ABSTRACT

This report, the second segment of the first phase of the Indiana Education Facilities Comprehensive Planning Study, reviews the area of enrollment projections and facilities inventory-space utilization analysis for 1968 through 1985. Chapters cover introductory material, population data for Indiana, college enrollment in Indiana, and projections for enrollment. Appendices include births by geographic area, mathematical equations, and Indiana colleges and universities by size of undergraduate enrollment for September 1967. (Related documents are HE 004 008, HE 004 005, and HE 004 047.) (MJM)

FOREWORD

This report represents one segment of the first phase of the Indiana Higher Education Facilities Comprehensive Planning Study that was begun in the summer of 1967 under the sponsorship of the Indiana Advisory Commission on Academic Facilities. Funds for the project were made available to the commission by the U.S. Office of Education under the Higher Education Facilities Act of 1963 (P.L. 88-204). Cooperating in the study with the advisory commission is the Indiana Conference on Higher Education, a voluntary organization of thirty-eight Indiana colleges and universities. The Needs and Resources Committee of the Indiana Conference worked with the study director in developing the scope and outline of the study.

This study has two primary objectives. First, we hope to develop a detailed look at the future needs and expected resources of the institutions of higher education in Indiana and the likely impact of various alternative policy actions. We will attempt to present this information in a form that will be useful in the planning processes of the Indiana Conference on Higher Education, the Advisory Commission on Academic Facilities, the U.S. Office of Education, and the Indiana General Assembly. Secondly, we have designed the study to facilitate its utilization by the individual institutions of higher learning in the state. Although the published reports from the project will deal only with groups of institutions or statewide totals, we will also supply each institution cooperating in the study with detailed confidential information about its own institution. This has already been done in the areas of enrollment projections and

facilities inventory-space utilization analysis, and the approach will be continued in the remaining phases of the study. These data will allow each institution to see how it compares with the statewide findings and should also further its data base development and planning efforts.

The general research design of the over-all study is presented in an outline-flow chart form. During this first year of the study, the focus has been mainly on the development of a comprehensive survey of the current scale and composition of higher education in Indiana. This phase is culminated with the publication of six "current status" reports. These are based on surveys conducted during the 1967-68 academic year and cover facilities inventory-space utilization, programs and faculty and staff, finances, student migration patterns, and preliminary projections of student enrollments. The sixth report summarizes the findings and implications of the surveys.

The second year of the study will be devoted to the long-run forecast of needs and resources. Special studies will be conducted of future space needs, the composition of the future demand for higher education, future faculty and staff needs, and expected revenues. In addition, a simulation model of Indiana higher education will be constructed that will allow us to test the impact of alternative assumptions about future growth patterns in higher education in the state. For instance, we will be able to assess the needs and resources effects of such factors as alternative faculty salary assumptions, changes in the demand for various types of academic programs, and alternative allocations of enrollments between private and public institutions.

Our study obviously could not be successful without the fullest cooperation of the institutions involved. To say that this cooperation has been superb would be an understatement. The schools committed themselves to the project in the summer of 1967 and held to that commitment throughout the year. They not only allowed the study staff access to their records, but they also assumed the responsibility of developing much of the raw data. We know this was a particular imposition on their limited time and staff resources in many cases, and we can only hope that their efforts will prove beneficial to the long-run development of higher education in the state.

Finally, a special word of thanks is in order to the Graduate School of Business and the Bureau of Business Research at Indiana University. Although the study is not an official Bureau project, the School of Business has released part of my time to serve as study director for the project, and the study has been housed in and received the support of the Bureau of Business Research. Without the advice and assistance of the Bureau staff, logistical and research support problems would have been much more difficult.

PROPOSED WORK SCHEDULE
INDIANA HIGHER EDUCATION FACILITIES STUDY

PREFACE

In the spring of 1967 the Indiana Conference of Higher Education, in cooperation with the Indiana Advisory Commission on Academic Facilities, agreed to a comprehensive planning study to determine the future needs of higher education in Indiana. Estimates of future enrollments are an integral part of that plan, and the present study is submitted to supply these estimates.

This study was made possible through the cooperation of many people. The following institutions participated in the study and supplied the basic enrollment data through their registrars.

Basic data concerning births and deaths in Indiana were supplied by the Indiana State Board of Health. The task of tabulation and computation was simplified by use of the facilities of the computing center at Purdue

University. Programming assistance provided by Professor John Moser was invaluable. The authors gratefully acknowledge the cooperation and assistance of all those who made this study possible.

HIGHLIGHTS

POPULATION DATA FOR INDIANA

The population trends of Indiana have followed closely those of the United States. Indiana constituted 2.6 percent of the U.S. total population from 1930 to 1965.

In 1977 Indiana college-age population will peak at 429,000 (an increase of 79,000 since 1967). In 1985 the college-age population will have decreased to 371,000, the estimated amount for 1970.

COLLEGE ENROLLMENT IN INDIANA

In the past 13 years, the number of Indiana students attending Indiana institutions has nearly doubled.

Indiana undergraduate enrollment increased 154 percent from 1950 to 1967, and graduate enrollment increased 228 percent during the same period of time.

PROJECTIONS OF ENROLLMENTS IN INDIANA

It is expected that the percentage of total undergraduate students in public institutions of higher education will increase from 63 percent in 1967 to approximately 65 percent in 1985.

Enrollment in public institutions should increase to 100,000 in 1985, and regional campuses should expect an enrollment of 39,000 (an increase of one percentage point).

A trend for more women to seek higher education has been noted.

From 1951 to 1967 graduate enrollment has increased 4 times (from 7,400 to 29,000) and could increase an additional 2 1/3 times (to 65,000) by 1985.

I. INTRODUCTION

In order to plan future programs and facilities for higher education in Indiana, a study of future college and university enrollment for the state is essential. This study, undertaken for the Indiana Advisory Commission on Academic Facilities in cooperation with the Indiana Conference of Higher Education, was designed to provide potential enrollment data for Indiana colleges and universities. Data concerning the total population, births, and college enrollments of the State of Indiana were obtained.

Various analyses, all based on scientific procedures, might have been used to obtain enrollment projections through 1985. Any method of analysis must be based on fundamental assumptions, which depend upon the judgment of the individual making them.

One of the first decisions made was the selection of the base period to be used. The base period influences the prediction. Its selection is a matter of judgment and also depends on availability of data. For this study birth figures from 1929 through 1967 were used. College and university enrollments from 1950 to 1967 were selected. This period was chosen because of the relative stability of the base period and because enrollment figures for that period were regularly reported to the Indiana Association of Collegiate Registrars and Admissions Officers on an official basis.

An earlier enrollment study in 1955¹ utilized several mathematical models. Experience has shown since that time that a linear projection of college enrollments expressed as percentages of the appropriate age groups provided an adequate and reliable estimate. For example, the linear model based on eighteen- to twenty-one-year-olds, Model C₁,² in the 1955 study predicted that 120,931 undergraduate students, excluding special and other students, would attend Indiana colleges and universities in 1967-68. The actual 1967-68 undergraduate enrollment, excluding special and other students, was 125,569. This represents less than a 4 percent error in the 1955 prediction. Because of the demonstrated accuracy of this type model, it was the only one used in the present study. Four different estimates of undergraduate enrollment in Indiana were made using this basic model (Figure 1). Two were based on past undergraduate enrollments for the state, and two were obtained by estimating enrollments for each individual college within the state and by summing these to obtain the total for the state.

Individual college estimates, while not reported in this study, were made available to the president of each institution. Any prediction for individual institutions can be valid only insofar as the particular institution follows the linear trend used in the model, and for a given school this may or may not be true.

II. POPULATION DATA FOR INDIANA

Indiana's population trends have closely followed those of the United States for many years. For the period used in the present study, 1930 to 1965, the total population of Indiana has represented about 2.6 percent of the total U.S. population (Table 1, Figure 2), and there has been a slight decrease in this percentage in the last few years. In addition, during the same period of time, Indiana has accounted for approximately 2.6 percent of all the births in the United States (Table 2, Figure 3).

Since Indiana and the United States are following similar population and birth trends, it is appropriate to use Indiana birth data to predict college enrollments even though many of the college students are not residents of Indiana. It was necessary to obtain the most accurate Indiana birth figures for the state in order to predict college-age populations. The Indiana State Board of Health has provided information concerning births and deaths in Indiana for each year from 1928 to 1967 (Table 3, Figure 4). Also, a tabulation of births for each of the 92 counties of Indiana from 1900 to 1965 has been included as Appendix A. County information may prove helpful for individual colleges drawing from specific areas.

Birth registration completeness checks made in 1940 and 1950 indicated that it was advisable to correct the number of births for under-registration. The check in 1940 showed a 96.5 percent completeness in Indiana, and for 1950 the percent was 99 percent. It was assumed that the improved registration was a linear function passing through the points 96.5 percent in 1940 and 99 percent in 1950. From this function, an estimated percentage of completeness was obtained for each year from

1928 to 1950. It was further assumed that the percentage completeness would not exceed 99 percent, and, therefore, this percentage was used for all years after 1950 (Table 3).

Estimates of the number of eighteen-, nineteen-, twenty-, and twenty-one-year-olds were obtained by applying mortality rates to the corrected births for each year from 1928 to 1967 (Table 4). For the purpose of estimating total undergraduate enrollments, the total eighteen- to twenty-one-year-old age group was obtained for the period 1950 to 1985 (Table 5, Figure 5). The mortality estimates were based on mortality tables that are several years old, and since the life span is increasing, the estimates are probably conservative. In addition, migration was disregarded. A check against State Board of Health population projections that included a migration factor indicated that the college-age populations in Table 5 were about 5 percent less than the State Board projections for 1980. Consequently, it appeared that these college-age estimates were adequate for prediction purposes. It can be seen from Table 5 that the peak population occurs in 1977 when college-age population will be nearly 79,000 more than in 1967. Because of the decreasing number of births from 1961 to the present, the college-age population will decline from nearly 429,000 in 1977 to 371,000 in 1985. The college-age population in 1985 will be about the same as it will be in 1970.

It has been shown in two reports, Residence and Migration of College Students 1949-1950 (Federal Security Agency, U.S. Office of Education) and Home State and Migration of American College Students, 1958 (American Association of Collegiate Registrars and Admissions Officers), that

Indiana has a net in-migration of students. Since it would be difficult to obtain each state's college-age population and to get historical residence patterns from the Indiana colleges, only U.S. population figures could be used if residence is to be considered. However, as previously shown, Indiana reflects the same population trends as the United States. Consequently, it was assumed that Indiana college-age populations could be used in the same manner as U.S. college-age populations. In addition, the assumptions were made that past resident and nonresident trends would continue into the future and that if this relationship changes, the reciprocal nature of nonresident enrollment in the various states would cause the nonresident student to be replaced by a resident student.

Figure 5 ESTIMATED COLLEGE-AGE
POPULATION IN INDIANA
(1950-85)

III. COLLEGE ENROLLMENT IN INDIANA

Fall enrollments of undergraduate and graduate students were obtained from each college and university in the state for the years 1950 to 1967, and undergraduate students were also reported by class (Table 6). These data were received from both public and private institutions (Table 7, Table 8). For the period, total undergraduate enrollment increased 154 percent, and graduate enrollment in the state increased 228 percent. The public institutions experienced a 198 percent increase of undergraduates and a 222 percent increase of graduate students. Undergraduate enrollment in the private institutions increased 103 percent for the same period, and graduate enrollment increased 260 percent. While nearly 54 percent of the total undergraduates were in public institutions in 1950, 63 percent of the state undergraduates were enrolled in public institutions in 1967. Eighty-three percent of the graduate students were in public schools in 1950, as compared with 82 percent in 1967.

Geographic distributions of college and university enrollment by county in Indiana and by state were obtained for the fall semester or quarter for 1967-68 (Figures 6 and 7). The number shown for each county or state represents the number of undergraduate students from that county or state who were attending Indiana colleges and universities. Indiana students attending institutions outside the State of Indiana are not included.

A comparison of data in Figure 6 with comparable data in the 1955 study (Potential Enrollment for Indiana Colleges and Universities, 1955 to 1972, by N. M. Parkhurst and Betty Suddarth) shows that the number of students from Indiana attending colleges or universities in Indiana has,

-17-

generally speaking, doubled during the past 13 years. The number has failed to double in only three counties, whereas it has increased 400 percent in six counties and 500 percent in two counties. The in-migration of students from other states has increased in terms of number of students; the number coming from 19 states has doubled during the past 13 years.

IV. PROJECTIONS OF ENROLLMENTS IN INDIANA

On the basis of data collected, trends for the past 18 years were studied. These data have been used to project trends into the future for approximately 18 years to arrive at enrollment predictions. These methods of prediction are based upon postulated relationships between the future and the past. The premise is generally made that the future will reflect the past proportionately and will not show influences greater or lesser than those in the past. Consequently, one of the first assumptions is that the average behavior (economic, social, and political) of the base period, whatever it was, will prevail in the following period. In the present study, the base period selected, 1950 to 1967, was one of relative normalcy. It was not disrupted by a major war such as World War II or a period of deep depression. Therefore, this trend should be more stable than those of previous periods where such unsettling conditions did prevail. Whether stable conditions will prevail in the future is not known.

Before analytic projections can be accomplished, the choice of a system of fundamental concepts of behavior must be made. The system chosen is referred to as an analytical model that is an embodiment of all of the characteristics of behavior attributed to the quantity under study. In this way, trends and other important properties are incorporated into a mathematical expression that, when fitted to the past, will carry important characteristics into the future.

PROJECTION OF UNDERGRADUATE ENROLLMENT

One basic model with four variations was used in the present study for the prediction of undergraduate enrollments.¹ This model, called UPM for undergraduate prediction model, was selected because of its demonstrated accuracy in the past.² In this model, undergraduate enrollment is assumed to be a fraction of the college-age population that allows this population to exert a major influence. All other influences are grouped together.

UPM is based on past enrollment expressed as a percentage of the college-age population. The percentage is assumed to be a linear function that implies a constant rate of change. The linear relationship obtained was projected through 1985, and future percentages were computed. These extrapolated percentages were then applied to the appropriate population group to obtain future enrollments. It is important to note that college-age populations up to and including 1985 can be accurately predicted from currently available birth data.

UPM-1 was calculated using total undergraduate enrollments for the state as a whole from 1950 to 1967. These enrollments were expressed as percentages of the eighteen- to twenty-one-year-olds for the same period (Table 9). The total undergraduate estimates thus obtained were subdivided into classes based on an average percentage in each category for the past five years (Table 10, Table 11).

¹The prediction equations for the models are given in Appendix B.

²This model was Model C in the 1955 study.

UPM-2 was calculated using freshmen enrollments for the state as a whole for the period from 1950 to 1967. These enrollments were expressed as a percentage of the eighteen-year-olds (Table 12). Average advancement ratios for the past five years were applied to the freshmen estimates to obtain sophomore, junior, and senior estimates (Table 13, Table 14).

For comparative purposes it must be pointed out that the "other" category that is included in the estimate based on total undergraduate enrollment (UPM-1) is not included in the estimate based on freshmen enrollment (UPM-2). Consequently, UPM-2 is consistently lower than UPM-1. When the predicted "other" category from UPM-1 is added to UPM-2, it can be seen that the two estimates for undergraduate enrollment for Indiana are very close (Table 11, Table 14).

The other two state estimates, UPM-3 and UPM-4, are based on individual college estimates. These individual estimates were made using the same type models as UPM-1 and UPM-2, respectively. In other words, an estimate based on total undergraduate enrollment expressed as a percentage of the eighteen- to twenty-one-year-olds was made for each Indiana college. These estimates were then totaled to obtain another state estimate, UPM-3 (Table 15). In addition, an estimate for each Indiana college was made based on freshmen enrollments expressed as a percentage of eighteen-year-olds. These estimates were totaled to obtain the state estimate, UPM-4 (Table 16). The "other" category from UPM-3 was added to the total of UPM-4 for comparative purposes. The state estimates based on the summation of the individual institutions are lower than comparable estimates based on the annual totals for the state. That is, UPM-3 is lower than UPM-1, and UPM-4 is lower than UPM-2. This is because enrollments in the state

as a whole have shown a steadily increasing percentage of the college-age population while individual college percentages in some instances have been decreasing, remaining relatively constant, or increasing at a slower rate. The model used in this study does not take into account local conditions, unique functions, or policies of individual colleges; it merely projects past trends into the future. While a linear function describes the state behavior adequately, it may or may not be valid for an individual school. The individual school's basic needs and policies will have considerable effect on any estimates of future enrollments.

Various subtotal estimates are of interest. A public and private breakdown (Table 17) shows that while 63 percent of the undergraduate enrollment in Indiana is now in public schools, this percentage can be expected to increase to 65 or 66 percent by 1985 if present trends continue. Tables 18 and 19 give public and private enrollment estimates. The Model P-1 estimates were obtained by totaling the individual college estimates for each category. Model P-2 estimates were obtained by a linear projection of the percentage of eighteen- to twenty-one-year-olds enrolled in each category. It is interesting to note that the public institution estimates, both for main and regional campuses, are essentially the same by both methods. Estimates based on annual total enrollments in private institutions are greater than the sum of estimates based on enrollment in the individual private institutions. (Using Model P-1, Figure 8 represents the public-private trend.)

An examination of the public institutions separately indicates that public enrollment in the four main campuses may reach 100,000 in 1985, while the regional campuses could have an enrollment of 39,000. This

represents 28 percent of the public enrollment attending regional campuses in 1985 (compared to 27 percent in 1967). Decisions to increase offerings so that more students could obtain degrees at regional campuses and any decisions to set ceilings for enrollments at main campuses would obviously affect these percentages.

Undergraduate enrollment in Indiana colleges and universities by size category as of September, 1967, is shown in Table 20.³ Estimates of future enrollments for the schools presently in the size categories were made (Table 21, Table 22). Model S-1 estimates were obtained by summing the individual schools for the appropriate category. Model S-2 estimates were obtained by linear projections of the percentage of the college-age group enrolled in each size category. It can be seen that the greatest variation between the two estimates lies within the categories of less than 500 and of 501-750. The other three categories yield estimates, using the two models, that are essentially the same. Figure 9, using Model S-1 for estimates, depicts graphically the breakdown by size.

A categorization by men and women for the state total and for each individual school was also considered important. A linear projection of the percentage of women for the period from 1950 to 1967 was made. The percentage of men was obtained by subtraction. In addition, another projection based on only the past five years was made because, in some instances, using the entire 1950 to 1967 period for the basic data gave an unrealistic picture for some schools. For the state as a whole, the base period from 1950 to 1967 appeared to be the most valid.

³The institutions included in each category are listed in Appendix C.

It would appear that the trend has been for more and more women to attend institutions of higher education (Table 23). How long this trend will continue is not known. The percentages of men and women were applied to the enrollments estimated by UPM-1 to obtain estimates for men and women from 1968 to 1985, and UPM-1 was used for Indiana as a whole (Table 24). Estimates based on UPM-3 were made for each institution and presented to the president of each institution.

*Undergraduate enrollment estimated from UPM-1.

PROJECTIONS OF GRADUATE ENROLLMENT

Many difficulties in estimating graduate enrollment are encountered. No specific age group can be isolated to use as a base for graduate students. Many graduate students are part-time or seasonal; thus, enrollment data is ambiguous. Graduate programs have grown much more rapidly in recent years, and new graduate programs in schools that previously had none have been introduced. The regional campuses of the state universities presented even greater difficulties for there seems to be little relationship between their undergraduate and graduate enrollments.

Estimates of graduate enrollment were made involving the relationship between graduate enrollment and the freshmen for the same year and the seniors for the preceding year. Two assumptions are involved. One is that the number of graduate students is dependent upon the number of college graduates available--that is, the seniors for the previous year. The other assumption is that the number of graduate students is dependent upon the number of assistantships available, which in turn is dependent upon the number of freshmen enrolled. On a statewide basis, these assumptions appear reasonable. However, for individual schools with graduate programs, and especially for the regional campuses, these assumptions may not be realistic since the migration and age of graduate students varies considerably.

A statewide estimate based on graduate students expressed as a percentage of freshmen plus seniors was made (Table 25). A linear projection of this percentage was accomplished and the extrapolated percentages obtained were applied to the undergraduate estimates, both UPM-1 and UPM-2 (Table 26, Figure 10). In addition, using the same method, estimates were made for each institution that offers graduate programs.

leading to graduate degrees. No attempt was made to estimate graduate enrollments in institutions that did not offer graduate degrees.

Further estimates were made for the regional campus graduate enrollments. Since one of the functions of a regional campus is to provide programs for the community in which it is located, the births for the appropriate county for the period that would correspond to the twenty-two- to thirty-five-year-old age group were tabulated. Graduate enrollments for the regional campuses were then expressed as percentages of the appropriate county twenty-two- to thirty-five-year-olds. While the individual schools will receive estimates of their graduate enrollments, with the regional campuses receiving the additional estimates based on county population, only the state total is presented in this report.

Graduate student enrollment has increased from 7,400 in 1951 to over 29,000 in 1967, or nearly four times. Based on this historical data, it seems that graduate enrollments could increase to 65,000 by 1985. This represents a graduate enrollment nearly 2 1/3 times as great as the enrollment in 1967. What effect public policies, such as draft laws and institutional changes, will have are not known at this time.

Any projection of the past into the future can be fallible. A generalized mathematical model, devised on specific historical data may or may not be pertinent in specific instances. Any additional information that can be supplied by individual schools should be utilized in making more refined estimates. In addition, periodic review of how closely or distantly the model fits actual experience is necessary. For any given year, the actual enrollment may fall above or below the estimated figure, but general trends should be observed for divergence of the estimates.

In planning facilities in the future, a study of long-term trends is necessary. As more data become available through the years, new estimates should be made to include this additional material.

Figure 10 INDIANA GRADUATE ENROLLMENT
(ESTIMATES OF GRADUATE STUDENTS BASED ON
GRADUATE ENROLLMENTS EXPRESSED AS A
PERCENTAGE OF FRESHMEN PLUS SENIORS)

APPENDIX A

BIRTHS BY GEOGRAPHIC AREA

Births by geographic area for each year, 1900 through 1965, are given on the following pages. Included in this tabulation are all counties and each city over 5,000 population at the time of the 1960 census. (It will be noted that data for many smaller cities are not available prior to 1960.)

Figures for 1936 and prior years are by place of birth, and starting with 1937, all data are by place of residence. In general, this change would result in a decrease of births assigned to cities and urban counties because births occurring in hospitals would be allocated to the county in which the parents lived rather than to the county and city in which the hospital was located. For example, prior to 1937 all births occurring in Indianapolis hospitals were assigned to Marion County, but in 1937 the practice of referring them to the parents' home county became effective. Because of the difficulty in obtaining population estimates for counties and cities, no birth rates are given.

APPENDIX A (Cont.)

INDIANA BIRTHS BY GEOGRAPHIC AREA

1900-65

NOTES:

Data are for each county and each city of over 5,000 population in 1960.

Where asterisk appears there is no satisfactory information for that year.

Births listed as "1900" are for the twelve-month period ending September 30, 1900.

Data are from the following sources:

| | |
|----------------------------------|---------|
| State Board of Health occurrence | 1900-16 |
| U.S. government occurrence | 1917-36 |
| U.S. government residence | 1937-46 |
| State Board of Health residence | 1947-65 |

APPENDIX B
MATHEMATICAL TECHNIQUES AND EQUATIONS

Model UPM assumes a linear relationship between time and the proportion of the college-age population in college. The equation is:

$$P = a + bt$$

Where P = percentage of college-group in college
 t = year minus 1900
 a, b = constants

In order to compute future enrollments, u , each percentage, p , must be multiplied by the appropriate college-age population. The constants, a and b , must be determined from the base period data. The statistical technique of least squares was used to calculate a and b . This technique minimizes the squares of the deviations of the actual data points from the line and causes the sum of the deviations of the data points from the line to equal zero. This technique gives the best possible straight line for the particular data used.

For UPM-1 the equation is:

$$P_{UPM-1} = 1.0118207t - 27.485263$$

$$U_{UPM-1} = P \text{ (appropriate 18-21-year-old group)}$$

Where P_{UPM-1} = percentage of 18-21-year-olds
 U_{UPM-1} = number of total undergraduates

For UPM-2 the equation is:

$$P_{UPM-2} = .0774299t - 19.818116$$

$$U_{UPM-2} = P \text{ (appropriate 18-year-old group)}$$

Where P_{UPM-2} = percentage of 18-year-olds
 U_{UPM-2} = number of freshmen

The male and female percentages are assumed to follow a linear relationship. The relationship for women was computed using the least squares technique. The percentage of men was obtained by subtraction of the female percentage from 100. The equation is:

$$X = a + bt$$

Where X = percentage of women

t = year minus 1900

a,b = constants

Based on the period from 1950 to 1967, the equation becomes:

$$X = .410848 t + 11.947396$$

$$\text{then } W = X \left(\frac{T}{\text{UPM-1}} \right)$$

Where W = number of women

$\frac{T}{\text{UPM-1}}$ = total undergraduates
estimated from UPM-1

The graduate student estimates based on the percentage of freshmen for the same year plus seniors for the preceding year are obtained from the following equation:

$$Z = a + bt$$

Where Z = graduate students as percentage
of freshmen and seniors

t = year minus 1900

a,b = constants

For the period used this results in the equation:

$$Z = .92952462t - 19.605788$$

$$\text{then } g = z \left(\frac{fs}{\text{UPM-1}} \right)$$

Where g = number of graduate students

$\frac{fs}{\text{UPM-1}}$ = number of freshmen and seniors
from UPM-1

APPENDIX C

INDIANA COLLEGES AND UNIVERSITIES BY SIZE OF UNDERGRADUATE ENROLLMENT FOR SEPTEMBER, 1967

Enrollment of 500 or Less

Ancilla Domini
Bethel College
Christian Theological Seminary
Frankfort Pilgrim College
John Herron School of Art
Huntington College
St. Benedict College
St. Meinrad College

Enrollment of 501 to 750

Concordia Senior College
Fort Wayne Bible College
Franklin College
Grace College
Marion College
Oakland City College
St. Mary-of-the-Woods College

Enrollment of 751 to 1500

Goshen College
Hanover College
Indiana Institute of Technology
Manchester College
Marian College
Rose Polytechnic Institute
St. Mary's College
Taylor University
Wabash College

-73-

Enrollment of 1501 to 5000

Anderson College
Butler University
DePauw University
Earlham College
Indiana Central College
St. Francis College
St. Joseph's College
Tri-State College
Valparaiso University
Vincennes University

Enrollment Over 5000

Ball State University
Indiana State University
Indiana University
Purdue University
University of Evansville
University of Notre Dame
