ABSTRACT

This publication contains curriculum suggestions for teaching Environmental and Community Health - Consumer Health for grades 10, 11 and 12. Emphasis is placed on the psychological dimension of contemporary quackery and pseudo-scientific practices, and sources of health information and health counsel. In general, the grade 10 through 12 materials provide students with experiences that will enable them to function as intelligent and discriminating adult health consumers. Outcomes that are expected include: 1) becoming increasingly aware of the forces which influence their purchasing power; 2) understanding the role of advertising as it affects consumer demands; and 3) developing an ability to critically analyze advertising and promotional appeals. The publication format of four columns is intended to provide teachers with a basic content outline, in the first column; a listing of major understandings and fundamental concepts which children may achieve in the second column; and information specifically designed for classroom teachers which should provide them with resource materials, teaching aids, and supplementary information, in the third and fourth columns. FOREWORD

This publication contains curriculum suggestions for teaching Strand IV - Environmental and Community Health - Consumer Health, for grades 10, 11, and 12.

The publication format of four columns is intended to provide teachers with a basic content outline, in the first column; a listing of the major understandings and fundamental concepts which children may achieve, in the second column; and information specifically designed for classroom teachers which should provide them with resource materials, teaching aids, and supplementary information, in the third and fourth columns.

The comprehensive nature of the health program makes it imperative that teachers gain familiarity with all of the strands presently in print. In this way, important teaching-learning experiences may be developed by cross-referring from one strand to another.

It is recommended that the health coordinator in each school system review these materials carefully and consult with teachers, administrators, and leaders of interested parent groups in order to determine the most appropriate manner in which to utilize this strand as an integral part of a locally adapted, broad and comprehensive program in health education.

The curriculum materials presented here are in tentative form and are subject to modification in content and sequence. Critiques of the format, content, and sequence are welcomed.

William E. Young
*Director, Curriculum
Development Center*

Gordon E. Van Hooft
*Chief, Bureau of Secondary
Curriculum Development*

OVERVIEW

Consumer health instruction suggested for the high school grades is based on a comprehensive foundation of knowledge and attitudes established at earlier grade levels.

Emphasis is placed on the psychological dimension of contemporary quackery and pseudoscientific practice, and sources of health information and health counsel. Since many students should possess the necessary background and maturity to become involved in independent study, it is anticipated that many teachers will choose to use this approach.

In general, the grade 10-12 materials provide students with experiences that will enable them to function as intelligent and discriminating adult health consumers.

OUTCOMES

Young adults in grades 10-12 should:

- . become increasingly aware of the forces which influence their purchasing behavior.
- . understand the role of advertising as it affects consumer demand.
- . develop an ability to critically analyze advertising and promotional appeals.
- . demonstrate increased sophistication in evaluating health information.
- . understand the dangers inherent in cancer and arthritis quackery.
- . be aware of pseudoscientific practices so as to distinguish them from scientific practices.
- . have a familiarity with medical and paramedical specialists whose services are available to health consumers.
- . be cognizant of major trends in medical care practices, and understand the nature of common group medical care plans.
- . use their knowledge as a basic guide for becoming intelligent, discriminating health consumers.

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

I. Influences on
Consumer
Behavior

A. Psychological
considerations

The determinants of man's behavior are being probed so that business can more effectively manipulate our buying habits.

Keep a running list of vocabulary words for this unit.

Manufacturers and those in advertising devote countless dollars exploring persuasive techniques that will influence consumer purchases.

1. Persuasion

Those whose efforts are directed toward consumer motivation are becoming increasingly familiar with the dynamics of persuasion.

From the class obtain examples of persuasive selling techniques that have and have not worked. Discuss why.

In some instances persuasive techniques succeed in breaking down consumer resistance and the result is a purchase. In other instances, too much, too little, or perhaps the wrong type of persuasion can antagonize the consumer and result in no sale.

a. People enjoy
buying

For some consumers buying is an expression of power, success, or accomplishment, while for others it can be explained in terms of the consumer's inclination to be nice to the seller.

Discuss the reasons why people are motivated to buy goods. Classify these in one of three major areas: physical, emotional, and social. Set up a checklist, and using this list, ask parents and friends why they purchased a specific item.

Those who sell and advertise recognize that the positive urge to buy exists in many people. At the same time, they acknowledge the existence of consumer resistance by encouraging him to rationalize, or by supporting his positive buying urge.

Students may set up their own list of items, e.g., cars, cosmetics, clothes, food, cameras.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

Taped commercial messages may be used to demonstrate how advertising supports the consumer's positive buying urge.

b. Rational and irrational consumer motives

Rational buying motives may be described as those reasons for buying that are self-approved and consistent with the individual's own concept of a rational or thinking man.

Irrational motives are usually those reasons for buying or not buying which are inconsistent and not self-approved.

Rational motives are usually conscious, while irrational motives tend to be unconscious.

No matter how rational people pretend to be, their purchases are often based on irrational motives. The essential point, to the advertiser or seller, is that the buyer must be given a self-approved reason for purchasing the product.

2. The use of symbols

a. Symbols defined

Symbols may be defined as "anything which stands for, suggests, or represents something else by reason of relationship, convention, or arbitrary agreement."

Have students list as many symbols as they can. Even though each word is in itself a symbol, have students confine their examples to specifics.

Specific examples are the dove, as a symbol of peace, the owl as a symbol of wisdom, and the fox as a symbol of cunning.

Any object or action which is not a symbol can acquire other meanings and associations and thus symbolize other ideas and concepts.

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

b. Functions of
symbols

Symbols are used to subtly suggest to the consumer that purchasing the product is the same as purchasing the symbolic object or idea.

Prepare a bulletin board displaying examples of symbolic appeals used in the advertisement of products that appeal to teen-agers.

(1) To rein-
force
self-
image

A symbol is appropriate if it adds to or reinforces the way the consumer conceives of himself.

Discuss various ways consumer health practices are efforts to reinforce one's concept of the person he is or wants to be.

Each of us attempts to enhance our self-image and in choosing between two similar products, the one with the appropriate symbolism would be the consumer's choice.

(2) To reflect
sexuality

Many consumer products have a sexual connotation and make their appeal through this symbolic channel.

All students might make a list of those items they buy or would like to buy. From these lists have two students prepare a survey sheet. Include male-female and grade level on sheet.

Smooth fabrics and mixtures symbolize femininity while coarse fabrics and mixtures are usually symbolic of masculinity.

Survey all classes, tabulate results to show those items most frequently purchased at each grade level and by each sex.

Girls tend to prefer smooth peanut butter while boys prefer chunky.

The names chosen for many products are themselves symbols. Deodorants are excellent examples of this.

(3) To symbolize
age

In order to make a special appeal to a specific age group, advertisers use symbols to attract members

There is frequent use of the music of the "turned on" generation as a symbol to attract young people. Teen-agers are

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

of that particular age group to the product.

(4) To symbolize social participation

Most products say something about the social world of the consumers who use them.

3. Motivational mechanisms

The behavior of health consumers is affected by transitory or enduring emotional states.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Products advertised in New Yorker or Mademoiselle appeal to members of some social classes, whereas similar products advertised in Look or Reader's Digest would not have the same appeal. Thus, the magazine itself symbolizes one's real or imagined social station.

Collect ads with varied social class appeals. (From the "man of distinction" to the muscle man appeal.)

From these ads that are brought to class, select those that include symbols designed for each of the four major purposes. Display these ads on poster board. Have students classify each under one of the four major functions. This could be an evaluative technique.

SUPPLEMENTARY INFORMATION FOR TEACHERS

especially sensitive to communications which imply childishness or "squareness." Consequently, advertisers are apt to use symbols of freedom, romance, or independence when appealing to teen-agers.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

a. Aggression

Aggression is that emotion which leads people to attack, destroy, damage, or overcome other people or objects.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

List the various motivational mechanisms. Discuss generally or specifically for each mechanism how the emotional make-up of individuals would affect their consumer practices.

SUPPLEMENTARY INFORMATION FOR TEACHERS

A basic tenet of Sigmund Freud was that aggression is a primary instinct in man. The most obvious way by which manufacturers allow us to release our aggressive impulses harmlessly is by packaging products in noisy wrappings that must be torn or smashed. When aggression is released, we gain satisfaction from the aggressive act. Cigarette packaging is an excellent example of this phenomenon. At the same time, wrappings can become a matter of frustration when the packaging becomes so complex that the individual almost gives up the challenge.

b. Ambivalence

When we express both positive and negative feelings about the same activity or object, we are ambivalent.

Promoters of health products and services capitalize on consumer ambivalence and thereby increase sales volume.

In what way do toothpaste advertisers and manufacturers take advantage of our ambivalence to sell their product?

We can both love and hate something at the same time. For example, many young people dislike washing their faces, but at the same time they may have positive feelings about the benefits of the activity. Realizing the negative face-washing feelings as well as the positive aspects, soap or facial cream promoters concentrate on the positive aspects. Result - increased sales.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

c. Anxiety

Anxiety in one form or another is experienced by all people, and has a marked influence on consumer behavior.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Advertisements for supplementary vitamins and minerals that use the "subclinical deficiency" theme illustrate the use of anxiety in promotion of a health product.

Ask students to bring to class advertisements that create a fear that one is depriving his family if it is not used.

SUPPLEMENTARY INFORMATION FOR TEACHERS

Anxiety may be defined as an aroused state in which one feels threatened but is not always aware of the cause.

Psychologists believe that the underlying reason for anxiety is the fear of personal weakness and inadequacy in relation to one's total environment.

Anxiety also arises from fear of the unknown. It follows that new or mysterious products may lead to mild anxiety. To reduce consumer apprehension over a new health product or service, the seller may try to alleviate anxiety by creating faith in the manufacturer, dealer, or product, rather than by making claims of a "new scientific breakthrough." Thus, the promoter who is skilled in communication and persuasion may use selling techniques quite unlike the quack or charlatan.

Mild anxiety is a powerful motivator and could cause a person to seek health counsel. Severe anxiety can sometimes incapacitate the individual and prevent him from following through on health care.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

d. Autonomy

In advertising, the appeal to one's desire to make his own decisions and to determine his own destiny is commonly seen.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Have students identify advertisements that appeal to one's desire for personal autonomy.

Analyze these ads and determine which age group is the target for the ad.

SUPPLEMENTARY INFORMATION FOR TEACHERS

Self-direction, independence, and self-confidence make up the quality referred to as autonomy.

Autonomy is evidence of positive mental health, and behaviorists believe our strivings for personal autonomy to be one of man's most urgent drives.

e. Compensation

Compensatory behavior involves those attempts by the individual to "make up" for real or imagined weaknesses or shortcomings in his psyche or physical being.

Many health products provide outlets for compensatory strivings.

Arrange a bulletin board of advertisements displaying health products that provide outlets for various compensations. Each student can select one of these ads and explain how the consumer might compensate constructively, rather than follow the advice in the ad.

Hair restorers, acne cures, cosmetics, weight reduction preparations, etc. usually have compensatory appeal.

f. Fantasy

The form of fantasy that has important implications for consumer behavior is daydreaming or wishful thinking.

If one's aspirations, hopes, and fantasies coincide with the claims made in advertising, powerful motivating forces are created. The older citizen may likewise be lured into purchases because of fantasies concerning regaining youthfulness, attractiveness, sexual potency.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

B. Other influences on consumer behavior

1. Ignorance and gullibility

a. Ignorance

Faulty knowledge or lack of knowledge about a condition or disease can lead the consumer into purchasing worthless or harmful health products and services.

Indicating how they reflect consumer ignorance, analyze ads for obesity that imply or actually state that people can eat all they desire and still grow thin. Which of the motivational mechanisms is being used?

It is essential to know the facts about a condition or disease for which a product or service is being offered. It is also essential to know what the ingredients of a product are or, if a service, what treatment is involved, if the consumer is to make intelligent choices.

b. Gullibility

The tendency of many individuals to accept as fact whatever they see or hear (gullibility) probably influences buying habits as much as any other single factor.

Collect ads that do not tell anything about the product or service being offered.

"Instant Water" made a lot of money for its inventor. Another advertisement which brought dollars rolling to the advertiser's door was, "Don't Wait: Send Your Dollar Now." The address was given and that was all.

2. Promotional techniques

Ultimately, promotional techniques are generally intended to sell products, rather than to benefit the consumer.

Have students check various stores to make a list of devices used to promote sales.

Promotional devices are many. Some are: discounts, prizes, contests, special introductory offers, trading stamps, sales ("one cent," "white," "inventory items sold below cost.")

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

3. Social pressure

Individuals may purchase health products or services primarily because of subtle or direct pressures from peers, friends, or other individuals and/or groups.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

In a short paragraph react to the concept that "people tend to measure success by the items they buy."

SUPPLEMENTARY INFORMATION FOR TEACHERS

Purchases of cosmetic substances, dietary preparations, etc. may be a result of social pressure.

Often, social pressure is indirectly exerted because an individual desires to be like others he admires. Viewed in this broad perspective, social pressure has many obvious influences on consumer health behavior.

C. Advertising and selling approaches

1. Low-pressure selling

Low pressure selling's effectiveness is a result of its attempt to openly help people to buy through support of their motives.

Role play a situation to demonstrate the soft sell technique.

Low pressure selling or soft sell is sometimes referred to as "open selling." This approach is essentially honest. Those who depend on this technique oppose the high pressure selling techniques which do not make the consumer feel that he is really making the decision to purchase a product.

2. High-pressure selling

The aggressive, forceful and unrelenting sales tactics of high pressure take the decision for the purchase out of the hands of the customer.

Dramatize a situation in which a fictitious consumer is "high pressured" into buying a drug product. Have a class describe their personal reactions to such a technique.

Indecisive consumers, or those who have not convinced themselves of the need for a product or service, are especially susceptible to the "high-pressure" approach.

OUTLINE OF CONTENT

3. Positive approaches

The positive approach to advertising and selling is that which convinces the consumer he is getting a good product.

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Have students gather examples of health advertising. Each example should be accompanied by a critique of the positive technique.

Arrange a bulletin board of the better examples of positive selling and the critical comments prepared by the students.

SUPPLEMENTARY INFORMATION FOR TEACHERS

In the positive approach, the seller displays great enthusiasm for his product. Obviously, if the seller is not enthusiastic and the consumer is not convinced that the product is a wise purchase, consumer resistance increases. This resistance conflicts with whatever positive buying urges might be present.

The fundamental characteristic of the positive approach in both advertising and selling is to present the health product or service as the solution to some problem or need of the buyer. The more evident this solution is to the buyer, the more apt he is to buy the product.

4. Analysis of advertisements (See Appendix A)

In addition to the guides for evaluating advertisements suggested for grades 4, 5, 6, Appendix A contains a summary of critical questions that one should pose when analyzing advertisements.

Briefly review the advertisement evaluation guides included in the grades 4, 5, 6 curriculum materials.

Individuals or groups might be asked to use this guide in evaluating ads for:

- . cold remedies
- . hair removers
- . baldness cures
- . deodorants
- . acne remedies

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

5. Creative Code of the American Association of Advertising

- . dental products
- . food supplements
- . reducing pills and
gadgets.

Perhaps the teacher can obtain a copy of the Creative Code and the Copy Interchange Program from the American Association of Advertising. How is advertising controlled by this Code? To what extent are the controls effective?

The Creative Code and the Copy Interchange Program for enforcing the Code attempts to control advertising to some extent.

The National Association of Broadcasters has a similar code, but unfortunately not even the subscribers live up to the code.

The same procedure can be applied to the code of the National Association of Broadcasters.

D. Health information

Unprecedented increases in both the volume and variety of health information in the mass media have made it increasingly important that the individual be able to critically evaluate this information.

1. Unreliable sources

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

a. Superstitions

Health information based on superstition, ignorance or prejudice, rather than scientific evidence, can be expensive and harmful to the health consumer.

Ask students to collect as many superstitions as they can find that relate to health. Discuss these in terms of their scientific credibility.

Some unusual superstitions are:

A baby will not grow if a hat is placed on his head before he is a year old.

Illness of a child may be prevented by bathing him in greasy dishwater.

A sore throat is cured by drinking water out of a stranger's shoe.

You will not be sick the

following year if you dip your head in the ocean on January 1st.

Sleeping with a dog prevents rheumatism.

Other superstitions are more plausible, yet equally useless.

b. Ignorance or prejudice

As a class project, choose one example of ignorance relative to health, and write a brief statement about the effects of such ignorance on the health consumer. A series of these informative statements could appear as a regular feature in the school newspaper.

The individual who through ignorance or prejudice insists on being his own doctor can lose his life. Self-diagnosis and treatment of abdominal pain costs thousands of lives a year.

The abdominal pain that turns out to be a ruptured appendix after treatment with a laxative is a good example.

c. Customs

Family customs are a strong force in determining health practices and attitudes.

Have students bring in examples of family customs that have been handed down from generation to generation.

OUTLINE OF CONTENT

d. Expoundings of the quack

e. Commercialized health information

2. Reliable sources of health information
There are many reliable sources of health information available to the interested consumer.

3. Criteria for evaluation of health information

Before accepting health advice, consideration should be given to the qualifications of the person offering the advice.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Review the characteristics of a quack in the grades 7, 8, 9 material.

Compare health information pamphlets prepared by commercial agencies to those prepared by a professional or governmental agency. Pamphlets on care of skin, hair, and teeth, as well as foods and drugs, might be used. Which might be more valid and why?

Ask students to compile a list of sources of health information they consider reliable.

Bring in ads from a popular magazine or paper. Use the guidelines to evaluate the products and services offered.

SUPPLEMENTARY INFORMATION FOR TEACHERS

It is important to remember the quack's dominating motive is to make money.

Family physician, county medical society, local health office, hospital administrator, health educator, voluntary health organizations, professional health organizations, and government health organizations are reliable sources of health information.

Guidelines for evaluating health information:

1. Who are the persons or organizations giving the advice?
2. What is the educational background in the health sciences of the individual?
3. What kind of reputation does the person have in the community?
4. What is the motive?
5. Is the information presented in a scientific manner?

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

II. Contemporary Quackery and Pseudo- scientific Practice

A. Cancer and arthritis quackery

Any disease with an unknown etiology and no known sure cure is prey to the quack's unscrupulous tactics.

1. Cancer

Cancer quackery is one of the cruelest types of quackery, since the person who goes to a cancer quack may delay medical treatment until it is too late.

The etiology of cancer is unknown. Some forms of cancer are incurable, but many forms are curable if medical treatment is instituted in time.

Contact a consumer affairs agency in your community for literature and guest speakers. e.g.: Better Business Bureau, Consumer Protection Bureau, etc.

Medical treatments for cancer are surgery, radium, X-ray, radioactive isotopes, and other chemotherapy.

Cancer quacks can be classified as follows:
dumb - he knows not, but does not know he knows not
deluded - he knows a little, but distorts his little bit of knowledge
dishonest - he knows not and he knows he knows not

(These classifications can be applied to all kinds of quacks.)

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

a. Quack
techniques

Ask students to make up an ad for a cancer treatment that sounds legitimate, but is absolutely worthless. A contest can be held to choose the most convincing ad. The winner might receive the title of "King or Queen of Quacks." The prize could be a toy duck that quacks.

(1) Poultices
and
pastes

Though poultices and pastes (as therapeutic techniques) have been virtually abandoned by physicians, it is not uncommon for quacks to use these modalities.

Cabbage poultices were popular a few years ago. Oatmeal poultices have been used as treatments for acne.

(2) Sprays

The idea of sprays for treatment and prevention of cancer may seem ludicrous to the intelligent consumer and yet many people avail themselves of this "service."

A liquid in the form of an aerosol spray can was used in a "Drive-In" for cancer prevention in California.

(3) Gadgets

Students may be able to bring in examples of gadgets, poultices, and internal remedies that have been promoted by quacks.

The Orgone Accumulator made a lot of money for the inventor. It was found to be a wooden "tub" lined with zinc. The patient sat in this and it was supposed to draw the cancer out

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

of the body, and at the same time, the patient would absorb the energizing, youth preserving powers of the universe.

(4) Internal
remedies

Internal "remedies" are those nostrums usually administered orally or by injection.

(5) Diet

There is no scientific evidence to indicate that diet, as a therapeutic factor, is related to cancer.

Some cancer diets:

grape cure

cabbage cure

a combination of soy beans, rose hips, and sesame oil.

b. Mexican
centers for
cancer cures

Even though many quack cancer treatments have been exposed and banned in this country, it is still possible for one to receive these treatments in some areas of Mexico.

Although these conditions exist in some parts of Mexico, authorities recently closed one of these cancer quack centers.

Some vitamin products have been advertised as cancer cures.

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

- c. I.A.C.V.F.
(International
Association of
Cancer Victims
and Friends)

- d. Patrons of
the cancer
quack

Quack treatment of the
early cancer patient is
especially dangerous,
because of the delay of
adequate treatment that
might otherwise be pro-
vided by a competent
medical practitioner.

Refer to the American
Medical Association
Proceedings, of the
Second National Congress
on Medical Quackery:
"Why people become
victims of medical
quackery."

(1) Neurotics

Neurotics may be afraid they
have cancer but do not. They
are excellent bait for cancer
quacks. As a consequence of
his contact with the quack,
the neurotic's chief loss is
money.

(2) Former
cancer
patients

Some people have had legitimate
treatment for cancer with good
results. They go to the quack
to fend off a reoccurrence.

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

(3) Patients
in early
stage of
cancer

Some patients may have begun legitimate treatment and become discouraged so they look for a "miracle" cure. They may go directly to a quack and lose their chance of being cured at all.

(4) Incurable
cancer
patients

Some people have been told they cannot be cured. Because people always have hope, they try anything. They lose only money, since their condition is terminal.

2. Arthritis and
rheumatism
quackery

The nature of the arthritis syndrome, its widespread prevalence, and our present inability to cure the condition, have made arthritis victims a prime target of quacks.

Call students' attention to the numerous products advertised on TV to treat arthritis and/or rheumatism. Do they claim to cure arthritis? alleviate the discomfort? Are these commercials misleading? How?

Survey: How many students have an arthritic victim in their family?

It is estimated that there is one arthritic victim in every five families or about 12 million people in the United States. These diseases, by nature, subside from time to time with or without treatment. Many of the so-called arthritic cures occur during the normal quiescent period of the disease and the quack takes full credit for relieving a condition that nature has taken care of temporarily. But people spend at least 250 million dollars a year on worthless remedies plus another 10 million on misrepresented treatment centers.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

- a. Review of concepts

Briefly review the general nature of arthritis, differentiating between rheumatoid and osteoarthritis.

The specific etiology of arthritis is unknown, although certain predisposing factors make an individual more prone to the disease. There is no known cure.

Legitimate treatments include steroid hormones, rest, physical therapy, surgery (on rare occasion), gold injections and salicylate therapy.

(Aspirin is commonly used and is often effective in controlling the symptoms of the disease.) The physician uses different methods of treatment for individual cases.

- b. Quack remedies

(1) Devices

It has been estimated that approximately 15% of the arthritics in the U.S. use quack devices that have been ruled useless and/or dangerous by the F.D.A.

Some examples of devices used:

- a. illegal vibrators. They may have harmful effects if the affected part needs rest.
- b. roto-view. The Food and Drug Administration found this device to consist of a plastic lamp shade over an ordinary light bulb.
- c. pads and mitts filled with radioactive minerals. Most of these were found to contain ordinary top soil. One gadget, however, was so full of radio-

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

- d. active material it burned the patient's skin. copper bracelets and other bands. These are as useless as the old time superstition that a cat's heart dried and steeped in honey and worn around the neck would make the person invisible.

(2) Uranium
mines

The radiation from uranium mines has never proven to be an effective arthritis treatment.

Movie: "Misery Merchants" (29 minutes). This movie tells the story of an arthritic victim and her involvement with quack devices and the development of a uranium mine for treatment of arthritis. It is well done and makes an impression on the students.

People have paid \$10.00 a day or more for the privilege of sitting in the dampness of a uranium mine to absorb the radioactive rays that were promised to cure them.

(3) Mineral
spas and
baths

Hydrotherapy is sometimes used to relieve the symptoms of arthritis, but, like all other treatments, it is not a cure.

The mineral spas and baths are a big time hoax that has made fortunes for the proprietors.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

(4) Drugs

Instead of following the advice of a physician, many arthritics choose their own pain-relieving drugs, most of which are much more expensive and no more effective than aspirin, the compound recommended by many physicians.

(5) Curative foods

There is no empirical evidence to suggest that any food or group of foods is effective in curing arthritis.

(6) Liniments

Repeated use of liniments should be avoided by the arthritic unless it has been recommended by his physician.

B. Pseudoscientific practices

The unfortunate existence of pseudomedical science is the result of

- the tendency of most physical illnesses to run a course and vanish, with or without treatment and,
- the fact that many physical illnesses are psychosomatic.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Evaluate ads for aspirin and other drugs. When a product is advertised as containing "the ingredient most doctors recommend," determine what that ingredient is.

Advertisements for liniments are easy to find. Determine what the active ingredient is and if it is valuable in alleviating pain temporarily.

A representative of your county medical society might be able to speak on the existence of pseudomedical practice in your area.

SUPPLEMENTARY INFORMATION FOR TEACHERS

Glorified aspirin, costing many times the amount of ordinary aspirin, is big business.

Drugs made of herbs and juices are popular with the arthritic quack.

Irradiated water has been advocated for arthritis.

Immune milk is another nostrum sold as an arthritic cure.

If a liniment promises more than temporary relief, it is an outright lie. It is possible for some liniments to aggravate arthritis and cause painful irritation to the skin.

The pseudosciences have tremendous appeal for a gullible public. Millions of dollars a year are wasted on them. Man believes in a pseudoscience to satisfy his needs and solve his problems. He attempts to achieve feelings of security and adequacy through artificial means when he has not attained them through mature judgment and action.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

1. Physiological
basis
- a. Homeopathy

The theory behind homeopathy is that the more infinitesimal the dose of "medicine" is the more potent it is, and the more potent it becomes the less "material" it is and the more "spiritual" it becomes. Modern homeopaths also say that after the material substance has vanished there are mysterious radiation effects.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

Some examples of homeopathic medicines are *Asterias rubens* (powdered starfish), *Mephitis* (skunk secretions), *Cimex lectularius* (crushed live bedbugs), *Acidum uricum* (uric acid from human urine or snake excrement).

Most homeopathic medicines are from plants, but some are now being "proved" from metallic compounds.

Although homeopathy is declining in the United States, there remain many advocates.

Generally the legitimate homeopaths are men who have standard M.D.'s and, in the matter of diagnosis, surgery, etc., they employ all the methods of orthodox medical science. It is in the matter of drugs that they call upon the homeopathic tradition. But even in the matter of drugs the legitimate homeopaths will also use allopathic (a homeopathic term for orthodox medicines) medicines as well.

There are, of course, some homeopaths left in this country who are not M.D.'s, but quacks.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

b. Naturopathy

Naturopaths do not accept the bacterial theory of disease causation but believe that all disease is the result of violation of the natural laws of living and can be cured by nature's forces.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

N.D. stands for Doctor of Naturopathy. Naturopaths do not use drugs or surgery.

There was no one founder of naturopathy. Although it is not known exactly how many naturopaths are practicing in the United States today, it is estimated that there are over 2,000.

The treatments consist of enemas, vitamins, minerals, chlorophyll, vegetable and fruit juices, cow's raw milk, hot packs, fasting, exercising, etc., for diseases ranging from a toothache or common cold to cancer and syphilis. One naturopath has advocated a grape diet as a cure for cancer. A typical treatment for appendicitis is fasting for a short period, then taking a cold water enema for four days, followed by a special diet.

Naturopaths depend on nature's forces such as water, air, sunlight, electricity, exercise, rest, diet, and mental and moral science for the cure of disease. X-rays have been added in recent years.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

There are a dozen or so naturopathic colleges in the United States which award the degree of Doctor of Naturopathy. Some of these colleges require a high school diploma and others do not.

2. Psychologically-based

a. Hypnosis

Hypnosis is an artificially induced state resembling sleep where the person is open to suggestion.

Students: Look up Freud's use of hypnosis.

Investigate the story of Bridey Murphy.

Report on "the use of hypnosis in medicine." Have a student report on the possible dangers of hypnosis in the hands of an unqualified person.

The person under hypnosis will not do anything that is repugnant to him, although he may follow rather silly suggestions. A person under hypnosis will always "wake up" eventually even if he is never told to. While under hypnosis he can frequently recall facts from far back in his experience, but he can never recall mysterious facts that never occurred.

Legitimate uses of hypnosis are for anesthesia and treatment of mental disturbances.

b. Psycho-quacks

The American Psychological Association has reported that increasing numbers of unqualified persons are engaging in counseling, sensitivity training, and other forms of therapy. Such quackery poses a danger to the public.

OUTLINE OF CONTENT	MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS	SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES	SUPPLEMENTARY INFORMATION FOR TEACHERS
c. Others	There are many ways in which man attempts to fulfill his needs through reliance on unproven psychological phenomena.	Have students prepare for class discussion short reports of such topics as: 1. astrology 2. phrenology 3. physiognomy 4. palm reading 5. graphology	A qualified psychologist is one who holds a certificate issued by the New York State Education Department and has two years of supervised experience in rendering services satisfactory to the Board of Examiners of the State Education Department.
III. Health Personnel and Medical Care			
A. Physicians and dentists			
1. General practitioner	A general practitioner or family doctor may refer a patient with a complex problem to a medical specialist.	Movie: "Even for One," 28 minutes. Sterling Movies. Describes the services of a general practitioner.	Training requirements: four years college, four years medical school, 1-2 years internship. Licensing: A medical school graduate must take a comprehensive examination to qualify for a license. All physicians must be licensed by their state board of medical examiners before they can practice medicine. If a physician wishes to be qualified to practice in more than one state he may take the National Board examination. The National Boards are in three parts. The first part is taken at the end of

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

2. Medical
specialist

Medical specialists are physicians who have had specific preparation in depth in a particular area of medicine.

Initiate this discussion by polling the class for a list of all the medical specialists they can think of.

Specialty board examinations are given the candidate after completion of the required advanced training.

a. Board
qualified
specialist

A physician who has completed all of the required specialty training, but does not take the specialty board examination is said to be board qualified or board eligible.

b. Diplomate

A person who has received a diploma or certificate. In medicine the term refers particularly to a holder of a certificate of the National Board of Medical Examiners or of one of the American Boards in the Specialties.

A specialist who passes the specialty board examinations, receives certification as a specialist from his own specialty board and becomes a diplomate in his specialty.

2 years of medical school. The second part at the end of 4 years of medical school, and the last part is taken at the end of the internship. If the physician passes these Board examinations, he is qualified to practice in the majority of the states without taking the state board examination.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

c. Types of medical specialists

Expanding knowledge in every area of medicine has made medical specialties a necessity.

If the students' textbooks do not include a list of medical specialists, distribute a mimeographed sheet of same including a brief, one sentence description of each. This sheet may serve as a guide for student questions and discussion.

The specialists listed are supplemental to the lists in grades 4, 5, and 6.

All training requirements are past the basic M.D. and internship.

3. Dental specialists (Not covered in 4, 5, 6)

Review the functions of the orthodontist, periodontist, and pedodontist from grades 4, 5, 6.
Review the function of the dental hygienist.

A basic Doctor of Dental Science or Doctor of Dental Medicine degree requires at least 2 years of college (most dental schools now require 4 years) and 4 years of dental school. This qualifies the dentist to do general practice. If he wishes to specialize, he must take extra training.

a. Endodontist

The endodontist works in the branch of dentistry concerned with the diagnosis, treatment and prevention of diseases of the dental pulp and its surrounding tissues.

b. Oral path- ologist

The oral pathologist performs the same duties as a medical pathologist, but confines his study to the area of the mouth.

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

c. Oral surgeon

The oral surgeon performs surgery involving the mouth, e.g., extraction of unerupted wisdom teeth, repair of broken jaw.

d. Prosthodontist

False teeth, either replacement of one or more missing teeth or the replacement of a whole set, are made with close attention to the shape, size, and color of the original teeth. The prosthodontist is an artist.

4. Selecting a
Physician or
Dentist

a. Criteria

The effort involved in selecting your doctor and dentist is worthwhile if your choices prove to be professionally competent individuals with whom you are able to establish a satisfying doctor-patient relationship.

Ask parents how they selected their health advisers for each specialty. List those more commonly used. Write down responses. Have a student tabulate responses using the following categories: neighbor, family, friends, medical or dental societies, recommendation by a specialist, others. Report findings to class. Discuss validity of sources.

Guidelines:

1. Is the physician licensed to practice in the state in which he resides?
2. Is he a graduate of an approved medical or dental school?
3. Is he a member of the local, state, or national professional societies?
4. Is he a staff member of an approved hospital or clinic?
5. Does he periodically increase his skill and knowledge by attending conferences, etc.?
6. Does he possess a personal-ity that inspires confidence?

7. Has he established a reputation for professional ethics and good character?
8. Has he had a variety of experiences to develop his skill?

When moving to a new area it is important to select a physician or dentist before an emergency arises. If possible, obtain suggestions from your previous physician and dentist.

b. Procedures

Have students discuss how they would go about selecting a physician in a new community.

Obtain a copy of the medical directory and familiarize students with it by looking up some of the local physicians.

Procedure:

- a. Secure the names of competent medical and dental practitioners from county medical or dental societies, approved hospitals, local health department, a medical or dental school, or the American Medical Association directory.
- b. Check professional membership by contacting the professional societies or their directories. (Can be found in most libraries.)
- c. Check standing and reputation in the community from a competent source.
- d. Make an appointment and see if his personality is compatible with yours.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

B. Paramedical specialties

There are a number of professions closely allied with the medical profession, that make up a team to serve the health needs of the public. These include physical, occupational, and speech therapy, and the activity of medical social workers.

C. Other health personnel (See Appendix D)

Appendix D contains a listing of additional health personnel that are members of the comprehensive medical services team.

D. Medical care

Medical care personnel and practices have changed markedly in the past 25 years.

1. Trends

Compare the "good old days" with today's practices by having students report on medical practices of their parents' or grandparents' day.

The family physician is being replaced by specialists. Comprehensive care has been changed to limited care because of specialization. Solo practices are giving way to group practices. Home visits by the physician have been replaced to a great extent by the patient's visiting the physician's office, clinics, or hospital. The little black bag has given way to the scientific setting of the office or hospital. The emphasis is now moving toward preventive medicine rather than curative medicine.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

(See Appendix C)

SUPPLEMENTARY INFORMATION FOR TEACHERS

Research sources of information on the major changes in the medical care scene in the last 25 years. Include the reasons for, and the advantages and disadvantages of, the movement from:
a. general practice

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

a. Physician-patient ratio

The type and quality of medical care received is determined to a great extent by the availability of physicians in a particular geographic area.

- b. solo practice to group practice

Initiate a discussion on the factors influencing physician-patient ratio (e.g. economics, urbanization)

Why are the United States statistics misleading?

Relate the Mississippi statistic to the economy of the state, the high infant mortality rate, and the ethnic make-up of the population.

Student project: Find out the physician-patient ratio in your own community, either on a city or county basis. (The county medical society or the city directory will list the number of physicians in practice.)

Efforts to encourage physicians to relocate from cities to rural areas (to more equitably distribute medical

SUPPLEMENTARY INFORMATION FOR TEACHERS

The hospital originally for only the needy is now for everyone.

There is a great inequity in the distribution of physicians on a world-wide basis.

1960 statistics:

Israel--1:400

Afghanistan--1:41,000

Nigeria--1:96,000

United States--1:780

Recommended ratio for United States --1:740

There are about 295,000 physicians in the United States.

Physician-population ratio in the United States:

Mississippi--1:1,450

Washington, D.C.--1:540

New York City--1:595

There are over 1100 counties in the United States with one physician for every 1700 people.

Incentives such as government subsidies to physicians who would practice in rural areas failed.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

personnel) have, in general, been unsuccessful.

b. Method of payment

The physician may be paid according to the type of medical care plan his patients have.

2. Medical care plans

Notwithstanding the fact that the costs of medical care have increased more than other types of expenditures, we still spend less on medical care than on many other products and services.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Determine how the consumer dollar is spent.

Students: make a pie graph indicating the relative amounts spent for each item.

Movie: "Dialogue With Life" 20 minutes. The movie deals with modern medical practices and how payment for hospital care is made possible by health insurance.

a. Voluntary health insurance programs

About 80% of the population has some form of voluntary health insurance.

Students might ask parents what health insurance they hold and the benefits it provides.

SUPPLEMENTARY INFORMATION FOR TEACHERS

Subsidies by the community for office and home have been offered, but this has not produced a mass exodus from the cities.

1. Fee for service--this is a predetermined schedule of fees for specific services.
2. Salary--based on time.
3. Capitation--based on the number of people cared for. The physician receives "so much a head."

Alcohol and tobacco	\$.05
Recreation	.06

Voluntary health insurance is designed to assist the individual and his family in avoiding financial hardship when ill health or accidents occur. The principle involved is regular

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

- (1) Blue Cross-
Blue Shield

Blue Cross-Blue Shield plans are among the most common of the several voluntary, group health insurance plans available in the United States.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Discuss the following statement: "Why pay for health insurance when you can earn interest from the money in the bank and have it available when needed?"

SUPPLEMENTARY INFORMATION FOR TEACHERS

prepayments. Some health insurance plans are nonprofit and others operate for profit.

Blue Cross-Blue Shield plans are non-profit. There are 76 Blue Cross-Blue Shield plans across the nation.

Blue Cross originated in the 1930's in Texas and has spread rapidly across the nation. This part of the "Blue Plan" was for hospital coverage only.

Blue Shield is a sister policy of Blue Cross, providing for payments to physicians as well as hospitals.

- (2) Types of
voluntary
health
protection
available

Illustrate, using several hypothetical families, and ask students to determine which plan should be purchased by the various families.

- Loss of
income
protec-
tion

Loss of income protection is designed to provide partial payment of salary or wages when illness or accident prevent the insured from working.

Health insurance permits the family to pay for rent, groceries, automobile, etc., when the wage earner is unable to work. The benefits usually begin a week or two after an illness begins. Insurance that provides 50% of a regular salary may be a good investment.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

- Hospital expense protection

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Ask students to determine the cost of an ordinary operation such as an appendectomy. Compare this cost for patients who have no insurance and those who have hospital insurance.

- Surgical expense

Surgical expense insurance provides a set amount to cover surgeon's fees.

Discuss payments the patient might have to make if the policy only pays a set fee for a specific operation and the doctor's fee is more.

SUPPLEMENTARY INFORMATION FOR TEACHERS

This is the most popular form of health insurance.

Provision is made for the wage earner and his dependents. Coverage may be for 60, 90, or 100 days as a rule. The plans call for payments for room and board, drugs, anesthetics, and the operating room.

Fees ranging from \$50.00 to \$500.00 or sometimes more are payable for surgical expenses.

In Blue Plan policies if the policy holder makes more than \$6000.00 a year the physician may charge more than the predetermined fee and the patient will have to make up the rest. If the policy holder makes less than \$6000.00 he will have no out-of-pocket expense. The physician receives only the predetermined fee set by the Blue Plan.

- Regular medical expense

Regular medical expense coverage will take care of many general medical expenses not covered in the hospital or surgical plans.

This type of health insurance covers the cost of physicians fees for home visits, office visits, and hospital calls. Some policies do limit the coverage to hospital calls. Generally the first few calls are not covered and there is an overall maximum for each illness.

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

- Major medical expense
Major medical insurance protects a family (or individual) from catastrophic losses that would otherwise place the family heavily in debt.

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

Student project: Find the total cost of an illness such as a stroke. Include expenses for hospital, drugs, nursing care, physicians, ambulance, loss of income, etc.

SUPPLEMENTARY INFORMATION
FOR TEACHERS

This type of insurance covers catastrophic illnesses. It is relatively new, beginning in 1949.

Major medical insurance does not pay for minor illnesses. The policy holder pays for these himself (unless he also has an insurance policy to cover the minor illnesses). Policies have a maximum benefit clause that may range from \$2,500 to \$15,000. There may also be a deductible clause. Some policies call for the insurance company to pay 75% to 80% of the expense with the patient being responsible for the rest.

(3) HIP
(Health
Insurance
Plan)

HIP is a health insurance plan in effect in New York City.

It is a prepaid group medical insurance plan.

This plan was originated to care for the municipal workers in New York City. Now other people may join.

The plan does not cover hospital expenses.

There are three quarters of a million people now enrolled in 32 different medical centers.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

b. Criteria for selecting a plan

Before one chooses a health insurance policy, he should first make certain the company is reliable, and then select a policy with provisions adequate for his specific needs.

In what way is the consumer protected from disreputable insurance companies?

Have students ask physicians about the type of insurance plan they favor and why.

Guidelines for choosing a plan:

1. Provides high quality medical care by physicians affiliated with an approved hospital with competent nursing service
2. Coverage for both chronic and acute illnesses for the wage earner and his dependents
3. A free choice of physicians
4. A choice of accredited hospitals
5. A non-profit or low cost operating program
6. Fee schedule sufficiently high to attract and hold competent physicians.

c. Compulsory or government medical care programs

Special efforts have been made to extend adequate medical services to those who are unable to bear the costs of such care.

Have students report on socialized medicine in Britain and other countries. Follow this by a debate of the question: "Are government medical care programs a move toward socialized medicine?" Get a physician's point of view.

The person has a choice of physicians within each group.

HIP has a department of health education that stresses preventive medicine.

Voluntary health insurance does not meet the health needs of all of the citizens of the United States.

About 6 million people receive public assistance. There are millions more who are close to needing public aid, but they do not receive it.

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

(1) Medicare

Medicare is a two part health insurance plan designed to benefit all persons 65 years of age and over.

Discuss the reasons medical needs of the aged have become a major problem.

Stress the contributory approach of Medicare in contrast to the public assistance approach.

What are some of the financial problems of the aged?

Medical care for the poor or indigent is the oldest of public programs.

The indigent now include the aged, blind, dependent children, and the totally disabled.

Medicare went into effect on July 1, 1966.

An increase in the social security tax pays for the benefits of the basic plan.

The aged have low incomes, but many of their expenses are less. When debts are incurred, they are large and usually come from medical bills. The aged have no way of replenishing their assets. They have difficulty obtaining voluntary health insurance and the premiums are higher just at the time they can least afford it. Most commercial underwriters have stipulations regarding age.

- a. The need for medical care is greatest after age 65
- b. Hospital stays are twice as long as in younger age groups
- c. The need for health services is two and one half times greater than that for other age groups

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

- Basic plan

Obtain copies of the booklet describing Medicare benefits and use for student discussion.

- d. Chronic, degenerative diseases are maladies of the aged
- e. There are no mass preventive measures
- f. Diagnostic and treatment procedures are expensive

The first part of the Medicare program is called the Basic Plan. All persons 65 years of age and over are eligible for this part of the program automatically.

- Voluntary plan

To gain a better understanding of how Medicare operates, prepare several actual problems for the students to solve.

The person 65 or over may or may not adopt the second part of the plan. It is designed to cover other medical expenses.

Example: A man, 65 years old, suffers a stroke. He is covered by both the basic and voluntary plans. He spends 80 days in the hospital and 30 days in the nursing home.

The patient has free choice of physician and hospital. Medicare does not pay for out-of-hospital drugs. It does not cover catastrophic illnesses or custodial care in a nursing home.

Hospital bill - \$2400
Nursing home - \$200
Doctor's bill - \$600
The patient pays:
hospital _____
nursing home _____
doctor _____

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

(2) Medicaid

Medicaid is a state program for medical assistance for needy persons.

Total cost of illness:

Medicare pays _____

Patient pays _____

Discuss: Is health care a right or a concession?

Is the contributory or public assistance approach better? Advantages? Disadvantages?

The individual state makes its decision as to whether or not it will adopt such a program.

There are 20 states with programs for the medically needy. The state must make application to the federal government as, in theory, the federal government is supposed to assume 55-83% of the cost. The state pays 40% of the rest and local governments pay 60% of the rest. To be reimbursed by the federal government the state must provide (by law) the following services: outpatient hospital services, laboratory and X-ray services, in-patient hospital services, skilled nursing home services, and physicians services. A state may elect to provide additional services such as payment for drugs, dental services, home nursing services, blood transfusions, ambulances, naturopaths, glasses, appliances, and hearing aids.

OUTLINE OF CONTENT

(3) New York State's Medicaid

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

The Medicaid program adopted in New York State is in a state of flux, since opinions differ concerning income level eligibility for benefits and the amount of fees to be paid for medical and surgical expenses.

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

Compare Medicaid and Medicare. List the similarities and the differences. Ask students to write their own opinions as to the merits or disadvantages of the two types of programs.

Have all students read the American Medical Association pamphlet "Let's Use - Not Abuse Health Insurance."

3. Medical care facilities

a. Hospitals

Although they have many important roles, the primary function of hospitals is patient care.

Have students read the American Medical Association pamphlet "How to Be a Better Patient." Encourage their reactions to this reading.

SUPPLEMENTARY INFORMATION FOR TEACHERS

The eligibility of the beneficiary is based on income.

Eligibility requirements, under the present law, are based on the net income of the family, the number of persons in the household, and the number of wage earners. Other factors considered are savings accounts and life insurance. There are no stipulations as to the cost of the home, cars, swimming pools, etc. If a wage earner makes one dollar over the stipulated income, he receives no assistance.

Functions of a hospital today are:

1. Training of physicians, nurses, technicians, and other personnel
2. Research
3. Promoting the highest standard of medical care
4. Comprehensive total patient care

The hospital is also the community health center because it is the building with the largest concentration of health resources. It provides a broad range of services such as preventive medicine, surgery,

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

postoperative care, obstetrical care, laboratory services, rehabilitation services, etc.; and the quality of care can be controlled by auditing committees.

b. Hospital systems
There are various types of hospital systems, each serving its own particular type of function.

The United States Public Health Service, the Veteran's Administration, and the military operate the various federally-owned hospitals. They serve special beneficiaries such as the merchant seamen, veterans, Indians, servicemen and women, and some government employees.

(1) Government hospitals

One third of all hospitals in the United States are owned by the government, but two-thirds of all hospital beds are government operated.

Have students give examples of federal, state, and local government hospitals. Discuss how they differ and why.

The federal hospital system includes hospitals for narcotic addicts located at Lexington, Ky., and Ft. Worth, Texas, and the National Leprosarium for lepers at Carville, La.

There are state hospitals for the care of the mentally ill and other types of chronic diseases.

County hospitals are usually general hospitals.

Not all counties have a county hospital.

OUTLINE OF
CONTENT

MAJOR UNDERSTANDINGS AND
FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS
AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

(2) Nongovern-
ment
hospitals

- Voluntary
community
hospitals

Voluntary community
hospitals are nonprofit
organizations providing
general care for short-
term illnesses.

Ask student volunteers
to survey the hospitals
servicing their com-
munity.

Survey could include:
a. type of control/
financing
b. nature of
service pro-
vided

c. bed capacity
Discussion might
follow on whether
these services are
adequate and appro-
priate for the
community.

The hospitals are run by co-
operative groups, church, or
labor organizations. They
provide short term care. The
greatest number of nongovern-
ment hospitals are of this
type.

- Proprietary
hospitals

Proprietary hospitals are
under private ownership and
are run for profit. Only 3%
of the total hospital beds
in the United States are
of this type.

- Nursing homes

How many nursing homes
serve your community?
Has there been an
increase in the number
of these homes in
recent years? Why?

Only 5% of the nursing homes
are government operated.
Most nursing homes are
operated for profit.

E. The consumer
and the drug
industry

Drug industries are big
business whose primary
purpose is to sell their
product.

Films on the drug in-
dustries are listed
in the reference
section.

Ethical drug companies may also
manufacture "over-the-counter"
drugs that do not require a
prescription. These are called
proprietary drugs.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

1. Ethical drug companies

Firms that manufacture prescription drugs are called ethical drug companies.

2. Cost of drugs a. Advertising

Ethical drug companies aim their advertising at the physician, but it is the consumer who pays the price.

In your community, calculate the number of physicians assigned to each detail man and see how much money is spent on each physician in this type of advertising program.

There are approximately 295,000 physicians in the United States. The ethical drug companies employ 15,000 detail men. Detail men are the drug salesmen. They visit each physician on their route about once a month trying to get the physician to use their particular drug company's products.

Request a local physician to save a single bottle, tube, etc. of each drug sample sent to him during a period of one month. The volume of these samples is quite impressive and will help your students to appreciate the high cost of some medicines.

Ethical drug companies spend about 750 million dollars a year promoting their products. The increase in sales volume has gone from 200 million dollars a year in 1939 to over 2 billion dollars a year.

b. Generic versus brand name drugs

Drugs sold under the brand name are usually more expensive than those sold under the generic name.

Discussion: Why does the physician object to using the generic name? Why do pharmacists object?

The generic name for a drug is the officially established or chemical name of the drug. All drug companies are allowed to sell drugs by their generic name. The brand name is the company's name for the same drug. Examples of the differences in prices of two

drugs for the same quantities.

Brand Name	Generic Name
Cortone	Cortisone
acetate \$14.95	acetate \$7.60
Serpasil \$4.60	Reserpine \$1.40

Some of the reasons physicians do not use generic names are:

- a. They lack sufficient information pertaining to the product.
- b. The detail men have used subtle advertising approaches.
- c. Physicians want the assurance that generic name drugs will meet the same standards in quality as brand name drugs.

Pharmacists are opposed because:

- a. they say they have no way of knowing of the reliability of some of the drug firms.
- b. although druggists are allowed a 60% mark-up on generic drugs they say they will lose money by not being allowed to use the brand name drugs.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

c. Geographical influence

Drugs cost more in the United States than any other country in the world.

Have students prepare a brief paper on the reasons for the variation in drug costs. What would be the advantages and disadvantages of government price regulations?

Comparison of the prices of
Miltown, a tranquilizer

Argentina	\$.85
Germany	1.30
Mexico	2.18
Belgium	4.64
United States	5.42

d. Type of purchase

The private consumer pays more than anyone else.

Comparison of the price of a tranquilizer sold per 1000 tablets to:

retail druggist	\$39.50
government	.60
consumer	65.83

e. Research and drug cost

Drug companies maintain that research is the main reason for the high cost of drugs.

Movie: "The Drug Debate" Lederle Laboratories Congressional Hearing.

Officials maintain that research by drug companies is minimal. Drug companies disagree.

Although a pharmacy must now stock about 2000 drug items in contrast to about 400 drug items 10 years ago, this does not necessarily reflect progress. There are still only four basic sulfonamides, but there are over 200 brand name sulfonamides.

3. New drugs

a. Patents for new drugs

There are two basic types of patents for all drugs, the product patent and the process patent.

Should there be patents for drugs? List reasons why and why not.

A product patent is awarded to an inventor who has discovered a unique substance. The product does not occur in nature. The exception to this was the discovery of Vitamin B 12.

OUTLINE OF CONTENT

MAJOR UNDERSTANDINGS AND FUNDAMENTAL CONCEPTS

SUGGESTED TEACHING AIDS AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION FOR TEACHERS

b. Trademarks

Trademarks are not patents, but the specific mark of the drug manufacturer.

Relate the concept of trademarks and patents of drugs to other manufactured products in the United States. How does this compare with other businesses? How does it differ?

The process patent is awarded for a unique method of manufacturing a substance already known.

Both types of patents extend for a period of years in the United States.

Trademarks mean reputation. The drug industry and other interested parties believe that patents and trademarks serve as incentives to research and development of new drugs that make America the leading developer of new drugs.

c. Drug testing

To facilitate public protection, the scientific community, governmental agencies, and the drug companies must cooperate and keep strict vigilance over drug testing for protection of the public.

Investigate the thalidomide disaster as an example of distributing inadequately tested drugs. (Life Science series has the story.)

The thalidomide disaster sparked a controversy over drug testing. The pharmaceutical manufacturing industry set up a Drug Safety Commission in August of 1962. The Commission proposed these recommendations:

1. Self regulation of the pharmaceutical industry.
2. Must make certain the drug tester is competent. Instances of "professional research quacks" are rare, but even one is too many. In 1963, a Maryland physician was indicted for falsifying experimental data. His results were too uniform to be real. He

AND LEARNING ACTIVITIES

SUPPLEMENTARY INFORMATION
FOR TEACHERS

had received \$13,000 a year from a drug company for his "testing."

3. Investigation of files to become aware of past experimental drug failures so time and money will not be wasted on repetitive trials.
4. Special education of researchers in the sparsely populated field of teratology (human congenital malformation).
5. More scientific investigators for the Food and Drug Administration.
6. Education of the public.
7. Cooperation between law making and scientific bodies.
8. Grants to support institutional research and to compensate the investigator.

Refer to Strand II, Grades 7, 8,9- "Kefauver Harris drug amendments of 1962."

APPENDIX A

Critical Analysis of Advertisements

Critical Questions	Additional Information
1. What is the advertisement trying to make you believe?	
2. What specific facts are provided concerning the condition or disease for which this product is to be used?	Generally, ads provide little or no information concerning the etiology of a condition or the legitimate therapies that have been developed for this condition.
3. Exactly what does the product contain, or, if it is a service, what does the service consist of?	
4. Does the ad contain half-truths?	
5. Is there any indication that the product may be harmful or irritating to some individuals?	
6. How does the advertisement make its appeal?	Advertisements may appeal to medical or scientific authority, to public gullibility, romance, strength (men), beauty (women), social prestige, etc.
7. Has the advertiser used words such as "may" or "if" to protect himself?	Vague and often misleading terms or phrases prove confusing to consumers.
8. Does the ad perpetrate a myth?	Many ads for dietary supplements are guilty of perpetrating myths. Hair restoration formulas and cosmetics are frequently guilty of this.

APPENDIX B

Selected Internal Nostrums

Product/Technique	Description
Koch Treatment	<p>The "Koch Treatment" was developed about 1914 by Dr. William Koch. It consisted of injections of "glyosylide" (ordinary tap water), a strict diet, and enemas. The cost of one injection of this cancer nostrum - \$500.00.</p>
Krebiozen	<p>Dr. Steven Durovic developed Krebiozen and brought it to the U.S. where it was promoted as a cancer cure by Dr. Andrew Ivy. Laboratory analyses have shown that krebiozen consists of mineral oil and the common chemical, creatine. The F.D.A. has withdrawn this product from interstate commerce.</p>
Cellular Therapy	<p>Dr. Paul Nieham is the alleged inventor of "cellular therapy." Used for a variety of maladies (i.e., leukemia). This nostrum consists of dried cells from freshly slaughtered lambs. These are injected into the person's body.</p>
Laetrile	<p>The perpetrators of this product are Dr. Ernest Krebs, and his two sons. A sugar compound obtained from apricot pits is the main ingredient in laetrile. Glenn Kittler, a journalist, wrote a paperback entitled, <u>Laetrile, Control for Cancer</u>, which has since been banned in the U.S.</p>
Hoxey Treatment	<p>The "Hoxey Treatment" combines a nostrum with a diet. It consists of kidney tablets, calcium tablets, Vitamin C, and a diet that excludes salt, sugar, bleached flour, pork, tomatoes, and pickles.</p>

APPENDIX C

Paramedical Personnel

<u>Personnel</u>	<u>Descriptive Comments</u>
<u>A. Psychological Personnel</u>	
(1) Clinical psychologist	<p>Psychologists are involved in both the prevention and treatment of behavior disorders. There are various types of psychologists, each requiring a specific type of training. To attain the Ph.D. in psychology, approximately 8 years of college are required. The clinical psychologist assists in the diagnosis and treatment of mental and emotional difficulties. He usually works directly with the client, but may also become involved with the family, friends, physician, and teachers of the client.</p>
(2) Counseling psychologist	<p>The counseling psychologist is a specialist in normal thinking and feeling, rather than abnormal thinking and feeling. Well-trained in counseling dynamics, most of these professionals hold the Ph.D. degree.</p>
(3) Social psychologist	<p>Social psychologists study the social forces which influence individual and group behavior. They attempt to understand how social attitudes and behaviors develop, and how neighbors, friends, relatives, and the larger social scene interact.</p>
(4) Psychometrist	<p>The psychometrist measures individual's mental, social, and/or emotional characteristics. His training may be less extensive than that required for other psychologists. Nonetheless, he is required to complete the master's degree and 1 year of supervised experience to be qualified.</p>

Personnel

Descriptive Comments

(5) Psychiatric social worker

This specialist requires a depth background in both the behavioral and the social sciences. Usually this requires 4 years of college plus one (1) year of special training in a clinical setting. The psychiatric social worker learns about a client's family background, education, work experience, and social interactions, so as to enable the psychiatrist to better understand and treat the client.

B. Podiatrist (Podiatry)

The functions of the podiatrist are included in the curriculum materials for grades 4, 5, and 6. This individual usually has 1-2 years of college and 4 years of professional training. A podiatrist must be licensed by the state in which he practices. There are only six (6) accredited schools of podiatry in the country.

C. Health Educator

These professionals may teach in schools, public health agencies, or work as educators in voluntary agencies. Training is required for (4) years of college. To become a certified teacher of health, competency (20) additional appropriate norms are required.

D. Nurse (Registered)

The nurse training for becoming a registered nurse (R.N.) involves 3 years in an accredited hospital or university. The R.N. nurse is a professional occupation to serve the public. The nurse works in a variety of settings, all of which require a minimum of 2 years of college. The nurse is a professional who works in public health, education, industry, nursing homes, and other settings. The nurse is a professional who works in public health, education, industry, nursing homes, and other settings. The nurse is a professional who works in public health, education, industry, nursing homes, and other settings.

Title	Description of Function
Occupational Therapist	A rehabilitation specialist who uses creative, educational, and recreational therapy in the treatment of mental and physical illnesses; may teach new job skills to the handicapped in a hospital or rehabilitation center.
Physiotherapist	Under the direction of a physician, uses physical and mechanical means (i.e., whirlpool, diathermy, massage, etc.) to treat individuals; may be employed in a hospital setting, or as a privately-practicing professional.
Pharmacist	Concerned with drugs, their origin, nature, properties, and their effects on living organisms; provides the medicine that is ordered by a medical doctor and, therefore, is a vital member of the health-care team.
Medical Technologist	A nonmedical worker whose functions are supervised by a pathologist; activities include analysis of blood, tissue preparation, etc.
Bacteriologist	A scientist who studies bacteria and other microorganisms.
Biophysicist	Concerned with the application of physical principles to biological problems.
<u>Others:</u> Serologist Virologist Epidemiologist Hematologist Entomologist	

APPENDIX D

Other Health Personnel

Title	Description of Function
Dietitian	Supervises the diets of hospital patients; special responsibility for special diets for cardiac, ulcer, diabetic, etc., patients; also involved in the administrative aspects of institutional food management.
Food Technologist	Applies scientific knowledge to the processing, packaging, preparation, distribution, and production of food in the commercial food industry.
Nutritionist	Primarily an educational specialist, the nutritionist imparts knowledge of foods and nutrients so as to enhance the nutritional status of people.
Sanitary Engineer	A public health worker responsible for creating and maintaining a healthful environment. Often concerned with sanitary conditions in swimming pools, restaurants, water supplies, milk, public housing, and the atmosphere.
Science Writer	An experienced journalist whose rich background in the sciences enables him to write "news items" concerning the health of individuals and groups.
Medical Illustrator	Using his artistic talents to illustrate medical facts or events, the medical illustrator frequently is employed by those who publish journals, popular magazines, etc.

Title	Description of Function
Occupational Therapist	A rehabilitation specialist who uses creative, educational, and recreational therapy in the treatment of mental and physical illnesses; may teach new job skills to the handicapped in a hospital or rehabilitation center.
Physiotherapist	Under the direction of a physician, uses physical and mechanical means (i.e., whirlpool, diathermy, massage, etc.) to treat individuals; may be employed in a hospital setting, or as a privately-practicing professional.
Pharmacist	Concerned with drugs, their origin, nature, properties, and their effects on living organisms; provides the medicine that is ordered by a medical doctor and, therefore, is a vital member of the health-care team.
Medical Technologist	A nonmedical worker whose functions are supervised by a pathologist; activities include analysis of blood, tissue preparation, etc.
Bacteriologist	A scientist who studies bacteria and other microorganisms.
Biophysicist	Concerned with the application of physical principles to biological problems.
<u>Others:</u> Serologist Virologist Epidemiologist Hematologist Entomologist	

These supplementary aids have not been evaluated. The list is appended for teacher convenience only and teachers in the field are requested to critically evaluate the materials and to forward their comments to the Curriculum Development Center.
