some extent in outdoor areas and for steaming bulk soils prior to use in growing plants.

Why are soils steamed?

- 1 To kill soil-borne insects
- 2 To kill all of the bacteria, fungi, and virus organisms that are harmful to commercial crops
- 3 To destroy weeds
- 4 To promote soil granulation

Sources of steam.

1. Existing steam boilers
2. Portable oil-fired steam boilers
3. Package steamers
4. Bricked in permanent-type boilers

Preparing the soil for steaming.

1. Add humus or organic matter.
2. Water the soil lightly. Soil that is too dry will heat up slowly because of poor heat conduction and distribution. Soil that is too wet will also heat up slowly because it requires considerable heat to heat a large quantity of water.
3. Keep the soil moist a week prior to steaming so as to encourage weed-seed germination. This will make the weeds easier to kill.
4. Rototill or otherwise loosen the soil. Be sure all soil is loosened and that all lumps are broken up.
5. If soil in raised benches is being sterilized, unroll the canvas steaming hose down the length of the bench. (Ground beds may have buried tile for steaming purposes.)
6. Cover the bench with a suitable cover. The cover may be draped over the bench, weighted down with pipe or held in place with "C" clamps.

The soil should be steamed at 180°F. for thirty minutes.

Soil Sterilization
(Information Sheet continued)

**KILLING TIME FOR VARIOUS SOIL ORGANISMS
WHEN USING STEAM STERILIZATION**

Organism	Time to Kill	Temperature
Nematodes	Instantly	140° F.
Soil Insects	Instantly	140° F.
Soil Fungi	10 minutes	140° - 160° F.
Soil Bacteria	10 minutes	140° - 160° F.
Weed Seeds	10 minutes	140° - 160° F.
Soil Virus	30 minutes	180° F.

The soil temperature during steaming is registered on a soil thermometer.

After steaming, it is often found that there are other problems which could develop.

- 1 Nitrifying and other beneficial soil organisms are killed
- 2 Ammonia build-up in the soil which may cause root burn

Solving after-steaming problems

- 1 Use high quality, long lasting kinds of peat such as German or Canadian sphagnum, peats or other forms of organic matter that break down slowly.
- 2 Avoid sterilizing in hot water
- 3 Don't feed the previous crop after it shows color, and leach it during the last waterings.
- 4 Keep soils cultivated during critical periods to encourage air to enter the lower soil.
- 5 Keep soils medium dry when steaming: sterilizing wet soils encourages the build-up of ammonia
- 6 Adding 4 lbs of gypsum or 40% superphosphate per 100 sq. ft. of soil immediately after steaming seems to help tie up free ammonia
- 7 Leach heavily after steaming

Soil Sterilization
(Information Sheet continued)

Soil Fumigation

Conditions under which chemicals are most extensively used for soil pasteurization.

- 1 Situations in which overhead costs are so low that the time required for aeration is not expensive
- 2 Situations where weeds and soil-borne insects are the main reasons for sterilizing.
- 3 Situations in which steam boilers are not available for sterilizing.

Chemical fumigants effective against fungi, bacteria, and nematodes are:

- | | | |
|---------------------------|----------------|----------------|
| 1 Chloropicrin (Tear Gas) | 4 Vapam or VPM | 7 Formaldehyde |
| 2 Methyl bromide | 5 Vorlex | |
| 3 Mylone | 6 Trizone | |

Chemical fumigants effective against nematodes are:

1. Dichloropropene-dichloropropane mixtures
2. Ethylene di-bromide

Other fumigants include.

- | | | |
|------------|-----------|------------|
| 1 Bedrench | 3. Trapex | 5. Brozone |
| 2 Zinophos | 4. Nemes | |

Factors to consider in fumigating soil:

- | | | |
|--------------------------|-----------------|-------------------------|
| 1. Soil temperature | 4 Soil Texture | 7. Depth of application |
| 2 Soil moisture | 5. Seals needed | |
| 3 Organic matter content | 6 Soil type | |

Forms in which chemical fumigants are applied:

1. Tractor-mounted equipment which lays a plastic film and injects the fumigant under the plastic cover.
2. Liquid water-miscible materials which are metered into sprinkler irrigation systems.
- 3 Granules, liquids, and powders which can be worked into the soil from equipment mounted in front of a rototiller
- 4 Tractor-mounted chisel-tooth injection shands can be used.
- 5 Materials in pressure cylinders can be released under plastic covers.
- 6 Hand-operated needle point injection guns can be used.

No plants should be planted into a fumigant-treated soil for a period of two to three weeks.

Precautions to be observed in using soil fumigants.

- 1 Avoid inhaling the material.
2. Avoid contact of the fumigant with the skin.
- 3 Allow sufficient time for aeration after the material is applied.

Soil Sterilization
(Information Sheet continued)

ADVANTAGES AND DISADVANTAGES OF
STEAM AND CHEMICAL SOIL STERILIZATION

Treatment	Advantages	Disadvantages
Steaming	A very effective job Cost of treatment is less per acre than for chemicals (\$350 - 500 per acre)	High initial cost Edges of benches and growing areas may not receive steam. After steaming, problems frequently occur
Fumigation	Useful when a source of steam is not available Gives good control of insects, weeds, and nematodes	Cost of treatment per acre is high. Not very effective against hard-to-kill organisms. A great deal of time is required for aeration after treatment.

QUESTIONS
or
ACTIVITIES:

- 1 What is the most widely used media for reproduction of plants?
- 2 What type of peat is most widely used in the United States?
- 3 How much water will sphagnum moss absorb?
- 4 What happens to vermiculite when heated?
- 5 What leaves, when in a molded state, make the best growing media?
- 6 What three media are probably the most readily available for use by the horticulturist in the South?
- 7 Why have many people witnessed failures in plant growth in a medium of sawdust?
- 8 What are the advantages of perlite?

Information Sheet
on
PLANT GROWING MEDIA OTHER THAN SOIL

Many different growing media may be used for rooting cuttings taken from desired plants. These may be used alone or in mixtures with soil

SAND

Sand is probably one of the most widely used growing media in the reproduction of plants. It consists of small grain or rocks ground into a fine texture by weathering. This sand must be of a good quality and must not contain silt. The recommended sand for use in rooting cuttings is of the quartz type and should be washed. It can be the same quality sand used in masonry.

PEAT

Peat, commonly referred to as peat moss, is a material that has resulted from the decaying of the remains of thick vegetation in wet, marsh, swamp areas. It has been preserved over the years by being under water in a partially decomposed state. Peat varies widely in its state of decomposition, acidity, mineral content and origin. Light brown peat has been normally produced by a type of vegetation that results in a quite acid state. Brown to black peat is of the type that is alkaline. This is the type that is desirable and most used in the United States. It has a very high water-holding capacity and contains approximately 1% nitrogen. This nitrogen assists in the decomposition process which results after peat has been placed in use. When peat is used, it should be broken apart and moistened well before adding to the growing media or mixture.

SPHAGNUM MOSS

Commercial sphagnum moss is a material that has been produced by dehydrating certain acid-bog plants. The dehydrating results in a relatively sterile material. It is very light in weight and has a very high water-holding capacity. It has been said that it will absorb 10 to 20 times its weight in water. After dehydrating the plant materials have been shredded in order to make it more usable. This material contains such small amounts of minerals that plant growth in it for any length of time will need additional fertilizer.

VERMICULITE

This is a material that is micaceous in nature and is therefore a mineral. It is composed of thin layers that expand or explode when heated. It is heated in order to dehydrate it for use in horticultural mixtures. It is light in weight and has a very high-water-holding capacity. Expanded vermiculite should not be pressed or compacted in any way when wet. If this is done the desired porous structure of the material will be destroyed.

Plant Growing Media Other Than Soil
(Information Sheet continued)

LEAF MOLD

Certain leaves can be decayed and placed into a growing media or mixture and will serve a very good purpose. Maple, oak, sycamore, and elm are among the most suitable leaves for this purpose. In preparing such a compost the layers of leaves should be alternated with thin layers of soil. Small amounts of nitrogenous fertilizer should be used between the layers of leaves and soil. This nitrogen assists in the decomposition of the leaves. The mixture should be protected from the weather so that leaching of the mineral elements will not result during heavy rain storms. To prepare suitable leaf mold, 12 to 18 months should be allowed for proper decaying of the leaves. A disadvantage of leaf mold is that it may contain nematodes, weed seed or noxious insects and diseases. It should be sterilized before being used as a growing media for horticultural plants.

SHREDDED BARK SAWDUST AND WOOD SHAVINGS

In the South these materials are probably the most readily available for use by the horticulturist. They are by-products of the lumber industry and can be obtained readily at very low cost. They are usually of the hardwood or pine variety. Decomposition of these materials is slow and one should be sure that they are decomposed before using them for plant propagation. Usually it is advisable to add nitrogenous fertilizer to these materials during the decaying process.

USING SAWDUST

Sawdust may be used to improve the physical conditions of soils and as a mulch. As a mulch it insulates the soil against wide fluctuations in temperature, discourages weed growth and reduces evaporation of soil moisture. However, there is a difference of opinion as to its merit. Some operators have long used this easy-to-get forest by-product in large quantity with complete success. Others have had unfortunate experiences with sawdust and have discarded it as unsuitable to their needs.

Possibly a lack of understanding as to how to handle sawdust has caused some of these failures. When sawdust is incorporated with the soil--used in place of peat--it requires large quantities of nitrogenous fertilizer if the plants growing in the soil are not to suffer from nitrogen starvation. The organisms in the soil which break down cellulose require appreciable amounts of nitrogen and will use up all available supplies of this element.

It has been estimated that 24 lbs of nitrogen are required per ton of sawdust from some species of pine to bring the nitrogen content up to 1.2 to 1.5%, the values needed for decomposition without inducing nitrogen deficiency in plants. This would equal 115 lbs of ammonium sulphate or 72 lbs of ammonium nitrate per ton of sawdust during the period of its decomposition, which may be 2 or 3 years. A 4 inch layer of loose dry sawdust over a space 20X30' weighs a little over a ton. A bushel of sawdust (10 to 15 lbs) requires 0.8 lbs of ammonium sulphate or 0.5

Plant Growing Media Other Than Soil
Information Sheet continued:

lb of ammonium nitrate When the sawdust is used as a mulch, nitrate fertilization is not required to the extent that it is when the material is incorporated with the soil.

Sawdust is widely employed as a plunging material in heel beds in retail sales yards, for which it has unanimous approval, despite the fact that research showed that it is very poor for this use, vastly inferior to peat. The need for frequent watering is the chief disadvantage of sawdust as a filler for nursery heel beds. Because of the rapidity with which it dries, it is necessary to soak thoroughly and often

10. What is a flat?

Information Sheet
on
INTRODUCTION TO PROPAGATION

Plant propagation is the controlled reproduction of plants in order that man can have selected plants which are of specific value to him

Plants may be propagated by two methods - - sexual or asexual

Seed reproduction in plants is basically a sexual process because it involves the union of sperm and egg cell before the seeds are formed. The seed has a supply of food sufficient for establishing a plant in a new location.

The vegetative methods of propagation such as layering, division, cutting, grafting, and budding are the asexual types of plant propagation

There are a number of types of facilities and propagating structures for the reproduction of plants

Many types of greenhouses are used. they are usually made of glass, plastic, or similar material

The hotbed is used for propagating but it is generally smaller and less expensive. Heat is provided by fermenting manure or electric heating cables

Many growers use a propagating case made of plastic to start young plants. This case may have mist spray in it to control the environment

The ideal structure for plant propagation should have the proper amount of ventilation, temperature and shade or light

There are several media and mixtures used in propagation. All media should be loose and of a light mixture so that the excess water will drain. It should be free from seeds, nematodes, and disease organisms

Some common types of media are sand, peat, sphagnum moss, vermiculite, and perlite

If soil is used, sterilization is a must. It may be treated by steam or chemicals. If chemicals are used, methyl bromide is an excellent chemical to use.

Flats are small rectangular containers used for germinating seeds or rooting cuttings. Many types of containers such as clay pots, peat pots, and plant bands are used

Many plant propagators use a synthetic plant hormone to promote rooting of cuttings. Various methods are used in applying these root-inducing substances, but the most common is to dip the cutting in the hormone powder, which is a chemical mixed with powdered talc at suitable concentrations. Many of the rooting hormones contain a fungicide to give protection against diseases

UNIT Plant Propagation

TOPIC Propagation from Cuttings

OBJECTIVE To develop an understanding of the methods of reproducing plants from cuttings

INTRODUCTION Cutting is one of the most important methods of propagating ornamental plants. Many plants can be started from cuttings in a limited amount of space. This is an inexpensive, rapid, and simple method of starting plants.

Cutting may be defined as the process of propagating plants by the use of vegetative parts which when placed under suitable conditions, will develop into complete plants.

- 8 What are the requirements of a good rooting medium?
- 9 Give four types of rooting media.
- 10 When are cuttings ready to transplant?

Information Sheet
on
PROPAGATION FROM CUTTINGS

Producing plants from cuttings is often cheaper and faster than producing them from seed by budding or by grafting. The use of cuttings also helps maintain the characteristics of the original plant. Many types and varieties of plants will not produce the same quality or type of plant from seed and must be reproduced by cuttings, budding or grafting.

Commercial plant producers use cuttings to secure large numbers of plants faster than securing the same plants from seeds. Cuttings are also used because they are easier and simpler to make than various budding or grafting operations.

Cuttings are classified and named according to the part of the plant from which they come: stem cuttings, leaf cuttings, or root cuttings.

Stem cuttings are most important and more commonly used. They are made by cutting a segment or piece of a growing limb or shoot from the parent plant. These cuttings are further classified or named by the type of wood or growth period from which the cuttings are made.

1. Hardwood cuttings are usually made in the winter months (or dormant stage) from plants or trees which shed their leaves. Plants propagated by hardwood cuttings include junipers and Yews.
2. Semi-hardwood cuttings are usually made from evergreen plants and are cut from newer growth on the plant after it has finished the rapid summer growth. Plants propagated by semi-hardwood cuttings include euonymus, evergreen, azaleas, and holly.
3. Softwood cuttings are made from new growth in spring or early summer while that part of the plant is growing rapidly. Plants propagated by softwood cuttings include pyracantha, magnolia, and spirea.
4. Herbaceous cuttings are made from plant materials which are soft, rapidly growing, and relatively high in water content. Plants propagated by herbaceous cuttings include coleus, chrysanthemum, geranium, and carnation.

The following environmental conditions are necessary for rooting cuttings: high humidity, air temperature of 60° to 70° at night and 75° to 85° during the day. The temperature of the rooting medium should be as close to 70 to 75° as possible. Others are adequate light and a good rooting medium.

After cuttings have been made and placed under environmental conditions favorable for rooting, a callus layer may develop at the basal end of the cutting. The callus serves as a protective layer which retards the development of decay on cuttings that are fairly slow to root. The formation of callus and the formation of roots are independent of each other although they often occur at the same time.

Propagation From Cuttings

Information Sheet continued;

The plant from which cuttings are taken should be healthy and moderately vigorous. The cuttings should come from average growth from portions of the plant in full sun. The cuttings are usually three to five inches long with two or more nodes. The cuttings should be made with a sharp knife, making the basal cut at about a 45° angle just below a node. It is best to take cuttings in the early morning and keep them moist, cold and turgid (swollen) by wrapping in damp burlap or plastic bags until they are stuck in the propagating bed.

The lower 1/3 to 1/2 of the leaves should be removed from the cuttings. Dip the base of the cutting in a rooting hormone and insert in the rooting medium, spacing so that the leaves barely overlap. The depth of sticking the cuttings is generally 1/3 of their length. After the cuttings are stuck, the medium should be thoroughly watered to wash the particles closely around the base of the cuttings.

During rooting the medium must be kept uniformly moist, but never soggy. Until the cuttings begin to root, they should be kept under partial shade. After rooting, the shade should be removed for increasing periods of time until it is left off completely.

A good rooting medium is one which can be kept uniformly moist, but which also provides good drainage and aeration. Some satisfactory ones are clean sharp sand (builders grade), vermiculite (horticultural grade), sand and peat moss mixture, equal parts of each, peat moss and perlite, equal parts of each.

The propagation box should be at least three to four inches deep. Usually they are wooden boxes or flats with slatted bottoms. Standard size nursery flats are usually about 15" wide by 22" long by 3-1/2" deep. This size is convenient to handle when filled with the rooting medium and cuttings.

To maintain the high humidity needed for rooting softwood cuttings, the top of the flat may be covered with plastic. This may be done by placing a wire or wooden frame over the flat to support the plastic 8 to 12" above the rooting medium. After the cuttings have been stuck and thoroughly watered, the flat is covered with a sheet of plastic, which should be tucked under the bottom of the flat or tacked to the sides and ends to hold it in place.

Cuttings should be properly managed after they have rooted. When the cuttings have roots 1/2 to 1" long, they are ready to transplant either into pots or directly to outdoor beds. If transplanted into pots, 2-1/4 to 3" pots are used. The potting mixture should contain about 1/3 organic matter such as peat or leaf mold, and 2/3 sandy loam soil. The cuttings should be partially shaded for 7 to 14 days after the cuttings are established. By fall the cuttings will be ready to plant in the field to grow to a size suitable for landscape use. If they were rooted late in the season, they should be carried over the first winter in a covered cold frame.

QUESTIONS OR ACTIVITIES.

- 1 Why do we wound plants that are to be layered?
- 2 What type of plants can be layered in a simple way?
- 3 What type of plants are air layered?
- 4 Why do we air layer plants?
- 5 What materials are used in air layering plants?
- 6 When is the best time to air layer plants?

Information Sheet
on
PROPAGATION BY LAYERING

The production of a new plant by layering is one of the surest methods. It is commonly used to propagate plants which are difficult to root.

A simple way of layering is performed by bending a branch of a plant to the ground and covering it with soil or a rooting medium, but leaving the terminal end exposed.

It is usually best to wound branches that are to be covered with soil. This helps to induce root formation. Many plants such as ivy, philodendrons, blackberries, and strawberries will root by this method.

Air layering is a method used to increase many plants such as croton, hibiscus, dracaena, and rubber plants. Many tropical plants get "leggy" and shed their lower leaves; they cannot be sold as choice plants. This is a method of securing good plants at a minimum cost.

Air layering is an excellent way to produce plants which do not come true from seed. In some cases, a layered plant can be produced in a shorter time than by other methods of propagation.

One method of air layering is to select a spot just below the joint or node of the plant to be propagated. It may be necessary to remove a few leaves in order to do this. Make a slanting cut upward. Be careful not to cut all the way through. Take a toothpick or other small piece of wood and place it in the upper end of the slit to keep it from sealing. Then sprinkle the area which is to be propagated with a hormone. This will stimulate the root growth. Wrap a small handful of moist sphagnum moss around this area to keep the roots moist while in formation. Cover the moss with a small piece of plastic film, polyethylene, or kitchen-grade aluminum foil to seal in the moisture. Tie the plastic with two pieces of garden wire or plastic tie. In a few weeks, under ideal conditions, the roots should be in formation and the stem may be cut from the parent plant and placed in a pot.

Air layering is best practiced during the spring and summer months when high temperatures and high humidity contribute toward quicker rooting.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC Propagation by Division

OBJECTIVE To develop an understanding of how to increase plants by division.

INTRODUCTION The propagation of plants by division is an easy and sure way of increasing plants such as chrysanthemums, daylilies, and some shrubs.

REFERENCES

Required.

QUESTIONS OR ACTIVITIES

- 1 List four plants that can be propagated by division.
- 2 When is the best time to divide shrubs?
- 3 Why do you divide perennials?
4. When should you divide perennials?
- 5 How should you divide a daylily or other bulbous plants?

Information Sheet
on
PROPAGATION BY DIVISION

Division is a simple form of plant propagation. Some plants which can be propagated by division are daylilies, iris, chrysanthemums, geraniums, sanservieria, and shrubs such as primrose, jasmine and fig trees.

Most of these plants can be dug and shaken free of soil. Then the clumps can be divided into units or small plants, each having roots, stems, buds, and leaves. They can be planted in containers or as individual plants where they are to grow permanently.

Plants are best divided after their season of blossoming, but with care they may be so increased at any season of the year. Larger shrubs may be divided in the same method as smaller plants, but in most cases they will have to be separated with a shovel or hatchet. They should be divided when the shrubs are dormant for best results.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC Propagation by Grafting and Budding

OBJECTIVE To develop an understanding of the methods and types of grafting and budding

INTRODUCTION Budding and grafting is usually performed when certain plants cannot conveniently be reproduced by cutting, layering, or division. Also, it is used when seeds do not reproduce the characteristics of the parent variety.

Experience is necessary to be successful at grafting and budding. One of the best ways is to study all you can about grafting and budding and then practice until you become skilled.

HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC Propagation from Seed

OBJECTIVE To develop an understanding of producing plants from seeds

INTRODUCTION The production of plants from seed is commonly used by horticulturists. Many ornamental plants are produced by planting seeds in flats or other containers using the proper cultural methods.

Producing good plants from seed requires great skill and knowledge. The grower must be able to determine the requirements for many different plants. He must know when seeds should be planted, how much space should be allowed for each type of seed, how deep to plant them, and the proper cultural methods.

QUESTIONS OR ACTIVITIES

1. Where does the average grower secure good seed?
2. What characteristics does a good growing media possess?
3. What is the proper temperature to germinate seeds?
4. What will happen when a grower attempts to germinate seeds at a cool temperature?
5. What is the best temperature to grow plants?
6. Why do you use a sterile moisture holding material in planting seeds?
7. What information should the label on a seeded flat contain?

Information Sheet
on
PROPAGATION FROM SEEDS

There are several basic principles that the grower must observe if he is to get good germination of his seeds and thereby be successful in producing new plants. These are

1. Use good seeds. For the average grower good seeds can be obtained from the commercial producer of seeds. These are growers who are not growing plants for the purpose of getting a flower but for the purpose of collecting and processing the seeds for sale to plant propagators.
2. The grower must always use the best of growing media for germinating the seeds. A wide variety of materials can be obtained for this purpose. The media whatever his choice must possess certain characteristics. It must be finely screened, porous, loose and have a good water-holding capacity. It should be sterilized and in most cases low in nutrients necessary for plant growth. These nutrients can be added after germination and after the plant begins its growth.
3. The germinator or grower must maintain the proper temperature if the seeds are to germinate properly. Different plant seeds require different temperatures, however there are general principles that will be helpful to the grower that will apply to most plants. Most of the common plants that the retail grower will deal with require a minimum of 65° for proper seed germination. In most cases the temperature should be about 70°F. This is very important because the grower who attempts to germinate seeds at a cool temperature will find that the seed will rot before having a chance to germinate.
4. The proper moisture level must be maintained and must be kept uniform. If this is not done after the seed germinates or sprouts the plant will die.
5. After germination occurs most species of plants grow better in a slightly lower temperature and in a cooler house. The best temperature is usually between 50 to 60°.

To sum up these general principles you could say that if you start with good seeds, sow them in a good growing medium, keep them warm and moist until after germination, success is most likely to occur.

Reasons For Failures In Germination

If the seed is good and there are proper amounts of heat, moisture and air, nearly all the seed will germinate. However, some factors are responsible for seeds not germinating. The more important factors are

1. Damaged Seed - Seeds with broken seed coats, insect or rodent damage or heat damage will not germinate properly or else will fail to germinate at all.
2. Old Seed - Seeds which are more than one year old will not germinate as well as fresh seed, especially if the old seed was not stored properly.
3. Soil or Media Too Wet - Too much water keeps air (oxygen) from moving around the seed, causing it to rot before the plant can emerge.

Propagation From Seeds (Information Sheet continued)

- 4 Temperatures Too Cold - When soil and/or air temperatures are low, the emerging plant develops slowly and uses up the stored food before it can manufacture its own food. Cold temperatures also slow down the absorption of water needed to start the germination process.
- 5 Hard Seed - Some plants produce seed with a tough coat which will not allow moisture to enter the seed. In such cases, it is necessary to use a special process to weaken the outer seed coat. This special process is called scarification, and is used to weaken the outer seed coat so that water may be absorbed to begin the process of germination.
- 6 Disease - Many diseases which affect plants are caused by bacteria or fungi carried to the young plant by air, water, or insects. These pests are present on the seed itself or are present in the soil. Damping off is one of the more common diseases affecting new plants. Many of these diseases can be controlled by using various seed treatments and through sterilization of the soil or media in which the seeds are planted.
- 7 Drying Out Of Soil Or Media - It is necessary to keep the soil or media well watered after seeds are planted. Care must be taken to keep the soil or media moist enough so that the seed have a continuous supply of moisture, but not so much as to encourage damping off or reduced aeration of the media.
- 8 Planting Too Deep - Seeds which are placed too deep in the soil or media may fail to produce a plant. These seeds will use all of their stored food and energy before reaching the surface and die before they can begin to make their own food. A good rule to follow is to plant seed no deeper than 3 times the smallest thickness or size of the seed. Most small seeds should be planted from 1/8" to 1/4" deep with a covering of a loose moisture-holding medium.

Seeding In Flats

Starting plants by seeding thickly in flats is a common practice. The seed may be broadcast or planted along marked rows. The seed should be placed at a depth which allows for easy emergence of the seedling. If the seeds are broadcast, little covering is needed. Some propagators may use a layer of a sterile moisture-holding material such as sphagnum moss as a seed bed to reduce the chances of damping off developing. However, care must be taken that the sphagnum moss is not soggy wet.

A flat 2" x 4" board made to fit inside the flat or a brick can be used for firming the top of the soil. In general, the smaller the seed, the less covering is needed. For example, celery seed would require less covering than either bean or corn.

Small seeds are often hard to handle and plant. To help distribute the smallest seed, you can mix them with a small amount of sand or other inert material.

Propagation From Seeds
Information Sheet continued

After the seed are planted in the bed and covered water the seedbed gently To prevent washout of fine and small seeds use fine misting nozzles, sub-surface irrigation or place burlap bagging over the seedbed and soak the bed thoroughly When misting nozzles or sub-surface irrigation is used to moisten the seed and media, the usual practice is to cover the flat with a piece of glass or place the entire flat in a plastic bag to conserve moisture until germination occurs After the initial watering no additional watering is usually required prior to germination

All seeded flats should be labeled The label should include the following information

- 1 Name of plant or variety
- 2 Date seeded
- 3 Student's name
- 4 Special treatment if any

Using pot labels

- 1 Always start entries at the blunt end of the label
- 2 Allow the lower 1/3 of the label to remain free of entries for insertion into the soil of the flat or pot This will permit reading of the information on the label without lifting and wiping off the label
- 3 The students should be taught that the seeding job is not complete until the label containing the required information pertaining to the seeding is in place in the container

HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC Developing A Plant Breeding Vocabulary

OBJECTIVE To become familiar with the words used when discussing plant breeding

INTRODUCTION It is next to impossible to understand any subject if one does not have a working knowledge of the terms involved. Reading will be meaningless if you have to skip every third or fourth word because you are not familiar with it.

REFERENCE

Required

- 1 "Plant Breeding as a Hobby", Circular 817, University of Illinois, College of Agriculture page 32

QUESTIONS OR ACTIVITIES

- 1 What is the process called by which stamens or anthers are removed to prevent self-pollination?
- 2 What is a perfect flower?
- 3 What are the three parts of the female portion of a plant?
- 4 Where do seeds develop?
- 5 How are generations numbered?
- 6 What part of the plant bears pollen?
- 7 Is it possible for one plant to pollinate itself?
- 8 What part connects the stigma and ovary?
- 9 Ask your science or biology teacher to explain D N A. (Desoxyribonucleic acid) to you. The discovery of D N A has revolutionized the field of plant breeding.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC Plant Selection and Fundamentals of Plant Breeding

OBJECTIVE To become familiar with selection processes and to develop an understanding of pollination and fertilization.

INTRODUCTION In order to breed plants successfully it is important to understand the principles of plant reproduction. A person does not have to be a scientist to understand and do plant breeding. Many people make a hobby of this field. Plant breeding, of course, is much more than a hobby. It is the foundation for developing new and better plants.

for
AGRICULTURAL OCCUPATIONS

UNIT Plant Propagation

TOPIC Heredity

OBJECTIVE To understand how traits are passed on from generation to generation

INTRODUCTION The study of heredity is not only one of the most rewarding studies of man, it is one of the most interesting. Heredity, like a lot of subjects, seems complicated and dull at first, but with knowledge comes interest. Once you understand basic concepts, you will want to look further into the subject. You will find it interesting to actually try some of the plant breeding experiments suggested in your reference material.

HORTICULTURAL OCCUPATIONS

UNIT Nursery Plant Production

TOPIC Transplanting Ornamental Trees and Shrubs

OBJECTIVE To develop an understanding of the major factors involved in the proper planting of ornamental trees and shrubs.

INTRODUCTION Since trees and shrubs are an important part of landscaping, it is essential to know how and when to plant them

Proper cultural practices will provide the desired effects after your careful selection of plants. These practices include the care of the plants, preparing the soil, setting the plants, and providing proper care immediately after planting.

REFERENCES Required

QUESTIONS
or
ACTIVITIES

- 1 When should bareroot shrubs and trees be planted?
- 2 What size hole should be dug for the correct planting of shrubs and trees?
3. When planting a bareroot shrub or tree, how much of the top should be pruned?
- 4 What does the nursery term B&B mean?
- 5 What size tree usually needs guy wires?

Information Sheet
on
TRANSPLANTING ORNAMENTAL TREES AND SHRUBS

Proper planting will benefit both the plants and you. If they are worth planting, they are certainly worth the time and trouble to do it correctly. Care and attention from the very beginning will be of value.

Container grown plants and those balled and burlapped (BB) can be planted anytime. Early fall is a good time to plant as they should be well established before summer.

Bareroot plants such as pecan and fruit trees, some shrubs, and roses need to be planted as soon as they begin to arrive at the nurseries. This is usually in late fall or early winter.

The size of the hole into which the plant is to be placed is very important. It should be at least one to two feet wider and at least six inches or a foot deeper than the roots of the plant.

The soil in the bottom of the hole should be worked well and mixed with organic matter. Unless barnyard manure is well rotted, avoid using it. Do not fertilize newly set out plants, especially bareroot (BR) ones.

After the hole has been dug, you can fill it with water and allow it to soak into the surrounding soil. Place some of the soil mixed with organic matter into the bottom of the hole, set the plant on this. Fill in around the roots with more topsoil and pack well. You could water again and complete filling the hole with soil. The plant should be placed at the same level at which it was originally growing.

If the shrub was bareroot, you can prune about one-third of the top to compensate for the roots lost in digging. Generally, balled and bagged will need some pruning also but container grown do not.

If the plant was in metal, paper, or plastic container, this should be removed before planting. If it was wrapped in burlap, this does not need to be removed. It can be loosened around the top near the base of the plant. Plants in containers may need to be watered before removing to prevent the soil from crumbling.

Newly planted trees or very tall shrubs will usually need to be staked especially if they are in a windy area. A stake can be placed on the side of the prevailing wind. This stake can be put in before planting if the plant is bareroot.

**Transplanting Ornamental Trees and Shrubs
(Information Sheet continued)**

If the tree is over five inches in diameter, it may need guy wires. The wooden stakes would be placed some distance from the base of the tree and driven about 18" into the ground. Wires can be used from the tree to the stakes. The wire should not be tied directly to the plant. Rubber hose protectors may be used around the wires. If the plant is not too large, plastic ties may be used.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Nursery Plant Production

TOPIC Care and Maintenance of Plants

OBJECTIVE To develop an understanding of the modern methods of pruning ornamental shrubs and trees

INTRODUCTION Pruning of plants is the cutting off or cutting back of parts of a plant for better shape or more fruitful growth

Trees and shrubs may need to be pruned in order to remove dead, diseased, or injured wood. Pruning may be needed to remove a branch that overlaps another or to remove foliage right after plants are transplanted in order to make up for the loss of roots.

Pruning also helps to improve the shape of the plant and makes it fit into the general pattern of the landscape.

REFERENCES Required

- 1 information Sheet on "Care and Maintenance of Plants"
- 2 "Modern Pruning Methods", B-997, Texas Agricultural Extension Service

QUESTIONS
or
ACTIVITIES

- 1 What is the cardinal rule to follow in pruning ornamental plants?
- 2 Give three characteristics of pruning tools
- 3 When can trees be pruned?
- 4 What two factors are important in pruning ornamental shrubs and small trees?
- 5 How much top growth should be removed from bare root dug plants?
- 6 Why do rose plants need to be pruned?
- 7 When should deciduous plants be pruned?
- 8 When is the proper time to prune shrubs which bloom in the spring?
- 9 When should climbing roses be pruned?
- 10 Why is a rounded or pointed top hedge preferred over a flat top hedge?

Information Sheet
on
CARE AND MAINTENANCE OF PLANTS

Take stock of your yard and check on an important chore - pruning. Are your sidewalks and driveways covered by overgrown, sprawling shrubs? Are your doorways crowded and your windows hidden? Then you should do some pruning.

Pruning - the removal of surplus or undesirable parts of the plant to improve the remaining parts - reduces the leaf surface or buds that grow into leafy shoots. This diverts the plant food from root production to shoot production and increases the leaf growth.

Deciduous plants, those which lose their leaves during cold weather, should be pruned between leaf drop and first spring growth. The skeleton is exposed and the plant is easier to work with. After pruning, the plant should have a framework of well-shaped, uncrowded branches.

Many evergreen shrubs need annual pruning. These might include wax-leaf ligustrum, pittosporum, oleagnus, yaupon, and viburnum. They may be pruned into midsummer as they have no dormant period.

Sometimes coniferous evergreens such as arborvitae need to be pruned to keep them within a certain size. This can be done by shearing the main branches and end branches with sharp hedge shears. Gradually clip from the outside to almost where the brown foliage begins. This foliage will turn green when the light reaches it.

The average pruning is from about one-fifth to one-third of the entire shrub. Many shrubs should be pruned by thinning out rather than by severe pruning. If a shrub is badly out of proportion to its surroundings, you can cut it back to within a foot of the ground. Fertilized, watered, and allowed to grow naturally, you will have an attractive shrub again.

Shrubs grown for formal hedges need frequent cutting to keep them closely sheared within definite dimensions. If a hedge is informal, it can be allowed to grow more or less at will, it can be controlled to some extent.

Shrubs which bloom in the spring should not be pruned until after their flowering. Severe pruning can be done then as the flowers are produced on wood grown the year before the blooms.

Pyracantha or other berry-bearing shrubs should be pruned before the blooms appear in the spring. The berries for next fall and winter will be lessened by late or severe pruning.

Care and Maintenance of Plants
(Information Sheet continued)

Rose bushes produce flowers on wood formed the same season. Therefore, the more of last year's wood you prune, the better for your rose bushes. Cut back old, non-productive canes. Remove any dead or diseased wood.

Climbing roses should be pruned after flowering. Flowers this spring will be produced on canes grown last season; they will be much greener looking and not as old appearing as the canes produced the season before. Branches which are too long may be cut back about one-third of their total length.

Use the proper tools when pruning. Be certain they are clean and sharp. Make a clean, smooth cut and leave no jagged edges, bruised bark, or stubs.

- 2 Always remove any dead, diseased, or broken branches from plants. If branches are rubbing, crowded, weak, or growing downward, they should be removed.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Introduction to Floral Crop Production

OBJECTIVE To develop an understanding of the field of floriculture and to learn about sources of information on the subject

INTRODUCTION Floral crop production in the United States is a comparatively young business which probably started during the early part of the nineteenth century in Pennsylvania. At that time, Philadelphia was considered the social center of the country. The need for floral arrangements for special occasions brought about the beginning of the production of floral crops. Today the production of flowers is one of America's largest industries.

IMPORTANT POT PLANTS

- 1 AZALES -----Bright flowering plant from mid-December through May Requires acid soil or peat moss as growing medium ample moisture but good drainage 60-65° temperature
- 2 BEGONIA -----Grown for foliage and flowers. Grown in soil that is porous and slightly acid Top soil should become dry before watering Water thoroughly. In winter requires full sunlight, in spring and summer place in filtered sunlight

Thrive in humid air and do well in a temperature of 60-70° Keep foliage dry
- 3 BROMELIAD-----Exotic looking plant with showy spikes of blooms which may be attractive for several months. Most store an emergency supply of water within a natural vase-shaped center formed by their durable foliage in leaf base cups They are easy to grow and do well in shade or sunny locations. The color patterns in the foliage and unusual growth habits make the Bromeliad an excellent and interesting plant for the home or office
- 4 CALADIUM-----Colorful decorative foliage plant grown from tubers which are sold in grades expressed in inches of diameter

Plant in loose well-drained soil. Need high humidity and ample water 80-85° best temperature to start Caladiums.

Require light but not full sun Fertilize with complete plant food about once a month

The fancy-leaved Caladiums offer a variety of form color, and leaf patterns that few plants can match Grow to 2 - 2-1/2' Can be used as house plants or for outdoor planting
- 5 CHENILLE --- --Bright green broad foliage. Flowers in hanging cat-tails up to a foot long of a deep red color Needs semi-light and ample moisture
- 6 DIEFENBACHIA --Large decorative foliage plant. Needs well-drained soil high in organic matter Filtered light. Commonly propagated by cutting stems into sections containing one or more eyes

Important Pot Plants
(Information Sheet continued)

7. **CHRYSANTHEMUM - (Mum)** - Grows best in porous, well-drained sterilized soil. Rooted cuttings should be planted as shallow as possible. They are heavy feeders and need a regular supply of fertilizer. Disease and insect control is very important. They have special requirements such as timing, pinching, lighting, and shading. Disbudding produces larger flowers.
8. **COLEUS** ----- Outstanding foliage plant which is tender; requires frequent pinching during growing season to produce attractive, compact plant.
- Needs loose, well-drained soil with ample moisture. Requires partial shade in hot, dry areas of Texas. Occasionally threatened with aphids and mealy bugs. Easily rooted from cuttings
9. **CROTON** ----- - Bright glossy leaves of many different colors on a single plant. Leaves are various shapes. Require strong sunlight to retain their color. Needs high humidity. Propagated usually by air-layering
10. **DEVIL'S IVY** ---- Variegated yellow-splashed green leaves. Filtered light for best coloring. Requires high humidity, but do not keep constantly wet. If on totem, moisten for humidity. Needs rich loam soil. Feed with complete fertilizer about once a month
11. **DRACAENA** ----- A versatile plant of various types. Most varieties are large and showy; most have leaves that are long and striped. Shade or filtered light. Moderately moist, but good drainage, and high temperatures
12. **FERNS** ----- Various assortments usually called table ferns. All like cool, moist shady conditions. Rich compost soil and moisture, but well drained. Will provide cool greenery background for other plants
- Many varieties excellent for basket growing.
13. **FICUS** ----- (RUBBER PLANT); - Commonly used as large specimen plants, so they do need space. Have glossy green foliage. Will tolerate dry air, and do well at 70 to 80°. Do not overwater.
- Filtered light ideal, but will take a great deal of sun
- Propagated mostly by air-layering.

Important Pot Plants
(Information Sheet continued):

- 14 GERANIUM -----Dusty, green foliage, succulent stems Large clustered flowers in many colors Require plenty of sun to bloom properly Allow to become quite dry between waterings Sandy loam high in organic matter is best Temperature from 60-70^o is ideal
- 15 GLOXINIA -----Showy, velvety foliage and large bell-shaped blooms in assorted colors Light high humidity, moisture, rich, well-drained soil Water spots foliage and flowers, so avoid getting water on them They need filtered light, and proper spacing
16. HYDRANGEA----Showy broad dark green foliage Long lasting flowering plant commonly grown for Easter and Mother's Day Flowers in pink blue, or white Plant requires regular water during flowering and likes high humidity
- 17 PHILODENDRON--Most important tropical decorative plant family Tropical conditions best, but will tolerate dry air and low lighting in homes Needs loose, porous soil, sufficient water to keep soil moist Many varieties and types Some used on totems and are strong climbers
- 18 POINSETTIA----Seasonal plant most popular at Christmas Small yellow flowers surrounded by striking colorful bracts in red, pink or white Keep warm, chills easily Requires moisture and strong light
- 19 SANSEVIERIA----(Snake Plant or Mother-in-law's tongue) - Among the sturdies of the foliage plants Will do well in shade areas or in sunlight Do need porous soil, adequate drainage Do not overwater
- 20 SCHEFFLERA--Attractive, fast growing umbrella-shaped foliage plant Glossy green foliage Filtered light Needs good drainage, and don't overwater Large plant, needs space Usually propagated from seed

UNIT Floral Crop Production

TOPIC Chrysanthemums

OBJECTIVE To develop an understanding of some important cultural practices in chrysanthemum production

INTRODUCTION The Chinese began hybridizing or crossing varieties of Chrysanthemums or mums as they are more commonly called, over 2,500 years ago. In the years since, plant breeders from many lands have done much to improve existing varieties. The Oriental growers tried to win the approval of royalty; European growers concentrated on magnificent showblooms; the American hybridizers have improved mums for florist trade.

In recent years much has been done to cause mums to flower on a year round basis. This is accomplished in greenhouses by controlling temperatures, shading, lighting, diseases and insects.

UNIT Establishing and Caring for Lawns

TOPIC Turf Grasses for Texas

OBJECTIVE To develop an understanding of planning the lawn and the proper selection of turf grasses for Texas

INTRODUCTION A beautiful lawn is the foundation for a pleasant home landscape. No matter how expensive the home, how beautiful the trees, shrubs, and flowers, they will not show up to the best advantage with an unattractive lawn.

A lawn is a living thing consisting of thousands of tiny living plants or grasses. Each plant needs food, water, sunshine, and soil. It is largely dependent upon you for many of these.

The lawn is a valuable part of the landscape design and should provide the proper setting for the house, trees, shrubs, and other buildings. It should be established properly in order to provide a beautiful area which will be easy to keep attractive.

REFERENCES Required
"Home Lawns", B-203, Texas Agricultural Extension Service, pp. 1-5

- QUESTIONS 1 Give five factors to consider in the selection of a turf grass
 2 List two ways turf grasses are classified
 3 Give three points about bermuda as a turf grass
or
ACTIVITIES 4 Give six points about St. Augustine grass as a turf grass
 5 Why does Zoysia grass make an excellent turf?

 - 8 How may chlorosis be corrected?
 - 9 Why are light frequent sprinklings harmful?
 - 10 Why is the aeration of the soil in a turf important?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Establishing and Caring for Lawns

TOPIC: Turf Problems

OBJECTIVE: To develop an understanding of the problems which occasionally arise in the management of a lawn.

INTRODUCTION: Many problems may arise in the successful management of beautiful, well-kept lawns. The horticulturist should be able to identify the important lawn diseases and insects and have a working knowledge of the control of these problems.

REFERENCES: Required

1. "Home Lawns", B-203. Texas Agricultural Extension Service, pp 12-14.
2. "Texas Guide for Controlling Insects on Ornamental Plants", Texas Agricultural Extension Service, L-199.

Supplemental

3. "Lawn Insects. How to Control Them", B-53, U. S. D. A.

**QUESTIONS
or
ACTIVITIES.**

1. List four problems which occasionally arise in the production of a turf.
2. What is the best way to control weeds?
3. What chemical is commonly used to control broad-leaved annual weeds in the lawn?
4. Describe the appearance of a lawn which has Brownpatch.
5. What is a good fungicide for controlling Brownpatch?
6. List eight dusts or sprays which are effective for controlling most lawn insects.
7. Why is renovation of old lawns necessary?
8. List four dusts that are recommended for the control of chiggers.
9. Give three good sprays for the chinch bug.
10. Give the mixture for controlling the Bermuda grass mite.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Causes of Plant Diseases

OBJECTIVE: To learn what causes plant disease and to learn to recognize these diseases

INTRODUCTION. There are probably about as many diseases as there are plants. Man must constantly strive to ward off these diseases. If all research stopped, it is possible that man would be living in a world of famine and hardship

REFERENCES: Required.

1. "What You Should Know About Plant Diseases", B-995, Texas Agricultural Extension Service

Supplemental

2. "Texas Guide for Controlling Insects and Diseases", L-245, Texas Agricultural Extension Service

QUESTIONS
or
ACTIVITIES:

1. What are the four most important causes of plant disease?
2. What is photosynthesis?
3. What is a vector?
4. What is the best approach to controlling canker disease?
5. What are fungi?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Controlling Plant Insects Plant Diseases, and Other Pests

TOPIC. Identifying Plant Diseases

OBJECTIVE: To learn to identify plant diseases and to become familiar with the terminology used in connection with plant diseases.

INTRODUCTION. Better quality and higher yields at lower cost are possible with better disease control Diseases cost producers millions of dollars each year A large part of this expense can be prevented by learning more about diagnosing and checking plant disorders

REFERENCES Required

- 1 "Identifying Plant Diseases" MP-512, Texas Agricultural Extension Service

Supplemental

- 2 "What You Should Know About Plant Diseases", B-995, Texas Agricultural Extension Service

QUESTIONS
or
ACTIVITIES.

- 1 What is the key to effective control of plant disease?
2. What is meant by blasting?
3. What is exudate?
4. What is the best way to check nematode damage?

Activity:

- 1 Study the terms that describe plant diseases on page 7 of reference no. 1.
- 2 Collect all the publications on plant diseases from your county agent.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects Plant Diseases, and Other Pests

TOPIC: Application and Safety Precautions of Horticultural Chemicals

OBJECTIVE: To learn the safe use of the important horticultural chemicals and procedures for effective application

INTRODUCTION: There are numerous methods of applying pesticides fungicides and other horticultural chemicals The purpose is to completely cover the plant or pest with the proper amount of control material The first factor to consider is the welfare of the people using the material, second is the welfare of the plants and then the effectiveness of the material in controlling the pest or diseases

REFERENCES

Required

1. Flower and Plant Production. Nelson. pp 302-311
2. Basic Gardening Illustrated page 81

QUESTIONS
or
ACTIVITIES.

1. What is the first factor to consider when using chemicals?
2. What is the second factor to consider?
3. What is the third factor?
4. What is one of the most common means of applying pest or disease control materials in the greenhouse?
5. How should you store a water hose to prevent spreading of diseases?
6. What are the safety rules that should be followed when a person is working with pest control chemicals?
7. Why should a plant be completely covered with contact poisons?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Controlling Plant Insects Plant Diseases, and Other Pests

TOPIC Controlling Leaf Diseases

OBJECTIVE To learn how to identify and control the major leaf diseases

INTRODUCTION A customer who wishes to buy a plant is usually looking for one which has a lot of healthy leaves A plant will not sell if its leaves have wilted and turned brown This will result in decreased profits on the part of the producer

REFERENCES Required

- 1 "Texas Guide for Controlling Diseases on Ornamental Plants"
MP-574 Texas Agricultural Extension Service pp. 10-13

Supplemental

Agricultural Extension Service

QUESTIONS

or

ACTIVITIES

- 1 How does one treat leaf scorch or scald?
- 2 What causes sooty mold?
- 3 What causes oedema?
- 4 What two chemicals are good for treating mosaic or leaf curl?
- 5 When do you spray azaleas and camellias for galls?
- 6 How often would one spray to control bacterial leaf spots?
- 7 What usually causes chlorosis?
- 8 What type of disease is anthracnose?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects Plant Diseases, and Other Pests

TOPIC: Controlling Stem Branch and Trunk Diseases

OBJECTIVE: To learn the major diseases that affect stems branches, and trunks of horticultural plants and how to control these disorders.

INTRODUCTION The stems branches, and trunks of plants are necessary for plant growth They are the transportation system for the plant since water and food move through them. A disease affecting these systems can cause a definite decrease in plant vigor

REFERENCES: Required
1 "Diseases on Ornamental Plants", MP-574, Texas Agricultural Extension Service. pp 14-16

Supplemental
2 "What You Should Know About Plant Diseases", B-995, Texas Agricultural Extension Service

QUESTIONS
or
ACTIVITIES:

- 1 How does a person treat a plant that has gall?
- 2 What is the control for a dodder infestation?
- 3 How does moss damage a plant?
- 4 What part of a plant does green scurf attack?
- 5 What causes wood rot?
- 6 What is the treatment for slime flux?
- 7 How is mistletoe spread?
- 8 What causes lichens?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Root Diseases

OBJECTIVE: To learn to detect root diseases and how to control them

INTRODUCTION: Roots are the storage organs of plants. If a disease is present in the roots of a plant, growth and vigor will be greatly affected.

REFERENCES Required
"Diseases on Ornamental Plants", MP-574, Texas Agricultural Extension Service, pp 17-21

QUESTIONS
or
ACTIVITIES.

- 1 What is a good treatment for mushroom root rot?
- 2 What is a good treatment for crown gall and hairy rot?
- 3 What is the first step when planning to fumigate for mushroom root rot?
- 4 What is the minimum distance from live plants that it is permissible to use carbon bisulfide as a soil fumigant on mushroom root rot?
- 5 In what sections of Texas is southern blight most common?
- 6 What temperature is required for southern blight development?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Controlling Plant Insects Plant Diseases, and Other Pests

TOPIC Controlling Diseases Affecting the Entire Plant

OBJECTIVE To learn the causes symptoms and control of diseases affecting
the entire plant

INTRODUCTION Many diseases are not localized in the stems, roots, or leaves,
they damage the plant in all parts. There are various controls for these diseases
but one must first be able to make a proper diagnosis. Never assume that because
a plant shows a symptom of a known disease that you have diagnosed the disease
properly. Many diseases have some common symptoms. Don't make the mistake
of diagnosing a plant disease without studying all symptoms of all diseases common
to the particular plant.

REFERENCES Required

- 1 "Texas Guide for Controlling Diseases on Ornamental Plants"
MP-574 Texas Agricultural Extension Service, pp 22-23

Supplemental

- 2 Basic Gardening Illustrated page 80

QUESTIONS
or
ACTIVITIES

- 1 What symptoms would a chrysanthemum exhibit that had aster yellows that would not be present if it was affected by verticillium wilt?
- 2 What is an effective control for aster yellows?
- 3 What is an effective control for verticillium wilt?
- 4 In what section of Texas is verticillium wilt most common?
- 5 Who are the only people that should handle chloropicrin?
- 6 What is a chemical called that controls mites?
- 7 What are two effective treatments for botrytis blight?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

- UNIT** Controlling Plant Insects, Plant Diseases, and Other Pests
- TOPIC** Controlling Lawn and Turf Diseases
- OBJECTIVE** To learn the major lawn and turf diseases and how to control them
- INTRODUCTION** It has been said that a landscape can be no better than the appearance of its lawn. A house can be made into a beautiful home by maintaining a nice green lawn. There are several diseases which can severely damage the appearance of the turf if they are not controlled.
- REFERENCES** Required
"Texas Guide for Controlling Diseases on Ornamental Plants".
MP-574 Texas Agricultural Extension Service pp. 24-26
- QUESTIONS**
or
ACTIVITIES
1. What is the control for fairy rings or mushrooms?
 2. What is the treatment for chlorosis?
 3. What are the symptoms of fading out?
 4. What is the treatment for slime mold?
 5. What is the treatment for *Piricularia* leaf spot?
 6. When should treatment for brownpatch be applied?
 7. When should treatment for rust on bluegrass be applied?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Identifying Plant and Soil Insects and Methods of Control

OBJECTIVE: To learn how to recognize the major insects of horticultural plants
To understand the various controls for these insects.

INTRODUCTION On any given day, a producer may walk through his plants and see numerous insects. Some of these insects and pests are taking money from his pockets by damaging his crop. A person who is depending on the proper growth and development of plants needs to know which insects are of economic importance and how to control them.

REFERENCES: Required.

1. Basic Gardening Illustrated, section to study: "Insect Pests", pp 78-79
2. Information Sheet, "Identification of Plant Insects and Methods of Control"
3. "Texas Guide for Controlling Insects on Ornamental Plants", L-199, Texas Agricultural Extension Service (Study list of insects, descriptions, and types of damage.)

Supplemental:

4. "Texas Guide for Controlling Insects and Diseases", L-245, Texas Agricultural Extension Service

QUESTIONS
or
ACTIVITIES:

1. What is the difference between a snail and a slug?
2. At what time of year do grasshoppers hatch?
3. What are the best methods of controlling borers?
4. What part of the plant do grubs damage?
5. In what type of soil are nematodes most active?

Information Sheet
on
IDENTIFYING PLANTS AND SOIL INSECTS AND METHODS OF CONTROL

Eternal vigilance and timely applications of effective controls will reduce losses to a minimum. Weeds in aisles or under benches are breeding places for a number of pests and cleanliness is imperative. A generally overlooked area is that outside the greenhouse. Weeds harbor many pests which can enter through side or top vents and open doors at the ends of the greenhouses. Cleanliness and proper attention to the outside areas as well as under glass will reduce the sources of infestation.

Great changes have occurred in the field of insecticides and there is a wide array of materials which are useful in combating pests. New materials are constantly being added and the horticulturist must keep informed as better insecticides are introduced.

Aerosol bombs have radically changed certain pest-control practices. Specific directions for their use cannot be given in general terms because they vary and directions on the bombs should be followed closely. Alternation in the use of materials is suggested to avoid the rapid build-up of resistant strains of pests.

Resistance of mites to insecticides is believed to occur by mutation which establishes populations that survive normal effective doses. This resistance is inherited and does not retrogress. Purchasing plants or cuttings infested with resistant mites can lead to considerable trouble.

Sprays and dusts are still used because in many instances they are just as effective as aerosols and may be cheaper for local applications. Many insecticides are deadly poisons and precautions regarding their use will be found on the container and should be followed.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC Nematodes

OBJECTIVE To develop an understanding of nematodes as a serious pest

INTRODUCTION. When leaves of plants are wilting, drying, and falling off for no apparent reason, nematodes may be the cause. Nematodes are small, slender, worm-like parasites which cannot be readily seen by the naked eye. These pests are small, but they can completely destroy a plant.

REFERENCES. Required:

1. "What You Should Know About Plant Diseases", B-995. Texas Agricultural Extension Service, page 3, pp. 13-14
2. "Identifying Plant Diseases", MP-512. Texas Agricultural Extension Service

QUESTIONS
or
ACTIVITIES.

1. List the steps involved in preparing a small plant specimen as illustrated in bulletin MP-512.
2. What is the most common type of nematode?
3. What should be determined before a large amount of money is spent on nematodes?
4. Knots and galls found on plant roots do not always indicate root knot nematodes. Give at least two exceptions.
5. Name two plants that are very good hosts for root knot nematodes.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC Control of Moles Gophers, Birds, Deer, and Ants

OBJECTIVE To become familiar with animals and birds that are a nuisance to
the producer of horticultural plants

INTRODUCTION Plant damage by animals and birds can become quite costly. The
rural nurserymen usually have a big problem with animals, and the small town
producers are plagued by flocks of birds

REFERENCES Required
Basic Gardening Illustrated, page 82

- QUESTIONS
or
ACTIVITIES
- 1 How can a person detect the presence of moles?
 - 2 What are the two most effective means of destroying moles?
 - 3 Why should traps be used with caution?
 - 4 How do gophers and moles differ in their digging habits?
 - 5 How do many gardeners who live in the country protect plant roots from gopher damage without using poisons or traps?
 6. What birds have no friends and should be eliminated?
 - 7 What is the best way to protect young seedlings from birds?
 8. What is the best long term control for deer?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Weeds

OBJECTIVE: To learn how to get rid of weeds and to prevent their recurrence.

INTRODUCTION: Weeds grow well without proper water and fertilizer. If you add these two ingredients, they will flourish and this produces a great deal of trouble. If not controlled, they can crowd out annuals and perennials and even small shrubs. Chemical, hand, and mechanical methods of control are all effective if you start early and are persistent

REFERENCES. Required:
Basic Gardening Illustrated, pp. 84-86

- QUESTIONS
or
ACTIVITIES:
1. If you are planning to pull up weeds in a bed, what should you do to the soil several days before starting?
 2. What has been the gardener's most useful tool for over 4,000 years?
 3. What is a good device for weeding between paving blocks?
 4. How does encouraging shrub growth reduce weed population?
 5. After weeds have been cleared, what can be done to prevent recurrence?
 6. What precaution should be taken when mixing and applying chemical solution where handling is required?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Principles Used to Prevent Personal Injury

OBJECTIVE: To learn the techniques and principles involved in horticultural work that will prevent personal injury.

INTRODUCTION: Gardening and growing horticultural plants can be hard work. In many instances a little time spent constructing a labor saving device can save several hours of back-breaking work.

REFERENCES: Required:
Basic Gardening Illustrated, pp. 90-93

QUESTIONS
or
ACTIVITIES:

1. What part of the body should do the lifting when you are picking up an object from the ground?
2. What effect does one pulley have on the force when you are attempting to straighten up a tree?
3. What can be used to remove a stump if no heavy equipment is available?
4. What preparation should be made to clay soils before attempting to do a lot of digging?
5. Tell how to make a handy device for blasting post holes and planting holes.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Selecting and Maintaining Horticultural Hand Tools

OBJECTIVE: To learn to select the right tools for a job and to keep these tools in good repair.

INTRODUCTION. No situation is quite as distressing as trying to complete a job when the proper tools are not at hand

REFERENCES: Required:
Basic Gardening Illustrated, pp. 88-89, 94

- QUESTIONS
or
ACTIVITIES:
1. Why will asking different gardeners for a suggested tool list be of little value?
 2. What type of shovel is effective for moving sawdust, manure, and other light materials?
 3. What is the most common size of hoe?
 4. How often should one sharpen a hoe if the cutting is not too hard?
 5. What type of hoe is used by a pushing motion rather than a chopping motion?
 6. What are the two most common shapes of lawn rakes?

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Maintaining Small Power Equipment

OBJECTIVE: To develop the ability to maintain small power equipment.

INTRODUCTION: Value of small power equipment quickly decreases if proper maintenance practices are not diligently followed. Preventing a breakdown is usually much easier than repairing one

REFERENCES: Required
Information Sheet. "Maintaining Small Power Equipment"

QUESTIONS
or
ACTIVITIES:

1. What are the two factions of preventive maintenance?
2. What should an operator of equipment do at the end of each work day?
3. Why should the fuel tank be filled at the end of the day?
4. What may be used to clean the air filter?
5. What two factors should be considered when checking a belt?

Information Sheet
on
MAINTAINING SMALL POWER EQUIPMENT

Small engine-powered equipment quickly loses its value if it is not carefully maintained. Profitable use of the equipment depends on trouble-free operation on the job. While no equipment, no matter how well maintained, can be guaranteed not to break down on the job, "down time" can be extremely short if a careful maintenance program is followed. Human and livestock health care is of a preventative nature. Equipment maintenance should be similar.

Preventive maintenance can be described as consisting primarily of two things.

1. Periodic equipment inspection to discover situations which may lead to equipment breakdown
2. Upkeep to minimize wear or to remedy potential trouble

Regularly used equipment should always be checked by the operator. Should he notice any slight malfunction, he should correct it before further trouble develops. The operator should see that field maintenance is carried out regularly.

Usually not enough horticultural equipment is operated by a horticultural business to warrant hiring a full-time field mechanic or serviceman. The operator has the responsibility to check oil, apply grease, and perform other maintenance when needed. In some instances, this may be required every few hours. At the end of the day, the operator should make an overall check and properly service his equipment. This will make the equipment ready to use the next day or on any future date it may be needed.

A regular program of shop maintenance should be carried out on each piece of small, engine-powered equipment. Small engines have prescribed periods of operating time after which oil should be drained and replaced. At that time a general check of the equipment is in order.

Before beginning operation of a small, engine-powered piece of equipment, the following should be checked:

1. Fuel
2. Engine oil level
3. Oil level and air filter
4. Belt tension
5. Chains, oil if necessary
6. Moving parts requiring frequent applications of grease or oil
7. Gearboxes
8. Implement adjustments

Maintaining Small Power Equipment (Information Sheet continued)

During operation, the operator should constantly watch for any slight malfunction. Often a change in the sound of the machine when in operation will indicate the beginning of trouble. A skilled operator can tell by the sound of the machine if everything is in good working order. If equipment is used for long periods during the day, regular shutdowns for preventive maintenance practices are advisable.

When equipment has been shut down for the day, it should be carefully checked and readied for the following day's operation.

- 1 Fuel - Fill the fuel tank. Moisture condenses more rapidly in a partially empty tank as the air cools.
- 2 Oil - Check the oil level and add oil as required. The oil should be changed periodically.
- 3 Transmission case - Check the lubricant level, adding or changing the lubricant as necessary.
- 4 Oil filter - Clean and check the oil level.
- 5 Chains - Apply oil to chains at regular intervals. Check the condition of the links.
- 6 Belt condition - Check belts for excessive wear and for proper tension.
- 7 Moving parts - Grease all moving parts.
- 8 Cutting surfaces - Clean and check cutting surfaces of plows, cultivator tines, mowers for sharpness. Cover cutting surfaces with used oil or grease if the machine is to sit out in the weather or not be used over a period of time.
- 9 Adjustment - Check machine to be sure that all operating parts are in correct adjustment.
- 10 Bolts - Inspect the machine for missing and/or loose bolts.
- 11 Damaged or broken parts - Determine if any parts have been damaged to the extent that machine operation will be impaired. Replace these and all broken parts to insure proper operation.
- 12 Machine cleanliness - Clean off accumulated dust and dirt regularly.

When small, engine-powered equipment is put away for the off-season, give special care to provide the maintenance necessary to insure rapid starts the following season.

Small, engine-powered equipment is most valuable when operating properly. Proper preventative maintenance helps insure proper operation.

The following general procedure should be used. However, check the operator's manual for specific maintenance procedures which may be needed for a particular piece of equipment.

Maintaining Small Power Equipment
(Information Sheet continued.)

1. Before beginning the check disconnect spark plug wire to eliminate a possible accident.
2. Using wire brushes scrapers rags and chemical de-greasers clean the entire machine. Use chemicals only outdoors.
3. Clean air filter. Rinse with gasoline or other solvent, wipe dry, and refill with oil. If the air filter has a dry element, replace with new element according to manufacturer's recommendations.
4. Check carburetor for sediment. Remove and check if necessary.
5. Re-connect spark plug wire and run engine for five minutes. Stop the engine remove the spark plug wire, and drain the crankcase oil. Fill with new oil as recommended by the manufacturer.
6. Drain gas tank. Reconnect spark plug wire, start the engine, and run until the tank and carburetor are free of gasoline
7. Remove spark plug and pour a teaspoonful of oil into the cylinder. Turn the flywheel to distribute oil. Replace the spark plug with a new one.
8. Adjust and/or sharpen any blades or implements.
9. Grease or oil any moving parts
10. Wipe a light coating of oil over bare metal parts.
11. Store in a protected, dry place

Material for this Information Sheet was taken from Module 10, "Operating, Repairing, and Maintaining Small Power Equipment." Center for Vocational and Technical Education, The Ohio State University, Columbus, Ohio.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Operating and Maintaining Horticultural Equipment

TOPIC Operating and Maintaining Lawn Mowers Safely and Effectively

OBJECTIVE To learn how to properly operate and to care for a lawn mower.

INTRODUCTION: A well mowed lawn can greatly increase the beauty of a home.
There is more to operating a lawn mower than filling it with gasoline and mowing
the grass.

REFERENCES Required

1. Basic Gardening, Illustrated, page 94, "Lawn Mowing"
2. Information Sheet, "Operating and Maintaining Lawn Mowers Safely and Effectively"

QUESTIONS
or
ACTIVITIES:

1. What are the three general categories of power mowers?
2. What is meant by scalping a lawn?
3. What is the first step in adjusting the cutting height of a power mower?
4. A sickle bar mower consists primarily of what two parts?
5. Why should extremely long grass clippings be removed from the lawn?
6. Explain why grass leaves should never be clipped too short.

Information Sheet
on
**OPERATING AND MAINTAINING LAWN MOWERS
SAFELY AND EFFECTIVELY**

Power mowers can be divided into three general categories (1) reel (2) rotary, or (3) sickle bar

Reel Mowers A reel mower is basically a common hand push mower powered by a small gasoline engine. As the mower moves forward the revolving blades slide past the bed knife and cut the grass blades

Reel mowers used on bluegrass and similar grasses have five revolving reel blades. Reel mowers used on the bent type grasses have seven or nine blades to provide a smooth even cut on these fine-bladed grasses

Reel mowers minimize the tendency of scalping or extremely close cutting on the high spots of an uneven lawn. Repeated scalping will result in a weak turf at those spots

The procedure for adjusting height of cut varies for each make of reel mowers. In general, the following procedures apply

- 1 Disconnect the spark plug wire from the spark plug and place it in a position where it is impossible for a spark to jump an air gap to the plug possibly causing accidental starting
- 2 Place mower on a perfectly flat hard surface such as a concrete walk or solid workbench
- 3 Adjust the bed knife to the proper height by manipulating the height adjusting set screws or by adjusting the wheel height
- 4 Check to see that the adjustment procedure has not distorted the bed knife. Rotate the reel and check the clearance between reel blades and bed knife for the entire length of each of the reel blades. This clearance should be uniform along the length of each blade. If this cannot be achieved through adjustment, it will be necessary to utilize special equipment to grind the blades to obtain the desired clearance

Rotary Mowers Rotary mowers have a vertical shaft engine mounted on a housing which encloses a horizontally revolving blade. The blade may be mounted on the engine shaft or one or more blades may be mounted on vertical jackshafts. As the mower moves forward the blade revolves at very high speeds lifting and cutting off the grass blades. Rotary mowers are generally simpler in construction than reel mowers

Scalping, or extremely close cutting of high spots on uneven turf, can easily occur through careless operation. Because the rotary mower is relatively square in design, the wheels may pass over a high spot and drop into a lower area during mowing and

Operating and Maintaining Lawn Mowers Safely and Effectively (Information Sheet continued)

cause the blade to crop near to or hit the soil surface. Excessive scalping may severely damage the turf.

Rotary mower adjustment varies in detail according to the make, but the following general procedures usually apply:

1. Place mower on a perfectly flat, hard surface, such as the concrete walk or a solid workbench. Remove spark plug wire so as to prevent the possibility of accidental starting which might result in serious injuries.
2. Adjust mower blade to proper height by adjusting wheel height in relation to the housing. Be sure to check the blade height and not the housing height since the blade is not level with the lower edge of the housing.
3. Adjust mower handle height to suit operator.

Rotary mower blades should be sharpened regularly since a dull blade rips instead of cutting the grass. Before removing the blade for sharpening, disconnect the spark plug wire. The blade may be sharpened by grinding or by filing. Prior to remounting, the blade must be balanced. The blade is mounted on a rod which is the same diameter as the hole in the blade. Place the ends of the rod on a hard, perfectly flat surface with room for the blade to revolve freely. Two short pieces of 2" x 4" hardwood would work. After resting the ends of the rod on the 2 x 4's, the blade should remain level. If the blade is not balanced, grind or file the heavier end until perfect balance is achieved.

Individual knives mounted on a base plate should be weighed after grinding to check their balance. If necessary, metal may either be ground off the back of the knife or holes may be drilled in the back of the knife to remove excess weight so that perfect balance can be achieved.

Sickle Bar Mowers Sickle bar mowers are used to cut overgrown turf or heavy weeds. They generally do not cut neatly enough for use on home, industrial, or recreational lawns.

Sickle bar mowers consist primarily of a cutter bar and knife. The knife is a narrow steel bar to which several triangular-shaped, sharp knife sections are riveted. The knife is driven by a pitman rod through a series of guards and over numerous wear plates. As the cutter bar moves forward, grass blades are cut by a scissor-like action as the knife moves rapidly back and forth over the wear plates. The sickle cutter bar is usually mounted on and powered by a garden tractor or is permanently mounted and powered by a specially designed power unit.

Operating and Maintaining Lawn Mowers Safely and Effectively
(Information Sheet continued)

Height-of-cut adjustment is not present on some sickle bar mowers. On other makes, height adjustment is made by raising or lowering a steel "foot" which rides on the ground and keeps the mower at a set level.

Correct mowing techniques greatly influence the health, vigor, and appearance of a lawn. Leaves of the grass plant are essential to producing food for plant growth. When cut off too low, the food producing section of the leaf is lost and turf vigor quickly declines. Grasses similar in height to the bluegrasses should be cut to a height of 1 1/2 to 2 inches. Low growing grasses of the creeping bent types should be mowed to a height of about 1/2 to 3/4 inches.

If the lawn is mowed frequently enough, clippings need not be removed. They filter down to the surface of the soil and act as a beneficial mulch for the turf. If the clippings are excessively long, they must be removed since they may smother the grass. Under certain conditions, some lawns develop excessive "thatch", dense mats of dead grass and clippings, at the soil surface. Under such circumstances, all clippings should be removed.

The mowing pattern should be varied each time the lawn is mowed to eliminate low spots, corrugations, and some matting. The changed lawn pattern created by changing mowing directions also enhances the overall landscape appearance.

Overlapping each opposing cut improves the lawn appearance. Mowing in the opposite direction of the previous cut and overlapping past the wheel mark of the previous cut can raise grass that may have been matted down by the wheels and permit it to be cut.

Safety should be foremost in the mind of any equipment operator. He should know his mower and its capabilities and should attempt only jobs for which the equipment is designed. Except for adjusting the carburetor, he should never place his hands in or near moving parts nor allow anyone else, especially children, to be nearby when the engine is running. When the engine is stopped for cleaning or repairs, the spark plug wire should be removed to eliminate the hazard of accidentally starting the engine. The operator of a rotary mower should be constantly on guard against running over articles such as glass or stones which could be thrown by the blades of the mower, since such debris can cause severe injury to people or pets.

Material for this Information Sheet was partially taken from Module No. 10, "Operating, Repairing, and Maintaining Small Power Equipment," Center for Vocational and Technical Education, The Ohio State University, Columbus, Ohio.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Operating Rotary Tillers Safely and Effectively

OBJECTIVE: To learn the different types of tillers and how to properly operate them.

INTRODUCTION: A rotary tiller can be a handy piece of equipment. It can also be dangerous. One should exercise extreme caution in the operation of these machines. If cautions are heeded, a tiller can be used by even the inexperienced gardener to loosen soils and in preparing soil mixtures.

REFERENCES: Required:
Information Sheet, "Operating Rotary Tillers Safely and Effectively"

QUESTIONS
or
ACTIVITIES:

1. What are the two categories of rotary tillers?
2. Which type is used only for light work?
3. On front tine tillers, what moves the tiller forward?
4. If the front tine tiller digs too far into the ground and does not move forward, what should you do?
5. What should be done before starting any tiller?

Information Sheet
on
OPERATING ROTARY TILLERS SAFELY AND EFFECTIVELY

Rotary tillers are classified into two categories according to the arrangement of the tilling tines. Front tine tillers are those which have the tines located in front of the wheels. Rear tine tillers have the tines located behind the wheels.

Front tine tillers are generally designed for light-duty work and are often used for cultivating. In a loose soil they may do a satisfactory job of tilling to a depth of several inches. The machines usually are not heavy enough to till deeper on loose soils or to till heavy clay-packed soils with heavy vegetative cover.

Front tine tillers do not have power wheels. The rotation of the tines causes the tiller to move forward. Some control can be exerted over rate of forward motion by adjusting the depth bar. If the tiller must be held back to do a proper job of tilling, the depth bar should be lowered to cause the tines to dig deeper and slow the rate of forward speed. If the tiller digs deeply and does not move forward, determine the adjustment of the depth bar.

Rear tine rotary tillers are designed for medium to heavy work. Excellent tilling can be done to depths of about eight inches in a variety of soils having various amounts of vegetation or organic matter. This type of tiller can thoroughly mix organic matter into the soil.

Rear tine tillers have powered wheels and usually a reverse gear. Power can be transferred to either the wheels or the tines. Rate of forward speed is controlled by selection of proper gear and throttle setting.

Tilling depth on rear tine tillers is also adjusted by a depth bar which is usually located behind the tines. The bar is raised for increased tilling depth and lowered for decreased depth.

Since rear tine tillers are often used on heavy or packed soils, several points of operation should be noted. The following operational procedures should be observed:

1. Rotary till when soil moisture is correct. Use standard method of squeezing a handful of soil to determine moisture content. When the soil ball flakes and cracks, soil has the correct moisture content for tilling.
2. First run tilling depth should be no more than one to two inches. Increase depth for each additional pass.
3. Final tilling passes should be at right angles to previous ones to break down lumps further.

Operating Rotary Tillers Safely and Effectively
(Information Sheet continued)

The handling procedures for front and rear tine tillers are considerably different. Each type can pose safety hazards to careless operators. Before starting any tiller, check to see that all clutches or belt tension pulleys are disengaged. The load on the engine may be great enough to prevent the engine from starting if these clutches were engaged. If the engine should start while the clutch is engaged, the machine may get away from the operator and cause personal injury or property damage. Even if the engine does not start while the clutch is engaged, a sharp pull on the starting rope may upset the machine or injure the operator.

Rear tine tillers present added hazards to the operator. Power to the tiller tines should be disengaged whenever the tiller is not being used for tilling. This includes turning the machine around when moving it from one site to another.

for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Operating Garden Tractors Safely and Effectively

OBJECTIVE: To learn how to operate a garden tractor safely and effectively.

INTRODUCTION: The sale of garden tractors has increased steadily in the past few years. These tractors are used in a number of horticultural enterprises as well as by homeowners and hobby gardeners.

REFERENCES: Required:

1. Information Sheet, "Operating Garden Tractors Safely and Effectively"

Supplemental:

2. Literature from manufacturers of garden tractors

QUESTIONS

or

ACTIVITIES:

1. If one is planning to buy a garden tractor and a sickle bar, what should he keep in mind in regard to tractor size?
2. What is the usual horsepower range of small riding tractors?
3. Where should one attach pulled equipment to avoid tipping a tractor backwards?
4. What is the major difference between small riding type garden tractors and riding lawn mowers?
5. What are the two most widely used types of transmissions on garden tractors?

Information Sheet
on
OPERATING GARDEN TRACTORS SAFELY AND EFFECTIVELY

The small walking or riding type garden tractor is used in a number of horticultural enterprises as well as by homeowners and hobby gardeners

Walking type tractors have had the same basic design for a number of years, but moderate improvements such as rubber tires have been introduced

The basic design consists of a small gasoline engine mounted on a set of wheels attached to a pair of handles. Power is usually transmitted from the engine through a reduction gear arrangement to a jackshaft. An idler, or belt tension pulley, is mounted for the belt between the gear box and jackshaft. This provides the clutch for the tractor. The power is transmitted from the jackshaft to the wheels by a chain or belt arrangement.

Extra pulleys may be mounted on either the gearbox shaft or the jackshaft to permit the use of implements requiring power. A number of implements are available for walking tractors. Those requiring power, such as sickle bars or snow blowers, demand engines of high horsepower and tractors of heavier design. Many implements are simply pulled or pushed by the tractor and often can be used with tractors of lower horsepower and lighter weight.

Implements are attached to the walking tractor in two basic ways with minor modifications according to the various manufacturers. Implements which are pulled are attached by a vertical rod or "pin" which secures the tool to the tractor frame behind the engine. Implements which are pushed by the tractor are rigidly secured to the frame in front of and under the engine with several bolts or pins.

The following implements are available for most walking tractors

Cultivator	Sickle bar mower	Lawn roller
Plow	Cart	Rotary roller
Disc	Seeder	Sulky
Reel mower	Fertilizer spreader	Grader blade

The tractor engine can also be used to power a number of other stationary pieces of equipment, such as a small rotary cement mixer, saw, compressor, compost or soil shredder, and others.

The walking tractor is a versatile piece of equipment which, in many horticultural enterprises, can supplement heavy equipment. Operators of small walking tractors should, however, be familiar with the equipment since too often the tractor is damaged and the operator injured where it is used for too heavy work. Quite often the walking tractor is not properly maintained since it is relatively inexpensive and possibly not used as often as larger equipment. Because regular maintenance schedules are often neglected, premature equipment failure may result.

Operating Garden Tractors Safely and Effectively
(Information Sheet continued)

Within the past decade, a small type of riding tractor has been developed. Most are scaled-down versions of the larger types. Horsepower ranges from 3 1/2 to 10. Due to the heavier weight of the machine and the added rider weight, the unit can handle somewhat heavier jobs than most walking tractors.

While all small riding tractors can handle mower attachments, they are not riding mowers. Riding mowers are quite different from small garden tractors in that riding mowers are built to be used for mowing grass only. The high interest in small riding tractors by homeowners with large lots has resulted in scores of different models produced by various manufacturers.

The construction varies considerably in type as well as quality. For example, some models have automotive type clutches, some centrifugal clutches, and others a belt-pulley type clutch. Transmissions also vary considerably; some have an automotive type while others have a belt type.

The teacher should obtain a variety of manufacturers' literature giving detailed specification of the various types of tractors.

The list of equipment available for small riding tractors is the same as that listed for small walking tractors.

Since the small riding tractors are basically a small-scale, standard tractor, several similar rules of operation should be kept in mind. All pulled equipment should be attached properly below the rear axle level to avoid tipping the tractor backwards if the load is too great. Care should be taken when operating the tractor on uneven or sloping ground to avoid turning over. The operator of a walking tractor can usually move out of the way quickly in the event of an upset, but the operator of the riding tractor is in a more precarious position.

Both walking tractors and small riding tractors can be valuable tools for a horticultural business or for the homeowner with a large lot. For maximum value, however, they should be used only to the rated capacity of the unit, on jobs for which implements are available, and in situations where their use can be justified economically.

HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Introduction to Home Landscaping

OBJECTIVE To develop an understanding of why landscaping has become important and to learn sources of information available to the beginner

INTRODUCTION By properly landscaping a home its value can be greatly increased. The landscaping industry has grown in leaps and bounds during recent years. This growth is probably caused by the great number of people moving to the urban and suburban areas. It seems that everyone tries to have a better landscaped lawn than his neighbor. Another factor which has contributed much to the landscaping business is the greater amount of leisure time now enjoyed by American people. Many have found that working in a flower garden or watering the lawn is quite enjoyable and provides a form of relaxation which is very refreshing in this hurry-up world in which we live

2. What are the two best ways to learn how to sell?
3. What are two ways in which good habits pay off?
4. How does a person become a "scientific salesman"?
5. What is required for a would-be salesman to become a tough, aggressive, and effective salesman?

Information Sheet
on
DEVELOPING PERSONAL TRAITS

The three basic ingredients of salesmanship are knowledge of self, knowledge of people and knowledge of the product to be sold. A person who wants to become a salesman must learn to use each of these basic divisions to its fullest potential. Before anyone can understand others fully, he must have a good understanding of himself and how he relates to others. Then it is necessary to understand the product or service fully.

There are two basic ways of learning to sell after you have studied the basic knowledge of the product. First, and probably the best, is to apply some FFA training and learn by doing. This means learning from experience. To do this, it is necessary to gain employment in a retail store such as a feed, seed, and horticultural supply store and make direct sales to the customers.

The second way to learn to sell is to learn from others. This makes it necessary to observe very closely the methods used on you while you are having a product sold to you. Observe what the salesman says during the sale. He will get your interest by saying or doing certain things. Observe how well he knows his product. Observe his mistakes. These can be very valuable to you.

A salesman must develop a good sales attitude. This is very important. It involves knowing oneself. It means knowing if you have the "mind" for selling.

A good attitude means that the salesman recognizes his responsibility to the company. It means becoming a part of the company and growing progressively more loyal to it as time goes on.

A good attitude means proving that you are growing and coming up with new ideas for the company. This involves keeping up to date on new developments. Agricultural supplies are changing each day and a good salesman keeps up with these things.

A good attitude means good sales habits. Old habits must be changed. When the salesman learns good habits, they are his alone. No one can share them. Good habits pay off in promotions and dollars.

A good attitude means selecting the right learning methods. These methods are study, experience, and a combination of the two. Study means lessons at school or constant review of materials in the business. Experience means practice. With each successful sale, the salesman grows. When study and experience are combined, the result is a good salesman with a good attitude.

Constant analysis of the sale makes a "scientific salesman". This analysis is done by getting the facts, analyzing the facts, drawing conclusions from the facts, and applying the conclusions. This means planning and executing the sale inch by inch. It means

Developing Personal Traits (Information Sheet continued)

reviewing the sale after it is made It means applying what you have learned to the next sale

A good salesman realizes that salesmanship provides a mutual benefit to himself and his customer This makes it necessary to get the customer's viewpoint and help him get the most for his money A good salesman speaks the customer's language If possible, he determines the customer's needs, problems, business, and what the product will do for him This is easily done by a salesman of agricultural products.

Developing the Right Sales Personality

In salesmanship as in any field of work the personality of the salesman is of utmost importance His ability to sell himself will be directly related to his ability to sell a product. Even before selling himself to others he must sell himself to himself This means being sure of what he can do Strong sales personality enables the salesman to apply scientific training to the sale of the product

Diligence and perseverance are necessary for a would-be salesman to become a tough, aggressive, and effective salesman

There are several qualities that make up the sales personality Each will be discussed briefly

1. Sincerity - Sincerity is a quality that creates an atmosphere of confidence on the part of the customer in the salesman Insincerity does just the opposite Sincerity is, in the final analysis, the total of the salesman's attitude toward his work The correct attitude causes the salesman to apply himself to his training and do his job
2. Tact - When a salesman meets a customer the opportunity for conflict or differences of opinion is great Tact is the quality of personality that can smooth out these conflicts and bring about the proper atmosphere for making a sale. It means that the salesman will not contradict The injured pride of a customer will prevent him from making a purchase. If the salesman wins an argument, he will still lose
3. Enthusiasm - This is the quality of the personality that means putting everything you have into it. It involves the whole body - the face, the voice, and the actions To have enthusiasm, a salesman must be thoroughly familiar with the merchandise to be sold and he must appreciate

Developing Personal Traits
(Information Sheet continued)

it The more the salesman knows about the product, the more enthusiastic he will become

4. Courtesy - One could never say too much about the importance of courtesy to the salesman. Courtesy is simply good behavior and good manners. It is the quality that gives good first impressions. Many times that good first impression makes the sale.
5. Cheerfulness - It has been said that we are what we think we are. If we think cheerful thoughts, we are cheerful. The cheerful salesman will meet his customers with a smile, whether he feels like smiling or not. Cheerfulness can be measured in important sales.
6. Initiative - This characteristic is most vital to the sales personality of the successful salesman. The alert mind of the salesman who possesses this quality will cause him to get new sales on his own and will cause him to operate without any prodding from his employer.
7. Friendliness - Many a sale has been won by the friendly salesman. His friendly personality puts the customer at ease. The feeling of the customer can be described as a certain good friendly feeling. The unfriendly salesman can be sure that his customers will never buy his products.
8. Persistence - This quality can suggest that in some cases a salesman can become obnoxious. This is not what is meant by being a persistent salesman. This quality causes a salesman to try again after failing to sell a potential customer. He does not admit defeat quickly. It simply means trying again to make a sale, using a different method.
9. Memory - A quick memory of the information involving the product is very important to the good salesman. A quick memory involving the name and other facts about the potential customer is also very important. It has been said that forgetting a person's name may mean the loss of a sale. To gain memory, the salesman will practice concentration, association, and repetition. Concentration on the facts, association of these facts to something familiar, and the repetition of these facts will cause the mind to grasp them.

Developing Personal Traits
(Information Sheet continued)

10. Application - Nothing is ever truly learned until it is put into practice. The applying of any idea to making a sale is putting that idea into practice. The only sales idea that is important is the one that works. The wise salesman will try hard to improve himself by applying what he has learned. Other attributes that help a salesman make a sale are a good vocabulary, a pleasant voice, shaking hands with the customer, and being vigorous and poised. All good salesmen are recognized as having these qualities.

Information Sheet
on
DISPLAYING HORTICULTURAL PLANTS AND SUPPLIES

Point-of-purchase displays normally consist of tri-plane and peg board tables, special display racks, bins, display floor windows, and floor displays. These must be located where they will be seen by the greatest number of customers. The basic reason for displays is to put merchandise where customers can see it and serve themselves.

Special racks, tri-plane and peg board tables are excellent for displaying impulse items and other small competitive items. Much of the fast turnover merchandise is adaptable to display selling. Customers like to handle the merchandise they buy; they find it interesting. These displays are easy to set up and maintain. They enable the salesman to handle a larger volume of sales.

Bin displays are more successful when used for familiar products, bulk seeds, and other seasonal items. It is a good idea to put reminder items where they command the customer's attention. The items that are to be pushed should be placed on shelves at eye level.

Most businesses find floor displays are best for large items such as barrels of special fertilizer packages or for large quantities of small items in a special promotion. A floor display should be well stocked, safe, and at a convenient height.

Sales floor window displays have one definite purpose. This is to stop customers and bring them into the place of business. They must be appealing and attract attention by action. This necessitates the use of special signs, background, lighting, and display cards. Window displays are most effective for whole goods or for tie-ins with advertised promotions.

Some Proven Principles of Effective Displays

In point-of-purchase display merchandising

1. Display in quantity - A single item does not attract customers. Bulk attracts attention and gives the impression of demand.
2. Use proper arrangement - Consider the traffic pattern. Locate displays where the greatest number of people will pass them. Each table and shelf should have a relation to the others. Establish a "theme" for the entire area. Keep all displays well stocked; remove a few items from the cartons, and do not make the display so orderly that it will discourage the customer from picking up items.

Displaying Horticultural Plants and Supplies

(Information Sheet continued)

- 3 Change display frequently - As customers need change, so do displays. Many dealers establish a rule to change displays after a given number of weeks. This practice permits more items to be displayed and helps keep them current with the season. Even displays of non-seasonal items should be changed because customers do not like to see the same thing on each visit. The change takes very little time, but it improves the appearance of the department and pays off in additional sales.
- 4 Keep displays clean and neat - This is a problem in many businesses, but all agree that good housekeeping is necessary.

Point-of-sale display advertising takes advantage of the customer's presence in the store. Plant displays so that they will act as silent salesmen.

Displaying Plants To Be Sold

The most practical way to display nursery stock or other plants to be sold is to arrange them in beds. This should be done whether the plants are under a lathhouse for shade or whether they are in the open. The beds should be rectangular in shape and not more than eight feet wide. A walkway adjoining the bed should be at least three feet wide. The plants in the beds should all be the same type. They are arranged according to size and the beds are covered to prevent drying out.

When arranging merchandise other than plants in the sales room, use the same principles involved in displaying plants. Small displays of similar items should be arranged. The customer should have access to these displays at all times. He should be encouraged to browse. Above all, these displays should be kept neat and stocked with merchandise.

1. What is the most rewarding type of advertising?
2. In most cases, what type of advertising will take up most of the advertising budget?
3. In what section of the newspaper will advertising do the most effective job?
4. What is the most important factor in direct mail advertising?
5. What three factors should be considered in selecting a method of advertising?

Information Sheet
on
ADVERTISING

Experience has shown that most salesmen get the most out of their advertising budget through point-of-purchase advertising, outside advertising, and special promotions

Point-of-Purchase Advertising consists of displays within the place of business. Items well displayed are half sold. Impulse buying results in millions of dollars' worth of sales annually as the growth of supermarkets shows. Good displays remind the customer of things he wants. If properly grouped they will often result in sales of related items. There should always be a tie-in with the various specialties and service sales programs and seasonal items should be displayed several weeks ahead of season.

The trend in modern retailing is increasingly toward self-service merchandising on a supermarket scale. People are naturally interested in products. If it is easy for them to satisfy their curiosity it will also be easy for them to buy. Farm businesses have always used bins, tri-plane tables, windows, counters, and peg boards to display items. Now however it is realized that these devices deserve to be the central theme in merchandising planning. Businesses who have tried self-service merchandising have been highly successful. Originality and ingenuity in displaying merchandise will be reflected in increased sales and profits.

Outside Advertising, in most cases, will take up the bulk of the advertising budget. It includes newspaper, radio, T V, handbills, direct mail, and road signs. The basic problem is selecting the most effective media to use. The medium that is selected must produce noticeable results in the cash register. Don't be satisfied with anything less.

In selecting the media, consider effectiveness, cost, and coverage. The salesman must have knowledge of all media, including their advantages and limitations.

Newspaper Advertising includes both the display and classified. When you prepare display ads, make sure that the layout is attractive and that the headline will arouse interest. Usually, the most successful advertising is done in the classified section. A skillfully prepared, personalized classified ad in the newspaper will get results because classified readers are a voluntary audience. Be sure to identify the business so there is no doubt who is doing the advertising. Many equipment dealers include in all their newspaper advertising a "Special for the Week". This is a promotion in which one item is featured at a special price. This takes very little space in an ad, and the results are gratifying.

Advertising
(Information Sheet continued)

Direct Mail Advertising can be directed toward a given group of prospects. The key is the mailing list. It must be up to date and broken down by specific groups interested in specific items. New names must be steadily added and old names dropped when mail pieces are returned undelivered. Salesmen should feed the list with names and addresses of new prospects and customers.

In a letter, postcard, leaflet, or sales flyer, personalize the message to the customer. Make the story as detailed as you wish because space is not a factor.

Radio and T. V. have some definite advantages. They convey fast, hard-hitting messages. T. V. is high in cost but has the advantage that a machine or plant can be demonstrated to the viewers. For both radio and T. V., the time of presentation is vitally important. It should be when a large percentage of the prospects may be listening or viewing; it should be tied into weather and news forecasts, or other home audience programs. Many businesses use spot announcements and obtain good results.

Road Signs on main roads leading to the store help in picking up transient business. Signs should be erected in a solo location and kept clean and well painted.

Many dealers have found handbills to be an effective, low-cost way to advertise promotions, and parts and service specials. A handbill must have an eye-catching layout and a timely, interesting message.

Special Promotions is an area of merchandising that is almost unlimited. Use the imagination and you will promote sales. In planning these slow-season specials, consider advertising through the newspaper, by direct mail, or with handbills. The purpose is not only to announce the special but also to use reduced pricing to get the customer to purchase immediately.

Again, these specials must be tied into promotional advertising and put on display to get attention. Even though a special event is held primarily to advertise whole goods, there is no reason why you can't advertise parts and accessories at the same time.

Plan your merchandising program so it will attract buyers. Make them come to your store. Include displays that will act as "sales clinchers". Finally, broaden your market with special promotions.

Advertising
(Information Sheet continued)

Selling Plants

We have discussed what is needed by the salesman in the way of personal knowledge of the product and his own personal ability to sell. These are just as important in selling plants as in any other field. In selling first of all, the customers must be induced to call upon you. This is commonly called "getting traffic".

Many methods have been used to "get traffic". Advertising is one of the best ways. Of course, advertising also takes many forms. One of the best ways of advertising to sell plants is by the use of attractive well-placed signs. They should be placed along the approaches to the sales yard. These signs should be kept in good repair and the paint job should be fresh. In some cases these signs may be landscaped themselves. Remember the principle involved in the use of signs is that too much information will not be helpful.

Another practice used by salesmen in nurseries or retail rooms where plants are sold is for the salesmen to be dressed in attractive uniforms.

Assignment Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Merchandising Horticultural Plants and Supplies

TOPIC Labeling and Pricing

OBJECTIVE. To learn how to effectively label and price horticultural plants and supplies.

INTRODUCTION: The very best of plant growing techniques and practices will not pay off unless items are properly labeled and priced. A short time studying this phase of merchandising could pay off in larger profits to the plant and supply businessman.

REFERENCES. Required:
Information Sheet, "Labeling and Pricing"

QUESTIONS
or
ACTIVITIES:

1. What is the common fault of most beginners when pricing plants?
2. What costs are involved in producing plants?
3. What percent mark-up do most nurserymen use?
4. What items will not sell at a high percentage mark-up?
5. Upon what is the percentage mark-up based?

Information Sheet
on
LABELING AND PRICING

All plants should be well-labeled so that the customer can tell what it is without asking questions. Tags of various shapes and sizes have been used for this. These are attached to the plants or plant containers by the use of small wires. When plants can be grouped together, the variety and size may be identified by the use of a single sign placed in a conspicuous spot. By all means, if possible, use color photographs on the labels. The price of the merchandise may also be placed on these descriptive labels.

When pricing plants and other merchandise for the first time, the beginner normally prices his plants too low. Much of the cost of production is hidden in the production of plants, transplanting, salesman's salary, unsold stock, shrinkage in volume, and overhead. These costs must be absorbed in the selling price.

There is no rule to follow in pricing nursery stock, but to understand the proper method of determining the mark-up on the plant will be helpful. The percentage mark-up is based on the selling price, not on the cost. For example, if an item costs the operator 75¢ and is sold for \$1.50, the mark-up would be 50% rather than 100%. This common misconception has caused many retailers to sell their plants too low. Normally, a mark-up of 50% on plants is too low. An average mark-up used by many retailers is 6 2/3%. However, high-priced merchandise will not sell at this high percentage. An example of this is that a \$1.00 item that costs only 30 or 40¢ will sell and a \$15.00 item will not sell if it is priced at \$30 or \$40.

UNIT Merchandising Horticultural Plants and Supplies

TOPIC Understanding the Customer and Making Sales

OBJECTIVE To understand customers and to increase sales of horticultural plants and supplies

INTRODUCTION Without a market for the final product, no business will succeed. Beautiful plants or excellent supplies are useless if they are not sold. Production and storing cost will become so great that the business will operate at a loss if the products are not bought and paid for by the customer.

Usually the amount of sales depends upon the salesman. Everyone working in a business should understand customers and know how to make sales.

QUESTIONS
or
ACTIVITIES

- 1 What is the first thing for a salesman to think about after losing a sale?
- 2 Which party should bring up the subject of financing?
- 3 Why do customers buy products?
- 4 Why should high pressure not be used in making sales?
- 5 What is the first problem of a salesman when dealing with a customer?

Information Sheet
on
UNDERSTANDING THE CUSTOMER AND MAKING SALES

We generally come in contact with two distinct types of customers. The first type is the customer who first has to be sold on the item or need for the product you are selling. He may be a potential buyer of a piece of equipment or a new and different type of fertilizer or a new and different service which your organization can perform for him.

The second type of a prospective customer differs from the first type in only one aspect, he has already decided he needs your type product. He may be undecided about buying your brand or buying a similar product from another salesman. In a case of this kind the customer must be sold on the superior features of your product. This can be done by pointing out a person in the area who is successfully using the product which you are selling. Seeing is believing.

The buying interests that cause customers to buy products are

1. Owner's comfort and convenience
2. Performance
3. Safety - This implies safety of the operator and protection of the equipment or product.
4. Appearance
5. Length of life
6. Economy - This implies saving time, money, and labor
7. Service
8. Prestige - This interest implies that a new owner is proud of his purchase.

Making the Approach to the Sale

Before a sale can be made, a plan has to be developed for getting the attention of the potential customer in point-of-purchase selling. This approach is not as difficult as it is in making a sale outside of the store. Farmers who come into your store are normally in search of a particular product; and if given the chance by a salesman with a pleasing personality, he will ask about the product he has in mind. If he comes in with no particular product in mind but just to browse, the salesman will need to make a sales approach if he hopes to make a sale.

A salesman should put first things first. His first problem is to get the attention of the customer. This is done in many ways and it is usually done at the same time the salesman is selling himself. It is not enough to say that the salesman must get a customer's attention, he must get his "favorable attention". A salesman who is friendly, alert, courteous, and has a confident approach to the customer will usually get his favorable attention immediately. However, his personality must be bolstered

Understanding the Customer and Making Sales
Information Sheet continued)

with a reasonably conservative and well-groomed appearance. This appearance should never be underestimated in getting the attention of the customer especially in the agricultural business. It is true appearance does not make the man but it does make that part of the man that the customer sees first. Many times this forms the total impression that the customer has of the salesman.

Enthusiasm plays a definite part in making a successful approach and sale. It has been said that enthusiasm is contagious. If the salesman displays the idea that he is "sold" on the product, this enthusiasm is likely to carry over to the customer.

The first few seconds of the sale are very important. In getting the attention of the customer, the salesman has only obtained his temporary interest. During these first few seconds the salesman in some way should reach the customer by indicating what the product can do for him. If this is done, the customer's attention or interest is aroused. You are then in a good position to hold his interest long enough to present your product.

Holding the customer's attention or interest can be done in several ways. Usually the best way is by doing something. This means showing the product or demonstrating the product to him. The customer's normal reaction is to look, to listen, and, if pleased with the product and presentation, to buy.

Making and Closing a Sale

Although most salesmen would like to close every sale, it isn't possible to get that high a batting average. After losing a sale though, a salesman should become concerned about the reason he failed. Some of the reasons for his failure to close may be found in this section on the do's and don'ts of closing sales.

Be Sincere

Make certain that statements and actions are sincere when dealing with prospects. If you make factual statements during your sales presentation, your customers will have confidence in your recommendations and will be more inclined to buy.

If you believe a customer is purchasing equipment or supplies that will not perform his job satisfactorily, you are obligated to tell him so. Part of your job as a salesman is to recommend to the customer the equipment that is matched to the job. Customer satisfaction will result from sincere opinions and efforts on your part in leading him to a wise and correct buying decision. He will gain confidence in what you say only if you are sincere.

Understanding the Customer and Making Sales (Information Sheet continued)

Don't High Pressure

People object to being pressured into buying. They like to believe that they make up their own minds. Closing a sale without using high pressure tactics is one of the greatest challenges of salesmanship.

It is easy to fall into the habit of speaking quickly, concentrating on key points, and then attempting to force the prospect to make up his mind. There is such a note of urgency in presentations of this type that the prospect feels he is being high-pressured into something he is not sure about. His natural reaction is to feel that something is wrong or that he should be cautious.

Most people will buy when the salesman has convinced them sufficiently that the product will fill their needs. The prospect must be led to believe that the decision is entirely his own. The skilled salesman implants his ideas carefully. He presents his proposition in such a way as to give the impression that he is helping the prospect solve his problems.

Sell When the Customer is Ready to Buy

In any favorable sales presentation, there are certain times when it is logical to obtain the order. Experience indicates that there are certain times when an opportunity to close seems to present itself naturally. One of these times is the point when the salesman and the prospect have reached substantial agreement and the prospect appears to be reasonably satisfied with the product. At this time a "psychological moment" exists and the salesman should ask for the order.

Don't Oversell

Many salesmen have talked themselves out of an order because they continued to sell after the prospect has decided to buy. Many times silence is the best tool.

Certain questions or reactions will indicate that the prospect is seriously considering the proposal. These indications are signals for the salesman to try to close regardless of when they occur in the sales presentation. Here are some typical indications that the prospect is ready to buy.

Understanding the Customer and Making Sales

(Information Sheet continued;

- 1 Favorable response to the reasons given for buying now
- 2 Favorable attitude toward the benefits described on a special trade allowance that is about to expire
- 3 When he asks "Is this the best price you can give me?" or "Do you have a machine already set up and ready to go?" or "Can you supply this product in a large enough quantity?"

Recognizing these and similar indications and answering to the prospect's satisfaction may induce him to buy. Don't be so absorbed in the sales presentation that you miss buying signals. Remember, many a salesman has lost an order because he didn't know when to stop presenting features and ask for the order.

Be Honest About All of Your Commitments

The surest and quickest way to lose a sale is to misrepresent the facts. You can make this mistake without being conscious of doing so. For this reason, you need to have a thorough knowledge of both your product and your competitor's product so that the possibility of error or misrepresentation will be reduced to a minimum.

If you come to points in your feature-by-feature selling and the customer asks you a direct question to which you do not know the answer, don't bluff your way through. Bluffing will kill any confidence he may have in you regardless of how superior your product may be. The proper thing to do is to be perfectly frank with your prospect. Tell him that you are not too sure about the information he is requesting, but that you will obtain it for him immediately. Make sure you answer the prospect's questions as soon as possible. The answer can skillfully be used as a reason for calling back on a customer who is offering stiff sales resistance.

Don't let a question keep you from continuing your feature-by-feature selling.

Be Persistent

Many sales have been lost because the salesman was not persistent. Sales Management magazine, March 2, 1962, in an article entitled, "Giving Up Too Quickly", states

- 1 Almost half of all salesmen - 48 percent - quit cold after a single call on a prospect
- 2 Another 20 percent make two calls before quitting
- 3 Seven percent make three, and five percent make four calls
- 4 The remaining 20 percent make five calls or more, and these are the men who get from 75 percent to 80 percent of the business

Understanding the Customer and Making Sales Information Sheet continued

This same article points out that. "Discouragement is a luxury no salesman can afford "

It is necessary to qualify each prospect and "sense" in your own mind how near you are to closing the sale. If you feel an individual is going to buy, stay with him until you sell him. Many sales are lost because the salesman quits too soon. Customers admire a salesman who has developed a degree of persistence. Persistence quite often wears down resistance. Persistent salesmen make it easier for customers to buy.

Don't Sell Price Sell Benefits and Advantages

A dangerous practice that many salesmen fall into is trying to arouse interest by overstressing price. The weak salesman will quote price, argue price, and cut price at the drop of a hat. What he fails to realize is that many customers are interested only in a fair price and that more times than not they are more concerned with quality and service than price.

Your job is to convince your prospects of the true value of your product. People will buy the most expensive items if they are convinced that they will receive their money's worth. If you sell a high quality product that is priced higher than that of competition, take every opportunity to describe the features in a way that justifies the higher price. Sell the benefits that make your product worth its price.

Make It Easy for Prospects to Buy

There are many things you can do during the selling process that will make it easy for the prospect to buy. You should practice all of them while making a sales presentation. A few methods of making it easy for the prospect to buy are

- 1 Know your product so that you are not required to secure additional information. The lack of product information may cause you to make an extra trip to see the prospect. By that time, he may be out of the mood to buy.
- 2 Know your prospect so that you can fill his needs and anticipate the sales resistance you think he might bring up during your sales story.
- 3 Offer available financing. Do not make him ask for financing arrangements. In addition, offer him a payment schedule that is possible for him to complete.

Understanding the Customer and Making Sales
information Sheet continued)

4. Summarize all agreements of the sale with him so that there will be no misunderstanding on the part of either you or the buyer.
5. Lead the prospect to a decision or an agreement at every opportunity. Many prospects need assistance in making a decision. you can guide them into making a decision in your favor.
6. Stay with your equipment and the prospect while demonstrating to make certain the equipment is working properly. You can answer any questions he might have while using it. It is important when making a demonstration to have the prospect operate the equipment as soon as possible. Let him operate it and he will soon feel that the equipment is his or that he would have a difficult time getting along without it.
7. Make sure that you always have order forms, finance charts, literature, and other pertinent facts that you will need to close the sale.
8. Be ready to close at any time during your sales presentation.

There are many more techniques that make it easy for the prospect to buy. Avoid statements, questions, or procedures that make it difficult for him to buy.

 Fig Trees Sansevieria
 Iris Geraniums
2. Dormant season
3. They get too big for their space or they become weakened due to competition.
4. Divide in autumn or early spring when plants are dormant.
5. Divide with a hand fork, knife, or hatchet, if clumps are large. Some can be soaked in water to loosen dirt from around roots. Pull apart and cut old leaves back about 1/2 and be careful with young growth

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Plant Propagation

TOPIC Propagation by Grafting and Budding

- 1 Stock is the name for the plant on which you graft The scion is the picce of stem which is grafted to the stock and becomes the new plant
- 2 It is the soft layer of tissue on a stem or root that lies between the bark and the wood
- 3 Any time during the growing season
Usually it is more satisfactory if done before buds begin to swell in late winter or early spring
4. A sharp knife makes a clean slice, thereby insuring maximum contact of cambium layers.
- 5 "T" budding and Patch-budding

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Plant Propagation

TOPIC Propagation From Seed

1. From commercial producers of seeds
2. It must be finely screened, porous, loose, and have a good water-holding capacity
Also, it should be sterilized and in most cases low in nutrients.
3. In most cases 70°F
4. The seed will rot
5. 50-60°
6. To reduce damping off
7.
 - a. Name of plant or variety
 - b. Date seeded
 - c. Student's name
 - d. Special treatment, if any

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Propagation

TOPIC: Developing A Plant Breeding Vocabulary

1. Emasculation
2. A flower having both stamen and pistil
3. Stigma
Style
Ovary
4. Ovary
5. F_1 , F_2 , etc
6. Anther
7. Yes
8. Style
9. Ask the student what he has learned about D. N. A (desoxyribonucleic acid)

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Plant Propagation

TOPIC: Plant Selection and Fundamentals of Plant Breeding

1. The process that occurs in nature whereby strong and well-adapted plants survive while weak and poorly adapted plants eventually die out.
2. Asexually and sexually
3. Flower
4. Stamen
5. Staminate flowers
6. Pollination is the transfer of pollen. Fertilization is the union of the germ cells. In other words, pollination is the trip over and fertilization is the actual joining of the male and female germ cells

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Propagation

TOPIC: Heredity

1. Dominant
2. Cross-pollination
3. One
4. No
5. When a self-pollinated plant produces plants unlike itself

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Plant Propagation

TOPIC: General Breeding Techniques

- 1 List of equipment.
Magnifying glass (10 or 15 power)
Tweezers
Small sharp-pointed scissors
Camel-hair brush
Small containers or vials
Tags
Alcohol
Rubber bands
Soft wire
Paper or cellophane bags
Paper clips
Notebook
2. Just before the flower opens
- 3 Morning. as it is cooler
4. Stamens must be removed
- 5 Steps in labeling
Write:
 - a. The number that you have assigned or the variety name of the seed parent.
 - b The letter X.
 - c. The number or variety name of the pollen parent.
 - d. The date the cross was made.Example on page 19 of reference

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Nursery Plant Production

TOPIC: Transplanting Ornamental Trees and Shrubs

1. As soon as they begin to arrive at the nurseries or in late fall or early winter
2. It should be at least one to two feet wider and at least six inches to a foot deeper than the roots of the plant
3. One-third
4. Balled and burlapped
5. One which is over five inches in diameter

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Nursery Plant Production

TOPIC: Care and Maintenance of Plants

- 1 If you have no good reason for pruning a plant, put the tools away without using them
- 2 High quality, sharp, and well adapted to the job on hand
- 3 At any time
- 4 Growth habit and blooming characteristics of the plant
- 5 About one-third
- 6 To tidy up their appearance, to control size and to improve their health, growth habits, and blooms
- 7 They should be pruned between leaf drop and first spring growth.
- 8 After they flower
- 9 After they flower
- 10 A flat top hedge is more difficult to maintain and clip and is more easily broken down by weather and other causes

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Floral Crop Production

TOPIC: Introduction to Floral Crop Production

1. Flowers cannot be stored for long periods of time.
2. a. Chrysanthemum
b. Rose
c. Carnation
3. Directly from the producer
4. "Say it with flowers."
5. Southern Florist and Nurseryman

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Floral Crop Production

TOPIC. Growing Annuals

1. Summer
2. Alyssum
3. a. Marigold
b. Nasturtium
c. Zinnia
4. Water annuals enough to keep the roots from drying out, but do not "drown" them.
5. Pulled up and thrown away
6. Summer
7. No
8. Fiery red
9. Rock gardens, banks
10. Often subject to wilt

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Floral Crop Production

TOPIC: Perennials

1. Chrysanthemum
2. Corsages
3. Every two years
4. Cut them back after spring bloom and give them a feeding.
5. About every twenty years

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Floral Crop Production

TOPIC: Poinsettias

1. Nitrogen
2. Red, white, and pink
3. White Fly
4. Lack of nitrogen or lack of water
5. Poorly aerated soil

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Floral Crop Production

TOPIC: Chrysanthemums

1. Fall
2. Aphids
3. 60° (Some varieties need 65°.)
4. Yellow
5. To make a short day which helps regulate blooming
6. All pinches must be made into the soft growth, usually 7 days after planting.
7. A slow start, often trouble with rotting of cutting
8. They should be sprayed overhead lightly the first 3 or 4 days.
9. Entire year with proper day length control
10. Sterilized

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Geraniums

- 1 They are poor shippers and will lose foliage.
- 2 Pinched
- 3 Red
- 4 Plastic tube system
- 5
 - a Use a fungicide on cutting
 - b Sterilize propagating materials
 - c Use disease-free cuttings
 - d Sterilize soil
- 6 Light pink
- 7 60 degrees night. 65-70 degrees day
- 8 Air freight
- 9 Four inch
- 10 The seed for most desirable varieties has not been available.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Floral Crop Production

TOPIC Hydrangeas

- 1 Two spotted mite (red spiders)
- 2 Wilt severely
- 3 March to May
- 4 Easter. Mother's Day
5. Bud rot

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Establishing and Caring for Lawns

TOPIC Turf Grasses for Texas

- 1 Geographic location the amount of water available for irrigation, the degree of shade present the time and money the home owner is willing to spend for establishment and the expected usage
- 2 Warm-season and cool-season
- 3
 - a Does not grow in shade
 - b Turns brown after frost in the fall
 - c Is more of a nuisance than other turf grasses
- 4
 - a Is susceptible to certain diseases
 - b Is more susceptible to iron chlorosis
 - c Is attacked by insects
 - d Needs more water for survival
 - e Will not survive at as low temperatures as will Bermuda
 - f Is a broad-leaved coarse-textured plant
- 5
 - a Is attractive and wear-resistant
 - b Is not invaded by weeds
 - c Is subject to little damage from insects and diseases

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Establishing and Caring for Lawns

TOPIC: Establishing a New Turf

1. Preparation of the soil, establishment of the grass, care and maintenance.
2. Peat, compost, gin trash, sawdust, and leaf mold.
3. Fertilizer applications should be made at rates and in combinations suggested by soil tests.
4. The type of grass used and the rapidity of cover desired.
5. In order to develop a deep root system.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Establishing and Caring for Lawns

TOPIC: Managing an Established Turf

1. Feeding, watering, aerating, and moving
2. It produces vegetative growth and gives the plant a deep green color.
3. It stimulates development of a good root system.
4. Stunted growth of the entire plant. The leaves are relatively small, thin, and yellowish-green to yellow. They show yellow to brown color at the tip of the leaf and down to the midrib.
5. Slow growth of the entire plant leaves are an unhealthy dark green, roots are stunted.
6. Pale, bleached leaves
7. Spring and early fall
8. Applying iron sulfate or iron chelate
9. Produce shallow, weak root systems, which does not allow efficient utilization of plant food or moisture in the soil.
10. It allows air or oxygen to get into the soil, water to move into and through the soil, and the soil to hold more water.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Establishing and Caring for Lawns

TOPIC: Turf Problems

1. a. Weed
b. Disease and insect control
c. Clover in the turf
d. Renovation of old lawns
2. By proper turf grass management
3. 2-4-D
4. Brownpatch occurs as irregularly shaped brown areas, usually circular, 4 to 48 inches in diameter. The fungus gives the grass a blue, water-soaked appearance. As the disease spreads, the dark areas turn light brown.
5. A fungicide containing PCNB
6. a. Chlordane
b. Dieldrin
c. D. D. T
d. Toxaphene
e. Malathion
f. Aldrin
g. Heptachlor
h. Lindane
7. When the old turf is run down, weedy, and in a generally undesirable condition, or when a new species is to be introduced.
8. a. Chlordane
b. Lindane
c. Sulfur
d. Toxaphene
9. a. Diazinon
b. Ethion
c. Trithion
10. Five gallons of spray mixture per 100 square feet of lawn area.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Causes of Plant Diseases

1. a. Fungi
b. Bacteria
c. Viruses
d. Nematodes
2. The manufacture of sugars from carbon dioxide and water with the aid of sunlight and chlorophyll
3. An agent that transmits disease-producing organisms.
4. Prevention by careful pruning
5. Tiny, thread-like plants, commonly called molds.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Identifying Plant Diseases

1. Proper identification.
2. Failure to produce seed or fruit.
3. Liquid discharge from diseased tissues.
4. Microscopic examination of roots.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Application and Safety Precautions of Horticultural Chemicals

1. Welfare of the people
2. Welfare of the plant
3. Effectiveness of the material in controlling the pest or disease
4. Hydraulic sprayers
5. Hang the hose on a rack with nozzle pointing upwards
6.
 - a. Read label precautions
 - b. Keep chemicals locked up when not in use.
 - c. Keep children away while using.
 - d. Don't smoke while spraying.
 - e. Don't spill material on skin or clothing.
 - f. Wash exposed areas of skin immediately after job is completed.
 - g. Never spray when windy.
 - h. Spray edible plants with great caution.
7. The chemical must touch the insect before death occurs.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT. Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC. Controlling Leaf Diseases

- 1 Water and fertilize properly and remove dead limbs
- 2 Caused by fungi which live on secretions from aphids and immature stages of white fly
- 3 Caused by excess rain or over watering
- 4 a Malathion
b Lindane
- 5 Just before buds open and after flowering
- 6 Two to four weeks or as needed
- 7 Most often caused by lack of iron
8. Fungus disease

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Stem, Branch, and Trunk Diseases

1. Prune infected portions sterilizing shears between each cut.
2. If little dodder is present, remove by hand. Destroy badly infected plants.
3. Reduces the amount of sunlight for trees
4. Twigs and limbs
5. Fungi
6. Install in the infected parts of tree to drain the excess fluid and relieve pressure.
7. By birds
8. Fungi and algae

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Root Diseases

1. Carbon bisulfide soil fumigation
2. Methyl bromide soil fumigation
3. Removing and destroying diseased roots
4. Ten (10) feet
5. East and southeast Texas
6. 75-95 degrees

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Diseases Affecting the Entire Plant

1. Symptoms exhibited by aster yellows that are not exhibited by verticillium wilt:
 - a. Bushy with numerous secondary shoots
 - b. Leaves may develop a slightly reddish, brownish, or purplish tinge in later stages.
 - c. Flower parts may develop into leafy structures.
2. DDT
3. Chloropicrin
4. West
5. Commercial growers or trained personnel
6. Miticide
7. Zineb, CM-19

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Lawn and Turf Diseases

1. Handpick and destroy mushrooms or toadstools.
2. Iron sulfate or iron chelate
3. Irregular-shaped dead areas from a few inches to more than several feet in diameter
4. Wash off with water applied as a spray with 20 to 30# pressure.
5. Zineb, Captan
6. One to two weeks before disease usually appears and a second application after disease appears. Then apply as needed.
7. Apply chemicals as needed in early stages of disease.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Identifying Plant and Soil Insects and Methods of Control

1. Slugs have no shells
2. Spring
3. Spray before eggs hatch and prune
4. Roots
5. Sandy soils

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Nematodes

1.
 - a. Select a plant that is partly alive.
 - b. Dig the plant instead of pulling it.
 - c. Wash the soil from the roots and allow a few minutes for drying.
 - d. Place the specimen in a polyethylene container and tie it securely.
 - e. Fill out form D-418, available from your county extension agent.
 - f. Place bag and D-418 in a box and send it to the research center.
2. Root knot nematode
3. Before spending a large amount of money for chemicals, determine if nematodes are causing a significant amount of damage to justify the expense and labor.
4.
 - a. Crown gall
 - b. Nodules from nitrogen fixation
5. Tomato, okra

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Control of Moles, Gophers, Birds, Deer, and Ants

1. By conical mounds of dirt pushed up from their main run
2. Baiting and trapping
3. Serious injury might occur to small children or dogs.
4. Gophers open their tunnels, moles do not.
5. Place chicken wire at the bottom and sides of planting holes.
6. Starlings.
7. Portable bird protectors made of scrap lumber, chicken wire, or cheesecloth.
8. Fencing

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Controlling Plant Insects, Plant Diseases, and Other Pests

TOPIC: Controlling Weeds

1. Water should be applied.
2. Hoe
3. Ice pick or screwdriver
4. Shrubs form a shade in which weeds do not thrive.
5. Apply organic mulch two to three inches deep.
6. Wear gloves.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Principles Used to Prevent Personal Injury

1. Legs
2. One pulley only changes direction of force.
3. Jack
4. Wet the soil 4 to 5 days before digging.
5. Hook a 1/2" pipe onto a hose and beat the bottom end into a flattened or pointed opening. This will enable you to stick the pipe down into the hole where the force of the water through the small opening will loosen the soil

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Selection and Maintenance of Horticultural Hand Tools

1. Tools are very personal pieces of equipment and all experienced gardeners have their favorites.
2. Scoop
3. 6"
4. Sharpen the hoe each time you take it into the garden.
5. Scuffle hoe
6. a. Fan-shaped
b. Rectangular

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Maintaining Small Power Equipment

1. a. Periodic equipment inspection to discover situations which may lead to equipment breakdown
b. Upkeep to minimize wear or to remedy potential trouble
2. Make an overall check and properly service equipment.
3. Water condenses more rapidly in a partially filled tank.
4. Gasoline or other solvents
5. Tension and wear

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Operating and Maintaining Lawn Mowers Safely and Effectively

1. a. Reel
b. Rotary
c. Sickle bar
2. Mowing too close
3. Disconnect the spark plug wire so that a spark cannot jump
4. Cutter bar and knife
5. The clippings will smother the grass
6. Leaves produce food for the plant. If leaves are cut too short, the health and vigor of the lawn will be greatly reduced.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Operating and Maintaining Horticultural Equipment

TOPIC: Operating Rotary Tillers Safely and Effectively

- 1 a Front tine
b Rear tine
- 2 Front tine
- 3 Rotation of the tine
- 4 Raise the depth bar
- 5 Check to make sure that all clutches and belt tension pulleys are disengaged

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Operating and Maintaining Horticultural Equipment

TOPIC Operating Garden Tractors Safely and Effectively

- 1 The tractor must have enough horsepower to operate the power sickle bar
- 2 3 1/2 - 10 horsepower
- 3 Below the rear axle level
- 4 Riding lawn mowers are designed only for mowing Small tractors are designed for several types of attachments
- 5
 - a Automotive
 - b Belt type

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Developing and Maintaining the Landscape

TOPIC Introduction to Home Landscaping

1.
 - a Art
 - b Engineering
 - c Horticulture

2.
 - a Homeowners who purchase subdivision or housing development homes
 - b Families who buy new homes already designed and constructed with no specific client in mind
 - c Families who purchase a lot, have their home especially planned and constructed for them on the lot
 - d Families who now live in older homes and desire to remodel or redesign their gardens

3. They do not fit into our mechanized way of living

4. Climate varies

5. The cost is included in the price of plants

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Selecting the Site

1. General location
2. Zoning prevents businesses from moving into a residential section.
3. No
4.
 - a. Privacy is difficult
 - b. Require installation of additional utilities, walks, and drives.
 - c. Outdoor space is limited.
 - d. More noise from traffic
5.
 - a. Drives and sidewalks are too steep.
 - b. Lawn is more difficult to keep
6. South. Sunlight can be better controlled

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Scheduling Landscape Development and Beginning Plans

1. A well-planned garden is one that is livable, interesting, beautiful, easy to maintain, and where relationships between outdoor and indoor areas are coordinated properly.
2. Drives and walks
3. Trees are essential for shade in Texas.
4. Provide privacy and assist in temperature control
5. a. There must be a program for site and landscape development.
b. There must be a plan.
6. A piece of real estate which may be merely a lot or one with a home on it.

HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Analyzing Problems and Determining Needs

1.
 - a. Suitability
 - b. Function
 - c. Economy
 - d. Beauty
2. Deciding and analyzing specific problems of a chosen site
3.
 - a. Do you prefer them to be beautiful and pleasant?
 - b. Do you want them to make you feel comfortable?
 - c. Do you care whether they fit together well and serve their purpose?
4.
 - a. Space
 - b. Garden development
 - c. Maintenance
5.
 - a. Individual taste
 - b. Past environment
6. No. It is even hard for professionals.

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT Developing and Maintaining the Landscape

TOPIC Developing the Landscape Plan

- 1 Before the property is purchased
- 2 1 inch equals 10 feet
- 3
 - a Entrance
 - b General living area
 - c Work space
 - d Place for private living
- 4 General living area
- 5 Bedroom area
- 6
 - a Formal
 - b Informal

Answer Sheet
for
HORTICULTURAL OCCUPATIONS

UNIT: Developing and Maintaining the Landscape

TOPIC: Selecting Plants

1. 12-25 feet
2. 6-8 feet
3. Dwarf shrubs
4. The roots may clog drain pipes.
5. Broadleaf evergreen
6.
 - a. Watering
 - b. Mowing
 - c. Edging
 - d. Clipping
 - e. Weeding
 - f. Fertilizing
 - g. Controlling insects
7.
 - a. Privets
 - b. Arborvitae

Answer Sheet

INTRODUCTION

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks.

1. _____ is the study of plants.
2. There are over _____ kinds of plants found in the world.
3. _____ and _____ are carbohydrates.
4. Van Helmont did an experiment to determine what made plants grow. His conclusion was that _____ alone produced growth.
5. Plants differ from animals in that they produce food from _____ and _____.

Topic Test
on
PHOTOSYNTHESIS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. _____ is the process by which liquids and gases move from an area of high concentration to an area of low concentration.
2. _____ means light.
3. All substances are made up of _____.
4. Photosynthesis requires four components. They are _____,
_____, _____, and _____.
5. When atoms are combined, we call them a _____.

Topic Test
on
RESPIRATION

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. Raw materials for respiration are _____ and _____.
2. Energy is _____ during photosynthesis.
3. Respiration _____ dry weight. (increases or decreases)
4. Plants release _____ at night. (what gas?)
5. _____ is the release of chemical energy.

Student: _____ School: _____

Date: _____ Score: _____

PART I: Fill in the blanks:

1. _____ handles the ventilation problem in greenhouses with no ventilators.
2. The _____ is the season for repairing greenhouse coverings.
3. It is necessary to provide a good means of exchanging the greenhouse air with outdoor air in order to regulate the greenhouse temperature. Adjust the _____, provide air movement around the plants, and introduce new supplies of _____ and carbon dioxide.

PART II True or False

- _____ 1. Vinyl film is more durable than polyethylene.
- _____ 2. The exterior of a greenhouse does not need to be painted more often than seven years.
- _____ 3. Film plastic eliminates the problem of dripping water in the greenhouse.

Topic Test
on
SIZE AND ARRANGEMENT OF GREENHOUSES

Student. _____ School: _____

Date. _____ Score _____

True or False.

- _____ 1 The depth of a bench for cut flowers needs to be at least twelve inches
- _____ 2 The best height for pot plant benches is 2-1/2 feet
- _____ 3 Before the type of greenhouse is chosen and built, a careful study should be made of the best bench arrangement for the crops to be grown.
- _____ 4. Wood contracts when it is wet; so boards must be fitted close together when making wooden benches
- _____ 5 One of the best bench making materials for drainage and air circulation is one inch by one inch welded wire fabric.

Topic Test
on
COOLING THE GREENHOUSE

Student: _____ School: _____

Date _____ Score: _____

Problems.

- 1 If a greenhouse was 100 feet long and 40 feet wide, how many square feet would it contain? _____ (answer)
- 2 How many CFM would need to be exhausted for a greenhouse containing 1000 square feet? _____ (answer)
- 3 How many square feet of padded area will be needed in a greenhouse that requires 7500 CFM to be exhausted? _____ (answer)

Work here

Topic Test
on
HEATING THE GREENHOUSE

Student: _____ School: _____

Date: _____ Score: _____

True or False

- _____ 1 In vertical blow heaters the shaft is vertical and the fan blade is horizontal.
- _____ 2. Direct-fired units are those which contain a combustion unit right in the unit itself
- _____ 3. In recent years the use of unit heaters for heating greenhouses has decreased considerably.
- _____ 4 The oldest and most conventional heating system is the pipe coil.
- _____ 5 The coldest spots in the greenhouse are the exterior side walls and gable ends.

Topic Test
on
WINTER PROTECTION STRUCTURES

Student. _____ School: _____

Date. _____ Score: _____

Fill in the blanks:

- 1 _____ gardens often have definite thermal belts and arctic regions.
- 2 The most dangerous spots for frost damage are stretches of open ground exposed on all sides, particularly to the _____ sky.
- 3 Regardless of what kind of shelter you use, keep soil _____ around plants.
- 4 _____ soil holds and releases more heat than _____ soil.
- 5 _____, made of double strength glass and available in several sizes, are set side-by-side to protect large areas.

Topic Test
on
STRUCTURES FOR SUMMER HEAT PROTECTION

Student _____ School, _____

Date: _____ Score: _____

Fill in the blanks:

1. A lath sunscreen should be placed so the laths run in a _____ and _____ direction.
2. If you like to grow _____ loving flowers such as tuberous begonias and cyclamens, you may want a permanent display structure.
3. From sunrise to _____ o'clock in the morning there is very little heat accumulation.
4. The subject of _____ in the garden is frequently ignored or misunderstood -- particularly by the beginner.
5. A structure facing an _____ direction is ideal, especially if you live in a hot summer area.

Topic Test
on
HUMIDITY AND WATERING

Student _____ School _____

Date _____ Score _____

True or False

- _____ 1. The majority of bedding plants are hand watered.
- _____ 2. There is no equipment available for the purpose of watering pot plants
- _____ 3. Watering of greenhouse cut flower crops by mechanical means is a well-established, proven practice .
- _____ 4. Rainbird-type nozzle systems consist of long lines of pipe with holes drilled in each end
- _____ 5. Most growers use pipe systems for watering bedding plants

Topic Test
on
VENTILATION

Student _____ School: _____

Date: _____ Score: _____

True or False:

- _____ 1 The disadvantage of using humidistats to control fans is that the problem of excessive humidity becomes greater.
- _____ 2 Thermostatically-controlled systems respond quickly to changing outdoor temperatures.
- _____ The thermostat controlling the first stage fans should be set several degrees above the setting of the heating thermostat.
- _____ 4 Motorized roof ventilators can be controlled automatically.
- _____ 5 Exhaust fans in cooling systems may be used during the winter months if a convection tube is attached.

Topic Test
on
LIGHTING

Student: _____ School: _____

Date: _____ Score: _____

True or False:

- _____ 1. Certain kinds of seed require light in order to germinate.
- _____ 2. Plants are classified into two groups in regard to light intensity, low-energy and high energy.
- _____ 3. Long day plants require from 8 to 12 hours of light per day.
- _____ 4. Research studies show that plants utilize chiefly three different wave length regions of radiant energy, the green, orange, and yellow.
- _____ 5. White light is a mixture of all colors but white light of incandescent lamp is rich in red.

Topic Test
on
WIRING AND ELECTRICAL CONTROLS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. The basic requirements of any well-planned wiring system are that it shall be _____, _____, _____, and efficient.
2. Only the first requirement, _____, will be achieved by compliance with the National Electric Code. The others depend on careful planning.
3. General lighting circuits should have a maximum of _____ outlets per circuit.
4. Provide individual circuits for motors _____ horsepower and larger.
5. Minimum wire size for general purpose circuits should be _____ with 15 ampere protection.

Topic Test
on
ORIGIN, COMPOSITION, AND IMPORTANCE OF SOILS

Student: _____ School: _____

Date: _____ Score: _____

PART I: Fill in the blanks:

1. The largest of the soil particles is _____.
2. Decayed plants and animal material is called _____.
3. _____ and _____ determine the rate of soil formation.
4. Clay feels like _____ rubbed between the fingers.
5. The difference in texture of soils is caused by the different sizes of soil _____.

PART II: List:

1. Three (3) layers of soil from top to bottom:
 - a. _____
 - b. _____
 - c. _____
2. Three (3) factors that are responsible for differences in soil color:
 - a. _____
 - b. _____
 - c. _____

Topic Test
on
SOIL MOISTURE

Student: _____ School: _____

Date: _____ Score: _____

PART I: Fill in the blanks:

1. Moisture moves through the soil in all directions, even against gravity by _____ movement.
2. In _____ textured soils, the particles are closer together and the attraction between soil and water is greater.
3. Much soil moisture can be lost when capillary water moves to the surface and _____.
4. All living cells carry on _____.
5. Movement of air through the soil is called _____.

PART II: Check T for true or F for false:

 T F

1. Soils should be worked while in a wet condition.
2. It is possible to change water-holding capacity of soil.
3. Underwatering causes decreased aeration.
4. Sandy soils require more frequent watering than heavy clay soils.
5. Oxygen must be present for respiration to occur.

Topic Test
on
SOIL MIXTURES

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks.

- 1 _____ soils are a mixture of sand, silt, and clay
- 2 _____ increases aeration of soil.
- 3 Loam soils become _____ after watering
- 4 For large scale mixing operations, use a power driven cement mixer or _____
5. Loam soils often _____ after drying.

List.

6. The characteristics of a good mixture.

- a _____
- b. _____
- c _____
- d _____
- e _____
- f _____
- g. _____
- h _____

Topic Test
on
MULCHES AND THEIR USE

Student _____ School _____

Date _____ Score _____

PART I. Fill in the blanks:

- 1 The most common mulch is _____
- 2 The time to apply mulch to the garden on established plants is in _____.
- 3 Additional _____ should be applied to a crushed corncob mulch
- 4 _____ may be produced during decomposition of lawn clippings
- 5 A light spray of _____ may be used by contractors to hold soil in place on steep slopes

PART II Multiple choice

- _____ 1 The cost of this material is usually prohibitive when large areas are mulched.
a. crushed corncob b. peat moss c. wood chips
- _____ 2 This material should not be used in areas where a cigarette may be dropped
a. corncobs b. asphalt c. straw
- _____ 3 Any mulch should be at least this deep
a. 1/4" - 1/2" b. 1" - 2" c. 2"-3"

Topic Test
on
FERTILIZER NUTRIENTS

Student _____ School _____

Date _____ Score _____

Fill in the blanks.

- 1 _____ is responsible for the dark green color in plants
- 2 The two lime elements are _____ and magnesium
- 3 Do not apply dry fertilizer to plants when the foliage is _____.
- 4 Place fertilizer _____ and to the side of the seed
- 5 Dry fertilizer can be _____ (how applied) over the soil surface by means of a spreader

List

- 1 Three primary elements
 - a _____
 - b _____
 - c _____
- 2 Three secondary elements
 - a. _____
 - b _____
 - c _____

Topic Test
on
SOIL ORGANISMS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. _____ converts nitrogen in the air to available plant nitrogen.
2. Moisture, lime, and _____ can be added to the soil to stimulate soil organisms
3. _____ feed on soil bacteria and contribute to organic content of the soil.
4. _____ decompose organic residues and promote formation of humus.
5. The _____ mixes soil and increases aeration. Also it promotes drainage

List:

6. Three ways to control harmful soil organisms:

- a. _____
- b. _____
- c. _____

Topic Test
on
SOIL STERILIZATION

Student: _____ School: _____

Date: _____ Score: _____

PART I: Fill in the blanks:

1. _____ sterilization is cheaper than using chemicals.
2. Ethylene di-bromide is especially effective against _____.
3. No plants should be planted into a fumigant-treated soil for a period of _____ to _____ weeks.
4. Ammonia build-up in the soil may cause _____.
5. Nematodes are killed _____ when exposed to 140° F. steam heat.

PART II: List:

1. Reasons for sterilizing soils:
 - a. _____
 - b. _____
 - c. _____
 - d. _____
2. Three precautions to observe when using fumigants:
 - a. _____
 - b. _____
 - c. _____

Topic Test
on
PLANT GROWING MEDIA OTHER THAN SOIL

Student _____ School _____
Date _____ Score _____

Fill in the blanks.

- 1 _____ is the most widely used medium for reproduction of plants
2. Sphagnum will retain _____ to _____ times its own weight in water
- 3 _____ expands or explodes when heated
- 4 Shredded bark, sawdust, and wood shavings are most commonly used in the _____ part of the United States
- 5 When sawdust is used, _____ must be added to the medium.
- 6 Brown to black peat contains approximately 1% _____
- 7 _____ results from decayed remains of thick vegetation in swampy condition

Topic Test
on
INTRODUCTION TO PROPAGATION

Student: _____ School: _____

Date: _____ Score: _____

PART I: Fill in the blanks:

1. Two methods by which plants may be propagated are _____, and _____
2. Three requirements of the ideal plant propagation structure are _____,
_____ and _____.
3. _____ is used for chemical sterilization of soil.
4. A good propagation media should be free of _____,
and _____.
5. Many types of containers are used in plant propagation such as _____
_____ and _____.

PART II: Place a check under T for true or under F for false for each of the following statements:

 T F

- 1 If soil is used, sterilization is a must.
2. Many plant propagators use a plant hormone to promote rooting of seeds.
3. Seed reproduction in plants is basically a sexual process

Topic Test
on
PROPAGATION FROM CUTTINGS

Student _____ School _____

Date _____ Score _____

PART I Place a check under T for true or under F for false for each of the following statements

T F

- _____ 1. Many types and varieties of plants will not produce the same quality and type of plant from seed and must be reproduced by cutting, budding, or grafting
- _____ 2. Cuttings are more difficult to make than budding
- _____ 3. Cuttings are classified and named according to the part of the plant from which they come
- _____ 4. Herbaceous cuttings are made from plant materials which are hard
- _____ 5. Low humidity is necessary for rooting cuttings

PART II Fill in the following blanks to make complete true statements

- 1 The temperature of the rooting medium should be close to _____
- 2 Three requirements of a good rooting medium are
- a _____
- b _____
- c _____
- 3 Cuttings are ready to transplant when roots are _____
- 4 Softwood cuttings are made (when) _____
- 5 During rooting the medium must be kept uniformly moist but never _____

Topic Test
on
PROPAGATION BY LAYERING

Student: _____ School: _____

Date: _____ Score: _____

PART I: Place a check under T for true and under F for false in each of the following statements:

- _____ 1. The production of a new plant by layering is one of the slowest methods.
- _____ 2. Air layering is an excellent way to produce plants which do not come true from seed.
- _____ 3. Air layering is best practiced during the spring and summer months.
- _____ 4. A growth hormone may help to stimulate root growth.
- _____ 5. Under ideal conditions, plants should root in a few months when they are air layered.

PART II: List:

1. List four plants which can be air layered:

- a. _____
- b. _____
- c. _____
- d. _____

Topic Test
on
PROPAGATION BY DIVISION

Student: _____ School: _____

Date: _____ Score: _____

 T F

- _____ 1. Plants are best divided after their season of blossoming.
- _____ 2. Larger shrubs should be divided when they are dormant for best results.
- _____ 3. Each root segment or division is actually a plant in itself or is capable of becoming a new plant.
- _____ 4. Division is a slow way of increasing your supply of perennials
- _____ 5. Deciduous and semi-deciduous perennials may be cut back to about four inches from the ground when you transplant.

Topic Test
on
PROPAGATION BY GRAFTING AND BUDDING

Student: _____ School _____

Date: _____ Score: _____

PART I: Answer the following questions.

1. Define stock.
2. What is the cambium layer?
3. List two kinds of budding

PART II: Place a check under T for true or under F for false for each of the following statements:

- _____ 1. In all grafting methods, the tight union between stock and scion must be sealed off from air with some kind of sealing agent
- _____ 2. Evergreens can be grafted in early spring, just before plants begin to grow actively

Topic Test
on
PROPAGATION FROM SEEDS

Student: _____ School _____

Date _____ Score _____

PART I: Place a check under T for true or under F for false for each of the following statements

 T F

- _____ 1. There are no bargains when obtaining good seeds
- _____ 2. A good growing media for germinating seeds should be high in the nutrients necessary for plant growth
- _____ 3. The minimum temperature for seed germination is 70° F.

PART II Fill in the following blanks to make true, complete statements.

1. Some propagators use a layer of a sterile moisture-holding material as _____
2. A _____ can be used for firming the top of the soil
3. To help distribute small seed mix them with a small amount of _____
4. The label on a seeded flat should contain
- a. _____
- b. _____
- c. _____
- d. _____

Topic Test
on
DEVELOPING A PLANT BREEDING VOCABULARY

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks.

1. The _____ is the part of the stamen that develops and bears pollen.
2. A _____ is a small flower in a composite flower, having stamens and a pistil
3. A _____ is the unit that carries hereditary traits.
4. The _____ is an enlarged base of a pistil in which the seed develops.
5. A _____ is a small flower in a composite flower, having a pistil but no stamens.

Topic Test
on
PLANT SELECTION AND FUNDAMENTALS

Student: _____ School: _____

Date: _____ Score: _____

PART I: Fill in the blanks:

1. _____ is the transfer of pollen.
2. _____ is the union of germ cells.
3. A perfect flower contains both _____ and _____.
4. The _____ which are often green cuplike structures support the petals and the floral parts.

PART II: Label the parts of the perfect flower:

Topic Test
on
HEREDITY

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. If a plant that is self-pollinated produces offspring identical to itself, it is said to breed _____.
2. If the first-generation offspring are not all identical to the parent plant, then it is said that _____ has occurred.
3. When the red and yellow genes come together and both are incomplete, the resulting color of the flower will be _____.
4. Hybrids are results of crosses between two _____.
5. When the male and female germ cells unite in the _____, each contributes one gene for each _____.

Topic Test
on
GENERAL BREEDING TECHNIQUES

Student: _____ School: _____

Date: _____ Score: _____

Place a check under T for true or F for false for each of the following statements:

 T F

- _____ 1. Only those composite flowers containing both disc and ray florets can be self-pollinated.
- _____ 2. Prepollination steps generally should begin after the flower is well opened.
- _____ 3. Extremely high temperatures or moist conditions are harmful to pollen.
- _____ 4. Some breeders use chicken bands for marking the parent plants.
- _____ 5. Composite flowers can be easily closed with a string or soft wire.

Topic Test
on
TRANSPLANTING ORNAMENTAL TREES AND SHRUBS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. The hole which the plants are to be set in should be _____ wider and _____ deeper than the roots of the plant.
2. The plant should be set at the _____ at which it was growing.
3. When planting a bareroot shrub or tree, _____ of the top should be pruned.
4. Trees _____ usually need guy wires.
5. The nursery term B&B means _____ and _____.

Topic Test
on
CARE AND MAINTENANCE OF PLANTS

Student: _____ School: _____

Date: _____ Score: _____

PART I: Place a check under T for true or F for false:

 T F

1. Trees may be pruned at any time.
2. Climbing hybrid-tea roses look best when old blooms are cut off just above the second bud in the axil of a leaf.
3. Many shrubs should be pruned by thinning out rather than by severe pruning
4. Shrubs which bloom in the spring should be pruned in the fall.
5. Climbing roses should be pruned after flowering.

PART II: Answer the following to make true complete statements:

1. Pruning ornamental shrubs and small flowering trees depends on the _____ and _____ of the plant.
2. When woody plants are dug without a ball of soil around the roots, they are said to be dug _____.
3. Deciduous plants should be pruned between _____ and _____.
4. Many shrubs should be pruned by _____ rather than by severe pruning
5. Pruning of plants is the cutting off or cutting back of parts of that plant for _____ or more _____.

Topic Test
on
INTRODUCTION TO FLORAL CROP PRODUCTION

Student _____ School _____

Date _____ Score _____

Fill in the blanks

- 1 The three most widely grown cut flowers are roses chrysanthemums and _____
- 2 The cultivation and selling of flowers is known as _____
- 3 Many greenhouses have been located in a particular area because of the great amount of _____ during the winter or the mild climate
- 4 Most cut flowers are sold to the retail flower shops through wholesale _____ houses
- 5 The U S D A does research in many phases of floriculture at _____ Maryland

Topic Test
on
GROWING ANNUALS

Student: _____ School _____

Date: _____ Score _____

Place a check under T for true or F for false.

 T F

- | | | | |
|---------------|---------------|----|---|
| <u> </u> | <u> </u> | 1 | Annuals grow only one year or less. |
| <u> </u> | <u> </u> | 2 | Morning glories bloom only in the winter |
| <u> </u> | <u> </u> | 3. | Asters are resistant to wilt |
| <u> </u> | <u> </u> | 4 | There are many varieties of zinnias |
| <u> </u> | <u> </u> | 5 | Some annuals take only six weeks from seed to flower. |
| <u> </u> | <u> </u> | 6 | Annuals can be produced in flats |
| <u> </u> | <u> </u> | 7 | Pansies are biennials |
| <u> </u> | <u> </u> | 8. | Asters make good cut flowers. |
| <u> </u> | <u> </u> | 9. | Annuals do best in well-prepared soil. |
| <u> </u> | <u> </u> | 10 | Hollyhocks are blue in color |

Topic Test
on
PERENNIALS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks.

1. Primrose clumps need dividing every _____ years, after blooming season.
2. Primroses like most soils, but rich _____ is ideal.
3. The _____ is probably the best perennial for beginning gardeners.
4. Polyantha primroses will repeat bloom in fall if you _____ them back after spring bloom and give them a _____
5. _____ is a favorite season for dividing and replanting as well as for planting newly purchased perennials

Topic Test
on
BULBS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. The term _____ is one that is loosely applied to any plant that has a swollen or thickened basal portion.
2. A _____ is a creeping underground stem, often thick with stored food.
3. Bulblets grow larger each year until it is time to _____ and replant them.
4. In early spring, cool air and high humidity enables young plants to tolerate more _____.
5. In mild-winter regions, tulips will _____ if not dug.

Topic Test
on
CHARACTERISTICS, IDENTIFICATION AND USE OF IMPORTANT POT PLANTS

Student: _____ School: _____

Date: _____ Score: _____

PART I: Fill in the blanks:

1. The Azalea requires _____ or _____ as growing medium.
2. Rooted mum cuttings should be planted as _____ as possible.
3. Coleus root easily from _____.
4. The Poinsettia is a seasonal plant most popular at _____.
5. The best temperature to start Caladiums is _____.

PART II: Underline the most appropriate answer.

1. Exotic looking plant with showy spikes of blooms which may be attractive for several months. (a) Azalea (b) Bromeliad (c) Hydrangea (d) Poinsettia
2. Bright glossy leaves of many different colors on a single plant. (a) Croton (b) Azalea (c) Ficus (d) Sansevieria
3. Showy, velvety foliage plant with large bell-shaped blooms in assorted colors. (a) Geranium (b) Caladium (c) Gloxinia (d) Begonia
4. Flowers in hanging cattails up to a foot long of a deep red color. (a) Ferns (b) Hydrangea (c) Croton (d) Chenille
5. Most important tropical decorative plant family. (a) Philodendron (b) Dracaena (c) Devil's Ivy (d) Schefflera

Topic Test
on
POINSETTIAS

Student: _____ School: _____

Date: _____ Score: _____

TRUE or FALSE:

- _____ 1. Poinsettia cuttings should be rooted under mist if possible.
- _____ 2. Poinsettias should be staked
- _____ 3. Poinsettias are very sensitive to light, and great care needs to be taken not to light them accidentally.
- _____ 4. The market acceptance for Poinsettias is excellent at Christmas.
- _____ 5. The most common cause of lack of roots is poorly aerated soil

Topic Test
on
CHRYSANTHEMUMS

Student _____ School _____

Date _____ Score _____

PART I True or False.

- _____ 1 The most popular color mum is yellow
- _____ 2 The ideal night temperature for mum is 95°
- _____ 3 The pot mum grower can keep diseases under control by using disease-free stock and doing a good job of sterilizing potting soil and handling equipment
- _____ 4 The grasshopper is the most persistent insect on mums

PART II Fill in the blanks.

- 1 The method of propagation for mums is by _____
- 2 The most persistent pests on mums are _____
- 3 Mums naturally bloom in the _____
- 4 _____ began hybridizing varieties of mums more than 2,500 years ago

Topic Test
on
GERANIUMS

Student _____ School. _____

Date _____ Score _____

PART I Place a check in the blank under T for true or F for false.

- | <u>T</u> | <u>F</u> | |
|----------|----------|--|
| _____ | _____ | 1 Geraniums are not commonly grown from seed because the seed of the most desirable varieties are not available. |
| _____ | _____ | 2 Geraniums are notoriously poor shippers |
| _____ | _____ | 3 Never pinch geraniums |
| _____ | _____ | 4 Blue is the color of geraniums most in demand. |

PART II Fill in the blanks

- 1 Geraniums are _____ several weeks before the cutting harvest is to start
2. _____ is the most popular color in geraniums
- 3 _____ is the second most popular color in geraniums.
- 4 There are several serious diseases of geraniums, and some of these can be transmitted with the _____

Topic Test
on
HYDRANGEAS

Student: _____ School: _____

Date _____ Score: _____

Fill in the blanks.

1. The _____ is the most common insect enemy of the hydrangea.
2. Stem tip or leaf bud cuttings are made from _____ to _____.
3. The hydrangea is forced for _____ and _____.
4. _____ causes considerable damage during storage.
5. Hydrangeas are grown outdoors in the _____.

Topic Test
on
TURF GRASSES FOR TEXAS

Student: _____ School: _____

Date: _____ Score: _____

Place a check under T for True or under F for False for each of the following statements:

 T F

1. Many of the 550 species of grass in Texas are suitable for turf.
2. Bermuda is the turf grass most widely adapted in Texas.
3. St. Augustine is not as cold hardy as Bermuda.
4. St. Augustine is susceptible to certain diseases, notably brown patch and leaf spot.
5. St. Augustine will not live in low, wet areas.

Topic Test
on
ESTABLISHING A NEW TURF

Student: _____ School: _____

Date: _____ Score: _____

Place a check under T for True or under F for False:

 T F

- _____ 1. In all instances, the character of the soil needs to be altered considerably.
- _____ 2. Terraces should be avoided if possible because of the difficulty of establishing and maintaining turf on terraces.
- _____ 3. A complete fertilizer should be plowed or spaded under to supply the plant nutrients needed for deep root development.
- _____ 4. Low-priced seed often are the most costly.
- _____ 5. Sprigging or sodding must be used for establishing grasses which cannot be propagated by seed.

Topic Test
on
MANAGING AN ESTABLISHED TURF

Student: _____ School: _____

Date: _____ Score: _____

PART I: Place a check under T for true or under F for false:

 T F

- _____ 1. Nitrogen is the key element in turf production.
- _____ 2. Potassium deficiency causes the leaves to be an unhealthy dark green.
- _____ 3. Iron chlorosis occurs on soils high in lime.
- _____ 4. The root system develops during the fall and early spring.
- _____ 5. Mowing too close encourages thinning of the turf.

PART II: Fill in the following blanks:

1. Four major factors in maintaining a turf are _____, _____, _____, and _____.
2. Calcium deficiency causes _____ growth.
3. Chlorosis may be corrected by applying _____ or _____.
4. Essential good physical condition for plant growth is a mixture of _____, _____, and _____.
5. Aerifying the soil is a means of _____ the soil.

Topic Test
on
TURF PROBLEMS

Student: _____ School: _____

Date: _____ Score: _____

PART I: Place a check under T for true or under F for false:

 T F

1. Proper turf grass management is the best means of controlling weeds.
2. Brownpatch is a fungus disease that attacks only St. Augustine grass.
3. Fungicides which contain PCNB are terraclor and captan.
4. If clovers are not removed from the lawn, they should be kept under control by frequent mowing.
5. Dusts generally are more effective in the control of chiggers than are sprays.

PART II. Fill in the following blanks:

1. Three good sprays for the chinch bug are _____, _____, and _____.
2. Two applications _____ days apart may be necessary for most effective control of Florida grass mites.
3. Four problems which occasionally arise in the production of a turf are _____, _____, _____, and _____.
4. Brownpatch is a fungus disease that often attacks _____ and _____.
5. Brownpatch may be controlled by spraying the affected and immediate surrounding areas thoroughly with a fungicide containing _____.

Topic Test
on
CAUSES OF PLANT DISEASES

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. The four most important causes of plant disease are _____,
_____, _____, and _____.
2. An agent that transmits disease-producing organisms is called a _____.
3. _____ is the best approach to
controlling canker disease.
4. A _____ is a plant on (in) which a parasite lives and obtains its food
5. The smallest form of a plant disease is the _____.

Topic Test
on
IDENTIFYING PLANT DISEASES

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. The key to disease control is proper _____.
2. _____ is a rust-like disease lesion; a disease in which scab is a prominent symptom.
3. A _____ is an open wound or dead spot, often sunken, in a stem or branch surrounded by living tissue.
4. A _____ is an outgrowth, often more or less spherical, of organized cells.
5. Knots on roots usually indicate that _____ are present.
6. A _____ is a dried, shriveled fruit, caused by certain fungus diseases.

Topic Test
on
APPLICATION AND SAFETY PRECAUTIONS OF HORTICULTURAL CHEMICALS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. A _____ sprayer is one of the most common means of applying pest or disease control materials in the greenhouse.
2. Some chemicals kill only on _____, therefore the entire plant should be covered.
3. Always _____ the label before using a chemical.
4. Many of the control materials are _____ to human beings and they must be used in such a way that they do not endanger anyone.
5. For an aerosol application the pesticides are purchased in a ready-to-use container commonly called a _____.

Topic Test
on
CONTROLLING LEAF DISEASES

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. _____ live o. secretions from aphids and immature stages of the white fly and cause sooty mold.
2. Lack of _____ causes chlorosis.
3. Oedema is caused by excess _____ or _____.
4. _____ and _____ are two chemicals good for treating mosaic or leaf curl.
5. Proper _____ and _____ are the best treatments for scorch and scald.

Topic Test
on
CONTROLLING STEM BRANCH, AND TRUNK DISEASES

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. _____ and _____ cause lichens.
2. Plants that have gall are treated by _____.
3. Plants badly infected by dodder should be _____.
4. Plants that have _____ are treated by installing tubes in the infected parts of the tree to drain excess fluids and relieve pressure.
5. Two chemicals used to control green scurf are _____ and _____.

Topic Test
on
CONTROLLING ROOT DISEASES

Student _____ School _____

Date _____ Score _____

Fill in the blanks

- 1 A soil temperature of _____ to _____ degrees is necessary for development of southern blight
- 2 _____ soil fumigation is an effective treatment for crown gall and hairy rot
- 3 Mushroom root rot can be effectively controlled by fumigation with _____
- 4 Root knot is caused by _____
- 5 Always _____ the soil where damping off and seedling blight are a problem

Topic Test
on
CONTROLLING DISEASES AFFECTING THE ENTIRE PLANT

Student: _____ School: _____

Date: _____ Score _____

Fill in the blanks.

1. _____ is an effective treatment for aster yellows.
2. _____ can be used to control verticillium wilt.
3. The _____ part of Texas is affected mostly by verticillium wilt
4. _____ and CM-19 are both effective controls for botrytis blight
5. The general name for a chemical used to combat mites is a _____.

Topic Test
on
CONTROLLING LAWN AND TURF DISEASES

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. Lack of _____ causes chlorosis.
2. _____ and _____ are controls for Piricularia leaf spot.
3. For control of rust on bluegrass apply chemicals as _____ in early stages of disease.
4. The control of mushrooms is to _____ and destroy them.
5. The symptoms of fading out are _____ dead areas from a few inches to several feet in diameter

Topic Test
on
IDENTIFYING PLANT AND SOIL INSECTS AND METHODS OF CONTROL

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. _____ of plants are damaged by grubs.
2. _____ rolls into a ball when disturbed.
3. _____ are microscopic worms that attack roots and cause galls.
4. Leaf rollers are small _____ that wrap leaves around themselves for shelter and food.
5. Aphids are sometimes called _____.
6. _____ are small, attached insects covered with shells or armor that suck sap from the plant.

Topic Test
on
NEMATODES

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. The _____ nematode is the most common type in Texas.
2. Tomatos and _____ are very good hosts for nematodes.
3. Before spending a large amount of money for chemicals, determine if nematodes are causing a significant amount of damage to justify the _____ and _____.
4. _____ and nitrogen nodules are often confused with knots caused by nematodes.
5. Nematode-affected plants have less ability to withstand lack of _____, lack of water, or any adverse condition.

MICROCOPY RESOLUTION TEST CHART
NATIONAL BUREAU OF STANDARDS-1963

Topic Test
on
CONTROL OF MOLES, GOPHERS, BIRDS, DEER, AND ANTS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. Conical mounds of dirt pushed up from their main run indicates the presence of _____.
2. _____ and _____ are the most effective means of destroying moles.
3. A bird that has no friends and should be eliminated is the _____.
4. _____ is the best long term control for deer.
5. Moles are unlike gophers because they have _____ tunnels.

56

Topic Test
on
CONTROLLING WEEDS

Student: _____ School: _____

Date: _____ Score _____

Fill in the blanks:

1. _____ should be worn while mixing and applying chemical solution.
2. The _____ has been the gardener's most useful tool for over 4,000 years.
3. Peat moss and other organic mulches are applied to soil in weed control to cut off _____
4. In areas where regrowth of persistent perennial weeds require frequent hoeing, use a recommended _____ weed killer.
5. _____ should be applied to the soil several days before trying to pull up weeds.

Topic Test
on
PRINCIPLES USED TO PREVENT PERSONAL INJURY

Student _____ School _____

Date _____ Score _____

Fill in the blanks

- 1 The _____ should do the lifting when a person attempts to pick up a heavy object without using equipment
- 2 One pulley only _____ direction of force
- 3 A 1/2" pipe hooked onto a hose makes an effective device for _____ post holes
- 4 A wall rack for lumber and pipe keeps the materials completely off the ground and away from _____ and _____
- 5 When you build rock walls and rock gardens, a _____ system suspended from a tripod is very helpful

Topic Test
on
SELECTION AND MAINTENANCE OF HORTICULTURAL HAND TOOLS

Student: _____ School _____

Date: _____ Score _____

Fill in the blanks.

1. A _____ shovel is handy for moving sawdust, manure, and other light materials
2. The scuffle hoe works best on packed, _____ ground.
3. The two most common shapes of lawn rakes are _____ and _____
4. The most common hoes have a _____ inch blade
5. The _____ rake is a good tool for leveling soil or gravel and collecting earth clods

Topic Test
on
MAINTAINING SMALL POWER EQUIPMENT

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. _____ and _____ should be checked when inspecting a belt.
2. Regularly used equipment should always be checked by the _____.
3. Cover cutting surfaces with used _____ or _____ if a machine is to sit out in the weather for a long period of time.
4. _____ or other solvents may be used to clean an air filter.
5. _____ maintenance consists of periodic equipment inspection and upkeep.

Topic Test
on
OPERATING AND MAINTAINING LAWN MOWERS
SAFELY AND EFFECTIVELY

Student: _____ School: _____

Date: _____ Score: _____

1. The three main categories of power mowers are:
 - a. _____
 - b. _____
 - c. _____
2. What is the general term used to describe the practice of mowing a lawn too close?
3. A sickle bar mower consists primarily of what two parts?
4. What part of plant produces food?
5. How can long clippings damage a lawn?

Topic Test
on
OPERATING ROTARY TILLERS SAFELY AND EFFECTIVELY

Student: _____ School _____

Date _____ Score _____

Fill in the blanks

- 1 The part of a tiller that turns and actually does the digging is called the _____.
- 2 Normally, front tine tillers do not have _____ wheels
- 3 If the front tine tiller must be held back to do a proper job of tilling, the _____ should be lowered to cause the tines to dig deeper.
- 4 _____ rotary tillers are designed for medium to heavy duty work and can thoroughly mix organic matter into the soil.
- 5 Before starting any tiller, check to see that all clutches or belt tension pulleys are _____

Topic Test
on
OPERATING GARDEN TRACTORS SAFELY AND EFFECTIVELY

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks.

- 1 The usual horsepower range for garden tractors is _____ to _____ H. P.
- 2 The two most popular garden tractor transmissions are the _____ type and the _____ type.
- 3 Extra pulleys may be mounted on either the gearbox shaft or the _____ to permit the use of implements requiring power.
- 4 Walking type tractors have had moderate improvements such as _____
_____.

Topic Test
on
INTRODUCTION TO HOME LANDSCAPING

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks

- 1 Gardens can no longer be entirely naturalistic because they do not fit into our _____ way of living
- 2 A good landscape development results only where plants and architectural materials are _____
- 3 When landscape plans are obtained from a nursery without charge, they may be of little value or you may pay for them indirectly through the purchase of _____.
- 4 The word _____ refers to the entire property.
- 5 The main problems of designing or arranging elements on the land lie in properly organizing and using the available _____.

Topic Test
on
SELECTING A SITE

Student _____ School _____
Date _____ Score _____

Fill in the blanks

- 1 The _____ of the homesite should be your first consideration
- 2 Proper _____ will prevent intrusion of industry in residential sections.
- 3 If streets and sidewalks have not been paved or do not exist, part of the future cost will no doubt be borne by the _____
- 4 _____ lots are often though preferable but they make privacy difficult.
- 5 A lot that is slightly above street level provides _____ and offers a good setting

Topic Test
on
SCHEDULING LANDSCAPE DEVELOPMENT AND BEGINNING PLANS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. _____ and _____ are the most essential elements and you should construct them first.
2. _____ are important especially in Texas areas where shade is desirable.
3. Hedges, screens, walls, and fences provide _____ and assist in _____ control around the home.
4. Few gardens can be planned, constructed, and planted in one year without considerable _____.
5. _____ is the term used for a piece of real estate which may be merely a lot or one with a home on it.

Topic Test
on
ANALYZING PROBLEMS AND DETERMINING NEEDS

Student _____ School _____

Date _____ Score _____

Fill in the blanks

- 1 _____ is largely a question of individual taste and past environment.
2. The basic step in the preparation of a program is to decide and analyze specific problems of a chosen _____
- 3 The four basic considerations that should be included in successful landscape development are.
 - a _____
 - b _____
 - c _____
 - d _____
- 4 From an artistic standpoint, everything varies in _____, _____, and _____.
5. Good landscape development always results in an increase of _____ values.

Topic Test
on
DEVELOPING THE LANDSCAPE PLAN

Student: _____ School: _____

Date: _____ Score: _____

List:

1. Four main functions which homesites and farmsites must provide:

- a. _____
- b. _____
- c. _____
- d. _____

2. Six areas of Texas in which plants vary:

- a. _____
- b. _____
- c. _____
- d. _____
- e. _____
- f. _____

Topic Test
on
SELECTING PLANTS

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. _____ and _____ flowering shrubs are not as permanent as woody plant materials and usually do not provide as good covering for garden areas.
2. Most native plants require little _____ or other care when they have become established after transplanting.
3. Plants from the Mediterranean regions and _____ often have similar cultural and moisture requirements to our native plants.
4. Large shrubs or small trees are _____ to _____ feet tall when full grown.
5. _____ shrubs attain a height of 6 to 8 feet at maturity.

Topic Test
on
GRADING DRAINAGE AND LANDSCAPE STRUCTURES

Student: _____ School: _____

Date: _____ Score: _____

Place a check under T for true or under F for false for each of the following statements:

 T F

- _____ 1. The minimum width for an entrance sidewalk is eight feet.
- _____ 2. Walks should always be as direct as possible.
- _____ 3. Landscape planners with a minimum of design experience should avoid curved walks
- _____ 4. The use of splash blocks is the most desirable method of preventing downspouts from eroding soil
- _____ 5. Lowering the grade around existing trees does not disturb their normal functioning nearly so much as does filling.

Topic Test
on
DEVELOPING PERSONAL TRAITS

Student. _____ School. _____

Date _____ Score. _____

1 What are the three basic ingredients of a salesman?

a. _____

b. _____

c. _____

2 What are two ways in which good habits pay off?

a. _____

b. _____

3 What are the best two ways to learn selling?

a. _____

b. _____

4 How can a person become a "scientific salesman"?

5. What is required for a would-be salesman to become a tough, aggressive, and effective salesman?

a. _____

b. _____

Topic Test
on
DISPLAYING

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. _____ displays are designed to stop the customer and bring him into the store.
2. _____ attracts attention and gives the impression of demand.
- 3 Each table and shelf should have a _____ to the others.
- 4 Special racks, tri-plane and peg board tables are excellent for displaying _____ items and other small competitive items.
5. _____ displays are more successful when used for farm or products.

Topic Test
on
ADVERTISING

Student: _____ School: _____

Date: _____ Score: _____

PART I: Fill in the blanks.

1. _____ advertising consists of displays within the place of business.
2. _____ buying results in millions of dollars' worth of sales annually, as the growth of supermarkets shows.
3. _____ advertising is high in cost but is effective because the product can be demonstrated

PART II: List:

1. Three factors to consider when selecting an advertising medium are:
 - a. _____
 - b. _____
 - c. _____
2. Three methods of "outside of the store" advertising are:
 - a. _____
 - b. _____
 - c. _____

Topic Test
on
LABELING AND PRICING

Student: _____ School: _____

Date: _____ Score: _____

Problem:

What would be the percent mark-up of a plant if the production cost was \$1.00 and selling price was \$2.00?

Work:

Answer: _____

Topic Test
on
UNDERSTANDING THE CUSTOMER AND MAKING SALES

Student: _____ School: _____

Date: _____ Score: _____

Fill in the blanks:

1. The first problem of a salesman is getting the _____ of the customer.
2. A dangerous practice that many salesmen fall into is trying to arouse interest by overstressing _____.
3. _____ percent of all salesmen quit cold after a single call on a prospect.
4. "_____ is a luxury no salesman can afford."
5. The surest and quickest way to lose a sale is to _____.

VOCATIONAL AGRICULTURE

ACKNOWLEDGEMENT

Teaching materials for Agricultural Cooperative Training in the agricultural machinery occupations have been prepared largely by Mr. Benny Mac Venable, Vocational Agriculture Teacher, Judson High School, Converse, Texas and Mr. Durwin Hill, Vocational Agriculture Teacher, Graham, Texas.

These teachers developed this material during a four-week period at the Center during the summer of 1966.

Some units were developed by the Agricultural Education Department of Texas Technological College, Lubbock, Texas.

A Suggested Basic Course Outline for Agricultural Machinery Service and Repair, Texas Education Agency (1966), was utilized as an outline for the units and the topics developed.

Information Sheet
 on
ORIENTATION

A person planning to work in the service occupations of an agricultural machinery dealership must understand the organization and management of the dealership if he is to be effective as a service employee. He must understand (1) the importance of the local dealership and the agricultural machinery industry to the agricultural industry of the community, nation, and world, (2) the relationship of the local dealership to the farmer and the parent organization, (3) the ways the local dealership carries out its business, (4) the jobs and job functions of employees in the local dealership, and (5) show the relationship of farming to merchandise handled by the dealership. A local agricultural machinery dealer expects his employees to be able to do their jobs with a high degree of speed and efficiency. In order to meet these expectations, the employees must have a thorough knowledge of the complete operation of the business.

Agricultural machinery dealers have played a vital role in the social and economic life of those engaged in production agriculture as well as the standard of living of all people

- 1 They have provided the farmer with efficient and economic production tools
- 2 Modern agricultural machinery has lowered the costs of production for the farmer. The following table bears out this fact

Farm Output and Labor and Machinery Inputs
 Index 1947-49 = 100

Year	(Indices)				
	Farm Output	Farm Labor	Power and Machinery	Labor Plus Machinery	Relation of Combined Labor and Machinery Inputs to Output
1910	61	135	28	163	133
1920	70	143	44	187	133
1930	72	137	55	192	132
1940	82	122	58	180	110
1950	101	90	118	208	103
1955	113	76	136	212	94
1956	114	72	137	209	92
1957	114	68	138	206	93
1958	124	66	137	203	84
1959	126	64	139	203	81

Orientation
(Information Sheet continued)

The use of agricultural machinery has promoted an increase in farm production and income in spite of a decrease in the number of persons employed on the farm.

1. While farm workers have decreased in number, farm production has increased.

2. The agricultural machinery industry has managed to keep its price rise on production costs relatively low.

Price Change

3. Fifty years ago one farmer could produce food and fiber for six other persons, whereas today, that same man can produce food and fiber for at least 29 others.

Orientation
(Information Sheet continued)

4. Today, 40 percent of the farms produce 87 per cent of the food and fiber sold from the farms.

The use of modern agricultural machinery has aided in raising the standard of living of the farmers.

1. Today farmers have more time for recreation, more conveniences, better educational advantages and improved facilities.
2. The investment in agricultural machinery is highest on farms in states having the highest standard of living.
3. The development and use of labor saving machines have made it possible for millions of farm workers to enter other industries, the arts, sciences, and professions.

for
AGRICULTURAL MACHINERY MECHANICS

UNIT: Introduction

TOPIC: Orientation

OBJECTIVES: To understand the methods of distributing agricultural machinery.

REFERENCES: Required:

1. Information Sheet, "Orientation"

Supplemental:

2. Farm and Power Equipment Retailers Handbook
NFPED Association, pp. 7-21

QUESTIONS
or
ACTIVITIES:

1. How does agricultural machinery get from the manufacturer to the farmer?
2. Who designs new machines?
3. How are parts supplied to the dealer?
4. Who sells agricultural machinery to the farmer?
5. Who is responsible for storage of the equipment?

Texas Education Agency
Texas A&M University
(cooperating)

Information Sheet
on
ORIENTATION

The distribution of agricultural machinery follows this route: from manufacturer to branch house - to dealers - to customers. All orders for machines by the local dealership are placed with the branch house.

The above pattern of distribution accounts for practically the entire output of domestic sales of tractors and other agricultural machinery.

The primary function of the manufacturer is to supply the agricultural machinery needed by the agricultural industry.

1. Manufacturers employ competent product engineers to design the new machines needed by the agricultural industry.
2. Manufacturers supply the branch houses with the parts and some machines to supply their dealers.

In addition to performing these functions, the manufacturer does the following:

1. Keeps in touch with machinery problems and needs of farmers
2. Through research, develops machines and systems to meet the needs of the farmer

The function of the branch house is to move the machinery from the factories to the farms in the most economical manner.

1. The branch house provides storage for the manufacturer.
2. The task of sales and distribution for the manufacturer is undertaken by the branch house.
3. Through this medium, the manufacturer gets national distribution more quickly and more thoroughly.
4. Retail dealers get more prompt and reliable service.
5. As the manufacturer's distributive agent, the branch house keeps the manufacturer advised on market conditions and needs of a particular area.

Orientation
(Information Sheet continued)

6. The branch office lowers substantially the manufacturer's handling cost of agricultural machinery and ultimately the farmers' purchasing costs.
7. The branch house buys parts in large quantities, relieving the manufacturers of the details of selling, warehousing, shipping of merchandise to individual dealers, and carrying of dealer accounts.
8. The branch house carries adequate stocks of repair parts at strategic locations, resulting in better service to the dealer, and thus the customer.

The distributor (branch house) builds a good dealer's organization and confines all his efforts to selling through dealers.

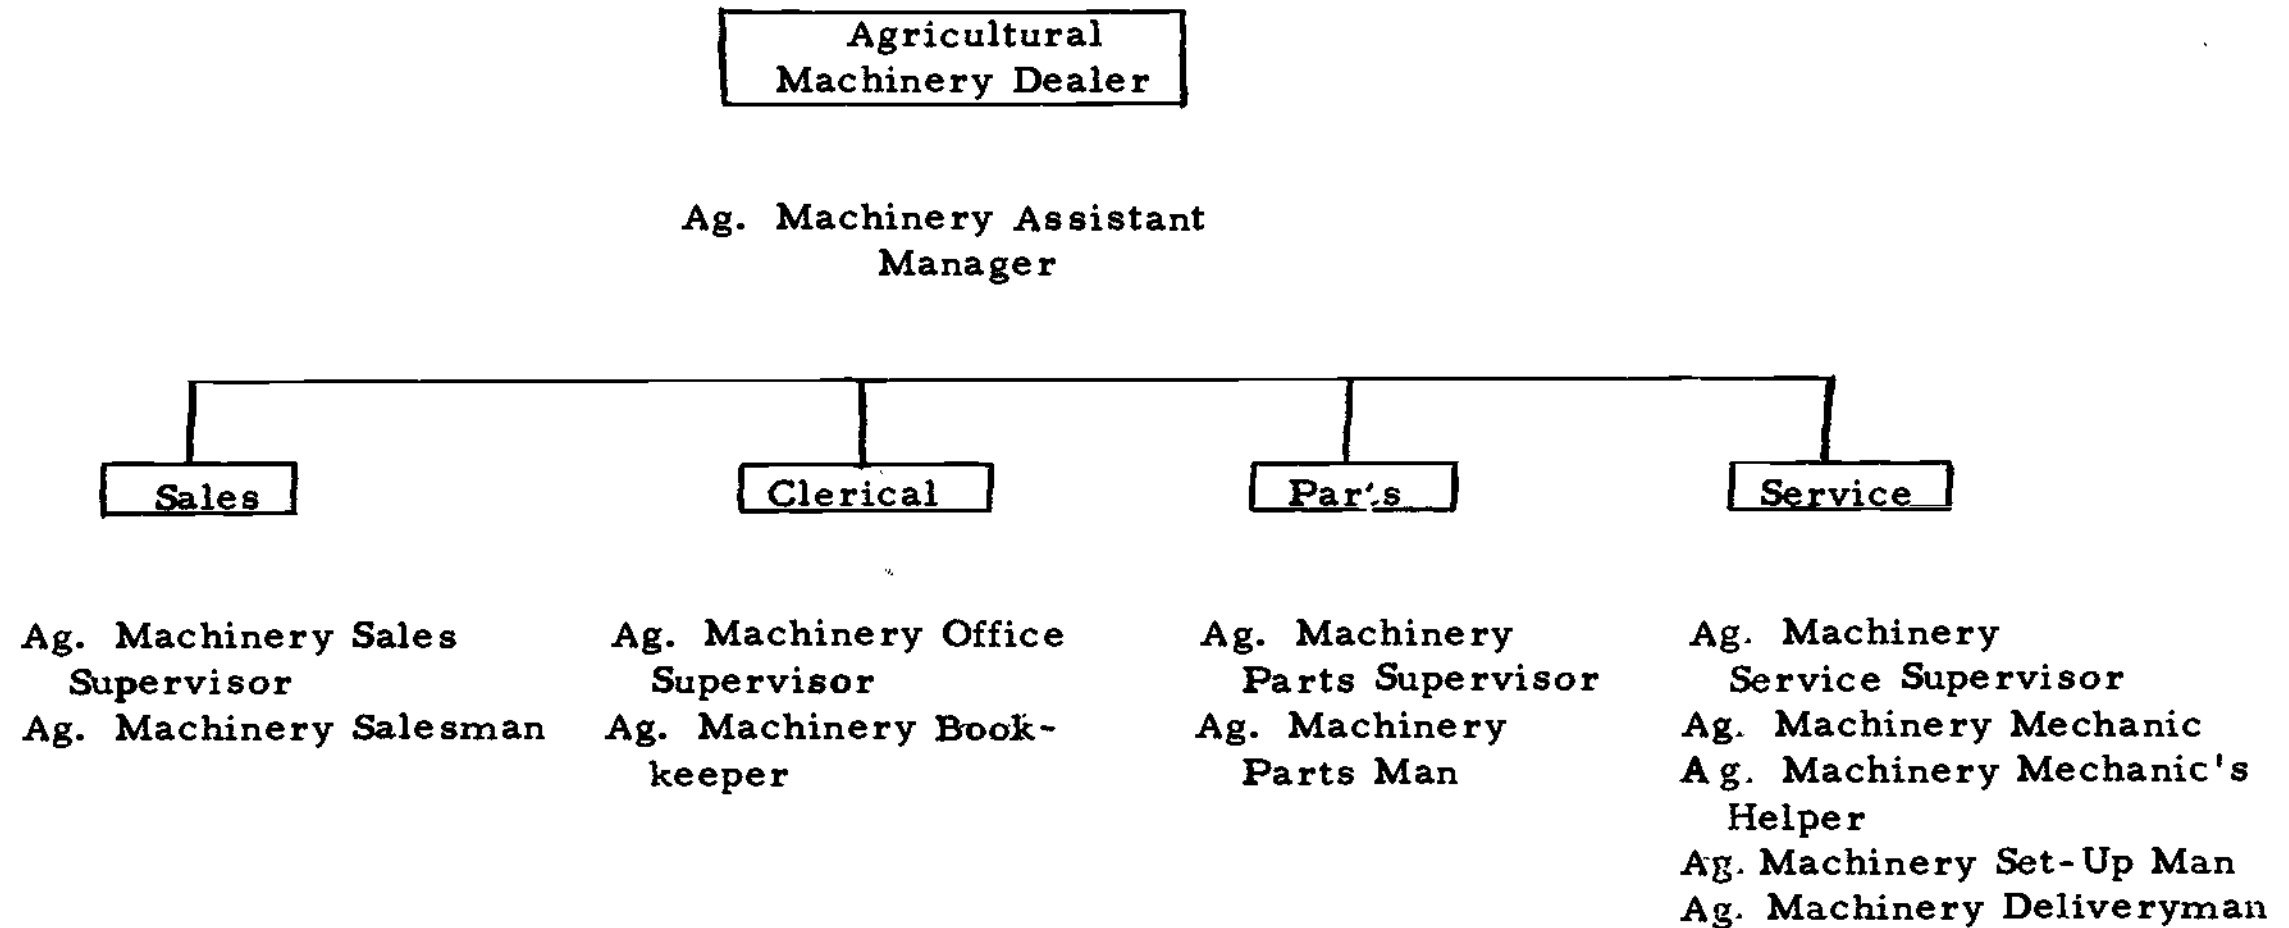

1. The distributors organization includes a service department with personnel who thoroughly understand the servicing of each machine handled.
2. A well developed program of selling is maintained by the distributor who aids the dealer in realizing a greater profit through better service to the customer.

The local agricultural machinery dealer is the vital link in this distribution pattern.

1. The dealer is the final link between the manufacturer and the user of the machine.
2. The dealer contributes greatly to the farmer's knowledge of machinery servicing.
3. He demonstrates the efficiency of the company machines to the farmer and explains how the machine can benefit the farmer.
4. He extends credit in many cases to the farmer so the machine can pay for itself in labor saved or money earned.
5. The dealer makes an effort to understand farm machinery problems and the need of the farmer and conveys these needs back to the manufacturer to provide a basis for improvement of farm machines through research.

Information Sheet
on
GENERAL SAFETY PRACTICES

The practice of safety in the shop goes beyond the knowledge of the proper use of hand tools and equipment. A most important consideration is your attitude. You must understand the hazards of the job you are about to undertake and must appreciate the need for applying such safety practices that will protect you from injury. Awareness of personal safety comes only through an understanding of the dangers which are present. Most accidents are caused by thoughtlessness, so you must be on guard at all times.

It is most important to give the job your undivided attention. "Visiting" is not permitted because it distracts you and may lead to an accident.

Horseplay, scuffling, punching, or playing pranks is dangerous. Some boys cannot pass by without striking a classmate, and the immediate response is to strike back. In no time at all both boys are scuffling. This childish action may result in a fall or possible injury from sharp tools, steel benches, and heavy equipment which are always present in a shop. Keep such physical activity for the athletic field where it is an approved activity.

Walk-avoid running! A running person cannot always keep from slipping with the possibility of serious injury. Bumping the operator of a machine might cause him to have an accident which would be your fault. Cultivate personal caution at all times. A cautious person is one who knows and observes safe procedures. Learn that caution and foresight pay off. A person who has learned to cultivate personal caution has trained himself to visualize the results of his actions.

Make it a habit to remove any article lying on the floor before someone trips over it. Learn to recognize unsafe conditions. In doing so you are protecting yourself and fellow workers. Get into the habit of removing sharp pointed tools from bench edges where you, or someone else going by, may get hurt-this is an application of personal caution. Store sharp-edged tools in racks and not in drawers where someone could cut himself when picking up other implements.

A protruding nail is an invitation to a first-aid station; either hammer it down or pull it out. Remove any splinters from boxes or pieces of wood which could puncture your skin.

Scraps of sharp metal on the floor could pierce someone's shoe, causing a serious wound-pick them up and place them in the scrap box.

General Safety Practices (Information Sheet continued)

Wipe spilled oil or grease off the floor-even though you did not spill it. Preventable falls send far too many people to the hospital.

Report any injury to your instructor immediately. No matter how small the injury-report it! It is far better to waste antiseptic than to ignore one small wound.

If something gets into your eye, it is dangerous to rub it. Instead report to your instructor immediately.

Be sure to wash your hands after handling caustics, acids, or batteries to avoid getting chemicals on your skin and into your eyes.

Asking for help when lifting a heavy object is a sign of mental strength, not weakness. Many serious injuries are caused by lifting improperly, lifting objects too heavy for one man, or lifting unwieldy shapes. More than 25% of all disabilities are caused by the improper handling of materials. This is the largest single cause of disability from all accidents. Sprains, strains, and hernias-the results of improper lifting-are painful and disabling.

When lifting a heavy object, place your feet close to the object for proper balance. Keep your elbows as straight as possible and bend the knees while gripping. Use your large leg muscles to lift-not the back muscles. Keep your back straight. When lifting a heavy object with the help of others, be sure that a signal is given by one of the team so that excess strain is not placed on any one member of the group. Teamwork accomplishes much more than individual effort.

Carry all objects in such a manner that you can see clearly where you are going. Long objects should be carried by two people to protect others

Power tools are provided with guards to prevent accidents. They are placed there for your protection. Be sure to call the instructor's attention to any loose or missing guard.

Wearing the proper clothing is very important when working in the shop. Each shop requires a specialized protective garment depending on the nature of the work. Some shopwork demands additional temporary protection when doing special jobs. This may take the form of goggles and gloves when welding; goggles or face shield for grinding; or a rubber mat when working around live electrical circuits.

Gloves should be worn when handling hot objects, especially when welding.

General Safety Practices (Information Sheet continued)

The hand tool is still very important, despite the development of complex machine tools. Everyone has need for hand tools, but not everyone knows how to use or care for them properly. A recent study of shop accidents showed that 66% of all injuries in one year were caused by misuse of the common hand tool. Most hand tool accidents are caused by (1) improper storage, (2) failure to keep the tool in good condition, (3) using the tool improperly, and (4) failure to use the right tool for the job.

Hand tools should be stored in a tool rack which has a place for each tool; they should not be stored in drawers or boxes. Tools should be cleaned frequently and stored in a dry place to prevent rusting. A light coating of oil will keep them bright under adverse conditions.

Wrenches are designed to be inserted from the side of a nut (as in the case of an open-end, adjustable, monkey, or pipe wrench), or over the top (socket or box wrench) to hold it firmly for removing or tightening.

If you have to pull hard on a wrench, make sure that it seats squarely or it may slip. Pushing on a wrench is dangerous; if the nut breaks loose suddenly you may skin your knuckles. However, if you do have to push on the wrench, use the palm of your hand.

Whenever you do have to exert any real force, there are two important points to remember: (1) Always place the wrench on the nut so that the pulling force is applied to the strong, stationary side of the handle, as it can withstand the greatest stress. (2) After placing the wrench on the nut, tighten the adjusting knurl so that the jaws fit the nut securely, to prevent slipping.

Hammering on a wrench or extending it with a pipe places an excessive strain on a wrench which is not designed to take.

When chipping, always wear goggles to protect your eyes. If others are working close by, make sure they are protected from flying chips by a screen, or else chip in a direction which is clear of workers. Remember - the time to take precautions is before you start a job, not after someone is injured.

It is dangerous to use a file without a handle, as the end of the tang is quite sharp. If the file "hangs up" by catching on the work, your hand might jam against the end of the tang, resulting in a very painful puncture wound.

Information Sheet
on
ORIENTATION

The operation of the agricultural machinery dealership is divided into five areas

1. Management
2. Sales
3. Clerical
4. Parts
5. Service

The nature of the work carried out in each area is determined by its function in the operation of the total business.

People in each area are employed with specific responsibilities.

1. Management

- Determine company policies
- Exercise financial control over the business
- Select, train and supervise employees
- Forecast and plan future company business
- Direct customer and employee relations
- Promote sales
- Coordinate jobs

2. Sales

- a. Sales Supervisor

- Directs sales work
- Directs sales records
- Promotes sales
- Trains sales employees
- Assists in job coordination

Orientation
(Information Sheet continued)

b. Salesman

Finds prospective buyers
Conducts demonstrations
Appraises used machinery
Closes sales
Makes financial arrangements for customer to purchase machinery
Maintains sales room
Follows up past sales

3. Clerical

a. Office Supervisor

Directs record keeping
Directs office procedures
Directs collections
Directs payments
Checks financial standing of potential customers

b Bookkeeper

Posts books
Directs depository funds
Writes orders and letters
Prepares payroll
Writes contracts
Assists in closing books

4. Parts

a. Parts Supervisor

Directs ordering and selling of parts
Selects parts employees
Trains parts employees
Maintains inventory control
Maintains catalogues and price lists
Plans merchandising programs

b. Parts Man

Dispenses shop parts
Dispenses customer parts

Orientation
(Information Sheet)

Maintains parts inventories
Checks inventories
Maintains price catalogue
Constructs displays
Maintains parts identification

5 Service

a. Service Supervisor

Directs personnel
Selects and trains personnel
Maintains service records
Advises on service problems
Inspects repair jobs
Directs machinery storage
Schedules machinery assembly
Prepares delivery orders
Directs delivery

b. Mechanic

Makes general repairs
Handles field repairs
Conducts special operations
Reconditions trade-ins
Makes pre-delivery checks
Maintains demonstration units
Services rolling stock
Maintains shop equipment

c. Set-up and Deliveryman

Picks up and receives new machinery
Assembles new machinery
Delivers and starts machinery

Orientation
(Information Sheet continued)

These areas have well-defined limits in which to operate in the dealership.

Material for this Information Sheet was taken from the Organization and Management Dealerships, The Center for Research and Leadership Development in Vocational and Technical Education, The Ohio State University, 1965

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

- UNIT: Introduction
- TOPIC: The Parts of Machines
- OBJECTIVE: To learn proper identification of parts of farm equipment that are essential in the construction of a workable machine.
- INTRODUCTION: The component parts of farm equipment include those parts that are essential to construct a complete high-quality operative machine.
- REFERENCES: Required:
1. Farm Machinery and Equipment, Smith, Ch. 5
 2. Ball & Roller Bearings, American Association of Agricultural Engineering and Vocational Agriculture.
- Supplemental:
3. Tractors and Crawlers, Frazee-Bedell, pp. 64-85.
- QUESTIONS
or
ACTIVITIES:
1. Explain the function and application of a cam.
 2. Define and explain the difference between an anti-friction and friction bearing.
 3. What is the function of a bearing?
 4. What are the types of ball bearings?
 5. What are the types of roller bearings?

UNIT Introduction
 TOPIC The Parts of Machines
 (Assignment Sheet continued)

- 6 How do roller bearings differ from ball bearings?
- 7 How would a person determine the proper bearing to use?
- 8 Explain why a bearing must be properly lubricated
- 9 Where are tapered roller bearings used?
- 10 What kind of bearings need bushings?

VOCABULARY: The following key words or terms have been used in this assignment and should now be a part of your vocabulary. Explain or define each:

Intermittent	Load line
Axial	Load line angle
Carburizing	Misalignment
Case harden	Preload
Creep	Press fit
Crowned	Push fit
Deflection	Raceway
End play	Radial
End shake	Radial clearance
Heat treatment	Separable
Loading grooves	Spherical
Radial load	Thrust load

Assignment Sheet
for
AGRICULTURAL MACHINERY MECHANICS

- UNIT:** Introduction
- TOPIC:** The Parts of Machines
- OBJECTIVE:** To develop an understanding of types of fasteners, washers, snap rings, and springs used in farm machinery.
- INTRODUCTION:** In every trade or occupation the problem of properly fastening parts of objects together is extremely important. At one time in history the supply of common nails, bolts, and baling wire was sufficient. Today this is no longer the case. Today's mechanic must be familiar with names, sizes, uses, and standards of the most commonly used fasteners.
- In this assignment we will discuss and illustrate some kinds, sizes and types of common fasteners so that you may familiarize yourself with them.
- It is felt that this is most necessary because of the complex, high speed and precision world in which we live, and the safety conscience employees and employers of today's industry.
- REFERENCES:** Required:
1. Information Sheet, "Fastening Devices"
 2. Farm Machinery and Equipment, Smith, pp. 50-54.
- Supplemental:
3. The Farm Shop, Wakeman & McCoy, pp. 105-106.

UNIT: Introduction
TOPIC: The Parts of Machines

QUESTIONS
or
ACTIVITIES:

- I: Place in the blanks in the margin the number of the answer which you think makes a correct statement of the following:
1. _____ The pitch of a screw is (1) the number of threads on the screw; (2) the distance between threads; (3) the angle between thread faces; (4) the diameter of the threads; (5) none of these.
 2. _____ The proper device for determining the pitch of a given screw is (1) micrometer; (2) rule; (3) calipers; (4) pitch gauge; (5) none of these.
 3. _____ Most of the new-type fasteners now on the market came from (1) the aircraft industry; (2) confiscated German patents; (3) the building trades; (4) the shipbuilding industry.
 4. _____ Hexagon socket-head screws are also known as (1) Phillips head; (2) clutch head; (3) cross head; (4) slotted head; (5) none of these.
 5. _____ The chief advantage of the spline and clutch head screws is the fact that they are (1) neat in appearance; (2) easy to withdraw; (3) safer; (4) able to absorb more turning force; (5) none of these.
 6. _____ To find the length of flat head wood screws, one measures (1) overall length; (2) from bottom of slot to point; (3) the shank; (4) none of these.

UNIT: Introduction
TOPIC: The Parts of Machines
(Assignment Sheet continued)

7. _____ Self-tapping screws are used extensively in sheet metal chiefly because (1) they have a better appearance; (2) they are stronger than other fasteners; (3) they are easily installed; (4) they do not require washers; (5) none of these.
8. _____ A flat head cap screw 1/4 inch in diameter and 1 1/2 inches long with coarse series threads will usually be described:
(1) 1/4" Cap Screw 1 1/2"-2ONC-FLT. HD.
(2) 1/4" x 1 1/2"-2ONC-FLT. HD. Cap Screw
(3) 1/4" FLT. HD. Cap Screws 1 1/2"-2ONC.
9. _____ Rivets are not practical for use in fastening metal parts which (1) require considerable strength; (2) must be assembled accurately; (3) will be removed or replaced periodically; (4) are subjected to vibration; (5) none of these.

IV. Fill in the blanks with a word or words to make a true, complete sentence.

1. The new standard system governing the manufacture of fastening devices used in this country is called the _____.
2. The two principal pitch series in this standard are _____ and _____.
3. The abbreviations for the above series are _____ and _____ respectively.
4. The meaning of "pitch" as applied to threads is: _____.
5. In the standard thread form, the basic angle between the sides of two threads is _____ degrees.
6. The head size of a standard hex bolt is the distance across opposite _____.
7. The nuts for standard bolts come in three thicknesses: _____, _____, and _____.
8. The head size of a standard bolt is approximately _____ times its diameter.
9. The length of bolts is measured from _____ to _____.
10. Bolts and their nuts are usually tightened by means of _____.
11. Screws which are used to fasten light or thin metal sheets without the use of tapped holes are called _____.

UNIT: Introduction
TOPIC: The Parts of Machines
(Assignment Sheet continued)

12. Two other names for the above type screws are _____ and _____.
13. A short steel rod threaded on both ends is called a _____.
14. Thin washers with teeth around the inside or outside edges or both are called _____ washers.
15. A thin nut which is used with a thicker one to keep it from loosening on the bolt is called _____.
16. Enlarging and shaping the end of a pipe or metal rod, such as a rivet, is called _____.
17. The three most common types of heads for set screws are _____, _____, and _____.
18. The unit denoting the sizes of tinnerns' rivets is _____.

UNIT: Introduction
TOPIC: The Parts of Machines
(Assignment Sheet continued)

11. ___ Cap screws are ordinarily used with nuts to fasten two pieces of metal.
12. ___ Bolts are sold with their nuts accompanying them.
13. ___ The most common type of cap screw is the hex head.
14. ___ The majority of screw pitches are uneven numbers.
15. ___ Most machine screws are of the coarse series.
16. ___ Machine screws ordinarily have threads the entire length of the shank.
17. ___ NC and USS may be used to designate American Coarse series threads.
18. ___ Stove bolts usually have hex nuts.
19. ___ Machine screws are smaller than cap screws.
20. ___ Carriage bolts are used to fasten wood to wood or wood to metal.
21. ___ Hanger bolts are used to fasten metal to metal.
22. ___ Castellated nuts are self-locking.
23. ___ Each type of recessed head screw requires a different type of screwdriver bit or wrench.
24. ___ Primarily, countersunk rivets are used in assembling aircraft to make them stronger.
25. ___ "Blind" rivets are so-called because they have no heads.
26. ___ The charge in explosive rivets is set off with an electric spark or sharp blow with a hammer.

III. Place + for TRUE and 0 for FALSE opposite the following statements:

1. The form of a thread in the fine series is different to that in the coarse series.
2. The hexagon head bolt and cap screws are the most used fastening devices in automobiles and modern machines.
3. The distance across the flats of a standard bolt head determines its wrench size.
4. The old U. S. Standard has been replaced by the American Standard.
5. The American Standard Fine Series is also known as NF and SAE.
6. Square headed bolts are used extensively in automobiles.
7. The nut for any standard bolt will fit any standard screw of the same diameter and pitch.
8. All bolts and screws tighten by turning clockwise.
9. The thread standards used in this country also apply to foreign countries.
10. Few bolts and screws have fractional numbers of threads per inch.

FASTENING DEVICES

THREADED FASTENERS

Distinction Between Bolts and Screws

Despite the progress made in standardizing machine parts, there is still considerable misunderstanding and confusion regarding the names, thread standards, and sizes of bolts and screws.

The public is inclined to make a distinction between two general types of threaded fastening devices, calling one "bolt" and the other "screw." Some manufacturers list every such device as "bolt" regardless of its size or type. Others may list a device as a "bolt" while other manufacturers may list the identical object as a "screw." While there is no single clearcut distinction between a bolt and a screw, there are a few generally accepted distinctions between them:

1. A bolt is usually thought of as a device used with a nut to fasten two parts together. A screw is usually thought of as a device for fastening two pieces together by passing through a hole in one and screwing into a tapped hole in the other, without the use of a nut. Bolts are usually sold with the nuts accompanying them, while screws are not provided with nuts.
2. The head (and nut) of a bolt is generally square or hexagon and is tightened by means of a wrench. The head of a screw is usually round in shape and is provided with a slot or some other means of tightening with a blade, such as a screwdriver. (Exception: hex cap screw)
3. The size of bolts is usually given in fractional inch sizes, such as 1/4", 5/16", etc., while the size of screws may be in fractional inch sizes, but is usually expressed in numbers from 0 to 30, which is the gauge size of the steel wire from which the screws are made.

Fastening Devices
(Information Sheet continued)

Screw Threads

The threads on bolts and screws are spiral ridges made by cutting spiral grooves around the body of a cylindrical piece of metal stock. (See Figure 1) These grooves are cut by means of a tool known as a die or by an automatic screw cutting machine which uses a die or chaser, and in the case of large sizes requiring accuracy, they may be cut on a lathe or on a thread milling machine. The shape of the groove (and hence the shape of the ridge) is determined by the shape of the cutting tool used, and it is obvious that this shape must be standard (always the same) or else bolts, screws, and nuts will not be readily interchangeable. The standard form for threads of bolts and screws is discussed in a later section.

In the following discussion, the term "screw" will not refer to the object known as a screw, but will refer to the threaded portion of any fastening device, whether it be a bolt, screw, or nut.

The pitch of a screw is the distance between corresponding parts of adjacent threads. The number of threads per inch can be measured with a rule as shown in Figure 1-A, which shows the number to be eight. Note that the first thread is not counted. Measuring the number of threads with a rule is difficult if there is not a full inch of threads; the reason being that if the number is odd, say thirteen, the half or quarter-inch graduation on the rule will be opposite a "valley" or groove of the thread and may be difficult to read.

The preferred way to measure pitch is with a screw pitch gage, shown in Figure 1-B. The pitch of a given screw is determined by mating the threads with the teeth of the proper leaf of the gage and then reading the pitch which is stamped on the leaf. The proper leaf is found by trial and error. The screw pitch gage can be used for finding the pitch of internal threads (as in nuts) as well as external threads.

The threads per inch for American (National) Standard threads are shown in Table 1. Such a table is quite useful in finding the proper screw for a certain tapped hole, for replacing a nut on a bolt, or for drilling and tapping a hole for a screw.

Fastening Devices (Information Sheet continued)

Note that it can be seen from this table that practically all the number of threads per inch listed are not only whole numbers but are even numbers as well. In fact, there are only five odd-numbered threads per inch for screws of sizes No. 0 to 3" in the Coarse Series (13, 11, 9, 7, and 5), and there are none in the Fine Series. The only fractional number of threads per inch ($4 \frac{1}{2}$) is for sizes 2" and $2 \frac{1}{4}$ " Coarse Series.

Screw-Thread Form

By 'thread form' is meant the shape of a thread that would be revealed if the longitudinal section bolt or screw were shown. There are about eight different thread forms recognized by the American Standard, most of them being used for special purposes. The thread form used almost exclusively in the manufacture of both bolts and screws is the American Standard, which is illustrated in the drawing to the right. Many foreign countries use different thread forms, making the exchange of such bolts and screws impossible.

$$p = \text{pitch} = \frac{1}{\text{No. threads per in.}}$$

$f = 1/8$ of p .
 $d = \text{depth of thread}$

American Standard Thread Form

Screw Thread Series

The American Standard Thread Form is divided into two principal series: coarse and fine. The form of the thread is the same regardless of whether it is coarse or fine, the difference being in the number of threads in one inch for the same diameter screw or bolt. The designation of these two series is (1) American Standard Coarse (also known as NC and USS), and (2) American Standard Fine (also known as NF and SAE).

Thus a certain bolt, say a hexagon head, $1/4$ " in diameter, $2 \frac{1}{2}$ " in length, may have American Standard threads of either the coarse series (NC; USS) or the fine series (NF; SAE) and its description in a catalog will be:

Fastening Devices
(Information Sheet continued)

1/4 - 20 x 2 1/2 (NC or USS) Hex Head Bolt
1/4 - 28 x 2 1/2 (NF or SAE) Hex Head Bolt

The 20 and 28 have reference to the number of threads per inch for a bolt of 1/4" diameter in the coarse and fine series respectively.

For a bolt of larger diameter, say 1/2", it is necessary that the threads must be larger and fewer per inch for both the coarse and the fine series. In this case the thread description of the bolt will be:

1/2 - 13 x 2 1/2 (NC or USS)
1/2 - 20 x 2 1/2 (NF or SAE)

Definite standards have been set up governing the number of threads per inch for each size screw. The coarse series threads are used with machine bolts and screws for general industrial use, which, it is said, comprise about 80% of all manufactured.

The fine series threads (or about 20% of machine screws) were adopted when it was found that the coarser threads would not stand up under the pressure and vibrations found in modern machinery, principally automobiles. The term SAE refers to "Society of Automotive Engineers," which was instrumental in the standardization of the machine screw threads.

For use in automobiles, the Society of Automotive Engineers adopted still another series, the Extra Fine thread series, for use in certain instances with thin metal where the thread engagement is small. In this series, a 1/2" screw will have 28 threads per inch, instead of 20 in the American Standard Fine series.

BOLTS

One of the most common types of fastening devices found in industry is the bolt, which is a steel rod, threaded on one end with a head on the other. The head is usually six-sided (hexagon or hex), and each side is called a "face," and the distance between any two opposite faces (flats) of the head determines the wrench size.

Fastening Devices (Information Sheet continued)

Bolt Sizes

The dimensions of a bolt are determined by using its diameter (D) as the unit of measurement. This is shown in Figure 2.

1. The diameter of a bolt is the diameter of the body (not the head), the smallest being usually 1/4". The diameters range from 1/4" to 3".
2. The length of a bolt is measured from the underside of the head to the end and varies according to the use to which the bolt is put.
3. The head size of a bolt (W) is the wrench size and is the distance across flats. For standard hexagon machine bolts, it is equal to 1 1/2 times the diameter of the bolt. However, the bolts used by automobile manufacturers do not follow this formula exactly. An explanation of S. A. E. bolt and nut sizes is given in the Information Sheet, "Wrenches."

Designation of Bolt Sizes

When referring to bolts as in orders, parts lists, and correspondence, a standard manner of designating the necessary information is used, with the data listed in the following order:

- | | |
|----------------|--------------|
| 1. Diameter | 4. Finish |
| 2. Length | 5. Type head |
| 3. Type thread | 6. Name |

This information is usually abbreviated as shown in the following example:

1/2" x 2 1/4" - 20NF - 2 Fin. -HEX. MACHINE BOLT

Types of Bolts

The most common types of bolts used for general industrial purposes are: (1) machine bolt, (2) stove bolt, (3) carriage bolt, (4) stud bolt (or stud), and (5) hanger bolt. All are shown in Figure 3 on the page of illustrations.

Fastening Devices (Information Sheet continued)

NUTS

Nuts are of the same size, thread form, and pitch, as the bolt they fit. The standard hexagon nut is also the same diameter as the bolt head, but is somewhat thicker. The thread of a nut is internal (female), and the same standard thread systems apply to them as those previously discussed. Usually the sharp corners on square or hexagon nuts are chamfered to prevent injury to the hand.

Nuts are designed in several types to suit different needs. The most common types are pictured on the page of illustrations and are square, hexagon, slotted head hexagon, castle (or castellated), cap (also called acron and bline), and wing. The hexagon is by far the most-used nut in automotive work, and comes in three different thicknesses: Heavy (also called standard), light (also called half nut), and jam (also called lock). The jam nut is the thinnest and is used with another nut, usually a light or half nut, to lock it on the bolt.

Small thin nuts are sometimes incorrectly called "taps" in certain parts of the country. (A tap is a fluted, threaded tool for cutting inside threads.)

Lock Nuts and Washers

Practically all nuts should be used with a washer of some type. However, some nuts have special safety devices which make this unnecessary. The slotted and castellated nuts (Figure 4) are used with cotter pins or safety wire to prevent them from loosening on the bolt. A few new type lock nuts, which were originally designed for the aircraft industry and which are now being used in other industries, are shown in Figure 5.

Spring steel nuts, such as those shown in Figure 5-A-B-C, are a class of nuts which are growing in popularity due to the fact that they can be installed very quickly and have the combined functions of nut and lock washer. The speed nut, Figure 5-A, has two forked prongs which engage the thread of the bolt and which are sprung inward to engage the bolt tightly when the nut is tightened. These nuts have numerous applications where no appreciable amount of strain is encountered, chiefly in radio and electrical installations and the assembly of parts made from plastics. They are made in angle brackets (Figure 5-B), as well as long metal strips with several "nuts" stamped at desired intervals.

Fastening Devices (Information Sheet continued)

Another type of spring steel fastener is the "Stalock" fastener (Figure 5-C), which grips the thread almost one complete round. This nut may be re-used, whereas many other types are sprung with first use.

An altogether different type of lock nut is shown in Figures 5-D and 5-E. It has two threaded portions through which the screw turns, each being slightly out of "pitch" with the other, causing a compressive action as the nut is tightened.

Lock washers are of several types, the most common being the split ring type shown in Figure 5. Other types have come from the aircraft industry which required light weight washers with great "holding power" and the ability to withstand severe vibration. These are put into a general class known as "shakeproof" washers and come in two chief styles as shown in Figure 5. They have twisted, tapered teeth which engage both the nut and the work so as to make loosening unlikely. Those with teeth inside are for use with fillister head screws, while those with outside teeth are to be used with hexagon and square nuts and screw heads.

SCREWS

Methods of Driving Screws

Although a few types of screws are designed to be tightened with a wrench, the majority of them are provided with slots or sockets for engaging the blade or bit of a screwdriver or specially designed wrench. In recent years the trend has been away from the use of slotted head screws, the reasons being that the screwdriver blade must be properly formed and fit the slot snugly in order that the maximum amount of turning force can be applied without splitting or "chewing up" the screw head. Also, slotted head screws are difficult to start straight unless the screwdriver blade is exactly centered in the slot. The most popular types of driving devices used with screw heads (See Figure 7) and the names by which they are known are:

1. Slotted head for use with the conventional type screwdriver.
One type of slotted head screw, used chiefly in radio work

Fastening Devices (Information Sheet continued)

(Figure 9-A), also has a hexagon head, making it suitable for both ordinary screwdriver or a "Spin-tite" wrench.

2. Hexagon socket head, also known as "Allen head," is used with the "L" shaped, hexagonal Allen wrench or key, shown in Figure 8.
3. Phillips head has a cross-shaped recess and is used with a Phillips screwdriver. Its chief values are ease of starting, attractive appearance, and the fact that the screwdriver cannot slip off the screw head while turning.
4. Reed-Prince head, also known as "cross head," is somewhat similar to the Phillips head and is used with a specially formed screwdriver bit.
5. Spline socket head, also called "fluted head," uses a special splined wrench which permits a maximum amount of force to be applied without splitting or straining the screw head.
6. Clutch head is used with a special screwdriver bit designed to permit considerable turning force. It is claimed that this type screw head makes starting screws in hard-to-get-at places easier since the screw will fit the bit snugly without falling off.

The recessed type of screw head was used principally with set screws and machine screws until a comparatively short time ago. Today, the use of such screw heads has been extended to almost every type of threaded fastening device, including stove bolts, self-tapping screws, and wood screws.

Needless to say, the universal use of special screw heads of the types described above necessitates the purchase of many different types and sizes of screwdrivers by the mechanic. The good mechanic always uses the correct type and size of driver for each specific screw.

Screw Specifications

Screws are designated in the same manner as bolts as shown in the example below:

Fastening Devices (Information Sheet continued)

(Complete)	No. 10 x 1 1/2" - 24-3FIN. FILL HD. MACHINE SCREW
(Abbreviated)	10 x 1 1/2" - 24 FILL HD. MACH. SCR.
(Complete)	No. 3/8 x 2 1/2" - 24NG-3 FIN. NX. HD. CAP SCREW
(Abbreviated)	3/8 x 2 1/2" - 24 NF-HX. HD. CAP SCR.

Cap Screws

The largest screw for fastening two pieces of metal together is the cap screw, which passes through a clearance hole in one piece and fastens it by screwing into a tapped hole in the second piece (See Figure 6). They are available with threads of either the American Standard Coarse or Fine series and in sizes from 1/2" to 1" and over. The lengths are usually from 1/2" to 6".
