ABSTRACT

This study examines the distribution of applicants for small grants, the consequences of being funded, and the processing of proposals. The sample included every applicant submitting a proposal in fiscal 1968. The following data were collected: 1) questionnaires from applicants, both funded and not funded; 2) factual material from proposals submitted; 3) questionnaires from field readers: 4) field reader ratings of proposals and funding recommendations; 5) interviews with the Directors of Educational Research at the nine regional offices. The report is organized according to the life-history of a research project--from submission of the research plan through dissemination of the findings. Chapter headings are 1) the applicant and his institution, 2) the successful applicant, 3) the proposal, 4) developing the proposal, 5) processing the proposal, 6) effects of the research, 7) appraisal of the program, and 8) conclusions and recommendations. A major conclusion is that the Regional Research Program is successful in its goal of identifying and supporting less established researchers. (Appendixes contain a comparison of respondents and non-respondents to the applicant questionnaire and the field reader questionnaire, tables not included in the body of the report, the questionnaires, and the codebook containing the frequency distribution of responses to each item.) PREFATORY NOTE

This report on the small-project grants administered under the Regional Research Program of the U. S. Office of Education is based on data obtained from applicants submitting proposals for grants, the field readers reviewing these proposals, and the Directors of Educational Research responsible for implementing the Program within the nine regions (now ten) of the Department of Health, Education, and Welfare. All of these individuals have contributed generously to this effort. The data cover Fiscal Year 1968 (July, 1967 through June, 1968); however, experiences extending to the end of the survey (May, 1970) are also reported. Whenever appropriate, the analysis specifies these time distinctions. The findings are applicable to the circumstances existing in fiscal 1968 and to this sample of respondents.

The reader should bear in mind that the report treats the regions as a whole, even though conditions for implementing the Program may vary from region to region. Each Director faces a particular set of local considerations and as a consequence the statements in the report do not apply uniformly to each region. Similarly, it would be surprising if the Directors agreed with every one of our interpretations. Where we are aware of differences in points of view, we note them in the text. The conclusions and recommendations are completely those of the authors.

8

SUMMARY

Background

To facilitate contact between applicants for small research grants and the U.S. Office of Education, the Regional Research Program (RRP) was established in September, 1966. Within a year, offices were operating within each of the nine regions across the country to award grants for small-project research. The researcher interested in studying an educational problem submits a proposal to the regional office in his geographic area. His request for USOE support must not exceed \$10,000, and the project must be completed within eighteen months.

The specific objectives of the Program are:

- 1. To support significant, small-scale educational research projects.
- 2. To facilitate participation in educational research by a broad range of college and university personnel.
- 3. To encourage small colleges to undertake research programs so that students may benefit from having professors who are engaged in educational research activities.
- 4. To provide for direct and expeditious handling of proposals.²

Objectives and Procedures of This Study

In the summer of 1968 the Bureau of Applied Social Research, Columbia University was awarded a contract by the U.S. Office of Education to study the effects of the RRP. In particular, this research was designed to examine the Program with respect to: (1) the distribution of applicants for small grants; (2) the consequences of being funded; and (3) the processing of proposals.

¹A tenth office was opened September 15, 1970.

²<u>Regional Project Research Guidelines for Preparing a Proposal</u>, Bureau of Research, Regional Research Program of the Office of Education, U.S. Department of Health, Education, and Welfare (March, 1969), p. 1.

The following data have been collected:

- 1. Questionnaires from 665 applicants who submitted proposals in Fiscal 1968. (Return rate was 78 per cent.)
- 2. Factual material from all proposals submitted in Fiscal 1968.
- 3. Questionnaires from 423 field readers who reviewed the proposals submitted in Fiscal 1968. (Return rate was 85 per cent.)
- 4. Field reader ratings of proposals and funding recommendations.
- 5. Interviews with the Directors of Educational Research at the nine regional offices.

Findings³

A. Applicants and Their Proposals

1. In the main, researchers applying to the RRP are young. Three out of ten are students, most of whom are studying for a Ph.D. Of the applicants who have earned a doctorate, nearly half (43 per cent) received it since 1964. Two-thirds of the employed applicants are faculty members of a college or university; the highest proportion of these are assistant professors.

2. Although a high number of applicants specialize in education (54 per cent), almost as many (45 per cent) are in disciplines--fairly strong evidence that the Program attracts applicants with a broad range of interests in research on the educational implications of their disciplines.

3. Thirty-eight per cent of the applicants were funded.

4. Applicants with either a master's degree or a doctorate in a discipline are equally likely to be funded. In addition, they are more likely to be funded than applicants with comparable degrees whose specialty is education, suggesting that the talented researcher is re-cruited to education rather than trained in education.

5. The Program funds the less experienced researcher. Both preand post-doctoral applicants who have never received a research grant

³The findings are based on the respondents. A comparison of respondents and non-respondents to the applicant questionnaire and to the field reader questionnaire is presented in Appendix A.

are more likely to be funded than the ones who have previously been awarded a grant or two. Moreover, among applicants from a discipline who have never received a grant, the pre-doctoral applicant has as much chance of being funded as the post-doctoral one. (Fifty-four per cent of these pre-doctoral applicants and 52 per cent of these post-doctoral ones are funded.)

6. Applicants whose major field is psychology are more frequently funded than those in any other field. Within psychology, it is the applicant specializing in learning or development who is most likely to obtain funds (55 per cent).

7. A review of the proposals shows that 30 per cent have psychology as their subject matter; 27 per cent, education; and the remaining 43 per cent include a number of subjects extending from art through zoology.

8. Taken together, the elementary and secondary levels are of greatest interest; less than 10 per cent focus on pre-school. Students are the most popular object of research, and outside of the few (14 per cent) who study teachers, almost no one plans to study participants in the educational process other than students.

9. Many applicants fail to specify adequately the research procedures of their proposed projects. For example, one-third who plan to study students do not indicate even an approximate sample size; onefourth of the applicants neglect to state how they expect to analyze the data; and one-third do not specify how they will process the data.

10. Applicants who intend their projects for doctoral dissertations are less likely than other applicants to request the maximum amount of federal support.

11. Professional salaries are the major budget expense.

12. When preparing proposals, most applicants have access to the USOE <u>Guidelines</u> and to a resource person knowledgeable about seeking research funds. However, less than one-half have other types of resources available at their institutions such as: copies of previously submitted proposals, sample application forms from funding agencies, or ERIC (Educational Resources Information Center) materials. The likelihood of being funded appears to be related more to the type and number of such resources available to the applicant than to which resources or how many he uses. Whether an applicant uses a particular resource depends on a number of factors, possibly his research training, his experience in writing proposals, or the stage of his research plan. The important factor is the availability of resources. The wider the range of choice, the greater the opportunity for the researcher to select those appropriate to his needs.

13. Applicants who have well-defined research plans compatible with the Program guidelines before they think of applying to the Program

are more likely to be funded than those who develop plans after they decide to apply. This suggests that the Program provides support for promising research ideas waiting to be tested. Without the Program's support these ideas might remain in the mind of the researcher--and, in a sense, become lost knowledge.

14. Typically, the applicant's source of information about the Program is a colleague or superior.

15. Applicants are critical of the length of time it took to process their proposals. The delay was due largely to understaffing and budget freezes which plagued Fiscal 1968, the year of this study, and which continue to hamper the operation of the Program. In fact, the Program has yet to have a normal year.

16. The negative consequences of budget freezes go beyond protracted processing of applicant proposals. The freezes prevent the Directors of Educational Research from traveling to institutions in their regions and may alter proposal processing. Minimal staffing in the regional offices impedes the general office work and communication between the regional offices and applicants.

17. Not funded applicants in some regions criticize the perfunctory way that they were informed of the granting decision. After spending time preparing a proposal, they were sent only a short form letter. Not funded applicants in other regions received an explanation of the decision and commented on how helpful it had been.

18. An alternative way to explain the granting decision to applicants is to transmit field reader comments directly to them. Five out of six applicants, whether funded or not, favor this method of feedback, as do four out of five field readers. Although the viewpoints of the Directors diverge on this topic, those who have not adopted the practice are willing to give it consideration.

19. The utilization and dissemination of research findings from funded projects is considerable. Six out of seven researchers discuss their projects in class; about half present their projects at departmental seminars; 67 per cent prepare (or will prepare) papers for professional meetings; and 72 per cent, manuscripts for publication.

20. Student researchers who intend their projects for dissertations are a particularly interesting group. They are more likely than nonstudents to recommend course or curriculum changes, to plan to publish the results of their projects, and to report that their interest in research on education has been strengthened as a result of their projects --evidence that the Program's investment in the less experienced researcher pays off.

21. Funded applicants who are also advisors for doctoral dissertations have student assistants on their projects. Four out of five of these (funded) applicants anticipate that these students will do further research.

B. Field Readers

22. Field readers and the Directors of the Program overwhelmingly agree that the panel system for reviewing proposals is superior to obtaining reviews by correspondence.

23. Field readers have suggestions for changing the Field Reader Evaluation Form. A majority would separate the criterion "adequacy of personnel and facilities into two criteria, "adequacy of personnel" and "adequacy of facilities." An equally large number think a rating scale should be provided for evaluating each of the four criteria: educational significance, soundness of research design adequacy of personnel and facilities, and economic efficiency.

24. In their assessment of the Program, field readers indicate that they value the exposure to new research ideas and the intellectual stimulation that result from reviewing proposals. They are disappointed, however, with the limited contact they have with the Program; the lack of feedback on proposals they evaluate; the amount of remuneration; and the time lapse between review of a proposal and payment.

C. Opinions of Applicants, Field Readers and Directors of Educational Research

25. Most applicants and field readers agree that the present \$10,000 ceiling on individual projects should be raised. They favor a ceiling closer to \$15,000. The Directors have different points of view. One advocates retaining the present ceiling; another thinks there should be none; while several others favor a sliding scale with provision for varying levels of support. In general, these Directors think it is appropriate to support established researchers at a higher level than doctoral candidates.

26. Only the Directors of the Program have a clear impression of the Program's policies and practices. Many applicants and field readers do not know whether the Program supports a broad or a narrow range of interests in education, whether it tends to be orthodox or venturesome in its support of research, or whether it is fairly strict or lenient in allowing departures from the research plans stated in proposals.

Conclusions and Recommendations

The major conclusion of this study is that the USOE Regional Research Program, committed as it is to developing research on education, is achieving one of its prime objectives. This does not mean, however, that the Program is without fault. Indeed, having studied the Program from

several perspectives, we offer ten recommendations for improving it. Moreover, it is important for these recommendations to be implemented in the near future or a good program will be undermined.

These recommendations are:

- 1. The administrative budget for the Directors of Educational Research should be stabilized.
- 2. The research budget for small-project grants should be increased.
- 3. The \$10,000 ceiling for individual projects should be raised to \$15,000 plus overhead.
- 4. The panel method of review should be continued.
- 5. Applicants should be notified of the status of their proposals within sixty days of submission.
- 6. Field reader comments should be sent to every applicant.
- 7. The Directors of Educational Research should offer direction to institutions in the selection of materials to expand their resources for developing proposals.
- 8. The Directors of Educational Research should increase their communication with both applicants and field readers.
- 9. The <u>Guidelines</u> for preparing the proposal document should be revised.
- 10. Periodic summaries of applicant and proposal data should be compiled.

INTRODUCTION

The Regional Research Program is close to the action ... geography is not irrelevant. Investigators must have some place to turn with their unsolicited, ... proposals.

Field Reader

The whole idea of regionalization is exciting. Washington is frightening to so many people. They [applicants] don't know which door to knock on.

USOE Staff Member

The [Regional Research] Program gave me a chance to get off the ground.

Funded Applicant

These three persons view the Regional Research Program of the U.S. Office of Education as filling a research need. They all know that seeking funds for research is no simple task. The prospective researcher must find out which agencies support research in his field, comprehend the eligibility requirements, obtain application forms and instructions, and then prepare a proposal, budget, and time schedule that can compete with an unknown number of others. The individual who at one time believed that he had a researchable problem can easily lose sight of that goal as the process of applying consumes his energy.

To facilitate contact between an applicant and a granting agency, the U.S. Office of Education established the Regional Research Program (RRP) in September, 1966. By September, 1967, an office had been opened in each of the nine existing DHEW (U.S. Department of Health, Education, and Welfare) regions¹ across the country to award contracts for smallproject research. To participate, the researcher submits a proposal for educational research to the regional office in his geographic area. There are two fundamental requirements: (1) USOE support must not exceed \$10,000; and (2) the project must be completed within eighteen months.

¹A tenth office was opened September 15, 1970.

The specific goals of the Program are:

- 1. To support significant, small-scale educational research respects.
- 2. To facilitate participation in educational research by a broad range of college and university personnel.
- 3. To encourage small colleges to undertake research programs so that students may benefit from having professors who are engaged in educational research activities.
- 4. To provide for direct and expeditious handling of proposals.²

As one Director of Educational Research phrased it, the RRP is committed to "building research resources." Regionalization itself is intended to simplify application procedures, and to make it easier for the promising researcher to compete for funds. As the regional office facilities become known in each locale, it is hoped that increasing numbers of researchers will seek the Program's support.

Generally, the Program's goals are not directed to resource building exclusively, but include dissemination and utilization of the results of research. In fact, dissemination is so important that USOE compiles abstracts, published monthly in RIE (Research in Education), to provide an overview of research on education throughout the nation. The individual researcher can augment this type of dissemination by utilizing his research to (1) improve classroom teaching; (2) to stimulate thinking about educational problems among his colleagues, either through personal contact on campus or through professional meetings or publications; and (3) to develop interest in research on education among students. These are secondary outcomes the Directors of Educational Research anticipate from funded projects.

Objectives and Procedures of This Study

This study of the RRP has three objectives, all related to the effects of the RRP. In particular, we have sought to examine the Program with respect to: (1) the distribution of applicants for small grants; (2) the consequences of being funded; and (3) the processing of proposals.

²Regional Project Research Guidelines for Preparing a Proposal, Bureau of Research, Regional Research Program of the Office of Education, U.S. Department of Health, Education, and Welfare (March, 1969), p. 1.

To accomplish the objectives, the following data have been collected:

- 1. Questionnaires from applicants, one version from funded applicants and another from those not funded
- 2. Factual material from the proposals submitted by applicants
- 3. Questionnaires from field readers who reviewed the proposals in the sample
- 4. Field reader ratings of proposals and funding recommendations
- 5. Interviews with the Directors of Educational Research at the nine regional offices.

In consultation with the Directors of the Program, it was decided to collect data from the July 1, 1967 through June 30, 1968 (Fiscal 1968) period in which all nine regional offices were operational. This is also the latest period that could be considered if applicants were to have an opportunity to complete projects prior to responding to the questionnaire. Although concentrating on Fiscal 1968 sacrifices the opportunity to describe recent applicants, it seems preferable to examine the effects of the research than to survey applicants whose research is still in the planning or data-collection stage. The sample includes every applicant submitting a proposal in Fiscal 1968.

The information obtained from these applicants about their educational backgrounds, positions, and institutional affiliations provides valuable baseline data. These data make it possible to compare applicants in later years with applicants in this study. Such cumulative data will enable policy makers to evaluate the Program and plan its development, taking into account statistical evidence about the researchers attracted by the Program.

Plan of the Report

The report is organized according to the life-history of a research project--from submission of the research plan through dissemination of the findings. Chapter One, by describing the characteristics of applicants, answers the question: Who applies to the Program? Chapter Two focuses on the funded applicant and shows to what extent the Program succeeds in supporting the less experienced researcher who has developed a small-scale project having educational significance.

Chapter Three introduces the proposal section. It reviews the proposal itself, taking into account the subject matter, research design, modes of analysis, and budget. Chapter Four reports how the applicant learns of the Program, the resources he has available and those he uses while writing his proposal. The cost of preparing the document is also examined. Chapter Five deals with processing the proposal and considers the procedures for submission from three points of view: that of applicants, field readers, and the Directors of Educational Research.

The outcomes of RRP-supported research are the topic of Chapter Six. Here the impact of the researcher's work on classroom teaching, colleague exchanges, and students is presented. Chapter Seven completes the analysis by providing an appraisal of the Program based on the opinions of applicants, field readers, and the Directors of Educational Research. It considers the process of review, the ceiling on grants, and the image of the Program.

Chapter Eight presents conclusions and recommendations of this study of small-project educational research under the RRP.

The report contains four supplementary sections: (1) a summary of the report; (2) a comparison of respondents and non-respondents to the applicant questionnaire and to the field reader questionnaire; (3) tables not included in the body of the report; and (4) the questionnaires and the codebook containing the frequency distribution of responses to each item of information.

CHAPTER ONE

THE APPLICANT AND HIS INSTITUTION

Every proposal submitted to the USOE Regional Research Program (RRP) is unsolicited. For this reason alone, it is of interest to know who chooses to apply. Moreover, the eligibility requirements are few. First, a prospective applicant must have the sponsorship of an institution or organization within the United States or its outlying territories. Second, he cannot be conducting another project funded by the Program; and third, he must have fulfilled the terms of any prior grant or contract he may have received from the U.S. Office of Education. More positively, the Program seeks to attract the individual interested in undertaking a small-scale project of some educational significance for which he has developed a suitable research design and procedures.

This chapter describes the background of those who apply and, in effect, answers the question: Who does the Program reach? We have considerable data from the 665 applicants with which to build a statistical profile of those who apply. In particular, we will consider the institutional sponsorship of the applicant's proposal, his employment status, field of interest, professional activities, academic training, and family background.

Cooperating Institution

Every applicant¹ to the RRP as noted above, must have the sponsorship of an institution or organization such as a college, university, school system, or private firm.² This sponsor is listed on the title page of the proposal as the cooperating institution. Table 1.1 shows that the great majority of proposals submitted to the RRP--84 per cent--name a college or university as the cooperating institution.

The fact that most applicants list a college or university as the cooperating institution suggests that institutions of higher education have the resources and facilities necessary for small-project research. They train professionals for teaching and research and have at hand classroom, laboratory, and library facilities essential for pursuing research.

One might expect that proposals submitted to the RRP would originate in Schools of Education. In actuality over one-half come from

1The applicant is defined as the person who intends to conduct the research and devote a considerable proportion of his time to it. Typically, the applicant is the project director named on the proposal.

²Since this study was conducted, the regulations have been changed so that projects of individuals not associated with an institution can be funded.

TABLE 1.1

A COLLEGE OR UNIVERSITY IS THE COOFERATING INSTITUTION FOR FIVE OUT OF SIX PROPOSALS

other departments (Table 1.2). More often than not, this is a liberal arts department such as psychology, but proposals can and do come from such diverse subdivisions as a Department of Physical Education, a College of Medicine, or a School of Engineering.

Both students and non-students are eligible for support from the RRP. In fact, three out of every ten applicants are students working either part-time or full-time toward an advanced degree (Table 1.3).

Employment Status

Of student applicants, the highest proportion are studying for a Ph.D. rather than an Ed.D. degree. To be specific, Table 1.4 shows that 60 per cent of the student applicants seek a Ph.D. degree; 35 per cent, an Ed.D.; and 4 per cent, a master's degree in education or a discipline.

Later in this chapter when we discuss applicants who have already earned doctorates, we will contrast those holding a doctorate in one of the disciplines with those holding a doctorate in education. Here we only direct attention to the fact that more student applicants are enrolled in Ph.D. programs.³

³We know for some student applicants (113 of the 201) the kind of doctorate they carned in 1968 or expected to earn by 1969. Fifty

*Applicants not working toward a degree.

Moreover, not every doctoral or master's candidate who applies to the RRP intends his research for meeting academic requirements. Of the 201 student applicants, 159 said they intended their proposed research for a doctoral dissertation. At the time they submitted their proposals to the RRP, 156 were working toward a doctorate and only three were completing requirements for a master's degree, but these students were looking ahead to the time they would be using their RRP-supported research for a doctoral dissertation. It should be added that another 27 applicants are dissertation advisors who anticipate that data from their proposed research will be used by one of their students for a dissertation.⁴

A major problem confronting the nine Directors of Educational Research is determining an equitable support level for doctoral candidates, if they should be supported at all. Each has his own point of view and, at present, they diverge considerably. One, for example, wants doctoral students to use the Program, but he advocates consultation with USOE during the planning stage of the dissertation so that the student incorporates USOE standards in the prospectus, as well as those of the department. From his experience too many students want to "tap the Program for funds" after the department has approved the project.

per cent of these indicated their degree would be a Ph.D. in education; 37 per cent specified an Ed.D.; and 13 per cent, a Ph.D. in a discipline. Sce Appendix B, Table 1.1.

¹Appendix B, Table 1.2

Two Directors of Educational Research take the opposite view and recommend discontinuing support of dissertations. They feel that fellowships are available elsewhere; doctoral students come from universities which have a long-standing tradition of research. They prefer utilizing the limited funds of the Program for building research resources at institutions where they are now meager. Others suggest that because the doctoral candidate's paramount interest is obtaining his degree, he should be funded at a lower rate than a faculty member whose research is expected to be disseminated in the classroom. These men agree that the Program should give students only "seed" money for facilities and a modest stipend rather than funding them at parity with more experienced researchers.

The analysis of the effects of the research conducted by doctoral candidates, a major interest of this study,^b hopefully will aid the Program's directors in resolving the dilemma of the place of the doctoral candidate in the Program. Of equal interest in assessing the impact of the RRP is the employment status of applicants, beyond the point of being students. Recall that Table 1.3 showed that nine out of ten applicants are employed at least part-time. The next table (Table 1.5) reports the position of employed applicants at the time proposals were submitted.

TABLE 1.5

TWO-THIRDS OF THE EMPLOYED APPLICANTS ARE FACULTY MEMBERS AT A COLLEGE OR UNIVERSITY

| Cases excluded* | _67 |
| | 665 |

*Applicants not employed.

See Chapter Six.

Without a doubt, faculty members are the individuals most likely to apply to the RRP. Of the applicants, only a few are research directors, administrators, school teachers, or other specialists in education.

These same data enable us to examine the extent to which the Program is meeting one of the stated aims, namely:

> To encourage ... research ... so that students may benefit from having professors who are engaged in educational research activities.⁶

The number of applicants among the 392 college or university faculties can be seen in Table 1.6.

TABLE 1.6

ALL FACULTY RANKS ARE REPRESENTED AMONG APPLICANTS

| Faculty rank | Proportion of applicants | |
|---------------------------------|--------------------------|--|
| Assistant professor | •36 | |

| Full professor | •2ð | |
| Other (e.g., adjunct, lecturer) | •07 | |
| TOTAL | 1.00 (392) | |
| NA = | 2 | |
| Cases excluded* | 271 | |
| | 665 | |

*Applicants whose principal position is not that of a faculty member.

Clearly, applicants come from every professorial rank. And, in light of the Program's interest in attracting young researchers to educational research, it is encouraging to note that the highest proportion of these applicants are assistant professors. As one Director of Educational Research put it, "The USOE small grants program seeks to give a chance to the 'little guy' who might otherwise lose out to the pros."

⁶<u>Guidelines</u>, loc. cit.

Major Field

Not unexpectedly, the majority of applicants state that their major field is education (Table 1.7).

,

TABLE 1.7

A MAJORITY OF THE APPLICANTS SPECIALIZE IN THE FIELD OF EDUCATION

| Major field | | Proportion of applicants |
|--|--|--------------------------|
| Education | | ç |
| Teacher training Administration Curriculum Research and statistics Special education (e.g., adult, business) All other subareas in education | .39 .22 .15 .09 .08 .07 1.00 (| •54 |
| Psychology | | .21 |
| Social science (e.g., socio economics) | logy, | •11 |
| Mathematics, physical or biological sciences | • | •05 |
| English and language arts | | •0 5 |
| Other (e.g., music, medicin | e) | •03 |
| | TOTAL | .99 (665) |

Within education, those specializing in teacher training or in administration have the highest representation among the applicants. Onefifth of the applicants are in psychology, and most of these researchers pursue one of three sub-specialties, all of which have an educational focus: developmental, guidance and counseling, or learning. In sum, 75 per cent of the applicants are in one of these two major fields.

Highest Degree

Although the largest proportion of applicants specializes in education, this does not mean that a doctorate in education is the prevalent degree. In fact, Table 1.8 shows that among applicants more have a Ph.D. in a discipline than either an Ed.D. or a Ph.D. in education. This table also shows that 40 per cent of the applicants have no more than a master's degree, and 4 per cent have only a bachelor's degree. Thus, the RRP is attracting a group of applicants with relatively heterogeneous academic training. Even though, as Table 1.7 showed, the majority (54 per cent) of proposals are submitted by applicants specializing in the field of education, the near equal number (45 per cent) from persons in the disciplines is fairly strong evidence that the problems of research are being attacked by a broad range of perspectives.

TABLE 1.8

MORE APPLICANTS HAVE EARNED A PH.D. IN A DISCIPLINE THAN EITHER AN ED.D. OR A PH.D. IN EDUCATION

| Degree specialty | Highest degree | Proportion of applicants |
|------------------|---|--------------------------|
| Discipline | Ph.D. | • 24 |
| Education | Ed.D. | •17 |
| Education | Ph.D. | •13 |
| Discipline | M.A. or M.S. | •18 |
| Education | M.Ed., M.A. or M.S. | •22 |
| Discipline | B.A. or B.S. | .02 |
| Education | B.A. or B.S. | •02 |
| | Other degree or pro- fessional diploma | •02 |
| | TOTAL | 1.00 (660) |
| | NA = | 5 |
| | | 665 |

It should also be noted, as Table 1.9 shows, that two out of every three degrees have been awarded since 1960--a finding which only confirms the fact that the Program is reaching young researchers at the beginning of their careers. Of even more interest, is the finding in Table 1.9 that 43 per cent of these applicants have earned their doctorate within the last four years.

TABLE 1.9

| Year of degree | | Proportion of doctorates | |
|-------------------|--------------------|-----------------------------|--|
| Before 1960 | •33 | | |
| 1960 - 1963 | •24 | | |

| | TOTAL | 1.00 (347) | |
| | Cases excluded $*$ | 3 09 | |
| | NA = | 9 | |
| | | 665 | |

TWO OUT OF THREE DOCTORATES HAVE BEEN EARNED SINCE 1960

*Other degree or professional diploma.

We complete this brief description of the applicants studied by reporting a few statistics about their personal and family backgrounds. All but nineteen applicants are white; more than four out of five are married men with either two or three dependents. Typically, they are 38 years old with a median income of \$14,000 in 1968 which they expect to reach \$16,000 in 1969. Two out of three have parents who did not attend college nor did one-third of these even complete grade school.

Summary

In sum, the Program is attracting men who are on the faculty of an institution of higher education. They are more likely to be junior than senior faculty members, and more likely to have earned a Ph.D.

⁷See Appendix B, Tables 1.3-1.10 for the statistics summarized here.

in a discipline than either an Ed.D. or a Ph.D. in education. Finally, the Program has succeeded in reaching young researchers whose primary interest is education, be it degree specialty or current major field. These individuals comprise the majority of the applicants.

ï

CHAPTER TWO

THE SUCCESSFUL APPLICANT

The USOE Regional Research Program (RRP) is based on the principle that individuals with good ideas who are interested in undertaking a small-scale project in educational research will find the Program receptive. The applicant need not be affiliated with a prestigious institution or have a long list of publications to his credit. He must only have researchable ideas with educational significance and be capable of carrying his project to completion.

To anticipate the results of this chapter, to a surprising degree the RRP is a place where the unknown educational researcher can market his idea. Whatever faults the Program may have, the Directors of Educational Research in the nine USOE regions have succeeded in implementing this Program goal. In fact, this goal may be the strongest feature of the Program.

To our knowledge, until this study of the RRP was undertaken, no systematic information about the funding patterns of granting agencies existed.¹ To be sure, foundations and government agencies package attractive annual reports describing their many grant programs. They do not, however, report how many applicants applied for support or what characteristics differentiate the successful from the unsuccessful applicants.

For this reason alone, this study of the RRP should be of interest to the research community. It provides considerable information about the process of sorting applicants into those who are funded and those who are not.

Cooperating Institution

This chapter focuses on the individual and institutional characteristics that identify the funded applicant. Of the 665 applicants, we look first at the institutional characteristics of the 251 who were

¹Two descriptive articles have been published on why research proposals are disapproved: Ernest M. Allen, "Why Are Research Grant Applicants Disapproved?" Vol. 132, <u>Science</u> (1960), 1532-1534, and Gerald R. Smith, "A Critique of Proposals Submitted to the Cooperative Research Program," in J. Culbertson and S. Hencley (eds.), <u>Educational</u> <u>Research: New Perspectives</u> (Danville, Illinois: Interstate Printers and Publishers, 1963), Ch. 17, 277-287. funded. (In proportions this comes to 0.38 of the applicants.) Moreover, the funding pattern reflects whether the sponsor is an institution of higher education or one of a variety of institutions or organizations not in higher education such as an elementary or secondary school system, a state department of education, or a private firm. As Table 2.1 shows, the applicant whose cooperating institution is a college or university clearly is most likely to be funded.

TABLE 2.1

| Cooperating Institution | Proportion of applicants funded | Number of applicants |
|--|---------------------------------------|----------------------|
| College or university | •40 | (560) |
| School system | •27 | (66) |
| Private agency (e.g., a rehabilita- tion agency) | •2 9 | (24) |
| State department of education | [4] | (9) |
| Other (e.g., private firm, educa- tional association) | [0] | (6) |
| TOTAL | •38 | (665) |

COLLEGES OR UNIVERSITIES SPONSOR THE HIGHEST PROPORTION OF FUNDED APPLICANTS

Note: Bracketed numbers refer to the actual number of funded applicants where there are too few cases for determining proportions.

The finding that proposals submitted by school systems were least likely to be funded (only 27 per cent) was suggested to us before the results of the applicant survey were tabulated. During our interviews with the Directors of Educational Research, more than one pointed out that the personnel of school systems lack expertise in proposal writing and need individualized assistance to prepare a satisfactory proposal. As one phrased the problem,

I'd like to have more time to go out there [to school systems], sit down with the research director and his staff and help him. I know they are capable of writing a proposal that could be funded.

To this Director of Educational Research, the school system should be a more important target of the Program because so many graduates of Schools of Education go into the public school system and as staff

members, plan curriculum development in a setting where the research skills for evaluating the innovation are often lacking.

The Directors in two other regions remarked that they assign a lower priority to working with school system personnel than with college or university administrators and faculty who are just beginning to develop a research orientation. They reason that more federal money is channeled into elementary and secondary education for evaluation research than into developing institutions of higher education.

Another Director of Educational Research takes a different position. He thinks that for the present it is unrealistic to expect school districts to contribute to research in a major way, at least in his region.

Only the very largest school systems can afford any kind of research staff. School districts tell me point blank that they just don't have any resources for doing research. State legislation straps them in funds.

In this Director's view, school districts should be utilizers of research and identifiers of problems that need solution, but not researchers, per se.

Finally, two others indicated that they do not have specific target populations in their regions. One said:

I go out after the idea, irrespective of where it comes from.

The other remarked:

I'm out to identify the potentially good researcher anywhere. I can't be expected to give him training in depth, but I can be expected to open research opportunities to him.

Thus, there is a diversity of opinion among the Directors of Educational Research about encouraging the personnel of school systems to submit proposals to the RRP. At the same time, the structure of many school systems, as well as their internal requirements, probably limit the extent of their participation in a program such as the RRP. The topic of school systems and the RRP, of course, merits a study of its own. Here we only call attention to the fact that for whatever reasons--unofficial policy, preferences of the Directors, or obstacles within school systems--the fact is clear: school systems do not fare as well as colleges and universities in securing funds from the RRP.

Sponsoring Department

From Chapter One we learned that proposals sponsored by a college or university originate most frequently in Schools or Departments of Education. We also know, of course, that these proposals are submitted to conduct research on education. With this information, one might guess that proposals listing a School or Department of Education as the university subdivision would be most likely to be funded. Such is not the case, however, as Table 2.2 shows.

TABLE 2.2

APPLICANTS SPONSORED BY UNIVERSITY RESEARCH BUREAUS ARE MOST LIKELY TO BE FUNDED

| Sponsoring Department | Proportion of applicants funded | Number of applicants |
|--|---------------------------------------|----------------------|
| Research bureau | •53 | (38) |
| Liberal arts department | •40 | (176) |
| Professional school or administrative office | •39 | (82) |
| School or department of education | •38 | (264) |
| TOTAL | .40 | (560) |
| Cases excluded $*$ | | 10 5 |
| | | (665) |

Not at an institution of higher education.

As may be seen in Table 2.2, research bureaus submit the fewest proposals to the RRP, but it is the applicants sponsored by research bureaus who have the best chance of getting funded.

Perhaps the most important finding in Table 2.2, however, is that the greatest number of applicants for RRP funds are associated with a School or Department of Education, but these applicants are, if anything, slightly less likely to be funded than the smaller number from

1)]

a liberal arts department or from a professional school. Except for applicants from a research bureau, the difference in funding rate among university subdivisions is so small that it warrants explanation.

Highest Earned Degree

Knowing that the Ph.D. is usually perceived as a research degree and the Ed.D. as oriented toward professional practice, the next step in finding out which applicants are more successful is to explore their academic backgrounds. Because so many applicants had not earned a doctorate when they applied for a grant from the RRP, Table 2.3 reports the proportion of applicants funded by whether their highest degree in 1967² was a bachelor's, master's or doctorate.

The figures in Table 2.3 are quite revealing. They show that applicants trained in a discipline, whether holding a doctorate or only a master's degree, are most likely to be funded. To be specific, a total of 43 per cent who have . doctor's or a master's degree in a field other than education submit successful proposals, but only 34 per cent of those with a Ph.D. in education and 30 per cent with a master's in education are funded.

To a leading spokesman for educational research,

Solid training in one or more of the behavioral, social and humanistic disciplines is indispensable for thoughtful educational research.³

Judging by the funding pattern of the RRP, today's talented researcher is recruited to the field of educational research rather than being trained as a researcher while a graduate student specializing in education.

Of particular significance is the ability of the RRP to attract young researchers to educational research, that is, those who have no more than a master's degree in another field. One can assume that these individuals are in an institutional setting that provides contact between the field of education and their own discipline or they would not have thought of applying to the RRP for a small-projects grant. Further analysis of our data will show how many of these 116 applicants intend their proposed research for a doctoral dissertation and the extent to which they are committed to the field of educational research.⁴

²1967 is used because this study focuses on applicants who submitted proposals to the RRP between July, 1967 and June, 1968.

³Lee J. Cronbach, "The Role of the University in Improving Education," <u>Phi Delta Kappan</u>, Vol. 47 (June, 1966), 544.

APPLICANTS WITH THE DOCTORATE OR A MASTER'S DEGREE IN A DISCIPLINE ARE MOST LIKELY TO BE FUNDED

*Other degree or professional diploma.

One curious finding in Table 2.3 deserves comment: namely, applicants with a Ph.D. in education are somewhat less likely to be funded than those with an Ed.D. (34 per cent of the Ph.D.'s in education and 40 per cent of the Ed.D.'s). We expected just the opposite because Ed.D. graduate programs provide training for teaching and professional service while the Ph.D. graduate programs in education are oriented toward research training. Table 2.4 in the next section of this chapter will help explain this finding by showing that only certain Ph.D.'s in education are less likely than Ed.D.'s to be funded.

31

⁵See Buswell and McConnell study of 1954 and 1964 Ed.D.'s and Ph.D.'s in education for an analysis of the differential training and career activities of these two groups of educational specialists. Guy T. Buswell and T.R. McConnell, <u>Training for Educational Research</u>, Cooperative Research Project No. 51074 (Berkeley, California: Center for the Study of Higher Education, University of California, 1966).

Previous Research Grants

Research costs money and even the most modest inquiry requires a researcher's time and available supplies. Moreover, most educational research is not an operation that can be undertaken by one individual equipped with no more than a typewriter, a ream of paper, and the kitchen table. Under these circumstances, it is only natural that researchers seek funds to carry out their work.

We purposely asked applicants seeking funds from the RRP whether they had obtained research grants in the past. The question was worded:

> [Prior to applying for a grant from the RRP] have you ever received a research grant from any of the following sources?

Sources ranged from a government agency to the applicant's own institution. Of the researchers funded by the RRP, 43 per cent had never received a previous research grant⁶--evidence that the RRP does give the young researcher a chance to get started.

Does the RRP, however, fund the less experienced researcher regardless of his level of training? In other words, is the Program equally likely to support pre- and post-doctoral applicants? Then too, how does the area of specialization influence the applicant's chances of obtaining support? We know that applicants trained in a discipline are more likely to receive RRP support than those trained in education, but is this still the case when we relate degree specialty and research grant experience to funding?

Table 2.4 answers these questions and adds to our knowledge of who is funded. First, there are differences among those who have previously received a grant and those who have not. In four out of five comparisons, those who have not received a previous grant are more likely to be funded by the RRP than those who have. This finding is shown in the column headed "Difference."

⁶Appendix B, Table 2.1

*Other degree or professional diploma.

Second, Table 2.4 shows that more than one half the applicants who have a degree in a discipline obtain their first research grant from the RRP. To be specific, 52 per cent of the applicants with a Ph.D. in a discipline (row 1), and 54 per cent of those with a master's degree in a discipline submit research proposals that are funded. This is an important finding. The Program supports not only unknown researchers, but it also gives as much chance to the pre- as to the postdoctoral applicant from a discipline.

Third, Table 2.4 provides more information about the Ph.D. in education that helps differentiate him from the Ed.D. It is the Ph.D. in education with no other research grant to his credit who is more likely to be a successful RRP applicant than the Ed.D. in the same circumstances. Note, however, that recipients of the research degree in education who have been awarded other grants do not fare so well as RRP applicants--only 30 per cent are funded.

Finally, the funding pattern for the Ed.D., as shown in Table 2.4, is perplexing. Of all the applicants, they are the only group more likely to be funded if they have received a previous grant. The explanation, as we will see shortly, lies in the present field of interest of these applicants.

Earlier, Table 2.2 showed that about the same proportion of applicants from Schools of Education and from liberal arts departments are funded by the RRP. Which applicants in these subdivisions is yet to be explored. Knowing that type of degree distinguishes the funded applicant from the not funded one, we want to consider this characteristic jointly with departmental affiliation to further delineate the recipient of RRP funds. Table 2.5 shows this relationship.

First, we want to mention that the numbers appearing in some of the cells under the headings "Research bureau," "Other subdivision," and "Not in higher education" (the last three columns of Table 2.5) are too small to show a clear pattern. We simply present these data to assure the reader that these applicants have not been overlooked.

The key finding in Table 2.5 is that applicants trained in a discipline who subsequently cross over to Schools or departments of Education are particularly likely to have submitted successful proposals. This is the case for applicants who have either a Ph.D. or a master's degree and especially so for those with only a master's degree. By reading the second row of Table 2.5, we see that 48 per cent of the applicants affiliated with Schools or departments of Education in addition to holding a master's degree in a discipline are funded, whereas only 38 per cent of those with the same type of degree but in liberal arts departments are successful.

Conversely, the few applicants with a Ph.D. in education who move into liberal arts departments are more likely to be funded than their more numerous peers with an identical degree who have remained in Schools or departments of Education.

From the figures in Table 2.5 one cannot draw the conclusion that researchers trained in one area who then become affiliated with another are necessarily better researchers. But the data do suggest that these men are in departments free of traditional barriers or they wouldn't have been recruited in the first place. For instance, the applicant with a Ph.D. in a discipline attached to a School of Education is a prime example of how some Schools of Education develop communication with relevant disciplines. Further research would be needed to learn whether, in general, investigators trained in one field who are recruited to another offer promise as researchers. However, we can say that among the applicants, those trained in a discipline who are attracted to Schools of Education merit study as a manpower resource for developing educational research.

38

Ōį

Most Ed.D.'s, as one would expect, are affiliated with Schools or departments of Education. Moreover, as applicants for RRP funds they are more successful than their colleagues with Ph.D.'s in education who have the same type of affiliation. Forty-three per cent of the Ed.D.'s in contrast to 33 per cent of the Ph.D.'s who specialize in education are funded. Why Ed.D.'s are more likely to be successful leads directly into the next, and last, section of this chapter which focuses on the applicant's field of interest at the time he submitted his proposal.

Major Field

Every applicant who completed our questionnaire was asked to designate his major field or specialty at the time he submitted his proposal to the RRF Not unexpectedly (as shown in Table 1.7) a majority of applicants designated education. The second most frequently listed specialty was psychology. Together these two fields included 75 per cent of the applicants. The remaining 25 per cent were in a variety of fields ranging from art to zoology.

The fact that applicants more often than not are in some branch of education does not necessarily mean that they are the ones who are funded. On the contrary, psychologists are most likely to submit winning proposals, as may be seen in Table 2.6.

TABLE 2.6

PSYCHOLOGISTS ARE MORE LIKELY TO BE FUNDED THAN SPECIALISTS IN ANY OTHER FIELD

| Major field | Proportion of applicants funded | Number of applicants |
|---|---------------------------------------|-------------------------|
| Psychology | •45 | (143) |
| Education | •35 | (361) |
| Social science (e.g., sociology, economics) | •35 | (74) |
| All other fields | •38 | (87) |
| TOTAL | •38 | (665) |

Applicants in education specified the sub-area of interest within their major field--for example, administration, teacher training, or

research and statistics. Applicants in psychology did likewise, naming developmental psychology, guidance and counseling, or another subspecialty.

Now we want to consider the funding patterns of the RRP taking into account the subspecialty of the many applicants in psychology or education. Doing so will further differentiate the applicants and, as we will see shortly, explain a seemingly paradoxical finding shown in Tables 2.3 and 2.5: Ed.D.'s, the recipients of a doctorate oriented toward professional practice, are more likely to be funded than Ph.D.'s in education, the recipients of the research oriented degree.

Within psychology, it is the applicant who specializes in learning or developmental who is most likely to obtain RRP funds (Table 2.7 below). Then, within the field of education, the applicant who specializes in teacher training or administration is more likely to be funded. Parenthetically, we might add that more applicants come from these two subspecialties than any other, as can be seen from the figures entered in the last column of Table 2.7.

An applicant's degree and his major field of interest are, of course, closely related. One trained in education tends to work in that field, and one trained in a discipline tends to stay within his discipline. But the story is not so simple. We know from Table 2.5 that applicants with a Ph.D. in a discipline who switch to a School of Education are especially likely to be funded for a small-projects grant. We then began to consider whether these Ph.D.'s name psychology or a branch of education as their major field of interest.

Moreover, throughout this discussion of funding patterns we have found the Ph.D. in education an enigma. In general, he is less likely to secure RRP funds than the Ed.D. The exception is the very few (11 cases) who switch to liberal arts. These applicants have a high funding rate; all the others lag behind the Ed.D.'s, as shown in Table 2.5.

In an effort to explain why almost all Ph.D.'s in education do poorly relative to Ed.D.'s in education as competitors for RRP funds, we decided to explore the field of interest of applicants with a doctorate. We have learned, for example, that applicants in some areas of education, notably teacher training and administration, are more likely to be funded than those in other educational sub-areas. We began to think we should find out who these applicants are--Ed.D.'s or Ph.D.'s in education, or perhaps even Ph.D.'s trained in a discipline.

As it turns out, this exploration was rewarding. The results of jointly relating type of doctorate and sub-area of interest to the probability of being funded are presented in Table 2.8. Admittedly,

*Applicants with another degree or a professional diploma who are now in the field of education or psychology (N = 243) and applicants in other fields (N = 161).

Note: Bracketed numbers refer to the actual number of funded applicants in a field when there are too few cases for determining proportions.

there are relatively few cases, but the findings are suggestive.

Comparing the total number of discipline trained Ph.D.'s in the field of education with the ones in psychology, we see that they are about equally likely to be successful. Fifty per cent of those Ph.D.'s now working in education are funded as are 46 per cent of those in psychology. Making the same comparison for Ed.D.'s, we see that whether they are interested in education or psychology, they are also about equally likely to be funded-40 per cent in education, and 45 per cent in psychology are successful. However, the percentages for the Ph.D.'s trained in education diverge considerably. Most are interested in education, but only 26 per cent of them are funded. By contrast, the few now in psychology have a good chance of being funded--exactly 50 per cent.

Studying the lower part of Table 2.8, namely, the section headed "Education," we can trace in more detail the funding trend of applicants with the three types of doctorates in the sub-areas within education. The principal finding here is that in the sub-area teacher training, the Ph.D. in education is no match for the Ed.D. or the Ph.D. trained in a discipline. The Ph.D. from a discipline also knowledgeable in the area of teacher training gets funded with relative ease--59 per cent, to be precise. The Ed.D. ranks second--39 per cent are funded. However, the Ph.D. in education who identifies himself as specializing in teacher training appears to be a loser-his funding rate is only 24 per cent.

We did not attempt to gather data on graduate experience; hence, we cannot say if this contributes to the percentage differences we see in Table 2.8 among funded applicants who specialize in teacher training. We will keep this finding in mind as we proceed with the analysis, but unfortunately, the questionnaire data do not provide a ready answer.

For the few applicants in the field of educational administration, the figures point in the same direction as those discussed above. Forty-five per cent of the Ed.D.'s in educational administration are funded; but none of the Ph.D.'s--whether from a discipline or education. The field of educational administration has been preempted by the Fd.D.'s applying to the RRP.

In brief, our data suggest that the applicant with a Ph.D. in a discipline has the universal degree. He can switch to the field of education or remain in a discipline (typically, psychology) and submit a proposal for educational research that has the best chance of being funded by the RRP. The Ed.D. is not as likely to be funded as the Ph.D. from a discipline when both designate education as the major field. The few Ed.D.'s who cross ever into psychology fare as well at their colleagues from the disciplines as recipients of RRP funds. The Ph.D. in education, however, has an uneven rate of success.

Only those in psychology are likely to be funded.

Summary

Overall, this chapter has shown that the RRP invests considerably in the less experienced researcher. A stated aim of the Program is to support promising researchers who seek to undertake a small-scale project in educational research, and the data show that to a considerable extent the Program succeeds in this aim.

In particular, our data indicate that the funded applicant can have a master's degree or a doctorate and be in almost any field, although his chances of being funded are maximal if he is in psychology. Moreover, the funded applicant is usually a novice in obtaining research grants. For c.ample, he is more likely never to have received a research grant than to have a grant or two to his credit.

6.1

CHAPTER THREE

THE PROPOSAL

The one means the applicant has of communicating with the reviewers who will evaluate his research plan is through the proposal. The <u>Guidelines</u> caution "... if it [the proposal] does not convey the message, staff and field readers will not assume meaning or intent."¹ As the contents of the proposals are examined, it will become apparent that all too often this caution has not been heeded. For the purpose of this discussion, the contents of the proposals are divided into six sections:

- 1. Subject matter
- 2. Educational level
- 3. Group to be studied
- 4. Research design
- 5. Modes of analysis
- 6. Budget

Subject Matter

ERIC

An aim of the USOF Regional Research Program (RRP) is to stimulate research on education, and the Program has elicited proposals for studies which go far beyond the usual subjects of reading, writing, and arithmetic. Virtually every field is represented,² even those with seemingly remote connections to education. The following randomly selected titles suggest the range and richness of subject matter:

"Biomechanics of Normal and Treadmill Running"

"Photographic Study of Nonverbal Responses in Youth"

"Discrimination of Recency in Children";

"Assaultive Language Usage Reveals Level of Self-Worth Among Ghetto Negro Teen-Agers in Group Situations--An Exploratory Study"

"Nonverbal Communication--Attitude Change and Hierarchical Roles."

¹Guidelines, op. cit., p. 3.

²See Appendix B, Table 3.1 for detailed classification of subject matter.

As may be seen in Table 3.1, the distribution of subject matter falls into three main groups: psychology (30 per cent), education (27 per cent) and a conglomerate of less frequently chosen subjects (144 per cent). The two major classifications--psychology and education--have been used here as a means of differentiating education as a psychological process of learning from education as an institution.

TABLE 3.1

THE SUBJECT MATTER OF PROPOSALS

| Subject of proposed research Proporti propos | |
|---|------------|
| Psychology (education as a process) | •30 |
| Education (education as an institution) | •27 |
| Mathematics, physical, or biological sciences | .15 |
| English and language arts | .13 |
| Social sciences other than psychology | .10 |
| Music or art .06 | |
| TOTAL | 1.01 (651) |
| Subject not elsewhere classified (e.g., aviation) | 11 |
| Not classifiable by subject (e.g., student activism) 3 | |
| | 665 |

*Tables in this chapter compare the funded and the not funded proposal only when the data show a difference between these two groups.

Within each field, the subspecialty provides a more precise definition of the subject matter to be examined in the study. For example, within psychology it may be educational psychology, testing and measurement, counseling, or guidance and placement. Within education, the specific area may be administration, finance, or history, or philosophy of education.

Apart from the fact that the few proposals from the fields of music and art have a slightly higher funding rate than proposals from other fields, there is no apparent difference in the Lunding pattern by subject matter (Table 3.2).

| Subject of proposed research | Proportion of proposals funded | Number of proposals |
|---|--------------------------------------|---------------------|
| Music and art | .46 | (37) |
| Mathematics, physical or biological sciences | •40 | (97) |
| Social sciences other than psychology | . 40 | (66) |
| Psychology | .38 | (193) |
| Education | •36 | (173) |
| English and language arts | •35 | (85) |
| TOTAL | •38 | (651) |
| Subject not elsewhere classified (e.g., aviation) | | 11 |
| Not classifiable by subject (e.g., student activism) | | 3 |
| | | 665 |

A VARIETY OF SUBJECT MATTERS ARE FUNDED

"Tables in this chapter compare the funded and the not funded proposal only when the data show a difference between these two groups.

Proposals in psychology and in education, which together total almost sixty per cent of all submissions, are equally likely to be funded. So too are the proposals in mathematics, English or one of the other social sciences. In sum, for proporals with these different subject matters, the difference between the minimum and maximum funding rate is only 5 per cent.

47

Educational Level

As Table 3.3 shows, the educational levels to be studied extend from pre-school to higher education. The studies concentrate on the elementary and secondary schools, which taken together are mentioned as the level of interest in 56 per cent of the proposals. The postsecondary levels are the anticipated focus of attention in over one-half of the studies (51 per cent); but for this group of proposals, the four year college is the level most frequently included in the research plan (37 per cent).

LEVEL OF EDUCATION TO BE STUDIED

*Total exceeds 1.00 because more than one educational level will be studied.

Group to Be Studied

Considering the fact that there is a \$10,000 ceiling on RRP projects, it is not unexpected that students lead the list of groups to be studied (Table 3.4).

SEVEN OUT OF TEN PROPOSALS SPECIFY THAT STUDENTS WILL BE STUDIED

| Group to be studied | Proportion of proposals |
|---|-------------------------|
| Students | •69 |
| Teachers | •14 |
| Schools | •06 |
| Principals | •03 |
| Community | •02 |
| School district | •01 |
| Parents | •01 |
| Guidance counselors | •01 |
| Other (e.g., employers, citizens, taxpayers) | .1.5 |
| TOTAL | 1.12* (543) |
| Not applicable | 122 |
| | 665 |

*Total exceeds 1.00 because more than one group will be studied.

It is less expensive to administer, for example, standard tests to captive classes of students than to research other groups.

As may be seen in Table 3.4, 69 per cent of RRP proposals focus on students. Researchers seldom simultaneously include teachers, as evidenced by the 55 point difference in the proportions. Of course, not all 14 per cent of the teacher groups are paired with students. Teachers themselves are studied separately. Other roles directly connected with the educative process are almost completely overlooked. The school as a whole has a better chance (6 per cent) of being studied than principals (3 per cent), parents (1 per cent) and guidance counselors (1 per cent).

Although the <u>Guidelines</u> state that applicants are "... to outline the proposed research procedures carefully,"³ our efforts to classify

³Guidelines, <u>loc. cit</u>.

the contents of proposals reveal that many do not. Of the 377 applicants planning to study students, 34 per cent fail to specify even a rough estimate of the sample size.⁴ Only 9 per cent have anything to say about the race or ethnicity of students,⁵ and only 10 per cent define the economic level of students.⁶

When teachers are subjects--the one remaining school group with much probability of being studied--the applicants are more negligent of details. Approximate sample size is not given in 55 per cent of the cases.⁷ These figures suggest the magnitude of the omissions of basic factual information in proposals.

Research Design

Applicants select a variety of designs to achieve the objectives of their proposed projects. As Table 3.5 shows, they most frequently use:

- 1. Experiments or quasi-experiments
- 2. Surveys
- 3. Standardized achievement or psychological tests
- 4. Tests developed for the study.

The subject matter of a study influences the choice of design. Studies in psychology, English, mathematics, the physical sciences, music, and art rely most on standardized tests or tests developed for the research; studies in education or a social science other than psychology are particularly likely to use surveys (Table 3.6).

Of greater interest, perhaps, is the absence of empty cells in Table 3.6. Each research design is used by a fair share of the researchers in every area. A comparison of the columns for psychology and education illustrates both the influence of subject matter on design choice and the variation of choice within a subject area. For example, 88 per cent of the studies in psychology use standardized tests; 45 per cent, experiments; 32 per cent, a survey; 18 per cent, observational or developmental techniques; and 16 per cent another design. In education, the survey is preferred (47 per cent); then observational or developmental techniques (38 per cent); standardized tests (31 per cent); another design (26 per cent); and last, experiments (23 per cent).

4Appendix B, Table 3.2. 5Appendix B, Table 3.3. 6Appendix B, Table 3.4. 7Appendix B, Table 3.5.

*Total exceeds 1.00 because more than one study design was specified.

Modes of Analysis

The many ways that applicants intend to analyze their data are detailed in Table 3.7. One-third of those who do specify the modes of analysis plan to rely on tests of significance; another 31 per cent, analysis of variance; and 28 per cent, correlation or regression analysis. For the remaining quantitative techniques the proportions drop sharply, reflecting an inverse relationship between complexity of technique and frequency of use.

The disquieting element in Table 3.7 is the number of omissions. Twenty-seven per cent do not state any plans for analyzing the data. In this instance, the instructions in the <u>Guidelines</u> may be a factor. Applicants are not explicitly instructed to describe the planned modes of analysis in the study design section of their proposals. When the <u>Guidelines</u> are revised, this oversight should be corrected. But the

*Total exceeds 1.00 because more than one mode of analysis was planned.

absence of a specific instruction, however, does not justify the high proportion of applicants omitting a discussion of the analytical techniques to be used.

To some extent, one missing detail leads to another. Many applicants fail to state how they intend to process their data. As Table 3.8 shows, this is the case for 246 of the 665 applicants (37 per cent). Virtually all applicants who do specify the intended data processing technique will use a computer.

Budget

The present ceiling on USOE funds for RRP-supported research is \$10,000, and most applicants plan with this as the target. Table 3.9

ふい

shows that 59 per cent of the proposals specify a federal budget between \$9,000 and \$10,000. In contrast, only 11 per cent request \$5,000 or less. The fact that even this many researchers are able to conduct a project on such a modest budget raises the question of who they are.

It turns out that they are the applicants who intend using their projects for dissertations. A majority of this group request the lower levels of support (Table 3.10).

TABLE 3.10

| \$9,001 - \$10,000 | • 47 | •63 |
| TOTALS | 1.00 (159) | 1.00 (505) |
| | | N = 664 |
| | No budget attached to proposal | |

Only 47 per cent of the applicants who intend their RRP research for dissertations request between \$9,000 and \$10,000 in federal funds, whereas 63 per cent of those who do not intend their research for dissertations request this amount. Doctoral candidates seem to anticipate that the size of their requests may influence their chances of being funded.

Arriving at a total sum to request is just one aspect of preparing a budget. The utilization of research dollars for specific items is also of interest. The budgets submitted in fiscal 1968 list the portion of the anticipated cost for each item that will be covered by either federal or local funds. However, there is no standard method for distributing funds from the two sources; and in effect, applicants are free to divide the costs as they choose so long as the request

for federal funds does not exceed \$10,000. For instance, the cooperating institution may assume the total cost of personnel, or computer time, or even indirect costs. Such arrangements produce the illusion that these items are cost-free if only the federal side of the ledger is reviewed. Accordingly, total costs are the basis for the analysis.

Treating each budget item as a total results in the loss of cases. Only 571 of the 665 budgets contain the information necessary for analysis. Eighty-one budgets have been eliminated because they do not state the local contribution,⁸ and another thirteen could not be included because the budgets had become separated from the proposals. The available data are reported in Table 3.11; first, as the median cost of the item, followed by the proportion of the 571 budgets upon which the calculation is based.

The magnitude of the median cost at the top of the list--that for professional personnel--stresses its importance. All other direct costs are mere fractions of this amount and none reaches \$1,000. Furthermore, it is the only project item appearing in every budget. Even items such as services and supplies, expected to be common among all projects, have not been reported by every applicant. But these variations reflect different accounting procedures at cooperating institutions.⁹

The median total budget is \$11,195, several hundred dollars over the amount provided by a maximum federal grant combined with the minimum local contribution. This is only the half-way point in the distribution, 50 per cent of the total costs exceed this amount with a few going as high as \$50,000--and even higher. An applicant receiving such strong support can choose among a greater number of alternatives in planning his project than the applicant who has no more than a 5 per cent commitment from his institution. Although this minimum standard for the local contribution is generally enforced, a maximum is not. Setting a maximum would tend to place more equal demands on the researchers.

⁸In Fiscal 1968 this information was a required part of the budget and application form; however, the procedure has been modified since that time. 'The local contribution is now being negotiated after a project has been approved for funding. There is no indication of the anticipated institutional commitment on either the title page or budget of each proposal submitted. Without this information, the true costs of the project are obscured; and in the present analysis, such omissions have resulted in a heavy loss of cases--the federal budget alone does not represent the total cost of the project.

⁹During the coding of the budget data, it was observed that data processing, including coding and key punching, is frequently under services rather than non-professional personnel and services. Indirect costs is another item applicants treat in different ways. Some do not use the category at all and instead apportion such costs among other categories.

| والمحمد | | |
|---|---------------------|--|
| Budget item [*] | Median amount*** | Proportion of cases reporting item as a cost |
| Direct costs | | |
| Professional resonnel | \$5 , 578 | 1.00 |

| Federal request | 9,257 | 1.00 |
| TOTAL | | (571) |

THE MEDIAN TOTAL COSTS OF BUDGET ITEMS

*Cumulative proportions for each item appear in Appendix B, Table 3.6.

"Cases not listing the cost for an item have been eliminated from the distribution.

If it is desirable to equalize the funds available for conducting the research and to limit the Program to truly small projects, then one other factor has to be taken into account. As Table 3.11 shows, the only other item in addition to professional personnel costs that absorbs a high proportion of the budget is indirect costs. This amount, \$2,152 represents about 20 per cent of the median budget. Table 3.12 summarizes the per cent of the total budget absorbed by this cost.¹⁰ For 18 per cent

¹⁰Indirect costs are not calculated in a uniform manner by all institutions. To compensate for this variability, indirect cost proportions have been recalculated using the total cost of the project as

FER CENT OF BUDGET FOR INDIRECT COSTS VARIES

| Per cent of budget for indirect costs | Proportion of proposals submitted |
|--|---|
| 10 per cent or less | .18 |
| 11 - 15 per cent | .16 |
| 16 - 20 per cent | • 20 |
| 21 - 25 per cent | .19 |
| 26 - 30 per cent | .17 |
| 31 per cent and over | .10 |

| | 665 |

of the projects, indirect costs represent no more than 10 per cent of the available funds, but for 10 per cent of the projects, indirect costs amount to more than 30 per cent of the budget. The variations in the rates may be i rtly due to the types of charges entered as indirect costs. More important, they exaggerate differences in total project costs and as a consequence, diminish the amount of the federal grant available for conducting the research. In effect, not all researchers receiving \$10,000 grants obtain equal amounts of project support. Under the circumstances, the Directors should consider providing a grant exclusively for the research and then arrange to reimburse the institution for furnishing essential services.

the base. This sum is the most reliable figure available; the definitions of item categories have not been standardized and prohibit using total professional costs or total salaries and wages as the denominator.

58

61

Summary

This chapter has described the proposals submitted by RRP applicants by presenting data concerning the subject matter, the educational level to be studied, the group to be studied, the research design, the modes of analysis, and the budget. In brief, these data show that the subject matter of RRP proposals is varied. The elementary and secondary levels are most frequently studied; students are the most popular object of proposed research. Few projects center on the teacher, and virtually none on policy-makers, either chief administrators or members of the board.

Every subject is explored in a number of ways. All recognized design techniques are used. However, applicants who utilize the more conventional quantitative modes of analysis far outweigh those relying on qualitative methods. Even though most state that their data will be processed by a computer, few depend upon complex statistical or mathematical programs for the analysis.

The median total budget is \$11,195. Only one-half of the projects can be conducted for less than this amount, the assumed small-scale range. The other half exceed \$11,195 and a few projects reach \$50,000.

The primary finding, however, in this review of the proposals is the consistent failure of applicants to provide sufficient details about their proposed projects. One-third of the applicants planning to study students do not estimate sample size; one-fourth of the applicants do not state plans for analyzing the data; one-third do not specify how they will process the data; and one out of six do not prepare their budgets as required. The omission of this vital information negates efforts to evaluate projects. Furthermore, if only the federal portion of the budget is submitted, the actual costs of the proposed research can never be known and in a sense, the projects cannot be compared on an equal dollar basis.

CHAPTER FOUR

DEVELOPING THE PROPOSAL

Beyond the instruction booklet issued by a granting agency, an applicant seeking funds for his research usually likes to sound out his ideas and obtain some appraisal of his plan before he formally approaches an agency. He may do this, for example, by discussing his proposed research with a colleague. The exchange can lead to other sources, such as an overlooked article, a contact with someone who has applied for a similar grant, or a substantive specialist who is willing to go over a draft of the proposal. These examples suggest that much can happen between the time a researcher first thinks of applying for a grant and finally transmits his proposal.

How to write a research proposal is, of course, easier said than done. The USOE Regional Research Program (RRP) <u>Guidelines</u>, urge the applicant to be "clear, concise, forthright, and complete,"¹ an injunction which applies to all expository writing. But how one achieves the desired degree of perfection is not explained. Hopefully, documenting the experiences of applicants will be instructive for those contemplating submitting a proposal, for the RRP, and for scientists interested in the process of sorting the ideas that get researched from those that are aborted.

In this section we will comsider how applicants hear of the RRP, at what point in time their research plans are formulated, and the type of resources they use in preparing the proposal. Lastly, we will discuss the housekeeping aspects of proposal development: the clerical costs, who bears the expense, and the number of man-hours spent preparing the proposal.

Finding Out About the RRP

Since our sample is composed of educational researchers applying to only one granting program and does not include researchers in general, we cannot gauge the number of potential applicants. We do know, however, how several hundred learned about the Program. Indeed, as Table 4.1 shows, sources of knowledge about the Program are varied: (1) word of mouth from a colleague or superior; (2) personal contact with a USOE official; (3) oral presentation or written materials prepared by agency personnel; and (l_4) announcements in professional publications.

83

| | 665 |

"Tables in this chapter compare the funded and the not funded applicant, only when the data show a difference between these two groups.

*** Total exceeds 1.00 because each applicant could name more than one source.

As may be seen in Table μ .l applicants are likely to hear about the Program from a colleague or superior.

A chief reason for regionalizing the Small-Projects Program is to enable direct contact between USOE personnel and potential applicants, as well as between the Directors of Educational Research and the funded researcher. All of the Directors of Educational Research agree that "going into the field," as they put it, is one of their most important functions; but as they told us, the scarcity of funds severely limits this type of activity. For example, one remarked, "In this region ... there has been a constant freeze on travel for the three years that I have been here." It is quite likely that only a limited number of applicants learn about the RRP from a USOE official because of travel freezes.

61

[(<u>)</u>]

۰. ۰.

Formulating a Research Plan and Applying for Funds

News of available funds from a granting agency may serve as a stimulus to the potential applicant for generating an idea into a research plan, or it may prompt him to move ahead with the plan he has been working on so that he can apply for support immediately. Applicants for RRP funds are in the latter category; that is, they state that they had a well-defined research plan before they thought of applying to the RRP.

To be precise, as can be seen in Table 4.2 below, 544 out of 658 applicants (83 per cent) had formulated research plans prior to thinking of submitting a proposal to the RRP. Correlating the time the research idea was formulated with the disposition of the proposal, we find that the early formulators are the ones being funded (40 per cent). This finding suggests that the RRP provides support for promising research ideas waiting to be tested. Without RRP, these ideas might remain in the mind of the researcher--and, in a sense, become lost knowledge.

TABLE 4.2

APPLICANTS WITH WELL-DEFINED RESEARCH PLANS BEFORE THEY THINK OF APPLYING TO RRP ARE MORE LIKELY TO BE FUNDED

| Stage of research plans and timing of application | Proportion of applicants funded | Number of applicants |
|--|---------------------------------------|----------------------|
| Well-defined before thinking of applying | •40 | (544) |
| Only general idea before think- ing of applying | •30 | (93) |
| Developed research plans after thinking of applying | •24 | (21) |
| TOTAL | •38 | (658) |
| NA = | | 7 |
| | | 665 |

Proposals, just as journal articles, can make the rounds. Thus, it is plausible that many applicants submit their proposals to other agencies before taking them to the RRP. However, we know that

relatively few applicants had, in fact, gone elsewhere.

The applicant questionnaire contained the following item:

Had you previously submitted a similar proposal to a funding agency?

(Item #12)

The figures in Table 4.3 show that four out of five applicants had not done so.

TABLE 4.3

FEWER THAN ONE IN FIVE APPLICANTS SUBMITTED A SIMILAR PROPOSAL TO ANOTHER FUNDING AGENCY

| | NA = | <u> </u> |
| a sector de la companya de la compa | | 665 |

Here we have another piece of evidence that the RRP provides support for those interested in research on education, but who have not tried to market their plans elsewhere.

Resources

No matter how 'ell-defined a research plan may be, when an applicant prepares the proposal it is helpful to have supplementary materials at hand. As a minimum he needs printed materials from the granting agency. This may seem too obvious to mention; but, as we shall see, not every applicant has this essential information. Then, if the applicant is inexperienced in proposal writing, he may find it helpful to have copies of proposals submitted by other researchers to which he can refer. Finally, even those with experience find it useful to consult someone knowledgeable about granting agencies regarding a time-schedule and budget.

Applicants were asked about both the resources available at their institutions and the resources they used while preparing their proposals. The answer options were presented as a check-list. Table 4.4 shows the items listed as well as the proportion of applicants who have each resource available.

TABLE 4.4

USOE "GUIDELINES" AND A "RESOURCE PERSON" ARE AVAILABLE TO MOST APPLICANTS

| | Resources available | Proportion of applicants |
|----|--|--------------------------|
| 1. | USOE "Guidelines for Small Project Research" | .87 |
| 2. | A "resource person" knowledgeable about apply- ing for research funds | •72 |
| 3. | Copies of proposals submitted by others | .45 |
| 4. | Sample application forms of funding agencies | • 71/1 |
| 5. | An "information bank" of agencies that fund research | • 40 |
| 6. | ERIC materials | •33 |
| 7. | USOE "Winning a Research Bid: Tips on Proposal Writing" | .10 |
| | TOTAL | 3.31* (621) |
| | No resources available | 31 |
| | NA = | 13 |
| | | 665 |

³Total exceeds 1.00 because each applicant could name more than one resource.

Approximately three resources are available for each applicant. The USOE "Guidelines for Small Project Research" is at the top of the list, but it is worth noting that 13 per cent of the applicants do not have this reference available. Next in line is a resource person knowledgeable about research procedures: 72 per cent of the applicants are at institutions which have such a person for consultation about application procedures. Notice too that at the bottom of Table 4.4 there is a line reading "No resources available"; 5 per cent of the applicants are in this resource-poor group--not one of the seven resources is available to them.

When we consider which of the available resources are actually used, we have a measure of their relative importance as an aid to the researcher in the preparation of a proposal. Moreover, these same data suggest which resources should be available at every institution.

 Ω^{*}

Table 4.4 showed that the USOE "Guidelines" and a "resource person" are available to most applicants, and Table 4.5 below reveals that almost every applicant having access to these resources puts them to use.

TABLE 4.5

| | Resources utilized | Proportion of applicants utilizing resource | Number of applicants v resource | |

| 3. | Copies of proposals submitted by others | .82 | (281) | |
| <u>1</u> . | Sample application forms of funding agencies | •75 | (272) | |
| 5. | USOE "Winning a Research Bid: Tips on Proposal Writing" | •67 | (67) | |
| 6. | An "information bank" of agencies that fund research | •56 | (249) | |
| 7. | ERIC materials | .,48 | (205) | |
| | Number of | applicant responses | (2065)* | |
| | | applicants using at le resource | | 597 |
| | Number of resource | applicants using no | | 55 |
| | | NA = | | 13 |
| | | | | 65 |

APPLICANTS SELECTIVELY UTILIZE RESOURCES

*Number of responses exceeds number of applicants because many applicants used more than one resource.

More interesting, perhaps, is the finding also in Table 4.5 that 82 per cent of the applicants review proposals written by someone else in their search for help. Returning to the data in Table 4.4, we see

that only 45 per cent of the applicants have access to such a resource. The fact that this resource is heavily utilized by the limited number having such a file available suggests that this is a valuable resource. The Directors of Educational Research might encourage the institutions with which they are in contact to incorporate such materials in their reference collections. Sample application forms from funding agencies are another source of information frequently used. Even though this type of material is available to less than half the applicants, 75 per cent take the time to review the file.

More generally, the data on resources--both those available and those used--can serve as a guide for the Directors of the RRP as they endeavor to help applicants and institutions develop their research potential. Indeed, it is the availability of a resource at an applicant's institution more than his use of any one resource that is related to funding. This information may be seen in Table 4.6 which shows the proportion of applicants funded: first, according to their access to a particular resource and second, according to their use of it.

For five of the seven resources listed, applicants who have the resource available are more likely to be funded than those who use it. For example, 47 per cent of the applicants who merely have access to ERIC materials are funded, whereas only 38 per cent who use these materials are funded. One more point, 43 per cent who work at an institution having an "information bank" available become successful applicants, but this figure drops to 35 per cent for those who make use of it.

More dramatic perhaps are the data in Table 4.6 for the applicant without even one of the seven listed resources. Just 10 per cent of these applicants are subsequently funded--striking evidence that the applicant working in a barren environment is left behind. In fact, applicants who have resources available, but who choose to ignore them, fare better: 18 per cent are funded.

At first glance, the findings in Table 4.6 seem anomalous. Why should the availability of a resource count more in funding than the applicant's actual use of it? We suggest that whether an applicant uses a particular resource can depend on a number of factors, for example, his previous experience writing proposals, how well-defined his research plan is, or how extensive his research training has been. But the availability of resources at the institution with which he is affiliated is crucial. This measure is an indicator of the research orientation of the institutional setting.

Our data support this reasoning. An applicant's chances of being funded appear to be related to the number of resources available to him.² Only 36 per cent of the applicants with a single resource at

²Appendix B, Table 4.1.

their disposal are funded, but the percentage increases to 45 per cent for those with five resources at hand. No such pattern, however, exists between funding and utilization of resources (Table 4.7). For example, 47 per cent of the applicants who use two resources are funded, but only 33 per cent of those using four are successful. In fact, not one of the few applicants using all seven resources is funded.

We want to consider one other resource utilized by some applicants that is qualitatively different from those just described, namely, informally discussing one's proposal with a USOE official before submitting it. Typically, these applicants contact the Director of Educational Research in their regions, although a few turn to a

staff member in Washington.³ Our data indicate that two out of five applicants have this kind of help, and that these applicants are more likely to be funded than the ones who do not consult a USOE official (Table 4.8).

Not unexpectedly, funded applicants find the discussion helpful; applicants not funded think otherwise.⁴ Herein lies the difficulty of having an official of USOE discuss an applicant's proposal with him prior to submission. In his desire to be funded, an applicant may interpret suggestions offered by the Director of Educational Research in his region as an informal commitment to funding. If his proposal is subsequently not funded, such an applicant can feel bitter. One said:

³Appendix B, Table 4.2.

| | | 665 |

I got nothing but encouragement followed by a brushoff [when the proposal was rejected].

Another remarked:

After improving the format and doing more bibliographic work, the proposal was returned rejected ... This was disheartening to say the least. If they hadn't told us initially that it was a good idea we would have felt less bitter about the ultimate rejection.

The Directors of Educational Research are aware of the tightrope they walk when they talk with an applicant about his proposal before submission. As one Director of Educational Research said:

> You have to be mighty careful in the kind of help that you give. It's easy to get into trouble. They [applicants] can't be led to expect that just because you encouraged them, it will insure their getting funded.

At the same time, several consider helping applicants to be an important part of their work. They are particularly concerned about the less experienced applicant who has no resource person at his institution. The help Directors of Educational Research offer such an applicant includes talking with him about his research ideas, referring him to a consultant nearby, and commenting on an outline or summary of the proposal before it is formally submitted.

An applicant who discusses his proposal with the Director of Educational Research in his region and is then turned down requires special attention when he is informed of the decision. A form letter notifying him that his proposal is not going to be funded is apt to leave him embittered. Although some applicants probably cannot be mollified, it would seem that many could be, if only the Director of Educational Research would take time to contact them on a more personal basis and give them constructive criticism of the proposal.⁵ In fact, two not funded applicants volunteered appreciation of just this kind of help.

> I think [a regional intern in this instance] 'caught my purpose' ... At no tive did he make me feel inadequate because of lack of experience or recognition in research. He gave me outstanding guidance for improving my research design.

> The regional office offered useful suggestions [when my proposal was turned down]. I was more or less disgusted with myself for not having taken more time to do a respectable job.

In offering the suggestion that Directors of Educational Research give special attention to some applicants, we are not overlooking a concomitant problem confronting the Directors every day, namely, the limited--or even complete lack of--clerical and professional help in the regional offices. This matter is being deferred until the next chapter as we wish to conclude this chapter by reviewing briefly the data collected on the time and clerical costs of developing a proposal for small-project research.

Time and Cost

We asked applicants about a few practical matters connected with developing their proposals. To the best of our knowledge no systematic information exists on the number of hours an applicant spends

⁵"Constructive criticism of the proposal" usually has meant that the Director of Educational Research or an assistant selectively excerpts comments made by field readers. Doing so, however, places the Director of Educational Research in the role of judge and can imply that he is an unquestioned expert in every aspect of the research process. An alternative is directly transmitting field reader comments, making the field reader responsible for communicating his evaluation rather than the Director of Educational Research. See Chapter 5 for a discussion of this idea from three perspectives, that of applicants, field readers themselves, and the Directors of Educational Research. preparing a proposal, whether he does the drafting on his own or on working time, what the clerical costs are, or who underwrites this expense.

We asked applicants:

Altogether, about how many hours did you actually spend preparing the proposal?

(Item #23)

Their answers ranged from less than two hours to more than 200. The median time was 48 hours, a week's work.⁶

There is some relationship between the amount of time spent preparing a proposal and its likelihood of being funded. Applicants who spend less than 20 hours on their documents are least likely to be funded (33 per cent); those who spend 41-60 hours are most likely to be funded (41 per cent). However, applicants who labor as long as 100 hours, more than two weeks' work, are less likely to be funded (38 per cent).⁷

Typically applicants prepare proposals on their own time. Only 19 per cent do so on working time.⁸ Thus, we know that applicants extend themselves beyond their regular work day to develop the proposals they submit to the RRP and that, by and large, they spend a considerable amount of time on the documents.

We also asked a question about the clerical costs of preparing the proposal:

It is difficult to calculate a precise figure, but what would you guess the clerical costs of your proposal amounted to?

(Item #22)

The median cost is \$48, although applicants spend anywhere from less than \$25 to more than \$100.9 As it turns out, however, the cost of preparing the proposal document is not related to the probability of being funded (Table 4.9).

- 6 Appendix B, Table 4.4.
- 7_{Appendix B, Table 4.5}.
- ⁸Appendix B, Table 4.6.

| TOTAL | •38 | (619) |
| | NA = | 46 |
| | | 665 |

THE CLERICAL COSTS OF PREPARING THE PROPOSAL ARE NOT RELATED TO FUNDING

Table 4.10 shows that few applicants personally pay the clerical costs of preparing the proposal.¹⁰ The applicant's department or institution usually absorbs this expense, and this suggests departmental support of the activity.

In addition, Table 4.10 shows that the clerical costs are seldom met by another research project, indirect evidence that few applicants are engaged in an on-going project. However, the few applicants whose clerical costs are absorbed by another project have the highest funding rate (Table 4.11). Conversely, applicants who personally pay all clerical costs have the lowest funding rate. Here again, we have evidence that the applicant on his own has less chance of getting started than the one who can count on the support of his institution.

Summary

This chapter has considered the applicant's experiences while developing his proposal for submission to the RRP. In particular, it has reported how applicants learn of the Program, whether they formulate their research plans before thinking of applying or not until afterwards, the type of resources at hand, and those used in addition

10 The question was worded:

Who paid the clerical costs of preparing the proposal? (Item #21)

The answer options were: (1) department or institution; (2) another research project; (3) personally; and (4) both institution and personally.

TABLE 4.10

THE APPLICANT'S DEPARTMENT OR INSTITUTION USUALLY PAYS THE CLERICAL COSTS

| Who pays the clerical costs? | Proportion of applicants |
|--------------------------------|--------------------------|
| Department or institution | •74 |
| Applicant | •20 |
| Both institution and applicant | •04 |
| Another research project | .02 |
| | 1.00 (661) |
| NA = | 4 |
| | 665 |

to the time and clerical costs of preparing the document.

The data show that a colleague or superior rather than a USOE official is the applicant's source of information about the Program. It is also apparent that more often than not applicants have woll-defined research plans before they think of applying to the RRP, and it is these individuals who are most likely to be funded.

In addition, when they prepare their proposals, most applicants have copies of the USOE "Guidelines" available and access at their institution to a resource person knowledgeable about seeking research funds. Less than half the applicants, however, have the various other resources such as copies of proposals previously submitted by others, sample application forms of funding agencies, or ERIC materials. More important, the likelihood of being funded appears to be related to the type and number of resources available to applicants rather than to which resources or how many were actually utilized. Finally, the probability of being funded is greatest if another project absorbs the clerical costs of preparing the RRP proposal.

CHAPTER FIVE

PROCESSING THE PROPOSAL

Once the researcher has prepared the final draft of his proposal, the next step is to submit the required number of copies to the granting agency. At this point the researcher becomes an applicant, his proposal is assigned an identification number, and processing begins.

In our discussion of the applicant's experience, statistical data will be supplemented by comments from applicants who voluntarily expressed their views. Some were favorably impressed by the way the regional offices processed their proposals; but many, as we shall sce, were critical. Whether positive or negative, their statements emphasized first, the length of time from submission to notification of final disposition and second, the explanation given for the granting decision.

Length of Time

One reason for creating regional offices was to streamline the processing of proposals so that the time lapse between submission and notification of the funding decision would be shortened. Unlike many other granting agencies, the USOE Regional Research Program (RRP) has no deadlines for submitting proposals. The Guidelines state:

> Processing of proposals from receipt to notification of action is usually completed within two months, except when complications beyond the control of the Regional Office arise. L Emphasis added.

The goal of rapid processing is without doubt laudable, but for a variety of reasons, only a limited number of applicants profit from it. In FY '68, the year of this study, two-thirds of them waited longer than they had expected to learn the disposition of their proposals (Table 5.1).

Although a simple check-mark was all that was needed to answer the questionnaire item about the length of time for processing, many applicants wrote letters to present their experiences in greater detail while others jotted notes in the margins of the questionnaires.²

¹Guidelines, op. cit., p. 6.

²Some applicants did not complete the questionnaire but chose instead to send notes berating us for asking them to fill it out. Each

| | | |

A few examples will illustrate the difficulty.

It took approximately 6-8 months to find out that my proposal was not funded. Several calls were made by my advisor to no avail. At one time no one knew the whereabouts of my proposal.

I was told that the grant application would be processed within 3 months. Instead, it took 11 months.

Inquiries were made and I was led to believe that action was imminent. For hand-to-mouth existers, like academicians, this is especially important.

It was 5 months before I was told there would be no money. The constant granting and withdrawing of funds from OE programs makes dealing with them like Russian roulette.

expressed the feeling that after taking time to write a proposal and waiting endless weeks to learn that he had been turned down, he had no interest in answering questions about the rejected proposal.

A typical note came from a minister: "This adds injury to insult." We telephoned this applicant, as well as the others who sent similar notes, to suggest that it was better to register their complaints on the questionnaire than to write off USOE. Almost every one of these applicants "took our advice" and returned completed questionnaires.

76 79

Regional offices can process proposals within a shorter period of time except when "complications beyond the control of the Regional Office arise," as the <u>Guidelines</u> state. The word "complications" is a euphemism covering problems such as budget freezes and understaffing. Both plagued FY '68 and continue to handicap the Program.

In fact, the Program has yet to have a "typical" year. Budget freezes which negate any attempts to plan even a few months ahead may be imposed at any time during the fiscal year. This "clamping a lid on funds," as one Director of Educational Research phrased it, "can mean no travel, no convening of a panel [to review proposals], even no mailing of proposals for individual reviews."

Good business practice calls for informing the customer, in this instance the applicant, of the budget freeze and the consequent delay in processing his proposal. But a second major problem, namely, minimal clerical and professional staff makes this all but impossible. When the regional offices opened, the Directors of Educational Research were promised staff assistants, but continuous cuts in appropriations have never permitted filling these positions.

Visits to the regional offices and Washington, in addition to interviews with the Directors of the Program, revealed how acute understaffing is for the RRP. The enormity of the problem is perhaps best conveyed in the words of some Directors of Educational Research:

I've had to beg, borrow and steal clerical help. I've had no one fill-time ... When someone is free, I grab them and get chem to do some of my correspondence.

I hate to make the old cry of adequate help. My secretarial help is part-time, hit or miss.

It makes me mad to even hear you [interviewer] raise the topic of office help.

A lot of the time I don't have the opportunity to do anything but stack the piles a little higher.

It is only fair to add that three Directors of Educational Research do have adequate clerical help.

I've got an efficient secretary. She's half-time with me, but she will pick up the phone all day.

We get along fairly well with what we have, and, of course, we're so much better off than they [Directors of Educational Research] are in other regions.

I'm lucky. I've had a half-time girl ever since I started.

Adequate clerical help would relieve the Directors of Educational Research of the routine tasks that they now are forced to neglect. But a clerk would only partially solve the problem. The Directors also need professional assistance, as they readily point out.

> I need someone at the intermediate level ... This would permit me to go into the field to work with the institutions that don't have research potential now.

I surely could use more help--someone with competence who can make decisions. It is hard to be a one-man operation and try to do the job that needs to be done.

It is not news to anyone associated with the RRP that understaffing and budget freezes severely hamper the functioning of the Program. These two administrative problems have been discussed at some length to underscore how adversely they can affect the processing of a proposal and accordingly, the applicant's image of the Program.

Notification of the Granting Decision

In addition to criticizing the RRP for the length of time it takes to process proposals, many applicants included criticisms of the way in which they were informed of the granting decision. Funded applicants confined their remarks to delayed confirmation of funding, but not funded applicants were specific in their negative comments about the treatment they received. Some of their difficulties can be attributed to the minimal staffing and budget freezes just mentioned--in other words, to circumstances beyond the control of the regional offices. Others may be interpreted as suggestions for improving the contact between regional offices and applicants without increasing the workload of the Directors of Educational Research. Again, we have both statistical data and voluntary comments.

Applicants who were not funded were asked whether they requested an explanation of the granting decision and, if so, what they were told. A total of 71 per cent responded "yes" to the question: "Did you ask for an explanation of the [funding] decision"?³ The applicants then indicated what they had been told. Their answers may be seen in Table 5.2.

The answers most frequently given were that the study was poorly designed or that the proposed research lacked educational significance. These the qualities, along with economic efficiency and adequacy of personnel and facilities, are used for evaluating small-project proposals. It is of interest to note that neither one of the last two criteria is often cited as a reason for not funding a proposal.

³Appendix B, Table 5.1.

TABLE 5.2

ONE OUT OF FIVE NOT FUNDED APPLICANTS WHO ASKED FOR AN EXPLANATION OF THE FUNDING DECISION FAILED TO RECEIVE ONE

| Why proposal was not funded | Proportion of applicants |
|--|-----------------------------|
| Qualities criticized: | |
| Soundness of design | •39 |
| Educational significance | •32 |
| Economic efficiency | •07 |
| Adequacy of personnel and facilities | •05 |
| Other (e.g., review of literature) | • 04 |
| Other explanation: | |
| No explanation provided | •21 |
| No RRP funds | •13 |
| Conflicting priority (e.g., within ERIC/CRIER) | .05 |
| | 1.26* (272) |
| NA = | 21 |
| Cases excluded $\overset{\leftrightarrow}{\leftarrow}$ | 121 |
| | 251 |
| | 665 |

*Proportions exceed 1.00 because some applicants gave more than one reason.

**Not funded applicants who did not ask for an explanation (121), and funded applicants (251).

It is not the purpose of this study to evaluate the reasons for not funding an applicant's proposal. We simply report them as part of the data collected, and sometimes these data contain disturbing elements. In particular, we want to consider the finding in Table 5.2 that 21 per cent of the applicants received no explanation of the granting decision, even after asking for one. The following are examples of the experiences these applicants had when they tried to discover the reasons for their rejection.

All I got was a curt "this is not the type of thing the small projects can fund" with no indication as to why.

I wrote to see why my proposal was turned down and also wrote a follow-up letter, but I got no reply.

After I received the letter of rejection I wrote to the regional office asking for comments and to this day I have never heard one word from them.

I never was officially informed of action taken. When I finally called long distance ... I was told verbally that the proposal had been rejected. This was the only information I ever received.

Two applicants who were not funded described quite different treatment.

The reply [to the request for an explanation] was courteous, commented on strong points, and explained the reason for rejection.

[The decision] was adequately explained by telephone and letter. I was pleased with the pleasant personal approach.

These applicants, unfortunately, are the exception. Four out of five not funded applicants who asked for an explanation of the granting decision were not satisfied with the one they received.⁴ It can be argued that it is difficult, if not impossible in some cases, to present a convincing argument to the applicant who must be told that his proposal is not going to be funded. Yet the specific comments made by dissatisfied applicants are sufficiently compelling to merit attention.

In essence, each applicant complains about the quality of feedback. After devoting a full week of his time⁵ to the preparation of his proposal, he is given the "brush-off" by the regional office. As one applicant remarked:

> I frankly don't see how an investigator can improve any future proposals without obtaining a critique.

⁴Appendix B, Table 5.2

⁵Appendix B, Table 4.4.

From our contact with the Directors of the Program, it is difficult to imagine that any would think an applicant is entitled to no more than a perfunctory letter informing him that his proposal is not funded. Pressures of time, lack of staff, and competing priorities probably account for such treatment when it occurs. Yet, repeated phone calls and follow-up letters from querulous applicants also further curtail already scarce office time. Moreover, the dissatisfied group is not a minority; 71 per cent of the not funded applicants had to ask for an explanation⁶--a figure high enough to warrant considering a basic change in RRP management.

An Available Alternative

We suggest that the method of notifying unsuccessful applicants be reviewed by the Directors of the Program in an effort to establish a more uniform policy. Toward this end, we present data collected on a feasible alternative which we hope the Directors of Educational Research will take under advisement. This change involves sending the field reader comments directly to the applicant when he is informed of the funding decision. In order to adequately explore this idea, we sought the viewpoints not just of applicants for RRP funds, but also of field readers, and Directors of Educational Research.

Viewpoints of Applicants and Field Readers

In answer to the question:

Do you think that a copy of the comments made by field readers should be sent routinely to each applicant?

(Item #26)

almost every applicant said "yes." Moreover, as can be seen in Table 5.3, applicants were equally likely to hold this opinion whether or not their proposals had been funded.

This viewpoint is not restricted to the applicants; the field readers themselves concur (Table 5.4). To be specific, 59 per cent indicate that they favor sending such comments routinely to each applicant. If the 20 per cent who say the comments should be sent only to those who request them is added, a total of 79 per cent endorse this policy. In addition, we call attention to another finding in Table 5.4: field readers make no distinction between funded and not funded applicants as recipients of their comments. Only 1 per cent think that comments should be sent only to applicants whose proposals have been rejected and another 1 per cent hold the opposite view.

6Appendix B, Table 5.1.

Viewpoints of Directors of Educational Research

We discussed with the Directors of Educational Research the possibility of sending field reader comments to applicants before the results of both the applicant and the field reader surveys were tabulated. Thus, the points of view the Directors express cannot be said to have been influenced by the opinions of either group.

In general, the Directors of Educational Research favor sending field reader comments to applicants, but some have reservations about sending them to every applicant. The reasons for their hesitancy vary, but this is not unexpected. Each Director of Educational Research is an individual in his own right. However, as we shall see, their opinions do not diverge to such an extent that agreement is out of the question.

At present two Directors of Educational Research routinely send field reader comments to applicants. As one said:

> I xerox the field reader comments, cut off the name of the investigator and any personal remarks he may have made. If the proposal has been reviewed by a panel, I send the investigator both the comments made by the panelist prior to coming to the meeting and then the consensus summation.

The other remarked:

FRĬC

All of these fellows [field readers] know that I'm going to send their comments back to the proposal writer ... There are very few instances when their comments should be tampered with. They might be a little cryptic, but this type of feedback doesn't hurt either.

Other Directors of Educational Research have reservations about routinely sending field reader comments to applicants. They cite four problems:

- (1) Some applicants can identify the reviewer(s).
- (2) Some field reader comments can be difficult to interpret.
- (3) Some evaluations can be unnecessarily harsh.
- (4) Reviewers can have discrepant views. This, as one Director of Educational Research put it, "can be particularly bad for the unsophisticated researcher ... and can lower our field readers in their estimate,"

We will discuss each of these problems.

One Director of Educational Research anticipates that some applicants would be able to identify the field reader. Another found that this did occasionally occur when he sent out field reader comments a couple of years ago, so he stopped. Three others stated that they have had no repercussions: no applicant has ever reported that he recognized the handwriting or point of view of an evaluator. One of these Directors did add that he has had two requests for the identity of reviewers, but as he said, "the law alone protects me from such a request." And finally, fears should be abated by the knowledge that field readers, the individuals central to the issue, are not at all concerned about this matter: not one mentioned it as a potential threat, not even those voicing an objection to sending their comments to applicants.

Ambiguity and lack of clarity in the comments of field readers can also pose a problem. To avoid this, some Directors of Educational Research analyze the comments, delete those that are beside the point, and summarize the salient ones. But this too can be difficult. First, this is a time-consuming activity for a Director of Educational Research already overburdened with clerical work. Second, as one Director said:

> The ideal time to furnish feedback to applicants is immediately after, say, the panel meets. But this is not possible for proposals that go on the approved list. The longer the time lapse, the more rusty you get in what you remember and often there are points that have to be elucidated a little bit more than the notes you've kept.

Thus, to write a coherent summary of the evaluation, a Director of Educational Research may have to completely review the contents of the applicant's file before composing the letter.

One Director of Educational Research who sends the applicant the verbatim field reader comments has pointed out that the quality of the remarks has improved now that the field reader is aware that they are intended for both the applicant and the USOE.

Sending out field reader comments has had a miraculous effect on what the field reader says and how he says it. Occasionally a field reader would make some comment on the evaluation form that the analysis proposed 'stinks.' I don't get this anymore. Instead, I get a reasoned explanation of whatever position the evaluator has taken.

This comment leads directly to the third problem anticipated by some Directors of Educational Research, namely: that field reader comments can be too "harshly stated." Although this undoubtedly

happens from time to time, the last quotation offers reassurance that field readers are more compassionate if they know their comments are going to be read by the applicant.

It is possible, that upon occasion field readers would prefer to address some of their comments, harsh or not, to USOE exclusively. Such an option could be provided by designing the evaluation form in such a way that a copy of the comments recorded below a perforation could be sent to the applicant and those above would be kept confidential.⁷

To explore the suitability of a perforated evaluation form for the review of proposals, we asked field readers whether they would recommend this change. A total of 36 per cent recommended the format not only for RRP proposals but for all USOE proposals.⁰

We asked the Directors of Educational Research to express their views about this possibility. Three indicated they are "all for it"; two are interested in testing it; one thinks it is preferable, but he would still be confronted with the problem of ambiguity in the comments made by some reviewers; and another thinks it would increase "the burden placed on the reader as well as not mask the style or handwriting of the reviewer." Unfortunately, this question was not raised during the interviews with the two remaining Directors of Educational Research.

The fourth and last problem discussed by some Directors of Educational Research is that of conflicting evaluations which would tend to confuse the applicant. But this problem, too, is manageable. Two Directors have devised ways for coping with it. One said:

> In the beginning I used to iron out the conflict if it existed ... I'd try to be the judge and go-between. But I found that wasn't a good idea ... In fact, I have learned just the opposite. I have letters in my file commenting favorably on the fairness of sending out all the comments.

The other remarked:

If a guy had four disapprovals and one approval, those sweet comments don't necessarily have to go

'This type of evaluation form is used by <u>Science</u>, the official publication of the American Association for the Advancement of Science, for reviewing articles. See <u>Bulletin</u>, American Association for the Advancement of Science (March, 1969) and the "Instructions to Reviewers," prepared by the editors of <u>Science</u>.

⁸Chapter Seven, Table 7.2.

back. Rather than ... falsely encourage the guy I just send him the comments of the others along with the letter that tells him he wasn't funded. After all, he is still hearing from more than one reviewer.

Each of these Directors has a different style, but both provide the applicant with information about the strengths and weaknesses of his proposal. In effect, this feedback is a minimum return on the effort expended by the applicant.

Finally, none of the Directors of Educational Research who have sent verbatim field reader comments to applicants have found that they need to protect the "unsophisticated researcher." As one Director said:

> Sometimes the criticisms are pretty rough, but the applicant can see where he went wrong and strengthen his proposal before he goes to anyone else for money. In the final analysis, is it kinder to turn down an applicant without letting him know why?

Summary

In brief, this chapter has examined the applicant's experience submitting a proposal to the RRP. Some applicants are pleased with the way the regional offices processed their proposals, but many are not. Whether satisfied or not, their evaluations emphasize the length of time from submission to notification of final disposition, and the explanation offered for the granting decision.

Understaffing and budget freezes severely hamper the efficiency with which regional offices can process proposals. These problems plagued FY '68, the year of this study, and continue to handicap the Program.

Some difficulties applicants encounter can be attributed to understaffing and budget freezes, and others to the limited contact they have had with regional offices. In particular, applicants complain about the quality of feedback when they are notified of the granting decision. After spending time preparing the proposal, they are given, as they put it, the "brush-off."

An alternative way to explain the granting decision to applicants is to transmit field reader comments directly to them. Both applicants and field readers favor such a policy. The viewpoints of the Directors of Educational Research diverge somewhat on this topic, but they are willing to consider the possibility. Hopefully, the discussion of the subject in this chapter will begin to answer their questions by providing information not previously available. More

generally, we have that the data presented will be useful to the Program's Directors in determining ways to improve the processing of proposals from submission to final disposition.

े. --

CHAPTER SIX

EFFECTS OF THE RESEARCH

In the proposal each applicant states the contribution he anticipates making to education and outlines his plan for dissemination and utilization of the results. This chapter examines the outcomes of the projects funded and some of the ways they have had an impact on education.

These projects are all small-scale efforts and no one expects dramatic short-run effects for the researcher or for the field of education. As one Director of Educational Research remarked:

> I don't expect phenomenal impact out of RRP-supported research. After all, the researchers only have at the longest eighteen months to do their work.

To be sure, research that has "phenomenal impact" is hard to come by whatever the size or duration of the project, and as this Lirector added: "research that is less than phenomenal can be useful." What the individuals administering the Regional Research Program (RRP) aim for is research that will be implemented, not research that "ends up on the shelf." By implementation they mean dissemination and utilization of research findings:

- (1) in the classroom
- (2) in colleague exchanges
- (3) in work with individual students who then may do further research on education
- (4) through professional meetings, publications, and the preparation of in-service teaching materials.

The Directors of Educational Research are also concerned about the impact of the research on the career of the researcher and his institution. One of the purposes of the Program is to strengthen research at developing institutions. Of concern is the researcher who gets funded, gains recognition for the quality of his work and then is recruited by another institution. As a result, the Directors have to start re-building research resources at the institution which has lost the promising researcher.

We have collected considerable data on the outcomes of the research in order to explore its impact on education and on the career of the researcher. At the time we surveyed researchers, nine out of ten had recently written their final reports or were completing the research undertaken with RRP funds.¹ Thus, these data reflect the short-run effects of the research. A follow-up study would be required to uncover long-range effects of the research.

Classroom Teaching

RRP research is utilized in the college classroom. A total of 84 per cent of the funded applicants report that they discuss their projects in class. Over forty per cent present project data as part of their discussion; while another forty per cent keep the discussion on a more general level (Table 6.1).

TABLE 6.1

SIX OUT OF SEVEN RESEARCHERS DISCUSS THEIR PROJECT IN CLASS

| Discussion of project in class | Froportion of funded applicants |
|---|------------------------------------|
| Discussed together with data | •43 |
| Discussed, but no data presented | •41 |
| Discussed both with and without presenting data | .01 |
| Not discussed | .15 |
| TOTAL | 1.00 (221) |
| Cases excluded $*$ | 29 |
| NA = | 1 |
| | 251 |

*Project just begun.

One might expect that funded applicants who have formal teaching responsibilities would be most likely to discuss their projects in class. However, as Table 6.2 shows, whether funded applicants did or did not have formal teaching responsibilities, they were equally likely to discuss their projects in a class--evidence that RRP researchers are classroom-oriented.

¹Appendix B, Table 6.1.

RESTARCHERS WITH OR WITHOUT TEACHING RESPONSIBILITIES DISCUSS THEIR PROJECTS IN CLASS

| | Teaching re | sponsibilities |
|----------------------------------|-------------|----------------|
| Discussion of project in class | Yes | No |
| Discussed together with data | • 744 | • <u>1</u> to |
| Discussed, but no data presented | •4I | .43 |
| Not discussed | . 15 | •18 |

| | | N = 219 |
| | Cases | excluded* 29 |
| | | NA = 3 |
| | | 251 |

*Project just begun.

Even more interesting are the figures in Table 6.3. They show the relationship between the subdivision of a funded applicant and discussion of his project in class.

Although most funded applicants within and outside higher education discuss their research projects in class, those affiliated with a university research bureau are most likely to do so. In fact, every funded applicant at such a bureau engages in class discussion. The old cleavage between teaching and research apparently does not describe RRP-supported research.

Tables 6.1 to 6.3 should be encouraging to policy makers of the RRP who are interested in the dissemination of research to the classroom. If any fear that the results of research facilitated by a university bureau are destined solely for professional journals and books, the data suggest their fears are groundless. Later in this chapter we will explore the publication intentions of funded applicants, but whatever they may be we already know that a major avenue for disseminating the results of research is classroom discussion.

Besides discussion there are other ways whereby research may enter the classroom. As a result of his work, a researcher may encourage students to take specific courses in allied disciplines, he may re-organize a course that he has been teaching, or he may evolve

9ġ

an entirely new course.

Table 6.4 lists five kinds of curriculum changes recommended by researchers, once again taking into account whether they had teaching responsibilities while conducting their projects.

The most likely recommendation of researchers, with or without teaching responsibilities, is shifting emphasis within a particular course. As one would expect, researchers with teaching responsibilities are more likely to re-organize a course (38 per cent) than researchers without such responsibilities (12 per cent).

Of the curriculum modifications listed, researchers are least likely to suggest courses in allied disciplines to students. The data for explaining this finding are not available, but the Directors of Educational Research could suggest this type of cross-fertilization to applicants as another way to utilize the results of research. We know that researchers who change fields, namely, Ph.D.'s in a discipline who switch to education and Ed.D.'s who switch to psychology are likely to be funded (Table 2.8). This suggests that communication among disciplines can be productive for education.

Not all researchers are led to introduce instructional changes, as Table 6.4 also shows. Note that 75 (43 per cent) of the researchers with teaching responsibilities and 20 (54 per cent) of those without teaching responsibilities state that their research has not led them to a single course or curriculum change.

We did some further analysis of these researchers. It turns out that 75 per cent of those who were students at least part-time when they completed the questionnaire recommend curriculum or course modifications, whereas only 45 per cent of the non-student researchers do so (Table 6.5). In sum, RRP research tends to have a greater impact on the curriculum if the project has been conducted by a student--the individual currently striving to adhere to a curriculum plan.

Colleague Exchanges

Collegial exchanges is a second way of implementing RRP research. Typically, this exchange takes place in the seminar setting. To learn whether researchers discuss their research at faculty or student seminars, we asked them:

Have you been invited to discuss this research with a faculty or student group?

RRP-SUPPORTED RESEARCH LEADS TO CHANGES IN CURRICULUM

RRP RESEARCH COMPLETED BY STUDENTS IS MOST LIKELY TO RESULT IN CURRICULUM CHANGES

*Project just begun.

The answer options included:

- -- Faculty seminar in my department
- -- Interdepartmental faculty seminar
- -- Faculty-student seminar in my department
- -- Interdepartmental faculty-student seminar
- --- Student society.

The extent of seminar participation by RRP-funded researchers is shown in Table 6.6 below. RRP researchers are more likely to be invited to discuss their research with members of their own department than with members of interdepartmental groups. Recall that Table 6.4 highlights the small number of RRP researchers who suggest courses in allied disciplines to students, and now we see that researchers are not likely to be invited to present their work at interdepartmental seminars.

Individual Student Training

As discussed earlier, a main goal of the RRP is resource building, that is, providing promising researchers with an opportunity to carry out small-scale research projects. Supporting research in institutions without much of a tradition in research is assumed to have a "multiplier effect," as it were. An atmosphere of empirical inquiry will develop in the classroom; students will become more researchminded; and a few will be afforded the chance to become research assistants on projects. The experience of working on projects, it is hoped, will propel some of the abler ones into educational research.

THE RRP-SUPPORTED RESEARCHER IS MOST FREQUENTLY INVITED TO DISCUSS HIS PROJECT WITH A SEMINAR IN HIS OWN DEPARTMENT

*Proportions exceed 1.00 because researchers could participate in more than one type of seminar.

**Project just begun.

From the reports of RRP-supported researchers we know whether students assisted on their projects and whether these students became more interested in educational research. These results of being funded are examined next.

In two out of three RRP projects, students assist researchers.² More important for the future of educational research are the results of Table 6.7. The researcher with teaching responsibilities who advises on doctoral dissertations is most likely to have students assist him in his research. A total of 84 per cent of these researchers state that students work on their projects, whereas only 42 per cent of those who neither teach nor advise on dissertations involve

²Appendix B, Table 6.2.

students in their research. In effect, an RRP grant to a dissertation advisor who is teaching is more likely to result in underwriting a student research assistant than a grant to a researcher with neither of these responsibilities.

TEACHERS WHO ADVISE ON DISSERTATIONS ARE MOST LIKELY TO HAVE STUDENT ASSISTANTS ON RRP PROJECTS

*Project just begun.

Note: Bracketed number refers to the actual number of funded applicants where there are too few cases for determining proportions.

Still more important, four out of five funded researchers who are both dissertations advisors and teachers report that students who assist them on RRP projects intend to do further work in research, an indication perhaps that experience on a project increases commitment to research (Table 6.8).

Earlier in this chapter we saw that projects conducted by students and by researchers at university bureaus are particularly likely to have an impact at the classroom level (Tables 6.3 and 6.5). Now in Tables 6.7 and 6.8 we see that projects conducted by dissertation advisors provide students with research training which, in turn, stimulates an interest in doing further work in research. In other words, the researcher's stage of professional development, his position, and the nature of his institutional affiliation may influence the

dissemination of his research findings. Given the interest of the RRP in supporting research that will contribute to a climate of research on the campus, these data suggest that the Program should continue to support both student and non-student researchers.

Disseminating the results of research beyond the campus is also of interest. Two active means are presenting a paper at a professional meeting and preparing a manuscript for publication. In addition, as a researcher's work becomes known, he may be asked by a professional journal to evaluate an article on a related topic, or approached by a publisher about a book on his research, or invited by a funding agency to evaluate a proposal. The applicants were asked about each of these outcomes and their plans and experiences are discussed here.

Professional Meetings and Publications

Presenting a paper at a professional meeting is an early stage in the dissemination of research findings beyond the campus. A recent study of information exchange in educational research finds that a meeting presentation is typically the first public announcement.³

At the time of the survey, 67 per cent of the RRP-supported researchers intended to present or had already presented papers at professional meetings.⁴ Most papers are presented at national meetings, although about 15 per cent are presented at state, regional, or international meetings of professional societies.⁵

Students using their projects for doctoral dissertations are less likely to present papers at professional meetings. As Table 6.9 shows, 58 per cent of the doctoral students report their research at professional meetings in contrast to 70 per cent of those who are not using project data for dissertations.

⁴Appendix B, Table 6.3.

5Appendix B, Table 6.4.

One might expect that findings about presentations at meetings would be parallel to that about publications. Though this is true in general, there are differences among PRP-supported researchers. Some attach greater priority to disseminating their research in written form.

First, a higher proportion of researchers write for publication. As noted above, 67 per cent present a paper based on this RRP research at a professional meeting whereas 72 per cent are writing or have written their research results for publication.⁶ As a rule, researchers write journal articles, although about ten per cent plan to write a book or part of a book.⁷

Second, not all researchers are equally likely to publish. The researcher with a Ph.D. in a discipline is most likely to prepare a manuscript for publication; the Ed.D. is least likely (Table 6.10).

TABLE 6.10

THE PH.D. IN A DISCIPLINE IS MOST LIKELY TO PUBLISH THE RESULTS OF HIS RRP-SUPPORTED RESEARCH

| Plan to publish | Type | of doctorat | e | |
|-------------------------------|-----------------------|-----------------------|-----------|-----|
| the results of this research? | Ph.D. in a discipline | Ph.D. in education | Ed.D. | |
| Yes | •75 | •70 | .68 | |
| No | .25 | •30 | •32 | |

| | | | | 251 |

⁷⁵RRP-supported researchers who did not have a doctorate when they applied for funds (N = 109), and researchers with a doctorate whose project had just begun (N = 12).

The $Ph_{\bullet}D_{\bullet}$ in a discipline is expected to be more research-minded while the $Ed_{\bullet}D_{\bullet}$, more practice-minded. And the publication plans of the

⁶Appendix B, Table 6.5.

7Appendix B, Table 6.6.

Ph.D. in a discipline and the Ed.D. recipients of RRP funds appear to suggest these different objectives. Whereas 75 per cent of the Ph.D.'s in a discipline intend to publish the results of their RRP research, this figure is 68 per cent for the Ed.D.'s.

Moreover, the publication history of RRP recipients with doctorates parallels the pattern of the publication intentions just outlined. As may be seen in Table 6.11, 92 per cent of the applicants with Ph.D.'s in a discipline have published at least one research study before applying for a RRP small-projects grant, then comes applicants with Ph.D.'s in education, and only then the Ed.D.'s.

TABLE 6.11

ALMOST EVERY PH.D. IN A DISCIPLINE HAS FUBLISHED A RESEARCH STUDY BEFORE APPLYINC FOR RRP FUNDS

| None | .08 | .15 | •21 |
| TOTALS | 1.00 (159) | 1.00 (81) | 1.00 (106) |
| | | | N = 346 |
| | | Cases | excluded* 309 |
| | | | NA = 10 |
| | | | 665 |

*RRP applicants who do not have a doctorate.

Although students who intend their RRP projects for doctoral dissertations are less likely than non-students to present papers at professional meetings (Table 6.9), this does not mean that they do not publish the results of their research. As Table 6.12 shows, 75 per cent of the students have publication plans for their research, a figure which surpasses 71 per cent for the non-student group.

Finally, the publication plans of doctoral students who subsequently received their degrees⁸ are worth noting, even though they

⁸Thirty-seven of the 65 doctoral students (57 per cent) reported that they received the doctorate after completing the RRP project.

THREE OUT OF FOUR DOCTORAL STUDENTS WHO INTEND THEIR RRP PROJECT FOR A DISSERTATION ALSO PLAN TO PUBLISH THE RESULTS OF THEIR RESEARCH

| Plan to publish | RRP project fo | r a dissertation |

represent only 57 per cent of the funded doctoral students. For this group of researchers, a total of 85 per cent who earned an Ed.D. plan to publish the results of their RRP research (Table 6.13). Even the young Ph.D. in education will be more active in publishing than those holding Ph.D.'s in education granted before 1968 (79 per cent, Table 6.13 to 70 per cent, Table 6.10, respectively). These data suggest that the younger generation of doctorates have a greater interest than the older generation in disseminating the results of their research through publication.

Invitations and Requests

، بر م

To learn the extent to which the dissemination of research conducted by RRP researchers leads to various invitations and requests, we asked the following question:

> As a result of this research, have you received any of the following requests or invitations?

> > (Item #53)

These options were listed:

- -- Asked by a colleague to critically read a paper. -- Asked by a journal to evaluate an article on a related topic.
- -- Asked by a journal to review a book on a related topic.

RRP-SUPPCRTED DOCTORAL STUDENTS WHO EARN AN ED.D. ARE MOST LIKELY TO PLAN TO PUBLISH THE RESULTS OF THEIR RESEARCH

| Plan to publish | Туре | of doctorat | e earned |
|-------------------------------|-----------|-----------------------|---|
| the results of this research? | Ed.D. | Ph.D. in education | Ph.D. in a discipline |
| Yes | .85 | •79 | [3] |
| No | .15 | •21 | [2] |
| TOTALS | 1.00 (13) | 1.00 (19) | [5] |
| | | Cases | N = 37 excluded [*] <u>214</u> 251 |

*Non-students (186) and students (28) who did not report they had received their doctorate when they completed the questionnaire.

Note: Bracketed numbers refer to the actual number of funded applicants where there are too few cases for determining percentages.

- -- Approached by a publisher about writing a book on this subject.
- -- Asked by a funding agency to evaluate a proposal in this or a related area of research.
- -- Invited by a funding agency to submit a proposal for further research in the area.

Table 6.14 shows the proportion of funded applicants receiving each of these invitations and requests.

Two out of five researchers, as a result of their RRP project, are "asked by a colleague to critically read a paper." This is the principal request. Very few researchers receive any of the other requests. For example, only 11 per cent are "asked by a journal to evaluate an article on a related topic," and fewer still--6 per cent --are asked by a journal to do a book review on a related topic. Invitations such as these are probably forthcoming after a researcher's work becomes known and accordingly, a follow-up study would be required to uncover these effects.

FEW RRP RESEARCHERS ARE ASKED TO TAKE ON ASSIGNMENTS RELATED TO THEIR RESEARCH

| Requests or invitations | Proportion of funded applicants | Number of funded applicants |
|---|---------------------------------------|-----------------------------------|
| 1. Asked by a colleague to critically read a paper | •38 | $NA = \frac{16}{222^{*}}$ |
| 2. Approached by a publisher about writing a book on a related topic | .15 | (206) NA = <u>16</u> 222* |

| 4. Invited by a funding agency to submit a proposal for further research | •07 | $NA = \frac{(205)}{17}$ |
| 5. Asked by a funding agency to evaluate a proposal in this or a related area | •06 | (205) NA = <u>17</u> 222* |
| 6. Asked by a journal to review a book on a related topic | •06 | $NA = \frac{15}{222^{*}}$ |

*Twenty-nine cases excluded because project just begun.

103

÷

Career of the Researcher

We conclude this chapter on the short-range effects of RRP research by discussing first, the funded applicant's interest in doing further research on education and second, his professional mobility. As we shall see, being a recipient of RRP funds has considerable effect on interest in doing further research on education and little effect on mobility.

We asked applicants:

What effect has this research experience had on your interest in doing research on education?

(Item #57)

We then presented the following answer options:

- -- It has strengthened my interest in doing research on education.
- -- It has not appreciably affected my interest.
- -- It has diminished my interest in doing research on education.

Seven out of ten funded applicants report that their interest in doing research on education has been strengthened as a result of their RRP project. Only three per cent indicate their RRP experience diminished their interest in research on education.⁹

As Table 6.15 shows, the funded applicants who are most likely to state that their interest in research on education has been strengthened, are the students who undertake projects for their doctoral dissertations. A total of 81 per cent indicate that their interest in the field has increased. This finding does not detract from the 68 per cent of the non-students experiencing greater interest. Resource building, that is recruiting researchers to the field of education is the focal point of the RRP, and every Director of Educational Research seeks to find such peorle. Without a doubt, their work has been productive, as Table 6.15 shows.

As a group, funded applicants do not change institutional affiliations. Three out of four have remained at the same institution. 10

Of the funded applicants, only those who intend their projects for dissertations are more likely to have moved. As may be seen in Table 6.16, 57 per cent re-located, in contrast to 14 per cent of the remaining funded applicants.

⁹Appendix B, Table 6.7.

¹⁰Appendix B, Table 6.8.

105

The fact that more than one half of the doctoral students relocate is not particularly surprising. From the perspective of the RRP the important point is that they develop a keen interest in research on education, which they carry to their new location.

Summary

This chapter has examined the results of RRP-supported research as they affect classroom teaching, colleague exchanges, training of individual students, publication plans, and the career of researchers. The data show that almost every researcher discusses his project in the classroom, about half participate in departmental seminars, and dissertation advisors who also have teaching responsibilities offer students the opportunity to work on their projects. In addition, most researchers plan to publish a manuscript based on their RRP research.

4

The students who are funded and intend using their RRP projects for dissertations are particularly interesting. As a result of their RRP research, they are more likely than non-students to recommend course or curriculum changes, to plan publishing the results of the research, and to have developed a strong interest in research on education.

CHAPTER SEVEN

APPRAISAL OF THE PRCGRAII

This chapter provides an appraisal of the USOE Regional Research Program (RRP) by all respondents. It covers the process of review, the ceiling on grants, and the image of the Program.

......

. . . .

The Review Process

Chapter 5 examined the review process from the perspective of applicant for small project grants. Now we want to consider the review process from the perspective of two other key participants, the field readers and the Directors of the Program. In particular, we will discuss their viewpoints of the two systems for reviewing proposals (by panel or by correspondence), and of the USOE Field Reader Evaluation Form. We will also report what field readers see as the advantages of being a reviewer and their comments about the Program.

As may be recalled, we surveyed field readers who had reviewed at least one proposal for the RRP in FY '68. In this discussion of the field reader data, however, we are not only interested in their experiences in FY '68, but in their cumulative experiences. And, most field readers who served in FY '68 have continued with the Program, 82 per cent to be precise.¹

All but two of the field readers surveyed have reviewed RRP proposals by correspondence² and 27 per cent have also reviewed them at a panel session.³ We asked field readers to evaluate these two systems for reviewing proposals by answering the following question:

> On balance, which system of review do you think yields better evaluations of Regional Research Program proposals: (a) proposals reviewed at a panel session? (b) those reviewed by correspondence? (Item #19)

A total of 33 per cent said they prefer the panel system, 7 per cent review by correspondence, and 60 per cent said they could not compare the two.4

1Appendix B, Table 7.1. 2Appendix B, Table 7.2. 3Appendix B, Table 7.3. 4Appendix B, Table 7.4. Cross-tabulating the field reader's experience with his appraisal of the two systems of review produced the results presented in Table 7.1.

TABLE 7.1

THREE OUT OF FOUR FIELD READERS WHO HAVE REVIEWED RRP FROPOSALS AT A PANEL SESSION PREFER THE PANEL SYSTEM

| | Experience | | |
|--|---|---|-----|
| Preferred system for reviewing proposals | Reviewed proposals by correspondence and by panel | Reviewed proposals by correspondence only | |
| At a panel session | .76 | .17 | |
| By correspondence only | •09 | •06 | |
| Cannot compare the two systems | .15 | •77 | |
| TOTALS | 1.00 (111) | 1.00 (286) | |
| | | N = | 397 |
| | | NA = | _26 |
| | | | 423 |

As may be seen in the table, 76 per cent of the field readers who have participated in panel sessions prefer this system of review. By and large, field readers who have been only individual reviewers report they cannot compare the two systems.

Some field readers jotted notes in the margins of their questionnaires explaining their preferences. A few examples are cited.

> I feel strongly that the panel process gives the proposal writer a better evaluation of his document than a review just by mail.

The panel affords an opportunity to thrash out differences in reviewer evaluations.

I have found the panels stimulating and without a doubt, the best in-service education I experience.

Not every field reader favors the panel. Two who prefer to review by mail said:

Reviewing by mail, one must get down to business. I have found that some panel members don't "do their homework," and the others have to do all the work.

I can spend more time reviewing a single proposal by mail than reviewing a batch of proposals for a panel session.

Of the nine Directors of Educational Research, eight were asked their opinions of the two review systems. All of the eight Directors rated the panel as the better method. Their reasons are perhaps best stated in their con words. One Director said:

> First and foremost, the panel provides an opportunity for the opinions of several individuals to converge on a particular topic. One of these may point up something all the others have not seen. And, it's an interdisciplinary effort and profits from the give-and-take that goes on in the course of arriving at a decision.

Another added:

The panel is the best way to keep subjectivity to a minimum. Some of these reviewers really get emotionally involved and the others bring him back in line.

A third summed up his preference by saying:

The panel is the superior system. The proposals get reviewed three times: (1) by the readers at home; (2) here as they are discussed; and (3) as they think them over in reaching consensus.

In addition, two Directors of Educational Research think it is a good idra for observers to attend panel sessions. They reason that the panel then becomes an additional resource-building tool in their regions. One described his recent experience in these words:

> I got in touch with the directors of regional training programs in my region and invited cach of them to send one of their research trainces at their own expense to a panel meeting. The directors agreed enthusiastically. I then sent a copy of every proposal that was to be considered at the panel to the research trainces, and asked them to read the proposals before coming to the session. I also told them they could comment on the

proposals at the panel session, but they were not to dominate the discussion.

I then insisted on their [invited guests] taking one responsibility: they were to report their experiences at the panel, without identifying any individual when they got back to their college. I must say I got very good reports on this.

Field Reader Evaluation Form

Both field readers and the Directors of Educational Research commented on the suitability of the Field Reader Evaluation Form for reviewing proposals submitted to the RRP. As we shall see, some recommend changes. Table 7.2 lists six changes in the form that field readers considered, and shows the proportion who recommend each one. We will discuss each change, adding the viewpoints of the Directors of Educational Research wherever available. Since the questionnaire to field readers was developed after interviewing the Directors of Educational Research, we do not have their opinions on every change considered by field readers.

Six Proposed Changes

(1) A total of 69 per cent of the field readers recommend that the criterion "adequacy of personnel and facilities" be separated into two parts: "adequacy of personnel" and "adequacy of facilities." They reason that these are in fact two distinct qualities which they would prefer not to evaluate jointly. For example, they may question the researcher's ability to carry out the project, but not the organizational facilities available to him. They would like the form to provide separate sections for such a contingency.

(2) The second change most field readers would like to have initiated is a rating scale for each criterion. After evaluating, say, the educational significance of a proposal, the field reader would then rate this criterion on a scale graded from 0 to 10. He would follow a similar procedure for the other criteria. One Director of Educational Research favors quantifying evaluations of a proposal in this way. The other Directors expressed no preference.

(3) The recommendation:

Perforate the form so that [field reader] comments recorded below a perforation could be sent to the applicant, while those above would be for USOE exclusively

was considered in Chapter 5 as one way the field reader comments could be transmitted directly to the applicant. As may be recalled,

CHANGES IN THE USOE EVALUATION FORM RECOMMENDED BY FIELD READERS

Ś

*Proportion exceeds 1.00 because each field reader could recommend more than one change in the evaluation form.

111

applicants, field readers, and several Directors of Educational Research favor sending a copy of the field reader comments to the applicant.

 (l_1) One-third of the field readers think that page 2 of the evaluation form, which asks the reviewer to discuss the proposal as it relates to his area of specialization, should be eliminated.⁵ Three Directors of Educational Research also are of this opinion. As one said:

I'd cut out that second page. We already know the field reader is qualified before we send him any proposals to read.

(5) Whether to standardize the form by using check-lists instead of essay-type answers evoked the most comment from the Directors of Educational Research. Two completely opposed the idea. The first explained his opposition in these words:

> I wouldn't want a check-list ..., concepts like "educational significance" defy a pat definition ... We shouldn't furnish them [field readers] with the language necessary to make the evaluation.

The second remarked:

The field reader picks out what he considers the most salient aspects [of the proposal] deserving comment. This is one way to evaluate his [field reader's] performance. You'd miss this opportunity with any kind of check-list, and there may be a tendency to just check without adequate thought.

Four Directors are interested in exploring the feasibility of developing some form of check-list, but not one of these favors only check-lists. Each wants space for essay-type responses, as do eighteen field readers who jotted comments in the margins of their questionnaires next to the item.

The criterion, soundness of research design, would be in the view of one Director, the best criterion for check-lists. For example, a check-list might specify the group to be studied, the sample size, the research methods, and the planned modes of analysis. The field reader would rate the extent to which these items were spelled out in the proposed research.

⁵We recently learned from one Director of Educational Research that field readers are no longer asked to complete this page.

(6) By and large, field readers would retain the four criteria now used to evaluate proposals. The only criterion some question is economic efficiency: 13 per cent would eliminate it. This is also the only criterion questioned by the Directors of Educational Research. Two think is does not belong on the form. In their view, it is not within the province of field readers, but of the project officer, who reviews the budget after a proposal is approved for funding. They point out that the local contribution, or cost sharing, is negotiated later, if the proposal is approved for funding.

Two others look at the criterion economic efficiency from another perspective. One said:

Economic efficiency is an important factor ... [field] readers can generally tell whether an applicant is trying to do too much for too little or not enough for too much.

The other expressed essentially the same opinion but added that the "good" field reader suggests budget alternatives when he disagrees with what the applicant proposes. If computer time in a proposal is underestimated, for example, he should offer a more realistic estimate. In other words, these Directors of Educational Research want the field reader to review the specific budget entries.

Finally, some field readers⁶ recommend adding other criteria to the four now used to evaluate proposals. In particular, they would approve including the following criteria:

- -- significance beyond education
- -- creativity of the researcher
- -- suitability [of the proposed research] for replication.

These criteria seem suggestive enough to warrant further thinking. To be applicable, however, they would have to be defined and this is a difficult task. For example, the criterion "significance beyond education" is defined by one respondent as "overal.' theoretical and scientific significance." To another, it means "immediate societal usefulness." Obviously, both respondents have differen ideas about the definition of this criterion and neither definition satisfactorily explains it. Moreover, adding a criterion as sweeping as "significance beyond education" seems to place unrealistic expectations in a smallscale project to be completed within a maximum of eighteen months. We did, however, want to mention this suggested criterion along with the other two for the Directors of the Program to take into account should they revise the Field Reader Evaluation Form.

⁶Appendix B, Table 7.5.

Advantages and Disadvantages of Being a RRP Field Reader

Field readers assessed their experience with the RRP in two ways. First, they checked a list of advantages which might be associated with being a field reader; and second, they gave their reactions to the overall Program.

To learn something of the motivation of field readers, we included the following item in the questionnaire:

> Listed below are some possible advantages of being a field reader for the Regional Research Program. Indicate those that apply to you personally.

(Item #39)

The eight answer options were:

- -- Acquisition of 'intelligence' about USOE granting practices
- -- Contact with educational researchers from other institutions
- -- Contact with USOE officials
- -- Exposure to new research ideas
- -- Intellectual stimulation
- -- Opportunity to contribute ideas to young researchers
- -- Opportunity to influence research on education
- -- Professional prestige.

The responses are summarized in Table 7.3 pelow.

As may be seen in the table, field readers value most the intellectual experience of reviewing proposals. A total of 79 per cent checked "exposure to new research ideas"; next, 68 per cent checked "intellectual stimulation." In contrast, only 23 per cent see "professional prestige" as a reward from being a field reader.

At the very end of the questionnaire space was provided for field readers to comment on any aspect of the Program they wished. Thirty per cent of the field readers expressed their views, and the comments are summarized in Table 7.4.

Four out of ten field readers who volunteered comments about the RRP consider it to be basically sound. Many field readers are enthusiastic about the Program, and the following excerpts from their remarks illustrate this point of view.

> I have a strong positive bias toward the RRP. It is closer to its clients than the central agency and the

small, it is good. Some fine work has been done in projects that cost a pittance.

The small grant program in my estimation has been most successful in stimulating a wide range of research in a variety of settings. I would count it

the most productive and the highest cost/benefit ratio of all USOE programs.

Apart from general reaction to the Program, Table 7.4 also shows that one in five field readers criticize the remuneration they receive. In particular, they criticize the low remuneration and the excessive length of time it takes to receive it. With respect to the modest amount received for evaluating proposals, one field reader said:

> The remuneration is so low that it hardly warrants the expense of processing, plus it demeans the value of the service in the eyes of those performing it. The fee should be raised or eliminated and, if the latter, some other means of recognition for the service should be considered.

Another remarked:

I think field readers should be paid more. It is difficult and time consuming work. I enjoy it but my time needs to be compensated or other ventures encroach.

In addition, some field readers complain about the long interval between review of a proposal and payment. As one phrased it:

Remuneration is scandalously slow. I have not been paid for proposals I evaluated seven or eight months ago.

Twenty-four field readers said they had so little knowledge of the Program that they could not comment on it. Others offered recommendations for improving the Program; the major one being better communication between field readers and the Program. The need is conveyed by these statements from field readers who feel out of touch with the Program:⁷

One of the RRP's limitations is that field readers have never really been oriented.

Another remarked:

The evaluation of a proposal meets a dead end of silence. It is somewhat frustrating to review a proposal and then have no clue as to the consequence of my comments, helpful or otherwise. For that matter, I am not even told whether the proposal gets funded.

With the increasing use of panels, such a sense of isolation is likely to be reduced.

Improved communication can take several forms. For some of the field readers, it is feedback. One expressed it this way:

There should be more feedback to reviewers. I mean about what happens to the proposals I evaluate ... At present I work in isolation, reacting to proposals on an absolute basis with virtually no knowledge of the Program's goals.

The theme of Program goals and fate of proposals was voiced over and over again. Another idea comes from a field reader who suggests that it would be helpful to arrange for field readers to meet as a group with the Directors of the Program at the AERA (American Educational Research Association) annual convention. Field readers would then have an opportunity to ask questions about the Program and to keep abreast of its development.

Finally, 13 per cent of the field readers urge that the RRP be better financed and even expanded. A few of their comments are excerpted here.

> The RRP should be more soundly financed. It puts the DER's [Directors of Educational Research] in a damned embarrassing position when they must drum up proposals and have good proposals rejected because of inadequate funds.

Uncertainty over the availability of funds has served to delay the review of proposals.

I hope the USOE will put more of its resources in the RRP. It should be expanded.

The Present Ceiling

At present, the ceiling for funding an RRP project is \$10,000. Because of rising costs and overhead, some Directors of Educational Research question the adequacy of the present ceiling. Therefore, we asked applicants, field readers, and Directors what the ceiling should be.

Table 7.5 below shows what applicants and field readers recommend as the ceiling for small-project research. A large proportion would retain the \$10,000 ceiling (14 per cent of the not funded; 30 per cent of the funded; and 40 per cent of the field readers). A small proportion would lower it (7 per cent of the not funded; 1 per cent of the funded; and 2 per cent of the field readers). But as the figures in Table 7.5 show, a considerable proportion of applicants and field readers recommend a higher ceiling.

Opinions among the three groups differ. The not funded applicants are the most conservative and less likely than funded applicants to

118

recommend a higher ceiling. Forty-nine per cent of the not funded would raise the ceiling; 69 per cent of the funded recommend raising it; and 58 per cent of the field readers would raise it. The funded applicants are confronted with the reality of their budgets: more than 50 per cent think that the ceiling should be \$15,000 or higher and 25 per cent think it should be \$20,000 or higher.

Essentially three reasons are given for higher ceilings:

- (1) It would cover inflationary increases in project costs;
- (2) It would permit greater flexibility in research design;
- (3) It would provide higher salaries for research and clerical staff and permit acquisition of necessary equipment.

Those who regard the present ceiling as adequate also told us why they hold this opinion. A few of their comments follow:

\$10,000 is enough to 'get off the ground.'

The amount [\$10,000] is about right to promote quickly realized objectives.

Keeping the ceiling low tends to discourage 'grantsmanship.'

A few funded applicants noted that the \$10,000 ceiling would be adequate were it not for the big overhead bite. Two described their experionce in this way. The first remarked:

> The \$10,000 limit is reasonable, if I could use it all for research, but the overhead requirements of my institution reduce the figure too much.

And the second:

\$10,000 turned out to be too small to fit everything in after the university got its 20 per cent overhead.

The Directors of Educational Research also commented on the present ceiling. One favors the present ceiling, summarizing his viewpoint in these words:

> The ceiling doesn't seem to interfere with the product. Some fine research has been done for less than

\$10,000. I don't know that I could buy any higher quality research with more money.

Another thinks the present ceiling is appropriate, but is bothered by the indirect costs. In essence, he thinks the base for funds should be \$10,000 plus indirect costs.

The remaining Directors who discussed the present ceiling favor raising it, but not giving the maximum to every funded applicant. To be specific, they favor a lower ceiling for the doctoral candidate. The amount they suggest ranges from a low of \$4,000 to a limit of \$10,000. Although the Directors differ on the exact ceiling for supporting a doctoral candidate, their reasoning is essentially the same. They want the funds to cover needed facilities, possibly a modest remuneration for the sponsor, and a stipend between \$3,000 and \$5,000 for the doctoral candidate himself.

These Directors of Educational Research want the ceiling raised for other applicants. One said:

1 think an established researcher (one who has a reputation for good work) ought not to be limited to \$10,000. Depending on the project he proposes, he ought to be eligible for \$30,000, \$40,000, maybe even \$50,000.

Another summarized his point of view in these words:

I'd like to see the ceiling raised along with the unsolicited nature of the program preserved. \$50,000 or under is my preference and the exact amount should be worked out in the regional office with the applicant.

And, finally, one Diroctor thinks no ceiling should be imposed.

The ceiling is completely uncalled for. We should handle all unsolicited proposals, for \$1,000 or \$100,000.

Overall Image of the RRP

Applicants, field readers, and the nine Directors of Educational Research gave us their impressions of the RRP by answering four questions about the Program's interests or procedures. These questions will be discussed separately so that the Directors can learn the opinions of those having contact with the Program.

The first question read:

Through a variety of sources, researchers get an overall impression of funding agencies. Is it your current impression that the Regional Research Program is limited to a few areas of special interest, or does it cover a broad range of interests in education?

Three answer options were provided:

-- A few areas of special interest

- -- A broad range of interests
- -- I have no impression

Table 7.6 below shows the proportion of applicants, field readers, and Directors who checked each of the answer-options.

TABLE 7.6

| Image of RRP | Proportion | | | |

| | 251 | 424 | 423 | 9 |

TWO OUT OF FIVE APPLICANTS AND FIELD READERS LACK A CLEAR IMAGE OF THE RESEARCH INTERESTS OF THE RRP

"The number of DER's who gave each response appears in brackets.

Every Director stated that the RRP has a "broad range of interests," but only 57 per cent of the funded applicants, 43 per cent of the field readers, and 18 per cent of the not funded applicants share this impression. The fact that only 18 per cent of the not funded applicants see the Program as having a "broad range of interests" is

probably an unintended consequence of having their proposals turned down. This study points up one aspect of research support which rarely is discussed: an agency's image depends not only on how many researchers it funds, but also on how many it turns down.

The most interesting aspect of Table 7.6 is the large number of both applicants and field readers who have no impression about the research interests of the RRP. One out of three funded applicants have no impression and two out of five field readers also have no impression. These figures suggest that many participants in the Program have virtually no knowledge of the Program's research interests.

The second question asked about the image of the RRP was:

Do you think the USOE Regional Research Program tends to be orthodox or venturesome in its support of research?

The answer options were:

- -- Orthodox; more likely to support established lines of research.
- -- Venturesome; willing to take risks in developing new lines of research on education.

-- No opinion.

Table 7.7 shows how the three groups of respondents answer this question. Eight out of nine Directors characterize the Program as venturesome. The one Director who checked "orthodox," added:

I would like to support more venturesome research, but I find that field readers are more likely to approve 'orthodox' research plans.

Moreover, one-third of the applicants, whether funded or not, and 39 per cent of the field readers have no opinion regarding the tendency of the RRP to be orthodox or venturesome in its support of research. Here again, there is a sharp contrast between the funded and not funded applicants. Only 5 per cent of those not funded view the Program as venturesome, but the number reaches 41 per cent for the funded applicants. It would seem that being denied support has repercussions other than loss of funds.

Even fewer applicants and field readers know whether the RRP is strict or lenient in permitting departures from the original proposal. This question was asked:

> As far as departures from the original proposal are concerned, is it your opinion that the Regional

| | Proportion | | | |

MORE FUNDED APPLICANTS VIEW THE RRP AS VINTURESOME THAM EITHER FIELD READERS OR NOT FUNDED APPLICANTS

"The number of DER's who gave each response appears in brackets.

Research Program tends to be fairly strict or somewhat permissive?

Table 7.8 shows the proportion of respondents checking each of the answer options. Seven of the nine Directors are strict about expecting researchers to adhere to plans stated in their proposals, but applicants and field readers have a different impression. Almost half of the funded applicants consider the RRP fairly permissive in allowing researchers to depart from their original plans. Note too the relatively high proportion of applicants and field readers who have no opinion about this policy. It is not surprising that so many not funded applicants (69 per cent) did not express opinions. Since their proposals did not become RRP projects, they lack the experience upon which to base a judgment. In addition, 37 per cent of the funded applicants and 58 per cent of the field readers are unsure about the Program's policy for handling departures from the proposal. This finding suggests, as well as those in Tables 7.6 and 7.7, that many applicants and field readers have had too little exposure to the RRP's policies to formulate opinions about its practices and interests.

The fourth question regarding the image of the Program was:

In comparing the procedures that an applicant must follow when submitting a proposal to the Regional Research Program with those required by other

agencies, would you say the Regional Research Program involves more, about the same, or somewhat less "red tape"?

An aim of the RRP, as stated in the Guidelines, is:

... to provide for direct and expeditious handling of proposals. 8

We can look to Table 7.9 to learn the success of the Program in achieving this goal. Six of the nine Directors think the Program does well. They say the RRP requires less "red tape" than other agencies. This opinion is not shared by applicants and field readers who are more likely to think of the RRP as requiring as much "red tape" as other agencies. The figures in Table 7.9 reveal that 37 per cent of the funded applicants, 36 per cent of those not funded, and 37 per cent of the field readers hold this opinion.

As discussed earlier in this report,⁹ applicants, field readers, and the Directors all have suggestions for speeding up the processing of proposals. If these suggestions are implemented, we would expect

a follow-up study of participants in the Program to show a higher proportion having the impression that the RRP requires "less 'red tape'" than other agencies.

Summary

EKIC

This chapter has provided an overall appraisal of the USOE Regional Research Program from the perspective of applicants, field readers, and Directors of Educational Research. It has considered the review process, the present ceiling on individual grants, and the image of the Program's research interests and policies.

Both field readers and the Directors of the Program overwhelmingly favor the panel system for reviewing proposals. In addition, they recommend some changes in the present Field Reader Evaluation Form. In particular, a majority of the field readers would separate the criterion "adequacy of personnel and facilities" into two criteria,

126

"adequacy of personnel" and "adequacy of facilities." An equally large mumber think a rating scale should be provided for each criterion. In general, field readers value the exposure to new research ideas that is an inherent aspect of evaluating RRP proposals; and additionally, they value the intellectual stimulation of the experience. But they are critical of the Program too. They are disturbed about the limited contact they have with the regional offices and the remuneration they receive.

Most applicants, field readers, and Directors agree that the present ceiling of \$10,000 per grant should be raised. Applicants and field readers favor ceiling closer to \$15,000. The Directors have different points of view on the issue. One advocates retaining the present ceiling; another thinks there should be none; while several others favor raising the ceiling, but with a provision for varying levels of support. They think it is generally appropriate to support established researchers at a higher level than doctoral candidates for comparable projects.

Only the Directors have a clear image of the RRP's research policies. At least one-third of the applicants and field readers do not know whether the Program supports a broad or narrow range of interests in education, or whether the Program tends to be orthodox or venturesome in its support of research. These findings suggest that the Directors should not delay implementing the recommendations for better communication between the participants on the outside and the Directors in the regional offices, if the Program is to build a uniform identity.

CHAPTER EIGHT

CONCLUSIONS AND RECOMMENDATIONS

The preceding chapters have examined data on the experiences and opinions of key participants in the USOE Regional Research Program (RRP). Those chapters have reported how the Program operates by answering questions such as: Who applies for funds? Who receives support? What projects are proposed? What are the outcomes of the projects? How do the Directors of Educational Research, field readers, and applicants appraise the Program? In these final pages we present the strengths and weaknesses of the Program and suggest steps which can be taken by the RRP and USOE to rectify the weaknesses.

Like many other granting programs, the RRP is multi-goaled. Certainly, a central goal is "resource building." Primarily this means identifying and supporting less established researchers who seek to carry out educationally significant, small-project research. A major conclusion of the analysis is that the Program successfully achieves this objective. Whether pre- or post-doctoral, applicants who have never received a research grant are more likely than previous grant recipients to be funded. Were it not for the RRP, many of these individuals may never have proceeded with their research plans.

In various ways, the research of these beginners contributes to resource building. It enters the classroom, leads to professional publications, and strengthens interest in doing further research on education. The last effect of the research is fostered by the Program in another way. When doctoral dissertation advisors are funded, almost all of them involve students in their projects. As a result of this experience, they report that their students plan to continue in research once the project has been completed. Thus, funding dissertation advisors serves the dual function of supporting research by a professor while simultaneously attracting students to research.

In addition to resource building, the Program advances the state of educational research by attracting researchers trained in various disciplines. In this way educational problems are explored from different theoretical perspectives and by different techniques. Although a majority of applicants specialize in education, almost as many specialize in disciplines ranging from art to zoology.

These findings offer strong evidence for concluding that the Program is what it purports to be and merits continued funding. As for improvement of the Program, the following recommendations are offered:

128

- 1. The administrative budget for the Directors of Educational Research should be stabilized.
- 2. The research budget for small-project grants should be increased.
- 3. The \$10,000 ceiling for individual projects should be raised to \$15,000 plus overhead.
- 4. The panel method of review should be continued.
- 5. Applicants should be notified of the status of their proposals within sixty days of submission.
- 6. Field Reader comments should be sent to every applicant.
- 7. The Directors of Educational Research should offer direction to institutions in the selection of materials to expand their resources for developing proposals.
- 8. The Directors of Educational Research should increase their communication with both applicants and field readers.
- 9. The <u>Guidelines</u> for preparing the proposal document should be revised.
- 10. Periodic summaries of applicant and proposal data should be compiled.

Recommendation 1: The administrative budget for the Directors of Educational Research should be stabilized.

The most serious shortcoming of the Program is its precarious administrative budget. Unpredictable budget freezes in addition to chronic understaffing have plagued the Program since its inception and continue to diminish its effectiveness. Anyone associated with the Program knows well that although it has been in existence nearly five years, it has yet to have a normal year, that is, one free of budgetary crises.

The budget freezes and inadequate staffing in the regional offices have only negative consequences. Travel ceases. Directors cannot visit institutions in their regions to develop the research potential of institutions and individuals. Processing of proposals is suspended. Paperwork in the regional offices continues to mount. These circumstances evoke negative reactions to educational research in general and to USOE in particular. When Directors cannot circulate among institutions in their regions, what justification is there for regionalization?

In brief, unstable and insufficient administrative financing nullifies the prime advantage of regionalization--contact between RRP staff and researchers.

Despite the frustrating budgetary constraints facing the regional offices, we have been impressed by the dedication of the Program's Directors. To a considerable extent, they deserve credit for the accomplishments of the Program. However, the regional offices tend to be one-man operations. Over time, this short-sighted economy undermines the Program. To build stability into the administration of the Program, funds must be provided for clerical help, a professional assistant, and travel. It is essential that these funds be exempt from freezes. Only then can the Directors do the job for which they have been hired and for which the Program has been created.

The RRP, it appears, is not unlike many other programs at USOE which are launched and then must operate on erratic and inadequate budgets.¹ Hopefully, the Program will not be "phased out" before it has been given an opportunity to demonstrate its effectiveness.

Recommendation 2: The research budget for small-project grants should be increased.

Having studied the Program from several perspectives, we think that in addition to stabilizing the administrative budget, the funds for supporting research should be increased. Generally, if one agrees with the claim of many educators, researchers, government officials, and informed laymen that the educational system in the United States suffers from serious shortcomings, then it would seem prudent to allocate more funds to the RRP for continuing its program of resource development. Moreover, as the Program becomes known the volume of applications for research support will increase. In the final analysis, the image of the Program (and

¹A report in <u>Science</u> makes the following observations about USOE:

[It is] difficult to determine which programs [at the U.S. Office of Education] are working and which are not, since many of the new programs are operating on a relative pittance.

Neither Congress nor OE has done much about seriously evaluating the multitude of programs on the books and making improvements where necessary. Drafting and passing a law to create a new program is in many ways easier and politically more profitable than finding out how a program actually works and correcting flaws or abuses.

Walsh, John, "Education: Nixon Nominates a Schoolman as Commissioner," Science, 163 (February 28, 1969), 912-915.

13.3

its parent organization, USOE) depends not only on how much productive research is funded but also on how much is turned away.

Recommendation 3: The \$10,000 ceiling for individual projects should be raised to \$15,000 plus overhead.

The recommendation for increasing the research budget of the RRP has already been stated, but this increase should be large enough to provide for raising the ceiling on individual grants to \$15,000 plus overhead. This increment would help compensate for inflated project costs. However, the major benefit would be greater flexibility in the choice of problems to be studied and research design.

A higher ceiling would permit the collection of data not otherwise possible. At present many RRP projects use students as subjects, but few study the context of the learning environment--the classroom as a whole, the school, the home, or the community. Studies of this scope typically require a larger expenditure than the \$10,000 now awarded.

The recommendation to raise the ceiling on individual projects should not jeopardize the Program's commitment to unsolicited, smallproject research. By keeping the individual awards at a modest level, more researchers can be supported, and the RRP is one of the few federal programs providing the researcher on education with an opportunity to explore the idea he has developed.

Recommendation 4: The panel method of review should be continued.

Chapter Seven provided considerable data on two systems for reviewing proposals (by panel or by correspondence). The majority of field readers and Directors consider the panel to be superior. Occasionally, technical proposals are best reviewed by specialists. When necessary, such reviews can be obtained by mail and then submitted to a panel to permit evaluating the merit of these proposals relative to the others being considered.

Recommendation 5: Applicants should be notified of the status of their proposals within sixty days of submission.

One aim of the Program is:

Processing of proposals from receipt to notification of action is usually completed within two months, except when complications beyond the control of the Regional Office arise.²

²Guidelines, op. cit., p. 6.

This statement leads to unrealistic expectations. Two-thirds of the applicants state that notification took longer than they had expected.³ Marginal comments in their questionnaires dramatize the irritation produced by the delay. We recommend that within sixty days of submitting his proposal the applicant be informed of the funding decision, or the expected date of that decision. The dividends from this procedure would be substantial.

Recommendation 6: Field reader comments should be sent to every applicant.

When the applicant is notified of the disposition of his proposal, the notification should be accompanied by a copy of the field reader comments. Applicants are eager for constructive criticism and field readers themselves endorse the idea. Although the opinions of the Directors diverge on this point, those who have not adopted the practice are willing to give it consideration.

In sending comments to applicants, the identity of field readers need not be revealed.⁴ His interests can be protected by revising the Field Reader Evaluation Form and informing him that his comments will be sent to the applicants. A form could be designed that would provide space below a perforation for comments addressed to applicants and space above for those intended for USOE exclusively.

Recommendation 7: The Directors of Educational Research should offer direction to institutions in the selection of materials to expand their resources for developing proposals.

Although the Directors conduct seminars, clinics, and individual conferences with prospective applicants, we suggest that they also endeavor to assist these applicants by providing guidance to institutions in the acquisition of resource materials. To be specific, one of the findings reported in Chapter Four was that the probability of being funded appears to be related to the number of resources available to applicants--not the number they use in developing their proposals. Whether an applicant uses a particular resource depends on a number of factors, possibly his research training, his experience in writing proposals, or the stage of his research plan. The important factor is the availability of resources at the institution. The wider the range of choice, the greater the opportunity for the researcher to select those appropriate to his needs.

³Table 5.1.

⁴It should be noted that the issue of concealed identity is not salient to field readers. Not one commented on it in the questionnaire.

By way of a reminder, these are the resources which are listed in the applicant questionnaire:

- 1. An "information bank" of agencies that fund research
- 2. Sample application forms of funding agencies
- 3. A "resource person" knowledgeable about applying for research funds
- 4. Copies of proposals submitted by others
- 5. ERIC materials
- 6. USOE's "Guidelines for Small Project Research"
- 7. USOE's "Winning a Research Bid: Tips on Proposal Writing."

We recommend that the Directors guide institutional efforts to secure these resources--most of which are not costly or difficult to obtain. With such materials available, applicants have a greater chance of successfully competing for research funds.²

Recommendation 8: The Directors of Educational Research should increase their communication with both applicants and field readers.

The Directors seem to have a uniform image of the Program's research policies and practices, but a great many applicants and field readers do not know whether the Program is narrow or broad in its interests, whether it is orthodox or venturesome, or whether it is strict or lenient in allowing departures from the research plans stated in proposals. These findings point up a gap in communications. If the Program is to build an identity, the Directors must bridge the gap by providing better and more frequent information to field readers and applicants.

The value that can be derived from improving the relationship of field readers to the Program should not be overlooked. Their specialized knowledge and skills could help the Directors further Program aims. However, field readers cannot be helpful unless they are kept up-to-date on the Program's activities. Informal discussions could be held when panels are convened, or at periodic regional meetings, or even at the annual AERA (American Educational Research Association) convention which is probably attended by a large proportion of field readers.

⁵A summary of some material from this report might also be useful to prospective applicants.

Finally, field readers ought to be notified of the outcomes of the proposals they review. Many admit to a certain frustration in spending time evaluating a proposal and never hearing the granting decision. We recommend that field readers be sent an annual summary of awards listing the project director, the institution, and the title of each study. This would not only inform them of the outcomes of the proposals they had reviewed, but it would also acquaint them with the Program's overall activities. In addition, such a summary would be a convenient way to maintain contact with past and present grantees.

Recommendation 9: The "Guidelines" for preparing the proposal document should be revised.

The section of the <u>Guidelines</u> entitled "The Proposal Document" states that applicants should "outline the proposed research procedures carefully."⁶ As it turns out, many do not. Typical of this lack of specificity is the fact that one-third of the researchers who plan to study students do not state an approximate sample size. Further, the <u>Guidelines</u> do not explicitly request a statement about the planned modes of analysis, and one-fourth of the applicants fail to provide this information. In conjunction with this, applicants neglect to state the data processing techniques they intend to use.

These omissions point up the need to revise the <u>Guidelines</u>.⁽ The simple injunction to "outline carefully" is an empty instruction unless applicants (particularly those who have never previously sought a grant) are told what facts to present in the outline.

Recommendation 10: Periodic summaries of applicant and proposal data should be compiled.

To provide an overview of each fiscal year, we suggest a periodic compilation of data from applicants. This need be neither expensive nor elaborate. With slight modification, the application form could serve as the collection instrument. These items would be useful: educational background, present position, type of institutional affiliation, major field of interest. In addition, there should be a fact sheet for the proposed research which covers subject matter, study design, expected outcome (other than the final report) and, where applicable, sample

⁶Guidelines, op. cit., p. 3.

Although the <u>Guidelines</u> have been revised and reissued as recently as October, 1970, the section entitled, "The Proposal Document," has not been materially altered since July, 1968. characteristics and total costs by item.⁸ Some of the questions and codes developed for this study could be adapted for this purpose. By summarizing these facts, the Directors would be informed of the consequences of their decisions. They would learn who is being attracted, and the nature of the problems being studied. They may discover areas that are underrepresented or not represented at all and, as a result, they may wish to devote attention to arousing interest in these areas among researchers. In sum, the profile of the Program that is being suggested here would facilitate planning and provide a basis for policy revisions.

One further comment about the recommendations. We have presented only those we consider most important, but all of the research reported here offers possibilities for re-examining and improving the Program. It is our hope that the Directors will use these materials for just this purpose.

⁸Subsequent to this study, a taxonomy for proposal data has been developed. See Richard V. McCann. "A Data Base and Data Flow Model for the Regional Research Program," NCERD, USOE, mimeo, November, 1970. Perhaps a similar one will be developed for applicant data.

APPENDICES

APPENDIX A

SAMPLE

The data for this study of the USOE Regional Research Program (RRP) were obtained from two primary sources. Both the applicants submitting proposals to the RRP in Fiscal 1968 and the field readers reviewing these proposals were surveyed by mail questionnaire between July, 1969 and May, 1970.

<u>Applicant sample</u>. In July, 1969 a 23-page printed questionnaire consisting of nearly 100 items was mailed to researchers who had applied to the RRP for a grant during Fiscal 1968. Since everyone had not received support, a different version of the questionnaire was sent to funded applicants (N = 289) than to not funded applicants (N = 585). The total sample size was 874.

On September 1, the return rate was only 36 per cent. Follow-up postcards were then mailed to all applicants who had not returned completed questionnaires. By September 23, the return rate had reached 46 per cent, somewhat of an improvement, but still not accept-able.

Thereafter, efforts to persuade applicants to complete their questionnaires were individualized. In most cases, a personallytyped letter was air mailed to the remaining applicants. The letter stressed the importance of the applicant's participation in the survey and invited him to return an enclosed postcard requesting another questionnaire, if somehow the original one had gone astray. These letters were effective: close to 50 per cent of these applicants either completed the questionnaire or returned the postcard.

In addition to letter-writing, contacts by telephone were started. Applicants in the New York City area served as test cases, and soon thereafter applicants in every region were telephoned. In all, some fifty applicants were contacted in this way. Telephoning was, of course, more costly and time consuming than letter-writing, but it was also more effective. In the end, 85 per cent of the applicants who were telephoned completed their questionnaires.

About fifteen applicants who had not been funded belong in a special group. Instead of completing their questionnaires, they sent indignant letters. They had no interest in answering questions about their proposals which had been so rudely turned down. Each of these applicants was telephoned to urge him to use the questionnaire for

A-1

registering his complaints. Only one of these applicants refused to take advantage of this opportunity.

In all, 665 questionnaires were returned. The return rate for funded applicants was 89 per cent and for the not funded, 73 per cent. Table A.1 below accounts for the 874 questionnaires which were mailed.

TABLE A.1

APPLICANT SAMPLE

| Questionnaires mailed | | Number of applicants |

| Returned and processed | | 665 |
| Not returned | | 177 |
| Dropped from sample: | | 32 |
| Withdrawals and transfers | 12 | |
| Multiple proposals ² | 11 | |
| Deaths | 5 | |
| Unlocatables | 4 | |
| | 32 | |
| TOTAL | MAILED | 874 |

¹After mailing questionnaires it was learned that the proposals submitted by these applicants had been withdrawn or transferred to another bureau within USOE.

²Eleven individuals had submitted two proposals in Fiscal 1968, but alternate respondents could not be secured.

Data from non-respondents has not been completely lost. Fartial profiles have been obtained from the proposals they submitted. Comparison of the non-respondent data with that provided by respondents (Table A.2) shows that respondents and non-respondents are alike in three respects:

1. Cooperating institution. A total of 84 per cent of the respondents and 85 per cent of the nonrespondents listed a college or university as the cooperating institution;

.

A--3

ERIC.

- 2. Employment. At the time the proposal was submitted, 89 per cent of both the respondents and the non-respondents were employed at least parttime;
- 3. Highest degree. In Fiscal 1968, 37 per cent of the respondents held Ph.D.'s; 17 per cent, Ed.D.'s; and 46 per cent, other degrees (e.g., M.A., B.A.). The percentage figures are similar for non-respondents: 41 per cent held Ph.D.'s; 14 per cent, Ed.D.'s; and 45 per cent, other degrees.

Faculty status is the one item which shows a difference between respondents and non-respondents. A higher proportion of junior than senior faculty members cooperated in the survey, suggesting that the Program is of more interest to junior faculty members. Among respondents, 24 per cent were assistant professors, but only 18 per cent were full professors. For the non-respondents, the figures are reversed: 18 per cent were assistant professors, and 25 per cent, full professors.

Field Reader sample. Late in March, 1970, an ll-page mimeographed questionnaire was mailed to 512 field readers, the evaluators of the proposals submitted to the RRP during Fiscal 1968. The response to this questionnaire was prompt and gratifying. By the end of April, 73 per cent of the field readers had completed questionnaires. Early in May a personally-typed follow-up letter was sent by air mail to those who had not returned questionnaires. As with the letter to the applicants, this letter urged field readers to take part in the study; it also added that if the questionnaire had gone astray, the field reader could return the enclosed postcard requesting another. This single follow-up effort increased the return rate to 85 per cent (423 questionnaires).¹

Data abstracted from USOE Field Reader Catalogs permit comparison of the present position, highest degree, degree specialty, and year degree awarded for respondents and non-respondents. As Table A.3 shows, there is no difference in the types of positions held. Ed.D.'s are slightly over-represented among the respondents and Ph.D.'s slightly under-represented. This 5 per cent difference carries over to degree specialty. A higher proportion of respondents than nonrespondents specialize in education and a lower proportion in psychology and surprisingly, in English as well. Finally, both groups of field readers tend to be young, having received their highest degrees within the last ten to fifteen years. The median year for respondents is 1955 and for non-respondents, 1954. The Program's ability to attract young people is not limited to applicants; it extends to field

^LThe corrected sample size is 498. Seven field readers could not be located and another seven were erroneously sent questionnaires.

VIRTUALLY EVERY FIELD READER HAS SERVED AS AN INDIVIDUAL REVIEWER

| Reviewed RRP proposals as an individual field reader? | Proportion of field readers |
|---|-----------------------------|
| Yes | •99 |
| No | <u>_01</u> |
| TOTAL | 1.00 (375) |
| | NA = 48 |
| | 423 |

B**-2**8

TABLE B7.3

ONLY ONE OUT OF FOUR FIELD READERS HAS PARTICIPATED IN A PANEL MEETING

| Participation in panel meeting? | Proportion of field readers |
|---------------------------------|--------------------------------|
| Yes | .27 |
| No | •73 |
| TOTAL | 1.00 (419) |
| | $NA = \frac{4}{423}$ |

TABLE B7.4

ONE OUT OF THREE FIELD READERS PREFER THE PANEL SYSTEM FOR REVIEWING PROPOSALS

| <u> </u> | |
|--------------------------------|---------------|
| Preferred system for | Proportion of |
| reviewing RRP proposals | field readers |
| At a panel session | •33 |
| By correspondence | •07 |
| Cannot compare the two systems | <u>.60</u> |
| TOTAL | 1.00 (398) |
| | NA = 25 |
| | 423 |

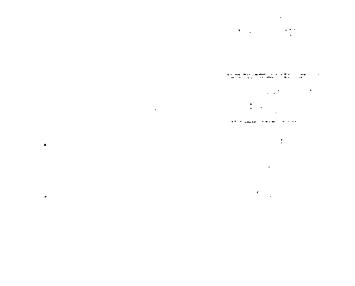

ERIC

TABLE B7.5

SOME FIELD READERS APPROVE ADDING CRITERIA TO THE FOUR NOW USED TO EVALUATE PROPOSALS

| Additional criteria | Proportion of field readers approving |
|--|---|
| Suitability for replication Significance beyond education Creativity of researcher | .56 .47 .42 |
| TOTAL | 1.45^{*} (161) NA = 262 423 |

*Total exceeds 1.00 because field readers could recommend more than one criterion.

STUDY OF

SMALL-PROJECTS PROGRAM

Supported by United States Office of Education

Columbia University Bureau of Applied Social Research 605 West 115th Street New York, New York 10025

.

STUDY OF SMALL-PROJECTS PROGRAM

This questionnaire is directed to the grant you received from the U.S. Office of Education for the project entitled:

١

| Position on project | Title |
|---------------------|-------|
| Name (Please print) | |

First, we would like to learn about your professional activities.

1-6/

1. In the last five years have you been engaged in any other research projects?

Please check for each of the years listed below

| | Engaged in Research on Education (1) | Engaged in Research Other Than Education (2) | Not Engaged in Research (0) |
|------|---|---|-----------------------------------|
| 1968 | 7/ 🗆 | | |
| 1967 | 8/ 🗆 | | |
| 1966 | 9/ 🗆 | | |
| 1965 | 10/ 🗆 | | |
| 1964 | 11/ 🗆 | | |

2. Have you ever received another research grant from any of the following sources?

Check all that apply

12/ 1 🗆 USOE

- 2 \square Another government agency
- $3 \square$ A private foundation
- 4 🛛 Your own institution
- 0 \square No grant received

| 3. | ha ۱ | t coop | perating institution was listed on the title page | of your proposal? | |
|-----|------------------------------|--------------------------------|--|--|---|
| 22/ | 1 🗌 | Colle | ege or University | City and State | |
| | | (a) | To what subdivision did you belong? | | |
| | | 24/ | Check as many as apply 1 School or Department of Education 2 Liberal Arts Department 3 Research Institute or Bureau 9 Other (Please specify) | | |
| | | (b) | If an instructional unit: Was the enrollment was it both? | of the division undergraduate or graduate students, or | |
| | | 25/ | 1 □ Undergraduate 2 □ Graduate 3 □ Joint undergraduate/graduate | | |
| | 2 🗆 | State | Department of Education | | • |
| | 3 🗌 | Scho | ol System | City and State | • |
| | 4 🗌 | Priva | te Agency | City and State | • |
| | 9 🗌 | Othe | r (Please specify) | | • |
| 4. | At th | e time | e you submitted this proposal, what was your | employment status? | |
| 26/ | 1 [] 2 [] 3 [] 4 [] | Empl Empl Gradu Gradu | any as apply oyed full-time oyed part-time uate student full-time uate student part-time t (Please specify) | | |
| | | | If Employed | If Graduate Student | |

| | (b) | Begin | ning date of employment Year 28-29/ | (b) Date of matriculation | |
| | (c) | Positi | on when submitted proposal | Month Year 33-34/ 35-36/ | |

ERIC.

5. (a) At the time you submitted your proposal, what was your major field or specialty?

Please check only one

Education

- 37/ 1 🗆 Administration
 - 2 🗆 Curriculum
 - 3 🗆 Research and Statistics

 - Psychology
- 38/ 1 🗆 Developmental
 - 2 🗆 Guidance and Counseling
 - 3 🖾 Learning
 - 4 🗆 Personality
 - 5 🗆 Testing and Measurement
 - 9 \Box Other (*Please specify*)

Social Science

- 39/ 1 🗆 History
 - 2 🛛 Political Science
 - 3 🗆 Sociology

 - × \Box Other field or specialty (*Please specify*)
- (b) Within your major field, were you specializing in one or more of the sub-areas listed below?

Check all that apv/v

- 40/ 1 🗆 Pre-school
 - 2 🗋 Elementary
 - 3 🗆 Secondary
 - 4 🗆 College
 - 5 🗆 Graduate
 - 6 🗆 Adolescent
 - 7 🗆 Adult
 - 8 🗆 Vocational
 - 9 🗆 Distributive
 - 0 🗆 None
- 6. In what activities were you engaged when you submitted the proposal to USOE?

Please give your best estimate of the time you spent on each activity

Per cent of time Activity Curriculum or educational program development 41-42/ Research (other than for a course or degree requirement) 43-44/ Services (school surveys, consultation, test administration or scoring, workshops, etc.) 45-46/ 47-48/ Working toward an advanced degree: 49/ 1 🗆 M.A. 2 🗆 Ed.D. 3 □ Ph.D. Teaching 50-51/ Other (Please specify, e.g., administration) 52-53/ 100%

-3-171

DEVELOPMENT OF PROPOSAL

- 7. How did you first learn of the USOE Regional Research Program?
- 54/1 Cal presentation of the program by a USOE official

 - 3 🗇 Through CORD, the program for developing research capacities at institutions of higher education
 - 4 🗇 From a colleague, supervisor, dean, or research coordinator
 - 0 🗆 Cannot recall
 - 9 🗆 Other (Please specify)
- 8. How did you plan to conduct the research described in the proposal?

Check one

55/1 □ As a staff member of a research organization (e.g., a Center, Bureau, Institute, or similar unit that conducts more than one study at a time)

Name of research unit Supporting institution City and State

2 As a non-staff member of a research organization who would use the facilities or equipment (e.g., computer, library, clerical staff)

Name of research unit Supporting institution City and State

- 3 🗆 As an independent study director not connected with a research organization
- 9. Was this project the first one you directed or co-directed?

56/ 1 🗆 Yes 2 🗆 No

10. Did you intend the proposed research for a doctoral dissertation?

57/ 1 □ Yes 2 □ No If Yes, please check one: 58/ 2 □ Ed.D. 3 □ Ph.D.

- 11. Thinking back, would you say you had some well-defined research plans before you thought of applying to the Regional Research Program?
- 59/ 1 🗆 Yes, research plans were well-defined before applying to the program.
 - 2 🗆 No, had general idea for research but did not think out details until after dec 🕮 g to apply to USOE.

180

3 🗆 No, did not develop the idea: for this research until I knew about the program.

12 Had you previously submitted a similar proposal to a funding agency?

60/ 1 🗆 Yes 2 🗆 No

- If Yes: (a) What was the agency? 61-63/
 - (b) Did you have to rewrite the proposal before submitting it to the Regional Research Program?

64/ 1 🗆 Yes 2 🗆 No

If Yes: What modifications did you make?

Check all that apply

- 65/ 1 \Box Restricted the scope of the project to stay within the \$10,000 ceiling.
 - 2 🗆 Expanded the research plans to take advantage of the \$10,000 ceiling.

3 \square Focused the project more towards educational problems.

- 13. Was the proposal written to extend research in the same specialty in which you had been working, or to begin research in another specialty?
- 66/ 1 🗆 To extend research in a specialty in which I had been working

2 \square To begin research in another specialty

- 14. (a) When you were preparing the proposal, did you have access to any of the following resources at your institution?
 - (b) And, which did you use?

| | Check all that apply | | |
|---|-------------------------------|--------------------------|--|
| | (a) Available Resources | (b) Resources Used | |
| An "information bank" of agencies that fund research | 67/ 1 🗔 | 68/ 1 🗆 | |
| Sample application forms of funding agencies | 2 🛛 | 2 🗔 | |
| A "resource person" knowledgeable about applying for research funds | 3 🗖 | 3 🗆 | |
| Copies of proposals submitted by others | 4 🗆 | 4 🗆 | |
| ERIC materials | 5 🗆 | 5 🗔 | |
| USOE's "Guidelines for Small Project Research" | 6 🗆 | 6 🗔 | |
| USOE's "Winning a Research Bid: Tips on Proposal Writing" | 7 🗆 | 7 🗆 | |

79-80/05

1.6

15. When you submitted this proposal, did you personally know anyone at your institution who was engaged in research that was being funded by an outside agency?

181 ***

If Yes: Was any of this research supported by USOE?

8/ 1 🗆 Yes 2 🗆 No 3 🗆 Don't know

16. Does your institution have a policy that requires one or more staff members to critically review a proposal prior to submission?

9/ 1 🗆 Yes 🛛 2 🗆 No 🔄 3 🗖 Don't know

17. Apart from institutional requirements, did you ask anyone to critically read your proposal?

10/ 1 🗆 Yes 🛛 2 🗆 No

- 18. If anyone critically read your proposal:
 - (a) What was his position?

| | Check all that apply | | |
|------------------------------------|----------------------------|-----------------------------|--|
| | Within your institution | Outside your institution | |
| Research specialist on education | 11/ 1 🗆 | 12/ 1 🗆 | |
| Researcher in a behavioral science | 2 🗆 | 2 🗆 | |
| Researcher in another discipline | 3 🗆 | 3 🗆 | |
| Dissertation advisor | 4 🗀 | 4 🗆 | |
| Colleague or peer | 5 🗔 | 5 🗆 | |
| Administrator | 6 🗆 | 6 🗆 | |
| Research coordinator | 7 🗆 | 7 🗆 | |
| Bureau director | 8 🗆 | 8 🗆 | |
| Other (Please specify) | 9 🗆 | 9 🗆 | |

(b) As a result of these reviews, did you make any of the following changes?

Check all that apply

- 13/ 1 \square Modified the research design
 - 2 🗆 Incorporated more detailed review of previous research
 - 3 \Box Pointed up the educational significance of the project

 - 5 \square Arranged for more extensive consultation
 - 6 🗆 Included a more complete description of the qualifications of the project personnel
- 14/ 1 🗆 Described the research facilities more explicitly
 - 2 🗆 Extended the bib¹²-graphy
 - 3 Corrected editorial or stylistic weaknesses (e.g., sentence structure, wording, or organization of material)

-6-182

- 4 \square Revised the budget
- 5 🗆 Changed the time schedule
- 0 \Box None of these changes

19. Before you officially submitted the proposal, did you informally discuss it with anyone from the USOE Regional Office or from Washington?

15/ 1 🗆 Yes 🛛 2 🗆 No

If Yes: (a) With whom did you discuss the proposal?

- 16/ 1 🗆 Regional Director of Educational Research
 - 2 🗆 Staff member from Washington

(b) Was the discussion helpful?

17/ 1 🗆 Yes 2 🗆 No

20. As far as preparing the proposal, how would you characterize the USOE's help?

Check one

- 18/ 1 \Box They provided all the help l needed.
 - 2 \Box l wish that they had been more helpful.
 - $3 \square 1$ didn't seek any help from USOE.
- 21. Who paid the clerical costs of preparing the proposal?

Check one

- 19/ 1 🗆 My department or institution
 - 2 \square The costs came out of another research project.
 - $3 \square$ I paid for them personally.
- 22. It is difficult to calculate a precise figure, but what would you guess the clerical costs of your proposal amounted to?

-7-

183

Check one

- 20/ 1 🗆 Less than \$25
 - 2 🗆 \$25 \$49
 - 3 🗆 \$50 \$99
 - 4 □ \$100 or more
 - 0 \Box Cannot guess the cost.

23. Altogether, about how many hours did you actually spend preparing the proposal?

Approximate number of hours 21-23/

- 24. Did you prepare the proposal on your own time or on working time?
- 24/ 1 🗆 On my own time
 - 2 🗆 On my salaried working time

PROCESSING THE PROPOSAL

- 25. Field readers evaluate each proposal according to four criteria: (1) educational significance. (2) soundness of research design: (3) adequacy of personnel and facilities; and (4) economic efficiency.
 - (a) Do you think it is appropriate for each proposal to be judged by all of these criteria?

25/ 1 🗆 Yes 🛛 2 🗆 No

If No: Which one(s) should be eliminated?

- 26/ 1 🗆 Educational significance
 - 2 🗆 Soundness of research design
 - 3 🗆 Adequacy of personnel and facilities
 - 4 🖾 Economic efficiency
- (b) Do you think that any other criteria should be added?

If Yes: Please specify the criteria

26. Do you think that a copy of the comments made by field readers should be sent routinely to each applicant?

Please check only one

- 30/ 1 \Box Yes, these comments should be sent routinely to every applicant.
 - 2 🛛 Yes. but only to an applicant whose proposal has been rejected.
 - $3 \square$ Yes, but only to an applicant whose proposal has been funded.
 - 4 \square No, I don't think the field reader comments should be sent to any applicant.
 - 0 □ I have no opinion.
- 27. It is not unnatural for field readers to be influenced by their own professional interests and experiences. For each of the groups listed below, please indicate the kind of reviewer who would be most likely to recognize the distinctive aspects of your proposal.

Check one under each heading Discipline of reviewers

- 31/ 1 🗆 Education
 - 2 D Psychology
 - 3 🗆 Sociology
 - 0 🗆 No preference

Research interest of reviewers

- 32/ 1 🗆 Basic research
 - 2 🗆 Applied research
 - 0 \Box No preference

Locale of reviewers

- 33/ 1 🗆 Major university
 - 2 🗆 Small college
 - 3 🗆 Non-academic setting, such as a state department of education or school system
 - 0 🗆 No preference

28. Did you have to wait less time or a longer time than you expected to learn that the proposal was funded?

 $34/1 \square$ Less than I expected.

- 2 🗆 About what I expected.
- 3 🗆 Somewhat longer than I expected.
- 4 \square Considerably longer than I expected.

38/ 39-40/

29. Before contracting for this research, did the USOE Regional Office require changes in the proposed research?

Check all that apply

72/ 1 🗆 Research design

- 2 🛛 Data collection instruments
- 3 🗆 Sample
- 4 🗆 Planned modes of analysis
- 5 🗆 Budget
- 6 □ No changes required

If changes required: How did you feel about making these changes?

Check one

73/ 1 \Box They probably strengthened the research.

- 2 \Box They were of small consequence.
- 3 \Box They probably detracted from the research.

30. Did you begin the research on the proposed starting date?

74/ 1 🗋 Yes 2 🗆 No

If No: What problems did the change of starting date create, if any?

Check all problems that apply

- 75/ 1 🗆 Data collection
 - 2 🛛 Own work schedule
 - 3 🗆 Recruiting staff for the project
 - 4 D Paying project costs
 - 5 🗆 Contracting for equipment
 - 0 🗆 No problems

79-80/06

31. Was there anything else especially noteworthy, either positive or negative, about the way the USOE Regional Office processed the proposal?

□ Yes □ No

If Yes: Please jot down your comments here.

CONDUCTING THE RESEARCH

1.6/

32. Were you required to obtain clearance from the USOE for any data-collection instruments used in this research?

7/ 1 🖾 Yes 🛛 2 🗖 No

If Yes: (a) How long did (ake to get clearance? Approximate number of weeks 8-9/

(b) Did the time required for clearance create any problems?

Check one

- 10/ 1 🗆 It created major obstacles.
 - 2 🗆 It created minor obstacles.
 - 3 □ It created no particula obstacles.
- (c) Did the USOE clearance require changes in any instruments?
 - Check all that apply
- 11/ 1 🗆 Deletion of items
 - $2 \square$ Addition of items
 - 3 □ Editing of items
 - 4 🗆 Entire instrument(s) discarded
 - 0 □ No changes
- (d) Was this USOF clearance helpful, or was it a hindrance?

Check one

- 12/ 1 🗆 Yes, heipful.
 - 2 🗆 No, a hindrance.
 - 3 \square It didn't affect the research one way or another.
- 33. Few researchers can anticipate all the contingencies that arise in a research project. While carrying out this research, did you have to depart from your plans?

Check phases of research requiring departures from plans

- 13/ 1 🗆 Sample
 - 2 🗆 Amount of time planned for data collection
 - 3 🗆 Modes of analysis

 - 0 🗆 I did not have to depart from my original plans in any appreciable way.
- 34. Did you encounter problems in obtaining the cooperation of schools or access to subjects?
 - 14/1 □Major problems3 □No problems at all2 □Minor problems4 □Not applicable
- 35. Did you have major difficulty obtaining project help of the following kinds?

Check all that apply

- 15/ 1 □ Clerical help
 - 2 \square Research assistants
 - 3 🗆 Cooperation of administrators at your institution
 - 4 \square Assistance of cons 'tants (or advisors' vhen needed
 - 0 🗆 No major difficulty

36. Did you find that so nuch time was spent collecting the data that less time for analysis was available than originally planned?

16/ 1 🗆 Yes 2 🗋 No 0 🗆 No data collected

37. Did you discover that the project had been underbudgeted in any of the following respects?

Check all that apply

- 17/ 1 🗆 Personnel
 - 2 🗆 Travel
 - 3 🗆 Supplies and materials
 - 4 Communications
 - 5 🗆 Services
 - 6 🗆 Equipment
 - 0 [] Project was not underbudgeted
 - 9 🗆 Other (Please specify)
- 38. Have you prepared any progress reports for the USOE Regional Office?

18/ 1 🗆 Yes 2 🗆 No 0 🗆 None was required

If Yes: Was the preparation of the progress report much cf a problem?

Check one

- 19/ 1 D No, preparing the progress report was a request easily met.
 - 2 🗆 No, but the time could have been better spent.
 - 3 🗆 Yes, it was a chore to prepare the progress report.
 - 9 🗆 Other (Please specify)
- 39. Have you submitted a final report on the project to the USOE Regional Office?

20/ 1 🗆 Yes 2 🗆 No

If Yes: (a) 'Vas the final report completed within the grant period?

21/ 1 🗆 Yes 2 🗆 No

(b) Are you currently engaged in research?

Check all that apply

- 22/ 1 🗆 I am engaged in research on education.

 - 3 🗇 I am not engaged in research.

40. If you have not completed this research project, how far have you progressed?

Check one

- 23/ 1 I have just received the grant.
 2 About one-fourth of the work has been completed.
 - 3 🗆 1 am about haif way through.
 - 4 □ I am about three-fourths of the way through.
 - $5 \square$ have nearly completed the research project.
- 41. Have you submitted another proposal to the Regional Research Program?

If Yes: What is the status of this proposal?

25/ 1 🗆 Fundea 2

2 🗆 Pending 3 1

3 🗆 Rejected

RESULTS OF THE RESEARCH

42. Have any students assisted you on this project?

26/ 1 🗌 Yes 2 🗌 No

If Yes: As a result of their experience on this project, have any of them decided they will do further work in research?

27/ 1 □ Yes 2 □ No 3 □ Don't know

43. Has this project been discussed in any class?

Check all that apply

- 28/ 1 🖾 Yes, discussed but no data presented.
 - 2 🖾 Yes, discussed and project data presented.
 - 3 □ No, not discussed.
 - 0 □ Not applicable
- 44. Has this research led to the addition of new materials to course reading lists?

29/ 1 🗆 Yes 2 🗆 No

45. Are data-from this project being used by students for independent study projects? For master's essays? For doctoral dissertations?

Check all that apply

- 30/ 1 🗇 Independent study projects
 - 2 🗆 Master's essays
 - 3 🗆 Doctoral dissertations
 - 0 □ Not applicable
- 46. Have you encouraged any students to pursue this line of research for independent study projects? For master's essays? For doctoral dissertations?

Check all that apply

- 31/ 1 🗆 Independent study projects
 - 2 🗆 Master's essays
 - 3 🗆 Doctoral dissertations
 - 0 □ Not applicable
- 47. Since you have undertaken this project, do you find that students are more likely to seek your advice regarding M.A. or doctoral theses?

Check one

- 32/ 1 🗆 Students are more likely to seek my advice.
 - 2 🗇 There is no nonceable change.
 - 3 \square Students are less likely to seek my advice.
 - 0 □ Not applicable

48. As a result of this research, have you recommended that any course or curriculum content be modified?

Check all that apply

- 33/ 1 □ I have planned a new course.
 - 2 🗆 I have revised one or more courses.
 - $3 \square$ I have recommended greater emphasis on certain topics, or the addition of new materials.
 - 4 🗆 I have suggested courses in allied disciplines to students.

 - $0 \square$ I have not recommended any changes.
- 49. Have you been invited to discuss this research with a faculty or student group?

Check all that apply

- 34/ 1 🗆 Faculty sen.inar in my department
 - 2 🗆 Interdepartmental faculty seminar
 - 3 🗆 Faculty-student seminar in my department
 - 4 🗆 Interdepartmental faculty-student seminar
 - 5 🗆 Student society
 - 0 □ Have not been invited
- 50. Have you presented (or will you present) a paper based on this project at a state, r 'onal, or national meeting of a professional society?

35/ 1 🗆 Yes 2 🗆 No

If Yes: Please check any that apply

- 36/ 1 🗆 A state meeting of a professional society
 - 2 \square A regional meeting
 - 3 🗆 A national meeting
- 51. Are you writing (or have you written) any manuscripts for publication based on this research?

37/ 1 🗆 Yes 2 🗆].

If Yes: What does this include?

9 \square Other (Please specify)

If you have no plans to publish, please state your reason for not doing so.

41-42/

52 Have you received requests for copies of any written materials based on this project?

Check all that apply

- 43/ 1 🗆 Proposal
 - $\mathbf{2}$ \square Instruments used in the research
 - 3 🗆 Preliminary report
 - 4 🗆 Project memoranda, etc.
 - 5 🗆 Final report
 - 0 \Box No requests received

53. As a result of this research, have you received any of the following requests or invitations?

Check each item

| | Yes | No | |
|----|-----|-----|---|
| | (1) | (2) | |
| 44 | / 🗆 | | Asked by a colleague to critically read a paper. |
| 45 | / 🗆 | | Asked by a journal to evaluate an article on a related topic. |
| 46 | / 🗆 | | Asked by a journal to review a book on a related topic. |
| 47 | / 🗆 | | Approached by a publisher about writing a book on this subject. |
| 48 | / 🗆 | | Asked by a funding agency to evaluate a proposal in this or a related area of research. |
| 49 | / 🗆 | | Invited by a funding agency to submit a proposal for further research in the area. |

54. Since you have had this research experience, have you been asked to serve as a consultant for any of the following groups?

Check all that apply

- 50/ 1 \square Board of Education
 - 2 🗇 State Department of Education
 - 3 🗆 Federal Government
 - 4 Commercial producer of learning materials
 - 0 □ No requests received
- 55. Was your teaching load reduced to enable you to devote more time to this research?

51/ 0 □ Do not teach 1 □ Yes 2 □ No

1.10

56. As a result of working on this project, have you improved your skills in any of the following areas?

-3-179

Check all that apply

1000

- 52/ 1 🗆 Supervising research assistants
 - 2 🗆 Expository writing
 - 3 🗆 Research budgeting
 - 4 🗆 Developing a research design
 - 5 □ Sampling techniques
 - 6 🗆 Survey techniques (interviewing, questionnaire construction)
 - 7 🗆 Locating relevant literature through ERIC
 - 8 🗆 Utilizing general library resources
 - 9 🗆 Computer programming
 - $o \square$ Modes of analysis, such as:
 - 53/ 1 🗆 Analysis of covariance
 - 2 🗆 Analysis of variance
 - 3 🗆 Correlation or regression analysis
 - 4 🗆 Descriptive analysis (non-analytical)
 - 5 🗆 Discriminant function analysis
 - 6 🛛 Factor or cluster analysis
 - 7 🗆 Qualitative or historical analysis
 - 8 🗆 Tests of significance (t tests, chi-square, non-parametric, etc.)
- 57. What effect has this research experience had on your interest in doing research on education?

Check one

- 54/ 1 🗆 It has strengthened my interest in doing research on education.
 - 2 🗇 It has not appreciably affected my interest.
 - 3 🗆 It has diminished my interest in doing research on education.

CAREER ACTIVITIES AND OPINIONS

58. What is your employment status now?

Check as many as apply

- 55/ 1 □ Employed full-time
 - 2 🗆 Employed part-time
 - 3 🗆 Graduate student full-time
 - 4 🗆 Graduate student part-time

If not employed, SKIP TO QUESTION 62.

59. Are you still employed by the organization where you were when you submitted the proposal to USOE, or have you moved?

Check one

56/ 1 □ Yes, I am still employed at the same organization. GO TO QUESTION 60.
2 □ No, I have moved.

If Moved: (a) What is your main organizational affiliation now?

Name of organization 57-62/ City and State (b) What is your position? . . . Title 63-64/ (c) At this new organization, about how much time do you devote to research? Check one 65/1 More time than at former location 2 \square About the same amount of time 3 \Box Less time than at former location 0 🗆 None (d) Did this move to another organization represent a promotion? 66/ 1 🗆 Yes 2 🗆 No 3 🗆 Not sure If Yes: Do you attribute the promotion to your research efforts? 67/ 1 🗆 Yes 2 🗆 Partly 3 🗆 No 4 🗆 Don't know (e) Did you receive a salary increase when you made this move? 68/ 1 🗆 Yes 2 🗆 No If Yes: Do you attribute the increase to your research? 69/ 1 🗆 Yes 2 🗆 Partly 3 🗆 No 4 🗆 Don't know GO TO QUESTION 62.

16-192

60. Have you been promoted since you started this research project? 70/ 1 🗆 Yes 2 🗆 No If Yes: Do you attribute the promotion to your research efforts? 71/ 1 🗆 Yes 2 🗆 Partly 3 🗆 No 4 🗆 Don't know 61. Have you received a salary increase? 1 🗆 Yes 72/ 2 🗆 No If Yes: Do you attribute the increase to your research efforts? 2 🗆 Partiy 3 🗆 No 4 🗋 Don't know 73/ 1 🗆 Yes 79-80/07 1-6 At present, how do you divide your professional time? 62. Please give your best estimate of the percentage of time you spend on each activity. Per cent of time Activity Curriculum or educational program development 7.8/

| 9-10/ | | Research (other than for a course or degree requirement) | | | | |
|--------|------|--|--|--|--|--|
| 11-12/ | | Services (school surveys, consultation, test administration or scoring, workshops, etc.) | | | | |
| 13-14/ | | Working toward an advanced degree: 15/ 1 | | | | |
| 16-17/ | | Teaching | | | | |
| 18-19/ | 100% | Other (<i>Please specify</i> , e.g. Administration) | | | | |

63. At present, are you an advisor for doctoral dissertations?

20/ 1 🗆 Yes 2 🗆 No

If Yes: About how many students are you currently advising? . .

64. If you have had teaching experience:

42

| 23-24/ | |) How many years have you taught in elementary or secondar | y school? |
|--------|------|--|-----------|
| 25-26/ | •••• |) How many years have you taught college undergraduates? | |
| 27-28/ | |) How many years have you taught graduate students? | |
| 29-30/ | |) How many years have you done other types of teaching? | |

65. Are you a member of any national professional societies?

31/ 1 🗆 Yes 2 🗆 No

... 182

If Yes: Please name the two which are of greatest value to you.

Use identifying words in full

32-33/ Name of professional society

66. Within the last two years have you attended a meeting of an academic or professional society?

36/ 1 🗆 Yes 2 🗆 No

67. Have you ever been a field reader for the U.S. Office of Education?

37/ 1 🗆 Yes

if Yes: Approximately how many proposals have you reviewed?

Number 38·39/ 2 🗆 No

If No: Do you know anyone who is (or has been) a fir 1d reader?

40/ 1 🗆 Yes 2 🗆 No

68. Have you ever been a consultant to the U.S. Office of Education?

41/ 1 🗆 Yes 2 🗆 No

- 69. How many research studies (articles, monographs, or books) have you published, and what was the date of your first publication?
 - Number
 Type of publication

 Articles

 42-43/
 Monographs

 44-45/
 Books

 46-47/
 Books

 Date of first publication
 Year

50/ 0 🗆 No research studies published.

. . . .

48-49/

70. Some researchers interested in education seek mainly to achieve recognition from behavioral scientists outside the field of education, while others are primarily concerned with being recognized by researchers within education or by schoel practitioners. Please check the group whose judgement is most important to you personally.

Please check only one

- 51/ 1 🗆 Researchers within education
 - 2 🗆 Researchers outside education
 - 3 🗆 School practitioners
 - 0 \Box None of these
- 71. Through a variety of sources, researchers get an overall impression of funding agencies. Is it your current impression that the Regional Research Program is limited to a few areas of special interest, or does it cover a broad range of interests in education?
- 52/ 1 🗆 A few areas of special interest
 - 2 \square A broad range of interests
 - 0 □ 1 have no impression.
- 72. Do you think the USOE Regional Research Program tends to be orthodox or venturesome in their support of research?
- 53/ 1 🗋 Orthodox; more likely to support established lines of research.
 - 2 U Venturesome; willing to take risks in developing new lines of research on education.
 - 0 □ I have no opinion.
- 73. As far as departures from the original proposal are concerned, is it your opinion that the Regional Research Program tends to be fairly strict or somewhat permissive?
- 54/ 1 🗆 Fairly strict in expecting researchers to adhere closely to plans stated in proposals.
 - 2 🗆 Fairly permissive in allowing *r* searchers to depart from their original plans.
 - $0 \square$ I have no opinion.
- 74. In comparing the procedures that an applicant must follow when submitting a proposal to the Regional Research Program with those required by other agencies, would you say the Regional Research Program involves more, about the same, or somewhat less "red tape"?
- 55/ 1 \Box More "red tape" than most other funding agencies
 - 2 🗆 About the same amount of "red tape"
 - 3 □ Somewhat less "red tape"
 - $0 \square$ I have no opinion.
- 75. Some researchers view the regulation requiring clearance of educational data-gathering instruments as a good idea, whereas others regard it as an unwarranted intrusion by USOE. What is your opinion, if any?
- 56/ 1 \Box It is a good idea.
 - 2 \Box It is an unwarranted intrusion by USOE.
 - 0 🗆 I have no opinion.
- 76. Have you ever submitted any data-gathering instruments to USOE for clearance?

57/ 1 🗆 Yes 2 🗆 No

-19-195 77. As you may know, it is standard practice for the USOE to withhold a fixed percentage of a grant until the final report has been approved. Do you think this is a good idea?

58/ 1 \square l agree with this practice.

- 2 \Box l disagree with it.
- $0 \square$ I have no opinion.
- 78. The USOE Regional Research Program encourages significant small scale educational research projects. What do you think the ceiling on funds should be for small project research?

Please comment on your preference.

62-63/

79. Finally, if you were to get a research grant for \$10,000 or less, do you have any preference about the source of the grant?

Check one

64/ 1 🗆 l prefer a government agency. (Specify a particular one, if you wish.)

2 🗆 I prefer a private foundation. (Specify, if you wish.)

9 \Box Other source (Please specify)

 $0 \square$ I have no preference about the source of the grant.

If you do have a preference: Which of the following considerations influenced your choice?

-20-196

Check any that apply

- - 2 🗆 Promptness of notification regarding support
 - 3 🗆 Method of proposal review
 - 4 \square Freedom to modify research plans
 - 5 🗆 Amount of project monitoring by funding agency
 - 6 \Box Little likelihood of budgetary cutback
 - 7 \square Latitude in preparation of final report
 - 8 🗆 Copyright privileges
 - 9 \Box Other (*Please specify*)

QUESTIONNAIRE FOR FIELD READERS

Supported by

United States Office of Education

Bureau of Applied Social Research COLUMBIA UNIVERSITY 605 West 115th Street New York, New York 10025

.

- 1. All information is confidential. The results will be published only in statistical form.
- Most questions can be answered by a check-mark. If you wish to explain your responses, jot your comments in the margin.
- 3. When completed, please return the questionnaire in the enclosed envelope

CAREER ACTIVITIES AND OPINIONS

1-6/ _____ (FR number)

1. Have you been engaged in research during any of the years listed below? PLEASE CHECK FOR EACH YEAR

| Year | | Engaged in research on education (1) | Engaged in research other than on education (2) | Not engaged in research (0) |
|------|-----|---|--|-----------------------------------|
| 1969 | 7/ | [] | [] | [] |
| 1968 | 8/ | [] | [] | [] |
| 1967 | 9/ | [] | [] | [] |
| 1966 | 10/ | [] | [] | [] |
| 1965 | 11/ | [] | [] | [] |
| 1964 | 12/ | [] | [] | [] |

 Have you ever submitted any proposals to the U.S. Office of Education's Regional Research Program?

13/y 1[]Yes 2[]No

| IF YES: | (a) | How many have you sublitted? Number | 14/15 |
|---------|--------------|--|-------|
| | (b) | What have the outcomes been? Number | |

| Pending | 16/17 |
|------------|-----------|
| Funded | 18/19 |
| Not funded | 20/21 |
| Not randou | |

3. Have you ever received a research grant from any of these sources?

CHECK ALL THAT APPLY

No.

| 22/ y | 1 [] | U.S. Office of Education |
|-------|-------|-------------------------------|
| • | 2 [] | Another federal agency |
| | 3 [] | State or municipal government |

1.7 (a) What is your major field or specialty? PLEASE CHECK ONLY ONE EDUCATION 23/ 1 [] Administration 2 [] Curriculum у 3 [] Research and Statistics 4 [] Teacher Training 9 [] Other (Please specify)_ _____ PSYCHOLOGY 24/ 1 [] Developmental 2 [] Guidance and Counseling у 3 [] Learning 4 [] Personality 5 [] Testing and Measurement 9 [] Other (Please specify)_ SOCIAL SCIENCE 1 [] History 25/ 2 [] Political Science У 3 [] Sociology 9 [] Other (Please specify)_____ 26/ [] Other Field or Specialty (Please specify)_____ У (b) Within your major field, do you specialize in any of the sub-areas listed below? PLEASE CHECK ALL THAT APPLY 27/ 1 [] Pre-school 2 [] Elementary У 3 [] Secondary 4 [] College 5 [] Graduate 6 [] Adolescent 7 [] Adult 8 [] Vocational 9 [] Distributive X [] Other (Please specify)___ 0 [] None

-2-

4.

5. At present, how do you divide your professional time?

PLEASE GIVE YOUR BEST ESTIMATE OF THE TIME YOU SPEND ON EACH ACTIVITY

| | Per cent of time | Activity |
|--------|---------------------|--|
| 28-29/ | •••• | Curriculum or educational program development |
| 30-31/ | | Research |
| 32-33/ | •••• | Services (school surveys; consultation; test administration; workshops) |
| 34-35/ | • • • • • | Teaching |
| 36-37/ | 100% | Other (<i>Please specify</i> , e.g., administration) |

6. Are you an advisor for doctoral dissertations? 38/ y 1[] Yes 2[] No IF YES: (a) How many dissertations are you currently supervising?

Number 39-40/

(b) Are any of these dissertations supported by the USOE Regional Research Program?

41/x 1 [] Yes 2 [] No 3 [] Don't know y

- 7. Are you now under contract to the U.S. Office of Education as a field reader? 42/ y 1 [] Yes 2 [] No
- 8. In all, how many years have you been a field reader for the U.S. Office of Education?

Number of Years 43-44/

9. Altogether, how many USOE proposals have you reviewed?

Number 45-46/

10. Of these proposals, about how many were submitted to the Regional Research Program?

Number 47-48/

- -4-
- 11. Thinking back, would you say that the quality of the proposals you have reviewed for the Regional Research Program has changed in the following respects:
 - (a) The criterion educational significance is more, or less, frequently satisfied now than in the past?

49/ y 1 [] More frequently satisfied

- 2 [] No observable change
- 3 Î] Less frequently satisfied
- 0 [] I have no impression.
- (b) The criterion soundness of research design is more, or less, frequently satisfied now than in the past?
- 1 [] More frequently satisfied
 2 [] No observable change
 3 [] Loss frequently satisfied 50/ y] Less frequently satisfied 3 [0 [] I have no impression.
- 12. Do you think that a copy of the comments made by field readers should be sent routinely to each applicant?

PLEASE CHECK ONLY ONE

- 1 [] Yes, these comments should be sent routinely to all 51/ y applicants.
 - 2 [] Comments should be sent only to applicants who request them.
 - 3 [] Comments should be sent only to applicants whose proposals have been rejected.
 - 4 [] Comments should be sent only to applicants whose proposals have been funded.
 - 5 [] No, I don't think field reader comments should be sent to any applicants.

- 0 [] I have no opinion.
- 13. Should field readers be informed of the outcomes of the proposals they evaluate?

52/y 1 []Yes 2 [] No 0 [] No opinion

Should the final report be reviewed by a field reader who recommended 14. the project for funding? · . • . • . •

53/ y 1 [] Yes 2 [] No 0 [] No opinion

The present USOE Evaluation Form asks the reviewer to: 15.

- Provide an overall evaluation of the proposal; (a)
- Discuss the proposal as it relates to the reviewer's area of (b) specialization; and
- (c) State to what extent the proposal satisfies four criteria:

 - educational significance
 soundness of research design
 adequacy of personnel and facilities
 economic efficiency.

Would you recommend any of the following changes in the Evaluation Form?

CHECK ALL CHANGES YOU RECOMMEND

| | For Regional Research Program proposals | For all USOE proposals |
|--|---|---------------------------|
| Eliminate (b) above | 54/ 1 [] | 56/ 1 [] |
| Provide a rating scale for each of the four criteria (e.g., educational significance). | 0 · 2 [] | 0 2 [] |
| Standardize the form by using checklists instead of essay-type answers. | 3 [] | 3 [] |
| Separate the criterion "adequacy of personn and facilities" into two criteria, "adequac of personnel" and "adequacy of facilities." | у | 4 [] |
| Perforate the evaluation form so that comme recorded below the perforation could be sen to the applicant, while those above would b for USOE exclusively. | t | 5 [] |
| Eliminate one or more of the criteria liste in (c) above: | d | |
| (1) educational significance | 6 [] | 6[] |
| (2) soundness of research design | 7 [] | 7 [] |
| (3) adequacy of personnel and facilities | 8 [] | 8 [] |
| (4) economic efficiency | 9 [] | 9[] |
| Add other criteria to (c) above: | | |
| (1) significance beyond education | 55/ 1 [] | 57/ 1 [] |
| (2) creativity of researcher | 0 2 [] | 0 2 [] |
| (3) suitability for replication | 3 [] | 3 [] |
| (4) other (Please specify) | 9[] | 9 [] |

20. In addition to being a field reader, have you ever been a consultant to USOE?

 - 2 [] Encourage the researcher to develop his own interest.
 - 3 [] I have no opinion.
- 33. In comparing procedures that an applicant must follow when submitting a proposal to the Regional Research Program with those required by other agencies, would you say that the Regional Research Program involves more, about the same, or somewhat less "red tape"?
 - 38/ y [] More "red tape" than most other funding agencies
 2 [] About the same amount of "red tape"
 3 [] Somewhat less "red tape"
 0 [] I have no opinion.

34. Some researchers view the regulation requiring clearance of educational data-gathering instruments as a good idea, whereas others regard it as an unwarranted intrusion by USOE. What is your opinion, if any?

39/ y 1 [] It is a good idea. 2 [] It is an unwarranted intrusion by USOE. 0 [] I have no opinion.

35. Have you ever submitted any data-gathering instruments to USOE for clearance?

40/y 1 [] Yes 2 [] No

- 36. As you may know, it is standard practice for the USOE to withhold a fixed percentage of a grant until the final report has been approved. Do you think this is a good idea?
 - 41/ y 1 [] I agree with this practice. 2 [] I disagree with the practice. 0 [] I have no opinion.
- 37. A stated goal of the Regional Research Program is:

"To encourage small colleges to undertake research programs so that students may benefit from having professors who are engaged in educational research activities."

Do you think that this goal should be emphasized more, about the same, or less than it is now?

42/ y 1 [] More 2 [] About the same 3 [] Less 0 [] I have no opinion

38. The present ceiling on funds for proposals submitted to the Regional Research Program is \$10,000. What do you think the ceiling on funds should be?

43-45/

- E. Specialties List

INTRODUCTION

This codebook is based on data obtained from four sources:

Applicant Questionnaire Field Reader Questionnaire Applicant Proposal Proposal Evaluation.

Applicant Questionnaire. In July, 1969, two versions of this questionnaire were mailed to all applicants submitting proposals to the USOE Small-Project Grants Program during Fiscal Year 1968. One was sent to applicants who were funded (N=281), and the other to those who were not funded (N=561). Six hundred sixty-five questionnaires were returned and processed (89 per cent of the questionnaires sent to funded applicants and 73 per cent of those sent to not funded applicants). Section I of the codebook presents the data from these questionnaires.

Field Reader Questionnaire. In March, 1970, a questionnaire was mailed to 498 field readers, the evaluators under contract to USOE, who reviewed the proposals submitted during Fiscal Year 1968. Four hundred twenty-three questionnaires were returned and processed (85 per cent). Section II presents the data from these questionnaires.

Applicant Proposal. Factual material was abstracted from the proposals submitted by each applicant in the questionnaire sample. Data from the 665 proposals for the applicants completing the questionnaire are presented in Section III, and those from the 177 proposals for the applicants not responding to the questionnaire are presented in Section IV.

The background data for the 177 non-respondents, appearing in Section VI of the codebook, was extracted from their proposals.

Proposal Evaluation. The field reader recommendations and ratings on the major criteria for evaluating each proposal are presented in Section V_{\bullet} .

NOTES

Multiple-Punched Columns. Originally, many columns were multiplepunched. For computer processing, the punches have been transferred to separate columns. Each numeric punch, one through nine, has been converted to a one (1) in the new column. A zero punch (0) in the new column indicates that the response category was not checked by the respondent. Each zero (0), X (11 punch), or Y (12 punch) has been transferred as a one (1), but the absence of the punch has not been assigned a value; the column has been left blank -- a reject (R). The frequencies for the zeros and rejects in the new columns do not appear in the codebook.

Column Totals. Where column totals appear in the codebook, the original column contained multiple punches.

APPLICANT POSITION

- 01 Director of Research
- 02 Supervisor of Research
- 03 Coordinator of Research
- 04 Research Associate
- 06 Project Director
- 10 Department Chairman
- 11 Full professor
- 12 Associate Professor
- 13 Assistant professor
- 14 Instructor
- 15 Lecturer
- 20 Post-graduate research student
- 21 Research Assistant
- 23 Graduate Assistant
- 24 Teaching Assistant
- 30 Director of service unit
- 31 Dean
- 33 Director of Library
- 35 General administration
- 37 Assistant to Dean
- 38 Assistant Dean
- 40 Supervisor
- 43 Program coordinator
- 45 Director of Extension
- 46 Associate director of
- special program
- 47 Director of educational program
- 49 Assistant Director special program

- 50 Guidance, NEC
- 51 Psychologist
- 54 Counselor
- 55 Consultant
- 58 Psychiatrist
- 71 Classroom teacher
- 72 Teacher, special education
- 73 Curriculum specialist
- 74 Speech therapist
- 75 Area specialist (e.g., drama)
- 81 Principal
- 82 Superintendent
- 84 Assistant Superintendent
- 85 Headmaster
