#### ABSTRACT

The North Carolina Employment Security Commission (ESC) conducted a followup study of the 986 State applicants deactivated during August 1968 and 6 months later to ascertain the effectiveness of the program. This report is concerned primarily with the 6-month followup. The 586 applicants who responded to the first questionnaire were mailed the followup survey. A total of 494 persons after 1 month and 464 after 6 months were still in the labor force. About two-thirds of the respondents were employed at the time of both studies. The unemployment rate was 21.7 in August and 14.2 percent 6 months later, reflecting the fact that 30 persons in the group dropped out of the labor force. For both the 1- and 6-month followup studies, the increase in the mean weekly earnings for those applicants who received services was greater than the gain in the mear weekly earnings of those applicants who did not receive es. A report on the 1-month followup study is available as MP 0 (

#### SIX-MONTH FOLLOW-UP SURVEY OF INACTIVE APPLICANTS IN THE RALEIGH, N. C. AREA MARCH, 1969

#### Explanation of the Study

This report supplements an earlier report \( \frac{1}{2} \) on a follow-up survey of inactive job applicants which was conducted in the Raleigh, N. O., area in September of 1968. Whereas the initial report dealt with the status of inactive applicants one month after their applications had been deactivated, this summary presents information relating to the status of a portion of the same applicant group six months subsequent to the one-month follow-up survey.

At the time of the one-month follow-up in September, 1968, an effort was made to survey all of the 986 applicants whose applications had become inactive during the month of August; however, only 586 applicants (59.4 percent) returned mail questionnaires or were contacted in person for information. In the six-month follow-up survey, questionnaires were mailed only to the 586 applicants who had responded or had been contacted at the time of the one-month follow-up. Of these 586 applicants, 419 persons (71.5 percent) responded or were contacted in person. Thus, during the second follow-up survey, information was obtained for only about 43 percent of the original 986 deactivated applicants.

Unless otherwise indicated all data in this supplemental report relate to the 586 applicants who were mailed questionnaires in connection with the six-month follow-up survey.

<sup>&</sup>quot;Whatever Happened to What's His Name," Employment Security Commission of North Carolina, August, 1968.

#### HIGHLIGHTS

As in the case of the one-month follow-up survey, one major objective of the six-month follow-up study was to determine the labor force status of job applicants six months after the initial follow-up survey. The following table compares the labor force status of 580 applicants at the time of the one-month and six-month study periods.

gar kan kalikatan inan diandapa mpan ada kentan dikant pi 1901 mpa mita mbalakhanpa mbala pa mbay pada dipanganan ada mbala man	At Time 1 Mo. F	e of Follow-Up		of collow-Up

Table G presents labor force status and response pattern information for the 586 applicants who were mailed questionnaires at the time of the six-month follow-up survey. As shown in Table G, an effort was made to contact in person 42 of the 182 persons who did not respond to the mail survey; however, only 34 persons could be reached. Nevertheless, information concerning the labor force status of these 34 individuals (which represented 18.7 percent of nonrespondents) was used to estimate the probable labor force status of all nonrespondents. (The procedure followed is shown in tabular form in the appendix). Table A shows the resulting estimated labor force status of all 586 individuals who were sent questionnaires during the six-month follow-up

3

Table A further presents a cross tabulation depicting the change in labor force status of the 586 applicants between the two survey periods (i.e., from September 1968 to March 1969). From this table it may be seen that of the 387 persons who were employed at the time of the September 1968 study, at least 333 (85 percent) were still employed (not necessarily on the same job) at the time of the March 1969 follow-up. Also 15 of the 387 employed in September had become unemployed by March 1969, and 38 had withdrawn from the labor force.

Tables B and C show cross tabulations of weekly earnings of responding applicants as of the 1st and 2nd follow-up survey. Table B depicts this information for those applicants which had received one or more local office services, whereas Table C shows the information for applicants who received no services.

Table E shows a comparison of average weekly earnings for employed respondents as of the time of their last regular job (as shown on the ES-511), at the time of the one-month follow-up in September 196 and the of the six-month follow-up in barch 1969. The weekly earnings data are broken down according to applicant groups which did or did not receive one or more services from the local office. It is apparent from this table that the same trend observed at the time of the one-month follow-up continued to exist at the time of the six-month follow-up; that is, the increase in the mean weekly earnings for those applicants who received services (\$5.78) was greater than the gain in the mean weekly earnings of those applicants who did not get services (\$4.12). Also, as in the base of the one-month follow-up, the mean weekly earnings for those applicants who did not get services (\$48.10) was somewhat higher than the mean weekly earnings for the applicant group which had received ervices. (\$80.35).

Table D presents a cross tabulation of unemployed respondents and respondents who were not in the labor force as of the time of the one-month follow-up by their labor force status at the time of the six-month follow-up. The data in this table also are further broken down into the applicant group which received local office services and the group which did not. It may be noted that a slightly higher proportion (23 percent) of the unemployed who had received ES services were employed at the time of the six-month follow-up than were the unemployed who had not received services (17 percent). Furthermore the average weekly earnings of those who had received service (\$67.29) was greater than the earnings of those applicants who did not get services (\$55.80). Conversely, among the applicants who were not in the labor force at the time of the one-month follow-up, a greater proportion of the applicants who did not get local office services (30 percent) had entered the labor force and found work than had those applicants who had received services (8 percent). Also, the average weekly earnings of the group which did not receive services was slightly higher (2.7.20) than the earnings of the group which had received services (\$53.80).

At the time of the one-month follow-up survey there appeared to be no significant difference between the applicant group which received local office services and the group which did not receive services in so far as the proportions who earned more pay, less pay, or the same pay on the job held at survey time when compared with the last regular job shown on the ES-511. As of the time of the six-month follow-up; however, the proportions are noted to have changed somewhat. As may be seen in Table F, among the applicants who had received local office services, 64.3 percent reported that their earnings in March 1969 were higher than in September, 1968. Among applicants who did not receive services,

-4-

only 58.1 pecent reported that their earnings had increased over the two survey periods. With respect to applicants reporting lower pay between the two survey intervals the proportions were 19.3 percent for applicants who had received services as opposed to almost 28 percent for applicants who had not received services.

Of the 986 applicants which were inactivated during August, 149 (15 percent) were classified HRD. In response to the one-month follow-up survey in September 1968 a total of 586 applicants responded, of which 85 (14.5 percent) were HRD. During the six-month follow-up survey in March of 1969, a total of 419 applicants responded of which 50 (11.9 percent) were HRD applicants.

The Labor Force Status of 148 non-respondents plus 19 persons whose questionnaires were returned by the Fost Office (total 167 individuals) as of the six-month follow-up period was estimated on the basis of the labor force experience of 34 persons who were contacted by telephone. \*

Questionnaires were returned by Fost Office as undeliverable. \*

·	TOTAL	586	358	0	んナナ	`

A blow-up factor for each L. F. component was computed by dividing the total non-respondents in the component by the response sample contacts in that component. The resultant factor for the component was then applied to the sample labor force status data for the component. Example for employed: 110  $\div$  17 = 6.470 Factor X 15 sample enployed = 97 total estimated employed non-respondents, etc.
