ABSTRACT

Among the freshmen who entered the City University of New York (CUNY) in fall 1970, about 63% were enrolled without interruption in each of their initial four semesters. Approximately 70% of them were enrolled in CUNY during spring 1972, the fourth semester since their original enrollment. At the senior college, more than 75% were in attendance during the fourth semester; this was true for 60% of the students from the community colleges. At both, high school average was positively associated with retention. Among students who left college, about 18% returned and were present for the fourth semester. While attrited students from community colleges were more likely to return than those from senior colleges, the differences were quite small. With regard to net retention rates, there was considerable variation among the colleges of CUNY. There was even more variation in the rates of return of attrited students. When the CUNY net retention data over four semesters are compared with national data over eight semesters, it is apparent that considerably more attrition will have to occur before the CUNY net retention rate approaches the threshold defined by the national data. INTRODUCTION

In the fall of 1970, the City University of New York (CUNY) initiated a policy of open admissions, whereby all graduates of New York City high schools were guaranteed admission. An important goal of the open admissions program is to avoid the low retention rates which have characterized open admissions models in other places. For this reason retention data are of great interest and significance, both within the University and for the public.¹ Indeed, the question of retention has generated considerable controversy. Some of the issues may be clarified by data we shall present.

This report has two aims. First, it presents data concerning the phenomena of retention, (including return from temporary leave). Second, it considers the CUNY data in a national context, thus adding perspective for the local setting.

Discussions of college attrition use the concept in different ways. The broadest definition would concern students who are no longer matriculated at the college at which they initially registered. While such a definition is used in some studies, it is simplistic, since it overlooks a number of phenomena: the students may have transferred to another CUNY college or are attending on another basis and are, therefore, still retained by the University; students may have dropped out of CUNY at one time and may reenter later. Thus, a college's retention rate is, to some extent, a function of the definition.

A very important aspect of retention at CUNY concerns those students who leave, later to return to college. In a study of CUNY students completed in 1968, Max (3) found that less than half graduated within four years.

However, over 70% graduated within seven years -- a figure considerably higher than at other large universities. This suggests that a substantial number of CUNY students exhibit a pattern of leave and return. Although open admissions has not been in effect long enough to assess the presence of the pattern over a seven year period, data presented by Lavin and Jacobson (2) showed that, among the 1970 freshmen, about a third of those who left after their first semester had returned for the third. For this class, we can now present additional data covering the first four semesters of open admissions.

PROCEDURES

Official CUNY retention data provided periodically by registrars on each campus are subject to certain limitations. First, students who transfer from their original college to another CUNY unit or to a college out of the CUNY system are not counted as retained. Second, students who leave and then return to another college (both inside and outside of CUNY) are not counted as retained. Third, students who transfer from the day session to the evening session at a given college are also not counted as retained. Fourth, students who leave and then return to their initial college should be included among the retained but this may not have occurred for all cases ^{and} on all campuses. A consequence of these limitations is that the registrars' data underestimate the retention rates.

The data presented in this report are not subject to all of the above limitations, and thus, may provide a more refined assessment of the phenomena of retention. Students who transfer from their original college to another CUNY college are listed as retained. Moreover, students who leave and

return to their original college or to another college within the CUNY system are also included among the retained. (For purposes of this report, they have been counted as retained at the college of original enrollment.)

However, the data do have certain limitations which should be noted. First, although we are able to track students who migrate from one college to another within CUNY, we cannot do this for students who transfer to colleges outside the University. Second, students who transfer from the day session to the evening session at a college are not counted as retained. Third, there are three colleges for which the data are not yet complete enough to permit application of our computerized tracking system. However for these campuses we do have the unrefined registrar data; in response to requests, we have made "refined estimates" in these three cases.²

In short, though CUNY has made improvements in its data collection system -- and will continue to do so -- our data still tend to underestimate retention rates. Nevertheless, the underestimates are not as great as those contained in the registrars' data.

DEFINITIONS

The data are summarized in terms of the following variables: retention rate, net retention rate, and fourth semester return rate. The retention rate is simply the proportion of the original cohort of freshmen who entered in Fall, 1970, who registered for all of the first four semesters at any college in CUNY. The net retention rate is defined by those students who are present for all four semesters, plus those students who left, returned,

and were present in CUNY for the fourth semester, regardless of whether or not they returned to the college at which they originally matriculated.³ The fourth semester return rate is the proportion of attrited students who returned and were present at any CUNY college in the fourth semester.

Our data on retention, net retention, and return are considered in the following manner: First, we present findings for CUNY as a whole. Second, we report aggregate findings for the senior colleges and for community colleges. Third, we present data for individual colleges. These findings are described with reference to high school average (really college admissions average or CAA)⁴ categories. The following chart indicates the names and definitions of the high school average categories:

High School Average (CAA)	Senior College Label	Community College Label
Less than 70.0%	Level B	Level B
70.0 - 74.9%	Level A.1	Level A
75.0 - 79.9%	Level A.2	Regular 1
80.0% or Above	Regular	Regular 2

At senior colleges open admissions students are in the Level B, Level A.1, and Level A.2 categories. At community colleges the open admissions students are in the Level B and Level A categories. These definitions allow one to compare senior college and community college students at all levels of high school average. We also present data on students for whom no information on high school average was available. This group consists of those who attained high school equivalency diplomas, students from outside of New York City, and others for whom the data were missing.

In the analyses to follow, data presented cover all freshmen who entered in Fall, 1970. This includes special program students (e.g., SEEK, College Discovery, and other special programs).

RETENTION

Data on retention and net retention rates are presented in Table 1. The overall CUNY data show that, of the students who matriculated in the Fall of 1970, 62.9% were present for all four semesters. As has been demonstrated in almost all other studies of student retention, there was a substantial difference between the senior and community colleges: 71.4% of the students at the former and 51.4% at the latter were present for their first four semesters. When we consider the students who were in attendance without interruption, as well as the students who left, returned, and were present in the fourth semester (the net retention rate), we see that the proportion of the original cohort still in attendance was considerably larger. Whereas the retention rate for the university as a whole was 62.9%, the net retention rate^{was} 69.5%. This net rate was higher for the senior colleges (76%) than for the community colleges (60.5%). However, at the latter the difference between the retention and net retention rates was greater.

Among the senior colleges, the schools with the highest net retention rate were Brooklyn College and Queens College, while those with the lowest were John Jay and Lehman. At the community colleges the highest net retention rate was exhibited by Borough of Manhattan, while Queensborough had the lowest rate.

We now consider retention rates in relation to high school average. Table 2 presents the data for level B students (those with high school averages below 70%). For the university as a whole, the net retention rate was 57.6%. The senior college rate (63.3%) was higher than the community college rate (55.4%). Among the senior colleges, retention was greatest at Hunter, City College, and York. It was lowest at Brooklyn College. Among the community colleges, the net retention rate was highest at Manhattan and lowest at Queensborough.

We next consider the findings for students whose high school averages were between 70.0 - 74.9%. The data are presented in Table 3. For this group the net retention rate for the University was 63%. Retention was higher at the senior colleges (68.8%) than at the community colleges (60.1%).

Among the individual senior colleges, retention was greatest at Hunter, City College and York. It was lowest at Lehman. Borough of Manhattan was the community college with the highest net persistence rate, while Queensborough had the lowest rate.

Table 4 presents the data for students with high school averages in the 75.0 - 79.9% interval. Seventy percent of these students enrolled during the fourth semester. Senior college students were more likely to have done so (72.2%) than community college students (66.7%).

Among the senior colleges, students at Brooklyn had the highest net retention rate (79.5%); we estimated that John Jay students had the lowest net retention rate (64.4%). Kingsborough showed the highest net retention

rate among the community colleges (74.8%), while Queensborough exhibited the lowest rate (59.3%).

Table 5 presents the data for students with high school averages of 80% and above. The net retention rate for these students was about 81%. The rate for the senior colleges (81.9%) was considerably higher than the rate for the community colleges (68.3%).

Among the senior colleges, the net retention rate was highest at Brooklyn (87.6%) while the estimated rate for John Jay was 63.2%. For the community colleges, Kingsborough (75.7%) and Manhattan (74%) showed the highest net retention rate, while Queensborough again had the lowest rate.

Table 6 provides the data for the group of students who have either no high school average or for whom this information was missing from our files. For this group the net retention rate for the University as a whole was 60.1 percent. It was higher at the senior colleges than at the community colleges.

Three main points emerge from this data. First, when students who left, returned, and were present in the fourth semester were added to those who were matriculated without interruption, the retention rate is increased. Second, both the retention rate and the net retention rate were higher at the senior colleges than at the community colleges. Third, both rates were positively associated with high school average. That is, as high school average increases, the greater is the probability that students who entered the University in the Fall, 1970, would be in attendance for the

fourth semester.

RETURN

An important aspect of retention analyses concerns the proportion of attrited students who return. (An earlier report (2) indicated that about one-third of the 1970 freshmen who left after their first semester of college came back for the third semester.⁵) Of all CUNY students who dropped out at any time during the first three semesters, nearly 18% returned and were in attendance for the fourth semester. The summary data are presented in Table 7. There was very little difference among the community college and senior college return rates.

Return rate data for level B students are presented in Table 8. The University-wide rate was 14.6%; senior colleges and community colleges had almost the same rate. However, there was considerable variation among individual campuses. For the senior colleges, almost one-fourth of the students who left Hunter College returned and were present for the fourth semester. This was true for only about 7% of those from Brooklyn College (i.e., those leaving Hunter were more than three times as likely to return for the fourth semester as the attrited from Brooklyn). Among the community colleges, the return rate at Borough of Manhattan was about 28%, while at Kingsborough and NYCCC, it was about 10%.

Table 9 presents data for students whose high school average was between 70.0 - 74.9%. Overall, about 15% of the attrited students returned for the fourth semester. Community college figures were similar to those for senior colleges.

Hunter College students had the greatest probability of returning, while Brooklyn and Baruch had the lowest fourth semester return rate.

At the community colleges, students who left Borough of Manhattan CC were five times as likely to return as their counterparts at NYCCC.

The figures for attrited students with high school averages in the 75.0 - 79.9% interval are presented in Table 10. About 17% of students in this category returned for the fourth semester. Again, senior and community colleges had similar return rates.

Lehman (23.1%) and York (22.8%) showed the highest return rates, while Baruch (5%) and Brooklyn (8.9%) exhibited the lowest rates. Among community colleges, the return rate for students at Borough of Manhattan CC was 35%. At NYCCC the rate was 11.1%. In short, students leaving BMCC were more than three times as likely to return than those leaving NYCCC.

Table 11 presents the data for students who were graduated from high school with an average of 80% or above. The return rate for these students was about 16%. The difference between senior (15.7%) and community colleges (20.1%) was relatively small.

Among the individual senior colleges, almost 29% of York students who left college returned for the fourth semester. This was true for less than 8% of Baruch students. Among community colleges, the return rate at BMCC was almost 30%; at NYCCC it was 5%.

The data for attrited students without high school averages are shown in Table 12. The overall return rate for this group was about 35%. There was substantial difference between senior and community colleges; at the latter, the return rate was 40%, while at the former it was less than 20%. While we note this difference, we are unable to interpret the finding at this time.

In summary, the return rate for the University as a whole was about 18%. At the senior colleges, high school average was unrelated to the return rate. At the community colleges, there was a slight tendency for high school average to be positively associated with return rate.

COMPARISON OF NATIONAL AND CUNY DATA

One of the difficulties concerning the interpretation of CUNY retention data is that no commonly accepted standards exist which define a "high" or a "low" rate. One way of approaching this question is to compare CUNY data with findings at the national level. Thus, a "high" rate could be defined as any figure exceeding the national rate, and a low rate would be any figure less than the national rate.

The most recent national data have been presented by Astin (1). This study followed a national cohort of students who entered college as freshmen in the Fall of 1966. For this group, one year follow-up data were collected in the Fall of 1967, and four year follow-up data were obtained during the Fall and Winter of 1970-71. This second follow-up occurred four years after original enrollment. Thus, the students in this cohort who attended four year colleges, if they were "on schedule", would have been

graduated in June (1970).

Astin does not present retention data for the same time period, four semesters, covered in this report on ^{the} cohort that entered in 1970. He provides data describing retention and degree attainment through eight semesters. While the time periods are not the same, it may be useful to compare the two sets of data: such comparisons provide an assessment of the degree to which the CUNY four semester retention data approach the eight semester threshold provided by the national data. (Of course, CUNY is not a "typical" university. Compared with students nationally, its student body has characteristics [lower socioeconomic status, etc.] which are more likely to result in lower retention rates.)

The data are presented in Table 13. The comparisons show that the four semester CUNY net retention rates are considerably higher than the eight semester national rates. The significance of this is that the CUNY cohort can withstand considerably more attrition before it approaches the national eight semester threshold.

SUMMARY

Among the freshmen who entered CUNY in Fall, 1970, about 63 percent were enrolled without interruption in each of their initial four semesters. Approximately 70 percent of them were enrolled in CUNY during Spring, 1972, the fourth semester since their original enrollment. At the senior colleges, more than 75 percent were in attendance during the fourth semester; this was true for 60 percent of the students from the community colleges. At both, high school average (CAA) was positively associated

with retention. (See Table 14)

Among students who left college, about 18 percent returned and were present for the fourth semester. While attrited students from community colleges were more likely to return than those from senior colleges, the differences were quite small.

With regard to net retention rates, there was considerable variation among the colleges of CUNY. There was even more variation in the rates of return of attrited students.

When the CUNY net retention data over four semesters are compared with national data, over eight semesters, it is apparent that considerably more attrition will have to occur before the CUNY net retention rate approaches the threshold defined by the national data.

NOTES

1. Many supporters and opponents of open admissions uncritically accept the idea that attrition is a "negative" outcome of education. In many cases this may be untrue, both from the viewpoint of the student and the University. We believe, for example, that a set of courses, particularly in community colleges, may provide students with skills which allow them to find more desirable jobs. From this vantage point, attendance, even if followed by leave, had a "positive" outcome. In short, we believe that even a truncated exposure to higher education may help improve a person's quality of life.
2. Estimates have been made in the following manner: At John Jay College, the average difference between retention and net retention rates for senior colleges has been added to the retention rate. This generated the net retention rate for John Jay. For Bronx and Hostos the same procedure was followed, except that we have used the average difference for community colleges.
3. Attrited students who return to a CUNY college other than the one at which they originally enrolled were counted as part of the net retention rate for their original college.
4. College Admissions Average (CAA) is computed from grades received in five high school subjects: English, foreign language, mathematics, science, and social studies.
5. Of this group of second semester attrited students, about 32% had returned and were also present for the fourth semester.
