ABSTRACT

With most data taken from 1970 or 1971 averages, this report presents a picture of the positive and negative aspects of the older worker's position on the labor market. The report, prepared for the White House Conference on Aging, shows that the participation rates of men are continuing to decline while the rates of women increase, that opportunities for part-time employment have grown, and that unemployment rates for older workers are lower than for younger workers. Also, it was found that older workers have less absenteeism and higher rates of production than younger workers. However, the total employment picture for this sizable minority is bleak. (GEB)

#### Preface

This bulletin was prepared for distribution at the White House Conference on Aging, November 29 to December 3, 1971, in Washington, D.C. The bulletin was prepared in the Office of Economic Trends and Labor Conditions, Office of Data Analysis, Bureau of Labor Statistics, U.S. Department of Labor.

Robert L. Stein and Janice Neipert Hedges had major responsibility for its preparation. Donald M. Landay and Arnold Strasser, Office of Wages and Industrial Relations, contributed the chapter on Pension Plans and Retirement Benefits. The chapter on Department of Labor Manpower Programs and Services was prepared in the Manpower Administration, U.S. Department of Labor, by Albert Mapou and Fred A. Kahn. Marian L. Hester, Carol Milner, and Mary Ellen Talbert also assisted in the preparation of the report.

# Chapter 1. Introduction

The position of the older worker 1 in the labor market of the 1970's in characterized by strengths as well as weaknesses. Along with other workers he has shared in the benefits of rising productivity and economic growth and now enjoys a higher level of income and longer periods of leisure than ever before. However, once older workers have a breakin employment they have more serious problems in finding another job than younger workers.

Actually, the older worker generally is in a good position to retain his place in the labor market. He has the advantage of experience which is regarded as an asset by many employers. He is unlikely to initiate a voluntary job shift or residential change. He has the protection of seniority and, in some industries, contractual arrangements which guarantee the continuity of his specific work activity until he retires. When he does reach the age of retirement, he probably will be better off than any previous generation of retired workers. His social security benefits will be higher, his opportunities for part-time or intermittent work will be greater, and he will be retiring after having earned more during his working life than did previous groups of retirees. Although his earnings generally are somewhat lower than those of workers aged 35-44, his family responsibilities in most cases also are less.

For a sizable minority of workers, however, this rosy picture does not reflect the facts accurately. Older workers do lose their jobs from time to time. Experience and seniority are no absolute guarantees of immunity from unemployment. Even in a period of unusually tight job markets, such as 1968-69, 8 out of every 100 workers past 45 years of age had at least one spell of unemployment.

Once an older worker loses his job, prospects for re-employment are dimmer than for young r workers. Older workers still face discrimination in hiring. In addition, their lower average level of educational attainment, and in some cases obsolescence of skills, make it more difficult for them to compete with younger workers. Many of those who do become re-employed find it necessary to accept a lower wage than they received on their previous job. The difficulty of learning new skills or of relocating in a new community add to the problem of re-employment. For some older workers, early retirement beckons as a refuge from the burdens of failing health and unsuccessful jobseeking, even though they must accept a permanent reduction in benefit levels.

The report that follows attempts to present a balanced picture of the positive and negative aspects of the older worker's position in the labor market as it is reflected in the latest available data, usually 1970 or 1971 (9-month average). Most of the tables provide comparative data for earlier periods. Among the more important statistical findings manifested in the data, the following merit highlighting—

1. The labor force participation rates of older men are continuing to decline, while those of older women continue upward. On

balance, the number of workers over 45 years of age will continue to grow in the 1970's, but at a much slower rate than previously.

- 2. Opportunities for part-time and part-year employment have grown substantially. Only a small proportion of older workers work part-time involuntarily, because of slack business conditions; a much larger proportion work part time because of poor health or partial disability, or for personal reasons.
- 3. Unemployment rates of older workers continue to be lower than for younger workers, although both have risen since late 1969. Among those who do lose their jobs, the average duration of unemployment is significantly longer for older workers.
- 4. Older workers are less likely than younger workers to change from one employer to another, from one occupation to another, or from one location to another. However, a sizable minority of older workers (12 percent) do change their labor market situation in some respect over the course of a year.
- 5. Older workers have less absenteeism, have generally high rates of production, and by most other indexes show themselves to be useful, reliable, and productive workers.
- 6. The earnings of family heads generally are less for those over 45 years of age than for those aged 35-44 years. However, family needs of older workers also are less. Workers in the 45-54 year age bracket are better off in relation to budgetary requirements than are younger workers.
- 7. On the average, older workers are not as well educated as the younger generation. Largely for this reason, a somewhat smaller proportion of workers past 45 are in professional and other highly skilled jobs. However, the educational gap between the age groups has been narrowing and is less than it was 10 years ago.
- 8. Over half a million workers 45 years or older indicated that they had experienced discrimination on the job in 1969.
- 9. Public and private pension payments even in combination do not usually enable retired workers to maintain the standard of living they desire. Moreover, a majority of workers in the private economy do not qualify for a private plan benefit. Because of the level of retirement benefits and also because work often fulfills a need for a purpose in life, many older persons work part-time or part year.

#### **Footnotes**

Although age 65 is considered the beginning of old age for many purposes, the older worker generally is defined as those workers aged 45 or older. The rationale in this case for a dividing line of 45 years is that cross-sectional data show at this age the onset of an increase in withdrawals of men from the labor force, an increase in the prevalence of part-time and rart-year workers, a decline in annual and weekly earnings, and a lengthening of the duration of unemployment—all factors that increase in subsequently older age groups.

For information on technological displacement and worker productivity, it was necessary to draw on studies conducted in the early

1960's.

# Chapter 2. Labor Force Participation

The population 45 years of age and older numbered about 62.1 million in 1970. Of this total about 31.5 million, or over half, were in the labor force. These older workers made up about 37 percent of the labor force.

By 1980, the population 45 years of age and older will increase to about 66.2 million. Somewhat less than half, or about 32.6 million are expected to be in the labor force in that year. They will account for about 32 percent of the labor force.

The expected increase of 1 million older workers during the 1970's compares with an increase of 4 million during the 1960's. The decline in the growth of the older worker group is due to factors that include a smaller increase in the older population and a continued decline in the labor force participation rates of persons 65 years of age and over.

The discussion that follows summarizes patterns and trends in the

labor force participation of older workers.

# Older men in the labor force

Virtually all men in their late twenties, thirties, and forties work or look for work. By age 55-59, however, 11 out of 100 men are no longer in the labor force and by age 60-64, 28 out of 100 have dropped out. Between ages 64 and 65, the proportion of men not in the labor force rises rapidly, from 36 to 50. The rise reflects the widespread eligibility of workers at age 65 for retirement under private and public pension plans.

Many men who leave the labor force at age 55, or even 65, would prefer to continue working. A survey in early 1967 of men not in the labor force showed that three-fifths of the 1.3 million who were 55-64 years old withdrew from the labor force because they were sick or disabled. This reason was given by a lesser proportion of white men than by men of other races; this difference is a reflection of the higher incidence of poor health and disability among minority races. Very few of the sick or disabled men reported that they would be able to or planned to work within a year. For many of them inability to work was of long duration.

Retirement was the second most important reason men 55 to 64 years old were not in the labor force; almost one-fifth gave this reason. The remaining fifth were not in the labor force for such reasons as temporary withdrawal, family responsibilities, or personal reasons.

When a worker leaves the workforce at age 55, the economic loss to the nation and to the individual is substantial. Men of 55 have on the average 11 years of work ahead of them, or nearly one-fourth of the entire worklife expectancy for men at age 16. 3 (See table A.)

9

Table A. Expectations of years of life, worklife, and retirement for men in the labor force at selected ages and years

Δ		Life exp	ectency	•	Exp	ectation	of wor	klife	Expectation of retireme			retirement	
Age	1940	1950	1960	1968	1940	1950	1960	1968	1940	1950	1960	1968	
16 years	50.4	52, 6	53. 3	<b>52,</b> 9	44.8	46.8	46.3	45.3	5 <b>.</b> 6	5.8	7.0	7.6	
25 years	42.4	44.4	45.0	44.7	36.7	38.5	37,9	37.O	5 <b>.</b> 7	5.9	7.1	7.7	
35 years	33.7	35.2	35.7	35.6	28.8	29.3	23.6	27.7	5.9	5.9	7.1	7.9	
45 years	25.5	26.6	26.9	26.8	19.7	20.6	19.7	18.9	5.8	6.0	7.2	7.9	
55 years	18.3	19.0	19. 2	19.0	12.4	13.0	11.9	11.0	5.9	6.0	7.3	8.0	
65 years	12.2	12.7	12.8	12.8	6.8	7.4	6.3	5, 5	5.4	5.3	6.5	7.3	
75 years	7.3	7.8	8.0	8.2	4.5	4.7	5.1	4.9	2.8	3.1	2.9	3.3	

Labor force participation rates of men aged 55 and over have declined in recent years. The rate for men aged 55-64 declined from 87 to 83 percent from 1950 to 1970, while the rate for those aged 65 and over declined from 46 to 27 percent.

#### Older women in the labor force

A marked increase in older women workers has been one of the most notable labor force developments of the post-World War II period. The number of women workers 45 years of age and over more than doubled between 1947 and 1970. Women accounted for about 30 percent of the total increase in the civilian labor force during this period. The proportion of women 55 to 64 years old in the labor force increased from one-fourth in 1947 to over two-fifths in 1970. Among those aged 45 to 54, the proportion in the labor force rose from one-third to over one-half during the same period.

The age pattern of labor force participation rates among women differs fundamentally from that for men. Although a relatively high proportion of young women aged 18 to 24 years are in the labor force (57 percent in 1970), many stop working with the arrival of children. As the children grow older, increased numbers of women again seek jobs. The labor force participation rate for women aged 45 to 54 in 1970 (54 percent) approached that for women 20 to 24 years.

Older married women return to work for varied reasons. These include helping to finance their children's education, paying off the mortgage, raising their family's living standard, or improving their financial security against old age. Some work in order to use their education and training or to meet people. But many, including widows and the wives of low earners, work because of financial necessity.

#### Future growth of the labor force

A sharp slowdown is expected in the growth of the labor force aged 45 to 64 years. <sup>4</sup> These workers are expected to increase from 28.3 million in 1970 to 29.3 million in 1980. This increase will be only one-fourth as great as that between 1960 and 1970. Their proportion of the

total labor force will decline sharply, from about 33 percent to about 29 percent. The slowdown in the growth of this group of workers is expected largely because of a sizable decline in the 45-54 year old population, as a result of the comparatively small number of births in the years of the Great Depression. Labor force participation rates for men aged 45-54 years are expected to remain about the same, but rates for those 55-64 are expected to decline slowly. Rates for men over 65 are expected to continue to decline substantially. Rates for women 55-64 are expected to continue to increase.

No significant change is expected in the number of workers over 65, who will remain at just over 3 million through the 1970's. At this level, they will represent a declining proportion of the workforce. The decreased propensity to work after 65 reflects in part the improvement in retirement benefits, improved security as a result of health insurance programs, including medicare and medicaid, and increased assets that may have resulted from full employment during the later years of the worklife. A larger supply of young workers may augment pressures on older workers to retire sooner than they might otherwise. The trend for men to retire earlier is expected to continue through the 1970's.

## Footnotes

Vera C. Perrella and Edward J. O'Boyle, "Work Plans of Men Not in the Labor Force," Monthly Labor Review, August and September 1968, pp. 8-14, 35-41.

2 Ibid. See also Herbert S. Parnes et al, <u>The Pre-Retirement</u>
Years, Vol. 1, Ohio State University, The Center for Human Resource
Research. Under contract to the U.S. Department of Labor. Parnes reported that over four-fifths of the 45-59 year old men surveyed who retired between 1966 and 1967 said that they were not looking for work because of ill health. A not uncommon pattern was one in which the combination of unemployment and poor health (and sometimes limited education) resulted finally in withdrawal from the labor force.

Howard N. Fullerton, "A Table of Expected Working Life for

Men, 1968," Monthly Labor Review, June 1971, pp. 49-55.

# Chapter 3. Unemployment

The difficulties older workers encounter in the labor market are expressed in the length of their periods of unemployment rather than in the incidence of unemployment Unemployment rates tend to be relatively low for older workers. In 1970, for example, the unemployment rate (annual average) for men aged 45 and over was 2.6 percent, compared with a rate of 3.0 percent for men 25-44. (See table B.) Those aged 45-54 had a lower unemployment rate than any other age group. Even the highest rate among older workers, for those 65 years and over, was only two-fifths the rate for male workers aged 20-24. Among women differences in unemployment rates by age were even more favorable for the older group.

Table B. Selected measures of unemployment, by age and sex, 1970

			Duration of unemployment		
Age	Unemployed persons	Unemployment rate	Average weeks	Percent unemployed 15 or more weeks	
Men, 16 years and over	2, 235	4.4	9.5	17.8	
16 to 19 years	599	15.0	6, 7	10.2	
20 to 24 years	478	8.4	7.9	13.7	
25 to 44 years	643	3.0	10.0	19.4	
45 years and over	51515	2,6	13.6	28.3	
45 to 54 years	247	2, 4	12.0	24.0	
55 to 64 years	197	2,8	14.1	29, 8	
65 years and over	71	3.3	17.4	39.1	
Women, 16 years and over	1, 853	5, 9	7.9	14.3

45 to 54 years	229	3.5	10.1	21.0	
55 to 64 years	111	2.7	10.2	20.1	
65 years and over	33	3.1	11.5	25. 6	

Lower unemployment rates for older workers are largely attributable to the fact that they are less likely than younger workers to be subject to the hazards of the job search. First, their longer job tenure 2 gives them greater job security. For example, from the fourth quarter of 1969 to the second quarter of 1971, a period when the unemployment rate (seasonally adjusted) for males aged 25-44 doubled; the rate for males 45 and

over rose by about 70 percent. Second, older workers are less likely to leave their jobs voluntarily and of course are less likely to be entering the labor force for the first time (or re-entering after a period of education).

However, older workers are far from immune from the loss of their Even very long service is no guarantee against involuntary separations. One out of every 25 blue-collar workers with 20 or more years of service lost his job in the year following the first interview (1966) of the Parnes study. 3

Once older workers have a break in employment, they have a serious problem in finding another job. The average duration of unemployment in 1970 for men 45 years of age or over was nearly double that of young men under 25 years of age. (See table B.) About 28 of every 100 unemployed older men had been looking for work 15 weeks or longer, compared with 19 of every 100 unemployed men 25-44 years of age.

Insight on the experience of older workers who are affected by plant shutdownsor large scale layoffs is provided by research conducted in the early A study of five plant shutdowns or large-scale layoffs showed, for example, that unemployment was markedly higher among workers age 45 and over than among younger workers. 4 In two of the cases studied in which detailed age breakdowns were feasible, the highest unemployment rates by far were found in the 55-59 year old group. A substantial proportion of the workers aged 60 and over who were laid off were not seeking work. Many had taken early retirement; others may have been discouraged from looking for work.

In the two plants in which women were a significant number of the displaced workers, the unemployment rate for women was almost three times the rate for men. At each level of education and age under 60, rates for women were much higher than for men. Among workers 60-64 years of age, a larger proportion of women than men were not seeking employment. The highest rate of unemployment for women workers was for those aged 45-54, compared with the 55-59 age group for men.

#### Footnotes

1 The unemployment rate is the percent that the unemployed constitute of the number that are working plus those looking for work.

The length of time a person has worked without interruption for the same employer. See Edward J. O'Boyle, "Job Tenure: How it Relates to Race and Age", Monthly Labor Review, September 1969. Reprint 112.

Parnes et al., op. cit.

Studies of Displaced Workers, BLS Bulletin 1408, 1964. See also Richard C. Wilcock and Walter H. Franke, <u>Unwanted workers: Permanent Layoffs</u> and <u>Long-term Unemployment</u>, New York: Free Press of Glencoe, 1963

# Chapter 4. Work Experience

The proportion of men who work full-time full-year declines in each subsequent age group after ages 35-44. Data on work experience for 1970 show only a slight decline between age groups 35-44 and 45-54 in the proportion of male workers who worked full time full year, but the groups aged 55-59 and 60-64 had declines of another 4 percentage points. (See table C.) The proportion of men aged 65 and over who worked full time full year in 1970 was 35 percentage points lower than the percentage of those aged 60 to 64 years (73 and 38 percent, respectively).

The age pattern of work experience for women differs markedly from that for men in that the proportion working full year full time is higher among those 45-64 years of age than among those 35-44. However, the proportion working full time full year shows about the same relative de-

THE RESIDENCE OF THE PARTY OF T

cline between the ages of 60 to 64 and 65 and over as for men.

<sup>1</sup> Not available.

The proportion of all male workers on part-time schedules (whether full- or part-year workers) in 1970 increased by age from about 4 percent among those 45-64 years old to 38 percent among those aged 65 and over. The higher proportion of part-time workers 65 years of age or older was due almost entirely to an increase by age in the proportion of those on voluntary part time, 2 percent among those 45-64 and 35 percent among those 65 and older.

In every age group, part time is more frequent for women workers than for men. The proportion of all women workers on part time is about one-fourth in the age groups 25-44 and 45-64, but increases to almost one-half at age 65 and over. The great majority of women who work part time do so voluntarily. (See table D.)

Table D. Percent of persons at work in nonagricultural industries by part-time status, age and sex, annual average, 1970

	Full-time		Part-time schedules			
Age and sex			Economic reasons	Voluntary reasons

Female						
25 to 44 years	100.0 100.0 100.0	74.3 76.9 49.9	25.7 23.1 50.1	3.5 3.9 3.9	22. 2 19. 2 46. 2	

Includes persons who do not perfer, or are unavailable for, full-time work.

The proportion of older workers who voluntarily work part time has increased in recent years. In 1960, for example, about 7 percent of all workers 45-64 years of age and 30 percent of those 65 and over were employed part time. By 1970, the proportions had risen to 9 and 39 percent respectively.

The proportion of male workers who work part year (irrespective of full- or part-time) increases with age. In 1970, for example, the proportion of part-time workers was 16 percent for those 45-54 years old, 22 percent for those aged 55-64, and 43 percent for those 65 years of age and over. Unemployment and illness or disability were the two major reasons for part-year work among men 45-64 years of age, 43 and 30 percent respectively. Among men 65 years of age and older, retirement and other reasons were cited by 72 percent of the part-year workers.

The proportion of women workers who worked part year declined from 48 percent among those 25 to 44 years of age to about 35 percent for those 45 to 54 years and 55 to 64, then rose to 51 percent for those 65 years of age and over. Women in every age group cited home responsibilities as their major reason for part-year work.

# Chapter 5. Mobility

The older worker usually is well settled in his career and in his community. He is less likely than younger workers to move voluntarily from one job, occupation, or residence to another, and he is less able to move. Stability, rather than mobility, characterizes the older group. A recent survey of male workers in the "pre-retirement years" (ages 45-59) for example, indicated that three-fifths of them had worked for their present employer (or had been self-employed) for 10 years or more and two-fifths said they were unwilling to consider another job even for a higher wage. Nine out of ten liked their current job and two-thirds regarded it as the best of their lives. Nearly four-fifths said they would work even if they had enough money to live comfortably without working.

Although older workers are significantly less mobile than younger workers, nonetheless, Parnes found that about 12 percent of the 45-59-year-old men surveyed in 1966 were in different labor market situations in 1967, because of a move from one employer to another, between em-

ployment and unemployment, or into or out of the labor force.2

Job mobility. Older workers, irrespective of race or sex, generally stay longer on a job than younger workers. Seniority gives the older group a larger degree of employment security, higher rates of pay, and more generous fringe benefits that include longer paid vacations and pension rights. Furthermore they feel that many employers hesitate or refuse to hire older applicants, especially those whose experience or training is not related specifically to the job opening. Even if layoffs are threatened whether as a result of technological changes, economic conditions, or other reasons—they are likely to conclude that it is less risky to stay where they are.

Most job shifts made by men over 45 are explained by the loss of their previous job. In contrast, most job changes made by younger men

are made in the expectation of getting a better job.

Occupational mobility. The outstanding demographic factor associated with occupational mobility is the age of the worker. Occupational mobility declines as age increases, irrespective of sex or race. (See table E.)

Older workers who change their occupation often move into service jobs, many of which have no great demand for skills and are less demanding physically than other low skilled or unskilled work. For some older workers, an occupational shift is the beginning of semi-retirement.

Change in residence. The percent of employed workers who move to a different county descends sharply with age. Data on the residential mobility of workers for 1969-70 show that less than 3 percent of all employed persons age 45 or older changed counties during the year. (See table F.) Although Americans undoubtedly deserve their reputation for being a people on the move, it is primarily the younger generation that is doing the moving. When older workers do move, their reason is more likely to be work-related than in the case of younger workers.

Willingness to move is a positive factor in obtaining employment. The study of plant closings in the early 1960's for example showed that most workers had to look outside their home area to obtain a job in the same industry. Greater proportions of employed than unemployed workers had sought work outside their home cities.

As mentioned earlier, the stability of older workers is a considerable asset to their employers. But when older workers lose their jobs—for whatever reason—their attachment to a particular line of work or industry, their specialization in particular skills and activities, and their

deep roots in the community put them at a disadvantage. If their unemployment results from the obsolescence of their skills (or that of their plants), a shift in consumer demand, or the decline or relocation of their industry, their problem is even more acute. Manpower retraining and relocation assistance programs for older workers recognize that these workers need special assistance because of their relative immobility.

# Chapter 6. Income and Earnings

Income 1 for workers aged 45 years and over generally is less than for workers aged 35-44, the peak earning group. The difference accelerates in successively older age groups.

The total income of older persons compared with that of persons aged 35-44 is shown in the following tabulation, by sex for the years 1960, 1965, and 1970. The figures are expressed in terms of ratios (income of age group 35-44=100). Little if any change is discernible during this period in the income-age indexes for men. The small improvement in the income-age indexes for women primarily reflects the increasing employment of older women:

Year	35-44	45-54	55-64	65 and over
Men:				
1970	100	97	81	32
1965	100	95	<b>7</b> 8	32
1960	100	95	78	31
Women:				
1970	100	107	85	44
1965	100	103	81	40
1960	100	103	70	44

Older persons living on retirement incomes are particularly likely to be hard pressed financially, but those still in the labor force are not exempt. As noted earlier, the work experience of older persons is characterized by longer periods of unemployment and more part-time work. But even those employed year round full time have lower earnings than younger workers. Earnings of male heads of families employed full time year round in nonfarm occupations in 1969, for example, were only 86 percent as much for those aged 55-64 as for those aged 35-44, while those 65 and over earned 68 percent as much as the younger group. 2

Lower average earnings of older workers employed full time year round are not explained by differences in weekly hours, as the following tabulation indicates. Differences in median years of education by age, however, probably account for some differences in earnings:

Age	Earnings	Hours	worked
35-44 years	- 100	,	100
45-54 years			98
S5-64 years			96
65 years and over			96

NOTE: Earnings data refer to men who head husband-wife families and who are employed year round full time in nonfarm occupations. Data on hours worked refer to married men, wife present, on full-time schedules in nonagricultural industries, but without reference to year-round employment.

The difference in earnings by age is more pronounced in some occupational groups than in others. Salesmen aged 45-54 earned only nine-tenths as much as younger salesmen. Earnings of managers and officials aged 45-54 are substantially less than those of managers aged 35-44 also. But in other occupations, workers aged 45-54 earned about the same as those aged 35-44 years. (See table G.)

Table G. Index of median earnings of selected occupational groups, 1969

ge 35-44=100)			Age	
Occupation	35-44	45=54	55-64	65 years and over
Total	100	95	86	68
rofessional workers  fanagers and occicials  clerical workers  alesmen  craftsmen  peratives	100 100 100 100 100 100	102 94 99 91 101 97 97	98 86 96 77 96 94 88	77 63 77 69 72 81 69

The period of peak earnings covers a wider age group in some occupations than in others. The 10-year age breaks used in the table, for example, indicate a longer period of peak earnings for professional, clerical, and craft workers and operatives than for workers in other occupations.

When 1969 incomes of families headed by males who worked year round full time the previous year are related to the Bureau of Labor Statistics family budgets, about one-fourth of those headed by men age 45-54 and almost one-fifth of those headed by men 55-64 were at or below the lower budget level. These proportions were less than for families headed by men aged 35-44, two-fifths, primarily because income declines less rapidly than family size. The income-budget situation of these older family heads is a cause for concern, however, particularly since the BLS family budgets contain no provision for savings other than payments for social security and life insurance valued at one year's regular family income.

The BLS family budgets are benchmark measures for research purposes of how much it would cost to maintain specifed levels of living (identified as intermediate, lower, and higher) in urban areas. The budgets can be scaled to families of various sizes and types living in different areas of the United States. See U.S. Department of Labor, Bureau of Labor Statistics, BLS Bulletins 1570-1 to 1570-6 (1968-1970).

# Chapter 7. Pension Plans and Retirement Benefits

Unless compelled to retire from the labor force because of disability or ill health, many men retire partially in their early sixties (some in their late fifties), by switching from full-time year-round work to part-time part-year work. Then, depending on the satisfactions and demands of their work, they fully retire from all gainful activity in their late sixties and early seventies as their mental and physical capabilities decline or their interests and needs shift to other activities.

Although full benefits are not payable until age 65 under social security and most private pension plans, three factors encourage men to retire from full employment before they attain that age. Two of them—the prevalence of physical and mental disabilities and ill health among older workers and the discriminations and other difficulties they encounter in getting regular full-time jobs—are discussed in other chapters. The third factor—public and private pension plans—encourages older workers to retire by meeting some of their financial requirements but, at the same time, discourages them from ceasing all gainful activity, because alone, or even in combination, these plans usually do not enable workers to maintain the standard of living they desire. Many older persons resolve this conflict and fulfill their need for meaningful activity—"psychic income"—and for contact with other people by working part time or part year.

The mixture of encouragement and discouragement stems from three characteristics of the benefits provided by these plans; (1) their availability to employed workers, (2) their availability before age 65, and (3) their limited adequacy. Therefore, many workers can and do partially retire as early as age 62 on social security, because reduced benefits commencing at that age are payable to qualified workers without further reduction if their earnings are below \$1,680 a year. Many other public and private pension plans also pay pensions, usually reduced because of age, to members with the requisite amount of service<sup>2</sup>, who retire from a job covered by the plan before age 65, and permit them

to earn all they can from working.

As a result, more than half the men awarded social security retirement benefits in recent years are under age 65. Two out of five of them continue to work chiefly because of the low level of such benefits and their ineligibility, in most instances, for another pension. In addition, many continue to work not only for these reasons but also because of the need for a meaningful purpose in life.

In fact, the smaller their social security benefits the less likely they are to get a private pension and the more likely they are to do some work. Fewer than one out of thirty married men awarded social security benefits under \$130 a month in the latter half of 1969, for example, also received private pensions compared with over half of those awarded larger benefits. As a result, almost half the married couples and two-thirds of the single persons initially entitled to social security

retired worker benefits in late 1969 had retirement incomes (pensions plus income from assets) below the poverty threshold as published by the Department of Health, Education, and Welfare. 4 Only about one in four couples and the same proportion of single persons could afford the BLS intermediate level of living on their retirement incomes. However, when they supplemented this by their earnings about three out of five couples and nearly half the single persons could afford that level. (In 1969, this was \$4,230 a year for a couple and \$2,325 for single persons.) Nevertheless, many whose retirement income from social security and private pensions is sufficient to maintain their desired standard of living need more than can be supplied by money alone. They perceive a needwhich is very real to them to have a meaningful purpose in life. a purpose can be, and for many is, satisfied by community service. For others, such a need can only be satisfied by gainful employment.

Apart from social security, pensions are the chief sources of ment income. In late 1969, private pensions were received by retirement income. about one of four married couples newly entitled to social security benefits (excluding those retired from government and railroad jobs not covered by social security), by one out of six single men, and by one out

of eight single women.

A substantial majority of workers do not obtain any pension coverage or do not acquire sufficient years of continuous coverage during their entire working life to qualify for a private plan benefit. The incidence of noncoverage is highest among those who work in trade, services, and construction; the degree of coverage or potential coverage is greatest for those who work for firms in mining and manufacturing. Even among these industries, however, workers' chances of obtaining pension benefits are less if they are employed by small nonunion firms than if they work for industrial giants or for firms with collective bargaining agreements. In the aggregate, about 55 percent of all private nonagricultural workers are employed by firms that have either a private pension plan, a deferred profit-sharing plan, or both. However, about 40 percent of these workers do not participate in their companies' plans because they are short-term employees or because they are excluded for other reasons.5 many of the workers not covered by a private pension plan have little prospect of ever obtaining any coverage unless they can obtain steady employment with a large firm or with a unionized firm. employment with a small unionized firm do not have much chance of Those who gain gaining any pension benefit unless the firm participates in a multiemployer Such plans are found in many industries, but are prevalent chiefly in apparel manufacturing, construction, trucking, and the mining industries.

The private plan provisions covering those who do participate in private pension plans have been, and are expected to continue to be, liberalized. During the latter part of the 1960's, for example, sharp improvements occurred in the retirement formulas of private plans, and early retirement and vesting6 provisions were introduced or liberalized. By the end of the decade, more than three-fourths of the workers covered by private pension plans were in plans that had a vesting provision, and more than nine-tenths were in plans with vesting, early retirement, or both. At the beginning of the decade, only about 59 percent of the covered workers were in plans with vesting and about 82 percent were in plans with either vesting, early retirement, or both.

In 1969, about 84 percent of all covered workers participated in plans that granted a benefit right by age 55 under either the normal, early, or vesting provision of the plan to members who had the requisite service. Almost three-fifths could gain such a right by age 40, and about two-thirds by age 45, if they also met the service requirements. In general, most workers participated in plans that required not more than 15 years of service, and almost two-fifths of them in plans that required 10 years or fewer to qualify for a nonforfeitable benefit right.

To gain these rights, however, workers had to meet an age, service, or, more often, a combination of age and service requirements. requirements of the plan provisions prevailing in 1969 can be illustrated generally by considering 100 workers who entered covered employment at age 25. Under the 1969 provisions, if these workers, who represent all covered workers, remain with their plan for 10 years, only 31 of them will have gained a nonforfeitable right to a pension benefit; if they remain for 15 years, 51 of them will have achieved such a right; and after 20 years only 57 of them would attain a nonforfeitable right to a pension At any of these service-ages, virtually all 57 would have gained their benefit right under the vesting provisions of their plan, because the early retirement provisions usually do not become operative until the worker reaches 55 and normal retirement rarely occurs before age 60. Should the 100 workers have entered into their covered employment at age 30 instead of 25, however, more than three-fourths of them would have gained a nonforfeitable right after 20 years of service. these would become eligible for early retirement after 20 years of service, and by age 55 about three-fourths of them would have qualified for early retirement.

As indicated previously, employment by a firm with a private plan is not tantamount to being covered by the plan. Some plans require the attainment of a specified age or length of service, or both, before a new employee is eligible to participate. Usually these requirements are justified on the basis of administrative cost and the uncertain tenure of new employees. However, the adoption of a participation requirement signifies more than administrative convenience, since three-fourths of the plans with participation requirements do not give credit for employment served before joining the plan, either in qualifying for a pension or in computing the pension benefit. These plans covered about three-fourths of the workers in plans with participation requirements.

#### Footnotes

<sup>1</sup> For each \$2 in annual earnings from \$1,680 to \$2,880, \$1 in benefits is withheld and for each \$1 over \$2,880, \$1 in benefits is withheld. However, full benefits are payable, regardless of annual earnings, for any month in which the beneficiary earned less than \$140.

Usually 20 to 30 years.

3 Age 55 in two out of three private plans and in most plans for

government employees.

Social Security Bulletin, July 1971, pp. 11-17. In 1969, the poverty threshold for married couples was \$2,200 and for single persons, \$1,750.

6 Vesting is defined as a guarantee to the worker of a right in a pension plan based on all or part of his accrued retirement benefits should his employment terminate before he becomes eligible for retirement benefits; that is, if his rights are vested, the worker is entitled to a retirement benefit when he reaches retirement age, regardless of

where he may be at the time.

# Chapter 8. Job Performance and Training Potential

Comparison of job performance scores by age indicates that refusal to hire older workers has little merit, except for positions with demand-

ing physical requirements.

Studies of the relative work performance of older and younger workers conducted by the Bureau of Labor Statistics in the late 1950's and early 1960's indicated no consistent pattern of superior productivity in any age group. 1 Ac ual records of work performed showed greater differences in productivity within age groups than among different ages. Large proportions of workers in the older groups exceeded the average performance of younger workers. Moreover, older workers had a steadier rate of output.

Results were similar for every occupational group surveyed office workers, operatives, and mail sorters—as well as for higher versus lower skilled workers, and time versus incentive workers. attendance and safety records of older workers were found to equal or

exceed those of younger workers generally.

A comparison of the performance of older and younger workers (maintenance mechanics, engineers, craftsmen, and telephone operators) in industrial retraining programs suggests that age by itself is not a reliable criterion for determining the suitability of workers for training. Although younger workers performed better on the average overall than older workers, individual older workers performed better than the average younger worker. 2

Moreover, average differences in the success of training older and younger workers have been found to diminish when education is held con-Differences are further minimized by adapting teaching methods to the learning abilities of older workers, for example, stressing simu-

lated exercises rather than lectures.

# Chapter 9. Job Discrimination

In a survey of employed persons in 1969, over half a million workers 45 years of age and older indicated that they had experienced discrimination on the job. The number of workers who encounter age discrimination in seeking employment may be far greater, according to

data on discriminatory employment practices.

The Age Discrimination in Employment Act (ADEA), enacted by the U.S. Congress in 1967, prohibits discrimination against workers 40-65 years of age. The law states "...the purpose of this Act (is) to promote employment of older persons based on their ability rather than age; to prohibit arbitrary age discrimination in employment; to help employers and workers find ways of meeting problems arising from the impact of age on employment." The act protects workers from age discrimination by employers that have 25 employees or more; by employment agencies serving covered employers; and by labor organizations that have 25 members or more, or that make referrals to covered employers or that represent employees of covered employers.

The ADEA is administered by the U.S. Department of Labor. Voluntary compliance is sought, but legal action may be initiated either by the Department or the individual if such efforts fail. During fiscal 1970, 14,000 establishments which were contacted informally removed potentially discriminatory employment practices affecting over 500,000 jobs. Investigations were conducted in an additional 10,400 establish-

ments, of which 2,200 were found in violation of the act.

Illegal advertising was by far the leading noncompliance practice in fiscal 1970; it accounted for half the practices of which employers were found in violation, and two-thirds of those of which employment agencies were found in violation. Refusal to hire accounted for about one-fourth and promotional bars for about one-tenth of the violations of employers. Discharges accounted for a small fraction, about one-twenty fifth. For employment agencies, failure to refer constituted most of the violations other than illegal advertising. One labor organization was found in non-compliance for excluding a worker from union membership because of age.

Monetary damages paid to individuals by establishments in noncompliance have increased, from \$40,000 in 1969, the first year the act

was in effect, to almost \$740,000 in 1971 (fiscal years).

One of the first injunctions issued under the Age Discrimination in Employment Act came with a recent ruling of the U.S. District Court in Minnesota that compulsory retirement provisions in an employer's pension plan may not be used to force early retirement of nonparticipants.

In addition to Federal prohibitions on age discrimination, 27 states and Puerto Rico had age discrimination in employment laws in 1970. No age limits were specified in the laws of Alaska, Hawaii, and Maine. Lower age limits in the remaining states ranged from 18 years in Colorado, Maryland, and New Mexico to 45 years in Delaware, Illinois,

and Rhode Island. Under State legislation, coverage of establishments generally is extended to firms that have a minimum of 3 to 6 employees, but in eleven states legislation applied to all establishments, irrespective of size.

### Footnotes

<sup>1</sup> Survey of Working Conditions, University of Michigan, Survey Research Center, 1971.

Public Law 90-202; effective date, June 1968.

3 Employees of Federal, State and local governments are not covered under the act. Protection against age discrimination is afforded Federal employees, however, under 5 U.S.C. 3307 which prohibits establishment of a maximum age limit in filling positions in the competitive service. A Presidential memorandum of March 14, 1963, extended this restriction to the excepted service. Executive Order 11141, February 12, 1964, extended the principle of equal employment opportunities for older workers to private firms holding contracts and subcontracts with the Federal Government. Employees of State and local governments often are covered under Stage age discrimination in employment laws.

1971).

# Chapter 10. Education

Older workers as a group have less education than younger workers. In March 1970, those aged 45-54 averaged 12.3 years of schooling (median), 0.4 years less than workers 20-24 years of age. Educational attainment declined to 11.8 years for workers aged 55-64 and to 9.6 years for those 65 years of age and over.

The education gap between white and minority workers is greatest for older workers: 3.6 years for those 55 years and over, nine times

the gap for those aged 25-34 years.

The differences in the median education of older and younger workers is less, however, than the difference in the median education of the older and younger population. Workers with the lowest educational attainment are more likely to withdraw from the labor force. In the age group 55-64, for example, the median educational attainment of men who were in the labor force in March 1970 was about 21/2 years higher than that of those who had withdrawn from the labor force.

Table H shows labor force participation rates by years of school eted. The holding power of education is illustrated by the fact that the labor force participation rate of all males 55-64 years of age was 14 percentage points lower than for all males 35-44 years, while the difference in participation rates among highly educated workers was only 5

percentage points.

Education also is the key to many better paying occupations. Notable differences in the proportions of older and younger male workers in the professions, for example, are attributable in part to differences in educational attainment. Among workers 55-64, for example, 11 percent of whom have four years or more of college, 10 percent are in the professions, while among those 35-44, 16 percent of whom have four years of

college, 18 percent are in the professions.

The level of education of workers is an important factor in determin-This is true of both older and younger ing their unemployment rates. In March 1970, the unemployment rates for men age 55-64 were 1.5 for those with four years of college, 2.5 for those with four years of high school education, and 3.5 for those with an elementary school Among men with a high school education, the difference between the unemployment rate of those age 35-44 and those 55-64 was only 0.5 percentage points.

# Chapter 11. Department of Labor Manpower Programs and Services

The Manpower Administration's principal efforts for older workers include employment assistance services and manpower work and training programs. Employment assistance has been provided to older workers by the Manpower Administration and affiliated State employment services for many years under the authority of the Wagner-Peyser Act. Manpower work and training programs, first initiated in 1962, are conducted under four legislative acts: The Manpower Development and Training Act (MDTA), the Economic Opportunity Act (EOA), the Social Security Act, as amended, and the recently enacted Emergency Employment Act (EEA). In addition, the Federal-State Unemployment Insurance Program provides experienced workers with income during periods of unemployment.

Employment Assistance Activities. Through Federal grants States operate over 2,300 local offices of State employment services, which serve those seeking or needing employment and those providing it. General services include interviewing, testing, counseling, and referral to placement or to appropriate training or other services involved in readying individuals for employment. Specialized services to workers age 45 and include specialized job counseling, job development, referral to training or necessary health and social services and job placement. A limited number of local offices have older worker service units to intensify and individualize services to this group. In calendar year 1969, the Employment Service processed about 1.46 million new applications for services from workers 45 years old and over, or 15 percent of total new applications. About 112,000 initial counseling interviews were provided to older workers, or about 10 percent of interviews given to all age groups. About 1.03 million nonagricultural placements were older recipients, or 20 percent of total nonagricultural placements.

MDTA Institutional Training. Institutional Training under the Manpower Development and Training Act of 1962, as amended, provides classroom occupational training, supportive services, and remedial education to equip undereducated and unemployed individuals with the skills they need to obtain gainful, self-sustaining employment. Emphasis is placed on aiding disadvantaged individuals who do not require special intensive assistance. In 1970, individuals 45 years old and over represented 9 percent of first-time enrollments in the program or about 11,700 enrollments, the highest enrollment in absolute numbers of all manpower work and training programs.

Job Opportunities in the Business Sector (JOBS). JOBS is a nation-wide undertaking by industry and government to stimulate private industry to hire, train, and retrain unemployed persons, and to upgrade the skills of people already employed. The program serves only disadvantaged workers and involves a commitment by employers to hire the workers first and train them afterward. Employers are encouraged to provide not only jobs and training but also a full range of supportive services, such as remedial education, prevocational and on-the-job skill training, counseling,

testing, and coaching required to help severely disadvantaged workers make a satisfactory job adjustment. In 1970, 4 percent of first-time enrollments of JOBS or about 3,500 enrollments were 45 years old and over.

The JOB Optional Program<sup>3</sup> is similar in nature to JOBS. It is intended primarily to serve disadvantaged participants in those cases where the training objectives can be satisfied with a low level of supportive assistance. About 10,000 individuals 45 years of age and over, or 11 percent of all first time enrollments, participated in MDTA on-the-job training in 1970. (See table J.)

Concentrated Employment Program. The Concentrated Employment Program (CEP)<sup>4</sup> is a system for packaging and delivering manpower services. Working through a single contract with a single sponsor (usually a Community Action Agency), the Manpower Administration provides a flexible package of manpower services, including outreach and recruitment; orientation; counseling and job coaching; basic education; various medical, daycare, and other supportive services; work experience or vocational training under a variety of individual manpower programs; job development and placement; and individualized followup after placement. Projects are established by priority in urban neighborhoods or rural areas having serious problems of unemployment and under employment, coordinating and concentrating Federal manpower efforts to attack the total employment problems of the hardest hit of the disadvantaged in a way that will make a significant impact on the total well-being of the area. Poor and unemployed individuals 45 years or older, residents of a designated CEP target area, are eligible to receive services. In 1970, 8 percent of first-time enrollees or about 8,800 CEP enrollees were 45 years old and over. (See table J.)

Work Incentive Program (WIN). The purpose of the Work Incentive Program<sup>5</sup> is to provide all the services and opportunities necessary to move Aid to Families with Dependent Children (AFDC) recipients from dependency to stable employment at a living wage. WIN provides a comprehensive program of the services required, including child care and other supportive services, funded through a single source. WIN enrollees are provided with training, education and work experience to prepare them to use their potentials in a job. Where suitable work opportunities in other manpower programs or in the job market do not exist, special work projects may be developed for certain individuals. Elderly welfare recipients covered by the AFDC program are referred by welfare agencies to the local office of the State Employment Service. In 1970, persons 45 years old and over represented 6 percent of first-time enrollments in the program, or about 5,600 enrollments.

Operation Mainstream. Operation Mainstream<sup>6</sup> is a job creation and work training program for chronically unemployed poor adults, mainly in rural areas, who have no reasonable prospects for full-time employment or training assistance under other programs. Enrollees participate in projects designed to improve or beautify the community. Project activities contribute to the management, conservation, or development of natural resources, recreational areas, parks, highways, and other lands in rural areas and small towns. The regular Mainstream program<sup>7</sup> provides 40-hour work weeks. In addition, work and training opportunities are provided in projects for senior citizens; these limit the work week to 20 hours. In 1970, persons 45 years old and over represented about 51 percent of

first-time enrollments in the regular program or about 6,400 enrollments. 8

Operation Mainstream has the greatest percentage participation of older workers of all manpower programs. Large national contracts referred to as Senior Citizen Programs serve only workers over 55 years. Program guidelines for contracts administered through the regional offices of the Manpower Administration clearly specify that emphasis is to be on older workers.

New Careers. New Careers<sup>10</sup> is a work-training employment program for both youth and adults involving activities designed to improve the physical, social, economic, or cultural conditions of the community. It assists the development of entry-level employment opportunities; provides maximum prospects for advancement and continued employment without Federal assistance; and combines work-training employment with necessary educational training, counseling, and other supportive services as may be needed. Another purpose of New Careers is to contribute to the design and creation of new career jobs in public service as support or paraprofessional personnel. Individuals 45 years and older who are poor or unemployed are eligible to enroll in projects. In 1970, they represented 7 percent of first-time enrollments in the program, or about 300 enrollments. (See table J.)

New Program—Emergency Employment Act of 1971 (EEA). A new program is being initiated under the recently enacted Emergency Employment Act of 1971 (P. L 91-54) which provides temporary 2-year authority for approximately 150,000 additional new jobs each fiscal year in the field of public service for the unemployed and underemployed, including a significant number of middle-aged and older persons. employment and training opportunities provided by the EEA are in addition to existing manpower work and training programs. The jobs are "transitional" in that they will lead people into permanent jobs, and not be a substitute for them. The Emergency Employment Act authorization for funds will be triggered when the national rate of unemployment is 4-1/2 percent or more for three consecutive months. In addition, local areas suffering from continuing high unemployment (over 6 percent) will qualify for a separate program authorized by the bill. This new program will provide a measure of additional assistance to the middle-age and elderly unemployed and underemployed.

Unemployment Insurance Program (UI). The Federal-State Program of Unemployment Insurance now covers about 52 million workers and another 5 million will be covered starting January 1, 1972, as a result of the Employment Security Amendments of 1970, P. L. 91-373. The system provides experienced workers with income replacements during involuntary unemployment. In fiscal year 1971, total benefits amounting to \$4.8 billion were paid to about 7 million different individuals. On the average about 40 percent of those receiving benefits were age 45 or older. Workers 45 years of age and older represented something less

than one-fourth of the 1970 unemployed.

Benefits are payable in most States for a maximum of 26 weeks in a year. As a result of the 1970 Federal Amendments, duration of UI benefits may be extended for another 13 weeks during periods of high unemployment (either 4.5 percent insured unemployment nationally or 4.0 percent insured unemployment in a State, plus 20 percent over the level in the preceding year base period)—economic conditions during

which unemployment effects even older, more experienced workers. Since older workers who become unemployed tend to have special difficulty in finding new jobs, extended benefits are especially helpful for them. In 1971, 21 States paid extended benefits, totalling about \$350 million.

										].			

1 Based on revised population data reflecting the 1960 Decennial Census results. For this reason they differ somewhat from figures shown in the preceeding table, which were based on estimates of the population.

Participation rates differ from those in the preceeding table because they are based on total population as of July 1.
