ABSTRACT

In this sixth survey of educational television in the United States, 187 UHF-VHP educational television (ETV) stations, 27 ITFS (Instructional Television Fixed Service) systems, and 35 CCTV (closed circuit television) systems reported on their operating policies and on their programming during the week of March 9-15, 1970. The amount and kind of programming addressed to age-differentiated audiences was the primary focus of the survey. Some of the significant trends noted were an increase in the number of ETV stations on the air, an increase in the number of days per week these stations broadcast, and an increase in "public" programming (in contrast to instructional programming). Some of this shift to public programming was caused by the great impact of the "Sesame Street" series, which was so-classified. The rest of the shift was probably caused by the increased use of programs produced by such national organizations as the Corporation for Public Broadcasting and the National Educational Television (NET) network. The material gathered in the survey is presented in both expository and tabular form. Information is included about production patterns, program sources, audience levels, program subjects, and station ownership. A statistical profile of each ETV station is given. (JY)

Foreword

One Week of Educational Television is essentially a quantitative study of the program offerings of ETV stations, ITFS facilities, and CCTV systems in education. It was initiated by the Morse Communication Research Center of Brandeis University in 1961. This marks the sixth time that the report has been published. Financial support was provided by the National Instructional Television Center and the Corporation for Public Broadcasting.

Pepper Weiss of NIT assisted the chief investigator in the collection, processing, and analysis of data and, in general, helped to coordinate the project. Paul Schneller contributed to the development of the survey instruments. Charles Flowers of Indiana University Research Computing Center was responsible for computer programming.

The one person whose vision and persistence has contributed the most to the continued existence of *One Week of Educational Television* is Edward J. Pfister formerly of NIT and now of the National Association of Educational Broadcasters.

Special appreciation is also given to those very patient people at the ETV stations, ITFS facilities, and CCTV systems who completed the survey forms.

Introduction

By Robert B. Hudson

The 1970 report of One Week of Educational Television is the sixth census of ETV station schedules in which the amount and kinds of programming addressed to age-differentiated audiences are described. It is a census, an accounting in a quantifying sense that permits limited data spin-offs but does not speak to program quality, program impact, or audience size. Some information on these latter points exists in a variety of studies and it may be useful to draw on such sources inferentially in commenting on the principal trends made explicit in the series of One Week of ETV surveys.

It is noteworthy that in the two-year period between the 1968 and 1970 surveys there was a 24% increase in the number of ETV stations on the air. The 190 stations operating in 1970 occupied nearly two-thirds of the channel assignments reserved for noncommercial educational use. More significant still is the statistic attesting that the traditional Monday-through Friday ETV week is being extended progressively into the weekend. On the average in 1970, ETV stations were on the air nine hours a week more than they were in 1968 (and this, plus the increase in the number of stations, brought about a 43% jump in total ETV hours). Seventy-four percent of these stations broadcast at least six days each week, and 39% broadcast seven days. Notwork interconnection, which provided such program series as the "The Forsyte Saga" and "The Advocates," was a powerful stimulus to weekend broadcasting.

Public Television

The current One Week of ETV survey shows clearly a remarkable growth in the non-school programming that has come to be known as public television. In 1970, 63% of all ETV hours broadcast were devoted to PTV (up from 51% in 1978) and the remaining 37% to instructional or classroom television (down from 49% two years earlier). This, on its face, appears to mark a pronounced shift in program emphasis; but the figures require closer scrutiny. Virtually all of the PTV increase came about

Robert B. Hudson served for many years as Senior Vice President of National Educational Television. He retired from that position in 1970 and is now associated with the Academy for Educational Development, Inc.

SAUL ROCKMAN

6/8/71

Dear Don,

These copies are for you and your associates at ERIC. You of course, have our permission to put it into you. microfiche collection. Hard copy would be less expensive I am sure, coming from NIT.

One Week becomes harder to do with time, I think and I'm really not sure of the future of this publication. I'd appreciate any comments or reactions from you or your people.

Peacu.

Saul

through the extension into weekend programming, a lengthening of the broadcast day, and the emergence of "Sesame Street," which in this survey is considered to be PTV programming. The amount of PTV presented each week by the average station rose 10.4 hours (from 30.7 to 41.1) but the amount of ITV dropped only 1.2 hours (from 25.4 to 24.2), and this loss is more than accounted for by the inroads into ITV school hours made by "Sesame Street."

One might say that 1970 was the year of "Sesame Street." Not only did this series of programs arrive with dramatic impact; it dominated ETV station schedules by claiming anywhere from five to fifteen hours per week of transmitter time.

There is another noteworthy factor in the sharp increase in PTV programming. A staggering 89% of all PTV programs reached the ETV station from outside sources. More than two-thirds of them came from NET, CTS/PS, and major ETV producing stations through the newly organized Public Broadcast Service. The 11% figure for local PTV programming was down from 13% in 1968 and 15% in 1966. Incidentally, one hundred and one stations asserted that they planned more "local public affairs programming" in 1970-71.

This dependence on outside sources reflects in part the quantity of programs available and the quality of the product. PBS is offering more hours of programs than have ever been offered to ETV stations, and the videotape and film library services have more uapth and variety in programs than ever before. On the PTV quality side, credit must be given to the Corporation for Public Broadcasting and to the Ford Foundation and other agencies for supporting NET, the major ETV producing stations, and the Children's television Workshop with funds that enabled them to engage and hold creative, skilled people and to budget for a quality product.

Local PTV program production has suffered usually because of a scarcity of funds and manpower rather than for lack of interest or sense of mission. General support grants by CPB are designed to strengthen ETV stations, and as more funds become available to CPB for this purpose, the trend away from local production may be reversed.

Reflecting the many hours devoted to "Sesame Street" and to "Misterogers' Neighborhood," 24% of all PTV hours were directed to the early childhood group. Programs for middle childhood claimed 7% of the hours, youth programs only 4%, and programs for adults 65%.

The adult fare in 1970 was rich in social documentaries, drama and the performing arts, the examination of public Issues and consumer problems; it gave access to minority opinion and minority iite styles. Rock music found a home on public television, as did Zubin Mehta and Leopol 1

Stokowski. Panels still weighed in heavily, but PTV increasingly engaged the interest of viewers and provided a wider choice in program fare than had ever before existed in American television.

Instructional Television

In the 1970 survey iTV was defined as "any program designed for in-school or for-credit viewing." Gains in total weekly hours of instructional programming from one biennial survey to another can be expressed in absolute terms—school-time hours in the week multiplied by the number of new stations. The exception to this formula in 1970 was, as noted earlier, the result of inroads made by "Sesame Street" on school-time hours. On ETV stations where "Sesame Street" was broadcast from ten to eleven o'clock in the morning, for example, in-school programs were preempted.

The drop in local production is significant also in ITV. Twenty-seven percent of all ITV programs were locally produced in 1970. This is down from 1.4% in 1968 and from 77.9% in 1962. The quantity and quality of programs available from national sources—essentially, NIT, GPNITL, and MPAT--had bearing on local production, as did availabilities from regional and state networks, but a study in New Trier Township schools in Illinois suggests that the "cottage industry" approach to ITV program production has been a failure to date and the One Week survey data seem to bear this out. The study observed further that there seems to be little positive transfer from the ability of some teachers to recognize a "good" program to an ability and willingness to produce one.

In most ETV stations teachers are not asked to "produce" ITV programs, but with rare exceptions the ITV program format in the United States is basically that of a teacher teaching—a teacher, albeit a good one, doing essentially what is done by a teacher in a conventional classroom. It would appear that television in our schools is thought of as a kind of inter-school system or intra-state system for extending the range of the teacher. Production values in some ITV programs often are limited to a "talking face." This misreading of the medium of television is endemic in American education. Television has been forced into institutionalized patterns and is seldom explorer for its true potential as something more than a mere vehicle, as something with attributes of its own that can add reality and a sense of process to the abstructions of the classroom. "Sesame Street" has begun to probe its depths and tap its resources and to develop television as an educative force. The NIT series "Ripples," used by most ETV stations, introduces the child to wholly new learning

g

experiences in a non-didactic way. There are other examples, but, unfortunately, not many.

There is a central question here: Should there be less, not more, local ITV production? To what extent is it educationally viable to continue the "cottage industry" approach to instructional television?

Within the education community these days there is much talk of educational alternatives—the "free form" school, the Parkway experiment in Philadelphia, independent study in a de-schooled society. Perhaps television's potentially greatest contribution to education of the young lies outside of the system. This would require a broader conception of the uses and the power of the medium than it presently enjoys in most circles.

In Sum

As one studies the One Week of Educational Television surveys for 1961, 1962, 1964, 1966, 1968 and 1970, the evidence is clear that public television belatedly is emerging as a strong force in American life and has found a place in the main stream of communications flow. Instructional television, on the other hand, captured the imagination of parents and educators when it was first introduced in the late 1950's, but its curve of educational interest and effectiveness flattered out during the 1960's and only now, at the beginning of a new decade, are demonstrations under way that promise to show educators and society a new facet of this lively medium.

Chapter 1

Educational Television

Station Operations

As of March 9-15, 1970 (the survey week of One Wesk of Educational Television, Number Six), 190 ETV stations were known to be broadcasting. That is an increase of 24% from the 153 stations reported transmitting in 1968 by One Week of ETV, Number Five. For the 1970 survey, 187 of the stations participated and all data will be reported on this basis.

There was a quantitative increase in programming, in terms of both total hours broadcast by all stations and average hours per station. The 187 stations transmitted a total of 12,217 hours of programming during the survey week, an increase of 43% from 1968. Average broadcast hours per station rose 16%, from 56.1 hours in 1968 to 65.3 hours in 1970.

Fig 1

Weekly Pattern of Broadcasting

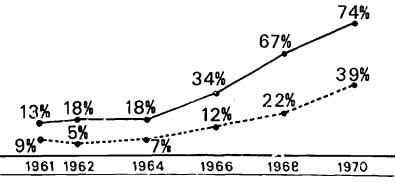

A weekly pattern of ETV broadcasting emerges from the findings. Monday through Friday the average station transmits between 11 and 12

 Data was unavailable from KTEH, San Jose, Catifornia; KYVE, Yakima, Washington; and KYZK, Pago Pago, American Samoa.

hours a day. Stations broadcasting during weekends average between six and seven hours a day on Saturday and Sunday; but not all stations transmit on weekends. All stations surveyed are on the air at least four days during the week, and all but two have at least a five-day schedule. Sixty-sevel stations broadcast six days a week (the sixth day is almost always Sunday), and 72 stations transmit for the full seven days. Only 11.4% of the total weekly broadcast hours are on weekends, 3.6% on Saturday and 7.8% on Sunday.

Weekend Broadcasting Patterns, 1961-1970

--- Stations broadcasting at least 6 days per week ---- Stations broadcasting 7 days per week

Fig. 2

There are 128 agencies that own and/or operate the 187 ETV stations surveyed. One hundred and eleven are single-station operations. There are six agencies with two sictions, three with three stations, one with four stations, three with five stations, three with eight stations, and one with lwelve stations. The ownership of stations can be separated into the categories indicated in the graph below. The "Other" category consists of stations with some form of joint ownership, such as those jointly Details of the programming activities for the four major ownership categories can be found in Appendix II, Tables 12-15.

Ownership of ETV Stations

numbers in () indicate hours

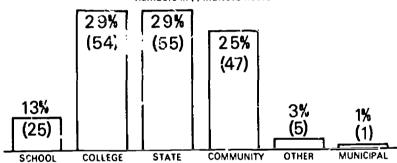

Fig 3

Anticipated Changes

The 128 agencies that own and/or operate the stations reporting were asked to indicate the changes in programming and tacilities/equipment expected within the next year (1970-71). Seven agencies (accounting for nine stations) did not anticipate major changes in physical facilities or equipment during that time. All of the others foresaw at least one major change. Many of the anticipated changes and additions involved color capability. In the table below, the figures in () indicate the number of stations operated by the agencies reporting.

Expected Additions in Facilities or Equipment	Number of Agencies
Color 'm chain	 - 48 (38)
Color video tape equipment	 - 49 (85)
Local color production capability -	 - 32 (60)
Cameras	 - 29 (61)
Video tape recorders	 - 26 (45)
Remote units	 - 25 (38)
New facilities (space or buildings) -	 - 25 (36)
New equipment in general	 - 17 (24)
Complete satellite transmitter	 - 8 (20)

Other items listed by the agencies included film equipment, black-and-white television equipment, translators, switchers, a complete 2500 MHz facility, and new audio equipment.

All but three agencies, reprecenting five stations, predicted major additions to their programming during 1970-71. Increases were anticipated

most often in local public affairs programming and ITV. In the table below, the figures in () indicate the number of stations operated by the agencies reporting.

Expected Additions In Programming		Number of Agencies
Local public affairs programming		75 (101)
School programming		40 (77)
Saturday broalcasts		36 (51)
Cultural affairs		36 (49)
Minority-group programming		30 (45)
Children's programming	_	30 (36)
Sunday programming		19 (31)
Evening programming		19 (21)
Weekday programming		18 (21)
Programming in general		16 (26)
National and International public affairs	-	11 (11)

Other areas mentioned were continuing education, sports, youth programming, ecology, and audience participation broadcasts.

Twelve of the agencies said also that they expected major decreases in certain program areas within the next year. The areas most frequently mentioned were cultural affairs and ITV, though some anticipate decreases in minority-group programming, local and national news/public affairs programs, Saturday programming, and children's broadcasts.

The participating agencies were requested to rank in order their three major programming needs. The weighted totals emphasize the general need for local public affairs programming. Although only three areas were to be ranked, four programming categories clustered closely together below local public affairs and received a substantial proportion of the total rankings. Listed below are the five most-cited programming needs in the order of their weighted totals.

Local public affairs Local cultural Adult education In-school Local news

In contrast, the two areas receiving the lowest weighted totals were national news programming and national/international public affairs programming.

Public Television Programming

One of the many effects of the publication of Public Television: A Program to: Action—the report of the Carnegle Commission on Educational

Television—was to formalize the dichotomy in educational television programming. The "Introductory Note" to that report includes this paragraph:

The Commission has separated educational television into two parts: (1) instructional television, directed at students in the classroom or otherwise in the general context of formal education, and (2) what we shall call Public Television, which is directed at the general community. (Bantam Books edition, p. xill.)

The present survey requested that each program be considered either general audience programming (PTV) or school programming (ITV); the latter was defined as "in-school or for-credit." Thus programs broadcast during the school day but not designed for an in-school or for-credit viewing audience (such as "Sesame Street") were considered PTV, and programs broadcast in the evening hours but designed as formal continuing education were designated ITV. According to these categorizations, five of the 187 responding stations broadcast only ITV and four broadcast only PTV.

As indicated previously, the length of the average broadcast week increased from 56.1 hours in 1968 to 65.3 hours in 1970. All of this increase is in the area of public rather than instructional television programming. Characteristically, instructional broadcasting coincides with those fixed times when schools are in session. Since non-commercial television in recent years has filled almost all school hours, any additional programming would be for general audiences. Consequently the longer broadcast week is related to a 65% increase in the total hour, of PTV programming. To accommodate more programming stations expanded both the weekday and weekend schedule. In large part, this considerable increase was stimulated by the operation of a national interconnection system.

PTV Programming - 1961-1970

	1961	1962	1964	1966	1968	1970
Total weekly hours PTV	1431	1396	1992	3248	4671	7697
Average weekly hours PTV per station	25.6	22.5	22.6	28.2	30.7	41.1
% of total hours in PTV	65.5%	54.0%	54.0%	57.5%	51.0%	63%

adjusted figure - see Qne Week, No 5, p 17

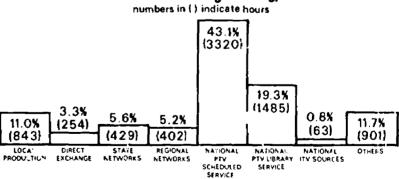

Sources of PTV Programs

Over the past several years there has been some confusion as to the source of PTV programs. The increases in state, regional, and national networking have served to blur the distinction between agencies transmitting programs to stations for simultaneous or delayed broadcast and the original distribution sources. For this edition of One Week an attempt was made to distinguish agencies that actually originated transmissions from those providing programs for transmission. The respondents were given with the following example:

... a program produced by WGBH, placed in distribution by ETS/PS and received by your facility for broadcast through a regional network—CEN—should be noted as coming from ETS/PS.

The sources of public television programming are shown in Figure 5 below. The largest proportion of PTV hours were provided by the national PTV scheduled services and the national PTV library services. These two services consisted of NET in all its forms, ETS/PS, and individual stations and organizations such as CTW, that provided material for the CPB-funded PBS interconnection.

Sources of PTV Programming, 1970

F-2 5

The 43.1% of all PTV programming distributed by the national PTV scheduled services includes 30.3% from NET, 6.3% NET tape delay service, 0.9% from ETS/PS, and 5.6% from other sources. The 19.3% distributed by the national PTV library services includes 14.6% from

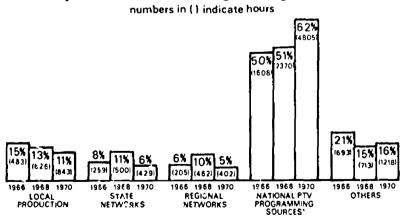

NET Flexible Service (more than half of which consists of "What's New" and "Misterogers' Neighborhood") and 4.7% from ETS/PS. The breakdown within each of these two major categories, however, is not considered accurate. Respondents knew that a particular program was distributed through PBS, but they were not always correct in reporting the source. (A further discussion of the distinction between the transmitting and distributing agencies can be found in Appendix I.)

National school programming sources have almost been eliminated from the PTV area, whereas in 1968 they provided 6.5% of the PTV hours.

Of the major program sources, the national PTV services have shown the greatest increase from previous biennial surveys. Figure 6 below compares the percentages for selected programming sources for 1966, 1968, and 1970. The figures for local production and for state and regional networks are available for 1964, but were not included because comparable adjusted figures could not be obtained for the national PTV programming sources.

Major Sources of PTV Programming, 1966-1970

*Figures for 1966 and 1968 have been adjusted to account for all NET programming and all ETS-PS programming hours. Sources are **Qne Week**, 1966, and 1968.

Fiq 6

National PTV programming sources account for about 80% of the increase in PTV hours. (The rest of the increase is due largely to the

increase in the number of stations.) Thus, it seems likely that the causative factor in the sharp increase in PTV hours is the additional material produced by the national PTV programming sources for distribution through the PBS national interconnection.

Local production of PTV programs has continued to decrease in proportion to hours broadcast; however, the total hours of locally-produced programming has consistently increased. This increase is almost entirely due to the growth in the number of stations on the air, and only slightly to note local production by individual stations. (See Appendix II, Table 2.)

PTV Local Production, 1962-1970

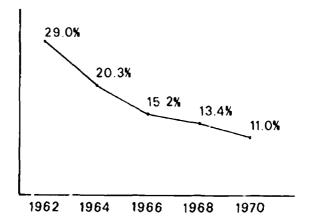

Fig 7

Subject Areas of PTV

Public television's programming emphasis changed sharply in 1970, largely because of "Sesame Street." For the first time, children's programming accounted for more hours of broadcast time than did news/public affairs programming. Nearly a third of the PTV hours are transmitted for children, and almost 60% of this is "Sesame Street." More than 90% of children's PTV programming was distributed by the national PTV program sources.

18

PTV Hours by Subject Category, 1970

numbers in () indicate hours

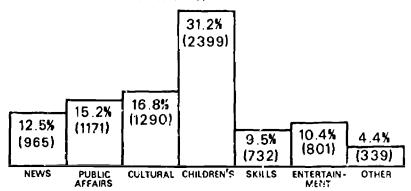

Fig. 8

The "Other" category contains programming that the respondents could not comfortably fit into the titled categories and includes 300 hours of continuing education programs that were not considered ITV (i.e., were not in-school or for-credit programs). The "Entertainment" category consists of 159 hours of feature films, 120 hours of sports broadcasts, and 522 hours of variety formats such as "Soul" and "The Show."

Almost two-thirds of the cultural programs were performances of some kind; three-fourths of all cultural programming was distributed by the national PTV programming services.

The news and public affairs programining was categorized by the respondents in two ways. First, by format:

News	reporting		•	-	-	•	•	-	-	•	-	-	•	•	-	-	10%
News	analysis/cis	cussio	n	-	•	•	•	•	-	•	•	•	•	•	•	-	26%
Single	-topic news	report	5	•	•	•	-	٠	•	•	٠	•	•	•	-	-	9%
Public	allairs doc	umenti	10		-			•			-		-	-	-	-	13%
Other	public affair	rs bro	arun	18			-	-		-							37%

Second, by the geographic scope of the programming:

Local -					•		-			-	•				-			18%
Regional	•		-			-					•	•	•	-	-	-	•	10%
National	•	•	•						-	•		-		•	-		•	22%
Internation	al							٠				-	•	-	-	•	•	11%
National/ii	ten	natio	nat	•					•		-	-	-	•	•	•	٠	29%
Other -	-	-						-	•	•	•	-	٠	•	٠	•	-	10%

Less than half (43%) of the news/public affairs programming is obtained from the national PTV services. Twenty-two percent is the result of local production. Since 18% of news/public affairs programming does emphasize local concerns (and, as such, is probably produced locally), some four percent of all news/public affairs hours is probably locally produced programming about other than local issues.

(Additional information concerning the subject areas of PTV programming can be found in Appendix II, Table 11. A comparison of selected subject areas from 1964 to 1970 is located in Appendix II, Table 9.)

Repeats, Use of Color, PTV Audience

Approximately 25% of the PTV hours consists of programs repeated at feast once during the preceding seven days. These repeat programs were mostly children's programming and cultural offerings. The proportion of PTV repeat programming remains about the same as that reported in 1968.

The use of color has risen sharply in educational television. In 1968 only 16% of the stations were capable of local production in color; in 1970, 40% had this capability. In 1968, 66% of the stations were able to broadcast in color; in 1970, 83% had that ability. More than 52% of PTV programming was available in color during the 1970 survey week, but since not all facilities were capable of color transmission, just 43% of all PTV hours were broadcast in color. This, nevertheless, is a remarkable increase from the 7.6% reported as color broadcasts in 1968.

The survey also examined the characteristics of the intended PTV audience. The respondents were asked to designate the age group for which each program was broadcast. Listed below are the five age groups and the percentage of programming intended for each.

Early childhood (up to age C) -	•	•		•	•				-	24%
Middle childhood (ages 6 to 12)			•	-	-		•	•	-	7%
Youth (12 to college)	•	•	•	-		•	•	-		3%
College/university										
Adult										

The respondents also were asked to designate programs broadcast for specific minority-group audiences. They were posed a program ing question: Regardless of the original design of the producer, for which special audience was this program transmitted?

Special audience programming totaled 753 hours, less 'han 10% of the entire PTV schedule. The largest portion of this, 41%, vas for the disadvantaged, and "Sesame Street" accounted for more than 95% of these program hours. The second largest was the 40% in the "Other" category; almost all of this was non-credit continuing education programming. The

remaining 19% was divided among blacks, senior citizens, Mexican-Americans, and others. A complete breakdown is given in Appendix II, Table 7.

Instructional Television Programming

Instructional television (ITV) programming was defined, for the purposes of this survey, as programming designed for in-school or for-credit viewing. Therefore, certain programs broadcast during the school day (such as "Sesame Street") were not considered ITV. Other programs transmitted in the afternoon or evening hours (such as in-service training for teachers and high school equivalency programs) were classified as instructional television if they met the criteria of in-school or for-credit viewing.

The amount of ITV programming has increased 17% since the 1968 survey. This is due entirely to the growth in the number of stations on the air. The average number of hours of ITV per week per station declined slightly, from 25.4 in 1958 to 24.2.

ITV Programming, 1961-1970

	1961	1962	1964	1966	1968	1970
Total weekly hours ITV	755	1200	1723	2440	3863	4520
Average weekly hours ITV per station	13.8	19.3	19.6	21.2	25.4	24.2
%of total hours in ITV	34.5%	46.0%	46.0%	42.5%	49.0%*	37.0%

'adjusted figure - see One Week No 5, p 24

Fig 9

Unlike that of public television, the amount of ITV programming as ETV stations currently schedule it, cannot markedly expand. More than 90% of instructional television is broadcast during the school hours on Monday through Friday. The parameters of the instructional day and the school week seem to form the limits of in-school instructional broadcasts.

The decrease in the weekly average of ITV hours is due to the impact of "Sesame Street" on the school television schedule. More than 600 hours of "Sesame Street" were broadcast during weekday in-school hours.

If this had been considered instructional programming, the ratio of FTV to ITV, now 63/37, would be 58/42, and the amount of ITV transmitted by the average station would be 27.5 hours per week, an increase of more than two hours. Thus, the Children's Television Workshop materials have both increased the amount of PTV programming available and decreased the amount of transmission time available for in-school services.

Sources of ITV Programs

As discussed in the section on public television programming, the 1970 One Week questionnaire attempted to distinguish between the agency that actually transmitted the signal and the agency that had provided the program to be transmitted. Figure 10, below, shows the sources of ITV programming in 1970. National ITV sources (essentially GPNITL, NIT, and MPATI) were the largest source of the ITV programming, accounting for 36% of the total hours.

Sources of ITV Programming, 1971

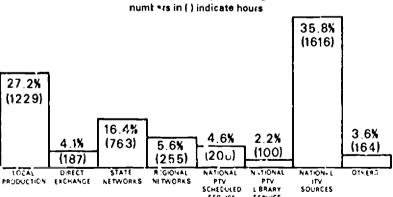

Fig. 10

Figure 10 should be considered reasonably accurate in differentiating between the transmitting agency and the distribution source of instructional television programs. For additional information and further explanation, see Appendix I (Methodology).

In the 1968 survey, confusion between the transmitting and distributing agencies apparently inflated the proportion of material from the state

networks, while minimizing the program hours distributed by the national ITV sources. As Figure 11 below illustrates, the separation of the transmitting and distributing agencies in 1970 reversed the proportion of ITV hours from state networks and national ITV sources. The figures for local production and state and regional networks are available for 1964 and 1966 but are not included in Figure 11 because comparable figures are not available for national ITV and PTV sources. These comparisons can be found in *One Week, Number Five*, 1968, p. 21.

Sources of ITV Compared, 1968-1970

numbers in () indicate hours

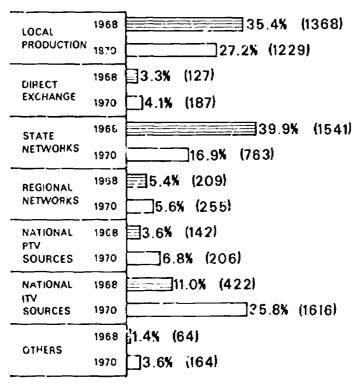

Fig. 11

The proportion of locally produced ITV programming continued to decline. In 1970 only 27% of ITV program hours were produced by the local stations. The actual number of hours of local production also showed a decrease. This is reflected in the reduction from 9 hours to 6.6 hours of locally produced ITV programs broadcast each week by each station. (See Appendix II, Table 2.)

ITV Local Production, 1962-1970

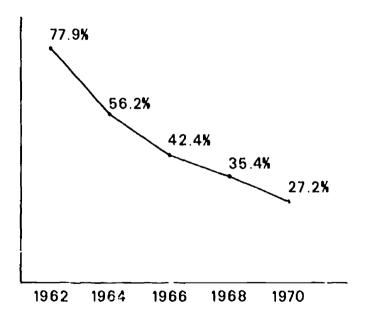

Fig 12

ITV Subject Areas

More hours of instructional television were devoted to the social and behavioral sciences than to any other general subject area. This is the first time that the physical sciences did not account for the largest proportion of ITV hours.

Subject Area of ITV Programming, 1970 numbers in () indicate hours

SOCIAL & BEHAVIORAL SCIENCES	28.1% (1272)
PHYSICAL SCIENCES	18.7% (847)
LANGUAGE ARTS & LIT.	16.2 % (731)
MUSIC	7.8% (352)
ART	6.5% (293)
MATH	6.1% (276)
FOREIGN LANGUAGE	5.3% (239)
HEALTH SAFETY & P.E.	4.1% (183)
OTHERS	7.2% (327)

Fig 13

NS25

For the sake of convenience and comparison, certain subjects were combined. The health and safety and physical education category contains 41 hours of physical education and 142 of health and safety programming. The social and behavioral sciences category contains 51 hours of education and 157 hours of news programming. The language arts and literature category includes 20 hours of theater, 244 hours of literature, and 467 hours of language arts programming. The "Other" category consists of 8 hours of home economics and almost 300 hours of kindergarten and pre-kindergarten ITV materials that have no single subject area for the total program.

(Additional information concerning the subject areas of ITV programming can be found in Appendix II, Table 11. A comparison of selected subject areas from 1964 to 1970 is located in Appendix II, Table 19.)

Forty-nine stations reported that they transmitted 94 hours of vocational education as part of their instructional schedule. This is slightly more than two percent of the total ITV schedule and is divided between the adult audience and senior high school students.

Continuing education accounted for 9.6% of the total ITV hours broadcast during the survey week. Of these 434 hours, 39% were in-service materials for teachers, 31% were university extension programs, and 8% were high school equivalency courses. For a complete analysis of continuing education programming, see Appendix II, Table 8.

Fiepeals, Color, Service to Schools

The proportion of ITV hours devoted to repeats of programs broadcast during the preceding seven days was up slightly over the 41.3% reported in 1968. In the 1970 survey week, 45.6% of all instructional television was repeat programming. It is notework, that 61% of the ITV hours consisted of programming that had been transmitted earlier but prior to the preceding seven days. Some of this was new programming broadcast during the first semester of the school year and repeated during the second semester, but much of it was programming that, like certain textbooks, has become a standard instructional resource.

Color ITV broadcasts have increased ten-fold since One Week, Number Five reported that 0.9% of instructional television programs were broadcast in color. Because of the cost of color production and the expense of providing color receivers to the schools, ITV color programming has not increased as rapidly as PTV color programming. In 1970, 10.6% of the ITV program hours were available in color, but since not all stations were capable of transmitting them in color, the percentage of ITV color broadcasts was 9.3%.

26

Most (95%) of the ITV programming was accompanied by related print materials such as teacher guides, workbooks, and other materials. Teacher guides were provided for 78% of the ITV hours, student workbooks for another 3%.

As in previous years, the greatest amount of programming was scheduled for the intermediate grades (4-6).

1TV Programming by Grade Level, 1970

numbars in () indicate hours

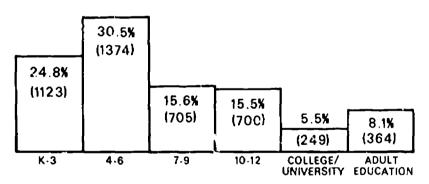

Fig. 14

There has been a growth in the proportion of programming scheduled for the primary grades. This increase in primary level programming is undoubtedly a reflection of the growing interest in early childhood education. As noted above, almost 300 hours of programming were offered to the pre-kindergarten and kindergarten child.

(For a comparison of the grado levels of ITV programming from 1966 to 1970, see Appendix II, Table 6. For a comparison of the audience of PTV and ITV programming by age levels, see Appendix II, Table 5.)

Fewer than 7% of the ITV hours were directed towards a special or minority group audience. More than two-thirds of the 300 special audience hours were intended for continuing education classes. The remaining third was scheduled for the disadvantaged, blacks, Mexican-Americans, and the handicapped. A complete analysis can be found in Appendix II, Table 7.

The services provided to the schools by educational television stations have increased over the past two years. About three-fourths of the stations

have expanded service to additional grades and increased the number of schools served.

In the area of ITV utilization, 18% of the stations reported holding regular workshops for teachers participating in the school service. An additional 56% indicated that workshops were held when they were needed or requested. Staff visitations to schools were regularly scheduled by one-third of the stations, and an additional 53% visited schools when requested or when the need was determined. During the 1969-70 school year, one-half of the stations conducted dissemination meetings for the schools in their coverage areas to discuss the broad issues of instructional television follow-up and utilization.

Chapter 2

Instructional Television Fixed Service

2500 Megahertz Activities

Instructional Television Fixed Service (ITFS) is a multi-channel, overthe-air television service established by the FCC in 1963. It occupies the 2500-2690 megahertz band in the spectrum, making available 31 channels to meet the needs of education for a low-cost instructional service with the option of using more than one channel at a time. The educational communications organizations, especially the Joint Council on Educational Telecommunications, have recently argued for official FCC action to "regularize" the use of this spectrum band solely for instructional/educational activities. The 2500 MHz band took on new importance to the educational broadcaster when the FCC reversed an earlier decision and proposed to the State Department that this spectrum allocation be reserred for educational and public service material in future international satellite agreements. It may be that the 2500 MHz band will be used in the near future not only as a short-range, ground-to-ground educational service, but also as a satellite-to-ground connection for the same purpose.

A survey of ITFS activity was included in One Week of ETV for the first time in 1968. A second ITFS survey is part of this project. As in 1968, a complete census was not possible. The most useful listing of ITFS installations, outside of FCC records, was chosen to reach 41 agencies operating ITFS facilities. Thirty-five agencies responded, but three of these were no longer in operation and only 27 of the remaining 32 answered fully enough to warrant inclusion in this survey. These 27 agencies operate 43 ITFS installations.

The survey of ITFS facilities for this issue of *One Week*, as well as the 1968 survey, was to have been a complete census of ITFS operation. Neither reached this goal. This may suggest the more informal and less structured nature of these broadcast organizations. Although the data on ITFS operations from the 1968 survey are available in *One Week of ETV*, Number Five, comparisons with the 1970 data were not made; for without additional information for both years, comparisons would not be appro-

- JCET News, October, 1970, Joint Council on Educational Telecommunications, 1126 Sixteenth Street, N.W., Washington, D.C. 20036.
- Television Facibook, 1970, Televisk. Digest. Inc., 2025 Eye Street, N.W., Washington, D.C. 20006.

priate. The information on ITFS operations that follows should be considered a survey of the field for the 1970 period—a status report. It is hoped that more comprehensive data will be available from ITFS operations in future studies of this nature.*

Utilization of Channel Capacity

Authorized channel capacity per installation	Number of channels utilized per installation	Number of facilities actually using channels
1 istel=3	1	3
2 Total=9	1 2	6
3 Total=15	2 3	1 14
4 Total=13	1 2 3 4	2 2 8
5 Total=3	5	3

Fig. 15

3. An extensive survey of ITFS facilities and operations has been published in a recent EPIE Report. In addition to discussions of the history, functions, and implications of ITFS, the report contains a supplement describing the operations of 65 agencies identified as operating 119 ITFS installations. A comparison of available figures suggests that the 1970 One Week data are representative of the population of ITFS operations. Furthermore, the emphasis of One Week is programming, white that of the EPIE Report is function and operations. See, EPIE Report, January, 1971, Educational Products Information Exchange, 386 Park Avenue South, New York City 10016.

.₁30

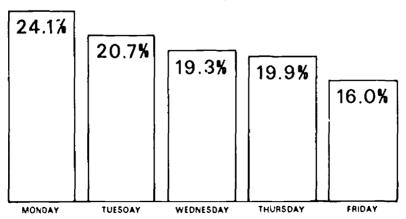

Of the 27 ITFS agencies responding to this survey, 20 were public schools or school systems; they accounted for 27 of the 43 ITFS installations. Two parochial school systems with eight facilities also returned questionnaires. In addition, five colleges with eight installations responded.

ITFS installations are usually capable of broadcasting on more than one channel simultaneously, but not all channels available to the ITFS facility were in use during the survey week. Three stations could use only one channel; nine were capable of using two channels; fifteen had three channels available; thirteen had four; and three had five. However, ten installations actually used only one channel during the survey week; six employed two channels; sixteen used three; eight used four; and three installations used five channels. Thus, of the 133 channels available, 16 were not used. Figure 15 compares the number of channels authorized and available for use with the actual utilization patterns during the survey week.

ITFS Programming

As could be expected, ITFS operations were on the weekdays. Twenty-five of the twenty-seven systems operated on each of the five days. No weekend programming was reported by any agency. A total of 1058 hours of programming was broadcast by the respondents and was distributed during the week as follows:

ITFS Programming by Day of Week

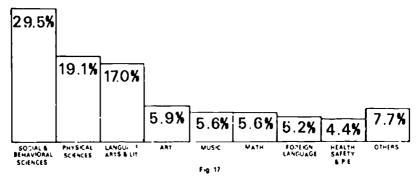

11(31

Almost all ITFS programming (96.4%) was transmitted during the school day. Eight agencies broadcast a small amount (2.8%) during the late afternoon, and three broadcast less than one percent of the total hours during the evening. Live programming accounted for only 5.3% of the total. Repeats of programs transmitted within the preceding seven days accounted for one-third of the programming. Programs broadcast in previous years (or semesters) amounted to 54.6% of the schedules. Only six of the ITFS installations broadcast color programming and this amounted to only four percent of the total hours. However, almost eight percent of the programming was available in color. Five agencies expect to add color equipment by June, 1971.

The programs transmitted over the 117 channels in use were obtained from two major sources. Local production accounted for 42.1% of the ITFS broadcast hours and the national ITV sources provided almost the same amount. The distributors of the remaining program hours were state networks (6.1%), other ETV stations and networks (6.2%), and other sources (5%). The "Other" sources include programs picked up off-air or off-cable from commercial and educational television stations. (For a breakdown of the distributors, see Appendix II, Table 16. See Table 17 for an analysis of off-air and off-cable pickups.)

Subject of ITFS Programming, 1970

Since all of the ITFS facilities in this survey were owned and/or operated by educational institutions and organizations, one might expect that all of the programs would be categorized as instructional television. However, as noted above, programs were transmitted in the late afternoon and evening hours, and programming was obtained from commercial and ETV stations. The respondents, in fact, reported that 7.6% of the program

32

hours were PTV rather than ITV. The PTV programs were primarily children's materials (mostly "Sesame Street") and news/public affairs programming.

The other 92.4% of the programming was instructional television. The distribution of instructional programming for ITFS facilities is approximately the same as that for ITV broadcasts by ETV stations. Again, certain subjects were combined for the sake of convenience and comparison. A complete breakdown of ITFS programming can be found in Appendix II, Tabin 19

As shown below, the largest amount of ITFS programming (27.7%) was offered for the intermediate grades (4-6). Proportionately fewer hours were scheduled for the primary grades (kindergarten to 3) by ITFS facilities than by the instructional services of ETV stations.

ITFS Programming by Grade Level, 1970

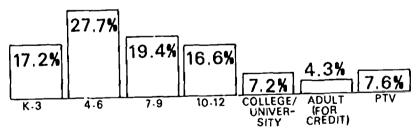

Fig 18

ITFS programming scheduled for a special or minority group audience amounted to 8.5% of the total hours. Eighty percent of the special audience programming was offered as adult education or was composed of special in-service materials. The remaining hours were scheduled for blacks, Mexican-Americans, and the disadvantaged. Each of these three groups was the intended audience for less than one percent of the total ITFS programming hours.

Related print materials accompanied more than 75% of the ITFS programming. Teacher manuals were supplied with 63%.

ITFS activities vary from the small one-channel operations to networks covering large metropolitan areas. This is reflected in the financial operations of the agencies. Twenty-two agencies operating 35 ITFS installations reported their annual programming budgets, and these ranged from \$15,000 to \$575,000. The mean budget was \$100,727 and the median

was \$50,006. Two agencies indicated that they did not have a budget for their operations that was separate from general education funding.

The production of local programs occupies a major role in the activities of ITFS systems, since local production is the major single source of programming. Nineteen agencies operating 31 installations provided estimates of the cost of a 30-minute locally-produced program. These ranged from \$30 to \$2,000. The mean cost was \$391 per half hour, and the median cost was \$200.

The activities of ITFS agencies have expanded during the past two years. About two-thirds of the agencies were transmitting to schools and grades not serviced in previous years.

In the area of ITV utilization, 81% of the agencies reported holds workshops for teachers in their service area. About one-fourth of agencies held these workshops on a regular basis. Seventy-one percent of all ITFS agencies made visits to schools receiving their signal, a 29% ctid it on a regular basis. About two-thirds of the agencies responds held major dissemination meetings for the staffs of the schools their area.

Chapter 3

Closed-Circuit Television

CCTV in Education

For the 1968 One Week survey, 88 closed-circuit television facilities in educational institutions were selected to represent the more than 600 known systems in the United States. These CCTV installations were identified through the NEA's A Survey of Instructional Closed-Circuit Television. Forty-four, or one-half of the sample, responded. It is likely that many of those not responding were minimal or experimental operations or were systems not functioning as instruments of mass communications.

Since the 1967 NEA survey, no census of CCTV operations in education has been attempted, and thus the only source for identifying the CCTV installations remains the 1967 NEA publication. Because no other listing was available from which to make another random sample, and because a longitudinal s'udy of the 1968 sample could provide additional data on the stability of CCTV operations, the 1970 One Week survey also used the 1968 list.

This time 65 of the 88 responded either by letter, questionnaire, or telephone. Thirty indicated that they no longer had CCTV facilities or were no longer using the CCTV facilities available to them; 11 of these agencies had responded in 1968. Thirty-five agencies sent back complete programming and questionnaire information; 21 of these were also respondents in 1968.

Because of the limited knowledge of the population of CCTV operations in education during 1970, and because this survey did not include the instructional efforts of business and industry through CCTV, the data below should be thought of as only a rough approximation of the CCTV programming activities in 1970. Only a few comparisons can be made with the 1968 results, since the size of the sample responding to the questionnaires has diminished significantly.

Clo. 3d-circuit systems have found greater acceptance, proportionately, in colleges and universities than in school systems. This is reflected in the ownership of the 35 responding CCTV installations. Twenty were owned by colleges or universities, eleven by schools, three by states, and one by a municipality.

 Wigren, Harold E., Henry T. Ingle and Michael Moil. da. Division of Audiovisual In-Biruction (now AECT). National Educational Association, Washington, D.C., 1967.

One of the advantages of closed-circuit television is the flexibility afforded by multiple channels. With several channels at his disposal, the CCTV user can transmit simultaneously as many programs as he has channels. Notwithstanding, almost two-thirds of the respondents transmitted on only one or two channels. Even those agencies with much greater transmission capability did not take full advantage of their multiple channels. Eleven agencies had only one closed-circuit channel available to them; six had two. Five agencies had three channels, six agencies had four channels, two had five channels, and two had six. Three other agencies had respectively eight, ten, and twelve channels.

Utilization of Channel Capacity

Available channel capacity per installation	Number of channels utilized per installation	N imber of facilities actually using channels
1 Total=11	1	11
2 Total=6	1 2	3 3
3 Total=5	2 3	3
4 Total=6	3 4	<u></u>
5 Total=2	3 5	<u></u>
6 Tota!=2	2 4	Bi
8 Total=1	8	<u></u> 1
10 Total=1	1	
12 Total=1	2	ים

During the survey week 33 of the 114 available channels were not used. Fifteen installations used only one channel and seven used two. Five agencies used three channels; six used four; one used five; and one used eight. Figure 19 below compares the channel capacity available for each CCTV operation with the actual number of channels used during the survey week.

The thirty-five CCTV installations responding transmitted a total of 928.2 hours during the survey week, averaging 26.5 hours each week for each installation. In 1968 the total was 985.9 hours from 44 facilities, and the average was 22.9 hours per week. The increase in average hours may have come about because the smaller installations either ceased to operate or did not choose to respond.

CCTV Programming

Aimost all of the CCTV programming was broadcast during the week-days (Monday-Friday). Twenty-eight of the 35 facilities carried programming for at least the full five-day period; the remaining seven installations had a three- or four-day week. Four facilities transmitted programs on Saturday.

CCTV Programming by Day of Week

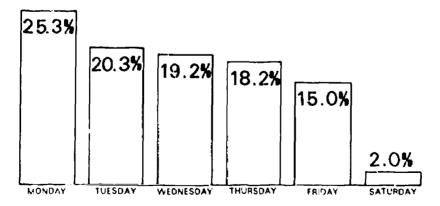

Fig. 20

The great majority of the program hours (90%) were, predictably, during the instructional day. Eight agencies carried five percent of the

program hours during the late afternoon, and five facilities transmitted the remaining five percent during the evening. Slightly more than eight percent of the program hours were live and only 13 of the 35 facilities did any live transmissions at all. Fewer than one-half (42.5%) of the program hours were of materials that had been transmitted at least once during the preceding seven-day period; almost two-thirds were repeats from previous years (or semesters).

Color transmissions totaled 4.2% of the programming, whereas 11.6% of the program hours were available in color. Only seven agencies tead color transmission capability. By June 1971, seven of the CCTV systems expect to have color video tape equipment: six expect to add color film chains; and two expect to have local color production capability.

More than one-half of the program hours transmitted by the CCTV systems were locally produced materials. This, however, is a reduction from the 72.4% local program production reported in 1968. The national PTV and ITV programming agencies increased their shares of the programming hours over the past two years.

Sources of CCTV Programming Hours

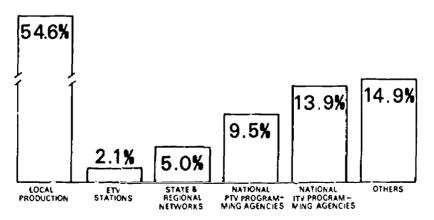

Fig. 21

The "Other" category includes programs picked up off-air or off-cable from commercial or educational television stations. (See Appendix II, Table 17 for an analysis of off-air and off-cable pickups.)

38

Since all of the CCTV installations selected were owned and/or operated by educational organizations, it is significant that 10.2% of the CCTV programming was categorized as PTV rather than ITV. Eight of the 35 facilities transmitted PTV programming, mostly children's programming ("Sesame Street"), skills programming, and entertainment presented during the late afternoon and evening hours. This programming was obtained primarily from commercial TV and the national PTV agencies.

The remaining 89.8% of the CCTV programming was scheduled for in-school audiences. The subject area most heavily represented was the social and behavioral sciences; then came the physical sciences and language arts and literature. This order is the same as that of the 1968 survey.

Subject Area of CCTV Programming, 1970

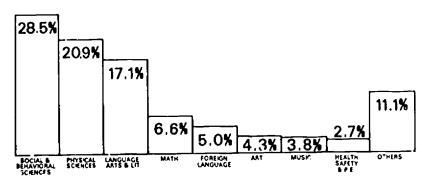

Fig 22

Once more, certain subject areas were combined for the sake of convenience and presentation. A complete breakdown of CCTV programming can be found in Appendix II, Table 19.

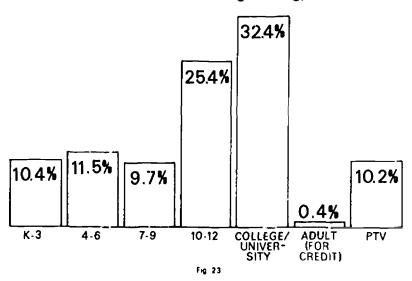

Since most of the CCTV facilities responding to this survey were owned and/or operated by colleges and universities, the largest segment of the audience consisted of college students. However, the proportion of college programming dropped sharply from 55.7% in 1968 to 32.4% in 1970. There is no apparent reason for this decrease, but the difference seems to be taken up by programming for the high school grades (10-12); its share of hours increased from 16% in 1968 to 25.4% in 1970.

The PTV programming described in Figure 23 was transmitted primarily for kindergarten or pre-kindergarten children and for the general adult audience. Less than two percent of the instructional hours were

devoted to vocational education programming. Only three and one-half hours of programming were directed specifically at a minority group; 6.8% of the total hours consisted of continuing education or in-service programs.

Grade Level of CCTV Programming, 1970

Related print materials designed to accompany instructional programming were found less frequently for CCTV operations than for ETV or ITFS programming. Almost half of the programming was not accompanied by supporting materials. Teacher guides were available for 37% of the program hours.

The wide difference in the amount and scope of programming activities undertaken by these closed-circuit agencies is a reflection of their budgets. Fifteen of the 35 CCTV agencies provided annual budget figures, and these ranged from \$3,300 to \$100,000. The mean budget was \$35,867 and the median was \$34,000. Five agencies indicated that they did not have a budget for their operations that was separate from general education funding.

More than one-half of the programming transmitted by closed-cliquit systems was locally produced, and 18 of the 35 CCTV operations provided estimates of their costs for a 30-minute local production. These ranged

from \$25 to \$500. The mean cost was \$166 and the median cost was \$160. Six of the systems indicated that they have no budget for local production.

The activities of the CCTV facilities have expanded over the past two years. Of the 35 systems surveyed, 43% were offering courses for grades not served two years before; 34% were providing programming to schools not served before; and 66% were offering courses not offered previously.

The informal nature of closed-circuit activities should be considered in interpreting the following information provided by the respondents. Most of the CCTV agencies conducted workshops for teachers. Eleven percent held them on a regular basis and 43% conducted them as the need arose. Staff visitations to classrooms using CCTV programming were scheduled on a regular basis by 11%, on an irregular basis by 43%. Forty percent of the CCTV agencies had held formal dissemination meetings in the past year for the staffs of the schools using their programming.

Appendix !

Methodology

The 1970 One Week of ETV survey was designed to obtain operating and programming information on all ETV stations, all ITFS installations, and a sample of CCTV operations. To obtain data comparable with that of previous One Week: projects, March 9-15, 1970, was selected as the survey week. Questionnaires were mailed to the respondents two weeks before the survey period. They contained 24 questions about the overall operations of the station or facility, and 24 questions for each program transmitted during the sample week.

Complete questionnaire returns were submitted by 187 of the 190 ETV stations, 27 of the 41 known ITFS operations, and 35 of the 88 CCTV systems sampled. The station operations questionnaires were coded and the data keypunched. The program information forms completed by the respondents were edited and then keypunched. The result was almost 30,000 IBM cards. Of these, some 25,000 were obtained from ETV programming, one card for each program broadcast. These cards were transferred to magnetic tape. FORTRAN computer programs were designed at Indiana University's Research Computer Center and run on its CDC 3400/3600 system. Additional programs were run on Indiana University's CDC 6600.

One of the problems encountered in studies of television programming is the tack of specific, well-defined terminology in this field. Traditional categories such as cultural and entertainment programs are not valid "subjects" of programming, but rather generic categories for placing various kinds of programming under a convenient rubric. In this survey, respondents were requested to place each program within the traditional category system and also to place it in one of 20 mutually exclusive subject areas. Thus, a program categorized as "cultural" would also be classified as art, or music, or drama, or even news of cultural affairs.

Another definitional problem is the source of the program transmitted. A distinction was drawn between the agency that actually transmitted the signal and the agency that had provided the program to be transmitted. The example used in the questionnaire to emphasize this differentiation was:

. . . a program produced by WGBH, placed in distribution by ETS/PS and received by your facility for broadcast through a regional network—CEN—should be noted as coming from ETS/PS.

Here, WGBH is the producer, ETS/PS is the distributor, and CEN is the transmitting agency.

One can see the need for a distinction between the transmitting and distributing agencies by noting that 48% of the PTV hours are locally originated white only 11% are locally produced; or by noting that 21% of PTV hours are direct broadcasts from the national interconnection while 37% are distributed by the national PTV services (excluding NET tape delay) through national interconnection for immediate or delayed broadcast.

In ITV also there is need for a distinction betwee, the transmitting and distributing agencies. State-wide and intra-state interconnections were the transmitting agencies for 1864 hours of instructional programming, while serving as the distributor for only 763 hours. Other comparisons can be made from Tables 3 and 4 in Appendix II.

This report does not make full use of the data reported by the respondents. The raw data can be made available in the future to qualified researchers with valid research interests.
