ABSTRACT

This curriculum guide has been prepared to assist senior high school teachers in providing a 1-semester course in health for Grade 11 or 12. Developed by teachers, health coordinators, school health services personnel, and representatives of 23 community health organizations and agencies, the guide first presents an overview of the basic concepts and understandings to be developed in each of the seven units, which cover such topics as nutrition, narcotics, alcohol, first aid, and consumer protection. Contained in each unit are: (1) a discussion of the scope of the unit, including unit objectives and suggested time allotments which range from 1 to 4 weeks, (2) an outline of the content which is correlated to learning activities and resources, and (3, an explanation of suggested evaluation procedures, including tests and inventories, classwork performance, self-appraisal, and teacher observations. A bibliography of books for each unit is provided.

INSTRUCTIONAL GUIDE

HEALTH

Senior High School

This publication was developed in accordance with the Comprehensive Curriculum Policy adopted by the Los Angeles City Board of Education.

APPROVED BY ASSOCIATE SUPERINTENDENTS:

ROBERT E. KELLY
Division of Secondary Education

EVERETT CHAFFEE
Division of Instructional Services

FOREWORD

Among the seven educational purposes of the Los Angeles City Schools, as stated in Point of View, is "that each pupil ... develop and maintain physical and mental health." To fulfill this purpose, a coordinated program of health instruction, health services, and maintenance of a healthful school environment is provided to assist senior high school students to

Gain scientific health knowledge
Acquire intelligent health attitudes
Develop effective health practices

This publication has been prepared to promote the achievement of these objectives through providing assistance to senior high school teachers in meeting the revised graduation requirements in health education. In this revision, completion of a semester course in health is required for graduation education. This course may be taken in place of 1 semester of physical education or as an elective in addition to physical education. The requirement may be completed during any semester or summer session between B11 and A12 inclusively. The health education course meets the State requirement for the teaching of first aid and the harmful effects of narcotics and alcohol.

Opportunities for a variety of health education experiences also are offered in related subjects and in other phases of the school health program. This total program of health education is designed to reinforce and to supplement home and community efforts to help each child attain his maximum health potential, physically, mentally, and socially.

EVERETT CHAFFEE
Associate Superintendent
Division of Instructional Services

ACKNOWLEDGMENTS

Grateful acknowledgment is expressed to the many teachers, health coordinators, school health services personnel, and representatives of 23 community health organizations and agencies who so generously made helpful suggestions during the development of this guide. The Physical and Health Education, Safety, and Youth Services Branch also is deeply indebted to the Senior High School Health Education Advisory Committee, which exercised overall leadership and assisted in many other ways. The members of this group were:

Arthur Andresen
Gordon Brown
Albert Calce
Everett Chaffee
Lyle Dixon
Lawrence Houston
George Ingles

Robert Kelly
Joseph Langan
Douglas MacKenzie
Isaac McClelland
Margaret McQuarrie
Herbert Morey
Gerwin Neher

Harriett Randall, M.D.
Ruth Rich
Jerrold Russon
Pat Turner, Chairman
Marie Wallis
Brooks Williams

Particular appreciation is expressed to Pat Turner, chairman of the committee, for his leadership and overall direction; and to the principals and teachers of the four schools which conducted the experimental program in health education during 1963-64. These persons also served as members of the advisory committee.

Thanks are conveyed to the following members of the teacher committees who participated in the development of learning activities which are described in the guide:

Gordon Brown, Lincoln High School
Paul Carver, Garfield High School
Albert Calce, Jordan High School
Lyle Dixon, Lincoln High School
Arlene Graber, Dorsey High School
Ralph Heiland, Garfield High School
Riley Johnson, Jefferson High School
Shirley Krizmanich, Gardena High School
James Kroll, Riis High School

Douglas MacKenzie, Canoga Park High School
Barbara MacMillan, Dorsey High School
Margaret McQuarrie, Narbonne High School
Helen Niparko, Cleveland High School
Beverly Pennock, Monroe High School
Virginia Robbins, Roosevelt High School
Marie Dunn Smith, Taft High School
Marie Wallis, Canoga Park High School

The suggestions of Joseph Langan, Supervisor of Health Education, Division of Secondary Education, during the various stages of development of this publication are gratefully acknowledged. In addition, gratitude is conveyed to Jerrold Russon, Supervisor in Charge, Physical Education Section, Division of Instructional Services, for his contributions.

Sincere appreciation is extended to Harriett Randall, M.D., Director of the Health Services Branch, Auxiliary Services Division, and to Virginia Crockett, M.D., Geraldine Dickinson, M.D., John Downing, D.D.S., and Vera Waegle, M.D., for their verification of the health information contained in this publication and for their valuable suggestions.

RUTH RICH
Supervisor of Health Education

TO THE TEACHER

This publication implements the course of study outline for senior high school health education. Its content is organized into seven basic units of instruction. An outline of content, lists of suggested activities and reference materials, and an explanation of evaluation procedures are included in each unit.

Obviously, each unit contains more material than can be included in the suggested time allotment. Therefore, teachers are encouraged to select and adapt from the wide range of activities suggested, those experiences which best meet the capacities and interests of students. Subject matter designated as optional should be reviewed with the school principal for guidance and direction.

The following content areas and suggested time allotments have been designated for this course:

CONTENT AREA	TIME ALLOTMENT (in weeks)
I. Orientation to Health Needs	2 - 3*
II. Guidelines for Improved Nutrition	1 - 2*
III. Transitions to Maturity (optional unit)	3 - 0*
IV. Narcotics, Alcohol, Tobacco, and Other Harmful Substances	3 - 4*
V. Progress in Public Health	4
VI. Consumer Health Protection	2
VII. Essentials of First Aid	3

*Suggested time adjustments in the event that Unit III is omitted or curtailed.

OVERVIEW OF BASIC CONCEPTS AND UNDERSTANDINGS TO BE DEVELOPED

Unit I. Orientation to Health Needs

- Health is a state of complete physical, mental, and social well-being.
- Health is a quality resulting from the optimum functioning of the total organism in his bio-social environment.
- A person's health potential is influenced by heredity, environment, and the ability to apply scientific health knowledge in his daily living.
- Each individual must assume responsibility for his own health and that of his family and community.
- The skin serves as a protective covering, regulator of body temperature, organ of excretion, and organ of sensation.
- Skin reflects the health, emotional state, occupational and/or recreational pursuits of an individual.
- Complexion problems are a normal concern of teen-age youth because skin eruptions are closely associated with the glandular changes that are taking place during adolescence.
- Body odor is produced by the action of surface bacteria on perspiration.
- Bacteria in the mouth thrive on refined sugars and starches, converting them to decay-producing acids within minutes.
- Decayed and missing teeth may lead to additional tooth loss, malocclusion, periodontal disease, and other health problems.
- Early removal of unerupted or impacted third molars reduces chances of gum infection and loss of other molars.
- Refractive errors are visual defects in which images do not focus properly on the retina.
- Periodic medical examinations and screening tests and the application of sound health and safety practices are important factors in eye and ear health.
- Most foot problems are caused by improper footwear.

Unit I. Orientation to Health Needs (cont.)

- Fitness entails optimum health, including proper nutrition, adequate rest and sleep, and proper medical and dental care, as well as sufficient capacity to meet the demands of daily living without undue stress or fatigue.
- Muscular activity helps the normal heart and circulatory system to function more efficiently.

Unit II. Guidelines for Improved Nutrition

- Proper nutrition is essential for

Building and repairing body tissues
Providing energy for work and play
Regulating body processes

The major classes of nutrients which are vital for cellular metabolism include

Carbohydrates
Fats
Proteins
Mineral Salts
Vitamins
Water

- Nutrients are distributed in a wide variety of plant and animal foods.
- No single food contains all the essential nutrients.
- A Calorie is the measure of the energy value of food.
- Body weight remains relatively stable when caloric value of food intake is just about equal to caloric expenditure.
- Weight control is an essential factor for good health.
- Proper nutrition can be achieved for the average individual by including in the daily diet servings from each of the Basic Four Food Groups.

Unit II. Guidelines for Improved Nutrition (cont.)

- Official and voluntary agencies help to protect the consumer against nutritional quackery and faddism in a number of ways.

Unit III. Transitions to Maturity (optional unit)

- Maturation is the process by which the individual grows and develops physically, physiologically, emotionally, and socially.
- In their development from conception to adulthood, human beings go through a series of stages, including prenatal, neonatal, infancy, childhood, and adolescence.
- Adolescence is a phase of the growth cycle which begins with the physiological changes of puberty and which ends with acquisition of the responsibilities of adulthood.
- Although patterns of growth and development follow a recognized sequence, the growth pattern of each individual is unique.
- The accelerated growth rate which starts with the onset of puberty, continues at a diminishing rate and gradually ceases during late adolescence.
- The endocrine glands control body growth and development and are responsible for the normal functioning of the reproductive system.
- Marriage establishes the family as the basic social unit of our society.
- The family functions as the established social unit for procreation and child rearing.
- Inherited characteristics are transmitted from parent to offspring through the genes which are located in the chromosomes of reproductive cells.
- Heredity as well as prenatal influences are important factors in determining the health and well-being of a child.
- Emotional maturity is evidenced by the ability to direct one's emotions into constructive channels.
- Social maturity is evidenced by one's acceptance of his responsibilities as defined by society.

Unit IV. Narcotics, Alcohol, Tobacco, and Other Harmful Substances

- . Narcotics, alcohol, and tobacco are harmful substances because they interfere with the optimum functioning of human body processes.
- . The control of drugs is essential to the health and well being of the individual, the community, and the nation.
- . Stimulants are substances which tend to excite or to arouse the brain and nervous system.
- . Depressants are substances which tend to lower the functional activity of the brain and nervous system.
- . Hallucinogens are drugs which elicit in normal subjects optical or auditory hallucinations and perceptual disturbances.
- . Drugs have an essential role in medicine, but unprescribed and unsupervised use can produce habituation or addiction and can lead to accidental injury or even death.
- . Any substance which is taken regularly can be habit-forming; however, addicting drugs produce both tolerance and physical dependence.
- . Narcotic addiction is a complex sociomedical problem, having physiological, psychological, and sociological implications.
- . Many persons who abuse drugs have been generally characterized as inadequate or psychopathic personalities with low frustration tolerance.
- . The misuse of alcoholic beverages is a serious social problem which often results in economic losses to the community, marital and family problems, traffic accidents, delinquency and crime, and impaired health suffered by victims of alcoholism.
- . Alcohol is a depressant drug which may be habit-forming and in some cases, addiction-producing.
- . Alcohol produces effects upon personality and behavior which cause the user to do things that he would not do under normal circumstances.
- . Alcoholism is a complex sociomedical problem having physiological, psychological, and sociological implications.

Unit IV. Narcotics, Alcohol, Tobacco, and Other Harmful Substances (cont.)

- The constituents of tobacco smoke contain many dangerous substances which produce changes in the normal functioning of physiological processes and which over a prolonged period tend to shorten or to impair human life.

Unit V. Progress in Public Health

- Public Health is an organized community effort aimed at the preventive, promotional, and rehabilitative aspects of both physical and mental health.
- Man has been able to realize his potential more fully through the application of scientific principles toward the solution of public health problems dealing with disease prevention, sanitation, and environment.
- Responsibility for community health is that of official, voluntary, and professional health agencies as well as that of individual citizens.
- Disease is a disturbance in the function or structure of any organ or part of the body.
- All human beings are subject to disease, both communicable and chronic or degenerative.
- Chronic disease is that which is slow in its course and of long generation.
- Communicable diseases are caused by specific infectious agents or their toxic products which are transmitted through the following modes: Contact (direct or indirect), vehicle (water, food), vector (mosquito, tick), or air-borne (droplet, dust).
- Immunity is resistance to infection.
- Protective defenses which help the body to resist disease include skin and mucous membranes, the phagocytic action of white blood cells, and the production of antibodies against pathogenic agents.
- Vaccines contain attenuated or dead pathogens, or their toxic products (toxoids).
- Immune serums contain antibodies against specific diseases.
- Active immunity may result from either having had a disease or being innoculated with the specific antigen.

Unit V. Progress in Public Health (cont.)

- A person may acquire passive immunity from the transfer of immune serum (gamma globulin) from another person or from certain animals.
- The venereal diseases are a group of communicable diseases that are transmitted almost always through intimate physical contact with an infected person.
- The organisms that cause venereal disease die very quickly when exposed to air; therefore, they are almost never transmitted through objects such as towels, drinking glasses, or lavatory facilities.
- There is no immunizing agent against venereal disease.
- Tuberculosis claims the lives of more people between the ages of 15 and 45 than any other communicable disease.
- Diseases of the cardiovascular system and cancer are the leading causes of death in the United States.
- There is a variety of career opportunities in the field of health occupations.
- Cancer is abnormal and uncontrolled cellular growth.

14

Unit VI. Consumer Health Protection

- A consumer is anyone who uses products and/or services.
- Consumer health information comes from many sources, both scientific and non-scientific.
- Wise decisions concerning the safe consumption and use of health services and products is dependent upon the ability of the consumer to apply sound criteria in his selection.
- Advertising is directed toward both the conscious and unconscious motives of the consumer.
- The consumer is protected by his own education and by the activities of professional organizations and local, state, and federal legislatures.
- Medical quackery is the fraudulent and unauthorized practice of medical skills by persons who pretend professionally or publicly to skill, knowledge, or qualifications which they do not possess.

Unit VI. Consumer Health Protection (cont.)

- Patent medicines are those which are advertised and sold to the public under a brand name without prescription.
- Prescription medicines are those which are considered unsafe for use except under medical supervision because they are habit-forming or toxic, or because their method of use requires particular supervision.
- Health insurance plans are designed to meet unexpected financial need directly related to health care.
- Local, state, and national health agencies protect the public in the safe use and consumption of foods, drugs, and cosmetics.
- Labeling provides protection to the public in the use of foods, drugs, cosmetics, and household products.

Unit VII. Essentials of First Aid

- First Aid is the immediate and temporary care given the victim of an accident or sudden illness until the services of a physician can be obtained.
- Medical Self Help is the care given victims of a disaster when the services of a physician are not, and will not be available.
- First aid education helps to prevent accidents by creating an awareness of safety hazards and by developing a sense of responsibility for the safety of others.
- Primary considerations in the first aid for wounds are: protection against infection and control of bleeding.
- For cases involving asphyxia, mouth-to-mouth breathing is the most effective method of manual resuscitation.
- Shock resulting from trauma is a depressed condition of the body functions due to failure of enough blood to circulate through the body following serious injury.
- Complications resulting from injuries may be prevented by maintaining cleanliness, quiet, immobility, and warmth.
- Emergencies requiring immediate first aid include severe bleeding, asphyxia, and poisoning.

Unit VII. Essentials of First Aid (cont.)

- . The injurious action of caustic poisons, such as lye and strong acids, diminishes when fluids are given to dilute the poison; however, vomiting should not be induced.
- . In cases involving poisoning, the label or container found near the victim should always be saved for identification of the poison.
- . The first aid procedures for injuries due to heat or cold are to treat for shock, relieve pain, and prevent contamination.
- . For injuries involving sprains, dislocations, and suspected fractures the injured body part should be immobilized, and medical attention should be obtained.

UNIT I

ORIENTATION TO HEALTH NEEDS

I. SCOPE OF THE UNIT

The health and well-being of the school-age population continues to be of national interest and concern. Research findings indicate that, without optimum health, the student is not likely to achieve a level of competency which is commensurate with his maximum capabilities.

Problems of dental health, vision and hearing, the nose and throat, muscular fitness, posture, and of the skin are reported frequently in health appraisals of high school students. Such problems often go uncorrected because of inadequate follow-up. However, health problems cannot be solved through corrective procedures alone. Paramount to the preservation and improvement of students' health is the teaching of scientific concepts which enable them to develop an understanding of the basic practices which contribute to optimum health and which are necessary for the prevention and control of health problems.

The purpose of Unit One is to orient students to the nature and goals of the required semester course in Health. The unit will also help students to

Develop a point of view regarding health which is firmly supported by the medical sciences.

Understand the need to apply scientific health knowledge and practices in their daily living.

Gain an understanding of the health needs and problems which are common to high school students.

Establish priorities in meeting personal health needs.

It is suggested that two weeks be allowed for the completion of this unit. Modifications in this time allotment should be based on the needs of students. Teachers should select from the range of activities suggested those experiences which are best suited to the capacities and interests of individual classes.

The outline of course content for Unit One, lists of suggested activities and reference materials, and an explanation of evaluation procedures appear on the following pages.

<p>The Skin (cont.)</p>	<p>Discuss the reason for the difference in color between the point of pressure and the surrounding tissue.</p> <p>Emphasize that the skin is the largest organ of the body (measuring approximately 17 square feet of surface) and that it performs several important functions. Destruction of large areas of the skin may be fatal, as in extensive burns. The skin serves as a</p> <ol style="list-style-type: none"> 1. Protective covering 2. Regulator of body temperature 3. Organ of excretion 4. Organ of sensation <p>The sebaceous glands secrete an oily substance, called sebum. This substance serves to lubricate the skin and hair. Excessive secretions of sebum, especially during adolescence, produce an oily skin and may be associated with complexion problems and dandruff. Frequent cleansing of the skin with soap and water and regular shampooing of the hair are the best preventive measures against these problems. Proper cleansing of the skin helps to wash away oily secretions before they clog pores. Soap and water are helpful also in removing surface bacteria, thus reducing chances of infection. There are an estimated 8,000,000 micro-organisms on the arms and hands alone; these are attached to the follicles and pores and under the skin surface in sebaceous ducts and glands.</p> <p>Veronica L. Conley, "Do You Know Your Skin?" (Reprinted from <u>Today's Health</u>, November, 1956, 1963 Revision), 1.</p>	<p><u>Text and Library Books</u></p> <p>"Do You Know Your Skin?" The Skin (cont.)	<p>Since ordinary soap has germicidal properties, medicated soaps are not necessary unless prescribed by a physician. Other preventive measures include balanced diet; avoidance of sweets and fried, greasy foods that may tend to aggravate complexion problems; adequate sleep, rest, and exercise; and emotional health.</p> <p>Discuss several reasons why the squeezing of blackheads, pimples, and pustules should be avoided. Additional practices which should be avoided are self-medication and the use of powder bases, pancake make-up, and other cosmetics which tend to clog pores and to prevent air from reaching the skin.</p> <p>Emphasize that complexion problems are a normal concern of teen-age youth because skin eruptions are closely associated with the glandular changes that take place during adolescence. These eruptions may disappear and recur at regular intervals during the ages when acne is likely to be most troublesome (ages 13-23). Persons with persistent and aggravated acne should see a physician. Dandruff, which results from the accumulation of skin cells that are shed by the outer layers of the scalp, can normally be controlled by regular shampooing and daily brushing. Persistent abnormal dandruff (seborrhea) requires consultation with a physician.</p> <p>Invite the school physician or nurse to discuss some of the medical techniques that are used by dermatologists in treating acne and the scars and pits which sometimes result from the treatment. For example, dermabrasion (skin planing) is a method used in the superficial removal of the upper layers of skin.</p>	<p><u>Text and Library Books</u></p> <p><u>Modern Health</u>. pp. 22-28. <u>Health and Safety for You</u>. p. 184.</p> <p>Los Angeles City Schools. <u>Acne</u></p> <p><u>Modern Health</u>, pp. 31-34. <u>Health and Safety for You</u>. pp. 185-186.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>The Skin (cont.)</p>	<p>Discuss the harmful effects of prolonged exposure to sunlight. Point out that a higher incidence of skin cancer is reported among persons (farmers, fishermen) whose work requires long hours of exposure to sunlight. Enumerate some of the precautions which should be taken to avoid sunburn. To what extent do suntan preparations provide protection against the powerful rays of the sun? What hazards are involved in the use of sun lamps?</p> <p>Point out that the glands of perspiration are of two kinds, eccrine and apocrine.</p> <p>--The eccrine glands are distributed extensively throughout the body surface, including the soles of the feet and the palms of the hands. These coiled tubular glands begin in the epidermis and continue into the dermis and subcutis. When stimulated by heat or nervous tension, they produce a clear fluid which is commonly referred to as "sweat."</p> <p>--The distribution of the apocrine glands is limited largely to the axillary and anogenital areas of the body. These glands produce a milky fluid, which differs somewhat from the typical "sweat" that is secreted by the eccrine glands and a body odor. Maturation of the apocrine glands is closely associated with the characteristic growth changes which occur during puberty. Since these glands usually do not become active until adolescence, body odor is relatively uncommon among children.</p> <p>Explain that the body odor is produced by the action of surface bacteria on perspiration. Preventive measures against this odor include frequent bathing or showering, the use of an effective deodorant, and frequent change</p>	<p><u>Text and Library Books</u></p> <p>Pamphlets*</p> <p><u>The Buying Guide Issue of Consumer Reports.</u> New York Consumers Union, 1963. pp. 78-82.</p> <p><u>Modern Health.</u> p. 22.</p> <p>Charts and Models of the Skin.</p> <p>Gray, Peter. <u>The Encyclopedia of the Biological Sciences.</u> New York: Reinhold, 1961. pp. 935.</p> <p>"What to Expect From Your Deodorant," (An article reprinted from <u>Today's Health</u> for June, 1963), 1-3.</p> <p>*List of Approved Free Supplementary Health Education Materials: Secondary</p>

UNIT I

ORIENTATION TO HEALTH NEEDS

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Dental Caries (cont.)</p>	<p>Use charts and diagrams to illustrate graphically the process of tooth decay. For example,</p> <p>Bacterial plaque + Fermentable foods such as refined sugars and starches → Acids which cause the enamel of the tooth to dissolve and the dentin beneath to become soft and discolored</p> <p>Emphasize that bacteria in the mouth thrive on refined sugars and starches, converting them to decay-producing acids within 3 to 5 minutes. This process continues for an hour or longer. As a result of between-meal treats, the bacteria can be forming decay-producing acids during most of the day.</p> <p>Invite the school dentist to discuss the caries-producing cycle and to demonstrate the use of the microscope-projector for showing bacterial masses directly from the mouth.</p> <p>Review the terms "zooglea" (living glue), "dental plaque," and "material alba." Point out that this is the sticky, gelatinous mass which coats the teeth and mucous membranes and serves as an enveloping, semipermeable barrier within which bacteria and other micro-organisms thrive. This sticky coating is not rinsed away with either hot or cold water. Brushing and the use of dental floss are required for its removal. When brushing is not possible, however, rinsing the mouth is important in neutralizing the acids that are formed immediately after eating.</p> <p>Instruct the class to perform the following demonstration on</p>	<p><u>Text and Library Books</u></p> <p><u>Modern Health</u>, pp. 41-43.</p> <p>"How to Educate High School Students in Oral Hygiene," (<u>Journal of Health, Physical Education, and Recreation</u>, for October, 1960. Reprint). 1-8.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Dental Caries (cont.)</p>	<p>the production of acid by micro-organisms of the mouth. The use of an acid indicator (.02 per cent aqueous methyl red solution) will show that acid is formed when microbial matter from the teeth is added to sugar.</p> <ol style="list-style-type: none"> Place sufficient scrapings from the tooth surfaces on a tile to form a $\frac{1}{4}$ inch circle. Place two or three drops of the acid indicator on the matter, and then add a few crystals of sugar. Additional dye may be required in order to obtain an intense color. <p>For additional information on this activity, consult the reference which is cited in the resource column.</p> <p>Demonstrate the use of a disclosing tablet as a means of checking how effectively film and debris are being removed from the teeth through brushing. Review pertinent factors concerning the proper method of brushing the teeth.</p> <p>Assign students to study the role of fluoridation in the reduction of tooth decay. Report that dental decay in the teeth of children who drink fluoridated water from birth is 65 per cent less, on the average, than decay in the teeth of children who drink fluoride-deficient water. Point out that the addition of fluorides to the water in the amount of one part of fluorine to one million parts of water (1 ppm) does not affect the taste, color, odor, or safety of the water supply in any way. The process is inexpensive, costing approximately 10 cents per person each year. Ask students to compile a list of professional and scientific organizations that endorse fluoridation of the water supply as a safe and effective method of reducing tooth decay. Some of these organizations are:</p>	<p>Text and Library Books</p> <p>"How to Educate High School Students in Oral Hygiene," (<u>Journal of Health, Physical Education, and Recreation</u>, for October, 1950. <p>Health of Special Sensory Organs (cont.)</p> <p>The Eye</p>	<p>Which of the above would probably offer the greatest opportunities for recall? Why? Ask students to attempt to rank the senses in order of importance.</p> <p>State that the eye is a light-sensitive organ which is composed of a number of different types of tissue and which may be subject to a variety of conditions that may interfere with its optimum function. In principle, the eye works like a camera.</p> <p>Use charts and models to review briefly the structures that make up the eye. Point out that these structures form a convex lens system which bends light rays reflected from an object and focuses them upon the light-sensitive receptor cells of the retina, the innermost lining of the eyeball.</p> <p>Explain that the focusing of light rays is accomplished largely through changes in the shape of the lens. This process is called "lens accommodation." Normally, the focusing of the eye on distant objects does not require lens accommodation because the light rays reflected from the objects are approximately parallel upon reaching the eye. However, lens adjustments are required for refraction of light rays that are reflected from objects which are closer than 20 feet. These adjustments take place through contraction of the ciliary muscles, which in turn loosen the suspensory ligament. The lens becomes more spherical in shape, thus increasing its refractive power to focus light rays on to the macula (yellow spot), the area of greatest visual acuity.</p> <p>Use charts and models to describe the protective function of various eye structures (eyelids, eyebrows, eyelashes, tear glands).</p>	<p><u>Text and Library Books</u></p> <p>Gray, Peter. <u>The Encyclopedia of the Biological Sciences</u>. New York: Reinhold, 1961. p. 379.</p> <p>Charts and Models of the Eye</p> <p><u>Modern Health</u>. pp. 174-177.</p> <p><u>Health and Safety for You</u>. pp. 223-226.</p>

<p>Common Problems</p> <p>Vision Defects</p>	<p>Demonstrate the use of the Snellen Eye Chart as a means of testing visual acuity. Discuss the meaning of vision test results that are expressed in fractions, as the following: 20/20, 20/40, and 20/200. The distance of the person being examined from the chart is represented by the numerator, and the lowest line read accurately is represented by the denominator.</p> <p>Point out that refractive errors, the results of defects of the eye in which images do not focus properly on the retina, are relatively common. Demonstrate the refractive power of different lens shapes that are used to correct errors in focusing, such as the following:</p> <p>--Hyperopia, or farsightedness, is quite common among young children. It is the result of the eyeball's being too short from front to back, which causes the images of close objects to fall behind the retina. Prescription glasses which contain convex or converging lenses are usually required for the correction of farsightedness.</p> <p>--Myopia, or nearsightedness, is a condition which occurs because the eyeball is too long. This causes the images of distant objects to fall in front of the retina. The majority of cases of myopia are correctable through the wearing of prescription glasses which contain concave or divergent lenses.</p> <p>--Astigmatism is the result of an irregular curvature of the cornea or lens. Some of the light rays fall in front of the retina, and others fall behind it, thus causing uneven focus.</p> <p>Explain that strabismus, or squint, is a condition in which</p>	<p><u>Text and Library Books</u></p> <p>The National Education Association and the American Medical Association. <u>School Health Services</u>. COMMENT

Text and Library Books

--The inner ear, for transposing the vibrations into nerve impulses, which are then conducted to the auditory centers of the brain. In the brain, the impulses are interpreted as sound. The inner ear also contains the semi-circular canals which share an important role with the eyes in maintaining equilibrium.

Indicate that motion sickness results from overstimulation of the nerve endings of the semi-circular canals. These tiny, fluid-filled canals may be likened to a builder's level.

Individual Care

Common Problems

Point out that the ear is protected against dirt and other foreign bodies by the tiny hairs and wax glands that are located in the auditory canal. Accumulations of wax may obstruct hearing temporarily. The wax is easily removed by a physician. Prying the wax out with a toothpick or other pointed instrument may result in damage to the ear drum.

Use charts and models to indicate the relationship of the ears to the nose and throat. Discuss the role of the eustachian tube in equalizing the pressure on both sides of the ear drum. Point out the mastoid bone. Report that infections of the middle ear are a major cause of hearing impairment. Some of the infections which may reach the middle ear through the eustachian tube are colds, tonsillitis, sinusitis, measles, and scarlet fever. The infection may spread to the mastoid bone which adjoins the middle ear, causing mastoiditis. An injury may also damage the middle ear. Prompt medical treatment is required for infections or damage. Antibiotic drugs have proved effective in controlling middle ear infections.

<p>Common Problems (cont.)</p>	<p>Develop a list of practices for avoiding infections of the middle ear. Discuss the effects of swimming and diving on the ears. How do loud and continuous noises affect the ear?</p>	<p><u>Text and Library Books</u> <u>Health and Safety for You</u>, pp. 237-238.</p>
<p>Special Problems</p>	<p>Indicate that otosclerosis, or hardening of the bone, is a disorder in which the small bones of the ear and the ear drum cannot vibrate freely. This condition results from the formation of spongy bone about the stapes and accounts for a small number of cases of deafness.</p> <p>Explain that hearing impairments may be classified generally as either of two types, conductive or sensorineural. The conditions that have been mentioned thus far are classified as conductive because, in each case, the sound vibrations are not conveyed effectively from either the outer or middle ear to the nerve endings of the inner ear. Perceptive hearing losses may result from disorders involving the internal ear, the nerve pathways from the ear to the brain, or the auditory centers in the brain. Infections of the brain (such as meningitis), birth injuries, and hereditary factors are among the causes of sensorineural hearing impairments.</p> <p>Ask for a special report on school and community resources for the hard of hearing. Request a copy of the work of the John Tracy Clinic.</p>	<p>The National Education Association and the American Medical Association. <u>School Health Services</u>. Washington, D. CONNECTION TO HEALTH NEEDS

COMMENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Medical Advice and Care (cont.)</p>	<p>In the whisper test, the person to be examined is seated with one ear toward the examiner, who is 10 feet away. The subject is asked to repeat the sounds that are audible to him. Subjects who must be 4 or more feet closer than other persons to hear whispered words are examined to determine whether they have a hearing impairment.</p> <p>In the watch-tick test, the subject is asked to detect the sound of a watch instead of a whisper.</p> <p>Discuss screening procedures by means of an audiometer. Ask for a report on the audiometer testing program in the schools. Explain that all hearing tests are performed on instruments named pure tone audiometers, which emit tones that range from a low growl to a high squeak. The amplitude of the tones is set at 10 or 15 decibels, depending on the room noise. The decibel is a unit of sound intensity, representing the smallest change in amplitude (volume) that can be detected by the normal human ear. At a distance of 4 feet, an average whisper produces 20 decibels. If the student responds to all tones at the amplitude of 10 or 15 decibels, his hearing is considered normal. If the tones are unheard, the audiometrist tests to determine at what volume the subject begins to hear the tone faintly. A loss of 15 decibels or more in 2 tones or more on a retest indicates the need for medical examination.</p> <p>Emphasize that screening is only a preliminary procedure and that students with significant hearing loss on screening tests, or who are suspected of having other ear difficulties, should be referred to a physician.</p>	<p><u>Text and Library Books</u></p> <p>The National Education Association and the American Medical Association. <u>School Health Services</u>. ORIENTATION TO HEALTH NEEDS

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
The Healthy Foot (cont.)	<p>Use a pedo-graph or similar technique to take the footprints of students. Ask students to analyze their prints and to compare them with illustrations of common foot divergencies.</p> <p>Request students to make an outline drawing of their shoes by placing them on sheets of paper and tracing around them with a pencil. Then instruct the students to superimpose a footprint, or an outline of the foot, onto the drawing of the shoe. Ask them to note the extent to which these patterns articulate. Point out that foot patterns develop when the foot is crowded into a shoe that is too short and too narrow, or when the shoe does not provide adequate support.</p>	Text and <u>Library Books</u>
Foot Problems	<p>List on the chalkboard the most important causes of foot problems. These include:</p> <ul style="list-style-type: none"> Failure to stand and walk properly Improper footwear (shoes and socks) Overweight Muscular weakness of the foot and leg Excessive strain from constant walking on hard surfaces 	<p>Los Angeles City Schools. <u>Foot Health Fact Sheet.</u> p. 2.</p> <p><u>Modern Health.</u> p. 271.</p>
Foot Faults	<p>Discuss some of the causes of weak, pronated feet. Point out that the height of the arch varies from individual to individual and that it is no indication of foot strength. The condition of flat feet may be normal for some individuals and is not considered serious unless accompanied by other symptoms. Emphasize that arch supports should not be used except as prescribed by a physician.</p> <p>Invite the corrective physical education teacher to discuss correct foot and leg alignment for standing and walking posture. Ask the teacher to suggest a series of exercises for the feet and legs.</p>	<p>Loman, Charles L. and Carl H. Young. <u>Postural Fitness.</u> Philadelphia: Lea and Febiger, 1960. pp. 39-48.</p> <p>Los Angeles City Schools. <u>Corrective Physical Education Guide for Junior and Senior High Schools.</u></p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Improper Footwear</p>	<p>Point out that inappropriate and badly fitted footwear (shoes and socks) is largely responsible for many foot problems, including the following:</p> <ul style="list-style-type: none"> --Corns and calluses. Overgrowths of the skin's horny layer caused by friction and pressure. The corn is usually conical and contains a core. The callus, which covers a larger surface area than the corn, is a thickening and hardening of the skin. --Bunions. Displacement of the toe toward the midline of the foot, accompanied by a thickening and swelling of the surrounding tissues. This condition is caused by shoes that are too short and too narrow. --Blister. Collection of fluid between the layers of the skin as a result of friction, heat, and the like. --Hammer toes. Deformity of the toes in which ends of the toes turn downward caused by shoes that are too narrow and too tight. --Arch stress. Strain of the longitudinal or metatarsal arch which may result from malalignment of the leg and foot, excessive weight, high-heeled shoes, and constant walking on hard surfaces with soft-soled shoes. --Ingrown toenail. Growth of the outer margin of the nail inward until it re-enters the skin. This condition is caused by tight footwear and improper trimming of the nails. The nails should be cut straight across and not too short. <p>Discuss appropriate shoes for various occasions (sandals, high heels, tennis shoes, ballet slippers, boots). Appoint a committee to conduct a survey during the lunch period to find out what types of school shoes are worn by boys and girls. How well do the shoes represented meet the standards of an appropriate school shoe?</p>	<p><u>Text and Library Books</u></p> <p>Los Angeles City Schools. <u>Foot Health Fact Sheet</u>. pp. 3-4.</p> <p><u>Modern Health</u>. pp. 271-272.</p> <p><u>Modern Health</u>. p. 36.</p> <p>Loman, Charles L. and Carl H. COMMENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Improper Footwear (cont.)</p>	<p>Ask the class to formulate a list of criteria for the selection of properly fitting shoes. Appoint a committee to role play "how to buy a shoe." Suggested questions for follow-up might include:</p> <ol style="list-style-type: none"> 1. How did the salesman determine shoe size? 2. If he did not have the proper size in a particular style of shoe, did he show a different size? 3. Did he attempt to analyze the particular foot needs of the individual and make appropriate recommendations? 4. How did the consumer determine whether the shoe fit properly? <p>Evaluate various kinds of shoe materials for durability, support, and ventilation.</p> <p>List on the chalkboard criteria for the selection of properly fitting socks. Evaluate the effectiveness of various types of sock materials in terms of their capabilities of absorbing moisture and protecting the skin from the inner surface of the shoe.</p>	<p><u>Text and Library Books</u> Los Angeles City Schools. <u>Foot Health Fact Sheet</u>. pp. 2-3.</p> <p><u>Modern Health</u>. pp. 270-271. <u>Health and Safety for You</u>. pp. 331-332.</p>
<p>Infections</p>	<p>Ask a student to report the school's dress code for footwear. How does this code correlate with recommended foot health practices?</p> <p>Discuss the various infections which may attack the foot.</p> <p>Request a special report on the cause and prevention of the fungus infection which is commonly referred to as "athlete's foot." Point out that the fungus is normally present on healthy feet. Infection occurs only when the skin's normal resistance against these micro-organisms is lowered. Skin care is the key factor in the prevention of athlete's foot</p>	<p>Los Angeles City Schools. <u>Foot Health Fact Sheet</u>. p. 3</p> <p>Los Angeles City Schools. <u>Foot Health Fact Sheet</u>. pp. 3-4.</p> <p><u>Modern Health</u>. p. 271. <u>Health and Safety for You</u>. pp. 186-187.</p>

ORIENTATION TO HEALTH NEEDS

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Infections (cont.)</p>	<p>as well as other infections. Foot baths in locker rooms are of no value. The following measures should be emphasized for the prevention of "athlete's foot":</p> <ol style="list-style-type: none"> 1. Keep the feet clean and dry. 2. Wear clean socks or "peds" daily. 3. Avoid wearing non-porous leather shoes, sneakers, and rubber-soled shoes for long periods. <p>Report that plantar wart, a virus infection occurring on the sole of the foot, requires medical treatment for its removal. This condition may become very painful. The warts seem to appear most often on parts of the foot that are subject to pressure.</p> <p>Discuss first aid procedures for blisters. Emphasize that special care should be taken to reduce chances of infection from blisters, ingrown toenails, breaks in the skin, and other irritations.</p> <p>Develop and administer a check list on individual care of the feet. Point out that in addition to foot hygiene, posture, and appropriate footwear, nutrition and weight control are important factors for optimum growth and functioning of the feet and legs. Exercise and rest are important, too. Exercise increases circulation and strengthens muscles of the feet and legs. Rest, usually by elevating the feet, massage, and alternate baths of hot and cold water are helpful for "tired feet."</p> <p>Request students to develop a list of foot conditions which require medical advice. Then ask them to choose the type of medical specialist whom they would consult regarding each problem.</p>	<p><u>Text and Library Books</u></p> <p>"A Dermatologist Talks About Warts," <u>Today's Health</u> (March, 1963). p. 4.</p> <p>Los Angeles City Schools. <u>Foot Health Fact Sheet</u>. p. 4.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>General Care (cont.)</p> <p>Physical Activity and Fitness</p> <p>Concept of Physical Fitness</p>	<p>Ask for a report on the training and qualifications of various health advisers who specialize in problems of the foot.</p> <p>Ask the class, "What is physical fitness and how does it contribute to total fitness?" Emphasize that, as an element of total fitness, physical fitness has many facets which may be attributable to both heredity and environment. Fitness entails optimum health, including freedom from disease, proper nutrition, adequate rest and sleep, and proper medical and dental care, as well as sufficient capacity to meet the demands of daily living without undue fatigue or stress.</p> <p>Instruct students to formulate their own definition of physical fitness and to compare it with the definitions from several authoritative sources. Following is a definition by the President's Council on Youth Fitness:¹</p> <p>In a technical sense, physical fitness can be viewed as a measure of the body's strength, stamina, and flexibility. In more meaningful personal terms, it is a reflection of your ability to work with vigor and pleasure, without undue fatigue, with energy left for enjoying hobbies and recreational activities and for meeting unforeseen emergencies. It relates to how you look and how you feel - and, because the body is not a compartment separate from the mind, it relates to how you feel mentally as well as physically.</p>	<p>Text and Library Books</p> <p>The American Medical Association and the American Association of Health, Physical Education and Recreation, "Exercise and Fitness." (An article reprinted from the <u>Journal of the American Medical Association</u> for April 5, 1958), 1-6.</p>

UNIT I

ORIENTATION TO HEALTH NEEDS

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Contributions to Posture and Body Build (cont.)</p>	<p>Ask each student to judge his posture by first standing before a full-length mirror and then by walking toward and away from it. Instruct him to write a report of his evaluation and to compare it with an appraisal by the nurse or physical education teacher.</p>	<p><u>Text and Library Books</u></p>
<p>Balance of Work, Rest, Physical Activity, and Recreation</p>	<p>Discuss the need of a planned daily program which allows sufficient time for work, study, rest, and relaxation. Report that "not having enough time for the things that I really want to do" and "feeling tired much of the time" are among the problems which are expressed most frequently by high school students.</p>	<p>Los Angeles City Schools. <u>Figure.</u></p>
	<p>Ask the class, "How much time should be devoted to various types of activities?" Divide the class into small discussion groups to formulate an optimum schedule for a 24-hour period. Instruct students to include both a typical school day and a Saturday or Sunday. Record the recommendations of the various committees on the chalkboard, and use them as a basis for formulating a schedule that is agreed upon by a majority of the class.</p>	
	<p>Assign each student to evaluate his daily activities in terms of the optimum schedule developed by the class.</p>	
	<p>Ask for volunteers to conduct a survey of the average amount of time devoted by students to various types of activities. Suggest that the findings be submitted for publication in the school newspaper.</p>	
<p>Fatigue</p>	<p>Ask students, "What is fatigue? How does it serve as one of the body's protective devices?" Review some of the symptoms and results of fatigue. Point out that fatigue is a normal physiological reaction which may result from a</p>	<p>Los Angeles City Schools. <u>Fatigue.</u> <u>Modern Health.</u> pp. 274-283.</p>

ORIENTATION TO HEALTH NEEDS

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Fatigue (cont.)</p>	<p>number of causes, including muscular exertion and nerve stimulation as well as psychological boredom.</p> <p>Ask the students to flex and to straighten the index finger in rapid succession as many times as they can. Point out that they will soon experience loss of coordination of the finger and pain. If they continue the exercise long enough, they will be unable to flex the finger. After a brief rest period, the finger will return to normal. Analyze with students the physiological basis of fatigue.</p> <p>Differentiate between normal and chronic fatigue. Point out that normal fatigue is a general reaction to physical or mental exertion which is relieved by proper rest. Chronic fatigue is prolonged and may result from any of a number of conditions, including:</p> <ol style="list-style-type: none"> 1. Physical activities that are excessive and continued over a long period without day to day recuperation and elimination of fatigue products. 2. Mental effort or strain, prolonged or intense, without time for recovery. This type is very harmful because it usually involves little physical activity and insufficient release of nervous energy. 3. Chronic illnesses, low-grade infections, or incomplete convalescence. Such causes are often difficult to identify but should be suspected when rest, a well-balanced diet, and adequate care do not relieve tiredness. 	<p><u>Text and Library Books</u></p> <p><u>Health and Safety for You</u>, pp. 338-340.</p> <p><u>Modern Health</u>, pp. 278-284.</p>

Los Angeles City Schools, Fatigue, p. 6.

ORIENTATION TO HEALTH NEEDS

ORIENTATION TO HEALTH NEEDS

III. EVALUATION

Evaluation is an important part of the teaching-learning process. Measurement devices and other techniques of appraisal assist both the teacher and the student to assess progress toward the achievement of the desired purposes of health education. A continual program of evaluation should be conducted throughout the semester to

- Provide guidelines in the planning and selecting of appropriate materials and activities to meet the needs and interests of students.
- Determine students' strengths and weaknesses in the subject area of health education.
- Ascertain the health interests, concerns, and problems of students.
- Establish a base line for determining progress at a later date.
- Provide evidence of student growth in health knowledge, attitudes, and practices.

Among effective evaluation instruments and procedures which may be used in providing information pertinent to Unit One are the following:

- A. Tests and Inventories
 1. Standardized Tests and Inventories on Health Knowledge, Health Attitudes, and Health Practices. Analyses of pretest results may be used to determine students' strengths and weaknesses in health. Results also may be used to identify misconceptions held by the students. (A complete listing of such instruments appears in the Mental Measurements Yearbook.)
 2. Points of View and Beliefs About Health. Lists of statements which reflect various concepts and points of view regarding health are presented to students. They are requested to identify those statements which would most nearly represent the views of a person who thinks scientifically.
 3. Health Interest Inventories. Lists of health topics are compiled and presented to students. They are requested to identify those health topics about which they would like to study.
 4. Surveys and Questionnaires on Health Habits. Students are asked to supply information concerning their behavior patterns in relation to personal health.
 5. Opinionnaires. Students are asked to state their opinions and views concerning various health problems and issues.
 6. Checklists and Questionnaires on Health Problems and Concerns. Students are asked to indicate health problems about which they are concerned.

III. EVALUATION (cont.)

7. Application of Principles. Questions of the "What would you do?" type are asked to test the ability of students to apply knowledge of health principles to everyday situations.
8. Interpretations of Data Concerning Personal Health Problem. Findings of a health examination on the eye, the ear, posture, or the teeth are presented to students. They are asked to tell what the findings mean and what follow-up procedures should be taken to correct the problem.
9. Sentence Completion Tests. Students are instructed to complete statements such as the following: "Probably, the most important concept to remember in relation to dental health is _____."
10. True-False Statements on Health Knowledge, Attitudes, and Understanding.
11. Multiple-Choice Tests on Health Knowledge, Attitudes, and Practices.
12. Matching Items Tests on Health Knowledge, Attitudes, and Practices.
13. Essay-Type Examinations on Various Aspects of Health.

B. Classwork Performance

1. Participation in Group Work and Class Discussion.
2. Oral and Written Reports.
3. Performance Checks and Rating Scales on Selected Procedures and Practices.

C. Student Self-Appraisal

1. Performance Checks and Rating Scales on Selected Health Practices and Procedures.
2. Self-Appraisal Charts and Records.
3. Student Surveys on Selected Personal Health Practices.

D. Teacher Observation of Health Behavior

1. Recorded Incidents of Student Behavior Both in and out of the Classroom.
2. Interviews and Conferences.
3. Rating Scales and Checklists.
4. Teacher Surveys on Selected Personal Health Practices.

E. Other Pertinent Information

1. Students' Health Records.
2. Dental Appraisal and Follow-up Records.
3. Posture Screening Data.
4. Performance Records on Students' Physical Fitness.
5. Student Autobiographies.

GUIDELINES FOR IMPROVED NUTRITION

GUIDELINES FOR IMPROVED NUTRITION

I. SCOPE OF THE UNIT

Americans enjoy higher nutritional standards and a more adequate food supply than the people of any other country in the world. This achievement has been largely a result of the application of scientific knowledge and the new discoveries in the fields of agriculture, biochemistry, nutrition, and the related sciences. In view of these facts, a person may reasonably ask such questions as

Why do the findings of nutritional studies indicate that the teenager, and especially the teen-age girl, may be deficient in one or more of the basic nutrients?

Why do Americans spend nearly one half billion dollars each year on such dietary fads as nutrient supplements, "health foods," and reducing schemes?

Since these problems are largely the result of faulty dietary patterns, they are essentially educational rather than economic in nature. The informed individual is less likely to submit to faulty dietary practices and to "nutritional quackery." Therefore, this unit is directed toward helping the student to gain the necessary concepts which will enable him to

Comprehend the specific nutritional needs of high school youth.

Understand and to apply basic principles of nutrition in selecting a balanced diet.

Discern the relationships between caloric intake, caloric expenditure, weight control and fitness.

Distinguish between sound dietary practices and nutritional fads or fallacies.

A time allotment of one to two weeks is suggested for the completion of this unit. To keep within this time schedule, teachers should select from the lists of activities suggested those experiences which are most appropriate for individual classes. The outline of course content for Unit Two, lists of suggested activities and reference materials, and an explanation of evaluation procedures appear on the following pages.

OUTLINE

A. NUTRITIONAL NEEDS

1. General Requirements
 - a. Proteins
 - b. Minerals
 - c. Vitamins
 - d. Carbohydrates
 - e. Fats
2. Specific Requirements

B. SOUND NUTRITIONAL PRACTICES

1. Basic Dietary Patterns
2. Individual Adaptations
3. Avoidance of Faulty Diets
4. Weight Control
 - a. Interpretation of Standards
 - b. Scientifically Established Procedures for Weight Control
 - c. Undesirable Reducing Practices

C. NUTRITIONAL FACTS AND FALLACIES

1. Nutritional Fads
 - a. Food Supplements
 - b. "Health Foods"
2. Food Combinations
3. Food Additives
4. Consumer Protection
 - a. Labels
 - b. Legislation

CONTENT

NUTRITIONAL NEEDS

General Requirements

Use posters, bulletin boards, and other visual aids to introduce the study of nutrition. Contrast the characteristics of individuals who receive proper nourishment with those who do not. Point out that nutrition provides the energy that is needed to perform at peak efficiency. It influences such factors as growth, resistance against disease, and the condition of the skin, hair, and teeth.

Ask for the definitions of the term "nutrition." Point out that it is the science which deals with proper nourishment of the body through (or by) determining the kinds and amounts of food that are necessary to

- Build and repair body tissues.
- Provide energy for work and play.
- Regulate body processes.

Any chemical substance, either organic or inorganic, that functions in one or more of the above ways is classified as a nutrient. Assign students to form their own definitions of "food," "nutrition," and "nutrient."

List the basic substances which make up the human body, and cite the percentage distribution of each. For example:

Oxygen	65
Carbon	18
Hydrogen	10
Nitrogen	3
Calcium	2
Phosphorus	1

GUIDELINES FOR IMPROVED NUTRITION

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>General Requirements</u> (cont.)</p> <p>Proteins</p>	<p>Clarify terms of measurement that are frequently used in the study of nutrition. For example:</p> <p>1 kilogram = 2.2 pounds 1 gram = 1/454 pounds 1 milligram = 1/1000, 0.001, or 1×10^{-3} grams 1 microgram = 1/1,000,000, .000001, or 1×10^{-6} grams</p> <p>The "International Unit" is based on a definite weight of a pure substance, such as</p> <p>1 International Unit of vitamin C = 0.05 milligram of pure ascorbic acid 1 International Unit of vitamin A = 0.0006 milligram of B carotene 1 International Unit of vitamin D = 0.000025 milligram of calciferol</p> <p>Define the term calorie as the quantity of heat which is needed to raise the temperature of 1 gram of water 1 degree centigrade. The kilocalorie (1000 calories) is the "calorie" unit that nutritionists use to measure the fuel value of food. Illustrate the definition of the food calorie by placing a centigrade thermometer in a quart of water, which is approximately 1 kilogram, and heating it. To raise the temperature of the water 1 degree centigrade will require the expenditure of 1 "calorie" (kcal.).</p> <p>Ask students to cite several reasons why proteins are essential for building and maintaining body tissues and for regulating body processes. Point out that proteins</p> <p>--Form a basic part of the nucleus and cytoplasm of every cell. --Perform a vital role in the formation of enzymes, hormones, antibodies, and hemoglobin.</p>	<p><u>Text and Library Books</u></p> <p>Bogert, Jean L. <u>Nutrition and Fitness</u>. 7th ed. Philadelphia: W. B. Saunders, 1962. pp. 40, 193.</p> <p>Byrd, Oliver E. <u>Health</u>. 3rd ed. Philadelphia: W. B. Saunders, 1962. pp. 60-61.</p>

GUIDELINES FOR IMPROVED NUTRITION

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES						
<p>Proteins (cont.)</p> <p>Minerals</p>	<p>--Are the chief source of the body's nitrogen. --Make up the outer layers (keratin) of the skin, hair, and nails. --Serve as an energy food, yielding 4 calories per gram.</p> <p>Distinguish between complete (animal) and incomplete (plant) proteins. Differentiate between essential and non-essential amino acids. More than half of the 23 or more amino acids that are the constituents of cells and tissues can be synthesized by the body. The remaining amino acids are termed "essential" because they must be supplied by food.</p> <p>Assign students to develop a list of typical foods that are high in protein.</p> <p>Cite some of the factors which influence protein requirements for various individuals. Size and age are important considerations; however, the amount of muscular energy expended is not. For example, the average adult requires about 1 gram (1/454 pounds) of protein for each 2.2 pounds of body weight. The baby of 1 year needs about 3.5 grams of protein per 2.2 pounds of body weight, the 6-year-old about 2.5 grams, and the adolescent boy or girl about 1.5. Ask students to compute their protein requirements on the basis of body weight and to compare the results with the Food and Nutrition Council's recommended dietary allowances.</p> <p>List the ways in which the body uses minerals. Ask students to construct a mineral chart with the following headings:</p> <table border="1" data-bbox="1745 786 1829 2108"> <thead> <tr> <th>Mineral</th> <th>Importance</th> <th>Food Source</th> </tr> </thead> <tbody> <tr> <td> </td> <td> </td> <td> </td> </tr> </tbody> </table>	Mineral	Importance	Food Source				<p><u>Text and Library Books</u></p> <p>Bogert, Jean L. <u>Nutrition and Fitness</u>. 7th ed. Philadelphia: W. B. Saunders, 1960. pp. 92-105.</p> <p><u>Modern Health</u>. p. 308.</p> <p><u>Health and Safety for You</u>. p. 244.</p> <p>Byrd, Oliver E. <u>Health</u>. 3rd ed. Philadelphia: W. B. Saunders, 1962. pp. 64-65.</p> <p><u>Modern Health</u>. pp. 308-309.</p>
Mineral	Importance	Food Source						

UNIT II

GUIDELINES FOR IMPROVED NUTRITION

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Minerals (cont.)</p> <p>Vitamins</p>	<p>Point out that a lack of adequate amounts of calcium and phosphorus in the diet may result in stunted growth, weakened or soft bones, rickets, and malformed or decayed teeth.</p> <p>Insufficient iron or copper (or both) may lead to nutritional anemia, a condition resulting from a deficiency of hemoglobin, the oxygen-carrying substance in the blood.</p> <p>Ask students to list several public health measures which have been employed successfully to prevent iodine insufficiency, which can lead to simple goiter (iodized salt, iodine added to the water supply). The recommended allowance by the National Research Council is approximately 2-4 micrograms (1/1,000,000) of iodine per day for each 2.2 pounds of body weight. Today, this amount is easily accessible in the food and water supply in most regions.</p> <p>Request students to identify typical foods that are high in iron, calcium, and phosphorus from a table in which the nutritive values of foods in average servings appear.</p> <p>Discuss the meaning of the term "vitamin." Point out that "vita" is a Latin word which means necessary for life. List some ways in which vitamins function to promote growth and to regulate normal body processes. Point out that vitamins act as enzymes, or catalysts, to promote chemical reactions which are essential for health.</p> <p>Analyze the methods that were employed by scientists who concluded that certain dietary substances could prevent or cure specific diseases. Develop appreciation for the scientific method in evaluating the work of men who have contributed to the knowledge of vitamins. Assign student reports concerning:</p>	<p><u>Text and Library Books</u></p> <p><u>Health and Safety for You</u>. p. 245.</p> <p>Bogert, Jean L. <u>Nutrition and Fitness</u>. 7th ed. Philadelphia: W. <p>Fats (cont.)</p>	<p>3. May contribute, along with other factors, to a tendency toward accumulation of excess amounts of cholesterol in the blood and to the development of atherosclerosis. Cholesterol is a lipid that exists in foods containing fats and oils. This substance is also manufactured by the human body and functions as a "provitamin" in the synthesis of vitamin D.</p> <p>Differentiate between saturated and unsaturated fats. Saturated fats are usually solid at room temperature, and unsaturated fats are usually in a liquid state. Point out that fats are classified as saturated or unsaturated on the basis of their ability, chemically, to take up additional atoms of hydrogen. If the molecular structure of a fatty acid is complete for hydrogen and cannot be altered, it is said to be saturated. The molecule of an unsaturated fatty acid can take up additional hydrogen atoms and thus may become saturated. This process, called hydrogenation, is used commercially to manufacture solid cooking fats from liquid vegetable oils.</p> <p>Invite the school physician to discuss the significance of saturated and unsaturated fats in controlling cholesterol levels. Discuss the extent to which this problem may affect the high school student.</p> <p>Instruct students to consult food charts to learn the cholesterol content of typical foods. Studies show that fats represent about 40 per cent of the total caloric intake of the average American. Approximately 80 per cent of the fat in the average diet comes from dairy products, meat, and fats and oils. It is estimated that approximately two-thirds of the total fat is of animal origin (these are usually</p>	<p><u>Text and Library Books</u></p> <p>Council on Foods and Nutrition, "The Regulation of Dietary Fat," <u>Journal of the American Medical Association</u>, 181 (August 7, 1962), pp. 411-429.</p>

<p><u>Weight Control</u></p>		

UNIT II

GUIDELINES FOR IMPROVED NUTRITION

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Interpretation of Standards</p> <p>Scientifically Established Procedures for Weight Control</p>	<p>Ask students to list some of the factors which should be considered in determining how much a person should weigh. Usually, the weight at which the individual looks, feels and performs his best should be his optimum weight. Evaluate the use of standard height and weight charts as an index for determining ideal body weight. How do charts which give the ideal weight for persons of a particular height, age, and body type differ from charts for average weights?</p> <p>Arrange with the school nurse for each student to be weighed and measured. Instruct students to compare these measurements with figures on a physical growth record chart (Meredith or Wetzel), or on a similar chart which gives the desirable weights for various body types as well as for heights and ages (Metropolitan Life Insurance Company). Plan for students who have personal questions concerning weight problems to consult with the school physician or nurse.</p> <p>Discuss the extent to which weight control is a problem among young people. Report that by the age of 20</p> <ul style="list-style-type: none"> 1 in every 4 women and 1 in every 5 men is at least 10 per cent overweight (10 per cent above the ideal weight).¹ <p>Discuss the extent to which being underweight may constitute a problem for medical attention. When a person is 20 to 30 per cent below his normal weight, he is likely to be in a state of severe malnutrition.</p>	<p><u>Text and Library Books</u></p> <p>Bogert, Jean L. <u>Nutrition and Fitness</u>. 3rd ed. Philadelphia: W. B. Saunders, 1960. pp. 85, 324.</p> <p>Wilgoose, Carl E. <u>Evaluation on Health and Physical Education</u>. New York: McGraw-Hill, 1961. pp. 61-74.</p> <p><u>Modern Health</u>. pp. 315-318.</p> <p><u>Health and Safety for You</u>. pp. 253-255.</p> <p><u>Modern Health</u>. pp. 318-319.</p>

GUIDELINES FOR IMPROVED NUTRITION

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Scientifically Established Procedures for Weight Control (cont.)</p> <p>Undesirable Reducing Practices</p>	<p>Discuss causes of overweight. To what extent may being overweight constitute a problem? When a person exceeds 10 to 20 per cent of his normal weight, he is definitely overweight. Point out that problems of obesity should be referred to a competent physician. Persons should not submit themselves to special diets without the direction of a physician. Eating the same foods that one ordinarily eats, only in less quantities, is recommended as a sound procedure for weight reduction. Reducing diets should contain the same essential nutrients as normal diets.</p> <p>Invite the school physician to discuss the health hazards of being overweight and to suggest scientifically established procedures for weight control. Emphasize that excessive weight has long been considered a threat to health. Obesity shortens life expectancy. It increases the probability of the following conditions: high blood pressure, deposits of lipoidal substances around the heart and in the arteries, arthritis, foot problems, psychological problems, and diabetes. Obese persons present a greater surgical risk and are more accident prone than persons of average weight. Discuss the value of exercise in weight-reducing programs.</p> <p>Cite the dangers of "crash" diets. Ask students to collect examples of crash diets that have been published in newspapers and magazines.</p> <p>Evaluate the following as a means of reducing weight</p> <ol style="list-style-type: none"> 1. Drugs and diet pills (hormones, laxatives, stimulants and the like which have not been prescribed by a physician) 2. Special diets and dietary formulas that have not been prescribed 3. Mechanical devices 	<p><u>Text and Library Books</u></p> <p>Byrd, Oliver E. <u>Health</u>. 3rd ed. Philadelphia: W. B. Saunders, 1962. p. 77.</p> <p>Byrd, Oliver E. <u>Health</u>. 3rd ed. UNIT II

GUIDELINES FOR IMPROVED NUTRITION

III. EVALUATION

Student progress toward the purposes of this unit may be determined in a variety of ways. Following is a list of suggested techniques and procedures:

A. Tests and Inventories

1. Application of Principles of Nutrition. Students are asked to determine the adequacy of menus in terms of basic dietary patterns, such as the Basic Four Food Groups.
 2. Analyses of Misconceptions and Misleading Information on Nutrition. Students are asked to identify and to refute erroneous beliefs and misinformation concerning foods and nutrition.
 3. Interpretation of Charts and Tables on Nutritional Data and Weight Control. Students are presented problems which involve the interpretation of data from tables and charts, such as tables of recommended dietary allowances and charts of height and weight averages.
 4. Identification of Reliable Sources of Information. Students are requested to identify reliable sources for obtaining information on various situations involving nutritional fads, fallacies, and quackery.
 5. Surveys and Questionnaires on Dietary Practices. Students are requested to supply information about dietary practices, problems, and concerns relating to nutrition.
 6. Opinionnaires. Students are asked to state their opinions and views concerning various issues and problems which relate to nutrition.
 7. True-False Statements on Principles of Diet and Nutrition.
 8. Multiple-Choice Tests on Knowledge, Attitudes, and Practices.
 9. Matching-Items Tests on Knowledge, Attitudes, and Practices.
 10. Essay-Type Examinations on Knowledge, Attitudes, and Practices.
- ##### B. Performance of Classwork
1. Oral and Written Reports.
 2. Participation in Class Discussion.
 3. Performance Checks. Students are presented with problem situations to determine their ability to make wise decisions concerning the use of foods and the application of the principles of nutrition.

III. EVALUATION (cont.)

C. Student Self-Appraisal

1. Checklists and Rating Scales on Individual Dietary Practices.
2. Self-Appraisal Charts and Records on Weight Control. Students are asked to keep records of caloric intake and caloric expenditure.
3. Student Surveys of Teen-Age Dietary Practice. Students are asked to keep a record of sound and unsound dietary practices observed by survey teams during nutrition and lunch periods.

D. Teacher Observation of Health Behavior

1. Recorded Descriptions of Students' Dietary Practices During Nutrition and Lunch Periods.
2. Interviews and Conferences with Students.
3. Rating Scales, Checklists, and Health Records Concerning Students' Nutritional Status.
4. Charts Noting Student Progress.

TRANSITIONS TO MATURITY

UNIT III

TRANSITIONS TO MATURITY

The topics included in this unit should be reviewed with the school principal for guidance and direction concerning scope of coverage

1. SCOPE OF THE UNIT

In his attempt to assume the responsibilities that are characteristic of maturity and adulthood, the adolescent is challenged during the normal period of transition by problems which are an outgrowth of a society that is becoming increasingly complex. Although the adolescent desire for independence is as strong today as in past generations, of necessity the period of dependency is becoming progressively longer. A greater number of years and, subsequently, a longer postponement of personal goals are required for young people to gain the basic knowledge and skills that are needed for adjusting effectively to the many roles demanded in a highly technical urban society.

This unit is directed toward helping adolescent students to

Understand and accept the physiological aspects of growth and maturation.

Gain an understanding of the multitude of forces, both physiological and social-emotional, that influence thoughts and actions.

Identify the changing role of the adolescent in personal-social development.

Develop a philosophy of living that leads to personally satisfying and socially responsible behavior.

It is suggested that a maximum of three weeks be allowed for the completion of this unit. Teachers are requested to review the topics in this unit with the school principal to determine the scope of coverage (as suggested above).

The outline of course content, lists of suggested activities and reference materials, and an explanation of evaluation procedures appear on the following pages.

UNIT III

TRANSITIONS TO MATURITY

OUTLINE

- (1) Heredity
- (2) Health Protection and Care
 - (a) Prenatal
 - (b) Birth
 - (c) Infancy and Childhood
 - (d) Adolescence
- d. Teenage Role
 - (1) Transitions from Parental Dependence to Independence
 - (2) Early Marriages
- 2. Community Citizenship
 - a. Development of a Philosophy of Life
 - b. Socially Responsible Behavior

A. EVIDENCES OF MATURITY

- 1. Physical Growth
 - a. Body Proportion and Muscular Development
 - (1) Sex Differences
 - (2) Individual Variations
 - b. Physiological Maturation
 - (1) Role of the Endocrine Glands
 - (2) Development of the Reproductive System
- 2. Personal-Social Development
 - a. Growth of Self-Confidence
 - b. Acquisition of Socially Approved Behavior
 - (1) Physiological Basis of Behavior
 - (2) Emotional Basis of Behavior
 - (3) Social Basis of Behavior
 - (a) Acquired Behavior
 - (b) Group Expectancies
 - 1) Family
 - 2) School
 - 3) Peer
 - 4) Community
 - (4) Individual Role
 - (a) Identification of Individual Role
 - (b) Understanding Role of Others
 - (c) Conformity and Individuality
 - (d) Approaches to Solution of Problems

B. RESPONSIBILITIES

- 1. Family Health
 - a. Appreciation of the Family
 - b. Mutual Respect of Family Members
 - c. Factors Which Contribute to Family Health

<u>Pleasant</u>	<u>Unpleasant</u>													
Like - love	Anger - rage													
Good - delicious	Fear - horror													
Joy - ecstasy	Sadness - grief													
	Dislike - hate													
	Disgust - contempt													

TRANSITIONS TO MATURITY

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Emotional Basis of Behavior (cont.)</p>	<p>Explore the reasons for bodily changes such as the following, which usually accompany varying emotional states:</p> <ul style="list-style-type: none"> --Increase in pulse rate and blood pressure --Constriction of blood vessels --Increase in breathing rate --Decrease in salivary secretion (dryness of mouth) --Increase in muscle tension and tremor --Increase in secretion of epinephrine or adrenalin into the blood --Increase in the blood-sugar level --Increase in perspiration rate --Dilation of the pupils of the eyes --Decrease in activity of the digestive system --Increase in frequency of urination --Increase in hair-follicle stimulation (gooseflesh) <p>Point out that the above physiological reactions are patterned and regulated through the sympathetic division of the autonomic nervous system and of the endocrine secretions (mostly epinephrine or adrenalin). The central nervous system, which controls skeletal muscles, is also active in emotional responses. As the emotional state of an individual subsides, the parasympathetic division takes control until the body mechanisms return to their normal equilibrium.</p> <p>Discuss the effects of persistent emotional tensions on physical and mental well being. (Cardiovascular, gastrointestinal, and skin conditions are examples). What is the meaning of psychosomatic? (Organic illness, the causes of which probably result from emotional tensions).</p> <p>Request each student to analyze his emotional reactions in various stress situations, such as when taking a test, presenting an oral report, or participating in some other important event.</p>	<p><u>Text and Library Books</u></p> <p><u>Modern Health.</u> pp. 204-205.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p data-bbox="409 2071 493 2455">Emotional Basis of Behavior (cont.)</p> <p data-bbox="1165 2208 1249 2455">Social Basis of Behavior</p> <p data-bbox="1291 2071 1333 2428">Acquired Behavior</p>	<p data-bbox="399 754 525 2016">Present examples which illustrate how emotional states may contribute to survival and may otherwise be beneficial. Why is some degree of anxiety necessary for survival?</p> <p data-bbox="567 754 735 2016">Ask students to list characteristic responses to various emotional states. Arrange for a committee to present to the class for identification photographs or pantomimes which depict responses to various emotional states.</p> <p data-bbox="766 672 1113 2016">Present examples which illustrate the degree to which emotional expression or suppression is conditioned by membership in a cultural group. How do the variety and intensity of emotional expressions as well as the occasions for their expression differ from culture to culture? Point out that the lie detector is based on the physiological aspects of emotional reaction which are governed by the autonomic nervous system and cannot be controlled voluntarily.</p> <p data-bbox="1144 672 1701 2016">Point out that social drives or motives differ from physiological drives in that they are acquired or learned as a result of cultural membership and interaction with the social environment. They are learned through reward-punishment systems in which socially desirable behavior patterns are approved or rewarded and socially undesirable patterns are disapproved or punished. Through this process the individual develops values which serve as guides to social action that is acceptable or "good" behavior in a particular social setting and to action which is unacceptable. Discuss the extent to which social behavior is rooted in physiological drives. An individual's system of values reflects his degree of maturation and his attitudes, interests, standards, and ideals.</p> <p data-bbox="1732 699 1911 2016">Ask the class to present examples which illustrate some of the ways by which children learn socially approved behavior patterns in their everyday life (association, trial and error, imitation). How have some of these principles been applied</p>	<p data-bbox="388 205 420 658"><u>Text and Library Books</u></p> <p data-bbox="756 137 924 658"><u>Modern Health</u>, pp. 61-70. <u>Health and Safety for You</u>, pp. 63-72.</p> <p data-bbox="1134 109 1386 658"><u>Modern Health</u>, pp. 48-58. Hilgard Ernest. <u>Introduction to Psychology</u>. New York. UNIT III

TRANSITIONS TO MATURITY

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
Family	Ask the class to develop a list of responsibilities, achievements, aspirations, and future roles usually expected of teenagers by the family.	<p><u>Text and Library Books</u></p> <p>Hilgard, Ernest. <u>Introduction to Psychology</u>. New York: Harcourt, Brace, 1967. pp. 118-162.</p>
School	Discuss the extent to which the school serves as a socializing agency. Request students to name the responsibilities and expectancies required of teenagers by the school. Obtain a copy of the school motto, and examine with students the extent to which the values expressed are promoted by teachers and students. To what degree do the goals and expectancies of the school agree with those of the family?	
Peer	Appoint a panel to discuss what value systems and behavior patterns are expected of teenagers by teenagers. How do these expectancies differ and agree from those held by parents and school? Instruct the panel to analyze the values of peer groups in our society.	<p><u>Health and Safety for You</u>. pp. 130-140.</p>
Community	Ask the class to identify the contribution of other organizations within the community in helping teenagers to develop socially approved behavior patterns. What expectancies are required of teenagers by the community? What is the status of the teenager as a member of the community?	
Individual Role	Explain that, as he matures and seeks independence, the individual's social needs broaden and shift from the desire for parental approval to that for approval by specific persons and groups outside the family. He becomes involved in new interactions and forms new relationships. Therefore, he must learn to differentiate and adapt to his varying role requirements.	
Identification of Individual Role	Discuss the importance of establishing an individual code of values or standards of conduct, and of following it consistently in adapting to various situations.	

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Identification of Individual Role (cont.)</p>	<p>Cite some of the many roles that an individual in a complex society must assume. For example, a man may be all of the following: a son, husband, father, business man, boss, client, and church member. Ask each student to list the individual roles that he must assume in his daily life.</p>	<p><u>Text and Library Books</u> Hilgard, Ernest. <u>Introduction to Psychology</u>. New York: Harcourt, Brace, 1967. pp. 462-502.</p>
<p>Understanding Role of Others</p>	<p>Ask the class to suggest traits or factors which contribute to the improvement of interpersonal relations. Then appoint several students to present for the class a panel discussion on some controversial issue. Using the list of traits developed by the class, instruct class members to rate the interpersonal competencies of the panel members.</p> <p>Discuss some of the reasons for conflicts with family and peer group members. Ask class members to dramatize and to analyze role-play situations involving the following interpersonal conflicts:</p> <ul style="list-style-type: none"> Parent - son or daughter Siblings Peers 	<p><u>Health and Safety for You</u>. pp. 130-140.</p>
<p>Conformity and Individuality</p>	<p>Ask class members to list the things that they do just for the sake of conformity. Discuss the concept of conformity in relation to accepting and obeying the regulations, customs, and respected ways of doing things that have been established by society.</p> <p>Devise a situation involving the concept of conformity. Develop and administer a list of multiple-choice questions with several responses, each of which is correct. Poll the class by a show of hands to find out how many students chose each response, and record the results on the chalkboard. Allow students the opportunity to change their answers, and</p>	<p>Hilgard, Ernest. <u>Introduction to Psychology</u>. New York: Harcourt, Brace, 1967. pp. 503-524.</p>

TRANSITIONS TO MATURITY

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Heredity (cont.)</p>	<p>Life begins as a fertilized egg normally containing two sets of 23 chromosomes--one set each from the mother and father. Hereditary characteristics are transmitted from parents to offspring through the genes in the chromosomes, which determine inherited traits.</p> <p>Genes are made up of chemically coded molecules of deoxyribonucleic acid (DNA), the hereditary substance contained in the nucleus of all cells (usually known as chromatin).</p> <p>Thousands of genes occur in pairs. Each gene pair is responsible for determining a specific trait. Some genes are dominant, and others are recessive. If both genes in a specific pair are dominant, or if one is dominant and the other is recessive, the dominant trait will usually become apparent. Recessive traits become apparent only when both members of the gene pair are recessive. Partner genes failing to show the dominant-recessive relationship express the trait which is intermediate between the two. Certain genes are termed sex-linked, or X-linked, because they are carried in the sex-determining X chromosome (XX = female; XY = male). The remaining 22 pairs of chromosomes are termed autosomes. Some genes lead to normal and some lead to abnormal traits. Expression of traits is based on the laws of probability.</p> <p>Request students to prepare a chart tracing the history of eye color in the family.</p> <p>List some of the health problems that may be traced to genetic origin, and discuss programs for their detection and treatment. (See page 112 for teacher resource information).</p>	<p><u>Text and Library Books</u></p> <p>Gray, Peter. <u>The Encyclopedia of the Biological Sciences</u>. III. TEACHER RESOURCE INFORMATION

CONTENT	BACKGROUND INFORMATION FOR TEACHERS ONLY	RESOURCES
	<p><u>The Role of the Endocrine Glands in Growth and Maturation</u></p> <p>1. <u>The Pituitary Gland (anterior lobe)</u></p> <p>Somatropin. This is the hormone which regulates general body growth, especially of the long bones and the fusing of the epiphyses. An oversecretion of this hormone during the growth period may produce gigantism. Hypersecretion after the growth period is completed may cause the enlargement of certain body parts, such as the hands, feet, and lower jaw. An insufficient secretion of this hormone can limit growth to that of a midget.</p> <p>Thyrotrophic hormone. This is the thyroid stimulating hormone which is essential for the proper functioning of the thyroid gland. The gland in turn secretes the hormone thyroxin, which aids in the control of metabolism and in the normal development of the body.</p> <p>Adrenocorticotrophic hormone (ACTH). This hormone is essential for the proper functioning of the adrenal cortex. The corticoid hormones which are secreted from the adrenal cortex have some influence on the development of the sex organs.</p> <p>Gonadotropic hormones. The follicle-stimulating hormone (FSH) initiates the process of ovulation in the female and spermatogenesis in the male. The luteinizing hormone (LH) stimulates the ovaries and testes to secrete estrogens and androgens. In the male, LH is referred to as the interstitial-cell-stimulating hormone (ICSH). These hormones are responsible for the development of the secondary sex characteristics. Both are excreted normally in the urine of all persons, male and female. A third hormone, prolactin (lactogenic hormone or luteotropin) promotes lactation and stimulates</p>	<p><u>Text and Library Books</u></p> <p><u>Health and Safety for You.</u> pp. 356-362.</p> <p>Gray, Peter. <u>The Encyclopedia of the Biological Sciences.</u> New York: Reinhold, 1961. pp. 491-492.</p>

	<p>the continued secretion of the hormone (progesterone) which initiates certain changes in the uterine lining in preparation for pregnancy.</p> <p>2. The Gonads (sex glands)</p> <p>The Testes. These two oval-shaped glands are suspended from the groin of the male in an external sac of skin called the scrotum. These organs serve two important functions:</p> <ol style="list-style-type: none"> a. The production of the androgenic hormones (chiefly testosterone) which are responsible for the secondary sex characteristics in the male. b. The production of spermatozoa. The sperm cells are produced in the hundreds of tiny seminiferous tubules which are contained in each testis. Although mature, sperm are not produced until puberty. The germ cells from which they are derived are formed during the embryonic stage. <p>The Ovaries. These two almond-shaped glands, which are located in the pelvis of the female, serve several important functions. They include:</p> <ol style="list-style-type: none"> a. The production of the estrogenic hormones which are responsible for the secondary sex characteristics in the female and the menstrual cycle. b. The cyclic development of the egg-containing sac-like structure, the Graafian follicle, 	<p><u>Text and Library Books</u></p>

CONTENT	TEACHER INFORMATION	RESOURCES
	<p>and the subsequent maturation and release of the egg cell from the ovarian cortex. Although the ovaries contain thousands of potential egg cells at birth, approximately 400 egg cells are released between the ages of about 12 to 45-50, usually 1 cell at a time. These are issued alternately from each ovary every 28 days. After its release, the mature ovum passes into the Fallopian tube.</p> <p>c. The secretion of the hormone progesterone. Immediately following the release of the egg cell, the follicle fills with hormone-secreting cells called the corpus luteum, or yellow body. This hormone serves several important functions including the prevention of another egg from maturing until the onset of the next ovulatory cycle, the preparation of the uterine lining for the reception of the fertilized egg, the cessation of menstruation and ovulation during pregnancy, the prevention of early miscarriage, and the preparation of the cells of the mammary glands for milk secretion. (The anterior pituitary hormone, prolactin, causes milk secretion.) If fertilization does not occur, the corpus luteum deteriorates, the uterine lining sloughs off, and menstruation occurs.</p> <p><u>Development of the Reproductive System</u></p> <p><u>Female</u></p> <p>Ovaries. Function in the production and maturation of the egg cell and in the secretion of hormones.</p>	<p><u>Text and Library Books</u></p>

CONTENT	TEACHER INFORMATION	RESOURCES
	<p>Fallopian tubes. Provide a passageway for conducting the egg cell from the ovaries to the uterus. The funnel-shaped outer ends (fimbria) help to guide the egg cell into the tube following its eruption from the ovary. The two tubes which lie in a horizontal line above the ovaries are lined with tiny hairlike cilia which move the egg toward the uterus.</p> <p>Uterus. Provides protection and nourishment for the fertilized egg. The uterus is a pear-shaped, muscular organ which is suspended by ligamentous bands between the ovaries. It is capable of stretching several times its normal size in order to accommodate the growing zygote through its embryonic and fetal development. The soft mucous lining of the uterus is called the endometrium. The upper portion is called the fundus and the lower portion, or neck, which opens into the vagina is called the cervix.</p> <p>Vagina. Is the muscular passageway leading from the cervix, or neck, of the uterus to the outside of the body. The vaginal opening is located between the urethra, the tubular passageway for the excretion of urine, and the anus. At birth, the opening of the vagina is partially covered by a membrane, which is easily torn or broken, called the hymen. The Glands of Bartholin are located along the vaginal wall and function to lubricate the mucous lining.</p> <p>The labia (majora and minora). Are the folds of skin and membranous tissue which form the external genitalia of the female.</p> <p><u>Male</u></p> <p>Testes. Function in the production of sperm cells and in the secretion of hormones. These organs lie in the scrotal sac, an external pouch which protects the heat-sensitive spermatazoa</p>	<p><u>Text and Library Books</u></p>

TRANSITIONS TO MATURITY

CONTENT	TEACHER INFORMATION	RESOURCES
	<p>from the body's temperature. The sperm cells, together with secretions from the seminal vesicles and the prostate gland, are discharged as semen from the penis during ejaculation.</p> <p>Epididymis. Is the tightly convoluted tubule which lies along the posterior surface of each testis and which leads into the vas deferens. It is the main duct in which the sperm collect from the smaller semiferous tubules.</p> <p>Seminal vesicles. Secrete a fluid which makes up part of the semen. These two glands are located on either side of the lower pelvis and join with each vas deferens just before this continuous passageway enters the ejaculatory duct of the prostate gland.</p> <p>Prostate gland. Secretes a milky fluid which makes up part of the semen. This glandular organ surrounds the urethra at the base of the bladder. Enlargement of this gland may constrict the passage of urine through the urethra.</p> <p>Cowper's glands. Discharge a fluid which functions to neutralize the acid in the urethra in preparation for the passage of sperm and to lubricate the urethra. These two small glands are located at the base of the penis.</p> <p>Penis. Forms the external sex organ of the male and contains the passageway for urine and semen. This muscular organ is composed of columns of erectile tissue which become engorged with blood during sexual stimulation, causing the penis to become erect. Ordinarily, the penis is soft and flaccid. A loose skin, called the foreskin or prepuce, covers the head of the penis to the urethral opening. The sensory center or head is called the glans penis.</p>	<p>Text and Library Books</p> <p><u>Facts Aren't Enough.</u> Chicago: American Medical Association, 1960. pp. 24-26.</p> <p><u>Preparation for Marriage.</u> Chicago: American Medical Association, 1960. pp. 10-20.</p> <p>Consult a physiology textbook for additional information</p>

CONTENT	TEACHER INFORMATION	RESOURCES
	<p><u>Health Problems of Genetic Origin</u></p> <p>Chromosomal abnormalities. These are errors in the number or structure of the chromosomes which result from improper cell division, either mitosis or meiosis. An example is mongolism, in which the total number of chromosomes contained in each body cell is 47 instead of the usual 46. This condition causes mental retardation and occurs in about 1 in 700 babies (presence detectable in contributing parent through examination of epithelial cells).</p> <p>Autosomal dominant birth defects. These include abnormalities, such as extra fingers and toes (polydactylia), congenital cataracts, certain types of deafness, and dwarfism.</p> <p>Autosomal recessive birth defects. These include enzyme defects, or inborn errors of metabolism such as phenylketonuria (accumulation of excessive amounts of the amino acid, phenylalanine, which results from the body's inability to utilize this substance and which leads to mental retardation) and galactosemia (inability of the body to utilize milk sugar or galactose). Albinism, deaf-mutism, sickle-cell anemia, and cystic fibrosis are also manifestations of this class of genetic patterns.</p> <p>Sex-linked (X-linked) recessive birth defects. These include two common varieties of color-blindness, hemophilia, and a childhood variety of muscular dystrophy.</p> <p>Birth defects having no discernible genetic pattern. These are thought to have some genetic origin because they tend to "run in families." Cleft palate, harelip, and club foot are examples.</p>	<p><u>Text and Library Books</u></p> <p>Fishbein, Morris. Editor, <u>Birth Defects</u>. Philadelphia: J. B. Lippincott, 1963. 334 pp.</p>

CONTENT	TEACHER INFORMATION	RESOURCES
<p><u>Prenatal Development</u></p> <p>Conception. Through the union of an egg cell and a sperm cell, fertilization is accomplished. The sperm cells that are ejected into the vagina work their way up through the uterus into the Fallopian tubes within 30 minutes and remain active for approximately 6 to 12 hours or more. If an egg cell is in the tube during this time interval, 1 of the 2 to 5 million spermatazoa that are discharged in a single seminal emission may successfully penetrate the ovum and fertilize it. Conception takes place the instant that this occurs, and the cell begins to divide rapidly into 2, 4, 8, and so on.</p> <p>Morula. As the zygote (fertilized ovum) passes down the Fallopian tube toward the uterus (1-3 days), it progresses through a series of cell divisions, or cleavages, forming first a mulberry-like cluster of cells called a morula.</p> <p>Blastocyte. Upon reaching the uterus (3-6 days), the cluster of cells develops into a fluid-filled cellular membrane containing an inner mass of cells at one end, from which the embryo as well as other structures will eventually develop. The outer cellular membrane develops into the fetal portion of the placenta, the chorion, which will attach to the uterine wall.</p> <p>Germ layer formation (Gastrulation). While implantation of the blastocyte into the uterine wall is taking place (about the second week) the mass of cells within the blastocyte (inner cell mass) flattens, giving rise to the amnion, the extra-embryonic membrane sac which contains the fluid surrounding the embryo, and to the 3 specialized layers of cells which form the embryo. These are as follows:</p> <p>The outermost layer of cells (the ectoderm) forms the brain and nervous system, the outer covering of the</p>	<p><u>Text and Library Books</u></p> <p>Gray, Peter. <u>The Encyclopedia of the Biological Sciences</u>. 	<p>body, the skin, hair, and nails, and the mucous linings of the mouth, nose, and rectum.</p> <p>The innermost layer (endoderm) forms the inner linings of the digestive tract, the respiratory tract, and a portion of the urogenital system.</p> <p>The middle layer (mesoderm) gives rise to bone, muscle, connective tissue, blood, bone marrow, lymphatic tissue, and the linings of body cavities.</p> <p>Advancing embryonic development. After approximately 3½ weeks, the embryo assumes an elongated shape to form the body cavity. The nerve cord (from which the brain and nervous system will develop) and the digestive tract appear as two tubes within this structure. Muscle segments from the middle germ layer (mesoderm) beneath begin to form on either side of the neural tube. By the end of the first month, the following are apparent:</p> <ul style="list-style-type: none"> --The early development of the brain, heart, and liver --The formation of limb buds that will develop into arms and legs by the 6th week --The beginning structures of the eyes and ears --The evidences of gill slits and a tail <p>By the end of the second month the embryo exhibits the general features and body form of a human infant:</p> <ul style="list-style-type: none"> --The beginnings of all organ systems have developed --The facial features (eyes, ears, and mouth) fingers, and toes have formed --The bones are beginning to harden 	<p><u>Text and Library Books</u></p> <p>Schifferees, Justus J. <u>Essentials of Healthier Living</u>. New York: John Wiley and Sons, 1963. pp. 159-164.</p> <p>Consult a physiology text-book for additional information.</p>

CONTENT	TEACHER INFORMATION	RESOURCES
	<p>Fetal development. From the 3rd week to the 9th month:</p> <ul style="list-style-type: none"> -- The completion of the organ systems will take place -- The teeth will be formed in the gums -- The hair and nails will develop -- The fetal heartbeat will be evident <p>By the 9th month the fetus will have increased in weight from 0.0000035 ($.35 \times 10^{-6}$) ounces at conception to an average of almost 6 pounds 4 ounces and in mass from a single cell to many millions of cells.</p> <p><u>The Extraembryonic Membranes</u></p> <p>Amnion. The membrane sac which contains the amniotic fluid surrounding the embryo.</p> <p>Chorion. The outer sac-like membrane encasing the amnion sac; its external surface contains villi which become embedded into the uterine lining to form the embryonic placenta. The villi, which are bathed in maternal blood, contain embryonic blood vessels through which the infant's blood circulates. An interchange of nutrients and oxygen from the mother's blood and of waste products from the infant's blood takes place by the process of diffusion through the chorionic villi.</p> <p>Placenta. The disc-shaped organ which is formed from the chorion and to some degree from the uterine lining. With the exception of certain viruses, drugs, blood-borne diseases, and antibody reactions, the placenta serves as a protective barrier as well as a diffusible membrane. It also secretes the hormone progesterone. This organ, which is about 8 inches in diameter and more than an inch in thickness at full term pregnancy, is shed as part of the afterbirth.</p>	<p><u>Text and Library Books</u></p> <p>Gray, Peter. <u>The Encyclopedia of the Biological Sciences</u>. New York: Reinhold, 1961. pp. 344-349.</p> <p>Schiffers, Justus J. <u>Essentials of Healthier Living</u>. New York: John Wiley and Sons, 1967. pp. 245-261.</p> <p><u>Preparation for Marriage</u>. CONTENT	TEACHER INFORMATION	RESOURCES
	<p>Umbilical cord. The attachment between the fetus and the placenta which contains the umbilical blood vessels. The cord, which is approximately 21 inches long at full term pregnancy, is shed along with the placenta as the afterbirth.</p> <p><u>Hazards During the Prenatal Period or Shortly After Birth</u></p> <p>Chemical hazards. Noxious chemicals, excessive drug dosage, malnutrition causing severe vitamin deficiency, and insufficient oxygen supply to embryonic tissue, may lead to congenital abnormalities, including malformation of the limbs, as in the case of the sedative drug thalidomide, and mental retardation.</p> <p>Disease hazards. Several infections are known or suspected to be responsible for birth defects. German measles virus (rubella) in the mother during the first 3 months of pregnancy may lead to eye defects, deafness, mental retardation, heart defects, harelip, and cleft palate.</p> <p>Radiation hazards. Radiation (x-rays and nuclear radiation) may lead to genetic damage resulting in breakage of the chromosomes and/or alteration of the genes. Abnormalities of the nervous system, mental retardation, and eye defects are among the congenital malformations caused by radiation hazards.</p> <p>Tobacco smoke hazards. Tobacco smoke constituents may be responsible for infant prematurity and underweight.</p> <p>Blood group incompatibilities. ABO and Rh incompatibilities constitute about 96 per cent of the cases of blood group sensitivities (antigen-antibody reactions between blood types of the mother and the infant). These incompatibilities lead to anemia and jaundice in the fetus and new born infant. They may be responsible for stillbirth and other abnormalities.</p>	<p><u>Text and Library Books</u></p> <p>National Foundation Pamphlet Series on Birth Defects</p> <p>Byrd, Oliver E. <u>Health</u>. 3rd ed. IV. EVALUATION

Certain techniques have proved helpful in ascertaining student progress toward the stated purposes of this unit. Following are several examples:

A. Suggestions for Evaluating Student Progress

1. Classwork Performance

- a. Participation in Panel Discussions and Group Work
- b. Oral and Written Reports

2. Tests and Inventories

- a. Application of Principles of Growth and Maturation. Students are asked to analyze the average growth patterns of maturing boys and girls and to apply the principles of growth and maturation to individual variations in growth rate, body structure, and other characteristics.
- b. Points of View and Beliefs Concerning Adolescent Privileges and Responsibilities. Lists of statements which reflect various adult privileges and responsibilities are presented to students. They are requested to identify those which they feel should be granted to the adolescent. Request students also to react to the statements from the point of view of a parent.
- c. True-False Statements on Superstitions as They Relate to Congenital Defects. Lists of statements which reflect various causes for birthmarks and congenital malformations are presented to students. They are asked to react to each statement on the basis of its scientific accuracy.
- d. Sentence Completion Tests. Students are instructed to complete statements such as the following: "The most important decision a teenager has to make is _____."
- e. Multiple Choice Tests on Knowledge and Attitudes.

B. Suggestions for Helping the Student to Evaluate His Own Progress

1. Student Checklists

IV. EVALUATION (cont.)

2. Self-Evaluation Rating Scale. Students are asked to rate themselves on the following aspects of behavior:

- Getting along with myself
- Getting along with family members
- Getting along with boys and girls of my own age
- Getting along with older people

C. Teacher Records and Observations

- 1. Student Autobiographies**
- 2. Ratings of Student Behavior in Group Situations**
- 3. Interviews and Conferences**
- 4. Recorded Incidents of Student Behavior Both in and out of the Classroom**

UNIT IV

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

I. SCOPE OF THE UNIT

The misuse of drugs and other harmful substances is one of the most pressing problems confronting this community. Among United States cities, Los Angeles ranks third in rate of drug addiction and in California represents 75 per cent of the narcotics problem. The misuse of alcohol costs the taxpayers of Los Angeles County approximately 15½ million dollars each year. Recent medical findings which link smoking with respiratory and circulatory diseases and premature death have spotlighted still another community problem.

Educators have been charged with the responsibility for alerting youth to the harmful effects of such substances for recent legislation recognizes that the schools are in a unique and influential position to inculcate scientific understandings and wholesome attitudes which will enable students to live personally satisfying and socially useful lives.

This unit is directed toward helping the high school student to

Develop an understanding of the dangerous physiological, psychological, and sociological effects resulting from the misuse of narcotics and other dangerous drugs.

Gain an accurate understanding of the effects of alcoholic beverages on the individual and on society.

Learn the effects of smoking on health and to form intelligent decisions concerning the use of tobacco products.

A maximum of three weeks is suggested for completion of this unit. The outline of course content, lists of suggested activities and reference materials, and an explanation of evaluation procedures follow.

UNIT IV

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

OUTLINE

- A. DEPRESSANTS, STIMULANTS, AND HALLUCINOGENS
1. Nature and General Effects
 2. Legitimate Uses
 3. Addicting and Habit-Forming Substances
- B. NARCOTIC AND OTHER DANGEROUS DRUGS -- A SOCIAL PROBLEM
1. Classification and Legal Definition
 2. Use and Abuse of Drugs
 3. History of Drug Use and Control
 4. Extent of Drug Abuse
 - a. International
 - b. National
 - c. Local
 5. Dangers of Drug Abuse
 - a. Synthetic Analgesics with Morphinelike Effects
 - b. Morphine
 - c. Codeine
 - d. Dihydrocodeinone (Percodan)
 - e. Heroin
 - f. Barbiturates
 - g. Tranquillizers
 - h. Chloral Hydrate
 - i. Marihuana
 - j. Cocaine
 - k. Amphetamines and Related Compounds
 - l. Mescalins and Related Hallucinogenic Drugs
 - m. Acetylsalicylic Acid
 - n. Sodium Bromide
 - o. Antihistamines
 - p. Other Noxious Chemical Substances
 6. The Abuse of Drugs as an Individual and a Community Problem
- C. ALCOHOL
1. The Use of Alcohol in Our Society
 2. The Use of Alcoholic Beverages as a Social Problem
 3. Nature and Major Classes of Alcoholic Beverages
 4. Alcohol and the Human Body
 5. Motivations Concerning the Use of Alcohol
 6. Alcoholism
 - a. Effects
 - b. Treatment and Rehabilitation
 7. Alcohol Legislation
 8. Alcoholic Beverages and the High School Student
- D. TOBACCO
1. Developments in Tobacco Research
 - a. Constituents of Tobacco Smoke
 - b. Effects of Tobacco Smoke
 2. Motivations Concerning the Use of Tobacco
 3. Economic Factors Related to Tobacco
 - a. Expenditures
 - b. Tobacco and the Economy
 4. Tobacco and the High School Student
7. Law Enforcement and the Abuse of Drugs
8. Treatment and Rehabilitation of Drug Misusers
9. The High School Student and the Misuse of Drugs

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

II. SUGGESTED ACTIVITIES AND REFERENCE MATERIALS

<p><u>Addiction and Habit-Forming Substances</u> (cont.)</p>	<p><u>Drug Addiction</u> (cont.) <u>Drug Habituation</u> (cont.)</p> <ol style="list-style-type: none"> 2. A tendency to increase the dose 2. Little or no tendency to increase the dose 3. A psychic (psychological) and generally a physical dependence on the effects of the drug. 3. Some degree of psychic dependence on the effect of the drug, but absence of physical dependence and, hence, absence of an abstinence syndrome. 4. Detrimental effect on the individual and on society 4. Detrimental effects, if any, primarily on the individual <p>Emphasize that any substance which is taken regularly can be habit-forming in the sense that the user becomes psychologically dependent upon the drug and feels that he cannot get along without it. However, addiction also produces both tolerance, the need to keep increasing the dose to get the same effect; and physical dependence, an intense physiological craving for continued use of the drug to prevent the onset of withdrawal illness. The symptoms of withdrawal illness may include profuse sweating, sleeplessness, vomiting, diarrhea, severe cramps in the legs, back, and abdomen, loss of weight, fever, loss of appetite, and muscle spasms.</p> <p>Request class members to apply the World Health Organization's criteria for defining addicting and habit-forming drugs to lists of well-known substances, such as the opiates, the barbiturates, cocaine, amphetamine, marijuana, headache remedies, laxatives, caffeine, nicotine, and alcohol. Ask the students to substantiate their reasons for classifying a substance as addicting, habituating, or both.</p>	<p><u>Text and Library Books</u></p> <p><u>Modern Health</u>. p. 159.</p>

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>NARCOTIC AND OTHER DANGEROUS DRUGS -- A SOCIAL PROBLEM</u></p> <p><u>Classification and Legal Definition</u></p>	<p>Differentiate between the legal and the popular usage of the terms "narcotics" and "dangerous drugs". Point out that the drugs which are subject to control by the Harris Act and the Marihuana Tax Act are legally defined as narcotics. The drugs specifically cited in this legislation include stimulant as well as sedative, or narcotic, type substances. For example, cocaine is a powerful stimulant, and the opiates, (including their synthetic equivalents) are sedatives. New drugs with addicting properties may be placed under Federal narcotic control by Presidential Order. The Health and Safety Code of California (Sections 11001-11002) also defines narcotic drugs by listing them by specific name.</p> <p>Indicate that addicting drugs not covered by Federal narcotic laws and specifically cited as "unsafe for self-medication" by the Food and Drug Administration are termed "dangerous drugs". Such drugs may be dispensed legally only upon the prescription of a licensed practitioner. The Health and Safety Code of California (Section 29001) also defines a "dangerous drug" as "any drug unsafe for self-medication". Listed among the drugs specifically cited are hypnotic (barbiturates) as well as stimulant (amphetamines) type substances.</p> <p>Instruct students to develop a glossary of terms which include the following:</p> <p><u>Sedative.</u> A drug which in moderate quantities relieves pain and anxiety, causes mental and physical relaxation, and usually produces sleep. Such drugs have a numbing effect on consciousness and in larger doses produce stupor, coma, and death.</p> <p><u>Narcotic.</u> A drug that produces sleep, causes mental or physical inactivity, relieves pain, produces a numbing effect, and in large doses causes stupor, coma, and</p>	<p><u>Text and Library Books</u></p> <p><u>Proceedings -- White House Conference on Narcotic and Drug Abuse, September 27-28, 1952.</u> (U. <p><u>Dangers of Drug Abuse</u> (cont.)</p>	<p><u>Addiction or habituation.</u> All drugs may be habit-forming, and some are addicting.</p> <p><u>Malnutrition.</u> The neglect of food in preference to drugs causes the addict to become poorly nourished.</p> <p><u>Infection.</u> Drugs contaminated by unsanitary handling, puncturing of the skin under unhygienic circumstances, and the use of an unsterilized needle make the addict highly susceptible to infections. Ulceration and abscesses of the skin and hepatitis are conditions which may be common among addicts.</p> <p><u>Cardiac and respiratory changes or failure.</u> Drugs may stimulate (speed up) or depress (lower) vital physiological processes. Overdoses can result in death. Air injected into the veins by means of a faulty needle and syringe unit may result in an air embolism (bubble) which may cause the heart to stop beating.</p> <p><u>Sensory distortion.</u> Drugs disrupt normal sensory perception, dull and distort judgment, and remove normal inhibition.</p> <p><u>Criminal involvement.</u> Experimentation with narcotic and dangerous drugs leads to a life of crime. Unprescribed drugs may be obtained only through illegitimate sources. The cost is so prohibitive that the addict must resort to crime to support his habit.</p> <p><u>Unlikely recovery.</u> Follow-up studies show that less than 15 per cent of drug addicts are cured.</p> <p>Ask for a brief report on opium. Indicate that this powerful narcotic drug is the dried, milklike juice which has been extracted from the unripe pods of a particular species of the</p>	<p><u>Text and Library Books</u></p> <p>Vogel, Victor, and Virginia Vogel. <u>Facts About Drug Addiction.</u> Chicago: Science Research Associates, 1961. pp. 9-11.</p> <p>"Drug Addiction: A Review," <u>The Journal of School Health</u>, 34 (February, 1964) 77-87.</p>

Synthetic Analgesics
with Morphinelike
Effects

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

COMMENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Synthetic Analgesics with Morphinelike Effects (cont.)</p>	<p>poppy plant, <u>Papaver somniferum</u>. Request students to find out what regulations exist concerning opium production and distribution in this country.</p> <p>Identify some of the common opiates and their synthetic equivalents. These include morphine, heroin, dilaudid, codeine, (Hycodan, Dicodid, and Percodan), and paregoric. Synthetically derived morphinelike drugs include Demerol and Methadone. The general effects of all these drugs include:</p> <ol style="list-style-type: none"> 1. Depression of the cerebral cortex 2. Reduction of pain and feeling 3. Production of euphoria 4. Constriction of the pupils of the eyes 5. Dilatation of the peripheral blood vessels 6. Slowing of the pulse rate 7. Decrease in blood pressure (in nonaddict only; disappears with tolerance) 8. Depression of respiration 9. Depression of metabolism 10. Constriction of gastrointestinal tract, leading to constipation 11. Development of addiction through repeated and uncontrolled use 12. Development of withdrawal symptoms when the drug is withheld <p>Trace briefly the history and medical uses of morphine. This is an odorless, powderlike substance which may be administered by hypodermic injection, or in the form of powders, pills, or capsules. Prescribed medically, morphine is used to:</p> <ol style="list-style-type: none"> 1. Allay severe pain after serious or extensive surgery 2. Lessen pain in some incurable disease 3. Relieve anxiety associated with pain 	<p><u>Text and Library Books</u></p> <p><u>Modern Health</u>. pp. 159-160.</p> <p><u>Health and Safety for You</u>. p. 175.</p>

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Morphine (cont.)</p>	<p>Review several of the reasons why the use of morphine is carefully controlled by physicians. These include:</p> <ol style="list-style-type: none"> 1. Morphine is reportedly 10 times stronger than opium. Hence, it is more highly addicting 2. As tolerance develops, dosage must be increased 3. The anesthetic effect of the drug is general. Control over pain is exerted through action on the central nervous system. Hence, the drug must be absorbed into the blood and carried to the central nervous system before the desired effect may be secured <p>Discuss existing regulations concerning the dispensing of morphine. Point out that control of the illicit drug traffic in morphine consists largely of preventing the diversion through theft and forgery of the drug supply available for legitimate medical uses.</p> <p>List on the chalkboard several harmful effects caused by the repeated misuse of morphine, such as the following:</p> <ol style="list-style-type: none"> 1. Uncontrolled use in large doses and overdoses is highly destructive to the tissues and organs of the body 2. Gradual physical and mental deterioration occurs 3. As tolerance for the drug develops, the size of the dose must be increased to secure the desired effect. Will power and self-control appear paralyzed. 4. When the use of the drug is discontinued, severe withdrawal illness occurs. Symptoms include: <ol style="list-style-type: none"> a. Restless sleep b. Running of eyes and nose c. Excessive yawning and sweating 	<p><u>Text and Library Books</u></p> <p>Vogel, Victor, and Virginia Vogel. <u>Facts About Narcotics</u>. Chicago: Science Research Associates, 1967. pp. 12-13.</p> <p><u>Modern Health</u>. P. 159.</p> <p><u>Health and Safety for You</u>. P. 173.</p>

Codeine	<p>List the medical uses of codeine. This drug is used to:</p> <ol style="list-style-type: none"> 1. Relieve mild pain 2. Quiet a cough 3. Promote sleep <p>Indicate that codeine is much weaker than morphine (about 1/6 as strong). Its power to induce sleep and to reduce pain is much less than that of morphine. Codeine is not as important as other opiates in drug abuse. In the United States, codeine is available only by prescription. However, liquid preparations in the form of cough syrups are available without prescription. Another exempt drug is paregoric. It, too, has low abuse potential because of its weak euphoric effects.</p>	<p>Vogel, Victor, and Virginia Vogel. <u>Facts About Narcotics</u>. Chicago: Science Research Associates, 1967. pp. 12-13.</p> <p><u>Modern Health</u>. p. 159.</p> <p><u>Health and Safety for You</u>. p. 175.</p>
Dihydrocodeinone (Percodan)	<p>Ask for a report concerning the regulations of the drug which is known as Percodan. This drug is a chemical relative of codeine and is derived from thebain, one of the numerous opium alkaloids. This drug possesses greater potential than codeine as both a pain reliever and an addiction producer.</p>	<p><u>Proceedings--White House Conference on Narcotic and Drug Abuse, September 27-28, 1962</u>. (U. S. Government Printing Office, Washington 25, D.C.). p. 281.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES														
<p>Heroin</p>	<p>Point out that heroin is the major drug of illicit narcotic traffic in the United States. It is estimated that a majority of the drug addicts are heroin users. This drug is a derivative of morphine and in its pure form (85 to 90 per cent is considered pure) is approximately 3 times the strength of morphine. The medical use of heroin is forbidden in the United States and many other nations of the world. Most heroin obtained through illicit channels has been cut with substances, such as milk sugar, to the extent that most capsules contain about 1½ grains of about 3 to 5 per cent heroin.</p> <p>Use the following example to demonstrate to students the amount of profit that 1 pound (454 grams) of heroin (90 per cent pure) costing \$1,000 would bring on the illicit market when cut with milk sugar or a similar substance and sold in capsules containing 2 to 5 per cent heroin at \$5 each.</p> <p><u>Example:</u></p> <table border="0" style="margin-left: 40px;"> <tr> <td>Per cent purity:</td> <td>90</td> <td>45</td> <td>22.5</td> <td>11</td> <td>5.5</td> <td>2.8</td> </tr> <tr> <td>Amount of dilution:</td> <td>1</td> <td>2</td> <td>4</td> <td>8</td> <td>16</td> <td>32</td> </tr> </table> <p>Results: 454 grams x 10 capsules per gram x 32 x \$5 = \$726,400 -1,000 <u>\$725,400</u></p> <p>Profit</p> <p>Cite some of the harmful effects of heroin. The drug is a white, powdery substance which is usually purchased in capsule form. Pharmacological effects of heroin are similar to those of morphine. At first, usually, the drug is sniffed in powder form. As tolerance develops, however, the user becomes more addicted to the drug. Then, he must inject it directly into the vein to obtain a more rapid and pronounced effect. Repeated misuse of heroin produces effects such as the following:</p>	Per cent purity:	90	45	22.5	11	5.5	2.8	Amount of dilution:	1	2	4	8	16	32	<p><u>Text and Library Books</u></p> <p>Mauer, David, and Virginia Vogel. <u>Narcotics and Narcotic Addiction</u>. Springfield, Illinois: Charles C. Thomas, 1954. pp. 53-58.</p> <p>"Drug Addiction: A Review," <u>The Journal of School Health</u>, 34 (February, 1964), 79.</p> <p>Vogel, Victor, and Virginia Vogel. <u>Facts About Narcotics</u>. Amount of dilution:	1	2	4	8	16	32										

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
Heroin (cont.)	<p>1. Marked deterioration of personality and character occurs. A physiological and psychological craving for the drug develops, and the total energy of the individual is directed toward one objective-- support of the addiction. Personal cleanliness, self-respect, and moral standards are abandoned. The addict readily turns to crime in order to obtain enough money for the purchase of the expensive drug.</p> <p>2. Deterioration of physical and mental health results. Several of the symptoms are:</p> <ul style="list-style-type: none"> --Malnutrition --Constipation --Loss of appetite --Restlessness --Nervousness --Hallucinations --Susceptibility to infections --Presence of punctures and sores on the arms from hypodermic needles <p>3. The user has severe withdrawal illness resulting from dehydration of body tissues when he does not take the drug. The effects are similar to those experienced with morphine.</p> <p>4. The life span of the heroin addict is shortened at least 20 to 25 years. The sharp decline in the number of drug addicts over 35 years of age helps to substantiate the inference that there is a high death rate among young drug addicts.</p>	<p><u>Text and Library Books</u></p>

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Barbiturates</p>	<p>Indicate that the barbiturates are depressant drugs having sedative and hypnotic effects. They are known as "sleeping pills" to the layman and by a variety of slang names to the addict, depending upon the color of the capsule which contains the drug ("red devils," "blue angels," "yellow jackets," and the like). The 21 barbiturate drugs which are listed for use in the United States are prepared from barbituric acid, a synthetically prepared crystalline powder. Their names usually end in "al" indicating a relationship to barbitol, the first drug of this type to be manufactured. The barbiturate drugs usually are sold in 1 to 1½ grain capsules under such names as Nembutal, Seconal, Phenobarbital, and Amytal.</p> <p>Point out the medical values of the barbiturates. Variation in speed of action, duration, and effectiveness of the various barbiturates make available to the physician and dentist a wide variety of sedative and hypnotic compounds for different degrees of use. They are prescribed to:</p> <ol style="list-style-type: none"> 1. Alleviate physical and mental distress 2. Induce sleep 3. Inhibit convulsions, or cause partial or even complete anesthesia <p>Cite the effects of the barbiturates. Use charts to point out the parts of the nervous system which they affect. In general, the barbiturates:</p> <ol style="list-style-type: none"> 1. Produce sleep and, in large doses, anesthesia 2. Reduce conscious activity of the brain 3. Depress the cortical region of the brain which is concerned with vision, audition, and other perceptive functions 4. Impair the processes of thought and memory 5. Disturb the fine coordination of motor movements 	<p><u>Text and Library Books</u></p> <p>Vogel, Victor, and Virginia Vogel. <u>Facts About Narcotics</u>. Chicago: Science Research Associates, 1967. pp. 14-15.</p> <p>State of California Interdepartmental Committee on Narcotics. <u>California Faces the Drug Abuse Problem</u>. Marihuana	<p>Explain that the narcotic drug, marihuana, comes from the resins contained in the leaves and flowering tops of the female hemp plant, <u>Cannabis sativa</u> (The active ingredient is believed to be hydrocannabinol). This plant grows almost anywhere and has been found both wild and under cultivation in many parts of the world, including the United States. It grows rapidly in any temperate zone and reaches from 3 to 18 feet in height. Leaves are dark green in color and are covered with fine hairs. The compound leaf structure is shaped like a human hand, usually with 7 lobes or "fingers".</p> <p>Review briefly the history of marihuana. Report that:</p> <p>Use of this narcotic drug, also known as "hashish," dates back at least 4,000 years. The hemp plant was introduced into the New World by the Spaniards as a source of fiber for the manufacture of rope. With the cultivation of this plant came the practice of smoking the dried tops. This practice spread north from Mexico and eventually, to the United States. Since 1900, the use of marihuana has become a significant problem in this country. The word "assassin" is derived from "hashish" the Arabian name for marihuana. This narcotic is also used extensively in the countries of Middle Asia, the Eastern and Southern Mediterranean, and North Africa, especially Egypt. In these areas the common practice is to take the drug orally as a liquid or solid.</p> <p>Point out several commercial uses of the hemp plant. (Stalks and stems are used in the manufacture of rope, hats, hemp, cloth, paper, and twine. The fruit of the hemp is used for bird seed; in paint, soaps, and linoleum; and as fertilizers.)</p>	<p><u>Text and Library Books</u></p> <p>Vogel, Victor, and Virginia Vogel. <u>Facts About Narcotics</u>. Marihuana (cont.)	<p>Emphasize that marihuana is not used for medical purposes in the United States because its reactions are unpredictable. The drug is nonaddictive; however, medical authorities warn of the development of "subtle drug dependence" or "psychological habituation." Among the unpredictable reactions to the drug are the following:</p> <ol style="list-style-type: none"> 1. Distortion in preception of time, space, and distance. (A person traveling at an extremely high rate of speed may think that he is traveling very slowly.) Objects which are close to the user may appear to be so greatly distorted that he may be afraid to step off a curb into the street. 2. Loss of inhibitions, resulting in a tendency to perform antisocial acts which ordinarily the user never would consider. 3. Intoxication, which is much like that produced from drinking alcohol. 4. Emotional dependence on the drug, which may lead to the use of other narcotic drugs. 5. Hallucinations and unusual sensitivity to sights and sounds. 6. Initial feeling of stimulation 7. Eyes usually bloodshot, with pupils dilated 8. Breath that has an acrid odor like that of burning leaves. 9. Loss of interest and motivation in the achievement of constructive goals. 	<p>Williams, Richard L., et al. <u>The Drug Takers</u>. CONTENT

Mescaline and Related
Hallucinogenic Drugs
(cont.)

ACTIVITIES AND INFORMATION

Point out that generally the hallucinogenic drugs produce:

- Stimulation of the nervous system
- Dilation of the pupils
- Constriction of the peripheral blood vessels
- Increase in blood pressure
- Psychological dependence, but physical dependence does not develop
- Tolerance through continued use

In large doses these drugs may be lethal. LSD and psilocybin are presently classified by the Food and Drug Administration as experimental drugs which may be distributed only to qualified investigators who will use them in approved programs of experimentation. At the present time, these drugs appear to be of minor importance in the drug abuse program because of cost and lack of availability.

Acetylsalicylic Acid

Discuss some of the medical uses of aspirin and of similar analgesic agents which contain acetylsalicylic acid. Point out that over 15 billion aspirin tablets (27.2 million pounds) are consumed by Americans each year. List some of the precautions which should be exercised with these drugs. Point out the number of cases of acetylsalicylic acid poisoning among small children. The ingestion of large doses of this drug may cause:

1. Severe irritation of the gastro-intestinal tract characterized by vomiting, nausea, diarrhea, and sometimes by gastric hemorrhages
2. Profuse perspiration
3. Severe thirst
4. Dehydration
5. Delirium, hallucinations, convulsions, and coma (severe cases)

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>The Abuse of Drugs as an Individual and a Community Problem (cont.)</u></p>	<p>Many young people are led to addiction by a friend. More than 90 per cent of the addicts testifying before a legislative committee reported that they began using drugs because of "friends" and "associates."</p> <p>Some young people experiment with drugs "to seek thrills," or "to try anything once."</p> <p>Present statistics to illustrate the annual cost of drug abuse to the individual and to the community. Authorities estimate that the addict needs about 30 to 60 dollars a day or about 10,000 dollars a year to support his habit. Since only a small proportion of the estimated 180,000 addicts are able to support the drug habit, each of the remaining individuals must steal at least 50,000 dollars worth of goods annually in order to realize 10,000 dollars. Analyze other costs to the community resulting from the drug abuse problem, such as those for law enforcement, the maintenance and supervised parole of drug violators, and for treatment centers and rehabilitation programs.</p> <p>Appoint a panel to report some of the problems which face the drug addict. Emphasize that:</p> <p>Most drug addicts demonstrate a helplessness to deal with their life situations either with or without the drug. Many are school dropouts from socially deprived areas. They have little or no vocational skills. Addiction renders them incapable of working efficiently at any job. When rehabilitated, the addict is often not accepted by former friends and associates. He finds a scarcity of job opportunities.</p>	<p><u>Text and Library Books</u></p> <p>Vogel, Victor, and Virginia Vogel. <u>Facts About Narcotics</u>. <p><u>Treatment and Rehabilitation of Drug Misusers (cont.)</u></p>	<p>periods of confinement with treatment for addicts and those in imminent danger of becoming addicts. The treatment consists of physical conditioning, counseling, group psychotherapy, individual psychiatric treatment, academic instruction, vocational training, and religious and other programs. The minimum is six months by law, up to 2½ years for those who volunteer for treatment, and for those convicted of misdemeanors and felonies, up to 7 years. There is close supervision on parole with chemical testing, use of outpatient treatment clinics, and experimentation with "halfway houses." California's first Halfway House for Narcotic Addicts was opened in Los Angeles in 1962.</p> <p>Point out that two testing methods are currently available to detect the use of drugs by a parolee. These are the Nalline test and the Urine Chromatography test. When administered hypodermically, the drug, nalline, will cause symptoms of withdrawal to occur, resulting from physical dependence to morphinelike drugs. For example, dilation of the pupils of the eyes occurs immediately following an injection of nalline into the vein of the person who has been using opiates. The second test involves a chemical analysis of the urine of the parolee to detect evidences of any drug that might be taken. This analysis usually takes several hours; however, traces of the use of any drug by a person can be detected.</p> <p>Divide class members into committees and ask them to identify responsibilities of high school students in preventing the spread of drug habituation and addiction. Ask the groups to suggest measures, including needed legislation, to curb the problem of drug abuse. Discuss some of the problems concerning drug abuse that are encountered by teenagers and suggest ways for solving them.</p>	<p><u>Text and Library Books</u></p> <p><u>Proceedings--White House Conference on Narcotic and Drug Abuse, September 27-28, 1962.</u> (U. NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES*

Drug, Narcotic Substance	Slang Term	Properties	Methods of Use	Effects
AMPHETAMINES Benzedrine Dexedrine Methedrine	Bennies, Dexies, Hearts Lid Proppers, Meth, Pep Pills, Speed, Uppers, Wake-Ups	Capsules or Tablets of various colors and in liquid form	Swallowed or injected (methamphetamine)	Dilated pupils; rapid speech; excitability; nervousness; sleeplessness; false sense of pep and mental alertness; habit-forming; tolerance through repeated use. Misuse may cause loss of mental powers, illness, or death.
BARBITURATES Arytal Luminal Nembutal Seconal Tuinal	Barbs, Blue Heavens, Candy, Downers, Peanuts, Phennies, Rainbows, Reds, Yellow Jackets	White powder sold in colored cap- sules	Swallowed or injected	Constricted pupils; slurred speech; symptoms similar to those caused by intoxication. Create addiction and painful withdrawal illness; user may become unconscious. Users in a groggy state may take fatal overdose. Chronic misuse of barbiturates may cause serious mental illness or death. Use with alcohol is frequently fatal.
COCAINE	Flake, Bernice, Coke Corrine, Gold Dust, Snow, Star Dust	Flaky, snowlike substance, resem- bling epsom salts or camphor. Sold in containers similar to those used for morphine or heroin	Usually sniffed be- cause mucous membrane is especially respon- sive to the drug. May be injected	Excitability; tremors. Alle- viates pain; constricts tissues dilates pupils; creates eupho- ria. Is habit-forming; pro- duces physical and mental deterioration (paranoid be- havior with continued use).

UNIT IV

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

Drug, Narcotic Substance	Slang Term	Properties	Methods of Use	Effects
HEROIN	H., Harry, Horse, Junk, Scag. Seat, Smack, Stuff	White powder resembling powdered sugar. Sold in capsules and other forms	Sniffed, or injected under skin or into vein.	Constricted pupils, water eyes running nose; drowsiness to stupor; chills, sweating on withdrawal. Physical and psychological dependencies are produced in brief period and are difficult to cure.
LSD L.S.C.	Acid, Big D, Cubes, Sugar, Trips	Liquid which is colorless, odorless, and tasteless. Available in capsules, tablets, or cubes	Swallowed	Dilated pupils, laughing-crying incoherent speech; optical and auditory hallucinations; psychological dependence; possible chromosomal damage as well as chronic brain damage and suicidal tendencies.
MARIJUANA	Gage, Grass, Pot Reeper, Roach, Tea, Weed	Leaves and flowers dried into grasslike form; rolled into paper cigarettes, folded in, or twisted at both ends. Strong odor of fresh-cut alfalfa hay	Smoked in cigarettes, pipes, or water pipes (hookah)	Reddening of eyes; talkative; laughter; euphoria; intoxication. Distortion of time and space perception. Large doses and chronic use may produce hallucinations and paranoia and result in lowered motivation and unpredictable behavior.

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

Drug, Narcotic Substance	Slang Term	Properties	Methods of Use	Effects
HASHISH	Hash	Resin from leaves of Far Eastern plant	Smoked in pipes or eaten	Effects similar to those of marijuana, but more extreme (hashish 7-10 times greater potency).
PEYOTE	Buttons	Mescaline from button-shaped growth; closely resembles mushrooms. After being plucked, mescale buttons are dried	Chewed and swallowed; ground and placed in capsules; boiled in water as tea	Dilated pupils; laughing-crying; incoherent speech; optical and auditory hallucinations; nausea, vomiting, cramps; tolerance through use.
VOLATILE CHEMICALS Aerosol products Airplane glue Freon Gasoline Paint thinner Plastic cement Toluene	Sock It	Fumes, gas or liquid	Inhaled through mouth	Dilated pupils; sneezing, coughing; chest pain; dizziness, vomiting; euphoria; psychological dependence; brain cell damage; cardiac arrest; lung damage caused from asphyxiation.

<p><u>ALCOHOL</u></p> <p><u>The Use of Alcohol in Our Society</u></p>	<p>Assign students to develop a timeline summarizing the various viewpoints which have been held toward the use of alcoholic beverages during various periods in history. Point out that</p> <p>Fermented beverages have been known to people in all parts of the world since prehistoric times. They were used for ritualistic purposes by the Sumerians, Egyptians, Greeks, and Romans. Since these drinks were found to be safer than the polluted waters which ordinarily were available, they often were used as a substitute for drinking water. Cautions against the misuse of alcoholic beverages were expressed in statements such as "moderation in all things" and "nothing to excess." Historical accounts of the effects of fermented beverages on behavior are contained in the Bible. Buddha (about 600 B.C.), Confucius (551-578 B.C.), and Mohammed (about 570-632 A.D.) also spoke out against the dangers of inebriety</p> <p>The process of distillation was discovered by the Arabs during the height of their medieval civilization. The word alcohol comes from the Arabic term "alkohol," meaning "spirit".</p> <p>Alcohol beverages were brought to the New World by the settlers (Virginia Colony, 1607), and the use of these beverages became widespread. The first brewery was erected in 1637 in the Massachusetts Colony, and the manufacture of alcoholic beverages soon became a leading industry. The moderate use of alcohol was acceptable to the Puritans and other religious groups during this period.</p> <p>Westward expansion and the conditions caused by "frontier living," are cited by authorities as being at least</p>	<p><u>Text and Library Books</u></p> <p>McCarthy, Raymond. <u>Alcohol Education for Classroom and Community</u>. <p><u>The Use of Alcohol in Our Society</u> (cont.)</p>	<p>partially responsible for a rapid increase in excessive misuse of distilled liquors in the United States during the 18th and 19th centuries.</p> <p>Attempts to curb the increasing misuse of distilled beverages began in the 1750's with the forbiddance by certain religious groups of inebriety and of commerce in distilled alcoholic beverages. The temperance movement gained momentum during the next century. Organizations, such as the American Temperance Union (1826), the National Prohibition Party (1870), and the Women's Christian Temperance Union (1851) became actively engaged in effecting legislation pertaining to alcoholic beverages. From 1851 to the Civil War years, prohibition was legislated by 13 states.</p> <p>National prohibition became a reality with the enactment of the 18th Amendment to the Constitution in 1919. Prohibition remained in effect until 1933, when passage of the 21st Amendment revoked the 18th.</p> <p>Analyze the extent to which alcoholic beverages are used in our society today. Report that the consumption of absolute alcohol per capita during the last several decades has remained relatively unchanged at approximately 2 gallons of absolute alcohol per capita for persons over 15 years of age. (California's consumption rate in 1962 was 2.66 gallons. Ask a student to find out the consumer expenditures for alcoholic beverages (10.7 billion dollars, 1962). Compare this amount with expenditures for other items (food 73.6 billion dollars). Various surveys regarding the use of alcoholic beverages by the adult population show that approximately</p> <ul style="list-style-type: none"> 1/3 report total abstinence 1/3 drink less than once a month 1/3 drink once a month or more. (It is estimated that about 1/6 of this group are alcoholics.) 	<p><u>Text and Library Books</u></p> <p>McCarthy, Raymond. <u>Alcohol Education for Classroom and Community</u>. COMMENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>The Use of Alcoholic Beverages as a Social Problem (cont.)</u></p> <p><u>Nature and Major Classes of Alcoholic Beverages</u></p>	<p>Appoint several students to survey the newspapers for reported incidents in which the misuse of alcohol may have been an attributable factor.</p> <p>Point out that alcohol is a class of chemical substances which is made up of the elements of carbon, hydrogen, and oxygen in the general formula, $C_nH_{(2n+1)}$, to which an OH is attached. The simplest is methanol, or wood alcohol (CH_3OH), which is made from the distillation of wood. This substance is extremely toxic when taken internally and may cause blindness or death. It is sometimes mixed with ethyl alcohol to form denatured alcohol. The kind that is used in alcoholic beverages is ethyl alcohol, or ethanol (C_2H_5OH). It is a colorless, inflammable liquid which has a wide variety of laboratory and industrial uses:</p> <ol style="list-style-type: none"> 1. As an organic solvent 2. In drug, cosmetic, and chemical preparations 3. As a preservative <p>Explain that almost all ethyl alcohol is made through the process of fermentation, a chemical change which is brought about by the action of yeast micro-organisms on sugar-containing solutions at room temperature. Bubbles of carbon dioxide are set free, causing the formation of ethyl alcohol. When the alcoholic content reaches approximately 12 to 14 per cent, the micro-organisms become inactive and fermentation stops. This chemical process may be expressed by the following formula:</p> $C_6H_{12}O_6 \longrightarrow 2C_2H_5OH + 2CO_2$ <p>Compare the alcoholic content of the three most common classes of alcoholic beverages. Point out that beer contains about 1/10 and wine about 3/10 as much alcohol by volume as distilled</p>	<p><u>Text and Library Books</u></p> <p>McCarthy, Raymond. <u>Facts About Alcohol</u>. Chicago: Science Research Associates, 1951. pp. 17-22.</p> <p>McCarthy, Raymond. <u>Alcohol Education for Classroom and Community</u>. New York: McGraw-Hill, 1964. pp. 69-76.</p> <p>Rice, Thurman, and Rolla Harger. <u>Effects of Alcoholic Drinks, Tobacco, Sedatives, Narcotics</u>. Evanston, Illinois: Harper and Row, 1962. pp. 49-59.</p> <p><u>Modern Health</u>. pp. 146-147.</p> <p><u>Health and Safety for You</u>. p. 169.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>Nature and Major Classes of Alcoholic Beverages</u> (cont.)</p> <p><u>Alcohol and the Human Body</u></p>	<p>liquor. (a 12-ounce container of beer contains about the same amount of alcohol as 1 ounce of 100-proof liquor.) Explain that</p> <p>Beer is produced from the fermentation of malted grain. Diastase, an enzyme, contained in the malt is responsible for converting the grain starches to sugar (maltose) so that fermentation can occur. The alcoholic content of beer is approximately 4 per cent.</p> <p>Wine is produced from the fermentation of plant and fruit juices and may vary in alcoholic content from approximately 10 to as much as 25 per cent. Wines containing alcohol above the levels of 12 to 14 per cent have been "fortified" by the use of additional alcohol.</p> <p>Distilled, or hard, liquors (whiskey, gin, brandy, and rum) have a much higher content of alcohol than either beer or wine. The alcoholic content of these substances is approximately 40 to 50 per cent, or 80 to 90 proof. (The term proof is equal to twice the per cent of alcohol by volume.)</p> <p>Use charts to illustrate the utilization of alcohol by the body. Point out that</p> <p>Alcohol requires no digestion. Immediately after swallowing, it is absorbed directly into the blood stream through the walls of the stomach (about 20 per cent) and small intestine (about 80 per cent). This action occurs very quickly; however, the rate of absorption may be slowed down by several factors, including the presence of food in the stomach.</p> <p>Alcohol is circulated throughout the body and diffuses into all tissue which contain water. Small amounts</p>	<p><u>Text and Library Books</u></p> <p>Rice, Thurman, and Rolla Harger. <u>Effects of Alcoholic Drinks, Tobacco, Sedatives, Narcotics.</u> Evanston, Illinois. NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>Alcohol and the Human Body</u> (cont.)</p>	<p>are eliminated by way of the lungs, sweat glands, and kidneys. The liver, which is the principal organ manufacturing the enzyme, alcohol dehydrogenase, is responsible for initiating the conversion of alcohol to carbon dioxide and water, the end products of oxidation. Hence, the disappearance rate of alcohol from the blood is dependent upon the liver; and black coffee, cold showers, and exercise are of no help in speeding this process. Following is the equation for alcohol oxidation:</p> $C_2H_5OH + 3O_2 = 2 CO_2 + 3H_2O$ <p>Compare the nutritive value of alcoholic beverages with that of other foods. Point out that alcohol is referred to as containing "empty" calories because it contains no vitamins, proteins, or minerals. There are about 7 calories per gram or about 80-100 calories per ounce of 50 per cent alcohol. A fifth of a gallon of distilled liquor is said to contain approximately 2,000 calories.</p> <p>Cite the physiological and psychological effects of alcohol. Emphasize that alcohol acts as a depressant on the central nervous system, affecting the highest levels of the brain, the cortical region, first. Generally, alcohol:</p> <ol style="list-style-type: none"> 1. Produces a false sense of well being, or euphoria 2. Causes dilation of the peripheral blood vessels; this may result in ruddiness of the face and neck and may produce a sensation of warmth 3. Irritates the mucous membrane lining of the stomach, especially in concentrations above 20 per cent alcohol. 4. Distorts judgment 5. Weakens inhibitions (Affects self-control) 6. Slows reaction time 	<p><u>Text and Library Books</u></p> <p>"Planning for Alcohol Education," (<u>California's Health</u>, Vol. 18. Reprint). 10-11.</p> <p>Lucia, Salvatore P. <u>Alcohol and Civilization</u>. New York: McGraw-Hill, 1963. pp. 43-94.</p> <p>"Planning for Alcohol Education," (<u>California's Health</u>, Vol. 18. <p><u>Alcoholism</u></p>	<p>Assign each student to write a paper stating his views concerning the labeling of alcoholic beverages as dangerous drugs which modify behavior and which may be habit-forming.</p>	<p>McCarthy, Raymond. <u>Alcohol Education for Classroom and Community</u>. New York: McGraw-Hill, 1964. pp. 204-210.</p>
<p><u>Effects</u></p>	<p>Point out that alcoholism is a complex chronic disorder which constitutes a major public health problem. This condition affects approximately 5 million Americans, or about 5 per cent of the adult population. About 20 per cent of admissions to mental hospitals in California are alcoholics. Alcoholism differs from inebriety in that the latter is by choice. However, alcoholism is the result of an uncontrollable urge or compulsion to drink. The alcoholic uses alcohol to such an extent that it interferes with and is detrimental to his physical and mental health as a functioning individual.</p>	

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Effects (cont.)</p> <p>Treatment and Rehabilitation</p>	<p>Discuss some of the theories concerning the cause of alcoholism. Emphasize that the specific nature and cause of this condition are not known. Most authorities agree, however, that alcoholism is a complex sociomedical problem, having physiological, psychological, and sociological implications.</p> <p>Cite some of the effects of alcoholism on the individual. Enumerate some of the medical problems that are associated with alcoholism. These include:</p> <ul style="list-style-type: none"> malnutrition nervousness fatigue chronic indigestion jaundice cirrhosis of the liver pancreatitis alcoholic hallucinosis delirium tremens tuberculosis <p>Ask class members to suggest some of the effects of alcoholism on families.</p> <p>Discuss the economic burden of alcoholism on the community. Emphasize that alcoholism is "perhaps the only disease which causes its victims to show up more in police courts and jails than in hospitals."</p> <p>Discuss the philosophy and goals of current programs for the treatment of alcoholism. Emphasize that treatment programs may involve nutritional therapy, medical and psychiatric treatment, individual and family counseling, and outpatient care.</p> <p>Ask class members to identify some of the current treatment</p> <p>County Commission on Alcoholism, "Estimated Costs to Los Angeles County Attributable to the Use of Alcohol," <u>Dorn Newsletter</u> (March 31, 1964), 6.</p>	<p><u>Text and Library Books</u></p> <p>Rice, Thurman, and Rolla Harger. <u>Effects of Alcoholic Drinks, Tobacco, Sedatives, Narcotics</u>. <p><u>TOBACCO</u></p> <p><u>Developments in Tobacco Research</u></p>	<p>Assign students to prepare a brief historical overview of events in the controversy concerning the smoking of tobacco which eventually led to the Surgeon General's report on <u>Smoking and Health</u>. Following is a brief summary:</p> <p><u>16th Century.</u> Controversy concerning the effects of tobacco on health developed soon after its introduction into Europe by explorers returning from the New World. Jean Nicot, French ambassador to Portugal, for whom the tobacco plant (<u>Nicotian tabacum</u>) is named, extolled its medical value as a curative drug in 1565.¹ During the same era, smoking was condemned as a foul-smelling, loathsome custom, harmful to the brain and lungs.</p> <p><u>17th and 18th Centuries.</u> The habit of tobacco smoking became widespread among the men of Europe and America in spite of early opposition by the clergy, physicians, and the ruling heads of England, Russia, and Turkey.</p> <p><u>19th Century.</u> The first well-documented study on the effects of smoking on health was reported in 1859 by a French physician, M. Boisson.² Of 68 patients with cancer of the oral cavity (45 lip, 11 mouth, 7 tongue, 5 tonsil), he noted that 66 smoked pipes, 1 chewed tobacco, and 1 used tobacco in some other form. He observed also that cancer occurred more often among smokers of short-stemmed pipes than among those who smoked pipes with long stems. He</p> <p>¹"Effects of Smoking," <u>Scientific American</u>, 207 (July 1962) 39-51.</p> <p>²<u>Loc. cit.</u></p>	<p><u>Text and Library Books</u></p> <p>U. S. COMMENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>Developments in Tobacco Research (cont.)</u></p>	<p>concluded that cancer resulted from irritation to the tissues by tobacco smoke and heat. Laymen who spoke out against smoking included Horace Mann, Horace Greeley, and Charles Dickens.</p> <p><u>20th Century.</u> Intensive research into the relationship between tobacco and health has been conducted during most of this century.</p> <p>--In 1900, statisticians noted an increase in the incidence of lung cancer which paralleled the increased use of tobacco, especially in the form of cigarettes.</p> <p>--After 1930, definite trends in death and disease rates among smokers and nonsmokers became more pronounced. Physicians began to note that nearly all their lung cancer patients smoked cigarettes.</p> <p>--In 1939, A. H. Roffo of Argentina produced the first experimental evidence of association of smoking with cancer.¹ By painting tarlike substances onto the backs of rabbits, he was able to produce cancer.</p> <p>--Since 1939, 29 studies have been completed which present evidence linking cigarette smoking to lung cancer. Evidence also indicates that smoking is hazardous to the cardiovascular system.</p> <p>--Between 1950 and 1960, a number of health organizations issued statements based on accumulated evidence, declaring that "smoking is an important health hazard particularly with respect to lung cancer and cardiovascular disease." These groups</p>	<p><u>Text and Library Books</u></p> <p>U. S. Department of Health, Education, and Welfare, Public Health Services. <u>Smoking and Health.</u> (U. S. Statements by the Surgeon General in 1957 and in 1959 implicated smoking as "a principal factor in the increased chance of developing lung cancer."</p> <p>--On June 1, 1961, a letter was sent to the President of the United States urging the formation of a Presidential commission to study the "widespread implications of the tobacco problem." This letter was signed by the presidents of the American Cancer Society, the American Public Health Association, the American Heart Association, and the National Tuberculosis Association.</p> <p>--On July 24, 1962, an expert committee was established by the Surgeon General, and this action was approved by the President of the United States. It was the opinion of this committee that "cigarette smoking contributes substantially to mortality from certain specific diseases and to the overall death rate."</p> <p>Ask for a committee to report the kinds of studies that were used as evidence for reports that smoking and other tobacco uses are injurious to health. Point out that the three</p>	<p><u>Text and Library Books</u></p>

COMMENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>Developments in Tobacco Research (cont.)</u></p>	<p>following kinds of scientific evidence were used:¹</p> <ol style="list-style-type: none"> 1. <u>Animal studies.</u> Exposure of animals to tobacco smoke and tars and to the various chemical compounds they contain. Seven of these compounds have been established as cancer-producing. Other substances in tobacco and smoke, though not carcinogenic themselves, promote cancer production or lower the threshold to a known carcinogen. Several toxic or irritant gases contained in tobacco smoke produce experimentally the kinds of non-cancerous damage seen in the tissues and cells of heavy smokers. This includes suppression of ciliary action that normally cleanses the trachea and bronchi, damage to the lung air sacs, and to mucous glands and goblet cells which produce mucous. 2. <u>Clinical and autopsy studies.</u> Observations of thousands of patients and autopsy studies of smokers and nonsmokers show that many kinds of damage to body functions and to organs, cells, and tissues occur more frequently and severely in smokers. Three kinds of cellular changes--loss of ciliated cells, thickening, and presence of atypical cells--are much more common in the lining layer (epithelium) of the trachea and bronchi of cigarette smokers than of nonsmokers. 3. <u>Population studies.</u> Another kind of evidence comes from two types of epidemiological studies. In 	<p><u>Text and Library Books</u></p> <p>U. S. Department of Health, Education, and Welfare, Public Health Service. <u>Smoking and Health.</u> (U. S. Government Printing Office, Washington 25, D. <p><u>Developments in Tobacco Research</u> (cont.)</p>	<p>retrospective studies, the smoking histories of persons with a specified disease (for example, lung cancer) are compared with those of appropriate control groups without the disease. All but 1 of the 29 retrospective studies showed that proportionately more cigarette smokers are found among the lung cancer patients than in the control populations without lung cancer. The 7 prospective studies in which groups of healthy smokers and nonsmokers were followed for a specified period showed that the death rate for cigarette smokers was nearly 70 per cent higher than for nonsmokers. The greater the number of cigarettes smoked daily, the higher the death rate. Men who began smoking before age 20 have a substantially higher death rate than do those who began after 25.</p>	<p><u>Text and Library Books</u></p>
<p>Constituents of Tobacco Smoke</p>	<p>Describe the composition of tobacco smoke. Point out that tobacco smoke is made up of about 270 different substances in the form of</p> <ol style="list-style-type: none"> 1. Various gaseous constituents (about 60 per cent of total tobacco smoke) containing numerous substances, several of which are capable of inhibiting the action of the ciliated cells of the trachea and bronchi.¹ These gases include carbon monoxide, carbon dioxide, methane, acrolein, methanol, acetone, ammonia, nitrogen dioxide, methyl nitrate, hydrogen sulfide, hydrogen cyanide, and methyl chloride. 	<p>U. HOW CIGARETTE SMOKE DAMAGES THE BRONCHIAL TUBES

These are photomicrographs of tissue surgically removed from the bronchial tubes of a patient with chronic cough who was discovered to have lung cancer after years of cigarette smoking.

This shows a section of the bronchial tube lining that has not yet been damaged. The cells appear normal with their surfaces covered by hair-like projections, the cilia. These keep up a constant beating motion which carries mucous and foreign materials up the bronchial tubes and out of the lungs. Cigarette smoke stops the action of the cilia and eventually causes them to disappear.

In this section, almost all of the cilia have been destroyed. The only way mucous can be removed from this part of the lung is by coughing. The cell nuclei are also abnormal. Several are small and dark and appear to be paired. This is a pre-cancerous change. Further down the bronchial tract a cancer was found.

COMMENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Effects of Tobacco Smoke Constituents on the Human Body (cont.)</p>	<p><u>Cancer of the Urinary Bladder.</u>¹ Available data suggest an association between cigarette smoking and urinary bladder cancer in the male but are not sufficient to support a judgment on the causal significance of this association.</p> <p><u>Diseases of the Cardiovascular System.</u>² Smoking and nicotine administration cause acute cardiovascular effects similar to those induced by stimulation of the autonomic nervous system, but these effects do not account well for the observed association between cigarette smoking and coronary disease. It is established that male cigarette smokers have a higher death rate from coronary disease than nonsmoking males. The association of smoking with other cardiovascular disorders is less well established. If cigarette smoking actually caused the higher death rate from coronary disease, it would on this account be responsible for many deaths of middle-aged and elderly males in the United States. Other factors such as high blood pressure, high serum cholesterol, and excessive obesity are also known to be associated with an unusually high death rate from coronary disease. The causative role of these factors in disease, though not proven, is suspected strongly enough to be a major reason for taking countermeasures against them. It is also more prudent to assume that the established association between cigarette smoking and coronary disease has causative meaning than to suspend judgment until no uncertainty remains.</p>	<p>Text and Library Books</p>

<p><u>Tobacco and the High School Student</u> (cont.)</p>	<p>Appoint a student panel to discuss arguments for and against smoking.</p> <p>Request each class member to develop a list of facts about smoking that high school students should consider.</p> <p>Divide the class into committees and request each group to develop an anti-smoking campaign that could be directed to teenagers. Submit these plans to the student council for use in a school-wide campaign.</p> <p>Request committees to develop radio commercials that are directed toward helping teenagers to make intelligent decisions concerning smoking. Arrange for the use of the tape recorder, and allow students to record their commercials for presentation to the class.</p> <p>Discuss parental attitudes toward smoking by teenagers.</p> <p>Ask for a report on the extent to which existing tobacco legislation is effective in restricting smoking by teenagers.</p>	<p><u>Text and Library Books</u></p> <p><u>Health and Safety for You</u>, pp. 164-168.</p> <p>"Cigarette Smoking and Health, Part III: A Proposal for Action in California," <u>California's Health</u>, 21 (October 1, 1963), pp. 49-54.</p>

NARCOTICS, ALCOHOL, TOBACCO, AND OTHER HARMFUL SUBSTANCES

III. EVALUATION

Evaluation of student progress in achieving the stated purposes of this unit may be determined in a variety of ways, including:

A. Tests and Inventories

1. Points of View and Beliefs Concerning the Use of Harmful Substances. Students are asked to react to the problems associated with the misuse of narcotic and other dangerous drugs.
2. Analyses of Misconceptions and Misleading Information. Students are asked to identify and to refute misinformation concerning harmful substances.
3. Application of Principles. Questions of the "What would you do?" type are asked to test the ability of students to make intelligent decisions concerning the use of narcotics, alcohol, tobacco, and other harmful substances.
4. Sentence Completion Test. Students are instructed to complete statements such as the following: "Probably the best response when offered an alcoholic beverage is _____."
5. Identification of Reliable Source of Information. Students are requested to identify reliable sources of information on questions pertaining to addicting and habit-forming substances.
6. Checklists. Students are offered lists of typical problems and concerns pertaining to situations involving the misuse of harmful substances. They are requested to identify those problems which are of personal concern.

B. Classwork Performance

1. Participation in Panel Discussions and Group Work.
2. Preparation of Oral and Written Reports.

PROGRESS IN PUBLIC HEALTH

UNIT V

PROGRESS IN PUBLIC HEALTH

I. SCOPE OF THE UNIT

Modern technology and research have enabled mankind to attain advanced health standards that were heretofore unrealized by any generation. Yet, as man progresses toward the solution of the age-old diseases that have plagued him for centuries, he is challenged continuously to find ways of coping with new health hazards typical of a highly technological space age. New dimensions in disease control, air pollution, nuclear radiation, and the growing problem of maintaining a safe and adequate water supply are examples.

Today's citizen must have more than just a passing acquaintance with present-day health problems in order to make intelligent decisions concerning them. Therefore, this unit is directed toward helping the student to

Develop an awareness of public health problems as they relate to both the individual and the population as a whole.

Examine those programs which have been proposed to resolve these problems.

It is suggested that four or five weeks be allowed for the completion of this unit.

To keep within this time allotment, teachers are urged to select and to adapt from the wide range of activities suggested those experiences which best meet the capacities and interests of the class. The outline of course content, lists of suggested activities and reference materials, and an explanation of evaluation procedures appear on the following pages.

UNIT V

PROGRESS IN PUBLIC HEALTH

OUTLINE

A. ROLE OF PUBLIC HEALTH

1. History and Significance of the Public Health Movement
2. Major Achievements in Public Health
3. Scope of Present-Day Health Problems
4. Public Health Organizations
 - a. Types of Health Agencies
 - b. Scope of Activities
 - (1) Official
 - (a) Local
 - (b) State
 - (c) National
 - (d) International
 - c. Professional Organizations
 - d. Voluntary Health Agencies

B. PREVENTION AND CONTROL OF DISEASE

1. Concept of Disease
2. Communicable Disease Control
 - a. Overview of the Problem
 - b. Disease-Producing Organisms
 - (1) Types
 - (2) Modes of Transmission
 - (3) Effects on the Body
 - (4) Destruction of Pathogens
 - c. Respiratory Infections

- d. Venereal Diseases
 - (1) Syphilis
 - (2) Gonorrhea
 - (3) Other Venereal Diseases
 - (4) Community Programs for the Control of Venereal Disease
 - e. Tuberculosis
 - f. Hepatitis
 - g. Infectious Mononucleosis
 - h. Poliomyelitis
 - i. Measles
 - j. Other Communicable Diseases
3. Individual Protection Against Disease
 - a. General Body Defenses
 - b. Mechanisms of Immunity
 - (1) Antigen-Antibody Reactions
 - (2) Types of Immunity
 - (3) Immunizations
 - c. Advances in Chemotherapy and Antibiotics
 4. Responsibilities in Disease Control
 - a. Individual
 - b. School
 - c. Community
 - d. Legal

PROGRESS IN PUBLIC HEALTH

OUTLINE

B. PREVENTION AND CONTROL OF DISEASE (cont.)

5. Chronic and Degenerative Diseases
 - a. Overview of the Problem
 - b. Diseases of the Cardiovascular System
 - (1) Congenital Heart Defects
 - (2) Rheumatic Heart Disease
 - (3) Hypertension
 - (4) Coronary Heart Disease
 - (5) Cerebral Vascular Disease
 - (6) Varicose Veins
 - c. Kidney Disease
 - d. Cancer
 - (1) Cause
 - (2) Prevention
 - (3) Treatment
 - e. Chronic Respiratory Diseases
 - f. Allergic Reactions
 - g. Diabetes Mellitus
 - (1) Cause
 - (2) Detection and Treatment
 - (3) Research and Education

C. ENVIRONMENTAL HEALTH PROTECTION

1. Sanitation
 - a. Milk Control
 - b. Water Contamination
 - c. Pest Control and the Use of Pesticides
2. Air Pollution
3. Radiation
 - a. Sources
 - b. Effects
 - c. Control

D. FUTURE HEALTH CHALLENGES

1. Unsolved Health Problems
2. Solutions

E. HEALTH CAREERS

1. Existing
2. Projected

<p>Respiratory Infections (cont.)</p>	<p>responsible for the various respiratory illnesses and to indicate their modes of transmission. Emphasize that, in addition to numerous bacteria, at least 20 viruses have already been identified as important causes of respiratory infection.</p> <p>Assign a student to report on the results of recent research concerning the cause, prevention, and treatment of the common cold, the most prevalent of human illnesses. What new vaccines have been developed to combat the common cold, and how effective are they?</p> <p>Discuss some of the reasons why the common cold should not be ignored. Analyze the soundness of some of the remedies concerning "what to do when a person first feels a cold coming on." Discuss some of the symptoms of the common cold and report upon several other diseases (scarlet fever, diphtheria, measles, influenza, pneumonia) that may begin with the same symptoms.</p> <p>Point out that influenza and pneumonia still rank high as a leading cause of death among certain age groups. Ask for a report on the work of the U. S. Public Health Service in the prevention and control of influenza epidemics. How do such measures affect the community?</p> <p>Ask students to look up the term "pneumonia" in the dictionary. Point out that pneumonia is a term that is used to describe a condition of inflammation of the lung, which may result from several causes. A Manual for the <u>Control of Communicable Diseases in California</u> lists the three types of infectious pneumonia as pneumococcal; bacterial, other than pneumococcal; and virus pneumonia. Ask for a report on recent developments in the prevention and treatment of pneumonia.</p>	<p><u>Text and Library Books</u></p> <p><u>Modern Health</u>. pp. 353-357.</p> <p><u>Health and Safety for You</u>. pp. 216, 309-310, 455-460.</p> <p>California State Department of Public Health. <u>A Manual for the Control of Communicable Diseases in California</u>. 1960, 416 pp.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Venereal Disease¹</p>	<p>Inform students that venereal disease is a term that is applied to a group of diseases which are passed almost always through intimate body contact (usually sexual) with an infectious person.</p> <p>--The two most common of these diseases are syphilis and gonorrhea. Others include chancroid, lymphogranuloma venereum, and granuloma inguinale.</p> <p>--The micro-organisms that cause these diseases enter the body through unbroken mucous membranes, and occasionally through breaks in the skin.</p> <p>--They die when exposed to heat, drying, or soap and water.</p> <p>--There is little evidence of these diseases being transmitted through inanimate objects, such as toilet seats, drinking glasses, or towels.</p> <p>--Expectant mothers with the infection can transmit the disease to babies before or during birth.</p> <p>--There is usually no effective immunity against these diseases, and they may be contracted over and over again.</p> <p>Discuss with students the magnitude of the venereal disease problem nationally and locally.</p> <p>--Point out that venereal diseases now rank first among the reportable communicable diseases at the state and national levels. Los Angeles and San Francisco, with 59.8 per cent of the state's population, account for 75.8 per cent of the total cases of syphilis and for 73.9 per cent of the cases of gonorrhea.</p> <p>¹This material should be reviewed with the school principal for specific guidance concerning scope of coverage.</p>	<p><u>Text and Library Books</u></p> <p>"Some Pragmatic Considerations in Venereal Disease Education," <u>The Journal of School Health</u>, 33 (April, 1963), 164-170.</p> <p>Los Angeles City Schools <u>Instructional Aids for Teaching About Venereal Disease</u>.</p> <p>Los Angeles County Health Department. <u>Teaching Manual for the Venereal Diseases</u>.</p> <p><u>Modern Health</u>. pp. 396-397.</p> <p><u>Health and Safety for You</u>. pp. 460-461.</p> <p>"The Venereal Disease Problem-- Report of Special Articles," <u>Medical Tribune</u>, (1963), 1-4.</p> <p>"Venereal Disease in California-- A Report to the Legislature," <u>California's Health</u>, 20 (February 15, 1963), 1.</p>

Venereal Disease (cont.)	<p>Clarify the following terms in relation to venereal diseases:</p> <ul style="list-style-type: none"> --Syphilis - An infectious disease that may spread throughout the entire body (systemic). --Gonorrhea - An infectious inflammatory disease, usually confined to the genital and urinary tracts in early stages. --Neurosyphilis - A stage of syphilis which involves the brain and spinal cord, and which may result in paresis, a form of syphilitic insanity, and locomotor ataxia, a disorder of the nervous system caused by syphilis and characterized by difficulty in coordinating voluntary movements. --Congenital Syphilis - A form of syphilis contracted by the unborn infant from its infected mother. --Chancere - The initial "sore" in syphilis. --Lesion - Diseased or injured tissue. --Ulcer - An open sore. --Latent - Not visible nor apparent; dormant. --Degeneration - Deterioration of tissue or organ. 	<p><u>Text and Library Books</u> <u>Modern Health.</u> pp. 396-397.</p>
Syphilis	<p>Present an overview of the pertinent facts about syphilis. Point out that man is the only known reservoir of syphilis and that everyone is susceptible to the disease. It is world-wide in distribution and has presented a major public health problem since 1493, when Columbus' sailors were treated in Barcelona, Spain, for a "new" disease which they had contracted in the West Indies. There is no well founded previous historical or scientific evidence to indicate that syphilis was present in Europe prior to this date.</p>	<p>U. S. Department of Health, Education, and Welfare. <u>The Eradication of Syphilis</u> (U. S. Government Printing Office, Washington 25, D. C.).</p>
	<p><u>Causative Agent</u></p> <p>The corkscrew-shaped organism that causes syphilis is the spirochete, <u>Treponema pallidum</u>. It is such a delicate microorganism that it can survive only a short time outside the</p>

<p>Syphilis (cont.)</p>	<p>body. It is easily killed by drying, sunlight, and disinfectants. In early syphilis, the presence of the pathogen can be determined by the examination of some of the serum from the chancre (sore) under a microscope with dark-field illumination. (In this method of microscopy the object is visible only because it reflects light.) The usual method of staining bacteria for identification cannot be employed. The organism was first identified by Schaudinn and Hoffman in 1905.</p> <p><u>Transmission of Treponema pallidum</u></p> <p>Transmission of the organism results from direct physical contact with an infectious lesion. The spirochete enters the body through minute breaks in the skin, or through unbroken mucous membranes, and is carried throughout the lymphatics, finally entering the blood stream. The habitat of <u>Treponema pallidum</u> is deep in the body tissues. However, when the organism is deposited on moist, warm, mucous surfaces, or breaks in the skin, it can survive well enough to establish a colony, penetrate the surface, and eventually spread throughout the body.</p> <p>An expectant mother can transmit the spirochete to the fetus through the placental blood system and cause congenital syphilis.</p> <p><u>Stages and Complications of the Disease</u></p> <p><u>Primary (early) Stage</u> This stage of the disease is characterized by a painless but highly contagious lesion called a chancre (shanker), which may appear at any time from 10 to 90 days after intimate contact with an infectious person. The chancre begins as a sore at the site where the spirochete entered the body. This can occur on other parts of the body, but it is most commonly found on the genital organs and</p>	<p><u>Text and Library Books</u></p> <p>California State Department of Public Health. <u>A Manual for the Control of Communicable Diseases in California</u>, 1960. pp. 321-327.</p> <p>Los Angeles City Schools. <u>Instructional Aids for Teaching About Venereal Disease</u>.</p> <p>Los Angeles County Health Department. <u>Teaching Manual for Venereal Disease</u>.</p>

<p>Syphilis (cont.)</p>	<p>occasionally in or around the mouth. In men, the sores generally appear externally on the sex organs. However, in the case of women, the lesion may be internal, and hidden from view. The lymph glands near the infection may become swollen. In either sex, the lesion may disappear in two to five weeks without having been treated, and so appear to be healed. Thus a person with the infection could pass through the primary stage without realizing it. During this stage, the disease may or may not be detectable through blood tests.</p> <p>Secondary Stage</p> <p>Symptoms of secondary syphilis usually occur in about four to eight weeks after the appearance of the chancre. A skin rash may occur on any part of the body, and lesions of the mucous membrane surfaces are often found. Other symptoms at this time may include a sore throat, fever, mouth sores, headache, swollen lymph glands, pains in the bones and joints, falling hair, and mucous patches which may be found in the mouth or around the sexual organs. At this stage, the disease can be passed on through kissing as well as through sexual contact. Symptoms may occur, subside, and recur for a period of four or five years after initial contact and will vary both in appearance and intensity in different persons. Like the primary stage, the secondary stage is also a contagious period, and the symptoms described will also disappear without having been treated.</p> <p>Latent Stage</p> <p>During this stage, there are no visible signs or symptoms of the disease. The manifestations of the secondary stage gradually disappear and the disease passes into a period of latency. The organisms become imbedded in various body tissues, and the only means of detecting</p>	<p><u>Text and Library Books</u></p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Syphilis (cont.)</p>	<p>the presence of syphilis is through a blood test. This period lasts anywhere from two to 50 years, but more commonly from five to 25 years.</p> <p>Late Stage After five years, untreated cases may or may not present manifestations of the infection. When apparent signs of the disease do appear, they often resemble or "imitate" the symptoms of other diseases. These symptoms depend upon what tissues have been destroyed. During this stage, progressive degeneration of the brain and spinal cord (paresis and locomotor ataxia) may occur, as well as damage to the heart and blood vessels and to the joints. Blindness, deafness, running sores, and tumor-like masses of the skin and mucous membrane are among the end results of the disease. The U. S. Public Health Service estimates that</p> <ul style="list-style-type: none"> One in 15 will become a syphilitic heart victim One in 25 will be crippled or incapacitated One in 50 will become insane One in 200 will become blind <p>Approximately 8,500 deaths each year are attributed to syphilis. These end results of the disease may take place as late as 20 to 30 years after the appearance of the original chancre, the first sign of the infection. Generally, this last stage of syphilis is non-infectious.</p> <p>Congenital Syphilis A pregnant woman infected with syphilis may easily transmit the disease to her unborn child if she does not receive prompt medical treatment. The risk of congenital syphilis is much greater if pregnancy occurs while the disease is in its early stages, and it is less likely to be a problem if pregnancy occurs in the later stages. By the fourth month of pregnancy, the condition of the placental membrane barrier is such that the organisms of</p>	<p><u>Text and Library Books</u></p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Syphilis (cont.)</p>	<p>syphilis can penetrate the wall and thus infect the unborn child. Congenital syphilis is frequently fatal during the prenatal stage or during infancy. Treatment, preferably started by the fourth month and continued through the remainder of the pregnancy, usually assures the mother of a live baby free of syphilis. Affected babies, however, may have skin, liver, bone, lung, eye, adrenal, ear, or tooth disorders. Recent investigations show that, with the use of penicillin, treatment can be started later in pregnancy, sometimes as late as a few weeks before birth, and damage to the fetus may be prevented.</p> <p><u>Prevention and Control</u></p> <p>Diagnosis of syphilis can be ascertained only by a medical doctor and includes clinical examination, microscopic dark-field examination for the organism, and blood tests, such as the Wasserman, Kahn, Kolmer, and VDRL (Venereal Disease Research Laboratory). These tests determine the presence in the blood of "reagin," an antibody substance produced usually in response to syphilis but sometimes also in response to other infections ("biologic false positives"). Another test, the T.P.I. (<u>Treponema pallidum Immobilization Test</u>) determines the presence in the blood of antibodies specific only to <u>Treponema pallidum</u>. Diluted blood serum from the patient is mixed with live <u>Treponema pallidum</u>, which has been obtained from a syphilitic rabbit. The mixture is then examined microscopically. If the specific antibody is present, the treponemes are immobilized. Blood serum from a patient without the infection, or from a patient with a biologic false positive serologic test, has no effect on the motile spirochetes.</p> <p>The test procedure for the Fluorescent Treponemal Antibody</p>	<p><u>Text and Library Books</u></p> <p>Page, Lot B. and Perry J. Culver. <u>A Syllabus of Laboratory Examination in Clinical Diagnoses</u>. Cambridge: Harvard University Press, 1960. p. 456.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Syphilis (cont.)</p>	<p>Test (FTA) consists of reacting the patient's serum with a dried smear of intact cells of <u>Treponema pallidum</u>. The smear is then stained with a fluorescein-conjugated anti-serum against human gamma globulin. Treponemal antibodies (gamma globulin), if present, will coat the treponemal cells. The tagged anti-gamma globulin will then attach to the coated cells, which become visible microscopically when illuminated by ultraviolet light.</p> <p>Measures for the prevention and control of syphilis are as follows:</p> <ol style="list-style-type: none"> 1. Programs of case-finding and reporting, which include interviewing of patients, tracing of contacts, and provision for early diagnosis and treatment. 2. Hygienic techniques, including special care in the disposal of discharges from open lesions and articles soiled by them, and attention to personal cleanliness. 3. Premarital and prenatal health examinations. 4. Mass education programs on the nature, cause, and incidence of the disease. Venereal disease rates are high among promiscuous persons because promiscuity increases the chance of infection. <p>The following significant historical events may be used to construct a time line of medical advances in the fight against syphilis:</p> <p>1905 Schaudinn and Hoffman, German scientists, discovered the cause of syphilis, <u>Treponema pallidum</u>.</p> <p>1907 Wasserman, a German scientist, worked out the first blood test for detection of the disease.</p>	<p><u>Text and Library Books</u></p> <p>Bio-Science Laboratories. <u>Specialized Diagnostic Laboratory Tests</u>. p. 112.</p> <p>California State Department of Public Health. <u>A Manual for the Control of Communicable Diseases in California</u>, 1960. pp. 321-327.</p> <p>"Venereal Disease in California--A Report to the Legislature," <u>California's Health</u>, 20 (February 15, 1963), 1.</p> <p>Los Angeles City Schools. <u>Instructional Aids for Teaching About Venereal Disease</u>.</p>

Syphilis	<p>1910 Erlich, a German Scientist, in his 606th experiment, found that Salvarsan, an arsenical compound, was effective in the treatment of the disease. Salvarsan, or arsphenamine as it is also called, became known as "606".</p> <p>1913 Paresis was shown to be a stage of syphilis when the spirochetes were found in the brain tissue.</p> <p>1917 Wagner-Jauregg, a Viennese physician, used the fever of malaria as a means of treating the insanity caused by syphilis.</p> <p>1921 Levaditi, a French scientist, determined that bismuth could be used as part of the treatment for syphilis.</p> <p>1931 Walter Simpson, an American physician, and Charles Kettering of General Motors Corporation developed a fever machine which induces artificial fever used as a supplemental treatment for the insanity caused by late syphilis.</p> <p>1937 "Shadow on the Land," written by Dr. Thomas Parran, Surgeon General of the U. S. Public Health Service, awakened the public for the first time to the seriousness of syphilis.</p> <p>1938 The first premarital examination law was passed.</p> <p>1938 New York was the first state to pass a law requiring prenatal examination for syphilis to protect babies and mothers.</p> <p>1943 Penicillin proved to be a safe, sure, and quick cure for syphilis.</p> <p>1950-60 New and rapid screening tests for the detection of syphilis were developed. Venereal disease education programs were initiated.</p>	Text and Library Books

PROGRESS IN PUBLIC HEALTH

COMMENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Gonorrhea</p>	<p>Present an overview of the pertinent facts about gonorrhea.</p> <p>--Point out that gonorrhea is a purulent (pus-producing) infection which most commonly attacks the mucous membrane linings of the genital-urinary tract, the rectum, and the eye (conjunctiva).</p> <p>--Emphasize that man is the only known reservoir of the disease and that everyone is susceptible to it. Gonorrhea is world-wide in distribution. It has a history which goes back at least to Hippocrates (460 B.C.) and to Galen (200 A.D.), who gave the disease its name. Although rarely as destructive as late syphilis, gonorrhea can cause sterility, blindness, arthritis, and heart trouble.</p> <p>--Report that gonorrhea is among the top ranking communicable diseases. It affects both sexes and practically all ages, especially the 15-29 age group. Its rate of occurrence is much greater than that of syphilis. There are no reliable estimates of the true incidence of the disease. However, it is estimated that there are about 1,300,000 new cases each year and that about 200 deaths are caused by the disease. Approximately 500,000 cases are under treatment at all times.</p> <p><u>Causative Agent</u></p> <p>The pathogenic agent of the disease is the diplococcus, <u>Neisseria gonorrhoeae</u>. This bacterium is shaped very much like a coffee bean and occurs in groups of twos. The microorganism is very delicate and dies within minutes after leaving the body. It is easily destroyed by the use of mild antiseptics or soap and water. However, the gonococcus is highly resistant when within the body and can be destroyed only by proper medical treatment.</p>	<p><u>Text and Library Books</u></p> <p>Los Angeles City Schools <u>Instructional Aids for Teaching About Venereal Diseases.</u></p> <p>Los Angeles County Health Department. <u>Teaching Manual for Venereal Diseases.</u></p> <p>California State Department of Public Health. <u>A Manual for the Control of Communicable Diseases in California, 1960.</u> pp. 144-152.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
Gonorrhea (cont.)	<p><u>Transmission of Neisseria gonorrhoea</u></p> <p>The organism usually is passed from one person to another through intimate contact, nearly always sexual intercourse. The gonococcus is usually contained in the purulent discharges from the infected mucous membranes. On occasion, this disease may be spread by the use of moist, contaminated articles, such as towels, which have been freshly soiled by discharge from an infected person. Gonorrhoea may also be transmitted by a mother with the disease to a newborn infant during its passage through the birth canal. In such cases, the infant's eyes may become infected with the gonococcus organism. By this method, it is also possible to transmit the infection to the eyes.</p> <p><u>Symptoms and Complications of the Disease</u></p> <p>The incubation period (the time interval between the initial infection and the appearance of symptoms of the disease) is generally three to five days. Gonorrhoea in the male and female differ in seriousness and ease of identification.</p> <p>In the male, symptoms and complications of the disease include:</p> <ol style="list-style-type: none"> 1. An itching or burning sensation about the genital organs. 2. A thick, yellow, purulent (pus) discharge from the urethra, occurring usually anywhere from three to nine days following infection 3. Painful urination. 4. Inflammation and scarring of tissue. The infection may travel to the posterior urethra, epididymis, and prostate gland; and, after varying intervals may travel to other body tissues. Inflammation of the urethra may form scar tissue, which makes urination difficult. 	<p><u>Text and Library Books</u></p> <p>Los Angeles City Schools. <u>Instructional Aids for Teaching About Venereal Disease.</u></p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Gonorrhea (cont.)</p>	<p>In the female the symptoms are often so mild as to pass unnoticed. Thus a woman may be infected without knowing it.</p> <ol style="list-style-type: none"> 1. Initially, the infection may involve the urethra, the cervix, the vagina, the uterus, and the Fallopian tubes. 2. Acute peritonitis may occur if the infection travels to the Fallopian tubes and the pus formed enters the peritoneal cavity. Sometimes the swelling and closing of the Fallopian tubes prevent the passage of ova, and sterility results. 3. A third stage of widespread infection results in damage to other body tissues such as the bones and joints and the heart. Although death from gonorrhea is rare, complications are often very serious. <p>Infection of the eyes during birth formerly caused blindness, but the placing of a few drops of a prophylactic medicine in newborn babies' eyes (required by law in most states) has eliminated nearly all blindness from gonorrhea.</p> <p><u>Prevention and Control</u></p> <p>Diagnosis can be made only by a medical doctor through a clinical examination, study of the personal history of the patient, and microscopic examination of the pus or discharge (using Gram stain) and laboratory culture of the organisms. Several antibiotics, including penicillin, are used in the treatment of the disease. In both men and women, the disease remains infectious until cured, and this condition can be determined only by a medical doctor.</p> <p>Measures for the prevention and control of gonorrhea are as follows.</p> <ol style="list-style-type: none"> 1. Programs of case-finding and reporting which include 	<p><u>Text and Library Books</u></p> <p>California State Department of Public Health. <u>A Manual for the Control of Communicable Diseases in California</u>, 1960. pp. 144-145.</p> <p>"Venereal Disease in California-- A Report to the Legislature," <u>California's Health</u>, 20 (February 15, 1963), 1.</p>

Proper community sanitation, with particular emphasis on efficient sewage disposal. 2. Effective practices of personal health and hygiene, especially handwashing. 3. Sterilization and other technical procedures to prevent transmission of the virus through blood products or contaminated instruments. 4. The use of immune serum globulin (gamma globulin) following exposure to infectious hepatitis, if prescribed. <p>Inform students that the occurrence of infectious mononucleosis is reported from many parts of the world, particularly continental Europe, Great Britain, Australia, and the United States. The disease is reported most frequently among the teenage and young adult populations.</p> <p>Point out that, although no infectious agent has been identified, the suspected cause of the disease is presumed to be a virus which is transmitted through direct person-to-person contact. The likely source of infection is discharge from the respiratory tract. Characteristic symptoms of the disease include high or moderate fever, enlargement of the lymph glands, sore throat, and general fatigue. A long recuperative period is usually required, but the disease is rarely fatal.</p> <p>Invite the school nurse to report the extent to which this disease is a school health problem and to discuss measures for its prevention and control. At present, there is no immunity against the disease.</p>	<p><u>Text and Library Books</u></p> <p>California State Department of Public Health. <u>A Manual for the Control of Communicable Diseases in California</u>, 1950. pp. 207-208.</p>

<p>Other Communicable Diseases (cont.)</p> <p><u>Individual Protection Against Disease</u></p> <p>General Body Defenses</p>	<p>public health problems. What is the recommended immunity schedule for these diseases?</p> <p>Ask the class to conduct an informal survey among their family members and friends to find out the number of persons who have not been immunized against smallpox within the last five years. What implications can be drawn from these findings?</p> <p>Present an overview of the protective mechanisms which help the body to resist disease.</p> <p>--Explain that the skin is considered the body's first line of defense because it provides a protective covering against which micro-organisms cannot penetrate unless the skin is broken.</p> <p>--Point out the protective function of body secretions such as tears and mucus. For example, the lachrymal gland secretions which constantly bathe the eye contain a substance called lysozyme. This substance acts like an antibiotic to help keep the eye free from infections.</p> <p>--Use charts and models to help explain the process by which the sticky, mucus coating, together with the ciliary action of the respiratory tract, function to trap and remove foreign bodies from the air passages.</p> <p>--Indicate that the white blood cells (leucocytes) are considered the body's second line of defense because by phagocytic action they attack disease-producing organisms that penetrate body tissues. These cells are able to pass in amoeba-like fashion through capillary walls and to move freely in the tissues ingesting great numbers of invading organisms. The number of white blood cells increases rapidly when the body has been invaded by infectious organisms, and a high white blood cell count may be an indication of a bacterial infection. (This count may go as high as 30,000. A white count of approximately 5,000 to 10,000 is considered normal.)</p>	<p><u>Text and Library Books</u></p> <p>Los Angeles City Schools. <u>Guarding the Health of Pupils.</u></p> <p>Gray, Peter. <u>The Encyclopedia of the Biological Sciences.</u> New York: Reinhold, 1961. p. 161.</p> <p><u>Modern Health</u>, pp. 422-428.</p> <p><u>Health and Safety for You.</u> pp. 442-444.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES								
<p>General Body Defenses (cont.)</p>	<p>--Discuss the protective function of the different kinds of white cells that occur in the blood. Use prepared microscopic slides of a blood smear (Wright's Stain), photographic slides, and charts to identify each kind. Explain that a differential count of white cells indicates the proportion of each type of white cell present per cubic millimeter of blood. Normally, there is a total of approximately 5,000 to 9,000 white blood cells per cubic millimeter of blood, with an average count of 7,000. This number represents at least six different kinds of white blood cells, which may be divided into two classes, as shown in the following table:</p> <table border="1" data-bbox="924 850 1071 2030"> <thead> <tr> <th data-bbox="924 850 976 2030">Type and Per Cent per 7,000 Leucocytes</th> <th data-bbox="976 850 1071 2030">Function</th> </tr> </thead> <tbody> <tr> <td data-bbox="924 1097 976 2030"> <p style="text-align: center;"><u>WHITE BLOOD CELLS (LEUCOCYTES)</u>^{1, 2}</p> </td> <td data-bbox="976 850 1071 2030"></td> </tr> <tr> <td data-bbox="1092 850 1260 2030"> <p>A. <p>General Body Defenses (cont.)</p>	<p>and other debris. They increase in number in certain bacterial infections, such as tuberculosis. The nucleus of the cell stains a deep blue or purple.</p> <p>Histiocytes 0-4% This cell is frequently classified as a monocyte in a differential white blood count. Its phagocytic action is similar to that of the monocyte.</p> <p>--Describe the function of the lymphatic system in combating infections. Discuss the defensive role of lymph. Point out that this fluid flows from the body tissues into the lymphatic vessels; it undergoes a filtering process in the lymph nodes, which are scattered along the lymph vessels, and eventually becomes a part of the venous circulation.</p> <p>--Enumerate the defensive functions of the lymphatic tissues. For example, these tissues</p> <ol style="list-style-type: none"> 1. Produce lymphocytes. 2. Ingest bacteria and other toxic foreign materials. 3. Play a role in antibody formation. (Antibodies are produced by plasma cells in the lymphatic tissue.) 	<p><u>Text and Library Books</u></p> <p><u>Modern Health</u>. pp. 424-427.</p> <p><u>Health and Safety for You</u>. pp. 295-296.</p>
<p>Mechanisms of Immunity Antigen-Antibody Reactions</p>	<p>Assign students to obtain definitions of the terms "immunity" and "immunology" from at least two different references. Point out that, in a limited sense, the science of immunology deals with the procedures by which the body develops a resistance to infectious disease. However, a more encompassing definition of this science has come to include similar immunological mechanisms, such as hypersensitivity, the study of the heightened response to reactions involving allergies, and acquired tolerance to and rejection of foreign tissue, and</p>	<p>Gray, Peter. <u>The Encyclopedia of the Biological Sciences</u>. New York: Reinhold, 1961. pp. 503-505.</p> <p>"The Mechanisms of Immunity," <u>Scientific American</u>, 204 (January, 1961), 58-67.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Antigen-Antibody Reactions (cont.)</p>	<p>the autoimmune diseases (conditions wherein immune responses occur which involve the host's antigens).</p> <p>Emphasize that generally immunological reactions involve the body's ability to react to, or to reject, substances which are foreign to its own biochemical makeup. These foreign ("nonself") substances are called antigens. They may be bacteria, viruses, protozoa, fungi, foreign tissue cells, or other agents. The antigen stimulates the body to produce a counteracting substance called antibody. The antibody combines with the antigen and renders it inactive.</p> <p>Discuss antigen-antibody specificity. Devise flannel or chalkboard illustrations using hypothetical antigen-antibody models of various geometric shapes to show graphically the specificity that each antibody possesses with the antigen that stimulated its production. Antibody against one disease does not usually afford protection against another. Indicate that generally the antibody has been identified as the gamma globulin portion of the blood.</p> <p>The formation of an antibody represents the synthesis of a specific protein by a specialized group of tissue cells. The lymphocyte appears to be the cell that is most closely associated with antibody formation. However, plasma cells and other formed elements of the blood seem to have essential roles. In addition, the polymorphonuclear and phagocytic leucocytes function in the final ingestion and elimination of destroyed tissue.</p> 	<p><u>Text and Library Books</u></p> <p>"The Thymus Gland," <u>Scientific American</u>, 207 (November, 1962), pp. 50-56.</p> <p><u>Modern Health</u>. pp. 427-432.</p> <p><u>Health and Safety for You</u>. pp. 443-450.</p> <p><u>Health and Safety for You</u>. p. 283.</p>

<p>Congenital Heart Defects (cont.)</p>	<ol style="list-style-type: none"> 2. Constriction or narrowing of the aorta 3. Narrowing of the heart valves (stenosis) 4. Failure of the opening between the pulmonary artery and the aorta to close normally within a few weeks after birth <p>Emphasize that a majority of the 30,000 to 40,000 children who are born with congenital heart defects can be helped by surgery.¹</p>	<p><u>Text and Library Books</u></p>
<p>Rheumatic Heart Disease</p>	<p>Report that rheumatic fever is the major cause of heart disease among boys and girls of school age. The condition is the result of inflammation and scarring of the heart muscle and the heart valves following rheumatic fever. The scarring may impair the function of the valves so that they do not open fully or close completely. This disorder interferes with the pumping action of the heart and disrupts the blood flow. A physician listening to a rheumatic heart can usually detect a blowing noise called a murmur. Children with such defects become short of breath from exertion that normally would not cause this effect. Emphasize, however, that murmurs do not necessarily indicate heart damage. Some murmurs are the result of congenital heart defects. The most common type, "the innocent heart defect," does not indicate heart damage and is not disabling.</p> <p>Assign a student to present a special report on the cause, prevention, and treatment of rheumatic fever. Point out that the cause of this disease is not completely understood. Rheumatic fever is not contagious; however, research has shown that 90 per cent of the cases of this disease are preceded by a particular streptococcal infection (Group A hemolytic streptococcus) of the throat, nose, or tonsils. There</p>	<p>American Heart Association. Pamphlet series*</p> <p>U. S. Department of Health, Education, and Welfare. National Heart Institute. <u>Rheumatic Heart Disease.</u> (U. S. <p>Rheumatic Heart Disease (cont.)</p>	<p>appears to be a tendency for the disease to run in families. This may be the result of either hereditary or environmental factors. There is a tendency also for this disease to recur. Because there are no single reliable symptoms, rheumatic fever can be diagnosed only by a physician. Confirmation usually requires a number of procedures, including blood tests, fluoroscopy, and an electrocardiogram.</p> <p>Indicate that the treatment for acute rheumatic fever is largely bed rest. Penicillin and other specific antibiotics are effective against streptococcal infections. Disease prevention, early diagnosis, and adequate medical and nursing care constitute a basic procedure against rheumatic heart disease. Assign a student to find out the extent to which rheumatic fever and heart disease programs are being conducted by the health department and the local heart association as part of the public health effort.</p> <p>Report that heart disease may also result from untreated syphilis. The spirochete that causes syphilis invades the aorta during the course of the infection; however, evidence of actual heart damage is not detected for many years. In the case of syphilis this condition is completely preventable if treated with specific antibiotics during early stages of the disease.</p> <p>Explain that hypertension is another name for high blood pressure. This is not a disease itself but rather a condition which may arise from several different causes. Consistently high blood pressure over a long period may result in damage to the heart, the kidneys, and to other organs of the body.</p> <p>Indicate that blood pressure may be defined simply as the amount of force (pressure) that is exerted by the blood.</p>	<p><u>Text and Library Books</u></p> <p><u>Health and Safety for You</u>. pp. 294-295.</p> <p><u>Modern Health</u>. pp. 366-371.</p> <p><u>Health and Safety for You</u>. pp. 292-293.</p>

Hypertension (cont.)

against the walls of the arteries. This pressure is caused by the pumping action of the heart and is maintained by the elastic walls of the arteries. Blood pressure is highest during the systole--the period when the heart contracts--and lowest during the diastole--the period between contractions. The sphygmomanometer, which is calibrated in millimeters of mercury, is the instrument used to measure blood pressure.

Point out that normally the pressure, measured in millimeters of mercury, in the arteries ranges between 100 and 140 systolic (as the heart contracts) and between 70 and 90 diastolic (between contractions). A blood pressure of 120 systolic and 80 diastolic is expressed as 120/80. Blood pressure up to 140/90 or 150/90 is usually considered normal.

Demonstrate the use of the sphygmomanometer. Indicate that the cloth cuff which is wrapped around the upper arm contains a rubber bag which is attached to a small rubber bulb for pumping air and to a manometer (pressure-measuring device). Placement of a stethoscope over the brachial artery directly below the cuff allows the detection of systolic and diastolic pressure through variations in the sounds that are caused by changes in pressure as the blood flows through the artery. The cuff serves as a constricting band which stops the blood flow when the pressure exerted by it is higher than systolic pressure. At this point, all sounds disappear. The pressure is then decreased gradually until a sound can be detected. The pressure reading taken at the instant that this sound is heard is systolic. The diastolic pressure is then determined by reducing the pressure still further to permit the flow of blood through the artery. The point at which sound can no longer be detected is equal to the diastolic pressure.

Emphasize that blood pressure varies in different persons at different times and under different conditions of physical

<p>Hypertension (cont.)</p> <p>Coronary Heart Disease</p>	<p>and emotional activity, increasing with exertion, excitement, fear, and mental anxiety. What is the relationship of the vasoconstrictor and vasodilator nerves to blood pressure and to the supply of blood to various body parts. Point out that constriction of the arterioles, the tiny branches of the arteries that carry blood to all tissues of the body, is an important factor in blood pressure. For several reasons that are not clearly identified, the arterioles begin to tighten up, causing the passageways for blood to become smaller; consequently, the heart must work harder to push the blood through to the tissues. This added strain may cause the heart muscle to enlarge and the walls of the arteries to scar, to toughen, and to lose their elasticity. This process is known as sclerosis, or hardening of the arteries.</p> <p>Indicate that the heart, like any other body tissue, requires a continuous supply of oxygenated blood in order to perform the monumental task of pumping blood to all parts of the body 24 hours each day of every year during the entire lifetime of an individual. Use charts and models to illustrate that the supply of blood to the heart muscle itself is provided through a network of coronary arteries that branch out from the main artery leading from the heart, and not through the heart chambers. If a condition occurs which prevents these arteries from keeping up a sufficient supply of oxygenated blood to an area of the heart muscle even for a short time, the tissue may be destroyed (Myocardial infarction).</p> <p>List several causes which may be responsible for blocking the flow of blood through the coronary arteries.</p> <ol style="list-style-type: none"> 1. The hardening of the arteries, which narrows the passageway through which the blood must flow. 2. <p>Coronary Heart Disease (cont.)</p>	<p>arteries (coronary atherosclerosis), which may result from the accumulation of lipoidal deposits which are composed largely of cholesterol. This condition may actually close off the artery (coronary occlusion), or it may cause the blood to clot, forming a plug which cuts off the blood supply to the heart tissue (coronary thrombosis). Although it is known that cholesterol, a substance which is normally present in the blood, constitutes a large portion of the fatty deposits, the reasons why these complex fatty substances are deposited in the arteries, or why they collect in different parts of the body of different persons have not been determined. However, the results of several research studies suggest that the incidence of coronary heart disease may be higher among persons with cholesterol levels that are considered above normal than among those whose levels fall within the normal range.</p> <p>Discuss the importance of "collateral circulation." When some coronary arteries harden and block, nearby arteries assume the function of supplying blood to tissues which have been cut off from their former source. This process is known as collateral circulation.</p> <p>Assign a special report on what is being done by various agencies and groups to help prevent heart disease.</p> <p>Invite the school physician to discuss the various diagnostic procedures that are used in the examination of the heart and circulatory system. <p>Coronary Heart Disease (cont.)</p> <p>Cerebral Vascular Disease</p>	<p>search concerning the relationship of diet, weight control, exercise, and smoking to heart disease.</p> <p>Emphasize that the brain, like every other tissue, must have a continuous supply of oxygenated blood to function properly. The blood vessel system of the brain is called the "cerebral vascular system." Disorders of these vessels are referred to as cerebral vascular (cerebro-vascular) diseases.</p> <p>Use charts and models to review briefly the portions of the cerebral cortex that are responsible for the control of various physical and mental activities. Point out that portions of the brain are damaged when the flow of blood is cut off even for a short time. The physical and mental activities that are controlled by these damaged nerve centers will be impaired, temporarily or permanently. This condition is referred to as a stroke, or cerebrovascular accident (CVA). The degree of severity or loss of function depends upon the area of brain involvement. The nerve centers which control the body movements of one side of the body are located on the opposite side of the brain. Hence, a stroke to the left side of the brain would affect the movements of the right side of the body, and vice versa.</p> <p>Illustrate by means of chalkboard diagrams the different ways in which the circulation of blood to the brain may be disrupted, causing a stroke.</p>	<p><u>Text and Library Books</u></p> <p>American Heart Association. <p>Kidney Disease</p>	<p>Ask the class to cite several reasons why man cannot live without the functioning of at least one kidney. Use charts and models to review briefly the vital processes that are carried on by the kidneys. Point out that, although a filtering process involving the selective excretion and retention of various blood constituents, the kidneys remove metabolic wastes and maintain chemical and water balance in the body. About every four minutes, all the blood in the body is processed this way. When a kidney does not function properly, an excess of urea and other body wastes begin to accumulate in the blood, disturbing the acid-base balance. This condition, called uremia or uremic poisoning, causes a lowering of the alkalinity (pH level) of the blood to a point at which vital body processes no longer function (acidosis).</p> <p>Cite several conditions which may lead to kidney damage, such as:</p> <ul style="list-style-type: none"> Nephrosis--Degeneration of the tubules of the kidney Nephritis--Inflammation of the tissues of the kidney, usually resulting from infections Calculous formation or kidney stones--Accumulation of deposits of uric acid, calcium oxalate, or phosphates in the kidneys, blocking the urine flow <p>Discuss the extent to which kidney disease is a public health problem. Emphasize that kidney impairment may be partially responsible for many of the deaths attributed to heart disease and high blood pressure. Ask for a report on research programs that are being conducted to combat kidney disease.</p>	<p><u>Text and Library Books</u> <u>Modern Health.</u> pp. 394-397 <u>Health and Safety for You.</u> pp. 296-299.</p>

<p>Allergic Reactions (cont.)</p>	<p>protein. Then explain that an allergy is essentially an abnormal or altered antigen-antibody reaction of the body cells to a specific substance (allergen). An allergen may be a protein, a fat, or a carbohydrate. Allergens can come into contact with the body by inhalation, ingestion, injection, or by touching the skin.</p> <p>Discuss some of the signs of hypersensitivity. An individual who is hypersensitive to a particular substance is said to be allergic to it. When he comes into contact with the substance it produces symptoms of altered body function. These symptoms may vary from skin reactions, as in food allergies and contact dermatitis (skin allergy), to anaphylactic shock, as in hypersensitivity to penicillin. In hay fever, inflammation of the eyes and the nasal passages is caused by sensitivity to a particular pollen, or to dust. Symptoms of skin allergy include "welts," itching, and skin eruptions that ooze, crust, and scale. Some reactions occur within minutes, and others do not occur for several hours. A tendency to allergies may be hereditary.</p> <p>Discuss the value of skin tests for detecting suspected causes of allergy. Why is self treatment a dangerous practice for such conditions as contact dermatitis (skin allergy)?</p> <p>Discuss the role of antihistamines and other drugs in providing temporary relief for allergic conditions. Indicate that the allergen causes the tissues involved to release histamine, a substance which stimulates tissue swelling and blood vessel dilation.</p> <p>Identify some of the ways in which pollen may be filtered from the air, particularly in a bedroom (air conditioning unit, or an electric pollen remover).</p>	<p><u>Text and Library Books</u></p> <p><u>Modern Health</u>. p. 94.</p> <p><u>Health and Safety for You</u>. pp. 216-218.</p> <p>"Delayed Hypersensitivity," <u>Scientific American</u>, 202 (April, 1960), 129-136.</p> <p><u>Health and Safety for You</u>. pp. 216-218.</p>

Allergic Reactions (cont.)	Assign a student to report to the class on recent developments in allergy research. How can these findings be related to the work being done on tissue transplants? Plan with the class a school health education campaign to combat hay fever, asthma, and allergic conditions.	<u>Text and Library Books</u>
Diabetes Mellitus	Discuss the extent to which diabetes mellitus is a public health problem. Report that this disease still ranks among the ten leading causes of death in the United States. Health authorities estimate that there are nearly 3,000,000 cases of diabetes in this country. Of this number, approximately 1,500,000 are diagnosed, leaving about 1,500,000 who have not been diagnosed. More adults than children are diabetic; however, there are approximately 50,000 children under the age of 15 with this condition. Heredity seems to be a significant factor in the occurrence of diabetes mellitus. Obesity appears to be a factor that may cause the condition to develop more rapidly. Also, a higher case rate is reported among women than men. Analyze with students the term "diabetes mellitus." Indicate that the prefix "dia" is of Greek derivation and means "passing through." The word "mellitus" is a Latin term meaning "sweetened with honey."	Conklin, Groff. <u>Diabetics Unknown</u> . New York: Public Affairs Committee, 1963. pp. 4-5. <u>Modern Health</u> . pp. 234-235. <u>Health and Safety for You</u> . pp. 359-360.
Cause	Explain that diabetes mellitus is a condition in which the body's ability to metabolize sugars and starches is impaired. This is a result of the insufficient production of the hormone insulin, a substance which is necessary for the complete metabolism of glucose by the body cells. The unmetabolized sugar begins to accumulate in the blood in abnormal amounts; and, as the blood-sugar concentration exceeds the renal threshold, excess sugar is passed in the urine. An abnormal amount of	<u>Modern Health</u> . pp. 234-235. <u>Health and Safety for You</u> . pp. 359-360.

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
Cause (cont.)	<p>urine is also excreted. Excessive thirst, hunger, loss of weight, fatigue, and slow-healing infections are also symptoms of diabetes mellitus. However, many individuals who may be diabetic may experience none of these symptoms. Thus the disease may go undetected during its early stages.</p> <p>Develop a glossary of terms, including:</p> <p>Hypoglycemia--An abnormally low level of sugar in the circulating blood</p> <p>Hyperglycemia--An abnormally high level of sugar in the circulating blood</p> <p>Hyperinsulinism (insulin reaction)--A condition in which the amount of sugar in the blood is reduced too suddenly, either from injection of too much insulin, or from not eating soon after an insulin injection. Symptoms include perspiring, trembling, and dizziness, followed by delirium and collapse. This condition may usually be remedied quickly by the administration of carbohydrates. Persons who are diabetics usually carry a card which bears the statement, "In case of sudden faintness, give two tablespoons of sugar dissolved in a glass of water, and call a doctor."</p> <p>Diabetic Acidosis--A disturbance in the normal acid-base balance of the body which may result from the burning or oxidation of excessive amounts of fats and which may progress to diabetic coma. In diabetes mellitus, the metabolism of glucose is impaired, thus requiring the utilization of body fat for energy. The end products of this metabolism may upset the acid-base balance, resulting in acidosis (a decrease in the normal alkalinity of the blood). This condition interferes seriously with vital body processes. Since some of these</p>	<u>Text and Library Books</u>

Cause (cont.)	<p>end products are similar to vinegar, a person in a state of acidosis may possess "vinegar breath" or ketosis.</p> <p>Diabetes insipidus--A condition that is caused by inadequate output of the antidiuretic hormone of the pituitary gland; characterized by extreme thirst and the excretion of abnormally large amounts of urine. This disease is not related to diabetes mellitus.</p> <p>Use charts and models to identify the portion of the pancreas (islands of Langerhans) which is responsible for the secretion of the hormone insulin.</p> <p>Invite the school nurse to discuss and to demonstrate various screening procedures that are used to help diagnose diabetes.</p> <p>Several relatively simple ways to detect the presence of sugar in the urine include the adding of a special chemical tablet to a test tube containing urine, or using a dip-stick test, in which a strip of paper containing special reagents is dipped into the urine. The presence of sugar is indicated through color changes. Quantitative blood tests are employed to determine the concentration of sugar in the blood (blood sugar level).</p> <p>Discuss several reasons why early detection of diabetes mellitus is important. Point out that there is no cure for diabetes at present. However, this disorder may be controlled effectively by means of a medically prescribed daily routine, including recommended diet, or diet and medication. Emphasize that some cases of diabetes can be controlled by diet alone. However, insulin injections or oral medication is usually required. Stress that oral compounds are not substitutes for insulin. Their major contribution is to stimulate those pancreas cells that are still active to produce greater</p>	<p><u>Text and Library Books</u></p> <p><u>Modern Health.</u> p. 227.</p>

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Detection and Treatment (cont.)</p>	<p>quantities of insulin.</p> <p>Indicate that the primary source of insulin has been the pancreas of animals (cattle and hogs). However, synthetic compounds have been discovered recently. Cite the death rate from this disorder prior to the discovery of insulin. Assign a special report on the work of Fredrick Grant Banting and others who shared in its discovery. Report that the Nobel Prize in medicine was awarded for this contribution (1923).</p> <p>Discuss several responsibilities which a person should accept in learning to manage diabetes. Indicate that the individual who is diabetic must learn to:</p> <ol style="list-style-type: none"> 1. Understand diabetes and its possible complications. 2. Administer insulin, if medically prescribed. 3. Record accurately the results of simple urine tests. 4. Practice weight control and strict adherence to the prescribed diet. Emphasize that strict adherence to a prescribed medical regime decreases greatly the chances of a person with diabetes developing secondary complications such as eye problems, loss of peripheral circulation, and gangrene. <p>Develop the attitude among students that today the person who is diabetic can participate in sports and other activities. Several outstanding athletes, as well as persons in other fields, are diabetic.</p>	<p><u>Text and Library Books</u></p>
<p>Research and Education</p>	<p>Ask a committee to contact the Diabetes Association and the health department to find out the kinds of mass screening and educational programs that are being conducted in the detection and treatment of this ailment.</p>	<p>American Diabetes Association, Pamphlet Series*</p> <p>*List of Approved Free Supplementary Materials. CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Water Contamination (cont.)</p>	<p>water, followed by a treatment utilizing bacteria.</p> <p>During primary treatment, the water is passed through a screen which removes large objects, such as sticks and rags. Next, the water flows slowly through a grit chamber which allows sand, gravel, and other heavy objects to settle. The water then flows into a large settling tank, where it stands for a considerable time to allow the solids in the waste matter to settle at the bottom as "sludge" or to rise to the top as "scum."</p> <p>Secondary treatment depends upon the action of bacteria to remove dissolved organic matter from the water. Most plants have a trickling filter for this purpose. This consists of a bed of coarse stones upon which the bacteria grow. As the water trickles down through the stones, the bacteria perform their work. An alternate treatment, in which the action of bacteria is hastened by exposing the sewage to atmospheric oxygen, is called the activated sludge process.</p> <p>The water may then be sent to another settling tank to stand while the remaining solids collect on the bottom. Finally, chlorine gas is added, and the water is discharged into the river or lake with about 85 per cent of its pollution removed.</p> <p>Another method utilizes a natural process, in which waste materials are introduced into large, shallow, man-made lakes. Here a balanced system of algae and bacteria breaks down the pollutants.</p> <p>Ask for a committee to visit one of the city's sewage treatment plants and to report to the class regarding its methods.</p>	<p><u>Text and Library Books</u></p>

<p>Water Contamination (cont.)</p> <p>Pest Control and the Use of Pesticides</p>	<p>Trace with students the history of federal legislation pertaining to water pollution. Report that the first Water Pollution Control Act (Public Law 845, 80th Congress) was passed in 1948. The Blatnick Act (Public Law 84-660), which was enacted in 1956, was the first comprehensive federal water pollution act. It improved and expanded the 1948 act. In 1961, Congress passed two amendments to the 1956 act (Public Law 87-88) which included these important additional provisions:</p> <ol style="list-style-type: none"> 1. Increased federal support for construction of municipal waste treatment facilities. 2. Strengthened federal enforcement powers. 3. Intensified research programs toward more effective methods of pollution control. 4. Increased federal support of state and interstate pollution control programs. 5. Increased water storage facilities through the planning and building of federal reservoirs to maintain water quality during periods of low flow. <p>Enumerate the environmental health problems that are associated with pest control and the use of pesticides. Point out the damage caused by insects and other vermin each year.</p> <p>All the land animals on the face of the earth--man included--don't weigh as much as the earth's insects. In America alone, they cause 4,000,000 worth of damage each year. California, with more than 200 kinds of crops, spends more on insect control than</p>	<p>Text and Library Books</p> <p>U. S. Department of Health, Education, and Welfare, Public Health Service.</p> <p><u>Protecting Our Water Resources--The Federal Water Pollution Control Program 1962</u> (U. S. <p>Pest Control and the Use of Pesticides (cont.)</p>	<p>cannot hope to be free from all possible objectionable consequences of their use. One such problem, for example, is the traces of pesticides that unavoidably may persist in or on some of our food crops beyond harvest...According to the best scientific evidence available, the traces that are allowed--and these are fixed by the Food and Drug Administration--constitute no known hazard. This question of allowable levels involves the "tolerance" concept...All chemicals have their safe and toxic levels...As currently used in routine operations to control mosquitoes and pests of our farms and forests, the hazards to wildlife are generally considered to be small. In the past, greatest losses have occurred in special eradication programs, especially where high dosages of pesticides were used more or less indiscriminately over large areas.</p> <p>Ask the class to read and to evaluate Rachel Carson's book, <u>Silent Spring</u>.¹ Invite a resource person to discuss the extent to which pesticide residues cause a public health hazard to the food and water supply. Analyze the report on the use of pesticides by Frank M. Stead, Chief, Division of Environmental Sanitation, California State Department of Public Health.²</p> <p>Review the work of government laboratories in the study of animal-feed spray residuals analysis of other types of food,</p> <p>¹Rachel Carson, <u>Silent Spring</u>. For example, scientists conducted many complex tests of cranberries during the study of the effect of aminotrizole in 1959. Point out that every pesticide must undergo extensive laboratory tests before it can be sold. These tests include use of the pesticide with thousands of laboratory animals over a designated period of time. Food and Drug Administration tolerance levels are based on this information and represent an amount that meets all safety requirements.</p> <p>Report the occupational health implications in the use of pesticides. The Bureau of Occupational Health announced that:¹</p> <p>Illness and death from organic phosphate pesticides is the greatest occupational health problem in agriculture. Reports of occupational disease from this use have tripled since 1954.</p> <p>Develop a list of precautions pertaining to the use of pesticides in the home.</p> <p>Ask students, "What is air pollution and to what extent is it a public health problem?"</p> <p>¹Bureau of Occupational Health, "California's Health-- Biennial Report Edition, 19 (December 1, 1961), 58.</p>	<p><u>Text and Library Books</u></p> <p><u>California's Health-- Biennial Report Edition, 19 (December 1, 1961), 58.</u></p> <p>Darling, William J., and Gwen Lam. <u>Food and Science Today and Tomorrow.</u> New York: Public Affairs Committee, 1963. 22 pp.</p> <p>California Agricultural Experimental Extension Service. <u>Control of Household Insects and Related Pests.</u> Division of Agricultural Sciences, University of California, 1961. p. 6.</p>

PROBLEMS IN PUBLIC HEALTH

COMMENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>Air Pollution</u> (cont.)</p>	<p>Formulate through class discussion a definition of the term "pollutant." Emphasize that a pollutant may be any substance which is harmful to man and that most pollutants are man-made.</p> <p>Point out that air pollution results from the tons of partially burned waste products of fuel and debris which enter the atmosphere daily from automobiles, industries, incinerators, and other sources. There are more than 50 pollutants discharged as dust, soot, and smoke and as the vapors and fumes of noxious gases, including carbon monoxide, nitrogen oxides, sulphur oxides, and ozone. Illustrate by means of a Bunsen burner the formation of soot as a product of incomplete combustion. Close the air holes of the burner to produce a luminous flame, and hold the bottom of a porcelain dish in the flame. The black deposits that collect on it are the result of the incomplete burning of a hydrocarbon--in this case, the gas from the Bunsen burner. Then change the flame to nonluminous, and expose the sooty part of the dish to the hottest part of the flame. The carbon will burn off, indicating that now complete combustion has taken place.</p> <p>Cite examples of extremely serious air pollution, such as the lethal smog which settled on Donora, Pennsylvania, in 1948 and on London in 1952, causing numerous deaths. In London, the average rate of about 2,000 deaths per week rose to nearly 5,000 during an acute smog episode. The concentrated smog was responsible for the deaths of many persons with heart and lung ailments.¹</p> <p>¹U. S. CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Effects (cont.)</p>	<p>Since nuclear radiations are atomic in nature, they interact with matter on an atomic basis. Fundamentally, these radiations produce ionization of atoms, or actually mutate the atom itself. By ionization is meant the displacement of one or more of the surrounding electrons from their atomic orbits, causing an otherwise neutral atom to become a charged particle. Mutation is caused when certain of the atomic particles combine with the nucleus itself, causing the basic characteristics of the atom to change. Since a body cell is made up of a great number of atoms, the cell itself is affected by radiation. This effect or damage is evidenced in one of two ways: (1) the function of the cell may be altered; and (2) the function of subsequent cell progeny may be altered.¹</p> <p>Discuss some of the symptoms of radiation sickness. Emphasize that the degree of illness depends upon the amount of radiation received by the body. The parts affected by radiation and resulting pathology are:²</p> <p>EARLY EFFECTS</p> <p><u>The Blood System.</u> Antibody constituents are destroyed or decreased in such numbers that diseases may more easily attack the body. The bacteria-scavenging quality is lost, thus allowing secondary infection to take hold. Blood clotting is reduced, which could allow hemorrhaging.</p>	<p><u>Text and Library Books</u></p>

III. EVALUATION

Planned evaluation is an integral part of every learning activity. Student progress in achieving the purposes of this unit can be determined in such ways as the following:

A. Tests and Inventories

1. Analyses of Community Health Problems. Students are asked to react to a community health problem in terms of what they consider to be its nature and scope and to propose solutions to the problem.
2. Interpretations of Data Concerning Community Health Problems. Tables and charts are presented to illustrate specific health problems, and students are requested to formulate conclusions based on the data.
3. Applications of Principles. Questions of the "What would you do?" type are asked to test the ability of students to apply knowledge of health principles to everyday situations.
4. Nature-of-the-Proof Tests. A situation is described and a number of conclusions are listed which pertain to it. On the basis of the evidence presented, students are requested to support or to refute each conclusion as:
 - A fact
 - An assumption
 - An untrue statement
5. Sentence Completion Tests. Students are instructed to complete statements such as the following: "The most pressing public health problem facing our nation today is _____."
6. Questionnaires and Checklists on Health Attitudes.
7. True-False Statements on Health Knowledge and Understanding.
8. Multiple-Choice Tests on Health Knowledge, Attitudes, and Practices.
9. Matching Items Tests on Health Knowledge and Practices.
10. Essay Type Examinations on Health Knowledge and Attitudes.

III. EVALUATION (cont.)

B. Classwork Performance

1. Oral and Written Reports.
2. Participation in Group Work and Class Discussion.
3. Scope of Projects Undertaken.

C. Student Self-Appraisal

1. Checklists and Rating Scales.
2. Self-Appraisal Charts and Records.
3. Student Surveys of Environmental Health Conditions.

D. Teacher Observation of Health Behavior

1. Recorded Incidents of Student Behavior Both In and Out of the Classroom.
2. Interviews and Conferences.
3. Rating Scales and Checklists.
4. Teacher Surveys of Environmental Health Conditions.

UNIT VI

CONSUMER HEALTH PROTECTION

I. SCOPE OF THE UNIT

Space age communications methods and the techniques of motivational psychology are characteristics of a sophisticated American culture which are being utilized to direct health information, both factual and non-factual, to the public. The result is that Americans spend at least \$1 billion per year on unnecessary, falsely promoted, worthless, and sometimes dangerous health products, appliances, and treatments.¹

Realizing that each of the nation's 19½ million teenagers (27 million by 1970) spends an average of \$564 each year, manufacturing and business firms are increasingly aware of the teenage consumer.² The informed consumer is best prepared to make intelligent decisions concerning the selection of health products and services and to protect himself and his family against fraudulent health practices. Therefore, this unit is directed toward helping the student to gain the necessary concepts which will enable him to

- Evaluate critically claims in labeling and advertising
- Avoid fraudulent health appliances and devices
- Understand the nature and persistence of medical quackery
- Realize the dangers of self-diagnosis and self-medication
- Appreciate the role of professional, official, and voluntary agencies in public health protection
- Formulate a plan for obtaining future medical care and for meeting health costs

A maximum of two weeks is suggested for completion of this unit. The outline of course content, lists of suggested activities and reference materials, and an explanation of evaluation procedures follow.

¹U. S. Department of Health, Education, and Welfare, Food and Drug Administration, "Consumer Protection Under the Food, Drug, and Cosmetic Act--Outline of Information in FDA Packets," (Consumer Information Branch, Food and Drug Administration, Washington, 20204, D. C.), 1.

²"American Business Discovers a Really Swinging Market--The Teenager," Los Angeles Times (April 14, 1963), 1-2.

A. EXPENDITURES FOR HEALTH SERVICES AND PRODUCTS

1. National
2. Personal

B. CONSUMER GUIDELINES

1. Reliable Sources of Health Information
2. Protective Agencies
3. Labeling
4. Misleading advertisements, Statements, and Statistics
 - a. "Medical Quackery"
 - b. Other Deceptions
5. Folk Medicine and Self-Treatment
 - a. Folk Remedies
 - b. Patent Medicines
 - c. Drugs Prescribed for Others

C. CONSUMER RESPONSIBILITIES IN HEALTH

1. Balance of Necessities and Luxuries
2. Long Range Health Plans
 - a. Selection of Health Services
 - b. Evaluation of Health Insurance
3. Application of Critical Thinking to Consumer Health Practices

CONSUMER HEALTH PROTECTION

<p><u>Other Deceptions</u></p> <p><u>Folk Medicine and Self-Treatment</u></p>	<p><u>a disease by the patient in his home without proper medical supervision.</u> Evaluate the use of electric vibrators as a means for reducing.</p> <p>Analyze with students some of the reasons for the origin and persistence of folk medicine and "self-doctoring" in the United States, especially in rural areas and along the frontier. Some of these are:</p> <ol style="list-style-type: none"> 1. The scarcity of physicians. Since there were no medical schools, persons wanting to become doctors had to travel to Europe for their training. 2. Distances. Most people lived miles from towns where physicians' offices usually were located. When sickness and emergencies occurred, people were forced to rely on the nursing skills and "favorite" remedies of family members and friends. 3. Superstition and gullibility. Fear, ignorance, and superstition impeded the application of scientific health knowledge. <p>Assign a committee to present an overview of the health and medical practices that prevailed in the frontier and rural areas of the United States. Ask students to report information concerning the following:</p> <ol style="list-style-type: none"> 1. What were some of the medicines that were taken along by Lewis and Clark on their expedition to the Northwest, and what were some of the incidents that required the use of such medicines? 2. Who were some of the first physicians who traveled to the West, and what were some of the health 	<p><u>Text and Library Books:</u></p> <p>"Do-It-Yourself Doctors of the Old West," <u>Today's Health</u> (October, 1963), 34-37.</p> <p>"Marcus Whitman: Medic, Missionary, Martyr," <u>Today's Health</u> (July, 1964), 13.</p> <p>"Doctors Who Helped Tame the West," <u>Today's Health</u> (December, 1963), 44-47.</p> <p>"The Paleface Medicine Men of the Frontier," <u>Today's Health</u> (March, 1964), 45-47.</p> <p>"A Doctor's Eye View of the Old West," <u>Today's Health</u> (August, 1964), 40-43.</p> <p>"Tracing the Trail of Lewis and Clark," <u>Today's Health</u> (September, 1962), 45-47.</p>

<p><u>Long Range Health Plans</u></p>	<p>Ask students, "Why does an individual and/or family need to formulate some type of long-range health plan for obtaining medical care and advice and for meeting the costs of health examinations, illness, or injury?" Report and analyze the following data that were collected by the U. S. Public Health Service Health Interview Survey of 1962;¹</p> <ol style="list-style-type: none"> The average person in the United States spent \$129 per year for hospital care, medical and dental services, medicines, and other health related services or products. The amount spent for doctors' services comprised about a third of the total health expenditures. Expenditures per person ranged from \$112 for people living in families with less than \$2,000 family income to \$153 per person for those in families with incomes of \$7,000 and over. The amount of health expenses at all income levels increased with advancing age and was greater for females than for males. In families with incomes of less than \$2,000 the amount of expense ranged from \$29 per person under 15 years of age to \$162 per person 65 years and older; with family incomes of \$7,000 or more, comparable amounts were \$80 per person under 15 years of age and \$308 per person 65 years of age and older. 	<p><u>Text and Library Books</u></p> <p>U. How can the public be alerted to false advertising claims and pseudoscientific statements that reach them through radio, television, and newspapers and other printed materials? 	<p><u>Text and Library Books</u> Editors of Consumer Reports. <u>The Medicine Show</u> New York: Consumers Union, 1963. pp. 221-227.</p>

CONSUMER HEALTH PROTECTION

III. EVALUATION

Student progress in achieving the purposes of this unit may be appraised in a variety of ways, including:

A. Tests and Inventories

1. Points of View on Consumer Health. Lists of statements which reflect various concepts and points of view concerning consumer health practices are presented to students with the request that they identify those statements which most nearly represent the practices and views of a well-informed consumer.
2. Identification of Fraudulent and Misleading Statements. Lists of statements, both factual and non-factual, are presented to students. They are requested to distinguish those statements which most likely would be made by a medical "quack" from those which probably would represent the statements of a reputable health adviser.
3. Matching Items. Students are asked to match the names of the various specialized fields of medicine that are listed in one column with corresponding medical functions listed in second column.
4. Application of Principles. Descriptive situations involving consumer health practices are presented to students, and they are requested to tell how they would react to each situation.
5. Interpretation of the Facts. Students are asked to interpret and to evaluate the information appearing on the labels of drugs, foods, and cosmetics.
6. Analysis of Attitudes Toward Self-Medication. Students are asked to state whether they agree or disagree with various situations involving practices of self-medication and self-diagnosis.
7. Identification of Reliable Sources of Information. Students are requested to identify reliable sources for obtaining information on various situations involving possibly fraudulent consumer health practices.

B. Performance of Classwork

1. Performance Checks. Students are presented with problem situations involving the selection of health products to determine their ability to make decisions based on wise consumership.
2. Oral and Written Reports.
3. Contribution to Committee and Class Discussions. Students are given an opportunity to rate the contributions of fellow committee members with whom they are working on a project.

C. Student Self-Appraisal

ESSENTIALS OF FIRST AID

I. SCOPE OF THE UNIT

The unit, Essentials of First Aid, consists of the American Red Cross Standard First Aid Course. Every student completing this course should be given the opportunity to obtain the American Red Cross Standard First Aid Card. This involves an evaluation period in addition to the classroom instruction, thus allowing three weeks for completion of the unit. The procedures for this evaluation, together with the Standard Course Lesson Plan, have been reproduced as follows with the permission of the American National Red Cross for use in the senior high school health education program of the Los Angeles City Schools:

The primary purpose of first aid training is the prevention of accidents. In dollar costs, accidents drain the economy of the nation to this extent in any given year:

Total costs of accidents	\$ 8,700,000,000
Medical fees and hospital expenses	600,000,000
Administrative and claim settlements costs of insurance	1,500,000,000
Property damage in motor vehicle accidents	1,500,000,000
Property destroyed by fire	815,000,000
Property destroyed or production lost due to occupational accidents	1,500,000,000

First aid education can and does help reduce these figures, first, by creating an awareness of the problem; second, through skills and knowledge necessary to prevent accidents and give proper care to accident victims; and third, by developing a sense of responsibility for the safety of others.

The standard course meets the need of most people because they do not encounter injuries to the extent that policemen, firemen, and first aid station attendants do. Therefore, the instructor should stress prevention, early medical care, common injuries, and lifesaving skills. The primary objectives are to

Encourage good safety attitudes and practices

Prepare students to give first aid, particularly to themselves and members of their family.

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>ARTIFICIAL RESPIRATION</u></p>	<p>State that the over-all objectives of artificial respiration are to:</p> <ul style="list-style-type: none"> --Maintain an alternating decrease and increase in the expansion of the chest --Maintain an open airway through the mouth and nose <p>Use charts and models to show briefly how the respiratory system works and what happens when breathing fails.</p> <p>List conditions in which artificial respiration may be helpful. For example:</p> <ul style="list-style-type: none"> --When air is excluded from the lungs, e.g., drowning, choking, hanging. --When oxygen is displaced from the blood stream, e.g., carbon monoxide poisoning --When there is low concentration of oxygen, e.g., empty silos, wells, cisterns, and noxious gas fumes --When the respiratory system is depressed or paralyzed, e.g., electric shock, alcoholic intoxication, certain drugs 	<p><u>Text and Library Books</u></p> <p><u>American Red Cross First Aid Textbook.</u> pp. 32-45.</p> <p><u>A Supplement on Artificial Respiration to Accompany Red Cross Textbooks.</u> pp. 1-14.</p> <p><u>American Red Cross First Aid Textbook.</u> pp. 1-14.</p>
<p>Electrocution</p>	<p>Explain the effect of electric shock. Ask the class to discuss:</p> <ul style="list-style-type: none"> --How accidents involving the use of electricity occur --How such accidents can be prevented --What rescue methods and precautions should be stressed --What first aid care should be administered 	
<p>Poisoning by Gas</p>	<p>Explain the effect of gas poisoning. Discuss with the class:</p> <ul style="list-style-type: none"> --How accidents involving various poisonous gases occur --How such accidents can be prevented 	

UNIT VII

ESSENTIALS OF FIRST AID

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p>Poisoning by Gas (cont.)</p> <p>Drowning</p> <p><u>Methods of Artificial Respiration</u></p>	<p>--What rescue methods and precautions should be stressed --What first aid care should be administered</p> <p>Review with students the basic rules of water safety. Encourage nonswimmers to join a water safety program.</p> <p>Discuss simple water rescue methods. Assure the class that they can help even if they can't swim.</p> <p>Point out that in the absence of equipment or of help from a second person, regardless of the cause of cessation of breathing, authorities agree that the mouth-to-mouth or mouth-to-nose method of artificial respiration is the most practical method for emergency ventilation of any individual of any age who has stopped breathing. This method has the advantage of providing pressure to inflate the victim's lung immediately. It also provides more accurate information on the volume, pressure, and timing of efforts needed to inflate the victim's lungs than is afforded by other methods.</p> <p>Impress upon students the need to start artificial respiration immediately when breathing stops. Point out that, normally, recovery should be rapid, except in electric shock, drug poisoning, or carbon monoxide poisoning cases. When such cases are encountered, artificial respiration must often be carried on for long periods. Artificial respiration should be continued until the victim begins to breathe for himself; until a physician pronounces the victim dead; or until the person appears to be dead beyond any doubt.</p> <p>Describe the mouth-to-mouth or mouth-to-nose method of artificial respiration. Illustrate methods for tilting the head to relieve obstruction of the airway and to dislodge foreign objects from the mouth. Discuss the mouth-to-mouth technique for use on infants and small children.</p>	<p><u>Text and Library Books</u></p> <p><u>A Supplement on Artificial Respiration to Accompany Rad Cross Textbooks.</u> pp. 1-14.</p>

ESSENTIALS OF FIRST AID

CONTENT	ACTIVITIES AND INFORMATION	RESOURCES
<p><u>Methods of Artificial Respiration</u> (cont.)</p>	<p>Demonstrate the back pressure-arm lift method of artificial respiration. Point out that the dangers of too much compression and too much expansion may result in the following:</p> <ul style="list-style-type: none"> --Possible damage to chest cage --Possible dislocation of shoulders <p>Arrange the class into pairs, of near equal weights, and instruct them to practice this method. Correct errors.</p> <p>Ask the class to suggest how artificial respiration might be done if the victim were:</p> <ul style="list-style-type: none"> --In a reclining position, face up --In a sitting position --In a position where only the chest and head are visible <p>Devise accident problems involving stoppage of breathing.</p> <p>Sample problem: Two men are found in a garage. The motor of the car is running. All doors and windows are tightly closed.</p> <p>Instruct the class to effect the rescue and to perform artificial respiration.</p> <p>Ask the class to suggest additional first aid problems which deal with injuries producing shock and stoppage of breathing.</p> <p>Assign each student to answer the following question in writing: "What would you do if someone accidentally drank some kerosene?"</p> <p>State that the over-all objective for poison cases is to dilute the poison as fast as possible; then, except as advised,</p>	<p><u>Text and Library Books</u></p> <p><u>American Red Cross First Aid Textbook.</u> pp. 47-54.</p> <p>Display of common household poisons.</p>

UNIT VII

ESSENTIALS OF FIRST AID

III. EVALUATION

Following are the required evaluation procedures pursuant to certification by the American Red Cross of having completed the standard first aid course:

A. Purposes of Testing

To test the validity of the/ teaching

To stimulate student interest and response

To evaluate the students' performance

B. Methods of Testing

1. Performance of essential skills

- a. Bleeding Control
- b. Artificial Respiration
- c. Fracture Immobilization
- d. Transportation of Accident Victim to Safety

2. Written Tests

- a. Subjective Tests. Example: Define first aid.

- b. Objective Tests. Three types and examples:

--True or False Tests. "In heat stroke the pulse is rapid." (T) F

--Completion Answers. "The recommended rate for giving artificial respiration is 12 times per minute."

--Multiple-Choice Questions. "First aid care for lye poisoning is:

1. Cause the victim to vomit
2. Give the victim 5 or 6 glasses of water
3. Give the victim lemon juice or vinegar mixed with milk or water"

C. Suggested Methods of Grading for Certification

Grading should be confined to "Pass" or "Fail" rather than a graduated series of markings. The instructor should consider skill proficiency the major factor and subject matter the minor factor in the final decision. In mathematical terms this would be about a 60-40 ratio. The Red Cross teacher-instructor certifies on Form 325 ("Evaluation Record Standard First Aid Course") that the students whose names are listed have met the requirements of the standard course and, therefore, should be awarded the American Red Cross Standard First Aid Card.

BIBLIOGRAPHY OF HEALTH EDUCATION MATERIALS

IN SENIOR HIGH SCHOOL LIBRARIES

Below is a list of health education materials in senior high school libraries. The publisher and the call number of each book are indicated to the right of the title.

ORIENTATION TO HEALTH NEEDS
