This study was conducted to discover differences in personality characteristics among student leaders. The personality characteristics of presidents of campus organizations affiliated with one of four distinguishable student subcultures, identified by previous research as vocational, academic, collegiate, and nonconformist, were measured by the Stern Activities Index. The index contains items to measure 12 factors of personality: self-assertion, audacity-timidity, intellectual interests, motivation, applied interests, orderliness, closeness, submissiveness, sensuousness, friendliness, expressiveness-constraint, and egoism-diffidence. Student leaders of the nonconformist subculture groups were omitted from the analysis because of the low frequency of response. Comparisons among the remaining groups were made for each of the factor means by the use of "t" tests. The significant differences found among the leaders were: (1) collegiate leaders scored higher on closeness and friendliness than the vocational or academic leaders; (2) on expressiveness-restraint, collegiate leaders scored higher than vocational leaders; (3) vocational leaders scored higher on applied interest than academic leaders; and, (4) academic leaders scored higher on motivation than collegiate leaders. It was concluded that the results of the research support the theory that student leaders possess different personality characteristics, depending on their particular reference group. (MB)

PERSONALITY CHARACTERISTICS OF LEADERS
IDENTIFYING WITH DIFFERENT
STUDENT SUBCULTURES

Stephen R. Brainard

University of Missouri

Several investigations have been conducted regarding the
personality characteristics of student leaders (Stogdill, 1948;
Flaherty, 1967; Johnson and Frandsen, 1962; Hartshorn, 1956).
Generally, these studies have compared selected leaders with
students in general or selected nonleaders. Recent litera-
ture in the social sciences has made reference to the exis-
tence of distinguishable student subcultures on the American
university campus (Clark and Trow, 1966; Stern, 1963). Cor-
responding with the subcultural emphasis, attempts have been
made to differentiate between student leaders who, by the
nature of the organization they participate in, have been
placed in different subcultural categories. Williamson and
Hoyt, using the Minnesota Multiphasic Personality Inventory,
discerned significant differences on certain scales for
groups of leaders participating in five types of organizations
(Williamson and Hoyt, 1952). Another study indicated signifi-
cant differences between liberal and conservative political
action group leaders on certain personality variables as
measured by the California Psychological Inventory. "Liberal
leaders tend to have lower superego strength, less concern for
conventialities, and more interest in radical conditions and

circumstances than do conservative leaders" (Windborn and Jansen, 1967).

Clark and Trow have proposed a theoretical typological model of student subcultures, with four distinct subcultures being described. Each of the four subcultures, vocational, academic, collegiate, and nonconformist, has its own recognizable characteristics (Clark and Trow, 1966).

The purpose of this study was to attempt to answer the question of whether groups of student leaders participating in each of the four subcultures proposed by Clark and Trow had differential personality characteristics when compared with each other. The hypothesis stated in the operational null form was:

> There is no difference in Stern Activities Index responses
> made by groups of student leaders who identify with
> different subcultures within the University of Missouri,
> Campus at Columbia.

METHOD

Definition of Terms

Student leader- the president of a recognized student organization on the University of Missouri, Campus at Columbia.

Personality characteristic- one of twelve factors measured by the Stern Activities Index.

Student subculture- subculture is defined by the College Student Questionnaire (CSQ) which employs Clark and Trow's typology of student subcultures. A student will be identified as

participating in one of the four subculture by his reponse
to questions 131-134 in Section 2, Part 2 of the CSQ.

Sample

The student leaders studies in this investigation included
the population of presidents of recognized student organizations
on the University of Missouri Campus. An official list published
by the Office of the Dean of Students indicated 220 exclusively
student organizations. All 220 presidents were asked to complete
items 131-134 of Section 2, Part 2 of the CSQ. Of the 220
original presidents asked to participate, 152 responded. The
responses are illustrated in Table one. A chi square analysis
was performed to determine if frequencies deviated significantly
from a uniform chance distribution (Edwards, 1968).

Insert Table 1 about here

In order that the number of Ss would be equalized for the
final sample, thirty Ss were randomly drawn from the 92 leaders
identifying with the collegiate subculture. The frequency of
response for the nonconformist group (N=5) was considered too
low to continue further investigation of the group. The Stern
Activities Index was then sent to the final sample of leaders
identifying with the vocational, academic, and collegiate
subcultures.

Instrumentation

The Stern Activities Index (AI) was designed to provide a
rather broad measure of personality. The instrument was modeled

after H.A. Murray's (1938) proposed "system for classifying the organizational tendencies that appear to give unity and direction to personality" (Stern, 1964). The AI consists of 30 scales of ten items each. From the 30 scales, fourteen personality factors were extracted by factor analysis. The factors are: Self-assertion (1), Audacity-Timidity (2), Intellectual Interests (3), Motivation (4), Applied interests (5), Orderliness (6), Submissiveness (7), Closeness (8), Sensuousness (9), Friendliness (10), Expressiveness-Constraint (11), Egoism-Diffidence (12), Timidity-Audacity (-2), Constraint-Expressiveness (-11), The two inverted factors were omitted from analysis in the investigation.

The College Student Questionnaire is "designed to facilitate the study of biographical and attitudinal characteristics of groups of college students" (Linn, Davis, and Cross, 1965). The section extracted from the CSQ (Section 2, Part 2, Items 131-134) is concerned with the identification by students of the philosophy of higher education which most appropriately applies to them. The student selects one of the following four philosophies:

Vocational- consists of students whose major purpose for attending college is to obtain a degree which will be instrumental in helping the student secure the job he could not otherwise obtain.

Academic- the student typically identifies himself with academic concerns of the more serious faculty members. These students are intrinsically interested in scholarship for its own sake.

Collegiate- the subculture is often referred to as the
"fun culture". The lives of these students revolve around such
activities as football, dates, fraternities, and drinking.
These students are quite resistant to serious academic demands.

Nonconformist- the students have been typically referred
to as the "bohemian", "alienated", or "radical" subgroup.
"The distinctive quality of this student style is a rather
aggressive non-conformism, a critical detachment from the college
they attend and from its faculty, and a generalized hostility
to the college administration " (Clark and Trow).

Data Analysis

Twelve factor means were calculated for each group.
Specific hypotheses were not generated regarding the predicted
mean differences. Consequently, a two-tailed t test was performed
using Student's t Statistic. Mean difference comparisons were
made between the three groups on all factors.

RESULTS

Based upon the analysis of mean differences, significant
findings were discerned on five of the twelve personality
factors. The results of the data analysis are illustrated in
Table 2.

Insert Table 2 about here

Comparisons between the vocational and academic groups

Student leaders who identified with the vocational group
differed significantly from those who identified with the

academic group on one factor, Applied Interests. The vocational students scored higher on the factor, indicating a greater "interest in achieving success in concrete, tangible, socially acceptable activities" (Stern, 1963). High scores on the factor seem to be related to an interest in activities which are typically characteristic of functions in business and industry. Mean differences on the eleven remaining factors were quite low, indicating a possible high degree of congruity between the two groups of leaders.

Comparisons between the vocational and collegiate groups

The vocational and collegiate leaders differed significantly on three factors, Closeness, Friendliness, and Expressiveness-Constraint. The collegiate group scored higher on all three factors. High scores on Closeness indicates a strong need for warmth and emotional supportiveness. The Friendliness factor involves a combination of affiliative and "playful" interests. The factor "involves a simple and uncomplicated form of amusement enjoyed in a group setting" (Stern, 1963). The Expressiveness-Constraint factor measures the degree of emotional lability accompanied with freedom from controls imposed by the self. Individuals scoring high on the factor are typically outgoing, spontaneous, impulsive, and uninhibited.

Comparisons between academic and collegiate groups

The academic and collegiate leaders differed on three factors, Motivation, Closeness and Friendliness. The academic group scored higher on Motivation and the collegiate group scored higher on Closeness and Friendliness. These results are

interpreted as meaning that the academic group has a stronger

need in terms of competitiveness, perserverance, and

intellectual aspiration, while the collegiate exhibits a

stronger need in terms of affiliation, play, sexuality,

supplication, nurturance and deference.

DISCUSSION

Student subcultures, which have been referred to through-

out this report, are not clean, distinct entities which can be

exactly, in qualitative or quantitative terms, delineated from

each other. The Clark and Trow model employed to define the

subcultures has not been empirically validated. The results

of the study should be interpreted as suggestive rather than

experimentally sound confirmation of theoretical statements.

The method employed to differentiate student leaders by

subcultures was successful in discriminating on certain

personality dimensions. This conclusion indicates the probable

utility of the method if future investigations designed to

separate students by subcultural groupings.

As a result of the low number in the defined student

leader population, effort was not made to control for sex.

Consequently, sex differences may have contributed to the

employment of a confounding variable. The author suggests

replication of the study controlling for sex.

The significant differences revealed were all in the

direction suggested by the theoretical model. It seems quite

logical to deduce that a student leader participating in the

collegiate or "fun" subculture would score significantly higher
on scales such as closeness, friendliness, affiliation, play,
etc., when compared to his compeers in the academic or vocational
subculture. Likewise, it seems reasonable to conclude that a
student leader in the vocational subculture would be more
interested in applied, business-related activities when compared
to his compeer in the academic subculture. Apparently, student
leaders differ according to their reference groups, and the
differences are predictable based on the unique characteristics
which tend to describe the subcultural groups.

Aside from the differences found, there were a number of
factors where mean differences were not significant, e.g., Self-
Assertion, Audacity-Timidity, Egoism-Diffidence. These findings
would seem to suggest further investigation to determine
certain dimensions pervasive to leaders, regardless of their
subgroup participation.

SUMMARY

Presidents of student organizations at the University of
Missouri, Campus at Columbia, were compared on personality
characteristics as measured by the Stern Activities Index.
These student leaders were subdivided into three groups, the
vocational, academic, and collegiate. The subdivision was
accomplished by having the student select one of four phil-
osophy statements descriptive of four student subcultures re--
spectively. The t test comparisons between all groups revealed
significant differences on five of 12 factors. The results
seem to lend credence to the theory that student leaders do

possess different personality characteristics, dependent upon
their particular reference group. The analysis also suggested
the need for further investigation to determine if certain
characteristics are pervasive to leadership regardless of
participation in separate subcultures.
