ABSTRACT

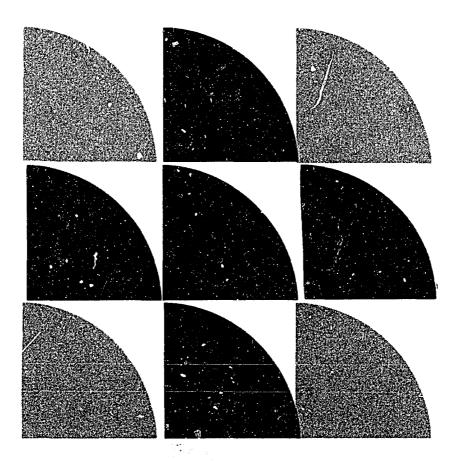

This Special Labor Force Report on the employment of school age youth in October 1972 shows little change in the number of students holding jobs, but a large increase among young people out of school. Separate consideration is given youth of Spanish origin, college students, and school reentrants. (Included with the report are supplementary information tables together with definitions and explanations of report terminology.) (Author/KP)

Special Labor Force Report on the employment of school age youth in October 1972 shows little change in the number of students holding jobs, but a large increase among young people out of school

KOPP MICHELOTTI

Young workers: in school and out

ABOUT 1 MILLION more young people were in the labor force in October 1972 than a year earlier—either at work or looking for jobs. Only a few of these additional young workers (age 16 to 24) were in school. Almost a.! the increase was among those no longer in school, where the labor force grew to 14 million (of the total of 20 million) young workers. Growth in the out-of-school labor force resulted from several factors: a larger population, partly because of fewer inductions into the Armed Forces, and a higher labor force participation rate for women. Much of the rise in the number of persons not in school occurred among those 18 to 21, reflecting in part a decrease in the proportion attending college.

The number of students in the labor force did not change over the year—6 million, or 2 out of 5 of the 14 million young people in school. Of all youth in the labor force in October 1972, 30 percent were students, a somewhat smaller proportion than in October 1971 but much higher than a decade earlier when the proportion was under 25 percent.

Students

In October 1972, as in other years, male teenagers still in school were more likely to be in the labor force than female teenagers in school. (See table 1.) Among students age 20 to 24 (most of them in college), there was no significant difference in the rates of men and women. Labor force participation rates of women students age 20 and 21 have been increasing faster than those of men of the same ages:

	1965	1968	1971	1972
20-21 years old:				
Men	42.8	44.1	46.8	45.3
Women	32.5	39.1	44.5	43.6
22-24 years old:				
Men	56.2	62.1	58.3	62.5
Women	54.2	53.2	53.7	62.9

Labor force participation rates of younger teenagers (16-17) were moderately below those of older teenagers (18-19), but both of these groups had sharply lower rates than students in their twenties.

The employment situation of students age 16 to 24 changed very little over the year. Of the 6 million in the labor force, 5.2 million were employed. The student unemployment rate, 12.5 percent, was not significantly different from a year earlier. Nor were the rates of men and women students far apart: 11.9 and 13.4 percent, respectively. Teenagers of both sexes had higher unemployment rates than students in their twenties. For all teenage students, the rate was 14.8 percent, in contrast to 7.6 percent for those 20 to 24.

About 12 percent of the unemployed students had been seeking jobs for 15 weeks or more—about the same as a year ago. There was little difference by age or sex in the duration of student unemployment.

Out-of-school youth

Among out-of-school youth, the labor force participation rate of men was higher than that of women at each age level:

women
47
66
66
61

For both men and women, at each age level, those no longer in school had substantially higher proportions in the labor force than did students, except women age 22 to 24.

Nearly a million more young people not in school were working in October 1972 than a year earlier, a total of 12.4 million. About 1.5 million were un-

Kopp Michelotti is a social science research analyst in the Division of Labor Force Studies, Bureau of Labor Statistics.

employed, not substantially different from October 1971, and the unemployment rate, at 10.6 percent, was also unchanged. For men from 18 to 21, however, the unemployment rate decreased, from 13.4 to 10.8 percent.

Age for age, there was little difference between the unemployment rates of students and those of out-of-school youth, except for those age 16 and 17. For the youth group as a whole, the student unemployment rate was higher, because student workers are concentrated in the younger age brackets. Over 40 percent of the students in the labor force were 16 and 17 years old, but fewer than 5 percent of those not enrolled in school.

Among young people no longer in school, long-term unemployment (15 weeks or more) decreased over the course of the year, from 20 percent to 15. There was no difference by sex in duration of unemployment but, among men, some variation by age: the proportion who had been jobless at least 15 weeks increased with age from 10 percent of those 16 to 19 years old to 23 percent of those 22 to 24.

cause of the introduction of 1970 census data into the estimation procedures. For example, the census adjustment increased the number of students by about 260,000 and the number of out-of-school youth by 220,000.

² Percent of civilian labor force who were unemployed.
NOTE: Figures for 1972 are not strictly comparable with data for earlier years be-

Youth of Spanish origin

In October 1972, about 650,000 16- to 24-year-old Americans of Spanish origin—were enrolled in school, about 36 percent of the total. (See table 2.) This is somewhat lower than the 44-percent enrollment rate of the total white group and the 43-percent rate of Negroes. Among teenagers in each group, about two-thirds were enrolled in school, but among those 20 to 24 the enrollment rates varied:

	Proportion
	enrolled in school
Whites, total	22
Spanish origin	13
Negroes	18

High school graduates of Spanish origin were about as likely as Negroes to be in college (26 and 30 percent, respectively), but less likely than other white high school graduates (33 percent).

About 38 percent of the students of Spanish origin were either working or looking for work in October 1972, about the same proportion as for white students but higher than the 26 percent for black students. (See table 3.) The rates of male and female students of Spanish origin were not significantly different statistically—42 and 34 percent, respectively.

Among the 1.1 million young persons of Spanish origin who were out of school, 94 percent of the men, but only half the women, were in the labor force. The labor force rate of men was comparable to that of all whites and higher than that of blacks. Among women, however, the rate was substantially lower than rates of either white or black women, in part because of the strength of the traditional role of women as homemakers.

Because of the small number of youth of Spanish origin, their unemployment rates are subject to relatively wide statistical variance. Therefore, differences between their unemployment rates and those of other groups are not always statistically significant. Unemployment rates of youth of Spanish origin tend to fall between the unemployment rates of whites and the higher rates of Negroes:

	White,	Spanish	Negro
	total	origin	
In school	11.2	19.4	27.4
Men	10.7	21.1	24.3
Women	11.8	17.1	32.3
Out of school	9.3	13.1	19.1
Men	8.9	13.6	13.8
Women	9.8	12.3	24.9

College students

Over the last 10 years, the number of young college students has nearly doubled, to 6.5 million in 1972. While the level of college enrollment continues to rise, the proportion of men under age 25 enrolled in college has declined somewhat since the late 1960's. Also, the proportion enrolled part time has increased. The comparable proportions for women have remained about the same:

	1969	1972
Proportion of high school graduates		
enrolled in college:		
Men .	46	39
Women	27	27
Proportion of college students enrolled		
part time:		
Men .	10	13
Women.	14	15

During the last decade, the rise in college enrollments was outpaced by the rate of growth of the college student labor force, as increasing proportions of students sought to work. In October 1972, the labor force rate of male full-time college students under 25 was 42 percent in contrast to 31 percent in 1962; for women in college full time, the rate rose to 35 percent, from 21. Increases were especially pronounced among teenagers in college full time. A total of 2.2 million full-time college students less than 25 years old were combining school with work in 1972.

Among those age 18 and 19, labor force activity is somewhat more common among those in secondary school than among full-time college students, probably because the demands of school work are greater in college. For men in college, the labor force rate was about 42 percent, compared with 49 percent for those below college level; among women, it was 33 percent for those in college and 43 percent at lower school levels.

The unemployment rate of the men 18 and 19 years old was about the same for students in college as for those in high school (11 and 14 percent), but among women the unemployment rate was lower for college students (13 and 24 percent).

As might be expected, the labor force activity of part-time college students was much greater than that of full-time students. For example, among college men age 20 to 24, the labor force participation rate of part-time students was more than double that of full-time students—95 and 43 percent—in Octo-

¹ Persons of Spanish origin are persons who claim Mexicano, Chicano, Puerto Rican, Cuban, Central or South American or other Spanish descent. About 95 percent of 16-to 24-year-old students and 97 percent of out-of-school youth of Spanish origin were reported as whites in October 1972 and were included in data published for whites.

ber 1972. Most men going to college part time are full-time workers who attend school a few hours a week, and their labor force participation rates are about the same as those of men not enrolled in school. Their unemployment rate was substantially lower than those of full-time students or men not enrolled in school. It may be that part-time students are better established in the labor force than full-time students who work and less subject to layoff.

Among women 20 to 24 years old also, part-time college students had high labor force participation rates. Their 82-percent rate was more than double the 39-percent rate of full-time students and even

exceeded the 63-percent rate of women out of school. One factor is the smaller proportion who were married: only 40 percent of women in college part time, compared with 63 percent of women out of school.

Women 20 to 24 years old in college full time had about the same unemployment rate as women out of school (8.8 and 10.1 percent). The unemployment rate of women in college part time, at 3.8 percent, was appreciably lower.

Part-time college men age 16 to 24 employed in nonagricultural industries worked an average of about 38 hours during the survey week, women an average of about 34 hours. Among full-time college students, the corresponding figures were about 20 and 16 hours. About 29 percent of the male part-time students and 8 percent of the women worked more than 40 hours in a week, but less than 5 percent of full-time students worked such long hours.

² Rates not shown where base is less than 75,000.

School reentrants

About 10 percent of the 16- to 24-year-olds enrolled in college in October 1972 had not been in school the previous October—384,000 men and 295,000 women. About half of them were freshmen. Apparently many had worked, traveled, or entered military service between graduating from high school and entering college. In this group, three-fifths of the men and half the women were enrolled full time. About a third of the men and women were married,

and smaller proportions of the married students were enrolled full time.

About two-thirds of both male and female reentrants were working or looking for work in October, a labor force rate considerably higher than that for all college students age 16 to 24. This is related to the larger proportions of returnees who were married and who were enrolled part time. The reentrants' unemployment rates (about 10 percent for both men and women) were no different from those of all college students.

---FOOTNOTES----

¹ This article is based on supplementary questions in the October 1972 Current Population Survey, conducted and tabulated for the Bureau of Labor Statistics by the Bureau of the Census. The data relate to persons 16 to 24 years old in the civilian noninstitutional population in the calendar week ending October 14, 1972. All members of the Armed Forces and inmates of institutions are excluded.

Because the estimates are based on a sample, they may differ from the figures that would have been obtained from a complete census. Sampling variability may be relatively large in cases where the numbers are small. Small estimates, or differences between estimates, should be interpreted with caution.

The most recent report in this series was published in the Monthly Labor Review, August 1972, pp. 25-30, and was reprinted with additional tabular data and an explanatory

note as Special Labor Force Report 147. Reprints of this article will be available upon request to the Bureau or to any of its regional offices.

Data presented here are not strictly comparable with data for previous years due to the change from 1960 to 1970 census data as the base for adjusting sample estimates from the Cerrent Population Survey.

- ² See Anne M. Young, "The high school class of 1972," Monthly Labor Review, June 1973, pp. 26-32.
- ³ Persons who identified themselves as Mexican-Americans, Chicano, Mexican (Mexicano), Puerto Rican, Cuban, Central or South American, or other Spanish descent.
- ⁴ Data for persons other than white are used to represent data for Negroes, since the latter constitute about 89 percent of all persons other than white in the United States.

Appendix

This report contains, in addition to the article from the September 1973 issue of the Monthly Labor Review, the following material:

Explanatory note

THE ESTIMATES in this report are based on supplementary questions in the October 1972 Current Population Survey conducted and tabulated for the Bureau of Labor Statistics by the Bureau of the Census. The basic labor force concepts, sample design, estimating methods and reliability of the data are described briefly in the following sections. 1

DEFINITIONS AND EXPLANATIONS

Population Coverage. Each month trained interviewers collect information from a sample of about 47,000 households located in 461 areas in 923 counties and independent cities, with coverage in 50 States and the District of Columbia. The estimates for this report include persons 16 to 34 years of age in the civilian noninstitutional population in the calendar week ending October 14, 1972. The civilian noninstitutional population excludes all members of the Armed Forces and inmates of institutions.

School Enrollment. The school enrollment statistics are based on replies to the enumerator's inquiry as to whether the person was enrolled in day or night school in any type of public, parochial, or other private school in the regular school system. Such schools include elementary schools, junior or senior high schools, and colleges or universities. Persons enrolled in special schools not in the regular school system, such as trade schools or business colleges, are not included in the enrollment figures. Persons enrolled in classes which do not require physical presence in school, such as correspondence courses or other courses of independent study and training courses given directly on the job, are not reported as enrolled in school.

Full-Time and Part-Time Enrollment in College. A person is classified as enrolled in college full time if he was taking 12 hours of classes or more during an average school week, and part time if he was taking fewer hours.

Age. The age classification is based on the age of the person at his last birthday.

Race . Race refers to the division of the population into two groups -- "white" and "Negro and other races." Other races include American Indians, Japanese, and Chinese, and any other race except white and Negro.

Spanish Origin. Persons of Spanish origin identified themselves as Mexican-American, Chicano, Mexican (Mexicano), Puerto Rican, Cuban, or of other Spanish descent.

Employed. Employed persons are all those who, during the survey week, (a) did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family, or (b) did not work but had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or for personal reasons, whether or not they were paid by their employers for the time off, and whether or not they were seeking other jobs.

Unemployed. Unemployed persons are all those who did not work during the survey week, made specific efforts to find a job within the preceding 4 weeks, and were available for work or would have been available during the survey week except for temporary illness. Also included as unemployed are those who did not work at all, were available for work and (a) were waiting to be called back to a job from which they had been laid off, or (b) were waiting to report to a new wage or salary job within 30 days.

Duration of Unemployment. Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to brock the continuity of the present period of seeking work.

Reasons Unemployed Persons Looked for Work. Unemployed persons are classified in the following six groups based on the reasons they are jobless: (1) "On layoff" if they expect to be called back to work; (2) "Lost job" if the job loss is permanent (these two groups are considered involuntarily unemployed; (3) "Quit job" if they ended their employment voluntarily; (4) "Left school" if they graduated, quit or were expelled from school; (5) "Wanted temporary work" if they were looking for short-duration work, either full time or part time; (6) "Other" includes persons who are looking for work for financial reasons, discharge from the Armed Forces, or for other reasons not included in any of the above groups.

Civilian Labor Force. The civilian labor force comprises the total of all civilian persons classified as employed or unemployed according to the above definitions.

Not in the Civilian Labor Force. All persons not classified as employed or unemployed are defined as not in labor force. Persons doing only incidental unpaid family work (less than 15 hours a week) are also classified as not in the labor force.

Occupation, Industry, and Class of Worker. Data on occupation, industry, and class of worker refer to the job held in the survey week. Persons with two jobs or more are classified in the job at which they worked the greatest number of hours in the survey week. The unemployed are grouped according to their latest full-time civilian job lasting 2 weeks or more. The occupation and industry categories in this report are the major groups used in the 1970 Census of Population.

Hours of Work. The statistics on hours of work relate to the actual number of hours worked during the survey week. For persons with more than one job, these figures relate to the number of hours worked in all jobs during the week.

Full-Time and Part-Time Workers. Full-time workers are persons who worked 35 hours or more during the survey week, and those who worked 1 to 34 hours but usually work full time. Part-time workers are persons who worked 1 to 34 hours during the survey week and usually work only 1 to 34 hours. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time. However, in a discussion of work experience during a previous year, part-time workers are those who worked less than 35 hours per week in a majority of the weeks worked.

Sums of Distribution. Sums of individual items--whether absolute numbers or percentages--may not equal totals because of independent rounding of totals and components. Percentage totals, however, are always shown as 100 percent.

RELIABILITY OF THE ESTIMATES

Estimating Procedure. The estimating procedure used in this survey inflates weighted sample results to independent estimates of civilian noninstitutional population by age, color, and sex. These independent estimates are based on statistics from the 1970 Census of Population and other data on births, deaths, immigration, and emigration, and strength of the Armed Forces.

Variability. Since the estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules and procedures. As in any survey, the results are also subject to errors of response and reporting.

These may be relatively large in the case of persons with irregular attachment to the labor force.

The standard error is primarily a measure of sampling variability, that is, of the variations that might occur by chance because only a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors but does not measure any systematic biases in the data. The chances are about 2 out of 3 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 19 out of 20 that the difference would be less than twice the standard error.

Tables 1 and 2 show approximations of the standard errors in this survey. They should be interpreted as indicators of the order or magnitude of the standard error rather than a precise standard error for any specific item.

The following examples illustrate their use. About 3, 512, 000 16-to-24 year-old men enrolled in school were in the labor force in October 1972. Table 1 shows the standard error on this estimate to be approximately 74, 500. The chances are about 2 out of 3 that the difference between the sample estimate and a complete census count would be less than 74, 500. The chances are about 19 out of 20 that the difference would be less than 149,000.

These 3,512,000 men represented 45.2 percent of all 16-to-24 year-old men enrolled in school. Table 2 shows the standard error of 45.2 percent with a base of 7,775,000 to be about .8 percent. Consequently, the chances are 2 out of 3 that a complete census count would have disclosed the figure to be between 44.4 and 46.0 percent, and 19 out of 20 that the figure would have been between 43.6 and 46.8 percent.

The reliability of an estimated percentage that is based on sample data for both numerator and denominator depends upon the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding absolute estimates of the numerators of the percentage, particularly if the percentage is large (50 percent or greater).

¹ For a more complete description of the methodology, see Concepts and Methods Used in Manpower Statistics from the Current Population Survey, (BLS Report No. 313).

^{1/} Full-time workers are persons who during the survey week worked 35 hours or more and those who usually work full time but worked 1 to 34 hours. Part-time workers are persons who usually work 1 to 34 hours and worked 1 to 34 hours during the survey week. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.
2/ Students attending 12 hours or more of college classass during the average achoel week were classified as full-time students.
3/ Percent not shown where base is less than 75,000.
