PART I

Population:

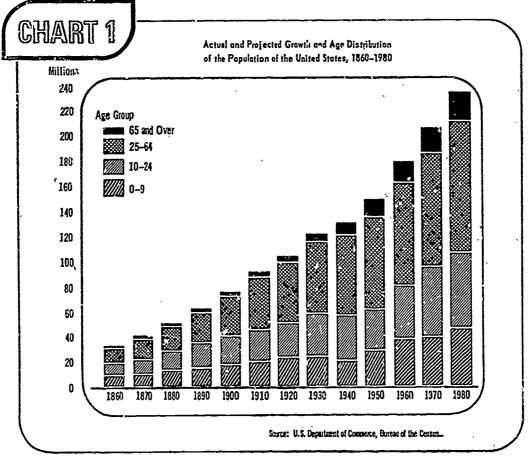

Nationwide

According to the U. S. Bureau of the Census estimates the population of the U. S. on July 1, 1965, was 193,818,000. Of these, 70,432,000 (36.3 percent) were under 18 years of age, 105,231,000 were between the ages of 18 and 64 and 18,156,000 were 65 and over; 79,594,000 (41.1 percent) were under 21 years of age.¹

The percent increases in the various age groups in the U. S. A. and in New York State from April 1, 1960, to July 1, 1964, are shown in the following table:

U.S.A. N.Y.S.

Source: U.S. Department of Commerce, Bureau of the Census; Currer? Population Reports, Population Estimates, Series P-25 and unpublished quarterly age distributions.

Some statistics and projections will illustrate what the often-used term "population explosion" means, particularly in regard to the younger age groups.

In 1960 there were 2.6 million youths reaching 18 years of age in the nation. The estimate for 1965 is 3.8 million.

The child population under 18 years of age numbered 68,717,000 on July 1, 1963. This age group had increased by 17 million from 1953 to 1963. In 1953, 33 percent of the total United States population was under 18; in 1963, 36 percent of the population were less than 18 years old. It is expected that by 1970 75 million children will be under 18 years of age and by 1980 there will be 88 million boys and girls of elementary and secondary school age or approaching it (under 5) in the United States.

The growth of the population under 15 was 68 percent in the years 1940 to 1960, as compared to the growth of the total population of 36 percent.²

New York State

Of the 16,783,604 persons comprising the New York State population in 1960 there were 5,725,772 (34.1%) under 20 years of age. Of these, 4,746,798 (82.9%) were urban residents (generally those living in incorporated places of 2,500 inhabitants or more). Of the rural population, which comprises all people not classified as urban, 129,199 (2.3%) were living on farms, the remainder of 849,775 (14.8%) were rural nonfarm residents.

It is estimated that in 1965 the population of New York State under 20 years of age represented about 36 percent of the total population.

A total of 436,857 persons 16 through 20 years old were not enrolled in school in New York State in 1960. Of these 183,324 were males and 253,533 females. Of this total, 213,311 (105,973 males and 107,338 females) or 48.8 percent had completed less than four years of high school.³

PART II

School Statistics Nationwide

School Enrollment

In the fall of 1960 more than 46 million young people were enrolled in the nation's schools, from kindergarten to the college tevel. The U. S. Bureau of the Census estimates that by 1970 our school and college enrollment, public and private, will range from a low of 55.7 million to a high of 60.3 million. A decade later (1980) the range will be from 62.2 million to 75 million.

In the fall of 1965 the American educational establishment had a total estimated enrollment of 53,935,000 students who were taught by 2,335,000 teachers in 88,600 elementary schools, 30,500 secondary schools and 2,170 universities and colleges.

Median education levels of Americans rose from 8.6 years of schooling in 1940 to 9.3 years in 1950, to 10.6 years in 1960 (10.7 for New York State).

Just under 60 percent of the white population and over 80 percent of the nonwhite Americans had a median educational level of eight years or less in 1940. By 1960 the percentages had dropped to under 40 percent for whites and to 60 percent for nonwhites.⁵

Dropouts⁶

The estimated retention rates per 1,000 pupils who entered the fifth grade of public and non-public schools in the United States increased from 505 in 1942-43 (high school graduation in 1950) to 636 in 1954-55 (graduation in 1962).

Each year larger numbers as well as percentages of the school age population complete their secondary education and greater numbers continue to college or other types of post-high school education or training.

The National Education Association made a study of the holding power rates of school systems in 128 cities with a population over 90,000, based on the graduating classes of 1960–1963 inclusive. The holding power rates of the Class of 1963 of the combined school system in the 128 large cities was 70.8 percent, based on grade 10 enrollment. The national average was 76 percent for that year.

In spite of this gradual improvement of holding power, approximately one third of the boys and girls who currently enroll in the fifth grade do not complete high school. Nationally, the figure of non-graduates totals about a million a year; if the current rate continues, the dropout aggregate might increase by as much as 7.5 million before the turn of the decade.

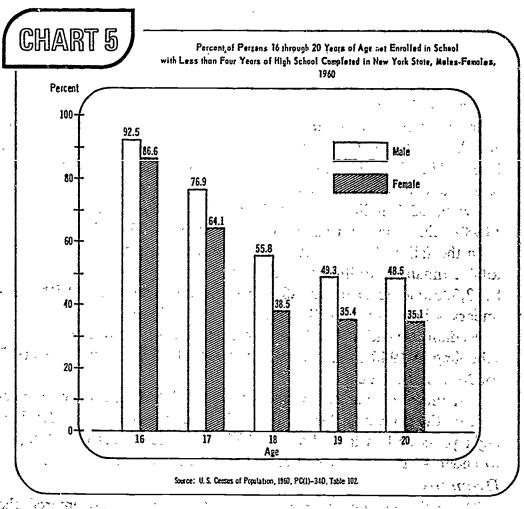

TABLE 5

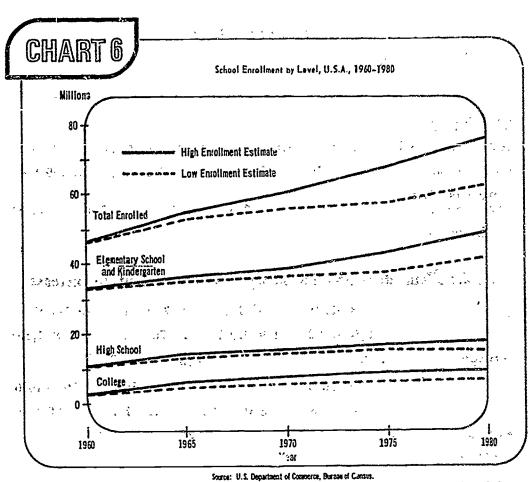

Percent of Youths, Not Enrolled in School Who Have Completed Less Than Four Years of High School, Males, Females 16 Through 20, New York State, 1960

Age	Percent	Age	Percent
Males 16 years	92.5*	Females 16 years	⇒ ⇔86.6
17	76.9	17	64.1
. 18	55.8	18	38.5
19	49.3	19	35.4
20	48.5	20	35.1

*Seven and one half percent of the 16 year old boys not enrolled in school had completed four years of high school.

The greatest percentage of school withdrawals occurs about the age when attendance is no longer compulsory—16 in most states. A major dropout zone is the switch from junior to senior high school; ninth and tenth grades and ages 16 and 17 have the highest attrition rates.

Twenty million American adults over 25 years of age had less than an eighth grade education as of 1962. Of this number, 7.8 million were "functional illiterates," that is, they have completed less than five years of school.

Between 1960 and 1970, 26 million youths will enter the labor force, 11.7 million (54.3 percent) will have completed high school, 6.6 million (25.6 percent) will have some college, 5.2 million (20.2 percent) will not have completed high school, and 2.3 million (8.9 percent) will have a grade school education or less.

In the period 1965-70, population increases will add about 3 million young people to the labor force each year, and their job opportunities will be vastly different from those of previous years. The fastest growth of the labor force is that of technical and professional jobs requiring 16 or more years of education. Jobs for those with no secondary school education decreased 25 percent. Unskilled jobs comprised about 10 percent of labor market opportunities in 1964, but this percentage will decrease to only 5 percent by the end of the 1960's.

These facts contribute to the gravity of the national dropout problem. Since the dropout generally lacks the basic skills required for an increasing number of jobs, he is the last to be hired, the first to be laid off, and is most subject to job loss through technological changes.

As of March 1962, persons 18 and older who had not completed high school, comprised 46 percent of the labor force but accounted for 63 percent of the total unemployed.

Estimated:

The number of high school graduates in public schools of New York State, excluding evening schools, increased 242 percent between 1930-31 and 1963-64 (from 49,931 to 170,698).

It is estimated that in the 10 years from 1964-65 to 1974-75 the number of graduates of all New York State high schools (public and private, including evening school graduates) will increase 23 percent (from 227,476 to 280,241).9

Public and Private Vocational Education Programs Offered to Youth in New York State, 1964-6510

- 111 Communities educate over 57,000 high school students in Trade, Technical, and Industrial Cooperative programs.
- 57 Communities offer advanced farming skills training to over 2,000 young adults.
- 238 High Schools enroll over 8,500 students in Vocational Agriculture.
- 575 High School Districts educate over 250,000 students in Vocational Business Skills.
- 105 High School Districts enroll over 15,000 students in Vocational programs for the Distributive occupations.

686 High School Districts provide Vocational Homemaking education for over 108,000 students.

200+ Registered Private Trade and accredited or approved Private Business Schools enroll over 95,000 young people and adults annually.

150 Manpower Training Projects are teaching new job skills to 10,000 unemployed.

29 Community Colleges and Agricultural and Technical Institutes enroll over 63,000 adults.

Vocational Rehabilitation

During the one-year period ending June 30, 1964, 1826 persons aged 14 through 19 and 918 persons aged 20 through 24 were rehabilitated through New York State's Vocational Rehabilitation Program.

Fourteen is the minimum age for acceptance for vocational rehabilitation services in New York State.

Of 26,658 persons, aged 14 and above, served in that period, 7,641 (28.7%) were rehabilitated. Of those rehabilitated, 2,744 (35.9%) were under 25 years of age. 12

Dropouts

In New York State, the percentage of dropouts has decreased over the years. According to a report of the State Education Department the school holding power rates in 81 school districts improved from 72 percent in 1954 to 77 percent in 1960.¹³

Dropout rates computed as a percentage of total enrollment in studies conducted by the New York State Division for Youth were as follows: Rochester (1960-61) 5.9%, Buffalo (1961-62) 8.5%, Syracuse (1959-60) 5.4%, Greene County (1958-62) 2.4%, Schoharie County (1958-62) 3.2%. These studies included public schools, grades 8-12 in Rochester and Syracuse, grades 7-12 in Buffalo and in the predominantly rural counties of Greene and Schoharie.

TABLE 10

Percent of Graduates Based on Ninth Grade Enrollment, New York
State, 1931–1965

Class of	Percentages Graduates Ninth Grade
1965	77 (estimated)
1964	73*
1963	74
1902	71
1901	68
1901	63 ↔
1941	43
1931,	32

^{*}The remaining 27% are dropouts and all others who have not graduated with this class. This applies also to the remaining percentages for the other years listed.

Although the proportion of dropouts is steadily decreasing, the total number of dropouts is increasing due to the growth in school population.

Holding Power Rates—New York State Schools

The percentage of those who were in the ninth grade four years earlier and who graduated rose from 32 in 1931 to 73 in 1964 and to an estimated 77 in 1965.

In New York City the dropout rate was 31 percent in 1958, 36 percent in 1961 and 30 percent in 1964.

In New York State public high schools excluding the six large cities (New York, Buffalo, Rochester, Syracuse, Albany, Yonkers) the holding power rate was 82 percent in 1963-64. The rate for New York City was 69 percent and the other large cities had relatively low holding power rates compared with the rest of the State.¹²

Median School Years Completed

According to the 1960 U.S. Census the median school years completed of persons age 25 years and over were 10.7 for New York State and 10.6 for the nation as a whole.

Youth Employment

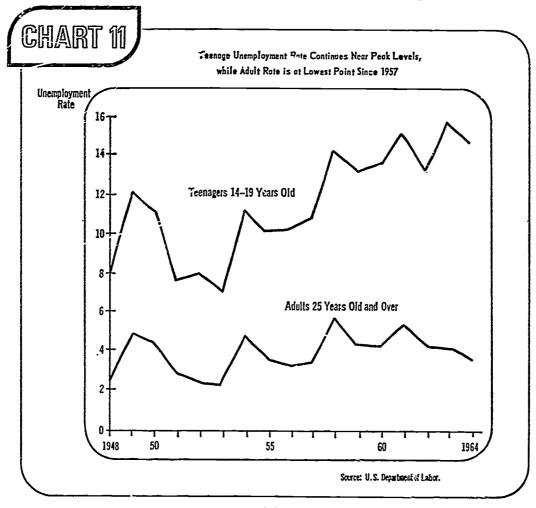

Nationwide

The estimated national average percent increase in total labor force from 1960 to 1970 is 22 percent. The estimated increase in the number of teenagers working or sea ring jobs during the sixties is 35 percent. About 2.2 million more boys and girls aged 14 through 19 will be in the nation's labor force in 1970 than in 1960. In 1960 about half of the labor force aged 14-19 of 6,200,000 (more than 3,000,000) were out-of-school teenagers.

Of the 6.5 million young persons aged 14 to 19 in the labor force in 1964 an average of close to 1 million (14.7 percent) were unemployed. High rates of unemployment among young workers reflect two trends:

- 1. Unskilled jobs typically available to young workers upon first entering the labor market have been growing at a rate slower than other, higher skilled occupations.
- 2. Their employment problems have been aggravated by a substantial expansion of the labor force in the younger age groups, the result of the sharp rise in birth rates in the early 1940s.

As chart 11 shows, the teenage unemployment gap (differential

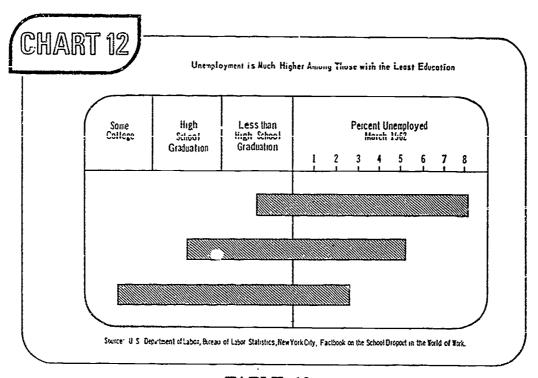

TABLE 12
Unemployment Rate, by Educational Attainment, March 1962

*Source: Manpower Report of the President, March 1965.

between teenage and adult unemployment rates) tends to increase as adults receive a larger share of job gains. The gap widened from 2.8 times in 1961 to 3.9 times the rate for adults in 1964. Non-white unemployment rates are generally much higher than those for white workers.

In February 1966, the teenage jobless rate had dropped to a nine-year low of 10.9 percent but teenagers still account for a disproportionately large 30 percent of all unemployed in the country.

Charts 12 and 13 show the direct correlation between the level of education and training, and job opportunities and earning power.

25

New York State

Estimated Percent Change in Teenage Labor Force, 1960–1970¹⁸

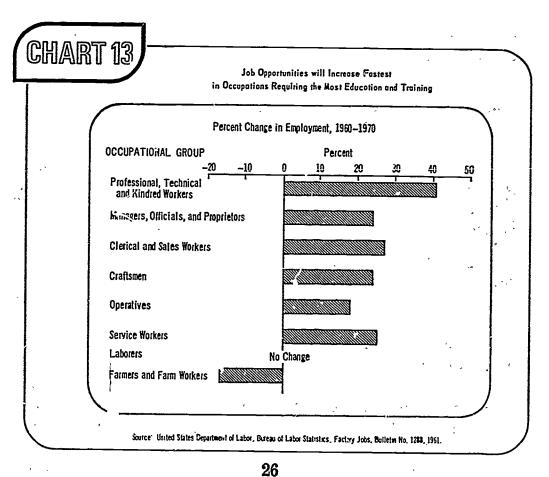

It was estimated that between 1960 and 1970 the age group 14 through 19 years in the labor force in New York State would increase by 118,552 (30.7 percent) from 386,164 to 504,716.

New York City

First Jobs

In 1964 half the New York City boys of 16 and 17 who graduated from high school or dropped out and then got jobs became office clerks, delivery boys, and stock clerks; in upstate cities it was one-eighth. Among the girls in New York City two-thirds got jobs as office clerks, typists, and stenographers; in upstate cities it was 28 percent.

Since 1952 factory work has declined in importance for both boys and girls in New York City, and so have salesclerk jobs. Upstate, factory work has declined for boys from 24 percent to 13 percent. For girls it was 7 percent in 1952, rose to 10 percent in 1956, and is now below 7 percent.

PART IV

Family Income

4(13),

There were almost a million families and unrelated individuals in New York State whose annual income was below \$4,000 in 1959. About 600,000 of such units had incomes below the poverty line of \$3,060 set by the federal government, and more than 330,000 had less than \$2,000 income a year. About 60,000 families with incomes under \$3,000 consisted of 5 persons or more.

PART V

Juvenile Delinquency

Nationwide

The Children's Bureau of the U. S. Department of Health, Education and Welfare reported a 14 percent increase in juvenile delinquency in the U. S. A. in 1964 over 1963, (tea percent in urban areas, 24 percent in semi-urban and 20 percent in rural areas), while the hild population, aged 10 through 17, increased by only 4 percent.

The delinquency rate, based upon child opulation 10 to 17 years of age in 1957, was 19.8 of every 1,000 c'ildren. By 1964, the rate of delinquency had risen to 23.6 of every 1,000 children. In numbers juvenile delinquency had increased by 56 percent between 1957 and 1964, while the youth population 2 ad increased only 31 percent.

The sex distribution was about 4 deli iquent boys to one delinquent girl.

Approximately 44,100 children vere living in public training schools for delinquent children on June 30, 1964, an increase of over 4 percent from 1963. The average length of stay was 9.3 months. The returnee rate was 28 percent. It is higher among the larger institutions and tends to decrease as the size of the institution decreases.¹⁷

of juvenile delinquency (expressed as cases per 1,000 children) was the ratio of the number of cases disposed of to one thousandth of the actual or estimated population, age seven through fifteen.

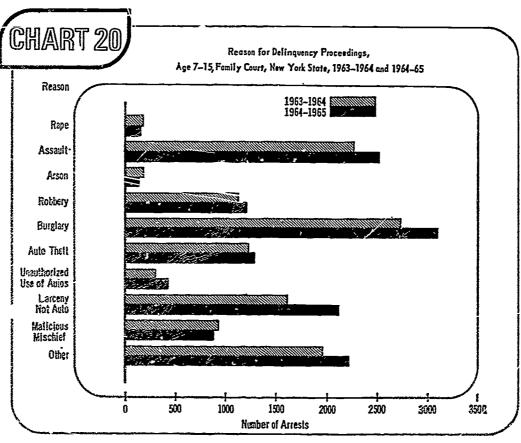

The general trend in juvenile desinquency from 1940 to 1962 was upward. The first peak occurred in 1943, followed by a gradual decline to a low in 1950, both in numbers and race, below the 1940 level.

Using the 1950 figures as an index (=100), juvenile delinquency in New York State increased almost every year, until in 1961 the index was 236, indicating an increase of 136 percent in eleven years. The youth population increased during the same period by 53 percent. Statistics of the Children's Court were discontinued as of August 31, 1962. The number of delinquency cases disposed of in 1962 was estimated for the last four months of the year on the basis of the period January through August 1962.

Beginning with 1963, statistics on juvenile delinquency have been compiled by the Judicial Conference of New York State. Because of the different way of recording cases in the Family Court it is not

possible to make comparisons between the statistics after 1962 and those of prior years compiled by the New York State Department of Correction from reports of the Children's Court. This is so mainly because the Family Court has established an Intake Service which has reduced the number of formal proceedings in the courts; therefore, the number of cases disposed of as reported by the Children's Court does not mean the same statistically as an equal number reported by the Family Court.

Delinquency Proceedings18

The Family Court of New York State disposed of 12,418 juverile delinquency cases during the Judicial Year 1964-65 (July 1, 1964 to June 30, 1965). This represents an increase from the Judicial Year 1963-64 of 9.3 percent.

Boys were involved in 11,460 proceedings (92.3%).

Of the 12,418 delinquency proceedings disposed of in the Judicial Year 1964-65, 58.9 percent originated in New York City.

The number of proceedings increased with each year of age until their sixteenth birthday as shown for boys in Chart 19.

One hundred and twenty-one proceedings (1 percent) involved boys who, although under 16 years of age at the time the delinquent act allegedly was committed, were 16 years or above at the time of disposition of proceedings. In eight cases the age was not stated.

The most frequent reasons for delinquency petitions for both sexes were burglary (22 percent), assault (18 percent), larceny other than auto theft (15 percent), robbery and auto theft (nine percent each). For girls alone the most frequent reasons were assault (36 percent) and larceny other than auto theft (23 percent).

About 4,900 cases disposed of did not result in any adjudication. Three hundred seventy-eight were withdrawn, 3,562 were dismissed for failure of proof and the balance for other reasons.

Supervision Proceedings

The New York Family Court Act of 1962 established a new category of youngsters over which it has jurisdiction—"persons in need of supervision" (PINS). Person in need of supervision means a male less than sixteen years of age or a female less than eighteen years of age who is an habitual truant or who is incorrigible, ungovernable or habitually disobedient and beyond the lawful control of parent or other lawful authority.

During the Judicial Year 1964-65 the Family Court of New York State disposed of 7,030 supervision proceedings. Of these, 3,865 (55 percent) concerned boys.

About 3,800 (54 percent) of all supervision proceedings originated in New York City.

The most frequent reasons were: running away from home, habitual truancy, and ungovernability.

With both boys and girls, the number of proceedings increased with each year of age until their sixteenth birthday.

Almost 23 percent of all supervision petitions did not result in any adjudication. The most frequent reasons for that were failure of proof and withdrawal of the petition (50 percent and 25 percent respectively).

Of the 5,428 proceedings in which supervision adjudication was made, about 2,870 (53 percent) involved probation. Approximately 1,426 (26 percent) were placed in, or committed to, public or private facilities and in 12 percent of the adjudicated cases, judgment was suspended. The remaining 9 percent were adjudicated in various other ways (discharged with warning, discharged to mental institutions, etc.).

New York City

Arrests of Youths Under Sixteen, 1961-65

The number of arrests of youths under sixteen for felony- and misdemeanor-type offenses has leveled off from 1964 to 1965. From 1961 to 1964 arrests of youths under 16 years of age had generally been on the increase.

In 1965 the New York City Police arrested 8,440 boys and girls under sixteen for felony-type offenses as compared to 8,342 in 1964, an increase of only about one percent. The number of arrests for misdemeanor-type offenses in this age group was 3,426 in 1965 as compared to 4,001 in 1964, a decrease of 14.4 percent. The rates in 1,000 youths also indicate the leveling-off trend, with the rate for felony-type offenses about the same for 1965 as for the previous year and that for the misdemeanor-type offenses dropping from 3.68 to 3.22. If both types of offenses are taken together, the number of arrests decreased 3.9 percent and the rate in 1,000 decreased from 11.36 to 11.16 from 1964 to 1965.

PART VI

Youth Crime

Nationwide

Arrests for all criminal acts, excluding traffic, increased 5 percent from 1963 to 1964. For persons under 18 years the increase was 17 percent. Taking into account the 1.9 percent increase in youth population, the net increase in youth arrests is still considerable. Suburban and rural areas reported a 21 percent and 22 percent increase respectively.

The age group 10-17 years makes up about 15 percent of the nation's population, but committed 43 percent of all property crimes; more than 60 percent of all arrosts for auto theft and over 50 percent of all larceny and burglary arrests involved youths under 18 years of age.¹⁹

In 1964, while the population of the U. S. A., ages 16 through 23, represented about 16 percent of the population 16 and above, the age group 16 through 23 was involved in 30 percent of all arrests reported to the F. B. I. and in 58 percent of all arrests for the most serious offenses.

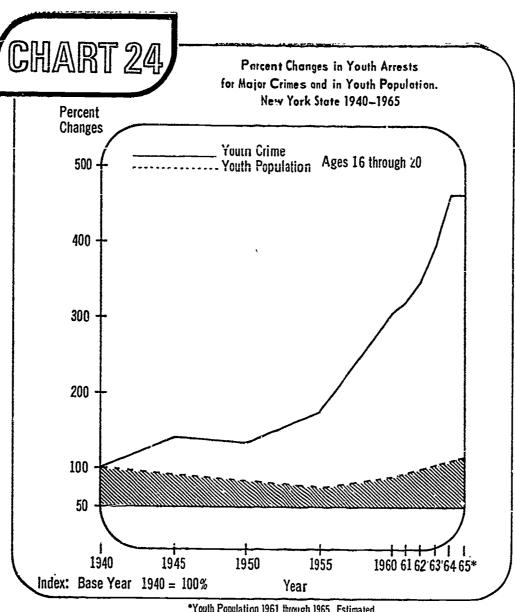

The rate in 1,000 population is 54.7 arrests for the 16-23 age group and less than half that (24.4) for the age group 24 and over for all olimses. In the category of the most serious offenses the youth rate is more than six times that of the adult rate (13.6 compared to about 2 per mil).

New York State

Youth crime in New York State is measured by arrests for major crimes (all felonies and those offenses specified in Section 552 of Criminal Procedure) of youths in the age group 16 through 20.

Chart 24 uses the number of youth arrests for major crimes and the 1940 population, 16 through 20 years old, as basis for arriving at percent changes for the period from 1940 to 1965. Between 1940 and 1955 youth arrests for major crimes increased 75 percent, whereas the youth population decreased during the same period by 21 percent. After 1955 the number of arrests for youth crime increased at a much higher rate through 1964. Youth arrests totaled 23,096 during 1965, compared to 22,963 in 1964. From 1963 to 1964 the number of youth arrests increased 18.4 percent; from 1964 to 1965 the increase was 0.6 percent.

Chart 25 is a semilogarithmic chart which shows the changes in youth arrests for major crimes from 1940 to 1965 for New York

*Youth Population 1961 through 1965, Estimated.

			-, -, -, 010	20,000

*Population between cansuses estimated on basis of last census.

State, New York City, and New York State excluding New York City, in relation to each other. Equal vertical distances, as can be seen by looking at the scale on the left of the chart, do not represent equal numbers, but they do indicate equal percentage changes. Generally, the curves for New York City and for the State excluding New York City run parallel, indicating that the percentage growth in youth crime does not differ much between New York City and the rest of the state. Consequently, the curve for New York State follows a similar trend, since it is based on the sum of its components, the number of youth arrests in New York City plus that of the rest of the state.

The table, in addition to the number of youth arrests from 1940 to 1965, also gives the rate in 1,000 youth population, for New York State, New York City, and New York State excluding New York City.

TABLE P

Arrest Rates in 1,000 Population, Ages 16 through 23, 24 and Over, 24 through 69, Based on F.B.I. Uniform Crime Reports 1963, 1964, and 1965 and Population of Areas Covered by Agencies Reporting to F.B.I.

^{*}Criminal homocide, forcible rape, robbery, aggravated assault, burglary, larceny (\$50+), auto theft.

The rate in 1,000 youth population increased from 4.4 in 1940 to 18.0 in 1964. This takes into account increases and decreases in youth population. From 1964 to 1965 the youth crime rate for New York State decreased by 1.2 per mil.

In 1965 statewide youth arrests represented 29.1 percent of all arrests for major crimes. A proportionately larger number of arrested youths was in the 16 through 13 age group than in the 19- and 20-year group. In 1965 youth's share in arrests for major crimes was

Source: New York State Department of Correction, Releases on Arrests for Major Crimes.

26.2 percent in New York City and 40.8 percent in the upstate area (New York State except New York City). In 1960, 29.0 percent of all arrests for major crimes in New York State involved youths, in New York City 26.9 percent and in the State excluding New York City 36.9 percent. The percentage of youth arrests in New York City declined slightly from 1960 to 1965 and increased in the rest of the state.

The breakdown of 1965 youth arrests for major crimes by sex shows that the girls' share is 5.8 percent for the age group 16 through 20 and slightly higher (6.8 percent) for the 19 and 20 year old girls alone. In the age group 21 and above women's arrests represent 11.1 percent of all arrests for major crimes.

In 1965 the estimated population of New York State, age group 16 through 20, was 10.96 percent of the population 16 years old and over. The percentage of youths involved in arrests for major crimes in New York State is, therefore, more than two and one half times the proportion of the 16 through 20 years old to the population 16 and over.

In numbers auto theft still ranks highest among youth arrests (4,594), closely followed by burglary (4,555), but arrests in both categories decreased from 1964 (-3.7 percent and -2.0 percent respectively). Robberies increased by 9.5 percent, but narcotic drug violations again showed a large increase (18.9 percent), though not as large as in the previous year when the increase had been 93.1 percent. The upstate increase in narcotic drug violations was much larger than that in New York City (49.3 percent compared to 17.3

(a) Rates for 1961-1964 derived from population estimates based on 1960 Census, for 1965 from New York State Office for Regional Development projections.

percent). Youth arrests for narcotic drug violations represented 7.5 percent of all youth arrests for major crimes in 1963, 12.2 percent in 1964 and 14.5 percent in 1965. Whatever the reason for this sharp increase may be, the narcotic problem is serious, as the drug habit breeds other crimes.

Of 11,107 youth arrests disposed of during 1965, 57.7 percent led to convictions. This does not include dispositions of New York City arrests after September 10, 1965, for which no reports have been received.

Annual rates of arrests per thousand youths for the years 1959 through 1965 are shown in Chart 27 for each of the largest cities, for the combined totals of New York City and 22 larger cities of the state, for New York State as a whole, New York State less New York City, and New York State less New York City and 22 larger cities.

Population figures on youths 16 through 20 years old on which rates are based were taken from the U. S. Census of Population for 1960 and were estimated for 1959 and 1961—1964 by moving the appropriate age group up or down without regard to death and net migration rates which are assumed to be negligible. Rates for 1965 for New York State and New York City were based on population projections of the New York State Office for Regional Development.

Felonies					•	Narcotics, Dangerous Wespons Rape Burglary Tools Other Sect. 755, Code of Crim Procedure		Source: Police Department of the City of New

The leading causes of youth arrests are shown in Table R for the years 1959 and 1965 by frequency rank, number, and percentage of total youth arrests for major crimes in the area of concern.

While the six highest ranking offenses for which youths were arrested were the same in both years 1959 and 1965, there were some changes in relative positions within the group, as well as increased numbers in all categories except sex offenses (excluding rape felony) which dropped from fourth to sixth place. Arrests for narcotic drug violations advanced from sixth to third place in New York State and from fourth to first place in New York City. This category does not figure at all among the first six in the rating for the state outside New York City, but the fact that youth arrests for narcotic drug violations outside New York City increased almost 50 percent from 1964 to 1965 shows that narcotics are a serious problem in the areas outside New York City as well.

New York City

Chart 28 shows arrests of youths 16 through 20 years old for felonies and misdemeanors in New York City in the years 1961 through 1965, as reported by the Police Department of the City of New York. The trend is upward in both categories; however, in New York City as in the state as a whole, a leveling off in youth crime can be observed in Chart 28. The increase in the number of youth arrests for felonies from the previous year was 13.6 percent in 1963, 12.0 percent in 1964 and 5.1 percent in 1965. Misdemeanor arrests of youths 16 through 20 years old increased from the previous year 12.4 percent in 1963, 21.3 percent in 1964 and less than half 6. one percent in 1965.

The youth felony rate in New York City per thousand youths increased from 22.4 to 22.9 and the misdemeanor rate decreased from 19.2 to 18.8 from 1964 to 1965. It should be noted that these rates are based on population estimates for the two years and, therefore, are subject to adjustment at a time when more accurate population figures will be available.

In Chart 29 and Table 29 New York City arrests for felonies and misdemeanors are broken down into age groups 16 through 17, 18 through 20, 16 through 20, and all ages; the rates in thousand were computed on the basis of population estimates for the year 1965. The rate for felony arrests of the 16 and 17 year old youths exceeds that of the 18 through 20.

PART VII

Youth and Traffic Accidents

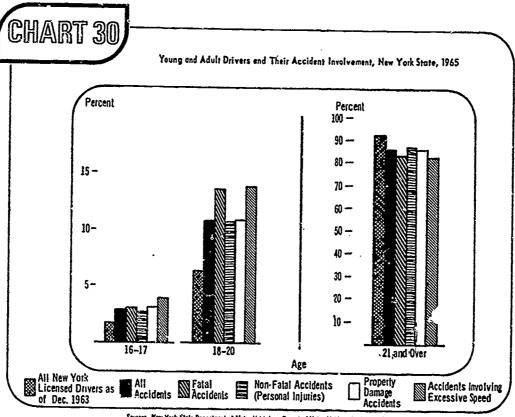

Nationwide

Nearly 8.2 million youths under 20 are licensed to drive an automobile in the U. S. A. (8.6 percent of all licensed drivers), but the teenage drivers were involved in 14.5 percent of all traffic accidents, nearly double what it should be for their age group.²⁰

In a Michigan study of 139 fatal accidents resulting in 177 deaths it was found that of 139 drivers at fault, 54 (or 38.8 percent) were 25 years old or younger. The population 16 through 25 in Michigan, however, was only 19.3 percent of the population 16 and above. The involvement of young drivers in fatal accidents was found to be equally disproportionate as the involvement in accidents of all kinds.²¹

New York State

About 1.7 percent of all licensed drivers in New York State were under 18 years of age in 1965, but 2.8 percent in this age group were involved in accidents. The accident involvement of the drivers 18-20

TABLE 30

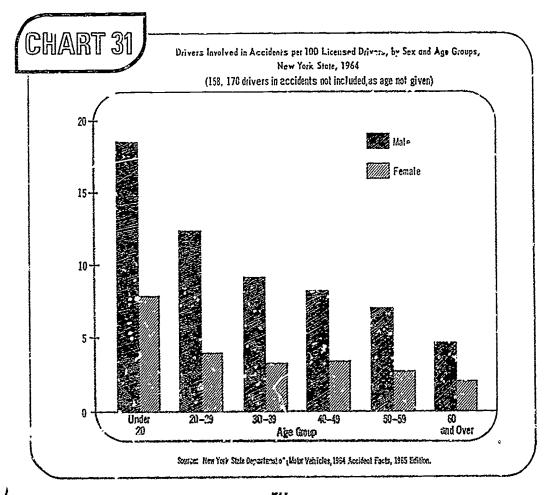

Accident Involvement of New York Drivers by Age, 1964-65

Percent	Age Group						
	16-	-17	` <u>1</u> %_	20 -	21 and		
	1964	1965	1964	1965	1964	1965	
Licensed Drivers	1.5	1.7	5.0	6.2	93.5	92.1	
All Accidents	2.9	2.8	9.5	10.7	87.6	86.5	
Fatal Accidents Accidents Resulting in	3.3	2.9	12.5	31.6	83.7	83.5	
Personal Injury	2.6	2.6	9.3	10.7	88.1	86.7	
Accidents Resulting in Property Damage	3.2	3.0	9.7	10.8	87.1	£6. 2	
Accidents Involving Excessive Speed (a)	3	.8	13	.8	82	.4	

(a) Excessive speed data are for December 1962 — November 1963

Note: For 158,170 drivers of a total of 678,294 New York drivers who were involved in accidents in 1964, the age was not stated. The corresponding figures for 1965 are 169,480 and 777,565.

years of age is also disproportionate; of all licensed drivers 6.2 percent were between the ages of 18 and 20, but 10.7 percent of this age group were involved in accidents of any kind and 13.6 percent in fatal accidents.

Excessive speed was a factor in 9 percent of all accidents on New York highways though it was a contributing circumstance in 40 percent of all fatal accidents for the period December 1962 through November 1963. The age group 16-20 represented 6.3 percent of all licensed drivers during that period, but shared with 17.5 percent in accidents involving excessive speed.
