#### **ABSTRACT**

A test developed to assess alienation in sixth grade Spanish American students was administered to migrant students in Grades 4-8. Validity studies indicate that the test may have been too difficult for the grade levels and cultural characteristics of that group. Recommendations for further testing are included. (See TM 000 995 for a copy of the instrument.) (AG)

\*a paper given at the Rocky Mountain
Educational Research Association Meeting

October 28 and 29, 1971.
Boulder, Colorado

During the third Migrant Summer Program of a public school during 1970, it was decided that the alienation and acculturation instruments developed by Cordova would be used to assess attitudinal change. For the purpose of this paper, only the alienation scale is considered.

The definition of alienation and its four factors to be measured were:

Alienation - a feeling of estrangement from a social system and a feeling of self-estrangement in that situation.

#### Factors

Normlessness - a low expectancy on the part of the individual that socially unapproved behaviors are required to achieve the given goals stressed by that social system or collectively.

Powerlessness - a low expectancy on the part of an individual that he can, through his own behavior, achieve any of the rewards he seeks.

Self-estrangement a situation in which there is a lack of intrinsic meaning in activities the individual engages in.

Isolation - a situation in which the individual assigns low reward value to the goals or beliefs that are highly valued in that situation.

(Cordova, 1969, p.17)

In light of the felt educational and social needs of these migrant children, the six week program was intended to:

- 1. Improve skills in mathematics and reading.
- 2. Encourage student competition and instill pride.
- 3. Help eliminate inferiority feelings.
- 4. Advance each student's will to succeed by giving him or her chance to succeed.
- 5. Help the student learn to enjoy school rather than to dislike it.
- 6. Give each student an opportunity to receive a broader education and to see some of the finer things of life.

7. Provide the migrant farm children in this area with enjoyable and meaningful experiences that will enable them to have a better chance to succeed in regular school.

The instrument was administered verbally to the migrant students in grades four through eight since it was assumed that lack of reading proficiency might hinder test comprehension. There were a total of 55 pre-test and 42 post test subjects. It was decided that the administration of the test would be the same for all groups since it was assumed that the treatment would not adversely affect the ability of the students to respond in the same environmental melieu. To substantiate test validity, Varimax Rotated factor analysis was TEST VALIDITY utilized for the major portion of the data evaluation. When the combined pre and post data for the alienation measure were reduced to eight factors, a dispersed grouping of items was noted. Sequential reduction to four factors showed the need to remove items due to low or double factor loadings and semantic inappropriatness. Again utilizing the Varimax Rotated Analysis fechnique but separating the data into respective pre ( $n_1 = 55$ ) and post  $(n_2 = 42)$  data sets, the four calculated factors showed little relationship when compared by group responses. A total of eleven items loaded within three of the four previously defined factor groupings and the pre and post response data. Of these eleven items, number 23, "How often do you find yourself enjoying your school work?", was considered to be poorly worded only to scale since, a true or false space was provided. Upon finding that item 19 measured the same assumed construct, item 23 was deleted. The remaining ten items were factor anglyzed under three factors combining the pre and post data. Item 13 loaded on two of the three programmed factors but was left in due

to usefulness in the semantic context of factor III, Isolation Sub-type of Alienation. The ten remaining "legitimate" items and their respective factor loadings are presented below:

FIGURE I

Varimax Rotated Factor Loadings for the Alienation
Scale, 3 Factors, 10 Items

No.	1	11	111	ltems .
44	73	-14	-14	Isolation SUB-TYPE OF ALIENATION In general, I do my work only because I have to.
46	67	11	27	How often do you wish you were out of school?
49	<i>5</i> 7	OI	23	Do you ever think of quitting school?
50	72	08	-17	How often do you feel that you would rather do something else.
54	61	13	-06	School would not be much fun if students obeyed the rules all of the time.
10	06	81	-16	SELF - ESTRANGEMENT CATEGORY  Most students enjoy doing as well as they can at school.
13	01	64	40	Though much of my time and effort has been spent doing homework, there have been many rewards for it.
19	10	83	01	I find that I actually enjoy my school work most of the time.
36	02	-01	65	POWERLESSNESS CATEGORY Sometimes I cannot understand how teachers arrive at the grades they give.
39	-02	03	76	Sometimes I feel that I have given a large part of my life to my school with little to show for it.

Figure | Continued

2.34 1.73 1.29 23.43 40.77 53.64 Eigenvalue Variance

The items were originally categorized in terms of sub-types of alienation in the following manner:

### FIGURE 2

· ·	IGURE 2
CATEGORY	ITEMS
Fowerlessness	1,2,3,6,8,12,14,16,31,34,36*, 38, 40, 58
Normlessness	51, 52, 53, 54*, 55, 56, 57, 58, 59, 60
Self-estrangement	4, 5, 7, 9, 10*, 11, 12, 13*, 15, 17, 18, 19*, 32, 33, 35, 37, 39*, 41,43, 47
Isolation sub-type of alienation	20, 21, 22, 24, 27, 28, 29, 30, 42, 44* 45, 46*, 49*, 50*

<sup>\*</sup>Shown to be legitimate in this analysis. See Table above.

Note: Items 23, 25, 26, 48 not included by test author.

(1969 p. 152)

Observing the results of this factor analysis (Fig. I), the Isolation sub-type of alienation contained the largest number of signifacant items. Of these five items, 54 originally was placed within the normlessness category. Semantically as well as from the loadings, this item appears to fit best within the Isolation factor (valuing something other than what the school requests — 'a potentially escapist attitude.)

Within the self-estrangement category, three items were noted to have grouped throughout the final stages of factor analysis. The powerlessness category found itself with but two items, one of which, 39, was originally

classified in the self-estrangement category (Fig. 2). Thus, not all items loaded within the original categories.

The normlessness category, having no significant loadings prior to the final reduction of factors, remained itemless in this analysis.

Practice dictates that at least four items relative to a given factor, be included in an instrument to be confident of measuring that factor. Since the last three categories contained less than four items each, confidence relating to measurement is low.

CONTENT VALIDITY Though this test was read to predominately bilingual respondents in grades four through eight, the wording of the items may have been too difficult for the grade levels and cultural characteristics of this particular group, though originally the test was intended for sixth grade bilingual students.

#### Mr. Henderson:

Here are 38 copies of your test. We gave it to the oldest students, and also started it in the next oldest group. We found that it is over their heads. By the time the teacher got one of the questions explained to where the student could understant it, he had just about answered it for him.

The test appears to be designed for the secondary level rather than the elementary level.

I do not think that the tests our oldest group (7th and 8th graders) have finished are valid. The students just did not understand the questions well enough.

Although the above correspondence from a participating teacher is subjective, it supports the idea that the test was not designed for the group to which it was administered. Further, this devolves upon the concept that any given test should be administered by trained personnel since clues to possible

-6-

inappropriateness of test administration can be seen in the above communication.

Considering specific items, there is some doubt as to the childrens' facility with certain words and phrases. For example:

Item 8 - "There is practically always a direct connection between how hard I study and the grades I get."

The words "practically", "direct", and "connection" might have proven obscure to the bilingual migrant students, particularly given their phrasing.

As Sax states, "...statements should be clear to the respondent." (1968, p.228)

Thus, unclear items might also contribute to test insensitivity.

Item 14 - "I generally expect good grades and I set my sights too high."

The above constitutes a "double-barreled" question to which more than one answer can be given. Items numbered 9, 18, and 43, see appendix A, may be termed ambiguous since each possible answer is open to a wide spectrum of interpretation. Such wording of items is generally conceded to be inappropriate for questionnaire usage. (Oppenheim, 1966, p. 115)

Observing the following thirteen items, 14,20,22,23,24,25,26,45,47,48,49, and 50, it was found that these questions request answers other than those listed on the Likert type scale. This may also have contributed to possible miscomprehension of the test.

DISCUSSION - The above analysis indicates that the instrument may not adequately measure alienation for the present sample. Conclusions regarding the use of the instrument on other samples will be left to the reader.

### RECOMMENDATIONS

- 1. It is suggested that the instrument be evaluated using larger samples.
- 2. Based upon appropriate analysis, the instrument should be rewritten to

compensate for the deficiencies indicated here, and others which may be discovered.

- 3. Consideration should be given to using the resulting instrument with a homogenous grouping of 6th grade students since the original instrument was designed specifically for this group.
- 4. Appropriate analysis of the instrument with other than 6th grade students should be accomplished prior to attempting the use of the instrument outside the 6th grade strata.

APPENDIX A

## HOW DO YOU FEEL ABOUT THINGS?

The purpose of this questionnaire is to learn how you feel about school and how you feel about a variety of other things.

There are no right or wrong answers. Each person has the right to feel the way he does about things mentioned in this group of questions — Answer each item exactly the way you feel, and be sure to answer all the items. Use the following way to describe your feelings.

_ 1	2	3	4	5
True Most of	Often	Sometimes	Seldom	
the Time	True	True	True	False

For example: If an item was -- "I like school"

If you like school most of the time, you answer by choosing answer "2". On the other hand if you never liked school then you answer number "5", and if your feelings were somewhere between true and false, you would pick the number of the answer that best describes the way you feel. Now try the questions: circle the number you choose.
