ABSTRACT

The development of soil conservation districts in Tennessee is the subject of this graduate study. Related literature, existing records, and personal interviews are used to record progress since Tennessee adopted Public Law 46 establishing soil conservation districts in 1939. In 1959 all 95 counties of Tennessee had organized soil conservation districts; continued cooperation of Federal, State, and local agencies is necessary to continue to combat soil erosion.

THE SOIL CONSERVATION DISTRICT
MOVEMENT IN TENNESSEE

by

June 1972*

ABSTRACT

This study was undertaken to record the development of soil conservation districts in Tennessee utilizing related literature, existing records, and personal interviews with selected parties involved through the years.

Soil erosion was a problem that the early colonists had to struggle with and the struggle continued until H. H. Bennett brought it national attention. During the 1930's the occurrence of several great dust storms, that reached from the midwest to Washington, D. C., helped further impress legislators with the need for a national program to control this type of erosion.

In 1935 Congress passed Public Law No. 46 which called for the setting up of an organization to be known as the Soil Conservation Service (SCS). To help the SCS bring soil erosion under control more quickly, a model soil conservation district act was drawn up, which all states adopted in total or with very minor changes. Tennessee adopted this model law in 1939.

It took 20 years, 1940-1959, for all the 95 counties of Tennessee to organize individual soil conservation districts as provided for in the Act. Previous agreements prior to the Act and World War II were partially the cause of this long time span. The Tennessee Agricultural Extension Service cooperated

*Date of completion of an M.S. degree thesis by Thomas C. Mathews entitled "The Soil Conservation District Movement in Tennessee" on which this summary is based.

with SCS in the districting process.

It was noted that the continued cooperation of Federal, State and other interested agencies and organizations will be needed if this type of work is to progress and expand in the future.

RESEARCH SUMMARY*

I. INTRODUCTION

Man's struggle to control soil erosion is as old as recorded history. It is still being written about today and estimates have been made as to the relatively small amount of land that will be available per person by the year 2300 A.D.

It has been verified that accelerated soil erosion depresses man's economic, social, physical, and spiritual well being through reduced crop yields, lower income, impaired health, and increased damage from floods.

Situation and Purpose

It has long been recognized that soil conservation districts were formed in Tennessee counties, as a result of cooperative efforts of county Extension agents and Soil Conservation workers, to combat accelerated soil erosion, a serious conservation problem in Tennessee.

Since no previous effort was uncovered regarding the making of a permanent record of historical circumstances surrounding the origin of soil conservation districts in Tennessee, it was felt that a study of this nature might be of value to all people interested.

*Thomas C. Mathews, Graduate Student, Department of Agricultural Extension Education, College of Agriculture, The University of Tennessee, Knoxville, Tennessee.

James H. Robinson, Associate Professor, Extension Plant and Soil Science Department, The University of Tennessee, Agricultural Extension Service, Knoxville, Tennessee.

Cecil E. Carter, Jr., Associate Professor, Agricultural Extension Education Department, The University of Tennessee, Agricultural Extension Service, Knoxville, Tennessee

Robert S. Dotson, Professor and Head, Agricultural Extension Education Department, University of Tennessee, Agricultural Extension Service, Knoxville, Tennessee.

Research Methodology

The methods selected for use were: 1) a historical review of records concerning the creation, growth and development of soil conservation districts in Tennessee; 2) a review of related literature; and 3) personal interviews with representatives of the agencies involved who were in appropriate positions during the times studied.

The study was broken into two time periods, namely: (1) the Initial Period, 1940-1949; and (2) the Final Period, 1950-1959.

II. MAJOR FINDINGS

Reasons for Organization and Continuation

It was found that American farmers became concerned with the problem of soil erosion as early as 1615 when William Boyd of Virginia saw the topsoil of his farm being carried away by heavy rainfall.

The writings, observations and experiments conducted by such men as Jared Eliot of Connecticut, John Lorain of Pennsylvania, Nicholas Sornby of Mississippi and others, indicated that the problem of soil erosion was neither unique to any one geographical area nor limited to a single type of farming operation.

It was not until the coming of H. H. Bennett, known since as the father of soil conservation, that soil erosion control work gained national prominence as a program of vital import to the nation. The great dust storms of the 1930's helped to convince the American people of the value and need for soil erosion control.

Through the mutual efforts of President Franklin D. Roosevelt, Bennett, and Congress, a national law was passed and signed in 1935 that established the Soil Conservation Service as a national agency to work on soil erosion.

All states passed soil conservation district acts to allow the districts to become local unit based. This proved successful because it established procedures for organizing districts and gave needed power to the districts to promote and carry out soil erosion control practices on the lands within their jurisdiction through agreements with local landowners.

All counties in Tennessee had operating soil conservation districts by September 9, 1959; but it required 20 years, 1940-1959, for this to become possible.

The Initial Period, 1940-1949

A summary of the findings during this time period is presented below.

1. It was not until 18 months after the passage of "The Tennessee Soil Conservation District Act" in 1939, that the first district was organized (See Appendix Table I).
2. Due to a formal agreement entered into by Tennessee Valley Authority (TVA), United States Department of Agriculture, and the Land Grant Colleges in 1935, no soil conservation districts were to be organized in counties where soil erosion control work was under the supervision of TVA.
3. The first Tennessee districts to be organized were in Sumner and Lauderdale Counties on June 13, 1940 - non-valley counties (See Figure 1, Appendix).
4. The peak of counties organizing districts during the Initial Period came in 1941, when 13 non-valley counties organized districts.
5. World War II slowed down the rate of districts being organized due to the lack of trained technicians to place in the new districts and the emphasis placed on wartime food production.
6. No new districts were formed in either 1948 or 1949.

7. The dates, counties, and SCS order in which districts were organized during the Initial Period, 1940-1949, are tabulated (See Table I, Appendix).

8. To see how the soil conservation districts organized from 1940-1949 and 1950-1959 fit into the Agricultural Extension Supervisory districts of the State of Tennessee (See Figure 2, Appendix). We see that early conservation districts appeared in all but District 5 - non-valley counties being involved.

9. How the soil conservation districts organized from 1940-1949 and 1950-1959 fit into the soil conservation areas of the State of Tennessee ~~are~~ shown (See Figure 3, Appendix). It is seen that the first conservation districts formed in soil conservation areas 1,2,3, and 4 - non-valley counties.

10. The number of counties forming districts, each year, for the Initial Period 1940-1949 (See Figure 4, Appendix).

The Final Period, 1950-1959

A summary of the findings during this time period includes:

1. In 1942, the original agreement of 1935 was terminated and replaced with a new one. Although this cleared the way for organization of soil conservation districts in the Tennessee Valley counties, no valley counties were organized until 1950.

2. One of the most helpful agreements was the Plan for Coordinated Action in the Soil and Water Conservation Phase of the State Agricultural Program signed on September 19, 1950.

3. Extension agents assisted in the work and one state specialist was appointed jointly by SCS and the Extension Service.

4. The high point of district organization came in 1952 when 14 counties organized districts. These were valley counties.

5. The dates, counties, referendum notes, and SCS order in which districts were organized during the Final Period 1950-1959 ^{are} given (See Table II, Appendix).

6. The number of counties forming districts, each year, for the Final Period, 1950-1959, (See Figure 5, Appendix). These were the valley counties.

III. CONCLUSIONS

1. With time and cooperation most of the problems that appeared during the time it took all (non-valley and valley) counties to organize soil conservation districts were eliminated or agreements reached on methods to be used in solving them.

2. Areas of mutual interest, means of coordinating the efforts of all personnel concerned, and guideposts for local use were delineated.

3. At the county level, better cooperation, less duplication of effort, and increased services to the clientele served by both the Extension Leader of the Extension Service and the Work Unit Conservationist of the Soil Conservation Service ~~requested~~ resulted.

IV. THE FUTURE

As the soil conservation district seeks to be effective in the future, it appears consideration is being given to altering its image as follows:

1. To expand horizons to include assistance to the clientele in other fields of conservation (e.g., pollution control and ecology) as well as continuing the program for conserving and improving the soil.

2. To assist in the field of land use planning by working more closely with city planners, local zoning boards, and other similar groups interested in the orderly growth and development of land so that it can meet the needs of the increasing population for new housing, new industries, and new recreational areas.

These appear to be the projected ways of the future.
