Descriptors-Comparative Analysis, Employment, Employment Projections, *Employment Trends, Federal Programs, Instructional Innovation, Labor Force, Manpower Development, *Manpower Needs, *National Surveys, Population Trends, Profile Evaluation, Race Influences, *Unemployment, *Vocational Education

It is the purpose of this study to present problems of unemployed youth in the context of changing manpower needs, labor force projections, and federally sponsored skill training programs. It is intended to be useful as a guide for administrators with job training responsibilities in the planning of vocational programs. Part I, dealing with National Trends, presents an analysis of unemployment and employment trends, and manpower requirements in the 1970's. Data on federally sponsored vocational training programs, and tables describing projected manpower needs are included. Part II, Profiles of The States, explores the relationship between net migration, labor force projections, unemployment, and federally sponsored training programs. Maps and tables of states are used to present extensive data. A future volume in the study will present a profile of nine American cities. (CH)

Foreword

Unemployment among nonwhite youth, particularly in ghetto areas, has been growing at an alarming rate. In 1967 one out of every four nonwhite teenagers was unemployed and in slum areas the unemployment rate was much higher. In the next decade the non-white teenage population is expected to grow rapidly, creating further pressures to meet the employment needs of increasing numbers of nonwhite youth. The purpose of this report is to present problems of unemployed youth in the context of changing manpower needs, labor force projections, and Federally sponsored skill training programs. The report is the first part of a series on vocational training, employment, and unemployment. Other sections deal with States and urban conditions.

The compilation of data is the product of an interagency effort. I would like to acknowledge the invaluable assistance of the Equal Employment Opportunity Commission, the Office of Economic Opportunity, the Department of Labor, and the Census Bureau of the Department of Commerce. Special thanks goes to Dr. Herbert Striner, Director of Program Development, W. E. Upjohn Institute for Employment Research, Washington, D.C., who has generously provided us with insight and direction. This study was prepared by Dr. Margot Louria assisted by staff members of the Office of Programs for the Disadvantaged. The findings and interpretations of these data are the responsibility of the Office of Programs for the Disadvantaged.

INTRODUCTION

The status of an American in our society is frequently determined by the type of job he holds. We are a work oriented Nation. The development of job opportunities for significant numbers of people becomes a pressing requirement of the American economy. The projected labor force for 1970 (16 years and over) is 84.6 million, an increase of 12.5 million from 1960 and a percent change of 17.4. A larger proportion of the 1970 labor force is expected to be made up of younger workers. The nonwhite labor force is projected to grow at an even faster rate. According to the Department of Labor projections, the total nonwhite labor force (16 years and over) will rise by 36.5 percent between 1965 and 1980 compared with a 25.8 percent increase in white workers.

In the 1970's the occupational structure of the economy is expected to change in response to differential rates of growth among industries and technological innovation. These changes in occupational requirements have important implications for the nonwhite labor force. Non-white employees tend to be disproportionately concentrated in less-skilled occupations that are apt to have high unemployment rates and that are not growing as rapidly as the more skilled occupations.

Nonwhites need to gain access to white-collar and skilled jobs at a faster rate than they have in recent years. If not, serious unemployment problems will result.

It is the purpose of this study to present an analysis of unemployment and employment trends and manpower requirements in the 1970's. Included in detail are data on Federally sponsored vocational training programs. It is hoped that administrators with job training responsibilities may find the survey a useful guide in the planning of programs. The study on Vocational Training, Employment and Unemployment is divided into three sections: (1) National trends, (2) Profiles of the States, and (3) Profiles of nine major American cities. This section is devoted to national trends.

EMPLOYMENT AND UNEMPLOYMENT PATTERNS

"In recent times education has become the difference that divides." 1/ Economic developments in the post World War II periodhave produced an industrial system with a strong technological orientation. Technology makes its own demands on manpower. In contrast to the early days of industrialization which called for few men of skill and talent and a large unskilled labor force, today's economy has a broad top echelon of technicians and a rapidly shrinking base of unskilled workers.

Unemployment reflects the characteristics of a technological society. With few exceptions, unemployment declines as the level of education rises. Of the unemployed in March 1%7, over half did not complete high school. Many of these persons were jobless precisely because they lacked the skills or educational prerequisites required for employment. In a survey of ten slum areas conducted by the Department of Labor in November 1966, 43.9 percent of the unemployed indicated that their joblessness was directly due to deficient education, lack of training, skills, or experience.

Within the economy, shifts in the occupational structure are taking place affecting employability. Blue-collar workers (craftsmen and foremen, operatives, nonfarm laborers) are in the decline in numbers and influence. As the relative demand for blue-collar workers declines, the need for technically trained professionals and other white-collar workers increases. Education must be responsive to these shifts. If the educational system does not accommodate itself to the requirements of a progressively growing technology, there will be an imbalance in job opportunities—numerous vacancies for the educationally qualified and no openings for those without education.

Educational systems that are able to shape their programs in accordance with the needs of a technological society will develop a well-qualified labor force and attract other workers. This is reflected in migration from the South and Southwest to California, Great Lakes States and eastern coast. Many of these migrants lack educational and skill qualifications required for employment in the communities to which they have moved. Without special training and compensatory education they may not be able to find jobs, and will add to the burden of welfare. In conclusion, the unemployed will consist more and more of the uneducated who are unemployable and thus outside the technological structure.

^{1/} John Kenneth Galbraith, The New Industrial State. Houghton Mifflin Company, 1967, p. 244. Galbraith defines technology as "the systematic application of scientific or other organized knowledge to practical tasks." And, "the more sophisticated the technology, the greater, in general, will be all of the foregoing requirements." Ibid., p. 12 and p. 17. This section is based on The New Industrial State.

PROJECTIONS OF MANPOWER NEEDS

As a result of industrial developments, the Department of Labor anticipates the following changes in manpower requirements, 1964-75: 2/

The greatest increase in requirements will be for professional and technical workers; more than $4\frac{1}{2}$ million additional personnel will be required, an increase of 54 percent. The white-collar group as a whole is expected to expand by nearly two-fifths, and to constitute 48 percent of all manpower requirements in 1975. The blue-collar occupations are expected to expand at less than half this rate, and will constitute 34 percent of all requirements. A rapid expansion in requirements for service workers is anticipated—a 35 percent increase in employment, bringing this group to about 14 percent of the total.

The Department of Labor expects major changes in the occupational distribution of employment by 1975. Manpower needs will decline in agriculture and rise in nonfarm employment. For nonfarm "goods producing" industries-manufacturing, mining, and construction—a moderate increase in manpower requirements is projected. Significant gains in productivity resulting from automation and other devices will increase output in goods-producing industries without requiring additional staffing. Requirements in service-producing industries—transportation and public utilities; trade; finance, insurance, and real estate; and Government—are expected to increase rapidly. The largest manpower increase in the service—producing sector will probably take place in Government, nearly all in State and local government.

To summarize: 3/

Government and the service and miscellaneous industries will increase sharply as a proportion of total industry employment. Other industries whose relative importance will increase are construction and trade. On the other hand, the relative importance of manufacturing and transportation and public utilities will decline slightly. Continued sharp declines in the proportion they represent of total requirements will take place in mining and agriculture.

^{3/ &}lt;u>Ibid</u>., p. 11.

State and local governments are involved in a growing number of activities ranging from education to air and water pollution control. In 1965 State and local governments spent 87 billion and employed 7.7 million workers. In 1975 they are expected to spend 128.5 billion and employ 11.4 million—an increase of 3.7 million people. The rise in employment will result from rapid increases in population which will generate demand for services, particularly in urban areas. (See chart on p. 7.) Shifts in the age composition of the population will add to the responsibilities of State and local governments to provide services. A greater number of teachers will be needed in the classrooms to take care of the rising number and proportion of school—age children in the population. Anticipated increases in the number of older persons will result in the demand for medical services.

In an effort to determine manpower needs in urban areas, mayors of 50 cities with populations of 100,000 or more were requested to estimate the number of additional personnel needed among 13 public service functions. 4/ The chart below indicates the total number of personnel which could be employed in 130 cities and the proportion of jobs which might be filled by inner-city residents without technical or professional training.

Projection of additional public service manpower needs for 130 cities with populations 100,000 or more, based on replies of 34 cities *

Function or program	Manpower needs	Number utilizing inner- city nonprofessionals
Anti-pollution enforcement	1,748	900
Education	84,602	39,134
General administration	13,940	5,313
Health and hospitals	34,534	18,790

^{4/} Findings from the inquiry were presented in a preliminary report by Harold L. Shepard, "Public Service Employment Needs in Cities with 100,000 Population or More," The W.E. Upjohn Institute for Employment Research, Washington, D.C., March 27, 1968.

The results of this preliminary survey indicate that one-half of the total number of jobs could utilize non-professionals. "In other words, at least 140,000 possibilities for inner-city residents may be said to be present in the 13 public service functions in cities of over 100,000 population." 5/

The table on the next page describes projected manpower needs as anticipated by the Department of Labor for local and State employment.

LABOR FORCE PROJECTIONS

Between 1960 and 1970 the total resident labor force is expected to grow by 17.4 percent-from 72.1 million to 84.6 million—and again by an increase of 18.1 percent from 1970 to 1980. The projected labor force for 1980 is 99,942,000. The annual increase is for nearly 14 million more jobs each year. In percentage increases the labor force is expanding at a faster rate than the population as the following table illustrates.

Population and Labor Force Projections by Age Group (Numbers in thousands)

		16 years and over	16 to 24 years	25 to 44 years	45 years
1.	Population 1960 1970 1980 Percent change 1960-70 1970-80	121,814 142,025 166,552 16.6 17.3	21,814 32,347 37,937 48.3 17.3	47,134 48,276 62,373 2.4 29.2	52,866 61,402 66,242 13.9 7.3

Source: Department of Labor, Manpower Report of the President, April 1968

Proportionately, the largest increases in the labor force are occurring at the 16 to 24 year age group. The number of young workers is rising very rapidly during the present decade. The increase in younger workers reflects the high birth rate following World War II. Many have already entered the labor force or will do so by 1970. During 1970-80 the number of workers, 16 to 24 years, will rise at a slower rate than the 1960-1970 period. In turn, the 25 to 44 age group will have the greatest increase in the 1970's.

In conclusion, the labor force will be growing at a rapid rate and will consist of a larger proportion of young workers, many of whom will be in entry-level jobs or in the early stages of their career development.

NONWHITE EMPLOYMENT TRENDS

Nonwhite workers are expected to constitute a larger proportion of the Nation's labor force in the 1970's than in the 1960's. Between 1960 and 1970 the percent increase in the nonwhite labor force, 16 years and over, is projected at 20; the corresponding increase for whites is 16 percent. A very rapid population growth in the present decade is anticipated for nonwhite youth. The percent change among nonwhites between 16 and 24 years is 52.3; close to an additional million nonwhite workers in the 16 to 24 age group are or will be entering the labor force by 1970.

Despite greater openings in some occupations and industries, employment opportunities for nonwhites are characterized by an over-representation in the low-income and low-skilled occupations, and an under-representation in the white collar, professional, and technical jobs. Industries with a declining rate of employment are the industries which have traditionally employed Negroes. The routine, repetitive, low-paid jobs -- those which most Negroes have held in the past--are being rapidly eliminated by automation. Throughout the country Negroes have made slight progress in gaining entrance to skilled manual work, white collar work, and jobs of professional status. But within the professional-technical category, Negroes have been concentrated in lower-paying occupations, and until recently, have been dramatically under-represented in professions such as medicine, accounting, and engineering. One-fourth of the nonwhite men who worked in 1966 earned less than \$3,000, compared with 7 percent of white workers. In every occupational category, nonwhite men had a much higher incidence of low earnings than did white men. Within the major occupations nonwhites were concentrated in such low-paying fields as service jobs and unskilled labor, which explains the large gap in earnings between white and nonwhite workers. For example, 15 percent of all nonwhite men employed in 1966 were nonfarm laborers as opposed to 4 percent of the white men (see p. 23).

Job opportunities must increase in the rapidly growing, better paid, and less unemployment-prone jobs in the white collar, skilled craft, and service fields on a substantially larger scale than in the past. If nonwhites continue to hold the same proportion of jobs as in 1964, it is feared that by 1975 their unemployment rate will be over five times that for the labor force as a whole. 6/

In summary, the effect of the projected shifts in the occupational requirements of the U.S. economy on employment opportunities is such that nonwhites will have to gain access to the rapidly growing higher skilled and white-collar occupations at a faster rate than they have in recent years in order to reduce unemployment.

^{6/} Technology and the American Economy, Report of the National Commission on Technology, Automation, and Economic Progress, 1966, p. 31.

UNEMPLOYMENT

Over 11 million workers were unemployed at some time in 1966 according to the Department of Labor. In 1967 the number of unemployed was probably higher. Rates of unemployment for most occupational categories of workers were not significantly changed from 1966, although certain unemployment trends became more pronounced. Workers in manufacturing, particularly in the durable goods industries, were among those with rising unemployment rates. The rate of joblessness for workers in durable goods rose to 3.4 percent in 1967 from 2.7 percent a year earlier; for those in non-durable manufacturing it increased to 4.1 percent from 3.8 percent. As might be expected from the developments in manufacturing, the rate of joblessness rose more sharply for operatives—from 4.4 percent to 5 percent. Non-farm laborers, whose job security is precarious at best, had a slightly higher rate (7.6 percent) than in the previous year (7.4 percent).

The Negro unemployment rate continued to be more than twice the rate for white workers, with the disparity greatest among teenagers. The unemployment rate for Negro teenagers (at 26.5 percent) was not appreciably lower in 1967 than during the recession-affected year of 1961 (27.6 percent). In addition, the disparity between the unemployment rates of nonwhite teenagers and those of white teenagers has increased. While the unemployment rate for white teenagers dropped as the economic climate improved, the rate among nonwhite teenagers in 1967 was higher than in previous years. One out of every four nonwhite teenagers was unemployed in 1967, almost $2\frac{1}{2}$ times the proportion for white teenagers, whereas in 1960 the ratio was less than 2 to 1. In the slum areas of large cities in 1966, nonwhite unemployment among 14 to 19 year olds ranged from 18.4 percent in Washington, D.C., to 36.0 in Philadelphia, with the rate running over 30 percent in seven other urban areas.

The differentials between youth and adult unemployment rates have persisted despite marked improvements in the overall employment situation. In the job market it is significant that nonwhite high school graduates do less well than white dropouts in getting and holding jobs. They earn less than white youths who have left school before graduation, and more of them begin in lower-status jobs. Many nonwhite workers employed for the first time have more education than they need for the jobs they find. Nonwhites are at a competitive disadvantage in getting good jobs, the barriers becoming formidable when the disadvantages of an inferior education are added to an impoverished home environment.

Charles C. Killingsworth has expressed the problem of employment for the better-educated Negro in his Jobs and Incomes for Negroes. 7/

There is another factor which apparently cannot be substantiated by statistical data but which competent observers believe to be significant both in the non-South and the South; that is the higher occupational aspirations of the Negroes, especially younger ones, who have invested a large number of years in schooling. These better-educated Negroes are far less willing than their less-educated parents to accept menial, low-paid, lowstatus, dead-end jobs. They try to compete at a higher level of the labor market, and this often means in the white-collar sector. Here, most of them face an important handicap in addition to deficient educational achievement. The great majority of young, better-educated Negroes come from blue-collar families, while the majority of bettereducated young whites come from white-collar families. In most white-collar occupations, the employer--whether rationally or not -- tends to require certain modes of behavior, dress, deportment and speech that are thought to be distinctively white-collar; whites generally tend to absorb these modes within the family, Negroes generally do not. Thus a kind of class discrimination appears to be at work in the white-collar sector.

VOCATIONAL EDUCATION

The Vocational Education Act of 1963 provided for a greatly expanded effort to extend and improve vocational education. One of the motives for the passage of the Act was the high level of unemployment among youth. Vocational education is largely skill training for in-school youth at the high school level. Secondary school programs in vocational or comprehensive high schools train primarily for entry-level jobs in service, semiskilled, or skilled occupations. Post-secondary schools offer more advanced technical training in a variety of fields. Adult programs provide all kinds of vocational training at different stages of skill learning plus refresher courses and special training for professionals. Separate vocational programs for persons with special needs are given at various educational levels. There have been no scholarship or stipend provisions for students in vocational education as yet. In fiscal year 1967 the total number enrolled in vocational education was 7,002,598. Of the total, 2,179,356 were in home economics and 951,972 in agricultural fields.

Although the Act was not implemented until fiscal 1965 when funds were appropriated, the program has already been subject to criticism. Foremost among the criticisms that vocational education has not been able to attract and recruit youth who have socio-economic handicaps in any sizable proportion. Nor has vocational education been able to reach or retain potential dropouts. It has failed to develop programs and provide services for students who could not benefit from regular course offerings.

From the viewpoint of minority groups, both the academically disadvantaged and the better-educated, vocational education is regarded with skepticism for the following reasons:

- 1. There is no assurance of a job upon completing training. Nonwhites have experienced greater difficulties in finding training-related employment than whites.
- 2. Negroes believe that good jobs in vocational fields are hard to get because of discriminatory practices of industry and unions in hiring and upgrading, particularly in trades requiring apprenticeships.
- 3. Supportive services such as counseling, placement, or a basic education curricula are seldom included in vocational education programs. Without these, academically disadvantaged youth cannot participate successfully in vocational programs.
- 4. Nonwhites tend to lack specific knowledge of the range of job opportunities, the type of training required, and how to plan for vocational careers. They are not informed about the programs available in their community and how to apply for them.

- 5. Vocational counselors and school officials have discouraged Negro youth from choosing vocations where Negroes are not normally employed. 8/
- 6. Those who complete vocational courses tend to rely on family and friends for jobs. "A nationwide survey of the 1962 graduates of vocational high schools showed the Negro youth to be more dependent than the whites upon informal sources of assistance in their job search. Half of all Negro students depended upon friends or relatives to assist them in finding jobs." 9
- 7. Many nonwhites have higher aspiration goals and shun the vocational education route because the curriculum is more specialized and provides only for entry-level jobs. They prefer a general academic course leading to college where there is more freedom for individual development.
- 8. In many areas, inner-city and rural, vocational opportunities for nonwhites have not existed. Programs that do exist are often inferior in the sense of providing realistic vocational training-training that will qualify graduates for good jobs upon graduation.
- 9. Vocational schools are unfamiliar with the style of life of the ghetto and have not developed methods to reach and recruit disadvantaged youth.

In conclusion, tradition has acted as a barrier to greater participation of minorities in vocational education programs. On the one hand, nonwhites have had to contend with a long history of discrimination in many vocational fields and continue to avoid choosing professions where whites predominate. On the other hand, vocational education has not met the training needs of disadvantaged youth. Nor has it been able to attract in quantity the better-educated and ambitious nonwhite who could profit from a vocational program. The greatest single deterrent to vocational education is that programs do not tie in with actual employment opportunities in the community. There appears to be little relationship between the proportions of enrollment in vocational programs and the distribution of jobs reflecting the changing structure of employment. fields of agriculture and home economics, which comprise a large percentage of enrollments, are not those expected to have expanding job opportunities. Little effort has been made to interrelate secondary and postsecondary skill training for life-cycle career development. There is insufficient planning for "career ladder" and guarantees of immediate employment upon completion of the course of study.

MANPOWER DEVELOPMENT AND TRAINING

The objective of the Manpower Development and Training Act of 1962 was to identify current and prospective manpower shortages and to seek out and train or retrain persons who can qualify for these positions. Its passage was prompted by the spread of automation along with widespread shortages of skilled personnel in technical fields and the increase of young workers entering the labor force. The Act has been amended in 1963, 1965, and 1966, providing accommodation both to conditions of the labor force and requirements for skill training.

Since passage of the Act in 1962 more than 1.2 million training opportunities have been authorized. Of these, nearly 740,000 have been for institutional (classroom) training, 455,000 for on-the-job training, and 60,000 for part-time and other training. As of June 1, 1968, 725,000 persons had been errolled in institutional training programs and 435,000 (60.0 percent) had completed their training. Approximately 285,000 persons had been enrolled in on-the-job training and 155,000 (54.4 percent) had completed their training; 76 percent of those completing institutional training and 89 percent of those completing OJT were employed when last contacted.

Training has been conducted in all major occupational groups and in more than 1,300 different occupations. Occupations range from beautician and appliance repairman to draftsman and programer for data processing. Among institutional programs the largest number of persons were authorized for training for auto mechanic/auto-body repairman, stenographer, general machine operator, welder, nurse aide/orderly, clerk typist, and licensed practical nurse. Among on-the-job training programs, the largest number was for aircraft subassembler, nurse aide/orderly, welder, and general machine operator.

From the onset MDT was faced with a dilemma. Its legislative intent was to prepare the growing labor force for the technological shifts occurring in the economy by sponsoring skill training and retraining. In its early years MDT programs offered high-level training in the technical fields where skill shortages existed. Trainees who met the skill and literacy requirements enrolled in MDT programs. The criticism was soon heard that MDT was directed towards labor shortage occupations and not the unemployed. MDT had catered to the upper levels of the labor force and had not paid attention to the problems of the hard-core unemployed or disadvantaged worker. A series of amendments reoriented MDT, permitting programs to include basic education and supportive services.

The primary objective of MDT now is to train or retrain the unemployed; training for skill shortages is secondary. The MDT handbook directs

employment service personnel to identify not only shortages in skill occupations but those where high turnover, retirements or expected expansion will provide job opportunities. The 1966 declaration of intent of the Manpower Administration allocated only part of the manpower and training effort for the training of skill shortages, and did not press for the setting up of training projects in those occupations. Moreover, the occupations most likely to be critically short of personnel require training beyond the two-year legislative limits and one-year practical limits of the MDT program.

In adjusting its goals to meet the needs of the disadvantaged, MDT is faced with additional criticisms. Disadvantaged trainees resent the low level of the jobs for which training is being given. They feel that MDT is for low-paid, undesirable, and dead-end jobs. Occupations such as nurses aides, hospital orderlies, maintenance or custodial work, and food service aides are scorned because of low pay and unattractive working conditions although demand is constant. There is no motivation for training in these fields without provisions for upgrading or built-in job mobility.

Nonwhite trainees completing MDT programs have difficulty finding and holding jobs. "In 1966," states Garth L. Mangum, "one-fourth of all nonwhite institutional completers were unemployed at last contact compared to 14 percent of white completers." 10/ And, "the percentage of non-mounties employed was substantially lower (and the percentage of non-whites unemployed substantially higher) than for whites even when controlled for age, education, occupation and duration of pre-training unemployment." 11/ In institutional training nonwhites continue to be over-represented in the service trades and under-represented in professional, technical, and skilled occupations. In on-the-job training, the disadvantaged have not been favored as recruitment and selection of the trainee-are within the discretion of the employer and union. The best qualified applicant is chosen. Supportive services upon which the disadvantaged trainee depends are not provided in sufficient; scope.

In conclusion, manpower development and training neither includes enough people in its programs nor leads to meaningful jobs. In FY 1967, MDTA provided for 286,400 slots. Unemployment in 1967 was over 11 million. MDT programs remain small relative to the needs of disadvantaged minorities. Only a small fraction have been able to benefit from the present program.

NEW MANPOWER TRAINING APPROACHES

Concentrated Employment Program (CEP): established in 1967 to bring together all Department of Labor training programs in a coordinated effort to reach out to, motivate, provide job orientation and job opportunities for the hard-core unemployed in specially selected areas.

Cooperative Area Manpower Planning System (CAMPS): started in 1967 as a mechanism for the planning, coordination, and implementation of Federal, State, and local resources at each level of operation to reduce unemployment and underemployment.

Job Opportunities in the Business Sector (JOBS): a new partnership between government and private industry to hire and train the hard-core unemployed. Costs for training disadvantaged workers by private companies and providing supportive services are paid for by the government at levels in excess of those under other OJT projects. Under the MA-3 program the Labor Department contracts with the National Alliance of Businessmen for job training; guaranteed job placement is included.

Testing, Informing, Discussion, and Evaluating (TIDE): introduced initially in 33 Youth Opportunity Centers in the summer of 1966 and now expanded as a means of holding youth until Neighborhood Youth Corps, MDTA, and Job Corps assignments were made. Youth were brought together for a four week period to discuss with counselors and others motivations and interests as well as what is required in the world of work.

Opportunities Industrialization Centers (OIC): conceived in Philadelphia in 1964 as a self-help venture for the disadvantaged and extended to all parts of the country. OIC offers special counseling (psychological conditioning, and motivation of trainees through a "feeder" program) in addition to up-to-date skill training and placement in jobs that are available locally. It coordinates training activities with local business developments, maintaining advisory committees, and is supported by both the Federal government and private industry. A national OIC institute in Philadelphia provides technical information services to other OICs and to localities that wish to establish OIC programs.

Project Transition: a Department of Defense program for returning veterans which provides training and educational opportunities. Project Transition has four basic elements—a counseling program to determine career interests and educational and training needs, an educational program to bring veterans up to the eighth grade or high school equivalency level, a training program to give them marketable skills, and a placement system to furnish employment opportunities. Training is provided through existing civilian—related military courses, through MDT or other Federally sponsored programs or, through private companies for prospective employees.

RECOMMENDATIONS

In an age of increasing specialization, finding jobs for unemployed youth requires skills and knowledge of the job development process. As the linkage between the unemployed, training programs, and employers who have openings, job development involves the following components:

- 1. Entry-level jobs have to be created and structured into careers so that the individual may know the skills and training required at each level of advancement in terms of life-cycle career needs.
- 2. In-depth counseling (testing if necessary) must be included as an integral part of job development, involving pre-vocational guidance, locating the job, interview procedure, on-the-job training, and upgrading.
- 3. Guidance must be extended to employers in order that they may understand the background of disadvantaged youth, and their problems in adjusting to the environment of work.

Youth must be able to plug into the system of vocational training at various stages in their careers. Training should match job development and identification of job skills, and be made available for upgrading and promotion. Training and education must be oriented to life-cycle careers in order that the worker may enter and re-enter the educational system as his job needs dictate.

Much more information on jobs and careers should be disseminated to school-age youth. They need to be exposed to white collar work as part of their school curriculum. Employment services should plan periodic visits to comprehensive and vocational high schools and provide a job panorama, describing different vocations and the training required for them.

All skill or on-the-job training programs for disadvantaged youth and adults must have provisions for literacy and computational courses. Without basic education the disadvantaged worker lacks fundamental employability skills and will not be able to adjust to his job or advance in a career. Included in these programs should be adaptive skill training or behavioral orientation to help workers understand employee-employer relationships.

Vocational education for public service careers is in need of pioneer work. Preparation for these careers involves the setting up of new programs at high school and post-secondary educational levels which would train people for entrance into the public service and help subprofessionals advance up the career ladder. Training should be flexibly structured so that the dropout who requires on-the-job training in an entry-level position and the employee who begins his career at a higher level of competency can continue learning at different skill levels.

Top priority should be given to Federal funding and operation of youth training programs designed to zero in on youth unemployment. Programs should be mobile, varied, and sufficient in scope to respond to the training and employment needs of unemployed youth, providing for basic literacy and job motivation.

The following summary on growth prospects for individual occupations was presented by Leonard A. Lecht in a report on <u>Manpower Requirements</u> for <u>National Objectives</u> in the 1970's prepared for the Department of Labor.

Occupational Growth Profile, 1964-1975

I. High Growth Occupations

White Collar Occupations:

Airplane pilots and navigators
Architects
College presidents, professors
and instructors
Dentists
Designers and draftsmen
Engineers
Librarians
Natural scientists
Nurses, professional
Personnel and labor relations
workers
Physicians and surgeons

Social, welfare and recreation
workers
Technicians, electrical and
electronic
Technicians, medical and dental
Technicians, other
Salaried managers
Cashiers
Office machine operators
Secretaries, stemographers
and typists
Stock clerks and storekeepers

Blue Collar Occupations:

Excavating, grading, and road machinery operators Attendants, auto service and parking Deliverymen and routemen Sewers and stitchers, manufacturing

Service Occupations:

Attendants, hospital and other institutions
Barbers, hairdressers and cosmetologists
Charwomen, janitors and porters
Cooks

Firemen, fire protection
Policemen, sheriffs and
marshalls
Practical murses
Waiters, bartenders and
counter workers

II. Moderate Growth Occupations

White Collar Occupations:

Accountants and auditors Lawyers and judges Pharmacists Teachers, elementary Teachers, secondary Bookkeepers

Blue Collar Occupations:

Brickmasons, stonemasons and
tilesetters
Cranemen, derrickmen and hoistmen
Electricians
Foremen
Machinists and job setters
Mechanics and repairmen, anto
Mechanics and repairmen, other

Painters, construction and maintenance
Plumbers and pipefitters
Stationary engineers
Toolmakers, diemakers and setters
Truck and tractor drivers

Service Occupations:

Guards, watchmen and doorkeepers Welders and flame cutters Leborers, except farm and

III. Low Growth Occupations

White Collar Occupations:

Self-employed Shipping and receiving clerks Telephone operators Insurance and real estate agents and brokers Selemmen and seles clerks, retail trade

Blue Collar Occupations:

Cabinet makers and pattern
makers
Carpenters
Linemen and servicemen, telegraph, telephone and power
Locamotive engineers
Printing craftsmen
Tinsmiths, coppersmiths and
sheet metal workers
Assemblers
Brakemen and switchmen, railroad

Checkers and inspectors,
manufacturing
Filers, grinders and
polishers, metal
Leundry and dryeleaning
operatives
Mine operatives and laborers
Painters, except construction
and maintenance
Taxi drivers and chanffeurs

Service Occupations:

Private household workers

Farm Occupations:

Farmers and farm managers

Farm laborers and foremen

The high growth occupations are those for which the increases listed between 1964 and 1975 are at least one-third greater than the percentage increases projected for total employment, (i.e., they are estimated to increase by at least 33% in the benchmark estimate and at least 50% in the estimate for the aspiration goals). The low growth occupations are those for which the projected increases are less than two-thirds of the percentage increases in total employment (i.e., they are estimated to increase by less than 16% for the benchmark estimate and less than 29% in the estimate for the aspiration goals.) Benchmark estimate is an estimate of demand for labor if the growth rate in GNP was 4.5 percent a year between 1964 and 1975. Aspiration goals refer to manpower priorities which Mr. Lecht believes will be set forth as national objectives.

Foreword

Unemployment among nonwhite youth, particularly in ghetto areas, has been growing at an alarming rate. In 1967 one out of every four nonwhite teenagers was unemployed and in slum areas the unemployment rate was much higher. In the next decade the nonwhite labor force is expected to grow rapidly, creating further pressures to meet the employment needs of increasing numbers of nonwhite youth. The purpose of this profile is to present the problems of unemployment in the context of migration, labor force growth and Federally sponsored skill training programs in the fifty States. This report is the second part of a series on vocational training, employment, and unemployment. Other sections deal with national trends and urban conditions.

The compilation of data is the product of an interagency effort. I would like to acknowledge the invaluable assistance of the Equal Employment Opportunity Commission, the Office of Economic Opportunity, the Department of Labor, and the Census Bureau of the Department of Commerce. Special thanks goes to Dr. Herbert Striner, Director of Program Development, W. E. Upjohn Institute for Employment Research, Washington, D.C., who has generously provided us with insight and direction. This study was prepared by Dr. Margot Louria assisted by staff members of the Office of Programs for the Disadvantaged. The findings and interpretations of these data are the responsibility of the Office of Programs for the Disadvantaged.

INTRODUCTION

The uneven development of the United States is resulting in a mobile America with millions of people on the move annually in search of opportunity. In the twenty annual surveys conducted by the Census Bureau since 1946, the proportion of movers each year has varied from 18.3 to 21.0 percent of the total population. Migration to and out of States, from one county to another, and within local areas is closely related to changing economic conditions and employment trends. The largest increases in net migration between States are occurring in California, Arizona, Nevada, and Florida. These same States show the greatest rates of job growth. In 1962 one out of six nonfarm jobs was in California, Texas, and Florida. The North Central region (Wisconsin, Michigan, Illinois, Indiana, and Minnesota) lost more migrants between 1960-66 than it gained. These States produce heavy steel and manufactured goods and are able to reduce labor costs through automation and other technological devices. Significant losses in nonfarm populations through net migration are being experienced in Pennsylvania, West Virginia and Southeastern States where job expectations have not been matched with opportunities. Net migration of nonwhites out of the South is continuing -- the average annual number leaving for the period 1964-66 was about 100,000.

Between March 1966 and March 1967 22.3 million had moved within their counties, 12.9 million had moved between counties and 6.6 million crossed State borders. Bureau of the Census, "Mobility of the Population of the United States, March 1966 to March 1967," Series P-20, No. 171, April 30, 1968.

The typical migrant is young, unemployed and of low income. He is more likely unskilled and in an occupation group (laborers, services workers, operatives) that has a high unemployment rate. His education and training are inadequate in relation to job vacancies and career mobility in his home community. He probably comes from a rural background and is looking forward to resettling in an urban area.

In spite of the exodus of people from Southern States, the total labor force of the South is expected to expand rapidly during 1960-70 and 1970-80. The nonwhite labor force is projected to grow at a slightly faster rate during these two decades in the South. In the Northeast and North Central regions of the United States the nonwhite labor force is expected to increase twice as fast as the total labor force. These projections and population shifts have significant implications in developing manpower policies which will serve the employment needs of our growing, mobile labor force.

The purpose of this survey of the States is to explore the relationship between net migration, labor force projections, unemployment, and Federally sponsored training programs. It is hoped that these State profiles will be a useful guide in the planning of training and retraining programs for the displaced worker. The report on profiles of the States is the second phase of a three-part study on Vocational Training, Employment, and Unemployment. The first section was on national trends and the third will be devoted to profiles of nine American cities.

MIGRATION

The uneven pattern of economic development in the United States is reflected in net migration between States. From 1960 to 1966 the movement was westward. Arizona, California and Nevada had percentage increases of 9.4, 9.6 and 29.8 from net migration. Florida was the only State outside of the West with a large gain through migration. Its net increase was 10.5.

Significant changes in the movements of people from State to State are also taking place in other regions. Out-migration from Southern States, dominant in past years, is no longer uniform. Georgia, Tennessee, Virginia and Florida were in-migrating States, 1960-66. West Virginia, North and South Carolina, Kentucky, Alabama and Mississippi continued to lose people through net migration. Similarly, the Northeast as a region is experiencing an uneven net migration trend. Maine, Vermont, Massachusetts, Rhode Island, and Pennsylvania were out-migrating States, 1960-66. On the other side, New Hampshire, Connecticut, New Jersey, and New York were receivers of population through net migration. The North Central region is the one area with a record of net out-migration for the entire region in the 1960-66 period.

Even with all the migration, States such as Mississippi will still have a rapid growth in the total population offsetting the number who may wish to leave. The only State where there is a projected loss in total population is West Virginia, which has had unemployment problems for many years.

Migration tends to parallel shifts in the geographical distribution of jobs. The majority of people leave their home States in response to job opportunities. The shift of population needs to be assessed in terms of (1) skills and training of out-migrants, (2) effect of out-migration on the home State's economy, and (3) employment and training opportunities in in-migrating States.

ERIC

·LABOR FORCE PROJECTIONS *

The projected growth rate of the labor force (16 years and over) varies considerably from State to State in the periods 1960-70 and 1970-80. States in the West are expected to grow rapidly during the present decade with Nevada showing a labor force increase of 70 percent, Arizona, 56 percent and California, 38 percent. States in other regions are projected to grow at a moderate rate: 25 percent in the South, 16 percent in the North Central region, and 15 percent in the Northeast. For all regions the greatest rise in the age level of the labor force will occur in the 16 to 24 year old group. During 1970-80 the labor force will grow more slowly in these regions, ranging from 25.9 percent in the West to 12.6 percent in the Northeast.

In all regions the nonwhite labor force is expected to increase at a faster rate than the total labor force for the two successive decades 1960-70 and 1970-80. In the South and West the nonwhite labor force will grow at a slightly faster rate than the total for the region. In the Northeast and North Central regions nonwhite workers are expected to increase nearly twice as fast as the total labor force. Significant for education and employment are the large increases projected in young non-white workers in particular regions as revealed by the following table:

Nonwhite labor force 14 to 24 years

Region	Percent change, 1970-80
Northeast	48.1
North Central	51.7
South	20.4
West	50.2
WEBU	

* Effective in January 1967 the age level for official statistics on the labor force was raised from 14 to 16 years and over. Nonwhite labor force figures for State and region only are based on persons 14 years and over since the latest available projections are from the Monthly Labor Review, October 1966.

UNEMPLOYMENT

Unemployment is highly uneven within and between States. For some States the extent of unemployment is associated with industrial change, especially where there has been dependence on a single resource industry such as agriculture, forestry or mining. Unemployment can be caused by geographical shift, as the transfer of the textile industry in New York and New England to other locations.

Unemployment includes those who cannot find work in their particular occupation and are reluctant to move or acquire new skills. It also includes those who lack employability because of insufficient education or training. Whether unemployment is structural (worker's qualifications and skills unsuited for openings) or whether it is a result of shortage of demand is frequently debated. According to J. Kenneth Galbraith, unemployment is a combination of both and will appear with the slackening of aggregate demand as well as be found among those rigidly identified with particular occupations and locations. Modern unemployment is also cultural in origin. Minority groups are known to have high unemployment rates because of prior handicaps in education and environment. States with the highest unemployment rates in 1967 are as follows:

State	Unemployment rate, 1967
Alaska	8.7
Nevada) West Virginia)	6.4
California) New Mexico)	5.0
Oregon	4.9
Mississippi	4.8

GROWTH IN NONAGRICULTURAL EMPLOYMENT

The greatest percent change in nonagricultural employment between 1961 and 1966 occurred in States with high rates of in-migration. Nevada's percent change was 46.9, Florida, 28.8, and California, 22.2.

Despite the exodus of workers from some Southern States, nonagricultural employment in the South is rising at a rate exceeding the national average as shown by the following chart:

Percent Change in Nonagricultural Employment

	1961-1966
USA	18.2
Florida	28.8
Tennessee	27.3
Mississippi	27.0
Georgia	25. 9
South Carolina	25.1
North Carolina	24.2
Kentucky	23.4
Louisiana	23.4
Alabama	20.0

The South is in a period of transition. It is changing rapidly from a rural agricultural to an urban industrial economy and, at the same time, is faced with the out-migration of its workers from key States. The exodus of rural Southern workers is to cities in the South, North, and West. The ability of the South to stem the flow of out-migrating people will depend on providing opportunities through a variety of manpower programs and services which would develop the potentiality of its workers. The success of economic development is dependent on efficient utilization of human resources. Whether or not the South attains the kind of industrial economy it wishes may be determined by the rate at which workers move out of or into the region.

MDTA TRAINING PROGRAMS

During fiscal year 1967, 286,400 persons were enrolled in training programs for unemployed and underemployed workers established by the Manpower Development and Training Act of 1962. Total unemployment in the United States for 1967 (preliminary 11-month average) was 3,076,000. The actual difference between the number of unemployed in each State and the number trained by MDT programs varies tremendously from State to State. The following table lists States with the largest numerical gap between the unemployed and MDT enrollees.

State	MDT enrollees FY 1967	Unemployed 1967	Difference between MDT and unemployed
California	28,000	389,000	361,000
Pennsylvania	20,100	167,000	146,900
Michigan	12,900	157,000	144,100
Illinois	14,400	149,000	134,600
Ohio	10,500	135,000	124,500
New Jersey	9,200	129,000	119,800
Texas	11,600	121,000	109,400

ERIC Fruit Floridad by ERIC

The uneven pattern of economic growth, migration, and unemployment reveals unique qualities of the States. The following States with unusual combinations of labor force projections, migration, and unemployment are described briefly:

Florida: It is growing faster than any other Southern State and is projected to expand further from 1970 to 1980. This is the result of a high rate of in-migration and natural population increase. Between 1965 and 1985 its net migration is projected at nearly three million. Florida has the lowest unemployment rate of all Southern States except Virginia. 26.4 percent of its employees on nonagricultural payrolls were in wholesale and retail trade.

Mississippi: It had an unemployment rate of 4.8 percent in 1967 and is an out-migration State. The nonwhite population is 42.7 percent of the total. Both the nonwhite population and labor force is growing at a faster rate than the white population and labor force. Mississippi is rapidly changing from an agrarian to an industrial economy. 72 percent of its vocational education enrollments, however, are in agriculture and home economics.

Nevada: With a high unemployment rate of 6.4, Nevada has a fast growing labor force which increased 69.8 percent, 1960-1970. It is rapidly becoming non-agricultural in employment with a percent change of 46.9 between 1961-66. 39.8 percent of its employees on nonagricultural payrolls are in service industries.

California: Its unemployment rate (5 percent) is rising and the number unemployed is large--389,000 workers in 1967. MDT training projects are not able to meet the needs of the unemployed. The difference between MDT enrollees and unemployed is 361,000. California is expected to receive an additional five million persons through net migration, 1965-85.

Michigan and Missouri: Both are expected to have large increases in non-white population and labor force. These States are expected to continue losing more migrants than they will gain. This is the result of a large net loss of white workers offset only slightly by additions of nonwhite migrants. The area has concentrated on heavy steel manufacturing now being rapidly automated. Michigan's unemployment rate was 4.6 in 1967; Missouri's was 3.4.

Pennsylvania: Its nonwhite population and labor force are projected to grow rapidly, 1960-70 and 1970-80. Pennsylvania has been losing people steadily through net migration. Its loss is projected at 652,000, 1965-85. The percent change to nonagricultural employment between 1961-66 was 11.9, which is below the national average, indicating that the State may have reached its peak in changing from an agrarian to an industrial economy.

New Jersey: It is expected to have rapid increases in its nonwhite labor force 1960-70 and 1970-80. New Jersey is a popular in-migrating State and is projected to receive over a million people between 1965-85. It's unemployment rate was 4.5 in 1967. The difference between the number of unemployed in 1967 and MDT enrollees was 119,800.

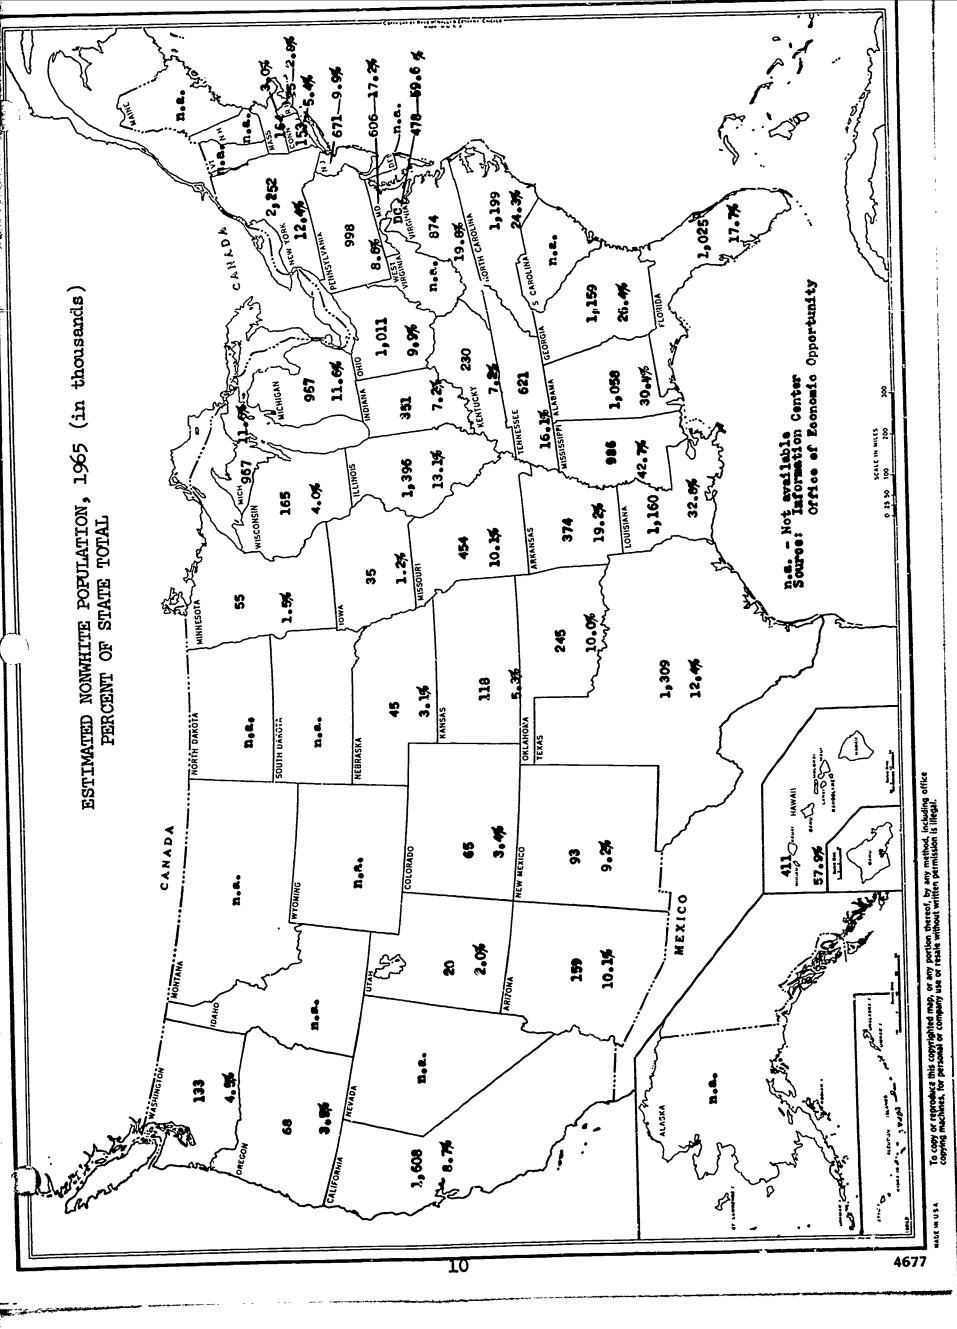

ERIC

RECOMMENDATIONS

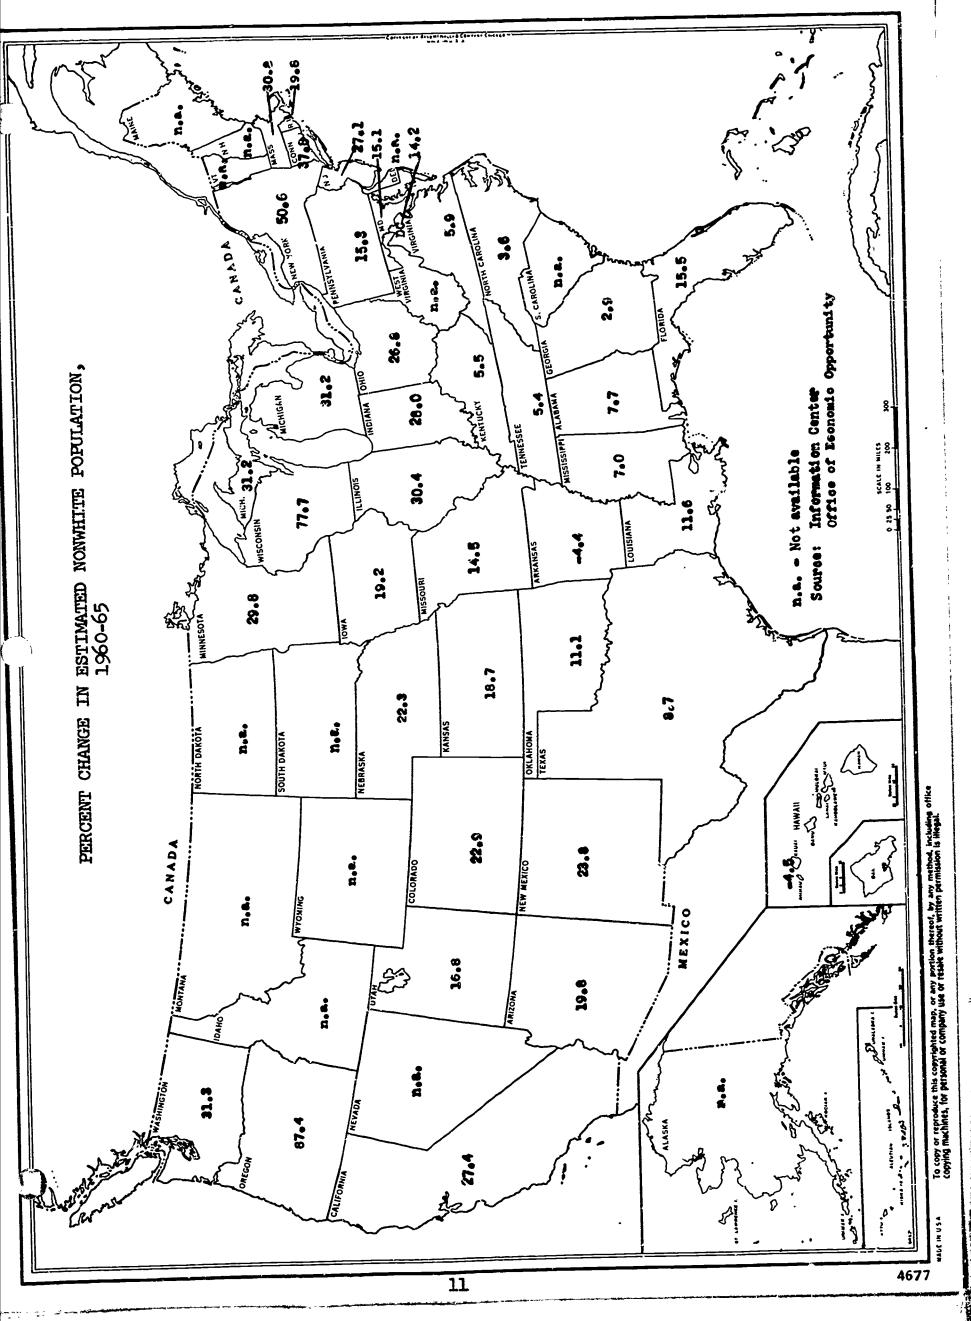

The mobility of the American worker and the swiftness of technological change are two significant features of the U.S. economy which have special implications for manpower policies. Planning at the Federal and State level can influence the direction of migration and assist in resolving the specific economic problems facing each State. The Federal government is in a position to counteract some of the instability caused by movements of people. California, the State which is favored among migrants, has rising unemployment and requires for employment technically trained workers. Unskilled workers from the Southers "tates may be moving into areas where jobs are only for those with qualifications. Skill training should be made available in s at scope in the home State, in the area to which the migrant is to or in both places.

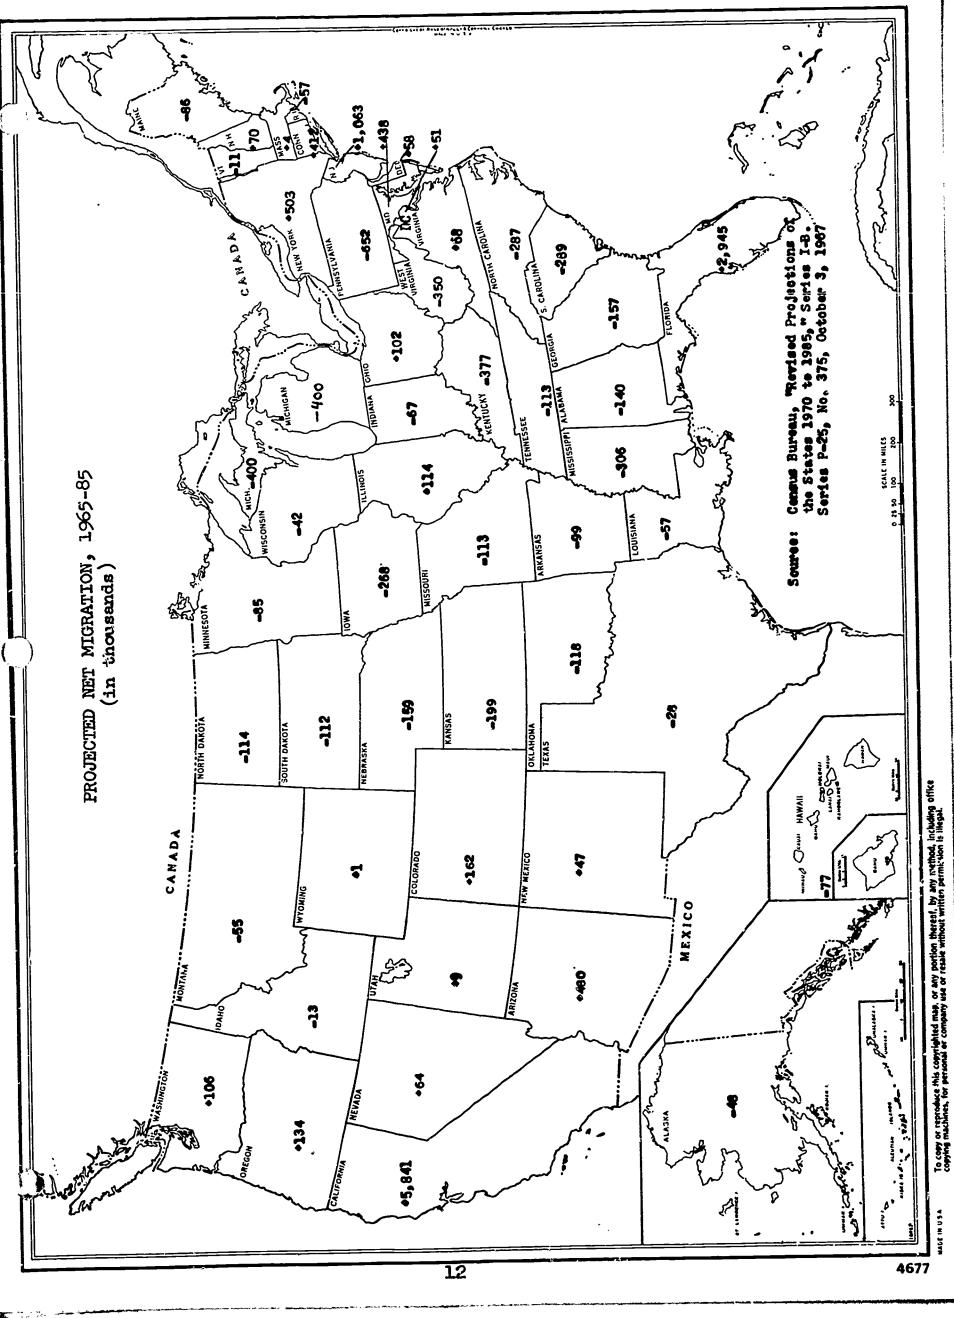

Labor force projections — ate that in several States the nonwhite labor force is growing at a rapid rate compared to the total labor force. In California, Florida, and New Jersey the nonwhite labor force is expected to rise by over 30 percent between 1960 and 1970 and by another 30 percent in the next decade. These are States to which nonwhites have moved in large numbers. Whether there will be job opportunities for all concerned depends to a large extent on the planning and implementation of programs in advance of anticipated labor force growth and migration.

SOURCES AND EXPLANATIONS

Unemployment

Data are from Department of Labor, Manpower Report of the President, April 1968.

Population and Labor Force Projections

Johnston, D. F. and G. R. Methee, "Labor Force Projections by State, 1970 and 1980," Monthly Labor Review, October 1966, and Manpower Report of the President, April 1968.

State Population

Estimated resident population, 1966, was taken from Bureau of the Census. "Estimates of the Population of States: July 1, 1966." Series P-25, No. 380, November 24, 1967. Other statistics on estimated nonwhite population were provided by the Office of Information, Office of Economic Opportunity.

Migration

For projected migration, Bureau of the Census, "Revised Projections of the Population of States, 1970-1985," Series P-25, No. 375, October 3, 1967 (Series I-B). For net migration, Bureau of the Census, "Estimates of the Population of States: July 1, 1966."

Educational Attainment

Data are based on the 1960 census reports.

Manpower Training Programs

Vocational Education Enrollments are provided by the U.S. Office of Education. MDT enrollees are taken from Department of Labor, Manpower Report of the President, April 1968.

Employment

Employees on nonagricultural payrolls are from Bureau of Labor Statistics. Employment and Earnings and Monthly Report of the Labor Force, June 1968. For percent change in non-agricultural employment, Bureau of Labor Statistics, Employment and Earnings for States and Areas 1930-1966, Bulletin 1370-4.

Data on occupational distribution of Negroes, 1967 were provided by the Equal Employment Opportunity Commission. When a particular industry is represented within a State by fewer than 5 establishments or by 5 to 9 establishments with less than 2,000 employees, hyphens appear in place of distribution figures for that industry.
