ACHIEVEMENT, PERFORMANCE FACTORS, \*BEHAVIOR CHANGE, CLASSROOM  
RESEARCH, \*CORRELATION, HEAD START, PSI, BI, STANFORD BINET,  
CLASSROOM OBSERVATION FORM,

THIS DOCUMENT IS SECTION 3 OF A 3-PART REPORT BY THE EDUCATIONAL TESTING SERVICE. THE DATA USED IN THIS SECTION WERE COMPILED FROM 79 CLASSES CONTAINING ABOUT 1,000 PUPILS. THE CLASSES WERE PART OF THE 1966 SUMMER HEAD START PROGRAM. THE PURPOSE OF THIS DOCUMENT IS TO NOTE GENERAL PERFORMANCE CHANGES IN THE PUPILS AS MEASURED BY TESTS ADMINISTERED AT THE BEGINNING OF THE PROGRAM AND AGAIN AT THE END. THE RESULTS WERE INTERPRETED AS SHOWING THAT, ALTHOUGH THE PUPILS' SCORES WERE BELOW THE DESIRED INTELLIGENCE LEVEL NORMS OF THEIR AGE-GROUP AT BOTH THE BEGINNING AND END OF THE PROGRAM, SOME POSITIVE IMPROVEMENT DID OCCUR. BECAUSE OF THE EXPERIMENTAL DESIGN, IT WAS NOT POSSIBLE TO DEFINITELY ASSESS THE EXTENT, OR EVEN THE VERY EXISTENCE, OF CONTRIBUTIONS BY 4 POSSIBLE CAUSES OF THE IMPROVEMENT IN PERFORMANCE. THE 4 POSSIBLE CAUSES WERE (1) THE HEAD START PROGRAM, (2) MATURATION, (3) OUTSIDE EXPERIENCES, AND (4) TESTING EFFECTS. A SECOND ASPECT OF THE STUDY, CLASSROOM OBSERVATION, PRODUCED AN ADDITIONAL SET OF POSSIBLE INFLUENCES ON PUPIL PERFORMANCE, NAMELY, (1) TEACHER CHARACTERISTICS, (2) PUPIL CHARACTERISTICS, (3) PUPIL EXPERIENCES IN THE CLASSROOM, AND (4) SCHOOL-COMMUNITY-PARENTAL FACTORS. Final Report under  
Contract No. OEO-1359  
dated June 15, 1966  
between  
Educational Testing Service and  
The Office of Economic Opportunity

This is one of three sections of the Final Report.  
The sections are:

- I. Some Characteristics of Children in the Head Start Program, by Richard H. Williams and E. Elizabeth Stewart.
- II. Facilities and Resources of Head Start Centers, by Joseph L. Boyd.
- III. Pupils and Programs, by George Temp and Scarvia B. Anderson.

Prepared by Educational Testing Service solely for submission to the United States Government under terms of Educational Testing Service contract with the United States Government acting through The Office of Economic Opportunity.

Reproduction of any part of this material, exclusive of copyrighted material, is permitted for any purpose of the United States Government.

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE  
OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

### Background Note

The purpose of this report is to summarize data collected on behalf of the Research and Evaluation Division, Project Head Start, Office of Economic Opportunity. The data reported and discussed here were compiled on the Summer 1966 Project Head Start program under provisions of a contract between Educational Testing Service and the OEO.

The portion of the contracted work reported in this section deals primarily with investigation of the relationships between pupil and program characteristics and pupil outcomes on certain prescribed instruments and other newly developed instruments. As contractor, ETS was requested to (a) collect pre and post pupil performance data on all children in selected classrooms; (b) conduct and record intensive observations of these classrooms; (c) appraise involvement of parents in the program; and (d) perform such statistical analyses as might be necessary to determine the relationships among the measured variables.

In cooperation with the Research and Evaluation Division of Project Head Start a design for analysis of all data collected was prepared. This design was guided by a list of research and evaluation questions provided by personnel from Project Head Start with suggested amendments by ETS staff.

The following pages, with technical appendices, represent the Final Report of work completed under the arrangements noted above.

#### Acknowledgments

The authors of this report are greatly indebted to:

Dr. Edmund Gordon, Director, Research and Evaluation, Project Head Start, Office of Economic Opportunity, for the many penetrating questions he posed during the course of the study.

Dr. Joseph Boyd who served as coordinator of all of the Head Start work ETS conducted in the summer of 1966.

Other ETS staff members from Curriculum Studies, Statistical Analysis, and Data Processing who helped with the design and analysis of the study: Dr. Elizabeth Stewart, Dr. Donald Trisman, Dr. Richard Williams, Mrs. Arleen Barron, Miss Elaine Marikakis, Mr. William Van Hassel, and Mr. Robert Stellman.

Dr. Marshall P. Smith, Trenton State College, who served as a consultant to the project.

Psychologists and educators (listed in Appendix) from all over the country who quickly and efficiently mobilized the necessary teams of testers and observers to collect the data of the study.

The Head Start Centers and teachers who were wonderfully cooperative.

The parents who willingly answered our interviewers' questions.

And--most of all--the children.

Summary of Highlights of this Section

(Project Head Start--Summer 1966)

Pupils and Programs

1. The classes (children) studied in summer 1966 Head Start programs, although still below established and desirable developmental performance on the widely-used Stanford-Binet intelligence test, performed beyond what would be expected on the basis of the time intervening between observations.
2. These same classes (children) on a newly developed inventory of behaviors (Project Head Start Behavior Inventory) were generally scoring positively at the beginning of the instructional sessions and slightly more positively at the end.
3. Summer 1966 Head Start classes (children) on the Preschool Inventory obtained higher total scores (and higher subscores) at the end of the instructional program than at the beginning.
4. Teachers of Head Start classes were in general prepared and experienced.
5. Classroom observed activities, although varied, were in the direction desired by child development experts.
6. Parental evaluation and involvement in Head Start programs was high and positive.
7. Only a few associations between specific differences in Head Start classes and amount of pupil change were noted.

## FINAL REPORT

There are very large differences in children admitted to Head Start centers and equally large differences in "graduates" of such programs. This truth is well known. And the need to present evidence of these differences is not great, although such evidence is of some interest to most readers. However, there is a need to look at this same information in other ways when you wish to talk about possible effects of Head Start participation on children. Specifically, we shall look at the information collected in order to describe children at the beginning of Head Start and at the end, and to point to particular changes observed.

The actual instruments used to observe children will limit, of course, the portion of their development that can be discussed--many important areas of personal growth, motivation, and success were not observed. All studies of human behavior draw the line somewhere in the interest of time or money or respect for individuals. The present study limited observation to two individual sessions per child and two classroom observations of a nationwide sample of 79 classes with nearly 1,000 pupils during the summer 1966 Head Start program. Therefore, no child nor class was interrupted for very long from the educational purposes of the program and most classes and children were not disturbed at all. In addition, information about teachers' experience and training and parental

knowledge of the local Head Start effort was collected.

Classes were observed because they, just as children, also vary. There are different facilities and materials available; teachers approach their responsibilities differently; and the curriculum is not so ordered or set as in more formal class situations. If changes were noted in the children of Head Start, it seemed sensible to see whether variations in programs were associated with these changes. The use of such information for future Head Start program planning will be discussed. Of course, information about classroom differences is also limited to the actual observations made from the unlimited number of possible observations that could have been made.

The identification of reliable scientific knowledge is a difficult task and many pitfalls exist in uncovering it. Commonly, there are agreements about data but disagreements about what such information means. A number of technical appendices are included for the aid of persons desiring to examine in detail the data collected and the methods used to obtain it.

Where were Head Start classes (children) at the beginning?

The first observation of Head Start children was begun as soon as practical after the first week of the 1966 summer programs. Because of individual, local administration of all Head Start programs, different starting dates were common. However, individual pupil information collec-

tion was started early in each program. The instruments used were the Stanford-Binet (I-M, short form), the Project Head Start Behavior Inventory, and the (Caldwell-Soule) Preschool Inventory.

The following table summarizes information obtained using the well-known and widely-used Stanford-Binet:

TABLE 1.

First Observation of Head Start Classes  
(Stanford-Binet, short form)

Average actual age of classes = approx. 5 years 9 $\frac{1}{2}$  months old

Average mental age of classes = approx. 5 years old

(average all classes, rounded numbers)

(The 79 classes observed ranged from average mental age equal to approx. 4 years old to average mental age equal to approx. 6 years 8 $\frac{1}{2}$  months.)

\* \* \*

On the Project Head Start Behavior Inventory, groups of items are scored to produce subscores. To indicate the kinds of information collected the first such group of items is reproduced below. (See Appendix B for all subscores.) The purpose of such a Behavior Inventory is descriptive. It is difficult, however, to interpret such descriptions without deciding upon some goal desired or without comparing one group's description with another group's description. In the present study, only Head Start children were involved so the interpretation presented is from first observation to second. (See section on Observed Changes, pp. 13-15.)

TABLE 2.

First Behavior Inventory of Head Start Classes  
 (subscore one, only)

Items

- 33. Likes to talk with or socialize with the teacher
- 35. Is eager to inform other children of the experiences he has had
- 38. Is usually polite to adults; says "Please," "Thank you," etc.
- 45. Is wanted as a playmate by other children
- 7. Often keeps aloof from others because he is uninterested, suspicious, or bashful
- 16. Has little respect for the rights of other children; refuses to wait his turn, usurps toys other children are playing with, etc.
- 24. Is reluctant to talk to adults; responds verbally only when urged
- 37. Is uncooperative in group activities

Subscore One Data

Highest possible score = 32  
 Lowest possible score = 8

Highest scoring class = 29  
 Lowest scoring class = 17

Average score of 79 = 23  
 Head Start classes  
 (rounded numbers)

\* \* \*

Similarly, groups of items on the Preschool Inventory are scored to produce subscores. However, it is also possible to derive a total score based upon all of the items in the inventory. Reported below are sample items from each of the four subscores in this inventory but with total score performance reported rather than subscores. (See Appendix C for all scores.)

TABLE 3.

First Preschool Inventory of Head Start Classes  
(selected items--total score)

Items (examples)Subscore one

When is your birthday?  
 Put one car in middle-size box.

Subscore two

What time of year is hottest?  
 What does policeman do?

Subscore three

How many wheels on a wheelbarrow?  
 Point to middle one. (object)

Subscore four

Draw a triangle.  
 Which is heavier--brick or shoe?

Total Score Data

Highest possible score = 90  
 Lowest possible score = 0

Highest scoring class = 70  
 Lowest scoring class = 26

Average score of 79 = 53  
 Head Start classes

(rounded numbers)

\* \* \*

A generalized summary of the information above (and in the Appendices) to answer the question of where were Head Start classes (children) at the beginning of the summer program would be:

The children studied in summer 1966 Head Start programs were generally below established and desirable developmental performance on one widely-used intelligence test; were generally scoring positively on an inventory of behaviors (desired and undesired); and were able to answer correctly about 59 percent of the preschool inventory questions at the beginning of the instructional sessions.

Where were Head Start classes (children) at the end?

The second individual observation of the same Head Start children was scheduled to begin during the next to the last week of the summer program (usually eight weeks). This was to allow for adequate time for all observations and to keep from losing individuals because of early departure. The instruments used were the same. The following tables summarize information obtained on the same classes (children) and the same instruments reported earlier.

TABLE 4.

Second Observation of Head Start Classes  
(Stanford-Binet, short form)

Average actual age of classes = approx. 5 years 11 months old

Average mental age of classes = approx. 5 years  $3\frac{1}{2}$  months old

(average all classes, rounded numbers)

(The 79 classes observed ranged from average mental age equal to approx. 4 years 2 months to average mental age equal to approx. 7 years.)

\* \* \*

(See table on the following page)

TABLE 5.

Second Behavior Inventory of Head Start Classes  
 (subscore one, only)

Items

- 33. Likes to talk with or socialize with the teacher
- 35. Is eager to inform other children of the experiences he has had
- 38. Is usually polite to adults; says "Please," "Thank you," etc.
- 45. Is wanted as a playmate by other children
- 7. Often keeps aloof from others because he is uninterested, suspicious, or bashful
- 16. Has little respect for the rights of other children; refuses to wait his turn, usurps toys other children are playing with, etc.
- 24. Is reluctant to talk to adults; responds verbally only when urged
- 37. Is uncooperative in group activities

Subscore One Data

Highest possible score = 32  
 Lowest possible score = 8

Highest scoring class = 30  
 Lowest scoring class = 20

Average score of 79 = 24  
 Head Start classes  
 (rounded numbers)

(See table on the following page)

TABLE 6.

Second Preschool Inventory of Head Start Classes  
(selected items--total score)

Items (examples)Subscore one

When is your birthday?  
 Put one car in middle-size box.

Subscore two

What time of year is hottest?  
 What does policeman do?

Subscore three

How many wheels on a wheelbarrow?  
 Point to middle one. (object)

Subscore four

Draw a triangle.  
 Which is heavier--brick or shoe?

\* \* \*

To answer the question (where were Head Start classes (children) at the end) in a generalized way, based upon the information collected, it can be stated:

The children studied in summer 1966 Head Start programs were generally below established and desirable developmental performance on one widely used intelligence test; were generally scoring positively on an inventory of behaviors (desired and undesired); and were able to answer correctly slightly more than 64 percent of the preschool inventory questions at the end of the instructional sessions.

Total Score Data

Highest possible score = 90  
 Lowest possible score = 0

Highest scoring class = 74  
 Lowest scoring class = 35

Average score of 79 = 58  
 Head Start classes

(rounded numbers)

Were changes observed in Head Start classes (children)?

Although to some people the generalized answers to the questions about beginning and ending status of Head Start classes would seem to dictate the answer to the present question, such is not the case. A comparison of before and after statements on a point by point base (with accurate, comparable numbers) must be made to reveal the differences often hidden by gross generalized comparisons. However, because it is only possible to measure human behavior roughly, often two precise measurements although apparently different may neither be correct; they may be only slightly negative and slightly positive descriptions of the same thing.

Errors from looking at only gross comparisons are avoided by attempting precise measurements of people and outcomes. Errors from too much dependence upon precise measurement are avoided by statistical analysis. The ways of allowing for such measurement errors are well developed in scientific work and the details need not delay us here. (See Appendices A, B, and C for statistical tests used.)

In order to answer the question about whether changes were observed in Head Start classes (children), we must look at both before and after performance on a point by point basis, and we must test that any changes so revealed are statistically significant changes.

The following tables place relevant information reported earlier and available in the Appendices in position for easy comparison.

TABLE 7.

Observation of Head Start Classes (Stanford-Binet, short form)  
(79 classes)

	<u>Average Actual Age</u>	<u>Average Mental Age</u>	<u>Average I. Q.</u>
First observation	5 years 9½ months	5 years	85
Second observation	5 years 11 months	5 years 3½ months	89+
Statistically Significant Gain	1½ months	3½ months	4½

(all rounded values in table)

\* \* \*

TABLE 8.

Observation of Head Start Classes (Behavior Inventory)  
(79 classes)

<u>Behavior Inventory</u>	<u>Possible</u>		<u>First Observation</u>	<u>Second Observation</u>	<u>Statistically Significant Gain</u>
<u>Subscore</u>	<u>Low</u>	<u>High</u>	(average all classes, rounded numbers)		
1	8	32	23	24	yes
2	6	24	16	16	no
3	8	32	22	23	yes
4	4	16	10	11	yes
5	8	32	24	24+	yes
6	4	16	12	12	no
7	4	16	12	12	no
8	6	24	16	17	yes
9	2	8	5	5+	yes

\* \* \*

TABLE 9.

Observation of Head Start Classes (Preschool Inventory)  
(79 classes)

<u>Preschool Inventory</u>	<u>Possible</u>	<u>First Observation</u>	<u>Second Observation</u>	<u>Statistically Significant Gain</u>
(average all classes, rounded numbers)				
Subscore 1	26	18	20	yes
Subscore 2	26	11	12	yes
Subscore 3	19	10	11	yes
Subscore 4	19	14	15	yes
Total Score	90	53	58	yes

\* \* \*

To summarize the above information in general terms:

1. The classes (children) studied in summer 1966 Head Start programs, although still below established and desirable developmental performance on the widely-used Stanford-Binet intelligence test, performed beyond what would be expected on the basis of the time intervening between observations.
2. These same classes (children) on a newly developed inventory of behaviors (Project Head Start Behavior Inventory) were generally scoring positively at the beginning of the instructional sessions and slightly more positively at the end.
3. Summer 1966 Head Start classes (children) on the Preschool Inventory obtained higher total scores (and higher subscores) at the end of the instructional program than at the beginning.

What are the reasonable alternative sources of these observed changes?

Concern in interpretation of the reported changes mentioned above arises from the fact that human beings (especially young children) are constantly exposed to many experiences that may influence their behavior and learning. For example, during the period of time of an investigation of the effect of certain school experiences on youngsters, the children are also watching television, talking to adults and other children, enjoying or reacting to experiences in the home and neighborhood.

In well controlled experimentation certain procedures may be built into the study to assess the effects of these and other experiences in order that clear-cut statements may be made about the effect on children of the school experiences being investigated. These procedures generally involve random assignment processes and control group methods.

In the present study random assignment was not possible and appropriate control group data were not readily collectable within the limitations of time and money. Therefore, certain reasonable alternatives must be considered in attempting to decide what particular sources of learning and changed behavior might account for the gains noted in Head Start classes during summer 1966.

The four reasonable sources of changes in the children studied are:

- (1) Head Start programs
- (2) Maturation

(3) Outside experiences (home, play, etc.)

(4) Testing effects

Although it will be impossible to decide among these alternatives unequivocally (and all probably contribute to the noted gains), it is helpful to discuss in general terms the different effect to be expected when each is the dominant source of change.

Program changes (such as those introduced by Head Start) most generally should result in rather sudden gains on the specific skills, abilities, and knowledge provided in any curriculum. This is nothing more profound than saying that children learn what is specifically taught and they ought to gain on measures that are directly or indirectly related to the instructional content.

Maturational changes refer to gains noted over a period of time on aspects of development for which we often cannot identify any instructional situation. That is, for example, children may not be able to run at one age and then at a later age are observed to be running quite well --all without specific instructional aid or intent. An identifying characteristic of maturational changes is relative slowness or undifferentiated acquisition stages before change is noted from one observation to another. Therefore, most authorities agree that maturational changes are a constant and underlying source of observed changes (especially in younger children). Such change processes should be considered whenever

substantial periods of times are covered by an investigation. Because of the slowness of maturational processes, it seems unlikely that they could account for the gains noted in Head Start children (except, perhaps, the gains noted on the Behavior Inventory).

Another source of change with possibly sudden or drastic results in observed behavior, however, is individual experiences outside of the class time devoted to Head Start. Such experiences are, in effect, the "curriculum" of the home and neighborhood and its results may be very much like the program or planned experiences in the school, especially the preschool. It would be fruitless to argue the case for or against the effect of outside experience during the summer of 1966 without data from children eligible but not enrolled in summer 1966 Head Start programs. It seems unlikely, however, that such outside experiences as might have occurred during that summer were substantially different from those experiences which have occurred in the past. (These past experiences had produced so little effect that Head Start programs were initiated to remedy the deficit.) A defensible position is that outside experiences undoubtedly contributed to the noted gains but cannot account for the unexpected gain in mental age, for instance, above and beyond  $1\frac{1}{2}$  months. Future research may provide evidence so this question can be decided on a factual basis.

Testing effects as a possible source of observed changes is at least partially eliminated by the statistical tests already reported on the in-

formation obtained. The noted and emphasized changes have survived an evaluation that takes into account testing fluctuations. There are, however, other possible influences of tests on students and teachers which are not evaluated by the statistical methods used. These include reactions to (or learning from) the tests by both students and teachers, the added experience or reaction of test administrators, and variations induced by personal reactions between the test administrator and the student taking the test.

It is possible, of course, to defend the idea that even while taking a test a child at this age is constantly learning. In particular he is learning how to interact and react to adults and new situations. Such learning would seem to be an important outcome for Head Start children. To be able to state exactly what portion of change is due to this one learning experience (and from each of the numerous other possible sources of changed scores) a controlled investigation is necessary.

In the present case, as noted, rigorous control was not practical and therefore mention must be made of several possible sources of change noted above. It is possible that a case could be made for any of these alone or in combination as accounting for a portion of the gains in overall class means cited earlier.

To summarize, it is stated that there are several possible alternatives as sources of the observed changes in summer 1966 Head Start

children that should be considered. An extreme position would be that all of the noted gains could be attributed to sources other than the program of Head Start; a more realistic position would be that a portion of the gain should be attributed to factors other than Head Start programs. However, it is not unreasonable to assume on the basis of the information reported that the program of Project Head Start did make a difference in children.

Did Head Start classes differ? In what ways?

To those acquainted with the problems of instruction of any age group, the answer to the first question is well known. Yes, Head Start classes, as classes of all kinds, did differ from each other in many aspects. Only a portion of the many ways in which classes are likely to differ were studied. For each of the selected ways in which classes were to be studied some schedule or procedure of observation was designed. These information collection forms are available in a separate appendix. In general, the differences studied may be grouped in four broad areas:

- (1) Teacher's background and experience
- (2) Characteristics of students in the class
- (3) Specific observed experiences of students
- (4) Various school-community-parental attributes

The four tables following, although lengthy, summarize most of the descriptive information collected. Particular portions of each table are discussed within the text but the reader is urged to explore all information in the tables in order to form his own picture of the ways in which Head Start classes varied.

#### Variations in teacher characteristics

Answers to 11 specific questions about the teacher's training and experience form the background for attempting a descriptive paragraph or two about the instructional staff in summer 1966 Head Start. The format of this information collection sheet was simple and direct. No teacher needed to spend more than a minute or two in completion of the information. A copy of the form is in the Forms Appendix and should be examined to see the choice format of this schedule.

If it was desired that Head Start teachers be experienced, female, specially (although briefly) trained for Head Start, and from predominantly elementary education college majors, such was largely the case. Response summaries in Table 10 show the exact percentages of teachers selecting each alternative.

Most Head Start teachers also had taught preschoolers and the educationally disadvantaged prior to the summer 1966 program. About 41% stated that they live in the neighborhood served by the Head Start

TABLE 10.  
How Do the Head Start Classes Vary?  
In terms of Teacher Background and Experience

	<u>No. of Teachers</u>	<u>Percentage</u>
Sex	78	
male		5.1
female		94.9
All teaching experience -	74	
first		5.4
some but < 5 yrs.		25.7
> 5 yrs.		68.9
Preschool teaching experience -	74	
first		36.5
some but < 5 yrs.		41.9
> 5 yrs.		21.6
Previous experience with Head Start -	78	
none		59.0
yes, but not as teacher-in-charge		7.7
as teacher-in-charge		33.3
Experience working with disadvantaged children -	78

6-day college sponsored		76.5
8-week college sponsored		4.4
Residence -	78	
not in center neighborhood		59.0
in center neighborhood		41.0
Number of Head Start classes taught concurrently	78	
one		93.6
more than one		6.4

center in which they worked. It is interesting that over 16% held a Master's Degree or above. Few teachers were responsible for more than one class during the summer program.

In summary, although classes of course have only one particular teacher, teachers of Head Start classes were generally prepared and experienced. This means that the chance of any particular child having a prepared and experienced teacher for the summer Head Start program was very high.

#### Variations in characteristics of pupils in Head Start classes

Although differences among classes because of differences among children have been implicit in data presented earlier in this report, it is appropriate to look at these data once again to emphasize such variation. In particular, classes varied in the average value obtained on the Stanford-Binet, the Behavior Inventory, and the Preschool Inventory. In addition, classes may also be described as varying at both the first and second collection of information with these same instruments as well as in amount of change on the same three. Table 11 presents in summary form this information about differences in classes.

Other differences in pupils were collected on the student identification sheet of the Preschool Inventory. Thus, it was possible to calculate proportions or percentages of students in each class with

TABLE 11.  
How Do the Head Start Classes Vary?  
In terms of Pupil Characteristics  
(N = 79 classes)

		<u>Mean of Means</u>	<u>Std.Dev. of Means</u>	<u>Lowest Mean</u>	<u>Highest Mean</u>
Binet M.A. -	pretest mean	59.74	6.63	45.50	80.40

certain distinguishing characteristics. Among these characteristics were mean age of pupils in each class and the spread of ages in a class. Interestingly, although the ages of children in Head Start classes were generally about 5 years 9 months, there was variation from one class with an average age just over 4 years to one with an average age just about  $6\frac{1}{2}$  years.

Another example was the percentage of pupils with English as their major language. Some 82% of the classes were completely English speaking. However, 2 percent of classes were composed of students whose major language was not English.

#### Specific observed experiences

A Classroom Observation Form was designed to systematize the collection of information during the requested "intensive classroom observation" phase of summer 1966 Project Head Start evaluation. Within the purposes of the evaluation it would have been feasible to send educated observers into each of the selected classroom and to ask them to report back in essay form what they had seen. Such reports have been collected before and, when cautiously interpreted, have aided in the formulation of judgments about programs and suggested hypotheses to be tested under more rigorous conditions. In the present instance, it was felt that a small step toward more objective information might be reasonable.

TABLE 12.

**How Do the Head Start Classes Vary?**  
**In terms of Classroom Program, Climate, and Organization**  
**(Based on 62 classes for which data from two observations are available)**

	<u>Mean</u>	<u>Std. Dev.</u>	<u>Lowest</u>	<u>Highest</u>
Adult/pupil ratio	.20	.07	.09	.40
Rating of adequacy of physical facilities (sum of two ratings, each on 5-point scale from 1 low to 5 high; highest possible score = 10)	6.52	1.66	4	10 (10% of classes)
Rating of availability of instructional and other materials (same type of score as above)	6.55	1.44	4	10 (8% of classes)
Rating of quality of teacher, from 2 low to 10 high (same type of score as above)	6.71	1.52	4	10 (5% of teachers)
Rating of general emotional climate, from 2 unsupportive to 10 supportive (same type of score as above)	8.06	1.24	4	10 (15% of classes)
Rating of organization of activities, from 2 unstructured to 10 structured (same type of score as above)	6.65	1.94	2 (5% of classes)	10 (5% of classes)
Rating of content of activities, from 2 playful stress to 10 informational stress (same type of score as above)	5.50	1.54	2 (5% of classes)	10 (2% of classes)
Percentage of observed classroom behavior (average from two observations) falling into the category of--				
child's choice of activity	18.72	12.04	0	60.71
physical affection shown by teacher or aide	12.78	8.67	0	39.00
child joining another child's activity	13.92	11.63	0	66.63
child encouraged to talk	13.44	9.22	0	48.79
child laughing out loud	14.43	8.69	0	36.75
teacher or aide reading aloud	3.84	4.21	0	18.06
child's talk interrupted by teacher or aide	.50	1.64	0	11.12
child's yawning or resting (not during rest period)	2.74	3.23	0	12.50
child admonished about talking	3.24	4.35	0	15.32
child crying or pouting	3.77	3.83	0	14.16
child hitting another child	4.35	5.05	0	20.87
child's lack of interest	8.23	7.80	0	39.60

	<u>Mean</u>	<u>Std.Dev.</u>	<u>Lowest</u>	<u>Highest</u>
Score for classroom based on first 11 categories <u>below</u> and two ob- servations (possible score range 0-22)	18.15	2.96	10	22 (13% of classes)

Percentage of classrooms where the  
following were observed--

	<u>During one of two observations</u>	<u>During both observations</u>
no case in which class could be described as apathetic	6.5	93.5
no case of teacher using sarcasm or ridicule with children	11.3	88.7
evidence that each child felt accepted in the class	12.9	85.5
attention to isolated children	12.9	83.9
children talking to each other spontaneously and after	16.1	80.6
no case of teacher or aide spending long periods talking, telling while children said nothing	24.2	72.6
no period when no one seemed to know what to do	14.5	71.0
opportunities for children to speak before a group	24.2	64.5
exhilarated, excited classroom	19.4	58.1
no children who did not talk to anyone	30.6	53.2
teacher and children plan and complete activity	41.9	48.4
teacher punish child or class with words or actions	37.1	45.2

Consequently, the Classroom Observation Form (included in the Forms Appendix) was written, revised on the basis of consultant comments and trial, and then utilized in the summer 1966 Project Head Start evaluation. Because the summer 1966 evaluation was the first large-scale use of the form, careful attention to the data collection situation must be given during interpretation of the data.

It was hoped that observations of Head Start classes by representatives of ETS would result in several specific behavioral ways to distinguish among classes. Evidence that the particular behaviors did differentiate among classes is contained in Table 12. Such summary data indicate that the behaviors observed occur in different frequencies and that classes vary on any particular behavior in expected ways. Several general statements are of interest:

1. Pupil choice of activities and opportunity to interact with other children were generally observed.
2. Encouragement for verbal activities was strong in most classrooms.
3. General trends for both specific behaviors and more global observed activities were in directions endorsed by most child development experts.

Some descriptive highlights from the classroom observation form indicate that observers saw evidence that each child felt accepted in the

class (94% first observation; 90% second observation); that few class-rooms were described as apathetic (3% first and second observation); and that children were given opportunities to speak before the whole group or small groups of other children (81% first observation, 73% second obser-vation).

In general, the desired direction on each of the 12 global descriptive questions was selected by no lower than 60% of the observers on any occasion. Most percentages were higher and ranged from 60 to 97% in the direction endorsed by child development experts in general discussions of desirable activities and environments for preschool children.

If it was desired that Head Start classes be supportive emotional climates for pupils, the observers report that most teachers were very supportive; no teacher was rated as highly unsupportive.

The structure or organization of the classroom experiences was also reported as generally structured and this is in conjunction with the report that most classes generally stressed playful aspects of ac-tivities. Such terms may be difficult to define but as indicators of general emphases of programs they seem adequate. Highly professionally skilled judges were later used to estimate the reliability of the rating scales and such study indicates the general concepts communicate re-liably.

Parent interview schedule

The parent interview schedule was developed in response to the request to obtain information about "parental evaluation of and involvement in the program." The content and format of the instrument were predicated on four assumptions:

1. The more the parent knows about the program in which her child is enrolled the more "involved" she is.
2. "Whether she would want to send another child to Head Start" is more relevant to her evaluation of the program than her response to such a general question as "What do you think of Head Start?"
3. Communication with parents of Head Start children may be difficult, and thus the interviewer should have a great deal of freedom and flexibility in asking questions.
4. The interview should be as brief and unthreatening as possible; it will be less threatening if the atmosphere is more one of obtaining information about the center than about the parent.

As would be expected, average class scores showed a restricted range: 9 to 14.5 (Table 13). Although these average scores are the data of the present classroom analysis, it is of interest to review briefly the individual responses of the 886 parents on whom complete interview data were obtained:

Questions

- 1, 2: Three-fourths or more of the parents had accurate information about whether their children had been given medical and dental examinations.

Questions

- 3, 5, 11: About 90% of the parents knew something about field trips in the program, said they talked to their children about what they did at Head Start, and knew about the meals the center provided their children.
- 4: However, relatively few (30%) could state (within 3) how many children were in their children's classes.
- 10, 6: Over 80% knew their children's teachers' names, and 70% said they had actually talked to the teachers about their children.
- 9: About the same percentage indicated they had talked to relatives and friends about their children's being in Head Start.
- 7, 8: However, many fewer (only about 30%) said that they had talked to Head Start social or medical workers about their children. (Whether such workers were in fact available was not determined.)
- 12: About 30% of the parents had not visited the Head Start center, but only a tiny fraction of those expressed no desire to do so. Of the 70% who had visited the center, about 10% had actually worked there (as aides, helping on trips, etc.).
- 13, 14: Almost all parents (over 90%) felt that Head Start had made a difference in their children, but only about half said it had made changes in their own lives.
- 15: Almost all the parents (97%) said they would want to "do it again"--send another child to Head Start.

TABLE 13.

33

**How Do the Head Start Classes Vary?  
In terms of Parent Characteristics**

	<u>No. of Classes</u>	<u>Mean of Medians</u>	<u>Std.Dev. of Medians</u>	<u>Lowest Median</u>	<u>Highest Median</u>
Median annual income for the class (where 1 = < 1,000, 2 = 1,000 - 1,999, 3 = 2,000-2,999, 4 = 3,000-3,999, 5 = 4,000-4,999, 6 = 5,000-5,999, 7 = 6,000-7,999, 8 = 8,000-9,999, 9 = 10,000 or more)	75	3.98 (about \$3,500)	1.18	1.43 (about \$1,000)	6.25 (about \$5,750)
		<u>Mean of Means</u>	<u>Std.Dev. of Means</u>	<u>Lowest Mean</u>	<u>Highest Mean</u>
Mean "Involvement" score, based on interview (possible range 0-17)	77	11.75	1.30	9.00	14.50
		<u>Mean of Percentages</u>	<u>Std.Dev. of Percentages</u>	<u>Lowest Percentage</u>	<u>Highest Percentage</u>
Percentage of noninterviewable mothers in the class	79	8.59	17.45	0 (57% of classes)	100 (3% of classes)

These conclusions, of course, cannot be generalized to the "non-interviewable" mothers, of which there were one or more in 32 of the 77 classes which form the N of this study. Because it was suspected that mothers who were hard to track down for interview (i.e., could not be located in three visits) may be different from the other mothers, the percentage of them in each class was included as a variable in the large correlational matrix.

#### Comments of classroom observers

Before going on to examine whether there were or were not associations between the specific differences described in the preceding tables and the amount of change noted in classes (children), some subjective comments collected from the observers actually present in the 79 Head Start classes may be of interest. It should be noted that these comments are not meant to represent the full range of activities and incidents that occurred and a particular incident may have occurred only once in all of the summer 1966 program while others may have been frequent events.

For their human interest then the following comments (selected by opening to observation schedules in a pile like a deck of cards) are noted:

- (1) Teacher showed me a drawing a boy had made. Coordination so poor when he entered he could not feed himself. Made short circling line marks on paper. Today for first time filled his page with continuous curving lines across page. Is now feeding himself. Teacher commented that 2 more weeks would have meant much to this child.
- (2) Two girls playing with wagon and trike tied together for a long time. A third girl wants a turn. Aide gives a little talk on sharing, explaining that in school we share. First two girls look bewildered and both leave in complete surrender. They are back later, however.
- (3) One little boy, Danny, came up and asked me if I knew that his daddy had gotten him a dog. He stayed with me for several minutes.
- (4) One boy brought a sack of pretty rocks. The teacher developed a good arithmetic lesson. The children estimated the number of rocks, then grouped the rocks in fours to count them. The teacher also brought in enumeration and comparison as she shared the rocks.
- (5) One child was noticeably quiet--she had been fitted for glasses the previous day--this observer felt the child was seeing things for the first time--she was especially fascinated by books and pieces of construction paper.
- (6) The use of real telephones by the children who were able to make calls to each other by pressing a bell elicited one conversation between two boys regarding the worth of girls--after a lengthy discussion which was

humorous they concluded that boys really are the superior sex--or in their words "good for more." This equipment was one of the most popular in the room and the teacher was always aware of how it was being used--the children were encouraged to use good speech--and manners.

- (7) Two paper plates labelled "big" and "little." Children one at a time sorted two sizes of beans for a mixed collection. One girl did successfully. Teacher tried to get "problem" boy to do this--he refused.
- (8) All day Johnny craved and demanded attention. While sitting at the teacher's feet he asked to go live with her. She told him she would very much like that, but pointed out that his family would be unhappy and that she had children of her own and no extra bed. He said that he had to sleep on the floor without "cover" and he didn't live with his mama and daddy anyway.
- (9) Students are well supervised during their eating periods. They are encouraged to eat all their food but not rushed. Have learned to discard straws and cartons in proper containers, return trays, and push chairs up to table.
- (10) One child sustained a cut on his hand while playing with a steel chair. He received immediate sympathy and support from all his classmates.
- (11) One little boy was present a few days and has been absent for two weeks. The difference in his actions and those of the other children could be a good measurement of what Head Start can do for children.

(12) A very positive approach taken by the teacher including the use of a Polaroid camera on the field trip--which excited the children when they saw the pictures and--further seemed to give them a favorable source of group identity.

Perhaps these few are enough to give the flavor of the human interactions among students and between students and teachers and to make, once again, the point that classes do differ in what occurs within them. Obviously, only a few of the more readily observed and recorded differences among classes have been reported in the more objective tables. The area where this report can claim to speak with any authority (and that limited by the design and analysis used) is in those objective variables reported above.

Further research is usually needed and a good investigation raises additional questions beyond those considered within its own structure. Further investigation by many different researchers with different questions and orientations should provide further information of genuine interest and value in evaluation of the effects of Head Start programs on children.

Was there an association between specific differences and amount of change?

A portion of the present investigation was to examine the possibility of relationships between specific differences among classrooms and amount of change. A detailed account of the observed change and the ways in which classes varied has been given. This section of the report will present information about the associations examined by the method of correlational analysis. In effect, for each of a number of specific pupil, program and school-community characteristics, the question was asked: Is variation in one characteristic associated with variation in the other characteristic under examination? Obviously, for a study such as this one which examined so many particular characteristics of pupils and programs a very large number of such associations (or correlations) are possible. The actual total correlation matrix calculated runs several score of pages and includes several thousand correlation coefficients. The total table is therefore not reproduced with this report but will be made available through appropriate sources.

The table on the following page reports statistically significant correlations between several possible pretest and/or assignment variables and difference scores on the three main information collection instruments.

One of the first conclusions possible after examination of the preceding table of associations between difference scores on the Stanford-Binet, the Behavior Inventory, and the Preschool Inventory is that relatively few characteristics of teachers, classroom experiences, and school-community variations are associated with such class gains.

Because association, in and of itself, does not identify causation it is best to interpret any correlations cautiously. It is particularly important to examine cautiously correlations that are significant but of low numerical value. This means that the correlations reported, although useful as indices of possible areas for more controlled investigation, are only suggestive of such areas, not definitive.

Two areas seem worth some comment. First the cluster of negative associations between the pretest Preschool Inventory and class gains on the Preschool Inventory may indicate its usefulness as an entrance measure to Project Head Start classes. Low scores on the pretest were associated with high gains on the Preschool Inventory for the classes studied.

Second, the cluster of associations between the pretest Behavior Inventory and gains on itself may also indicate its usefulness for a similar purpose. However, because the Behavior Inventory must be completed after some few days of acquaintance with the individual child, this instrument may be more generally practically useful as an indicator to teachers about who should receive special attention during the program, once the child has been admitted.

The preceding table reports significant correlations between several observed and rated treatment variables and difference scores on the three output instruments.

The lack of a large number or discernible pattern of significant correlations in the preceding table leads to the conclusion that only a few of the treatment variables observed or aspects of the classroom rated are indicative of areas for further fruitful investigation.

The negative correlations between ratings of the structured-unstructured organization of class activities and differences on the Stanford-Binet may be of interest. This is especially so when the negative correlations between ratings of the informational-playful aspect and differences on the Stanford-Binet are also considered. A tentative suggestion may be taken from these data that a controlled investigation should be made among highly formal, factual programs and less formal, play centered programs. The correlations here suggest that more formal, factual programs are not associated with as much gain on the Stanford-Binet as less formal, playful programs. Various other significant associations not reported in Tables 14 and 15 are contained in the total intercorrelation matrix. However, further examination of these when the input and treatment variables are equivocal is mostly of theoretical or descriptive interest. The purpose of this summary report is to indicate the main, important findings. Therefore, theoretical

implications of the total matrix will be reported, as appropriate, elsewhere. The descriptive interest has probably been well served by the portion of this report dealing with various kinds of descriptive data.

Of what use is the information described and discussed above?

The judgmental nature of interpretation of information has been mentioned earlier in this report. However, it seems important in an investigation of this kind to present one or two possible interpretations. This may help to clarify the information presented and to stimulate discussion about the more fundamental questions that produced the study in the first place.

One of the major fundamental questions facing the Project Head Start research and evaluation division has been the question of whether or not the massive efforts of Project Head Start are having an effect on children. Obviously, no one study can answer this question definitively. Nevertheless, the information collected in this study indicates that positive, consistent and developmentally desirable effects were observed during the summer 1966 program. It is, of course, not possible to tell from the information collection design used the actual contribution of various possible sources of change to these overall observed effects.

A second major question of interest undoubtedly has been whether or not there were particular program variations which seemed to be more

successful than others. The information presented on associations between various characteristics and pupil outcomes indicates only very tentatively and with large question marks the possibility that less formal, playful programs may lead to greater gains on one instrument. In addition, two other instruments seem most likely to predict gain on themselves under the undifferentiated effect of Project Head Start programs.

On the basis of the information presented it should be possible to bring to bear something more than subjective opinion to decisions on two major questions. These questions are:

1. Should summer Project Head Start programs be continued?
2. Should recommendations be made to local program directors about the nature and content of programs?

These questions (deliberately phrased in the language of value or choice decisions) are not answered by the information presented, but the information herein can aid in arriving at answers to these questions. No further justification seems necessary for scientific information collection than this role as aid to human choice behavior.

## APPENDICES

**Forms Appendix**

Information Collection Forms  
and Field Director's Manual  
(Stanford-Binet--not included)

## Overview of Head Start Evaluation Project

### Classroom Study

A sample of 100 classrooms will be studied intensively. The sample will be derived from the selection of two classrooms in each of 50 centers. The sample was drawn so that centers were weighted according to their number of classrooms.

The study will involve testing all children in the 100 classrooms early in the summer program (pretest) and near the end of the program (posttest). Information about the center facilities and resources, and about the teachers will be collected by questionnaires. The involvement of parents will be determined by an interview with a parent of each child and completion of a simple interview record. Two observations will be made of the classroom activities and functioning, to be recorded on a form that will be provided. Test all children on the roster at the time for post-testing\* even though some may not have been enrolled during the period of pre-testing.\*

### Responsibilities

The Field Director will be responsible for the data collection in one or more Head Start centers. He must be able to recruit and oversee the activities of several qualified test administrators. The major qualification of test administrators is that they be experienced in administration of the Stanford-Binet, Form L-N. It is desirable that they have had experience with preschool or primary grade children.

The Field Director should review the tests and data collection instruments with his staff so that they all are completely familiar with the materials. This manual and the directions incorporated in the instruments provide general and specific information about the use of each item.

Confidentiality should be maintained as far as possible on all forms. Project Field Directors should stress the confidential nature of all information to all Project Personnel and all Center Personnel. In addition to the person administering the form, only the Project Field Director should be given access.

Test and survey material will be sent to the Field Director for distribution to his staff and the centers he is working with. He should assure that materials are collected and returned to ERS at the appropriate times.

Wherever it is possible, without jeopardizing the orderly securing of information, Project Personnel should accommodate to any special requests of Center Personnel.

ERS cannot provide Stanford-Binet kits, or record forms. We assume that test administrators will have or can borrow kits. ERS will reimburse the cost of record forms or booklets.

Field Directors will be asked to cooperate with OEO and the Bureau of the Census in distributing and picking up certain other forms as indicated on page 4.

### Warm-up Session

Most of these children have had no experience with tests and may hesitate to respond. Therefore, we suggest that the initial testing session for each child be preceded by warm-up exercises such as:

1. (Place the ball and a black checker on the table)  
Which one of these things is bigger?
2. Pick up the ball and hold it up over your head.
3. Now put the ball on the table and roll it to me.
4. Can you close just one eye? Do it. Now open it.
5. Which will buy more, a penny or a nickel?

### \* Norms Study

Another objective of the summer 1966 Head Start evaluation project is to develop normative data on Head Start children for the Stanford-Binet, Form L-N and for two Head Start developed instruments: the Preschool Inventory and the Behavior Inventory. Norms for a national random sample and for subsamples for which there are adequate numbers of cases will be reported. The sample will be drawn so that only a small number of children in a class will be tested.

PROJECT MATERIALS \*

<u>Instrument</u>	<u>Week administered and subject(s)</u>	<u>Administered by (minimum level)</u>	<u>Estimated time</u>	<u>Disposition</u>	<u>Special notes</u>
Stanford-Binet (1960) Short Form L-M	2-3 and 7-8 each child	Trained examiner— Project Personnel (Experience with preschool important)	20-40 minutes per child	Mail completed sets of record forms to ETS in 3rd and 8th week	Use Wright's method of abbreviation same examiner each ad- ministration
Preschool Inventory (Caldwell)	2-3 and 7-8 each child.	Preschool, Primary, or other teacher who are Project Personnel	15-30 minutes per child	As above	In a class, complete Binets before start- ing Inventory. Same examiner each ad- ministration
Behavior Inventory (Zigler)	2-3 and 7 each child	Teacher in charge after briefing by Project Personnel	5-6 minutes per child	As above	
Classroom Observation Form	3 and 6-7 each class	Experienced Preschool, or Primary teacher, <u>not from same district</u> —Project Personnel	Full class session	Mail both obser- vations to ETS in 8th week	Same observer both administrations
Teacher Information	6 each tea in charge	Teacher in charge— Project Personnel can pick up immediately	3 minutes	Mail to ETS in 8th week	
Parent Interview	6-7 mother or female house- hold head each child	Person or persons who can gain parent confidence—Project Personnel	10-15 minutes per parent	Mail to ETS in 8th week	Home administration most desirable— note deviations
Director's Report Form	10 each classroom	Project Field Director		Mail to ETS by 11th week	To be forwarded by ETS

\* Materials for Classroom Study only -- If Norms Study materials are to be used by your personnel, information thereon will follow.

NON-PROJECT MATERIALS BEING HANDLED BY PROJECT PERSONNEL

<u>Instrument</u>	<u>Week administered and subject(s)</u>	<u>Administered by (minimum level)</u>	<u>Estimated time</u>	<u>Disposition</u>	<u>Special notes</u>
Center Facilities and Resources Inventory	6 each center	Center Personnel		Mail to ETS in 8th week	To be forwarded by ETS
Medical/Dental Information	7 each child	Center medical personnel		Mail to ETS in 8th week	To be forwarded by ETS
Parent Participation Record	7 each class	Senior teacher		Mail to ETS in 8th week	To be forwarded by ETS
Class Register	Early as possible each class triplicate alphabetized	Senior teacher	20 minutes	One form for class one form OEO/Census one mail to ETS	If class numbers are not yet assigned by Washington—Project Personnel assign them in coordination with Center Personnel

**Stanford-Binet (1960) L-H****General Instructions**

1. Examiners should discourage Center Personnel from using the title "doctor" in the presence of the children.
2. Examiners should be experienced with the Stanford-Binet and should have ability to establish easy rapport with preschool children.
3. Examiners not having recent experience with preschool children should arrange to test at least two non-sample preschool children before working with children from the sample.
4. Examiners should check Stanford-Binet kits carefully for all material necessary for testing through age eight. A crayon or kindergarten pencil and a watch with a sweep second hand may be needed.
5. Examiners should carefully review the Terman/Merrill Manual (1960) pages 46 to 64, giving special attention to pages 53-54.
6. Use either Record Booklet or shorter form for recording answers.
7. Testing should be conducted with only the examiner and child present unless successful administration requires the presence of another.

3. Where a test is spoiled in administration use TEST A (Alternate) as directed in the T/H Manual. If two or three tests are spoiled use first TEST A, then the lower numbered unstarred test, then the higher numbered unstarred test. Further spoilage of tests requires proration of credits. At the basal and ceiling level where six tests are used, the spoilage of more than one test requires proration.
4. If for one reason or another a child simply cannot be tested, the examiner should submit a record form in his name with a comment.
5. Above the child's name on the record form enter his identification number. Above his identification number enter in bold letters: ADMINISTERED IN \_\_\_\_\_ showing English, Spanish or whatever language was used.
6. In addition to completing the information called for on the record form used, enter the child's MA and IQ in the spaces provided on the Preschool Inventory Student Information Sheet.
7. Every effort should be made to test every child.

**Specific Instructions**

1. Use the abbreviated form with Wright's method (see T/H Manual p. 61-2) in which all six tests are used to establish basal and ceiling levels. Note that when all six tests are used the weighting of each is less than the weights given when only starred tests are used.
2. It is suggested that examiners start with tests for age-level four and proceed in an alternating fashion toward the ceiling and basal levels in order that successes may be distributed throughout the testing period. When testing is completed, it is suggested that the child be given some simple task where success is virtually assured.

**PA 9  
PRESCHOOL INVENTORY**

SIDE 2

<b>DO NOT WRITE IN THIS AREA</b>	
CHILD'S IDENTIFICATION NUMBER	
<input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	

**PRESCHOOL INVENTORY**

**Student Identification Sheet**

1. Where numbers are called for enter one digit in each box.
2. Age in months is to be the nearest month, not necessarily the number of completed months.
3. Under remarks enter any deviations from the standard procedures or any unusual circumstances.

**TEST III**

48. HOW MANY EYES?
49. HOW MANY NOSES?
50. HOW MANY HANDS?
51. HOW MANY TOES?
52. HOW MANY WHEELS-CART?
53. HOW MANY WHEELS-WHEELBARROW?
54. HOW MANY WHEELS-TRICYCLE?
55. HOW MANY WHEELS-ROW BOAT?
56. HOW MANY WHEELS?

**Testing Instructions**

1. Several suggestions for administering the Stanford-Binet apply here: General Instructions numbered 1, 5, and 7 and Specific Instruction number 4. Obviously the establishment of good rapport is essential.
2. On the answer sheet use only the last six digits of the child's identification number.
3. In items 19, 20, 21, score exactly as directed, but if failure occurs repeat test without using color designation and report results under Remarks on identification form.
4. In items 83, 84, and 85, score exactly as directed, credit him even if he only selects the correct color. The instruction should be changed to: COLOR THIS YELLOW (PURPLE) (ORANGE) followed by pointing.
5. Three forms are provided for this test:
  - a. Machine scoreable answer sheet
  - b. Four page leaflet entitled "Preschool Inventory (standardization edition)"
  - c. Single sheet entitled "Preschool Inventory - Student Identification" Use and return to ETS the answer sheets and the Student Identification sheets stapled together for each child. Use the leaflet for administering the test items using the page of geometric figures, and discard after use.
6. Be sure there are no blank items.

**TEST IV**

79. WHAT COLOR IS (RED CRAYON)
  80. WHAT COLOR IS (BLACK CRAYON)
  81. SAME COLOR AS THE SKY
  82. SAME COLOR AS THE NIGHT
  83. COLOR CIRCLE YELLOW
  84. COLOR SQUARE PURPLE
  85. COLOR TRIANGLE ORANGE

Classroom Observation Form

1. Observers should thoroughly familiarize themselves with the form and, if possible, go through a practice session before dealing with the sample classroom.

2. Legibility of writing where free comments are elicited is extremely important. Observers should be encouraged to transcribe in typing to a fresh form if legibility is a problem.
3. It is important that the same observer make both observations of the class room involved. Where this cannot be arranged, notation should be made on the cover sheet of the form used in the second administration.

4. If, for any reason, it seems desirable to omit the teacher's name from the information given on the cover sheet, the observer should devote extra care in being sure the class identification number is correct.

BEHAVIOR INVENTORY  
TEACHER INFORMATION FORM

These forms are extremely simple and need no discussion. Be sure that each teacher answers every question. There should be no blanks.

Field Director's Report Form

Specific instruction on the completion of this form will be forwarded with it.

Non-Project Forms - Class Register, Parent Participation Record, Medical Dental Information Form, Center Facilities and Resources Inventory.

Field Directors' responsibilities for these forms are primarily those of distribution and collection. Instructions appear on page 4 of this paper. The Class Register, however, will be indispensable to the Project. Field Directors should forward a copy of the Class Register to ETS as soon as possible after it is completed.

TEACHER INFORMATION

Teacher's Name \_\_\_\_\_ Date \_\_\_\_\_  
Address \_\_\_\_\_

Circle the number of one answer to each question.

1. How many years of teaching experience have you had?
- 1 First experience  
2 Some prior experience, but less than five years  
3 More than five years experience
2. Do you live in the neighborhood the center serves?
- 1 No  
2 Yes
3. What is your sex?
- 1 Male  
2 Female
4. How much teaching experience have you had with preschoolers?
- 1 First experience  
2 Some prior experience but less than five years  
3 More than five years experience
5. What is the highest level of education you have received?
- 1 High school  
2 Some college  
3 Bachelor's degree  
4 Some graduate work  
5 Master's degree or above
6. If you attended college, what was your undergraduate major?
- 1 Elementary education  
2 Preschool education  
3 Other area (specify) \_\_\_\_\_
7. If you did graduate work, what was your major?
- 1 None  
2 Local training program  
3 6-day university or college sponsored training program  
4 8-week university or college sponsored training program  
0 Other (specify) \_\_\_\_\_
8. What special training have you had for the Head Start program?
- 1 None  
2 Local training program  
3 6-day university or college sponsored training program  
4 8-week university or college sponsored training program  
0 Other (specify) \_\_\_\_\_
9. How long have you worked with educationally disadvantaged children?
- 1 First experience  
2 Some prior experience but less than five years  
3 More than five years experience
10. How long have you worked with educationally disadvantaged children?
- 1 First experience  
2 Some prior experience but less than five years  
3 More than five years experience
11. If you did graduate work, what was your major?
- 1 Elementary education

BEHAVIOR INVENTORY  
SUMMER**

Child's name	School			Examiner's Identification	Date
	Grant No.	Center No.	Class No.		
Present week of center's operation					
<b>INSTRUCTIONS</b>					
Please indicate as accurately as possible how this child behaves by marking one of the four responses to each question. Base your response to a very item on your personal observation and experience with the child.					
	Very much like	Somewhat like	Very little like	Not at all like	
	1	2	3	4	
1. Is usually carefree; rarely becomes frightened or apprehensive . . . . .					
2. Is sympathetic, considerate, and thoughtful toward others . . . . .					
3. Is easily distracted by things going on around him . . . . .					
4. Is very suggestible; lets other children boss him around . . . . .					
5. Talks eagerly to adults about his own experiences and what he drinks . . . . .					
6. Is unduly upset or discouraged if he makes a mistake or does not perform well . . . . .					
7. Often keeps aloof from others because he is uninterested, suspicious, or bashful . . . . .					
8. Defends or praises his own efforts . . . . .					
9. Is confident that he can do what is expected of him . . . . .					
10. Is jealous; quick to notice and react negatively to kindness and attention bestowed upon other children . . . . .					
11. Is methodical and careful in the tasks that he undertakes . . . . .					
12. Is rarely able to influence other children by his activities or interests . . . . .					
13. Tries to figure out things for himself before asking adults or other children for help . . . . .					
14. Greatly prefers the habitual and familiar to the novel and the unfamiliar . . . . .					
15. Appears to trust in his own abilities . . . . .					
16. Has little respect for the rights of other children; refuses to wait his turn, uses toys other children are playing with, etc. . . . .					
17. Seems disinterested in the general quality of his performance! . . . . .					
18. Responds to frustration or disappointment by becoming aggressive or enraged . . . . .					
19. Is excessive in seeking the attention of adults . . . . .					
20. Sticks with a job until it is finished . . . . .					
21. Goes about his activities with a minimum of assistance from others . . . . .					
22. Is constricted, inhibited, or timid; needs to be urged before engaging in activities . . . . .					
23. Is even-tempered, imperturbable; is rarely annoyed or cross . . . . .					
24. Is reluctant to talk to adults; responds verbally only when urged . . . . .					
25. Works earnestly at his classwork or play; does not take it lightly . . . . .					
26. Is often quarrelsome with classmates for minor reasons . . . . .					

**DO NOT MARK IN THIS SPACE**

## OFFICE OF ECONOMIC OPPORTUNITY

PROJECT HEAD START EVALUATION -- 1966

On this page you are asked to record activities that you see. These may be consecutive or going on at the same time. This should be done as simply and as accurately as you can. In addition, you are asked to record "critical" or memorable incidents of the type you might discuss over coffee with a friend. Attempt to record at least one incident in the "critical" section. In both records be brief but long enough to be clear.

## Classroom Observation Form

Instructions

Classroom observation for Head Start Evaluation 1966 is extremely important. In a literal sense you are the eyes and ears for the Evaluation team. You are asked to react as an individual to your experiences, but less than a full attempt at objectivity would defeat the purposes of evaluation as well as, ultimately, the purposes of Head Start.

General. When first reporting to a Head Start center for an observation present your credentials to whoever is in charge of the center. Let this person direct you to the proper classroom. Take your time and follow the schedule of the center. After you have been observing for a few minutes and feel comfortable in the classroom, begin to collect answers to the questions on the inside of this form.

Specific. Each of the observation activities has specific instructions stated or implied. You should read over the form carefully before reporting for your first observation.

## Spot Check on Classroom Behaviors

For each activity you have recorded on the opposite page make a tally each time the described behavior below occurs during that activity. When a new activity begins, tally under the number for that activity.

Activity Number  
1 2 3 4 5 6 7 8 9 10

Do you see ---									
a child showing lack of interest in what is going on in the classroom?									
a child making a choice of activities or participation?									
a teacher or aide cuddle or pat or hug a child?									
a child crying or pouting?									
a child told not to talk so much or to stop talking?									
a child encouraged to talk or to continue and expand a story or idea?									
a child joining an activity that another child has begun?									
a child yawning or resting when it is not rest period?									
a child laughing out loud?									
a child hitting another child?									
a teacher (or aide) reading aloud to a student(s)?									
a child interrupted by the teacher or aide when he is speaking?									
List other significant behaviors and tally if desired									

## This page should be completed after your visit to the Center.

Assuming that anything can be improved no matter how it rates at present, if you had to improve this particular Read Start Class, what would you recommend?

## Emotional Environment

Did you see ---									
teacher and children plan and complete some activity?	yes	no							
periods of time when no one seemed to know what to do?	yes	no							
the teacher use sarcasm or ridicule in talking to children?	yes	no							
children who did not talk to anyone as far as you noticed?	yes	no							
opportunities for children to speak before whole group or small group of other children?	yes	no							
a classroom that could be described as apathetic?	yes	no							
a classroom that could be described as exhilarated or excited?	yes	no							
evidence that each child felt accepted in the class?	yes	no							
a teacher punish a child or the class with words or actions?	yes	no							
children talking to each other spontaneously and often?	yes	no							
teacher or aide spending long periods talking, telling, directing the children while the children said nothing much?	yes	no							
(space to add own description)									
Final comments or additions to summarize observation.

INSTRUCTIONS TO INTERVIEWER

1. Interview the child's mother, stepmother, or other female head of the household. Make as many as three calls in order to obtain the interview. Turn in a form for each child even if the interview cannot be obtained on the third call or if the parent refuses to respond; of course, in such cases, only the information on the first page of the form will be completed.
2. Throughout the interview, the orientation should be toward finding out about the center, not the parent. Be friendly and informal. Record responses as unobtrusively as possible.
3. The wording of the questions is not rigid. Record and repeat as necessary, keeping the intent of the question, in order to communicate with the interviewee and secure a valid answer.
4. Choices given after the questions are for you to use in classifying the interviewee's answers; these choices should not be read to the interviewee. Try to obtain a full response to each question, and then code it where possible or fill in the "other" blank.
5. Immediately after the interview, record any comments which might bear on interpretation of the interview record-refusal to answer any or all questions, disturbing interruptions, etc.
6. All scoring should be done after you leave the interview. Circle the appropriate score (usually 0 or 1) for each question.
7. In order to score some responses for accuracy (e.g., whether child has had a dental examination, meals and snacks), you will, of course, need to check with the teacher in the child's Head Start class.

Type of introduction to be used with interviewee:

I'm (name of interviewer), working for (R and D or other service center). We are trying to find out more about the Head Start centers in this area, and we are calling on a number of parents to get information about the (name) Center. I understand that your child, (child's name), is going there. Would you mind answering a few questions about this center?

Comments by interviewer (to be recorded following interview, see item 5 above):

The interview will be short and will bring up no embarrassing or controversial questions. If interviewers can gain entry and establish rapport, they should have no difficulty in securing the required information.

Note that the questions are phrased so as to ask about the Head Start program rather than about the parent or family.

It is important that this interview be completed in a face-to-face interview in the child's home. If variation must be made from this, the details should be noted under comments.

In some cases the interviewer may find access to the parent facilitated by the presence of someone else well-known to the family.

If there are two children of the family in the same class, fill out an interview sheet for each child.

12. a. Have you ever been to the Head Start center?  
no \_\_\_\_ yes \_\_\_\_
- b. If no, would you have liked to visit the center?  
no \_\_\_\_ yes \_\_\_\_
- c. If yes (to 12a), for what purpose did you go to the center?  
work at center (aid, help on trips, etc.) \_\_\_\_  
participate in educational program for parents \_\_\_\_  
visit child's classroom \_\_\_\_  
take child or go get him (her) \_\_\_\_  
attend social meeting \_\_\_\_  
for child's medical or dental examination \_\_\_\_  
other \_\_\_\_
13. a. Do you notice any differences in (child's name) since he (she) started to Head Start?  
no \_\_\_\_ yes \_\_\_\_
- b. If yes, what kinds of differences?  
Causes more trouble at home \_\_\_\_  
Causes less trouble at home \_\_\_\_  
Speaks better \_\_\_\_  
More self-confidence \_\_\_\_  
Gets along better with other children \_\_\_\_  
Better able to do things on his own \_\_\_\_  
Interested in new things \_\_\_\_  
Other \_\_\_\_
14. a. Has Head Start made any changes in your life - apart from changes in (child's name)?  
no \_\_\_\_ yes \_\_\_\_
- b. If yes, what kinds of changes?  
Made new friends \_\_\_\_  
Started taking more trips \_\_\_\_  
Learned more about raising children \_\_\_\_  
Got help from some social agency \_\_\_\_  
Started reading more \_\_\_\_  
Other \_\_\_\_

## Interview

## Scoring

15. a. Do you have other children who are not in Head Start?  
 no \_\_\_\_\_ yes, younger \_\_\_\_\_ yes, older \_\_\_\_\_  
 yes, younger and older \_\_\_\_\_
- b. If no, if you had other children, would you want them to go to Head Start?  
 no \_\_\_\_\_ yes \_\_\_\_\_
- c. If yes, younger, do you hope they (he, she) can go to Head Start?  
 no \_\_\_\_\_ yes \_\_\_\_\_
- d. If yes, older, do you wish they (he, she) could have some to Head Start?  
 no \_\_\_\_\_ yes \_\_\_\_\_
- e. If yes, younger and older, do you hope the younger one (ones) can go to Head Start?  
 no \_\_\_\_\_ yes \_\_\_\_\_

15. No to b, c, 0  
 d, or e 1  
 Yes to b, c, 1  
 d, or e 0

## Sampling Procedures

There were 24,000+ classrooms in 1,437 units, from one to more than 100 classrooms per unit. A random sample of units would over represent small centers. A random sample with units being weighted in proportion to number of classrooms was decided upon. The following procedure was used to identify 50 centers.

1. Shuffle the available lists of grantees.
  2. Enter tables of random numbers to get a two digit number.
  3. Count from top of list stack to page corresponding to number from two.
  4. Make that page the first page by placing preceding pages at bottom of stack.
  5. Get initial list of units to furnish classrooms by identifying the unit containing every 400th classroom.
  6. This will yield a list of approximately 60 units.
  7. Delete Alaska and Hawaii from list.
  8. Contact units to determine if centers begin programs between July 1 and 15 and if they operate for eight weeks. Delete units not complying.
  9. If fewer than 50 units remain on list, repeat the procedure from steps 1 through 8.
  10. If more than 50 units remain, take first 50 as sample.
- All centers then were asked to name two classrooms (numbers one and two on their list of all classes) to the study being conducted.

Formula Used

t - Test:

$$t = \frac{\sqrt{N-1} \bar{D}}{S_D}$$

$$\bar{D} = \frac{\sum_{i=1}^n (Post_i - Pre_i)}{N} = \frac{\sum_{i=1}^n y_i}{N}$$

Let  $y_i = Post_i - Pre_i$

$$S_D = \sqrt{\frac{\sum y_i^2 - \frac{(\sum y_i)^2}{N}}{N}}$$
