## ABSTRACT

The data collected for this report can be divided into three segments: a 14-year collection, 1950-51 through 1963-64, on which analyses were performed and the original predictions generated; a six-year follow-up stage, beginning in 1964-65; a twenty-year collection, 1950-51 through 1969-70, from which new predictions were generated; and a follow-up stage beginning in 1969-70. The more current figures are reported in this volume. For each of the 58 libraries surveyed, the following statistics are reported in graph and tabular form: volumes held in the collection, volumes added to the collection money, expended for materials and binding; salaries and wages expenditures, professional staff size, non-professional staff size, total library operating expenditures, and (when available) the total enrollment statistic which is descriptive of the university of which each library is a part is included. Analyses are grouped into three categories: descriptions of the past and predictions of the future of several varieties of "composite" research libraries, the rank or standing of the individual libraries in respect to each of several statistics for the last six years, and the year-by-year intercorrelations among pairs of statistics which describe either the individual library or its parent university. ## INTRODUCTION TO THE 1971-72

### (NINTH) ISSUE

Graphs in this 1971-72 issue, as in the two preceding years, show two prediction curves: one based upon the 1951-64 data; the other based upon the 1951-70 data. General observations, appropriate background text, and discussion of predictions may be found in any of the first three issues. A discussion of the methods used in determining the new prediction curves may be found at the end of the following section on procedures, page 5.

The Summary Sheet following the Introduction deserves a few brief remarks. It provides a condensed review and comparison of the principal predictions with the statistics of actual library growth during the past three years. From the Summary Sheet the reader may judge generally the success or failure of both the old and new predictions. General impressions can be examined in detail by referring to the appropriate graph among Figures 1 through 28 on pages 15-42.

As in past years, the most precise predictions for the "Average Composite" library have been those for "Volumes Held." The Summary Sheet and Figure 1 show the steady year-by-year actual growth of "Volumes Held" which has continued much as originally predicted. When the first forecasts were made, collections averaged about 1.5 million volumes. Currently, they average a little over 2.15 million.

During the year in which the original predictions were made, 1963-64, "Volumes Added" by the "Average Composite" library approximated 70,000. Generally in years since, there has been a considerable increase in average acquisitions. However, actual "Volumes Added" by the "Average Composite" library in 1969-70 were a little over 107,000; in 1970-71 they were a little under 107,000; and in 1971-72 fell to less than 106,000. Thus, for the second time, actual acquisitions for the "Average Composite" library fell below that of the previous year.

"Total Library Operating Expenditures" statistics for the "Average Composite" library in 1971-72 indicated a more than 14 percent increase of actual over the originally predicted expenditure levels, and generally, the original predictions of the expenditure of funds have been consistently surpassed by

actual expenditures. However, again this year, "Total Library Operating Expenditures" have dropped below the new predicted level although they are still well above the original predicted mark.

Trends from data collected during the past five years generally indicate that "Volumes Held" in the "Average Composite" library are continuing to rise much as predicted while "Volumes Added" show a marked down turn from both the original and the revised predictions. At first glance it would seem logical that the predictions of "Volumes Held" and "Volumes Added" should agree. However, as explained in the Procedures Section, these two predictions are assumed to be statistically independent.

Percentages of variance from predictions, computed for the "Large," "Medium-Large," "Medium-Small," and "Small Composite" groups of libraries, reveal that some developments in these library groups vary widely from the levels originally predicted. The "Large Composite" libraries are 4.5 percent above the original predicted level and 10 percent below the revised predicted level in "Total Library Operating Expenditures" for 1971-72. In "Volumes Added," the same group is 24.5 percent below the original prediction and 17 percent below the revised prediction. Five year trends for "Large Composite" libraries show that actual "Total Library Operating Expenditures" have consistently continued to surpass the originally predicted levels but are falling behind the revision based on 19 years' statistics. On the other hand, actual "Volumes Held" in 1972 exceed the original predicted number by 1.5 percent and the revised prediction by about 0.1 percent.

The "Medium-Large Composite" libraries fall well below the original predicted levels for 1971-72 in both "Volumes Held" and "Volumes Added." They also show a 4.5 percent decline from the "Total Library Operating Expenditures" forecast of the original prediction and a 7 percent decline from the revised prediction. "Volumes Held" are below the predicted levels by 10 and 1.5 percent, while "Volumes Added" have fallen below the predicted levels by 36.5 and 19 percent.

For the "Medium-Small Composite" libraries, on the other hand, actual "Volumes Held" in 1971-72 are 5 percent above the original predicted levels and 0.3 percent above the revision. "Total Library Operating Expenditures"

are almost 27 percent above the original predicted levels but 6 percent below the revised forecast. Actual "Volumes Added" have surpassed original predictions, except in 1971-72, when acquisitions declined in number as compared with those of 1970-71. They have fallen sharply behind (by 23.5 percent) the revised predictions, while "Total Library Operating Expenditures" continue to rise above original predictions by a wide margin, although the latest year shows a decline of more than 6 percent from the predicted value..

The "Small Composite" libraries also continue to show gains over originally predicted levels. Actual "Total Library Operating Expenditures" for 1971-72 are 37 percent more than the originally forecasted amounts, although 9 percent below the revised predictions. "Volumes Added" are still 9 percent and "Volumes Held" are 12.5 percent over levels originally predicted in 1963-64. Compared with the new predictions, "Volumes Added" are off 22 percent and "Volumes Held" are 4 percent off the levels forecast.

For all groups there appears to be a leveling off in "Volumes Added" accompanied by a lessening increase in expenditures over the originally predicted levels.

SUMMARY: SELECTED STATISTICS, PREDICTED AND ACTUAL, OR "COMPOSITE" LIBRARIES, 1970-1972  
(Predictions from 1971-72 are based on 21 years data, 1951-1971.)

## PROCEDURES

The data collected for this report can be divided into three segments: (a) a 14-year collection, 1950-51 through 1963-64, on which analyses were performed and the original predictions generated; (b) a six-year "follow-up" stage, beginning in 1964-65; (c) a 20-year collection, 1950-51 through 1969-70, from which new predictions were generated; and (d) a "follow-up" stage, beginning in 1969-70. A detailed discussion of the statistics computed from the 14-year collection can be found in the first three issues (i.e., 1965, 1966, or 1967) of this report, and in general, the same computations have been performed on the more recent data. It is in presenting the more current figures that the contribution of this issue lies, and, although earlier data are reported also, the focus will be on new information.

For continuity, the sample of libraries studied remains the same as in earlier issues. These libraries are listed on page 7. For each of the 58 libraries surveyed, the following statistics were obtained: (1) volumes held in the collection; (2) volumes added to the collection; (3) money expended for materials and binding; (4) salaries and wages expenditures; (5) professional staff size; (6) non-professional staff size; (7) total library operating expenditures. In addition, and when available (8) the total enrollment statistic is included, which is descriptive of the university of which each library is a part. Two additional statistics were reported from 1950-51 through 1964-65: (9) reported graduate student enrollment and (10) number of Ph.D. degrees granted. A third statistic was reported from 1950-51 through 1968-69: (11) lowest professional salary paid.\*

When omissions largely had been removed from the data, either by reference to alternative publications or by calculation, a further problem remained, namely, the accuracy or plausibility of the data, regardless of source.

---

\*The data on which this study is based are now contained in an IBM card deck consisting of 1276 cards (each card represents one of the 58 libraries and one of the 22 years). Since the present study has only analyzed these data partially and since other investigators may wish to execute further analyses which relate to their unique interests, this card deck will be made available at cost to those requesting it.

There were several means by which inaccuracies or inconsistencies could be carried into the study's initial data. They could stem from varying interpretations placed on instructions originally given to each reporting library, in which case little could be done to remove them. In addition, inaccuracies could arise during the transcription and publication of the statistical reports or during the calculations of values to serve in lieu of missing data. In an attempt to locate inaccuracies or inconsistencies within the data, simple computer procedures were developed which compared each library's reported figures for each pair of adjacent years. These procedures revealed, for example, each library's annual growth (or decline) in professional staff size, in total library operating expenditures, in expenditures for acquisitions, etc. With a slight modification, these procedures also revealed the difference, if any, between the net acquisitions (as determined by subtracting "Volumes Held" for one year from "Volumes Held" for the next succeeding year) and the gross acquisitions ("Volumes Added") for each year. By means of these procedures, several publishing or reporting errors were located and corrected for the (Seventh) issue of 1969-70. Several inconsistencies in reporting also appeared, some of which seemed to reflect a library's decision during one year to include previously unreported volumes (perhaps on microfilm), then a later decision to revert to the counting procedure which ignored these same volumes. In the current issue similar problems were encountered in data accuracy or plausibility. However, no attempt was made to equate or correct these publishing or reporting "errors."

Again, as in earlier issues, analyses are grouped into three major categories: (1) descriptions of the past and predictions of the future of several varieties of "composite" ARL libraries, (2) the rank or standing of the individual libraries in respect to each of several statistics for the last six years, and (3) the year-by-year intercorrelations among pairs of statistics which describe either the individual library or its parent university (e.g., the correlation between "Volumes Held" and "Total Library Operating Expenditures," "Volumes Added," and "Professional Staff Size.")

In preparing descriptive data for the past and the predicted future of ARL libraries, several forms of analysis were employed. Initially, the data were used to calculate an annual average figure for each of the statistics and, thus, to create a "composite" library. Then using curve fitting procedures (see, e.g., J. P. Guilford's Psychometric Methods, second ed., pp. 70-71), several of these statistics were extrapolated to 1980, producing predictions of annual average figures for the years beyond 1964. In this issue actual or realized values for the years since 1964 are provided in Figures 1-28 as a check on these predictions.

Since the annual average figures for all ARL libraries are substantially influenced by the size of a few extremely large libraries, particularly Harvard, Yale, Illinois, and some others with current holdings near or well beyond three million volumes, these averages do not reflect a thoroughly typical state of affairs. Because of this, additional composites were thought necessary and were developed. To accomplish this, the 1962-63 figures for "Volumes Held" were used to divide the 58 libraries into four sub-groups. The 58 libraries were ranked according to their 1962-63 "Volumes Held" figures and were then divided into groups of 14 "large," 15 "medium-large," 15 "medium-small," and 14 "small" libraries.\* For each of these groups, a composite was calculated by means of the same procedures used in calculating the over-all average composite library, as described above. Also, the predicted future of each group composite was extrapolated to 1980 by means of the curve fitting procedures previously mentioned.

---

\*The 14 "large" libraries are California, Berkeley; California, Los Angeles; Chicago; Columbia; Cornell; Harvard; Illinois; Indiana; Michigan; Minnesota; Pennsylvania; Princeton; Stanford; and Yale.

The 15 "medium-large" libraries are Brown; Duke; Iowa; Johns Hopkins; Louisiana State; Missouri; New York; North Carolina; Northwestern; Ohio State; Texas; Utah; Virginia; Washington, Seattle; and Wisconsin.

The 15 "medium-small" libraries are Southern California; Cincinnati; Colorado; Florida; Joint; Kansas; Kentucky; Massachusetts Institute of Technology; Michigan State; Oklahoma; Oregon; Pittsburgh; Rutgers; Washington (St. Louis); and Wayne.

The 14 "small" libraries are Boston; Florida State; Iowa State; Maryland; Nebraska; Notre Dame; Pennsylvania State; Purdue; Rochester; Syracuse; Temple; Tennessee; Texas A & M; and Washington State.

A further set of analyses, similar to those just described, provided year-by-year descriptive data for three additional composite libraries: the median library (Mdn), the third quartile library ( $Q_3$ ), and the first quartile library ( $Q_1$ ). The median composite library's statistics are such that it consistently ranks midway between the 29th and 30th rank of the 58 libraries, i.e., the characteristics of this hypothetical library fall always at the 50th percentile, when all 58 libraries are successively ranked each year for each of the statistics graphed. Similarly, the third quartile composite has characteristics which place it at the 75th percentile in the annual rankings of each statistic, while the first quartile composite falls consistently at the 25th percentile. The characteristics of the Mdn,  $Q_3$ , and  $Q_1$  composites have also been extrapolated to 1980 by means of curve fitting.

The second set of analyses consists of annual rankings of the 58 libraries on the basis of several descriptive statistics. For each of the last five years, the libraries were ranked in terms of "Volumes Held," "Volumes Added," and "Total Library Operating Expenditures" statistics. As presented in Tables 20 through 22 of this report, these rankings essentially show the competitive positions of the individual libraries.

The last or the major analyses is a year-by-year correlational analysis of all possible pairs of the ten annually reported statistics. These employ Pearson product-moment correlations (see, e.g., Helen M. Walker and Joseph Lev's Statistical Inference, p. 233ff.). For these analyses, each ARL library is treated as an "individual" and its reported statistics for a given year are treated as its scores. Intercorrelations based on 20 years of data are reported.

Again this year, two prediction curves are shown in Figures 1-28. New curves based on 21 years data were determined in the same manner as the originals (i.e., both curves are parabolas that best fit the data). These calculations were made with subroutine LSTSQ from the Purdue University Computing Center's statistical library.

Since the original curves were fitted with manual calculations, the opportunity to check the original calculations was capitalized upon in connection with the issue for 1969-70. This checking procedure revealed

the following errors: (1) The prediction curve for "Volumes Held" by the Medium-Small Composite ARL library was originally reported as  $\hat{Y} = 1342.64x^2 + 15624.14x + 530032.82$ . This curve should have been reported as  $\hat{Y} = 715.55x^2 + 230023.80x + 514982.65$ . This error was due to the fact that the original curves used 1,053,502 for the realized level of "Volumes Held" in 1964. This was later corrected to 983,268. This correction, however, was never reflected as a change in the prediction curve. (2) The prediction curve for "Volumes Added" for the Medium-Small Composite ARL library was originally reported as  $\hat{Y} = 168.84x^2 - 857.98x + 31216.37$ . This curve should have been reported as  $\hat{Y} = 136.98x^2 - 482.06x + 30451.83$ . This error was due to the fact that the original curve used 53,522 as the realized level of "Volumes Added" in 1964. This was later converted to 49,954. Again, this alteration was not reflected as a change in the prediction curve. (3) A similar change was made in the "Materials and Binding Expenditures" of the Median Composite ARL library. The figure for 1963 was originally reported as 394,554. This was corrected in the fourth issue to report 366,508. This changed the equation of the parabola from  $\hat{Y} = 2073.92x^2 - 5598.60x + 117411.32$  to  $\hat{Y} = 1939.09x^2 - 4254.09x + 115099.81$ . (4) There was also a minor error in the calculation of the prediction curve for the "Total Library Operating Expenditures" of the Large Composite ARL library. The original curve was  $\hat{Y} = 10548.75x^2 - 18697.92x + 948271.74$ . The correct curve should be  $\hat{Y} = 10543.81x^2 - 18621.78x + 948123.36$ . (5) The original prediction curves were incorrect due to a transposition error in the original calculations. The prediction curve should have been  $\hat{Y} = 349.00x^2 + 26295.53x + 401911.88$ . Realistically, the "Volumes Held" prediction curve is a dependent function of the "Volumes Added" prediction curve. However, to reflect this fact it would necessitate that one of the curves be something other than parabolic. Thus, originally, the two prediction curves were assumed to be statistically independent, and this assumption has been continued through the current issue.

## RESULTS

Summaries of the Past and Predicted Future

To summarize the descriptive statistics for the years 1950-51 through 1971-72 and to project these descriptions into the future, eight composite types of libraries will be described. These eight library types were briefly mentioned in the preceding section of the report. They are more fully identified below.

The Names, Code Names, and Distinctive Features of Eight Composite Libraries

<u>Name</u>	<u>Code Name</u>	<u>Distinctive Features</u>
Average	AV	Each descriptive characteristic for all 58 libraries was averaged for each year, 1950-51 through 1971-72. This composite library is composed of the average values calculated for each year.
Median	Mdn	For each descriptive statistic, each year, the 58 libraries were rank-ordered, from largest to smallest. This composite library consists of statistics which would rank this library midway between the 29th and 30th rank on each statistic; it is a hypothetical 50th percentile library.
First Quartile	Q <sub>1</sub>	By using the same ranking information employed in preparing the Median (Mdn) composite library, the Q <sub>1</sub> composite was also prepared. This composite has descriptive statistics which consistently give it rank at the 25th percentile in each ranking of the 58 libraries.
Third Quartile	Q <sub>3</sub>	As with the Mdn and Q <sub>1</sub> composite libraries, this composite, the Q <sub>3</sub> , is based on rankings. Its descriptive statistics are such that it will consistently fall at the 75th percentile in each ranking of the 58 libraries.

Large	Lge	In preparing the description of this library (and each of the following three libraries), the reported collection sizes for 1962-63 were first used to identify the 14 libraries with the largest collections. Then, the <u>average</u> characteristics for these 14 libraries were calculated for each year, 1950-51 through 1971-72.
Medium- Large	M-Lge	This composite library was prepared in essentially the same way as the Large Composite library, except that it is based on averages calculated for the 15 libraries with 1962-63 collection sizes which were just smaller than the collections of the 14 largest libraries.
Medium- Small	M-Sml	This composite follows next in line after the M-Lge composite above. It is based on averages derived from the 15 libraries whose collections in 1962-63 were just smaller than the collections of the libraries in the M-Lge group.
Small	Sml	This, the last of the composites, is based on averages derived from the 14 libraries which had the smallest collections in 1962-63.

Tables 1 through 8 summarize the descriptive statistics of the eight composite libraries for the past five years; the tables present the composites in the same order of appearance as above. In reviewing these tables, it should be particularly recalled that the Average Composite is noticeably affected by the very large size of a few ARL libraries. Thus, although the characteristics of the Average Composite are average arithmetically, they are larger than "typical;" the more typical composite library is the Median.

Many of the same data which serve to describe the composite libraries for the years 1951-64 were used in preparing fitted curves from which predictions of future levels could be made. Before attempting to fit curves to the data, inspection indicated, as expected, that annual growth (e.g., in "Volumes Added" for the Average Composite library) clearly was not linear; any attempt to fit straight lines would result in poor correspondence between actual figures and a straight line's hypothetical figures. The plan adopted was to determine the equation for the parabola which conformed best to the

previous annual levels of each statistic, then to predict future levels of each statistic from the "best fitting" parabola. This same method was used in generating the new prediction curves, and, as with the original predictions, "Volumes Held" and "Volumes Added" are assumed to be statistically independent.

Collections, acquisitions, expenditures, etc., which are ten, twenty, or fifty times the present levels cannot be seriously envisioned for the foreseeable future and some of the fitted curves, when extended some years beyond 1980, indicate inconceivably high levels, thus there is some basis for expecting some deceleration of library growth. Although there has been continuous growth since 1951, including some of the most recent years, library growth currently is faltering.

Projections of the principal statistics for each composite library are presented in Figures 1 through 28. Each figure deals either with the "Volumes Held," "Volumes Added," "Total Library Operating Expenditures," "Professional Staff Size," or "Materials and Binding Expenditures" statistics of one composite library. Each figure presents actual levels of "Volumes Held" (or "Volumes Added," "Total Library Operating Expenditures," etc.) in the form of black dots for the years 1950-51 through 1963-64 or solid triangles for the years 1964-65 through 1971-72 alongside the corresponding levels derived from the best fitting parabola. The parabolas are extended to show predicted levels for the years from 1964-65 through 1979-80.

#### Correlations Among the Descriptive Statistics

Correlations among pairs of annually reported statistics for the 14 years represented in Table 9 are of some interest, yet they provide few unexpected results. Principally these correlations serve to show that suspected relationships are present; "Materials and Binding Expenditures," for example, correlates .89 to .96 with "Total Library Operating Expenditures," as might be expected, since "Materials and Binding Expenditures" is part of and dependent upon "Total Library Operating Expenditures." The correlations also show a relatively weak relationship between "Volumes Held" and "Total Enrollment," with the correlation centering around .18, and they show a

greater, but still relatively weak relationship between "Volumes Held" and "Graduate Enrollment." Throughout the 14 years, the correlation figure between "Volumes Held" and "Graduate Enrollment" varies between .24 and .44, centering around .37. Within Table 9, three correlation coefficients are shown for each pair of variables. In each set of three, the upper entry is the highest annual coefficient, the middle entry is the median coefficient, and the lower entry is the lowest annual coefficient.

Since Table 9 provides only a summary of the 1951-64 correlations between pairs of variables and since some of the characteristics of these relationships are not apparent in that summary, Tables 10-17 have been prepared. Each of these tables presents the correlations between one variable and each of the other variables, for each of 21 years. Within these tables, it is possible to identify some relationships which are highly stable. Other pairs of variables have produced annual correlations which vary irregularly across the years, with no apparent pattern in these variations.

#### Some Further Analyses

In addition to the analyses already reported, others also help to indicate more fully the characteristics of research libraries and the contexts within which they function. It must be recognized, for example, that university enrollments, both at the undergraduate and the graduate levels have been increasing steadily. Even though undergraduate enrollments bear slight relationship to the size or other features of research libraries, the size of the graduate program is clearly related. Work was, therefore, undertaken to trace the growth of enrollments and the awarding of doctorates since 1950-51. This work was discontinued in 1964-65.

Another analysis calculates the unit cost of library acquisitions. To determine these, "Volumes Added" were divided into "Materials and Binding Expenditures" figures for each year. Representative results, as determined for the Average, Median, and the Large to Small Composite libraries are shown in Table 18. Since gifts and volumes received by exchange are included in "Volumes Added," the resulting average unit cost does not truly reflect the average unit cost of volumes purchased.

The last of the secondary analyses consists of the percent annual increase in "Volumes Held" for the period covered by the study's data. These figures, as determined for the Average, Median, plus the Large to Small Composites, are shown for the latest five-year period in Table 19.

#### Annual Ranks of the 58 ARL Libraries

Each year, the 58 libraries have been ranked on three descriptive statistics: "Volumes Held," "Volumes Added," and "Total Library Operating Expenditures." These data for the past five years are given in Tables 20-22. One point should be especially remembered when examining Tables 20-22, which is that institutions in or near the middle ranks are more subject to rank shifts, since several institutions in the middle ranks will in each year have highly similar "Volumes Held," "Volumes Added," or "Total Library Operating Expenditures" figures. In other words, the differences between institutions for a given statistic are small relative to the reported values for "Volumes Held," "Volumes Added," and "Total Library Operating Expenditures." Thus, a fairly modest change in expenditures, for example, may be enough to shift a given library a few ranks up or down. Conversely, at the extreme ends of the ranks, the addition or loss of ten thousand dollars in "Total Library Operating Expenditures" is far less likely to have any observable effect on a library's rank. Here, the differences are very large relative to the values reported. In the top few ranks of "Volumes Held," even the addition or loss of one hundred thousand volumes is of no particular significance, since far greater numbers separate each of the first four libraries from its neighbors.

1969	.900	.829	.839	.959	1.000	.882	.947	.319
1970	.900	.843	.753	.967	1.000	.883	.954	.303
1971	.891	.828	.763	.966	1.000	.845	.957	.315
1972	.901	.808	.844	.955	1.000	.866	.955	.305

Table 15  
 Correlation of the Non-Professional Staff Size (FTE) Statistic  
 With Each of Seven Other Statistics  
 1967-68 through 1971-72

Year	Volumes Held	Volumes Added	Materials & Binding Expenditures	Total Salaries & Wages Expenditures	Professional Staff Size (FTE)	Non-Professional Staff Size (FTE)	Total Library Operating Expenditures	Total Enrollment
1968	.620	.537	.680	.905	.883	1.000	.904	.179
1969	.902	.824	.787	.910	.882	1.000	.910	.129
1970	.876	.743	.680	.908	.883	1.000	.902	.157
1971	.848	.679	.675	.891	.845	1.000	.871	.151
1972	.880	.751	.780	.914	.866	1.000	.917	.127

Table 16  
 Correlation of the Total Library Operating Expenditures Statistic  
 With Each of Seven Other Statistics  
 1967-68 through 1971-72

Year	Volumes Held	Volumes Added	Materials & Binding Expenditures	Total Salaries & Wages Expenditures	Professional Staff Size (FTE)	Non-Professional Staff Size (FTE)	Total Library Operating Expenditures	Total Enrollment
1968	.602	.574	.855	.970	.948	.904	1.000	.336
1969	.877	.891	.922	.983	.947	.910	1.000	.271
1970	.876	.831	.864	.964	.954	.902	1.000	.288
1971	.879	.838	.856	.973	.957	.871	1.000	.297
1972	.888	.820	.908	.987	.955	.917	1.000	.244

Table 17  
 Correlation of the Total Enrollment Statistic  
 With Each of Seven Other Statistics  
 1967-68 through 1971-72

Year	Volumes Held	Volumes Added	Materials & Binding Expenditures	Total Salaries & Wages Expenditures	Professional Staff Size (FTE)	Non-Professional Staff Size (FTE)	Total Library Operating Expenditures	Total Enrollment
1968	.026	.203	.431	.329	.329	.179	.336	1.000
1969	.108	.285	.344	.280	.319	.129	.271	1.000
1970	.089	.246	.361	.276	.303	.157	.288	1.000
1971	.065	.347	.389	.268	.315	.151	.297	1.000
1972	.060	.234	.356	.232	.305	.127	.244	1.000

Table 18  
Annual Unit Costs of Acquisitions for the Average,  
Median, Large, Medium-Large, Medium-Small, and Small Composite Libraries  
1967-68 through 1971-72

Year	Average Composite Library	Median Composite Library	Large Composite Library	Medium-Large Composite Library	Medium-Small Composite Library	Small Composite Library
1968	\$ 8.85	\$ 9.05	\$ 8.10	\$ 8.91	\$ 9.48	\$ 9.77
1969	9.84	9.37	9.24	9.32	10.14	11.58
1970	10.78	11.15	9.74	11.63	10.51	12.41
1971	10.87	11.36	9.85	12.34	10.13	12.08
1972	10.59	11.57	8.83	11.99	11.47	12.79

Table 19  
Percentages of Annual Increase in Collection Size (Volumes Held)  
For the Average, Median, Large, Medium-Large, Medium-Small, and Small Composite Libraries  
1967-68 through 1971-72

Year	Average Composite Library	Median Composite Library	Large Composite Library	Medium-Large Composite Library	Medium-Small Composite Library	Small Composite Library
1968	5.76%	5.67%	3.46%	3.13%	3.76%	6.96%
1969	5.35	5.18	4.43	5.40	6.33	7.38
1970	5.55	6.51	4.32	6.31	7.05	6.71
1971	4.03	3.16	4.08	3.08	5.33	3.81
1972	3.73	5.02	4.76	6.35	2.18	-2.01

Table 20

Ranking or Relative Standings of 58 Libraries with  
Respect to Volumes Held as Reported for 1971-72 through 1967-68.

SCHOOL	VOLUMES HELD	1971-72 Rank	1970-71 Rank	1969-70 Rank	1968-69 Rank	1967-68 Rank
