IDENTIFIERS *Illinois; School District Size

ABSTRACT

This report contains a history of school district organization in Illinois, a statistical profile of Illinois education today, a survey of selected districts offering quality education, and an agenda for change. Findings indicate that, of the measurable factors affecting the quality of local educational opportunity, district size is most critical. Districts of minimal size are generally inadequate to the task of providing the broad range of educational programs and services demanded of today's schools. Overly small teacher-pupil ratios, limited facilities, and disproportionate administrative costs cause operating costs per pupil in small districts to run higher than those in larger districts. The unequal distribution of local school revenue resources is a second serious problem in Illinois. The quality of educational programs, services, and personnel offered by both the sample's dual and unit districts ranged from very limited to comprehensive in scope. The appendix contains detailed enrollment and finance data for Illinois school districts by county. (Author/DN)

THE HONORABLE DAN WALKER
GOVERNOR OF ILLINOIS

MEMBERS OF THE ILLINOIS GENERAL ASSEMBLY

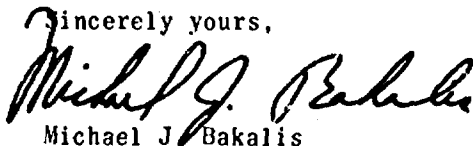

MEMBERS OF THE ILLINOIS SCHOOL PROBLEMS COMMISSION

Pursuant to the directives outlined in Governor Richard B. Ogilvie's Executive Order of January 1972 and Senate Bill 1556, the School District Survey staff defined quality education, developed measurable quality criteria, and applied them to selected Illinois school districts. The results of this analysis enabled the School District Survey staff to identify those forms of school district organization most capable of providing high quality education with efficiency and economy.

The quality of local education is influenced by a wide range of closely interrelated social, political, economic, and demographic factors. A detailed analysis of the specific role each of these factors plays in determining the quality of local education is beyond the scope of this project, but the findings of this report suggest the need for broad reforms which will make possible improved educational opportunities for all Illinois children.

I am pleased to submit on behalf of the Task Force on School Organization and Structure, Committee on School Organization, this final report of the Committee's findings, conclusions, and recommendations for the organization of local school districts in Illinois.

Sincerely yours,

Michael J. Bakalis
Chairman

Organization and Structure Task Force
Governor's Commission on Schools

EXECUTIVE ORDER

WHEREAS:

The financing of the schools has become the pivotal question around which the future of state-local taxation hinges for the next several years. The traditional reliance on the local property tax has been shifting in recent years. Recent developments in the courts have accelerated the necessity of moving toward change in property tax burdens, equalization of school funding, and the consequent increase in sharing of the cost of education by other tax sources.

The public has become troubled at the inability to accurately assess the performance of our schools and the seeming unresponsiveness of educators to standards of accountability. Moreover, when evaluations are made, they seem to lead to a discouraging conclusion of lower learning levels in basic reading and mathematics, increased drop-outs and a general deterioration of academic achievements.

The business practices of a multi-billion dollar enterprise in the state are archaic, fragmented and in need of modern management principles. Reports of instances of gross mismanagement are too frequent. At a time of severe shortage of public funds for education, the record of performance for those dollars is unsatisfactory. The portion of the education dollar used for nonteaching purposes is too great.

The organization of education in Illinois is confused and unnecessarily complex. Each new layer has been added to the past rather than replacing others. The new Constitution calls for a State Board of Education and new tasks for the Chief School Officer. The historic changes of the 40's and 50's in consolidation and the dual districts differential funding may have served as innovative reforms at that time, but today serious reevaluations must be made about the needs of the 70's and 80's. A new definition and structuring of the balance between state authority and local control must be achieved in terms of principle as well as in specific instances or events.

NOW THEREFORE:

By virtue of powers vested in me as Governor of the State of Illinois, I do issue this Executive Order creating a Commission on Schools to examine and review the operations and financing of our schools and educational system.

The Commission shall operate through four working Task Forces:

- . Finance
- . Organization and Structure
- . Classroom Quality
- . Business Management Practices

The Governor of the State of Illinois shall serve as Chairman of the Commission and the Superintendent of Public Instruction of the State of Illinois shall serve as Vice Chairman. The Governor shall appoint the Chairman of each Task Force who will be full members of the Commission along with such other legislative and citizen members as the Governor may designate.

Dated at Springfield, Illinois this 12th day of January, 1972.

Richard B. Ogilvie, Governor

SENATE BILL 1556

AN ACT creating a school district survey to study the organization and structure of public schools of the State and the State financial policies which relate thereto and to define powers and duties.

Be it enacted by the People of the State of Illinois, represented in the General Assembly:

Section 1. Purpose. Whereas Article X, Section 1 of the 1970 Constitution of the State of Illinois requires the State to provide an efficient system of high quality educational institutions and services, it is appropriate and necessary to survey the present organization and structure of public schools to determine if there is compliance with this mandate.

Section 2. Study Committee. The Governor's Commission on Schools -- Task Force on School Organization and Structure -- Committee on School Organization, hereinafter referred to as the Committee, is hereby directed to implement the provisions of this Act.

Section 3. Duties of the Committee. The Committee shall analyze that clause of Article X, Section 1 of the 1970 Constitution of the State of Illinois which provides:

The State shall provide for an efficient system of high quality public educational institutions and services.

The Committee shall develop a definition of high quality education and it shall determine which organization and structure of school districts

will produce the most efficient delivery of high quality educational services. The Committee shall then develop a specific set of evaluative educational criteria which provide a method for measuring whether there is organizational compliance with the constitutional mandate by school districts.

The Committee shall apply the specific set of evaluative educational criteria to the organization, structure and educational delivery systems of public elementary and secondary schools of the State for the purpose of identifying which school districts meet the constitutional requirement.

Section 4. Additional duties. The Committee shall analyze its findings, conclusions and such additional germane organizational factors as it deems necessary and develop specific legislative recommendations for a restructuring of school districts which will cause compliance with the constitutional mandate and which permit each child of the State the opportunity to attend school in a district which efficiently provides a system of high quality public education.

The Committee shall also develop specific legislative recommendations for a State financial aid formula which, based on its findings and conclusions, will insure that those school districts providing an efficient system of high quality public education shall receive an equitable distribution of State financial aid in a non-discriminatory manner.

Section 5. The Committee shall employ and fix the compensation of such employees and technical assistants as it deems necessary to effectuate the purposes of this Act. The Superintendent of Public Instruction shall prepare and submit vouchers for payment of the ordinary and contingent expenses of the Committee to the Auditor of Public Accounts to be

paid out of any money appropriated for such purposes.

Section 6. Reports. The Committee shall make a detailed report of its findings, conclusions, and legislative recommendations to the General Assembly, the Governor, the Superintendent of Public Instruction and the School Problems Commission no later than November 30, 1972.

Section 7. This Act shall take effect immediately upon its becoming a law.

Section 8. This Act is repealed as of January 31, 1973.

FOREWORD

The history of American public education is a chronicle of the efforts of communities large and small to adapt their schools to the increasingly complex demands of a fast-changing world. The size and scope of the public school system have undergone a remarkable expansion in the last 150 years as both the population and the need for education have grown. Just as remarkable is the continuing search for ways to improve public education.

School organization and school quality are closely linked, for it is through the organization of people, money and materials that formal education is accomplished. By effectively bringing the full weight of local resources to bear on the task of educating the young, good school district organization can enable local school districts to offer programs and services which might otherwise be beyond their ability. It is the purpose of this report to aid the development of quality education in Illinois through adequate and efficient school district organization.

It should be emphasized that the actual time to document, analyze, and report this study was limited to a five-month period. However, this study includes an exhaustive amount of data covering all districts in Illinois and an in-depth analysis of a representative sample of school districts. It is a comprehensive treatment of the critical issues affecting school district organization and the mandate of Senate Bill 1556.

CHAPTER I

PERSPECTIVE

A SHORT HISTORY OF SCHOOL DISTRICT ORGANIZATION

THE EARLY PERIOD

Prior to 1853, educational debate centered around the organization of a system of basic schooling for local citizens. The population was still predominantly rural, and vast stretches of the United States were still only sparsely settled. "Education" to most people meant little more than basic instruction in the reading and mathematical arts. The early settlers of Virginia, Kentucky, and Iowa were able to satisfy these modest educational needs by building their own one-room schools and "boarding out" teachers. Virginia later adopted a more formal system of school support when it adopted the "pauper system" by which fines and forfeitures accrued to the state were deposited in a Literary Fund to be used for the education of the poor.

States which were settled relatively early (such as Ohio and Pennsylvania) established formal township and local school districts. These formal school districts were little influenced by state or county government, and local citizens retained virtually unchallenged control over their schools.

Illinois Free School Law

Illinois first established a system of public schools in 1825 with the passage of the Free School Law. This law provided for the establishment of

common schools open to all white citizens between the ages of five and twenty-one upon petition by the qualified voters in a proposed district. These districts were more formal in nature than their counterparts in Kentucky and Iowa, since they were established as corporate bodies with elected trustees, an assessor, a treasurer and a tax collector. Financing was provided by the state, which granted aid in the amount of two out of every one hundred state tax dollars collected.¹

THE PERIOD FROM 1854 to 1899

By the middle of the Nineteenth Century, the processes of industrialization and urbanization, which were to eventually transform the face of America, were well underway. Traditional means of public education were becoming outmoded. In addition, the period marked the first time large numbers of European immigrants began reaching American shores. Education took on greater significance as politicians and ordinary citizens alike looked to the schools as the means by which these new millions might be taught the language, politics, and history of their new home. As the new century approached, some form of public-supported schooling became an accepted part of the social fabric of the United States. The expanded scope of public education required levels of financial support greater than the old village schools could provide. As a result, many states and territories took tentative steps toward the enlargement of their school districts.

Pennsylvania, for example, passed legislation establishing every township, city and borough as a school district, with an Office of the County Superintendent created to supervise the instructional program. Later, school districts of over 10,000 population were permitted to employ a

superintendent. Small attendance centers were closed and their students transported to other schools.²

Other states also sought legislative solutions to the problem of educating their growing populations. West Virginia, for instance, established a township unit system under which the state's counties were divided into independent administrative school districts. The boundaries of these new districts in West Virginia, as in many other states, were often fixed by such natural boundaries as streams or mountain ranges. The result was a patchwork of districts with wide disparities in size, wealth, and population.

Districting patterns were further complicated by action initiated by the wealthy areas in several states. These areas sought to establish school district boundaries which would exclude their less wealthy neighbors, thus reducing the cost of their own school support. The establishment of independent school districts by such wealthy areas tended to fragment existing districts and separate wealthy from nonwealthy areas.³

Illinois Moves Forward

The old modes of school district organization in Illinois were inadequate to the need for expanded and improved educational opportunities. Many Illinois schools of the period were too small and too inefficient to offer their students a high quality program. Educators and citizens alike turned their attention to the problem of establishing the kind of public school system envisaged by the state's first Superintendent of Public Instruction, Ninian Edwards. Superintendent Edwards argued for a statewide system of consolidated or "union" schools which would: (1) "extend instruction" by offering students a greater variety of courses; (2) provide

improved education at lower cost; (3) encourage "democracy" in the schools; (4) provide schools with stronger bases of economic support; (5) enable the teachers to specialize according to subject area; and (6) make possible more effective in-service education for teachers.⁴

The years 1845-46 had seen the passage of several major pieces of school legislation. An ex-officio Superintendent of Public Instruction had been created by the General Assembly in 1845. The law was general in tone, and although Section 6 of that law stated that the Superintendent ". . . shall use his influence to reduce to a system of practical operation the means of common schools in the state," the bill failed to specify how this reduction was to be accomplished.⁵

A three-level school organizational structure was formed in Illinois the following year. A board of trustees was established in each congressional township to serve at the intermediate level between local boards of education and the state. This board was authorized to reorganize area school districts if petitioned to do so by residents.⁶

The adoption of the 1870 Illinois Constitution was a landmark in Illinois educational history. That document stated that "the General Assembly shall provide a thorough and efficient system of free schools, whereby all the children of the state may receive a good common school education." The Constitution also established the Office of the Superintendent of Public Instruction as a constitutional office. Soon after, the 27th General Assembly incorporated all its old school laws into one bill with its Act of 1872.⁷ The 1870 Constitution prohibited any further special legislation pertaining to the management of common schools. This provision of the state charter was intended to bring uniformity to state

school law by limiting the organization of Special Charter School Districts. In 1870, there were seventy-four school districts existing by virtue of Special Charters which authorized them to operate according to legislative provisions peculiar to each district.⁸

THE PERIOD FROM 1900 TO 1947

The first half of the Twentieth Century was a time of unprecedented change in American society. Industrialization skyrocketed, new waves of European immigrants flooded America, more and more people were abandoning the farms for the cities, since it was the cities, rather than the now-settled frontier, which attracted millions of people seeking a chance for a new life. Social and economic life in the United States was being shaken to its roots. Education, too, was changing. The American people were coming to expect more and more of their schools. Improvement of the schools required that curriculum be expanded and teaching be improved. This required a broader administrative and economic support base than the existing school districts could provide. Reorganization of these districts thus became a necessary first step in the improvement of school quality.

Reorganization was not an easy process. Widely scattered rural population, facilities, and inadequate local revenues presented serious obstacles to school district reorganization. In addition, many citizens were reluctant to pass control of the schools from their local neighborhoods to a larger governmental unit or population center. Such pressure resulted in the perpetuation of small school districts. Responsibilities were not clearly defined, and the resultant overlapping functions and general confusion further impeded the development of quality educational programs in thousands of American communities.⁹

School District Consolidation in Illinois

In 1909, the Illinois General Assembly authorized school district consolidation by a majority vote of the electorate in each district.* That same year, the General Assembly passed an act requiring districts which did not maintain a high school to pay tuition to a high school for all their eighth grade graduates whose parents or guardians were unable to pay.¹⁰ The Illinois Supreme Court, however, ruled that school boards were not competent to decide who was able and who was unable to pay tuition. The 47th General Assembly made the necessary changes in the statute, and the revised law went into effect on July 1, 1913. The effect of the new legislation was most apparent during the 1915-16 school year, when high school enrollments in the state rose by 15 per cent while elementary school enrollment increased only 1 per cent.¹¹ The extension of a "good common school education" was fast becoming a reality in Illinois.

World War I Era

The era of the first World War was a time of crisis for Illinois education. Increases in school revenues failed to keep pace with spiraling increases in costs. The cost of living for example, had more than doubled, but teachers' salaries increased only slightly.¹² In an effort to provide better education without increasing costs, consolidated districts and non-high school districts were established in 1917. Under this system, all eighth grade graduates who resided in districts with no high school were allowed to attend the nearest high school, with tuition to that school paid by the students' home district.

* The law was liberalized in 1919 to allow consolidation upon approval by a majority of the combined electorate in the proposed district.

The distribution of money from the State School Fund was the subject of legislation passed by the General Assembly in 1927. Under that law, every district in the state conducting a school as prescribed by law was entitled to collect nine dollars per child in average daily attendance in Grades one through eight. In an attempt to help less wealthy districts enhance the quality of their school programs, the law made it possible for low valuation districts which levied the maximum education tax rate allowed without referendum to collect an additional twenty-five dollars per child.¹³

The Great Depression

The gradual impoverishment of the nation's schools during the Depression years brought the problems of the unequal distribution of wealth into sharp focus. Since state aid was apportioned according to the amount of local money raised for school support, wealthier school districts received a disproportionate share of state school funds. They thus were able to continue to provide their pupils with a high quality education. Districts with less taxable wealth were not so fortunate. The depressed economic conditions generally reduced the amounts of state money available for school support, and states' influence in local education was sharply reduced as a result. Because of this, many consolidation efforts shifted from the checkbook to the statute books. Many state legislatures mandated school district reorganization in the early 1940s.¹⁴ Such reorganization increased the number of county unit districts nationwide, and helped increase the size of school districts generally.¹⁵

In Illinois, pupil transportation remained a major obstacle to school district reorganization. Large numbers of the state's children lived in

rural areas. Roads were poor in many parts of the state, and transporting children several miles to and from school was impossible for most parents. The schools themselves could provide transportation, but it was expensive, and most small school districts simply could not afford the cost of buses and drivers. In 1939, the General Assembly appropriated a half million dollars for the transportation of pupils. This was the first time the State of Illinois had provided such aid, and it enabled rural school districts to consolidate or otherwise enlarge their size without undue hardship on their students.¹⁶

The late 1930s also saw an increase in the state distributive funds for education, as well as increases in the equalization quotas. The elementary school level was raised from \$30 to \$40 per pupil in average daily attendance, and high schools which levied a 75 per cent rate for educational purposes might receive \$80 per pupil. Significantly, the year 1938 marked the first time in the educational history of Illinois that high schools received direct state aid.

Illinois Education in the Post-War Period

Little attention was paid to school district organization by the General Assembly from 1919 through 1945. During this time, state aid and tax rate limitations were the same both for districts maintaining twelve grades and districts with a dual system. This gave dual system districts a financial advantage over unit districts, since they could raise the same amount of money for fewer students. The advantage was so great that in 1945 only one hundred of 11,955 school districts in Illinois were unit districts.¹⁸

In 1945, the General Assembly enacted a law to give unit districts basic taxing power equivalent to that of the dual systems. The statute also provided the unit district lower qualifying rates for special state aid. This legislation was enacted to encourage the formation of unit districts.¹⁹

The 64th General Assembly enacted a new school district survey law providing for the creation of a State Advisory Commission of nine members to be appointed by the Superintendent. Only two of the nine members were to be professional educators. The commission was required to report to the Legislature no later than January 1950.

County survey committees of nine members each were set up to study and plan school reorganization and make final reports by January, 1948. County committees were particularly effective for several reasons: (1) the County Superintendent was named the Executive Secretary of each county committee (most of the superintendents favored county reorganization); (2) school boards advocated reorganization and taxpayer federations tended to favor reorganization; and (3) a minimum salary law for teachers caused a new concern for schools with small enrollments.

New community districts were authorized which would maintain twelve grades and replace all underlying districts. The law provided that new district boundary lines need not respect former district lines, nor even county lines. It was believed that these new larger twelve grade community districts would quickly replace thousands of the former elementary and high school districts.²⁰

The steps to be taken by local school districts wishing to reorganize were mandated by laws adopted by the 1945 General Assembly. Local districts

desiring to reorganize with other nearby districts formed committees comprised of area residents to make a study of local needs and goals.²¹

The semipermissive legislation of 1945 and 1947 had a considerable impact upon school district reorganization in Illinois. The number of school districts declined from over 11,000 in 1945-46 to just over 5,000 by the end of the 1950 academic year. Since 1950, the number of school districts has further dropped to a total of 1,085 in 1972. This is a reduction of 90 per cent.²² (See Figure 1.1 on page 11.)

THE PERIOD FROM 1947 TO 1972

Trends in school district organization have changed little between the late 1940s and the early 1960s. More recently, however, rising inflation, population shifts to the cities, and the judicial mandate to eliminate racial and financial discrimination in the schools have given reorganization renewed urgency.

The complexity of Twentieth Century life has placed demands on the public schools that were unheard of a generation ago. As the role of education in the modern world becomes more and more important, parents, business leaders, and educators have renewed the demand for quality in teaching, instructional programs, and school services. Many small school districts across the nation are discovering that limitations of size and taxable wealth are making it difficult for them to offer the wide range of programs required of today's schools. Many such districts are looking to reorganization as the means to solve this problem.

While most emphasis in the last twenty years has been placed on the reorganization of small rural school districts, a nationwide school

redistricting movement in the cities has also grown. Urbanization has created special problems for metropolitan school districts. Large numbers of pupils concentrated in increasingly fewer, but larger, school districts and the concomitant growth of racial and economic ghettos in the cities' central cores are two particularly troublesome manifestations of urban growth.

Figure 1.2 on the following page indicates the decline in the number of local school districts nationwide in the past twenty-five years. (See Figure 1.2, page 13.) It is significant to note that, while districts with more than 25,000 pupils comprise less than one per cent of the total operating school systems in the United States, these districts educate over twenty-five per cent of the nation's more than forty-two million pupils.

In the words of the President's Commission on School Finance, "Equality of educational quality and opportunity cannot be sustained where school children are ethnically or economically isolated." Commission findings indicate that equal education is best attained where student populations are heterogeneously organized and where districts are large enough to encompass a distribution of wealth comparable to that of the entire state. Care must be taken, however, to establish educational administrative units which maintain effective communication with parents and students.²³

Recent Emphasis on School District Reorganization in Illinois

The 1966 Task Force on Education was charged to consider long-range goals for elementary and secondary education in Illinois, and to recommend plans for the attainment of such goals. Among other things, the Task Force Report urged the establishment of experimental programs in early childhood

Table 1.2

Number of School Districts Nationwide
1945-1971

education, compulsory kindergarten classes, remedial programs for the handicapped at all levels, adequate supportive services such as guidance and psychological counseling and more comprehensive vocational training programs. All of these recommendations were intended to enhance the quality of public education in Illinois. The Task Force Report noted, however, that local school districts unable to draw upon an administrative and economic base broad enough to support such programs did not have the means to implement these recommendations. As a result, the report urged that Illinois school districts be reorganized appropriately to provide such comprehensive school programs.²⁴

School district organization since the mid-Nineteenth Century has been characterized by the consolidation or expansion of existing districts and the organization of larger new districts. Generally speaking, increases in the size of school districts have followed efforts to widen the districts' economic support base, equalize the local tax burden, or enhance the quality of the local education program.

This process of school district enlargement, though steady, has been far from uniform. Most states have inherited a patchwork of local districts of widely disparate size and organizational type. Many school districts in Illinois, for example, are still probably too small to support the range of educational programs and services expected of today's public schools. As the responsibilities of public education continue to grow more numerous and more complex, these small districts will likely find it even more difficult to operate effectively. It is reasonable to assume, therefore, that the trend toward school district enlargement will continue for many years to come.

CHAPTER II
ILLINOIS EDUCATION TODAY
A STATISTICAL PROFILE OF ILLINOIS SCHOOL DISTRICTS

Types of School District Organization in Illinois

The public schools in Illinois are organized to provide instruction in either the elementary grades, the secondary (or high school) grades, or both. School districts offering instruction in Grades kindergarten through eight only are referred to as elementary districts. Districts which provide instruction in Grades nine through twelve are called high school or secondary districts. Districts offering instruction in Grades K-12 inclusive are referred to as unit districts.

Since the early years of statehood, seven basic types of school district organization have evolved in Illinois, each devised to meet a particular need. These seven organizational types, and the characteristics peculiar to each, are listed below:

- (1) A Common School District gives instruction in Grades 1 to 8, and also may have any or all of Grades 9 to 12; however, any district with a population of less than 2,000 may not maintain grades above the eighth unless they were maintained before 1949.
- (2) A Community Consolidated District may be either an elementary or a unit district. It may be formed by uniting contiguous territory having a population of at least 1,500 and an equalized valuation not less than \$5,000,000.

A consolidated district organized before July 1, 1951, with a population of 1,000 or more operates as a community consolidated school district; with a population of less than 1,000 it operates as a common school district.

- (4) A Community High School District maintains Grades 9 through 12. Whether organized originally as high school, township high school, consolidated or community high school district, all high school districts are now governed by laws covering community high schools. No petition for the establishment of a community high school district could be filed after March 29, 1965.
- (5) A Community Unit School District to maintain Grades K to 12 inclusive may be established in any contiguous, compact territory which meets population and assessed valuation standards.
- (6) A Non-High School District operates no school but pays the tuition of its residents attending other high schools.
- (7) Special Charter Districts operate under charters granted by the General Assembly prior to 1870. There are thirteen, each in a class by itself and each administered according to its special charter. The City of Chicago has a unit charter district as does also Bloomington, Canton, Decatur, Kankakee, Paris, Peoria, Rockford, Rock Island, and Springfield; Joliet and Lake Forest have elementary (K-8) charter districts; and Princeton has a secondary district.

A special charter district may, with referendum approval,

become part of the school township in which it is situated and operate under the general school law.

Number of School Districts in Illinois

As was noted in Chapter I, the number of school districts in Illinois has undergone a dramatic reduction since the end of World War II. In 1945-46, the number of school districts in the state stood at more than 11,000. Since that time, reorganization activity spurred by changes in Illinois school law favoring school district reorganization has reduced that number to the present total of 1,092 (as of July 1, 1972).

Of the state's 1,092 organized school districts, seven (7) are classified as "nonoperating" districts. Nonoperating districts neither own nor maintain schools of their own, but instead pay the tuition required to send pupils living within their borders to schools operated by nearby districts. One school district is administered by the Illinois Department of Corrections to provide schooling of various types to inmates of Illinois correctional facilities. The number of operating public school districts therefore stands at 1,084. Of this total, 436 are classified as unit districts, 143 as secondary districts, and 505 as elementary districts.

The number of school districts in Illinois is much greater than the number of districts in states of similar population and size. Michigan, for example, has a total of 626 school districts, Wisconsin 455, Ohio 631, and Florida 67. Forty-seven states have fewer total districts than does Illinois, and 34 of these states have fewer total enrollment higher than Illinois' average of 2,066 pupils per school district

for the 1971-1972 school year. (See Appendix Exhibit B, "Number of School Districts and Average Enrollment Per District by State.")

Size of Illinois School Districts

The "size" of a school district is measured by its enrollment, or the total number of students enrolled at all grade levels of all schools operated by that district. Illinois school districts vary widely in size. The size of the state's unit districts, for example, ranges from the 573,480 pupils enrolled by the City of Chicago School District #299 to the 98 pupils enrolled by the Stockland Community Consolidated School District #253. Enrollments in the state's elementary districts range from the 13,715 pupils in Schaumburg Community Consolidated School District #43 to the 19 students at Owego Community Consolidated School District #34. Secondary districts show a similar range of size, from the 17,419 students enrolled by Township High School District #214 to the 58 pupils registered in Mills Prairie Community High School District #229. (See Appendix Exhibit A, "Enrollment and Finance Data for Illinois Public Schools," for a listing of each district's total enrollment and enrollment rank.)

The bulk of the state's 436 operating unit districts (64.5%) enroll between 98 and 1,499 students. (See Figure 2.1.) Sixty-five per cent (65%) of the state's 505 operating elementary districts enroll between 1 and 999 pupils. (See Figure 2.2.) Thirty-eight point five per cent (38.5%) of Illinois secondary districts enroll fewer than 500 students. (See Figure 2.3.)

Even though elementary school districts which enroll fewer than 1,000 students account for 65.5% of the state's total number of elementary districts, such districts enroll only 17.7% of the state's elementary school pupils. (See Figure 2.4.) Secondary districts of less than 500 total enrollment account for 38.5% of the state's secondary districts, but enroll only 4.1% of the state's high school pupils. (See Figure 2.5.) Sixty-nine point two per cent (69.2%) of the state's unit districts enroll fewer than 1,500 students but these small unit districts enroll only 15.9% of the state's unit district student population. (See Figure 2.6.)

Debate over what constitutes an optimum school district size has occupied educational theorists for years. Everyone agrees that a district should have both a student population large enough to make a wide range of programs and services economically feasible and a tax base sufficient to support the facilities and personnel required for such programs. Factors such as population sparsity, transportation difficulties, and local political resistance, however, make the adoption of a single absolute size standard for all districts a practical impossibility. In farm areas, for example, extremely low population densities, and the resultant problems of student transportation, put an effective upper limit on the size of many rural school districts. In the state's crowded metropolitan areas such as suburban Cook County, travel distance is a minor factor in determining school district size, but local political concerns often impede the establishment of school districts spanning village or township boundaries. Some urban school districts, on the other hand, are considered by some too large. School administration in such districts

may be too remote from the people it serves, and the difficulties inherent in administering such sprawling education systems frequently result in undue inefficiency and waste.

It is possible, however, to adopt certain standards of school district size for purposes of analysis. Experts in educational administration have recommended that districts be of a size sufficient to produce a high school graduating class of at least 100.²⁵⁻²⁷ Allowing for a typical rate of attrition, a high school graduating class of 100 would require a high school enrollment (Grades 9-12) of approximately 500 students. An elementary district of proportional size would therefore enroll some 1,000 students. A 1,000-student minimum for elementary districts would provide an average of roughly 100 students per grade level, or four sections of 25-30 students per section through a K-8 program. A unit district of equivalent size would enroll approximately 1,500 students in Grades K-12.

These particular enrollment minimums (see below) have been adopted in this report as justifiable standards. Subsequent references to "minimum" district sizes refer to these specific enrollment standards:

<u>DISTRICT TYPE</u>	<u>SCOPE OF PROGRAM</u>	<u>ENROLLMENT MINIMUM</u>
Elementary	K-8	1,000 pupils
Secondary	9-12	500 pupils
Unit	K-12	1,500 pupils

These standards are widely accepted as reasonable, and although they do not fit the need of every Illinois community, they do provide a set of useful guidelines with which to evaluate the size of the state's school districts.

Using a minimum secondary district enrollment standard of 500 pupils, it is noted that 55 Illinois secondary districts, or 38.5% of the total,

are undersized. Applying the 1,000 pupil minimum enrollment standard for elementary districts, it can be seen that 330 such districts, or 65.5% of the total, are of less than desirable size. Measured against the 1,500 student minimum for unit districts, 301 unit districts, or 69.2% of the total, are below size. Statewide, 63.2% of operating districts are of less than minimum size.

Map 2.1 shows the per cent of all students in each county attending schools operated by districts of less than minimum enrollment.* As might be expected, counties which are significantly metropolitan in nature tend to have few students attending schools in such districts. Cook County has only one per cent (1%) of its students attending schools in undersized districts, Winnebago County 11%, Sangamon County 24%, Champaign County 17%, Rock Island County 2%, and St. Clair County 15%, percentages which compare with the statewide figure, which shows that 46.9% of the state's pupils attend schools in districts of less than minimum size.

The state's rural counties fare less well. Although the figure for many such counties is well above the statewide average, others (such as Marshall, Hancock, Scott, Moultrie, Cumberland, Edwards, and Johnson, to name just a few) have a full 100% of their students enrolled in schools operated by undersized districts. The explanation lies in the nature of

* Data entered on Map 2.1 is for the 1971-72 school year. The total enrollment of districts whose enrollment fell below the minimums established for their type (see above) was noted, and added to the enrollment totals for all other districts in the same county which also failed to meet these size criteria. This total in turn was compared to that county's total enrollment. The resulting percentage figure was entered on Map 2.1. (Per cents were rounded to the nearest one-tenth of a per cent). See Appendix Exhibit D for "Illinois School Districts of Less than Minimum Size (By County)."

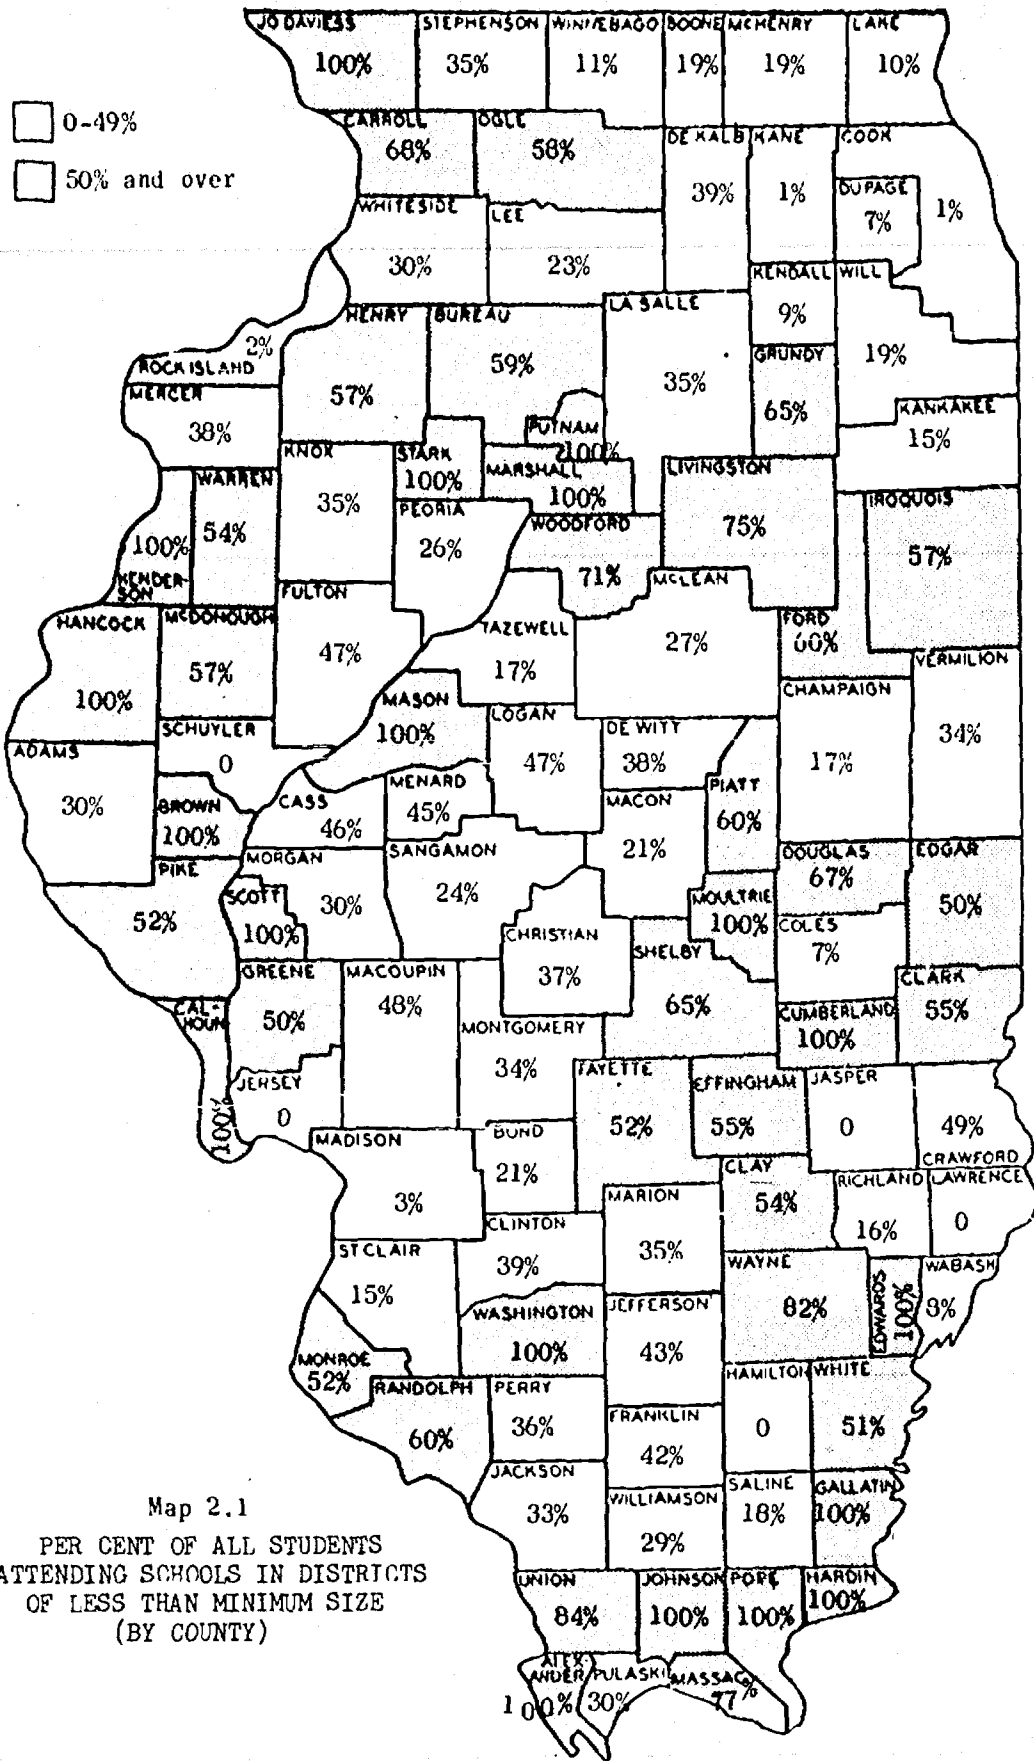

the state's rural population. These counties are agricultural by occupation, and their population is small and widely scattered. The organization of rural school districts large enough to meet the minimum size standards would often require that school district boundaries cover a considerable geographic expanse, which would in turn require that students travel prohibitively long distances to and from school. The low population density of rural areas has been and continues to be a major obstacle to the organization of rural school districts of adequate size. (See Appendix Exhibit C listing population densities of all Illinois counties.)

Wealth of Illinois School Districts

The wealth of a school district is measured by the amount of taxable wealth per pupil available for the support of local schools. This index of school district wealth is called the assessed valuation per pupil (AVPP) and is expressed in dollar amounts. The AVPP is defined as the quotient of the total equalized valuation of all the taxable real property in the district and the weighted average daily attendance of the district, or WADA.

Illinois school districts display as wide a range of wealth as they do of size. Among elementary districts, Maple Grove School District #17 ranks first in the state in wealth, drawing upon an assessed valuation of \$355,386 per pupil for the local support of education. This compares with the \$4,917 assessed valuation per pupil available to Briar Bluff School District #157. Statewide, the mean assessed valuation per pupil for elementary districts is \$32,691.

0-49%
 50% and over

Map 2.1
 PER CENT OF ALL STUDENTS
 ATTENDING SCHOOLS IN DISTRICTS
 OF LESS THAN MINIMUM SIZE
 (BY COUNTY)

Among the state's secondary districts, Beason Community High School District ranks first in wealth, with an assessed valuation per pupil of \$199,729. Odin Community High School District #700, on the other hand, draws upon a relatively small tax base of \$24,219 per pupil. The statewide mean assessed valuation per pupil for secondary districts is \$74,816.

Among unit districts, Monticello Community Unit School District #25 ranks first in wealth with an assessed valuation per pupil amounting to \$103,670, while Brookport School District #38 ranks last with an assessed valuation of \$3,451 per pupil. The state mean assessed valuation per pupil for unit districts is \$23,646. (See Appendix Exhibit A for ranking of Illinois school districts by AVPP.)

A school district's wealth is determined by factors as diverse as its organizational type and size, the socioeconomic status of its residents, and the uneven distribution of taxable property caused by the haphazard placement of geographical and political boundaries. The ways in which organizational nature of Illinois school districts influence their assessed valuation per pupil can be illustrated as follows: a typical unit school district in Illinois enrolls roughly 70% of its total student population in the elementary grades and 30% in the high school grades. Assuming for the moment that the per pupil costs are identical for elementary and high school students, it follows that 70% of the total taxable wealth within that district goes toward the support of the elementary school program, with the remaining 30% going to the support of the district's secondary school program.

One might assume that 70% of a community's taxable wealth would thus be appropriated for the support of elementary schools and 30% for the

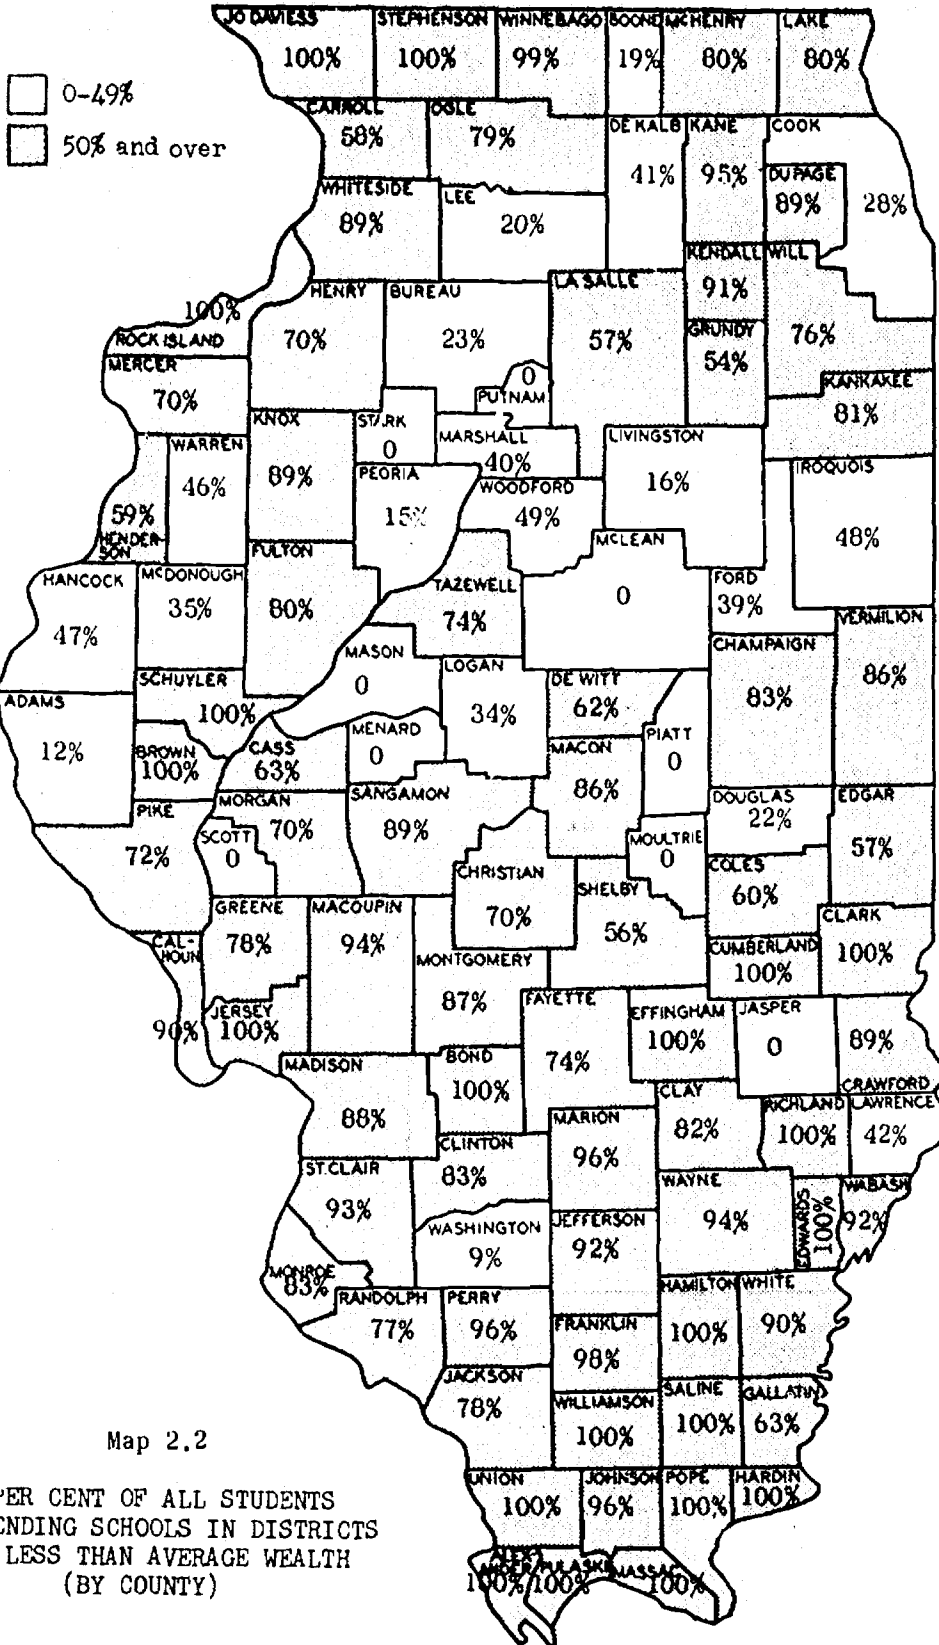

support of secondary schools, regardless of the nature of the local district's organization. That is not the case. A separate operating elementary district draws upon the full 100% of its assessed valuation to support programs intended to serve only 70% of the district's school-age population. Similarly, a separate operating secondary district draws upon a full 100% of its assessed valuation to support programs designed to educate only 30% of the district's school-age population. A unit district of identical boundaries offering programs intended to educate 100% of the district's school-age population still draws its support from 100% of the district's wealth. The result is significant disparities in per pupil financial strength among districts of different type.²⁸

Districts of any type with very small enrollments tend to have exaggerated assessed valuation per pupil figures, since the smaller the number by which a district's total assessed valuation is divided, the higher the resulting assessed valuation per pupil figure will be. The state's five wealthiest elementary districts, for example, whose average assessed valuation per pupil is a hefty \$276,134, enroll an average of only 215 students each (compared to the statewide average enrollment for elementary districts of 1,230 students). The state's five wealthiest secondary districts, which have an average assessed valuation per pupil of \$195,504, enroll an average of 113 students each (compared to the statewide average enrollment for secondary districts of 1,953 students). The five wealthiest unit districts, which average \$75,763 assessed valuation per pupil, enroll an average of 1,093 students each (compared to the statewide average enrollment for unit districts of 3,393).

It should be noted that mean assessed valuation per pupil figures are only rough indicators of the financial wealth of Illinois' school districts. This is particularly true in the cases of the state's elementary and secondary districts. An appreciable number of elementary districts, for example, have both very small enrollments and large amounts of taxable property within their boundaries. The resulting high assessed valuations per pupil (which sometimes total more than a quarter of a million dollars) act to raise the statewide mean assessed valuation per pupil for elementary districts. Wealth figures for secondary districts are distorted to an equal degree by the two dozen secondary districts which have assessed valuations per pupil in excess of \$100,000 each. The larger enrollments of unit districts tend to prevent the appearance of districts with assessed valuations per pupil which are overly high or low. The state mean assessed valuation per pupil for unit districts thus comes closer to representing the actual wealth status of Illinois unit districts than do the equivalent figures for elementary or secondary districts.

Map 2.2 shows the per cent of public school students in each county who attend schools operated by districts of less than average wealth.* Statewide, 66.7% of public school students attend such schools. Readers

* Data entered on Map 2.2 is from the 1970-71 school year. The total enrollment of those districts whose assessed valuation per pupil (AVPP) fell below the statewide mean AVPP for their type were noted, and added to other districts in the same county which also failed to meet these criteria of wealth. This total was in turn compared to that county's total enrollment. The resulting percentage figure was then entered on Map 2.2. (Per cents were rounded to the nearest one-tenth of a per cent.) See Appendix Exhibit E for "Illinois School Districts of Less Than Average Wealth (By County)."

Map 2.2

PER CENT OF ALL STUDENTS
 ATTENDING SCHOOLS IN DISTRICTS
 OF LESS THAN AVERAGE WEALTH
 (BY COUNTY)

will note that several downstate counties (among them Stark, McLean, Putnam, Piatt, and Moultrie) have no students attending districts of less than average wealth. This phenomenon is the combined result of the economics and population patterns of these areas. Such counties are situated in rich agricultural regions, the high value of whose farmland, combined with the sparse population common in rural areas, provides such districts with a higher-than-average assessed valuation per pupil. (Readers will note in this regard that many of the counties whose districts stand well above the state average for their type in terms of wealth have a high proportion of their students attending schools in districts of less than minimum size for their type.)

Disparities in assessed valuation per pupil are sometimes the result of accidents of geography. A school district which has the good fortune to include within its boundaries areas of concentrated commerce or industry will enjoy an assessed valuation per pupil significantly higher than that of a district of equal enrollment and socioeconomic status which does not have the benefit of similarly broad tax resources.

The graphs on pages 36 to 38 chart the distribution of Illinois school districts by both size (as measured by enrollments) and wealth (as measured by assessed valuation per pupil), according to organizational type. An examination of Figure 2.7 graphically illustrates the size-wealth status of Illinois' 505 operating elementary districts. The cluster of districts along the vertical, or wealth, axis represents the many Illinois elementary districts which, because of their very small enrollments, have exaggerated assessed valuations per pupil. The majority of Illinois' elementary districts, however, rank below the statewide mean assessed valuation per pupil

for elementary districts of \$32,691. It is noted that a significant number of elementary districts both fall below the statewide mean assessed valuation per pupil for elementary districts and enroll fewer than the statewide mean enrollment for elementary districts of 1,230 pupils. (The broken vertical line indicates the 1,000 student enrollment minimum for elementary districts described on page 26.

As is the case with elementary districts, the high assessed valuation per pupil of many secondary districts mainly is the result of their small enrollments. The majority of Illinois secondary districts fall below both the statewide mean assessed valuation per pupil for secondary districts and the statewide mean enrollment for secondary districts of 1,953 pupils. Relatively few such districts, however, fall below the recommended minimum size for secondary districts of 500 students. Generally speaking, Illinois secondary districts show a more balanced distribution through the size-wealth spectrum than do elementary districts. (See Figure 2.8.)

Figure 2.9 depicts the distribution of the state's unit districts by size and wealth. Unit districts tend to be larger in size than elementary or secondary districts, a pattern largely due to the fact that unit districts offer instruction in thirteen grades compared to the four offered by secondary districts and the nine provided by elementary districts. As was noted on page 31 the relatively larger number of pupils enrolled by unit districts works to depress their assessed valuations per pupil. A glance at Figure 2.9 indicates that unit districts do not display the wide range of either wealth or size exhibited by elementary and secondary districts. A considerably majority of unit districts enroll fewer than the

statewide mean enrollment for units of 3,393 students.* Most unit districts likewise enroll fewer than the 1,500 students recommended on page 26 as a minimum. In terms of assessed valuation per pupil, unit districts show much the same pattern as elementary and secondary districts; the assessed valuations per pupil of 53.2% of the state's unit districts rank below the statewide mean of \$23,646.

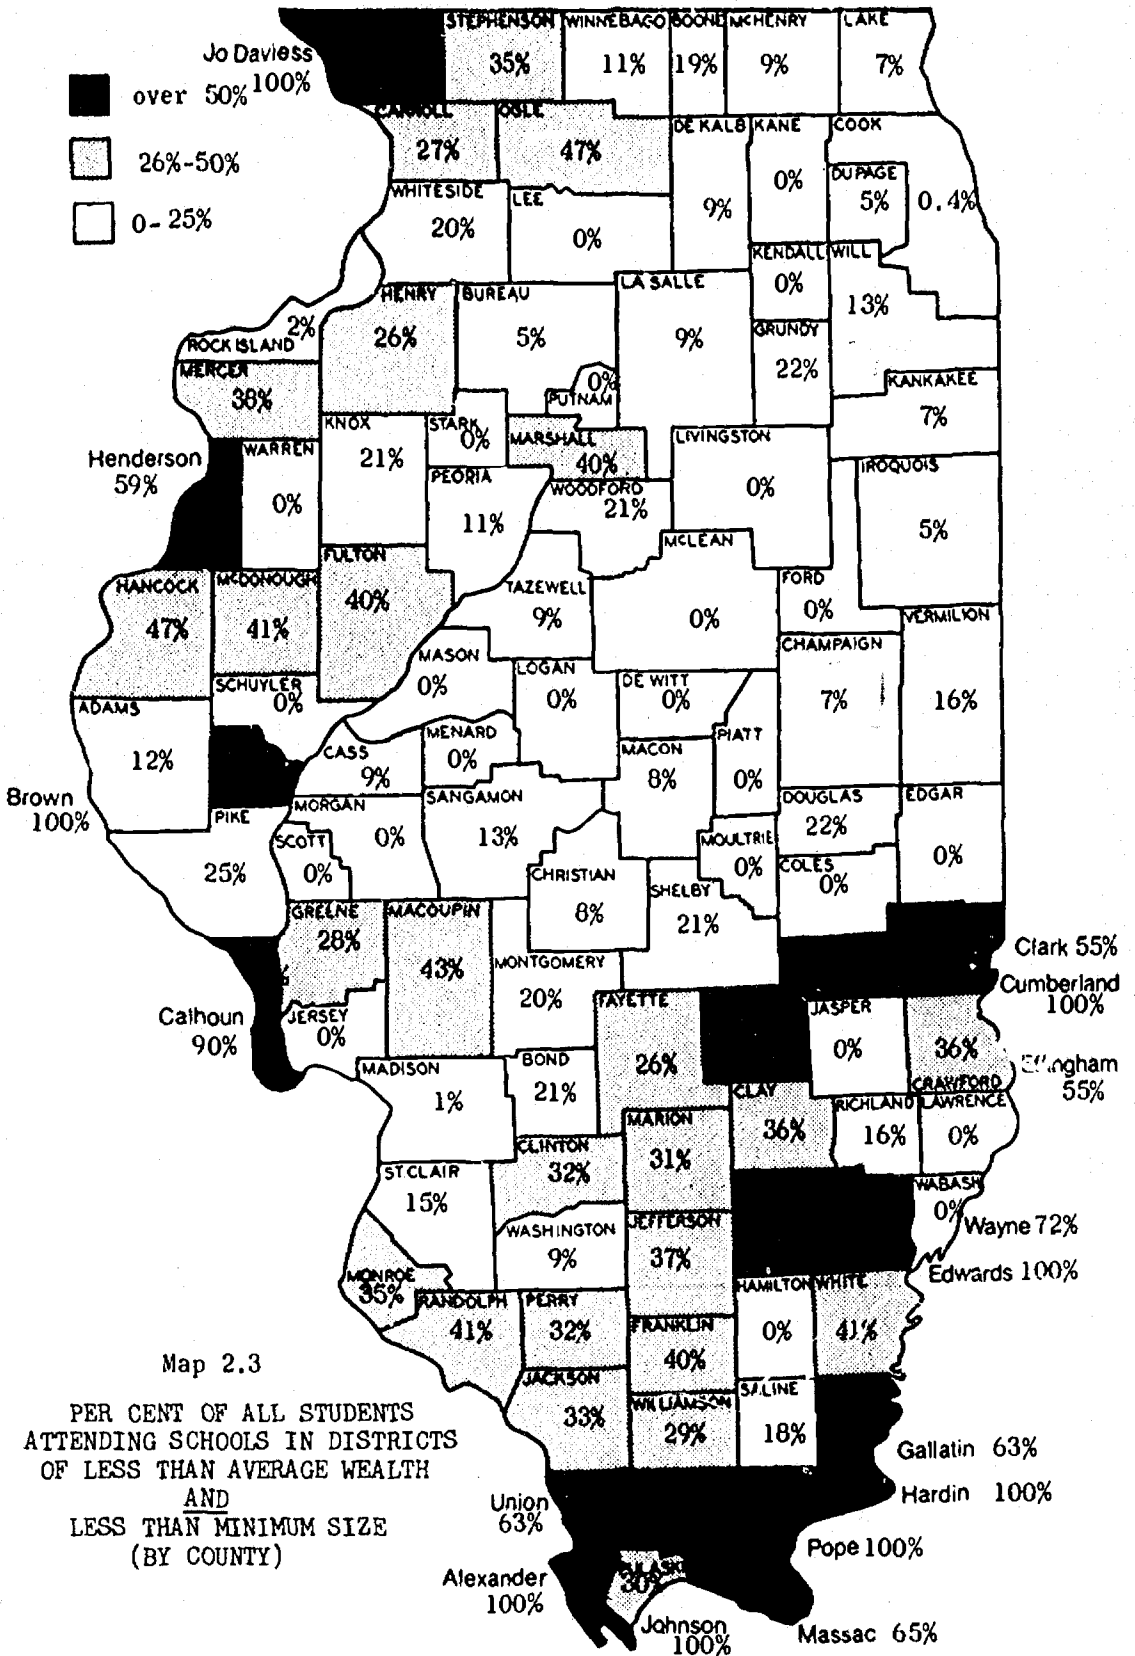

Map 2.3 on page 40 shows the per cent of all students in each county attending schools operated by districts of less than minimum size and less than average wealth for their type.** Statewide, only 6.3% of the state's public school pupils attend such schools. (See Appendix Exhibit F for a listing of undersize and wealth districts by county and Exhibit G for the summary of size-wealth status of Illinois school districts by county.)

Taxes and Local Education

Of the estimated \$2.8 billion to be spent by Illinois governments at all levels for the support of public education during the 1972-73 school

*Two mean enrollments for unit districts have been computed and entered on Figure 2.9. The solid line indicates the mean unit enrollment of 3,393 pupils which includes 573,000 students of Chicago School District #299. The dotted line indicates the mean unit enrollment of 2,082 students which excludes the enrollment of Chicago's unit school system.

** The identification of undersize and underwealth districts was made as follows: districts which enrolled fewer than the minimum enrollment for their type were noted. Districts which had an assessed valuation per pupil less than the state mean assessed valuation per pupil for their type were also noted. If a district met both these size and wealth criteria, its total enrollment was noted and added to that of other districts in the same county which were similarly marked. This total was then compared to that county's total enrollment. The resulting percentage figure was then entered on Map 2.3. Enrollment totals for districts which had fewer than the minimum enrollment for its type, but which were of average or above-average wealth were not included in the computation of this percentage, nor were enrollment totals from districts which fell below the statewide mean assessed valuation per pupil for their type but which met minimum enrollment standards.

Map 2.3

 AND
 LESS THAN MINIMUM SIZE
 (BY COUNTY)

year, approximately \$1.7 billion (or 61%) will be supplied from local school revenue sources such as fees, gifts, tuition, and real and personal property taxes. Of these various revenue sources, real and personal property taxes provide an overwhelming proportion of local money spent on education.

The nature and extent of local districts' financial resources is a critical factor in determining the financial health of local schools. Assessed valuation per pupil by itself is little more than a measure of a district's potential financial strength. Just as important as the amount of taxable wealth available to a district is the proportion of that wealth the district's residents are willing to devote to the support of local education. This local commitment to education is measured by the rate at which residents tax their real property for education.

Illinois school districts may levy a total of fourteen separate taxes on property to support local schools. The most important of these are taxes levied to supply the Educational Fund (out of which basic instructional costs are paid), the Operations, Building, and Maintenance Fund (out of which the costs of operating and maintaining the district's physical plant are paid), and the Transportation Fund (with which the costs of buses, drivers, and related expenses are paid).

Other funds for which local taxes may be levied include: the Capital Improvements Fund, Summer School Fund, Bond and Interest Fund, Fire Prevention and Safety Fund, Special Education Building Fund, and Area Vocational Education Building Fund. (See Appendix Exhibit H for a listing of levies for education allowed under current law.)

The sum of these levies constitutes a district's total tax rate for education. The total tax rate is determined by factors other than the level of local commitment to education. Several of the taxes levied for special purposes (such as the levy for the support of summer school programs) are not mandatory; local districts may or may not exercise these specific taxing powers at their discretion according to their assessment of local need. The State of Illinois also has set statutory maximum limits on the extent to which a district may tax to provide for any of the fourteen educational funds established by the School Code. These taxing limits differ for unit and dual districts, and differences in total tax rate between districts of different organizational type are frequently the result of such statutory limitations. (See Appendix Exhibit H.)

A unit district, for example, is allowed to tax a maximum rate of 1.600% without referendum approval for the support of the Educational Fund; with such voter approval, the allowable maximum tax rate is increased to 4.000%. Elementary and secondary districts, however, may not tax property at more than 0.9200% each for the Educational Fund without referendum approval, nor more than 3.000% with such approval.

The rate at which districts must tax themselves in order to qualify for state school aid also differs for districts of different organizational type. This "qualifying rate" is 0.90% for elementary and secondary districts of less than 100 weighted average daily attendance; the qualifying rate for those of over 100 weighted average daily attendance is 0.84%. Residents of a community served by an elementary district and a secondary district with identical boundaries and both with weighted average daily attendance in excess of 100 would thus pay a total tax of 1.68% for the support of a

combined K-12 school program if both districts taxed at the qualifying rate established for their district type. Under a unit district of equal size, residents would pay a total tax of only 1.08% in order to qualify for state school aid. This differential in qualifying tax rates between unit and dual districts was incorporated into Illinois school law in 1947, and was intended as a financial incentive for local dual districts to reorganize into community unit districts.

Total tax rates for education range from a low of 0.4362% to a high of 3.7720%, depending on a district's organizational type, the amount of taxable wealth available for the support of local schools, and the extent of a district's total levies for education.

State Aid to Local Districts

The Illinois public school system represents a large financial investment. It is estimated that over 2.8 billion dollars will be spent by Illinois governments at all levels for the support of common schools during the 1972-73 school year. Of this total, approximately 1.2 billion dollars will be provided by the State of Illinois. A glance at Figure 2.10 indicates the portion of the state's budget which goes for the support of the public schools. Illinois' per capita state expenditures for all education (including higher education) of \$140.75 ranks 38th out of the nation's 50 states.

State funds to aid local education are appropriated by the General Assembly. The bulk of state aid funds are apportioned to local districts from the Common School Fund supplied by legislative appropriation from the General Revenue Fund. Additional aid to school districts is provided

Figure 2.10

Allocation of State Resources
Fiscal 1973
(In Millions of Dollars)

Figure 2.11

Distribution of State Aid Dollar
1972-1973

Source: State of Illinois Appropriations Book for Fiscal 1973

through various categorical aids funded out of the General Revenue Fund or Driver Education Fund. Figure 2.11 illustrates the distribution of the state school aid dollar.

Illinois school districts which meet minimum eligibility standards are eligible for state school aid from the Common School Fund. (See Appendix Exhibit I for details of the state aid formula and eligibility requirements.) General state aid is of two basic types. The first type of aid is the flat grant. Flat grants are awarded on a per capita basis without regard to a district's financial need. At present, Illinois allots \$48 per pupil in flat grants. (In computing state aid, the number of pupils in a district is determined by its best six months' average daily attendance, with all students in Grades 9-12 weighted by 1.25 to allow for the generally higher costs of providing the personnel, facilities, and services required by high school programs.)

The second basic type of state school aid is the equalization grant. Equalization grants are intended to help provide at least a minimum school program for all Illinois students. The General Assembly decides what level of financial support is required to provide this minimum program. This basic support level is called the "foundation level," and currently stands at \$520 per weighted average daily attendance (WADA) pupil. If a district's combined resources from local revenues and flat grant state aid fall short of the \$520 per WADA pupil foundation level, a state equalization grant is allotted to supplement those resources until the foundation level of support is attained.

Illinois districts must tax local property at the minimum qualifying rate established for their district type in order to qualify for general

state aid. Every district is entitled to spend whatever additional revenues it is able to generate by levying local taxes in excess of the qualifying rate.

A district's basic wealth and total tax rate for education (and to a lesser extent state aid) are the principal factors determining a district's level of per pupil financial expenditure. Wide differences in basic wealth and taxing practices among districts result in equally wide disparities in spending for education at the local level. An example will serve to illustrate the relationship between local districts' tax rate and assessed valuation per pupil and the amounts of money generated for the support of local schools. An elementary district in Southern Illinois has an assessed valuation per pupil of \$355,386. Residents of that district are taxed for education at a total rate of 0.4362%. Another elementary district, this one located in suburban Cook County, has a more modest assessed valuation per pupil of \$23,159. Their total tax rate for education amounts to 3.7720%.

The wealth of the first district is roughly fifteen times that of the second district, while its total tax rate is only one-ninth the rate paid by property owners in the second district. The wealthier district is still able to generate some \$1,550 per pupil in local school tax revenues. The poorer district, even though it taxes itself almost nine times as heavily, is able to raise only \$873 per pupil, or roughly 56% the amount of money the wealthier district is able to raise with a considerably lower tax rate.

	<u>AVPP</u>		<u>Total Tax</u>		<u>Local School Revenue Produced</u>
District 1	\$355,386	X	0.4362%	=	\$1,550 per pupil
District 2	\$ 23,159	X	3.7720%	=	\$ 873 per pupil

State flat grant aid, which is awarded without regard to districts' financial need, does nothing to reduce the gap in spendable funds caused by such basic differences in wealth. State equalization aid is intended to eliminate such financial inequities, but does so only to the \$520 per pupil limit established by the General Assembly as the foundation level. The state aid formula is designed to maintain a minimum level of support for each Illinois student--there is no maximum limit on how much money a district may spend per child. Many wealthy school districts are able to spend considerably more than the foundation level amount per pupil. Furthermore, many of these districts (such as the elementary district cited above) are able to raise such money with a lower tax rate than that levied by other districts with an equal desire to provide quality education but which have significantly smaller amounts of taxable wealth upon which to draw for the support of schools.

The ability of a school district to generate local funds for the support of schools is measured by an "effort index." Generally speaking, effort indices indicate the degree to which district residents must tax local property to produce adequate amounts of local school revenue. Districts with a high assessed valuation per pupil are generally able to maintain a given level of school support with a lower tax rate, or less "effort," than districts with less taxable wealth per pupil available for school support. (See Appendix Exhibit A, "Enrollment and Finance Data for Illinois School Districts" for ranking of district effort indices.)

The current operating expense per pupil (OEPP) is a useful index of the amount of money a district is spending for the education of each of its pupils. The disparities in wealth among districts noted in previous pages

are evident in the differences among districts in operating expense. Illinois school district expenditures range from \$2,547 to \$507 per pupil. As districts' wealth (as measured in AVPP) increases, their average per pupil expenditures increase; however, as districts' wealth increases, their average total tax rates decrease. (See Figure 2.12.) In short, wealthy districts are able to provide more money per pupil for local education with a lower total tax rate than districts with lesser amounts of taxable wealth. (See Appendix Exhibit A, "Enrollment and Finance Data for Illinois School Districts," for a listing of each district's operating expense per pupil.)

Size and Operating Costs

The relationship between school district size and operating costs has been the topic of extensive study. The literature on the subject is vast, and uniformly suggests that, for the number of pupils served and the scope of program offered, small school districts are more expensive to operate and maintain than larger districts.

The largest single component of school costs is operating costs. Operating costs include expenses for instructional salaries, materials, equipment, and assorted administrative costs (including administrators' salaries).

School district size has a decided effect on the amount of money a district spends per pupil on instructional costs which in turn is assumed to have an effect on the potential quality of a district's program. A recent study conducted by the Division of Research, Planning and Development of the Office of the Superintendent of Public Instruction in Springfield makes the following points:

Figure 2.12

Average Operating Expense Per Pupil
and
Average Total Tax Rate
(By Wealth Category)
1970-1971

ASSESSED VALUATION PER PUPIL
(in thousands of dollars)

"In both elementary and high school districts, with the exception of one size group in each case, the larger the district, the higher the current operating expense per average daily attendance per pupil." 29

The report explains that the nearly constant increase in operating expense per average daily attendance (ADA) that accompanies increases in size of both elementary and secondary districts is the result of several factors. These factors include:

1. Larger districts generally provide a wider range of instructional opportunities and related resources.
2. Teachers and administrators are generally paid at a higher rate in larger districts.
3. Certified personnel in larger districts tend to have both more advanced degrees and greater longevity than their counterparts in small districts. As a result, these people are farther advanced up the salary schedule, which results in higher average salaries.
4. The demands made upon larger districts, particularly those situated in densely populated areas, require more (and more expensive) educational resources.

On the subject of administrative costs, the report states:

"In elementary and high school (and unit) districts, the larger the district, the lower the cost for both administrative salaries and total administration per average daily attendance. (There is one significant variation.)" 30

Administrative costs per pupil decline as district sizes increase because the number of administrative personnel does not increase in proportion to the increase in the number of children served. For example: the per pupil administrative costs of a district enrolling 1,000 students do not total ten times the per pupil administrative costs of a district enrolling only 100 students.

Among unit districts the situation is similar. Current operating costs per average daily attendance decline with increased size to a point,

then increase. The report notes apparent diseconomies when districts of any type reach an upper size limit (approximately 10,000 average daily attendance). The probable cause of such increased costs per average daily attendance in the larger districts (which tend to be located in heavily metropolitan areas of the state) is: (1) the increased demands for services, personnel, and facilities placed upon the urban schools; and (2) the inevitable inefficiency and waste that plagues the administration of any organization of such size and scope.

These conclusions are echoed in the report of the Great Plains School District Reorganization Project (Lincoln, Nebraska, 1968). On the subject of the administrative costs of school districts, the report cites "A Study of Administrative Costs in Selected School Districts of Iowa, Missouri, and South Dakota" by Richard Manatt and Anton Netusil of Iowa State University, which states:

"As district enrollments drop, per pupil costs for central administration excluding costs of administering attendance units, increase rapidly.

Large districts spend more for special services than for supervision, and a still smaller amount for general administration.

Median sized school districts spend more dollars for general administration than for special services or educational supervisors.

Smaller districts of each state spend almost nothing for special services; a portion of the administrator's time is devoted to teaching.

Per capita expenditures for both general administration and total central administration vary inversely with district enrollment.

Small and median sized districts do not have the services of educational supervisors or personnel assigned to special services.

Districts with 10,000 or more students spend more money for supervision and special services than for general administration.

Districts of median and smaller size schools spend most of their total administrative budget on superintendents, assistants, and secretaries."³¹

Dual districts as a rule tend to be more expensive to operate than unit districts of equivalent size because of the duplication of assorted administrative costs such as superintendents' salaries, bookkeeping and purchasing operations, and physical plant maintenance. Cesar M. Sabulao and Alan Hickrod, for example, in a 1971 study entitled "Optimum Size of School Districts Relative to Selected Costs," conclude that:

"The contention that it will be more economical to operate a unit district than to operate elementary and secondary school districts of comparable size to the unit district was verified provided that the size of the unit district is at that level where the least-cost-combination of the unit district is less than those of the dual elementary and secondary districts combined. This enrollment level for the unit district in Illinois was 1,500 ADA. As enrollment size increases from this level, estimates of per pupil cost for the unit district become consistently less when compared with estimates for the elementary and secondary districts of comparable size to the unit district."³²

SUMMARY

Illinois presently has more school districts than most other states of similar size and population. Although Illinois school districts show a considerable range of sizes (the largest district in the state is more than 30,000 times the size of the smallest), many districts are considered overly small by most standards. A total of 63% of all districts fall below the enrollment minimums outlined on pages 26 and 27 of this report. Statewide, 47% of all Illinois public school students attend schools operated by districts of less than minimum size for their type.

Illinois school districts display a wide range of wealth as well as of size. The assessed valuation per pupil of the state's wealthiest district, for example, is over 100 times that of the poorest. Fifty-eight

per cent (50%) of all districts are of below average wealth for their type. In the state as a whole, 67% of all students attend schools operated by districts of less than average wealth for their type. Of the state's 1,084 operating school districts, 339 or 31% fail to meet both minimum size and average wealth criteria.

Illinois school districts tax local property at widely varying rates for the support of local education. Illinois residents tax local property from 0.4362% to 3.7720% for education, depending on such factors as the taxable wealth per pupil available to the district, the district type, and the nature and extent of the district's total levies for education.

Differences in districts' wealth and tax rates frequently result in corresponding wide differences in the amount of money districts are able to generate for the support of schools. For example: if both the state's wealthiest and its poorest districts were to tax local property at an identical rate, the total local revenue thus raised by the wealthy district would amount to more than one hundred times the revenue produced by the poor district.

Current state aid formulas do not fully rectify the disparities in spending per pupil caused by such differences in the local ability to generate money for school support. The amount of money Illinois school districts spend per pupil per year ranges from \$500 to \$2,500. Districts with assessed valuations per pupil significantly higher than the statewide average tend to spend more money per pupil for school facilities, personnel, and materials than do districts with lesser amounts of taxable wealth. Furthermore, residents of these wealthier districts are able to provide broader financial support for their schools with less effort than that required by residents of poorer districts.

Research evidence from a variety of sources indicates that, as a rule, the per pupil costs for small school districts of any type are higher than larger districts. Recent studies such as Hickrod and Sabulao's "Optimum School District Size Related to Selected Costs" cited in this chapter suggest that unit districts operate at a lower per pupil cost than dual districts of equivalent size. Such research evidence, however, is not conclusive.

CHAPTER III

QUALITY EDUCATION

"Quality education" eludes precise definition. It may be defined in the abstract, using as a framework the findings of research in such fields as philosophy, psychology, and sociology. On a more concrete level, it may be defined in terms of the operational characteristics of the schools within which education takes place. Quality education also may be defined in terms of its social function as the means by which young people are prepared for the future responsibilities of citizenship, parenthood, and a career. Quality education, then, continues to mean many different things to many different people. Since it would be impossible to resolve this controversy within the limitations of this report, the report will deal only with the concrete operational aspects of the public schools as they relate to quality education.

Even this relatively uncomplicated approach poses problems for researchers. What constitutes quality education in one circumstance, for example, may be inappropriate or irrelevant in a different circumstance. It cannot be said with any certainty just how many course units of English or how many square feet of auditorium space a given school must have to provide its students with quality education. The many variables of history, geography, economics, politics, and community aspirations which together determine the quality of education in a given locale are too numerous, and their interrelationships too complex, to permit easy definition. As a

result, a quality program is best shaped not by the rigid standards of some hypothetical textbook ideal, but by the unique aptitudes and aspirations of the children it is intended to serve.

There are, however, several broad aspects of "quality education" which are widely accepted as legitimate, and which have been incorporated into a general statement of desirable educational objectives. The Office of the Superintendent of Public Instruction (OSPI) has involved its staff, educators in the field, and concerned citizens throughout the state in the development of Action Goals for the Seventies, which, if achieved, will result in quality education.

These goals are:

1. The educational system must provide opportunities which help students master the basic skills of reading, communication, computation, and problem solving.
2. The educational system must provide an environment which helps students, parents, and other community members demonstrate a positive attitude toward learning.
3. The educational system must foster a feeling of adequacy and self-worth on the part of the students.
4. The educational system must provide opportunities for students to express the full extent of their creativity.
5. The educational system must provide experiences which help students adapt to a world of change.
6. The educational system must provide an environment which brings about appreciation for and positive attitudes toward persons and cultures different from one's own.
7. The educational system must provide equal educational opportunities for all.
8. The educational system must provide every student with opportunities in training for the world of work.

9. The educational system must provide experiences which result in habits and attitudes associated with citizenship responsibilities.

These Action Goals serve as the standard against which some of the more elusive aspects of quality may be defined and measured.

By pointing to these Action Goals as guideposts, the task of finding the exact combination of facilities, materials, and personnel that best meets the unique educational needs of their community can be left to educators and local citizens.

What follows is a list of broad topics relating to the organization, financing, staffing, and evaluation of educational programs and services. An examination of school programs based on these considerations may be used to determine the excellence of such programs and to assess the financial status of school districts according to type. These evaluative considerations include (but are not limited to) the following:

1. Scope of program
2. Nature of educational services
3. Success of students
4. Administrative, supervisory, and instructional staff
5. Facilities and materials
6. Economic strength
7. Community factors
8. Equal educational opportunity
9. Administration

SCOPE OF PROGRAM

The task before the public school is enormous. It must take students of widely divergent backgrounds, interests, and abilities and help equip them for the varied responsibilities of citizenship, parenthood, and a career. To do this requires that the public school provide its students with programs and services ranging from instruction in basic reading and mathematical skills to career counseling. Any evaluation of the appropriateness and effectiveness of a school's overall program should be based upon the following considerations:

1. Basic curriculum content
2. Enrichment programs
3. Remedial programs
4. Education in Contemporary issues
5. Flexibility in schedule
6. Individualized study opportunities
7. Opportunities for creativity for staff and students
8. Use of community resources for instructional purposes
9. Planned procedures for change
10. Awareness of ethnic diversity

EDUCATIONAL SERVICES

The scope of public education has expanded considerably beyond instruction in the "Three R's." Today a quality education program offers its students a wide range of noninstructional services whose ultimate purpose is the enhancement of the learning potential of each student. Such an educational services program should not be developed piecemeal, but should

stem from a comprehensive services plan which takes into account the full spectrum of student services needs. Care should be taken to insure that such services as are offered are appropriate to the need, and that the scope and objectives of such programs be clearly defined. Students and staff alike should be made fully aware of the availability of such services, as should the community at large.

Any evaluation of the appropriateness and effectiveness of educational services programs should be based on these considerations:

1. Qualifications of administrative staff
2. Qualifications of teaching staff
3. Range of pupil personnel services
4. Adequacy of physical plan (in terms of programs)
5. Flexibility of building
6. Transportation
7. Use of aides
8. Use of clerks
9. Use of student leaders
10. Use of teacher talent
11. Financial support
12. Opportunity for student self-expression
13. Philosophy
14. Objectives

SUCCESS OF STUDENTS

The success of the schools is best judged by the success of the students who attend them. One of the strongest nationwide trends currently affecting education is the demand by taxpayers that education dollars produce measurable

education outcomes. Student success, as measured in academic, vocational, and social terms, is the final measure of the quality, scope, and relevance of a school's program.

Many teachers and administrators, however, feel strongly that assessment should not mean simply standardized testing, nor should the results of such assessments be used as a bludgeon against professional personnel.

Pupil performance evaluation should be based on the following considerations:

1. Achievement levels in school
2. Activities pursued
3. Attrition
4. Types of careers followed
5. Social development
6. Nature and range of nonacademic interests
7. Nature and range of academic interests

STAFF

The school staff lies at the heart of the educational process. The importance of the administrative, supervisory, and instructional staff of the schools makes it imperative that close attention be paid to their selection and their function within the system. Evaluation of overall staff capability and performance requires a careful examination based upon the following considerations.

1. Credentials
2. Continuing education
3. Adaptability

4. Sensitivity to needs of others
5. Willingness to experiment
6. Involvement with professional organizations
7. Professional accomplishments
8. Rapport with students
9. Rapport with staff
10. Willingness to accept criticism
11. Policies and rules relating to staff performance
12. Communication skills

FACILITIES AND MATERIALS

School facilities and materials include the buildings, the indoor and outdoor spaces, and the equipment with which the activities and programs of the school are carried out. Thus the quality of the facilities and materials is directly and inseparably related to the quality of a school system's programs. Evaluation of school facilities and materials should be based upon these considerations:

1. Suitability for program
2. Adequacy for program
3. Flexibility in use
4. Comfort
5. Safety
6. Harmony with surroundings
7. Economy of maintenance and use
8. Convenience of location
9. Accessibility
10. Provisions for long-range planning

SIZE AND ECONOMY

A school district should be able to support financially the kind of educational program implied by the state's constitutional mandate, which calls for the state to "provide for an efficient system of high quality public educational institutions and services." Each administrative district should have sufficient enrollment and financial resources to make possible the establishment and maintenance of these kinds of quality educational institutions and services.

Enrollment

All territory in the State of Illinois should be organized into local districts to include a pupil population sufficiently large to make it possible to provide an educational program which meets--with quality, efficiency, and economy--the present and probable future educational needs of all elementary and secondary school children and youth in the district. A comprehensive enrollment profile includes data on these points:

1. Total district enrollment
2. Teacher-student ratio
3. Attendance center enrollment
4. Enrollment per grade
5. Enrollment per square mile

Finances

Any evaluation of the financial and enrollment status should be based upon the following considerations:

1. Assessed valuation
2. Assessed valuation per pupil

3. Per capita personal income
4. Operating expenses per pupil
5. Per capita tuition charges
6. Local, state, and federal revenue shares
7. Tax rates
8. Tax rate per assessed valuation index
9. Teacher salary differentials
10. Bonded indebtedness

COMMUNITY FACTORS

The schools cannot exist apart from the community they serve. The fate of one is inextricably linked with the fate of the other. If the relationship between the community and its schools is a close one, in which each party shares the trust and confidence of the other, the schools and the community will thrive. It is the responsibility of all citizens concerned about the quality of public education to establish that kind of relationship.

An evaluation of the effect community factors have on the quality of local education should be based upon these considerations:

1. School-community relations (formal and informal)
2. Use of community facilities for school activities
3. Expansion of school program beyond school building
4. Participation in community affairs
5. Alumni relations
6. Out-of-school work programs
7. Service of complaints from public

8. Types of contacts between school and community
9. Awareness of community values
10. Awareness of local power structure
11. Use of community leaders

EQUAL EDUCATIONAL OPPORTUNITY

It is the responsibility of the state to ensure that every child in Illinois is afforded an equal opportunity for a quality education. Discrimination may be the product of racial bias, language differences, financial disparities, or cultural conflicts. To the extent that if discrimination is allowed to impede the full educational development of a child, Illinois education has failed to fulfill its constitutional mandate. Schools and school districts should therefore undertake to end discrimination in all its forms. Evaluation of the extent to which equal educational opportunities are being provided should be based on these considerations:

1. Racial integration
2. Funding levels among attendance centers
3. Instruction for non-English-speaking students
4. Programs for exceptional children

ADMINISTRATION

Through the leadership of the administrative staff, the goals and educational guidelines of each administrative district should be clearly established by the Board of Education and other policy making personnel. It then becomes the responsibility of the administrative staff to organize the available staff, material, and financial resources in the most efficient and effective manner to accomplish these goals. Evaluations of administrative leadership should be based on the following considerations:

1. Size of administrative staff
2. Rules and policies
3. Management
4. Articulation with other schools
5. In-service training

CHAPTER IV

OPPORTUNITIES FOR EXCELLENCE

A SURVEY OF SELECTED ILLINOIS SCHOOL DISTRICTS

A representative sample of Illinois school districts was surveyed during the month of December 1972. This survey, undertaken at the direction of Senate Bill 1556, was intended to aid the Committee on School District Organization in its assessment of the organization and structure of Illinois public schools as it relates to quality education.

The survey sample was comprised of a total of fifty-nine school districts selected by the Division of Research, Planning and Development of the Office of the Superintendent of Public Instruction in Springfield as being representative of all Illinois districts in terms of type, size, wealth, and geographic location. (See Appendix Exhibit J for a list of districts included in the survey sample and Appendix K for the map showing the distribution of those districts.) Districts were surveyed by professional educators selected for the task by survey personnel. The survey itself took the form of intensive interviews with district superintendents and other professional personnel. Inquiries were directed toward the collection of a wide range of information relating to the many facets of school district operations. Discussions ranged over such topics as the nature and extent of basic curricula, the types of enrichment programs offered, the nature and number of special services provided, the range of extracurricular offerings, the professional qualifications of district staff at all

levels, the adequacy of physical facilities, and the status of school-community relations. Hundreds of items of information about the operation of each district were thus assembled and delivered to survey personnel for analysis and review.

Interview techniques such as that used in the course of this survey cannot measure the more elusive aspects of quality in education. The survey does, however, paint a vivid picture of the range of learning opportunities available to Illinois children in the public schools.

An examination of the overall nature and extent of these opportunities in light of the Action Goals provides a useful index of how closely Illinois schools, in their present form at least, approach the ideal of a quality education for every child in the state.

SURVEY RESULTS

Curriculum

The nature and scope of the basic curriculum varies little from district to district throughout the survey. Fifty-five districts offer a program of basic instruction typical for their size and district type. Generally speaking, courses in the major disciplines of English, mathematics, science, and social studies are limited to basics--there is little course depth in any of the areas. Foreign language is rarely found at any level of instruction, opportunities for instruction in music and art are minimal, and vocational training opportunities are limited. Courses dealing with such contemporary concerns as consumer education or ecology are rare.

There are exceptions to the rule. A few small rural school districts, for example, whose overall curriculum is little more than adequate, offer programs in agriculture, business, or home economics which are unusually extensive for their size. Isolated cases such as these, however, reflect educational priorities peculiar to a particular region, and do not accurately represent the range of the districts' curriculum as a whole.

Without exception, the half-dozen districts in the sample which offer their students a wide range of basic curricular offerings are large for their type and are situated in the predominantly metropolitan areas of the state. Separate course offerings in each of several major subject areas are well-developed, and together span the breadth of each discipline. Opportunities for instruction in vocation and business skills are typically numerous and varied in such districts, as are courses in music, art, and foreign language. In addition, such districts provide instruction in such subjects as consumer education, drug education, and career education.

All the districts surveyed keep course offerings current and up-to-date. Larger districts, regardless of type, make a practice of reviewing course texts, instructional materials, and content periodically. In smaller districts, the review of curricular offerings is primarily the responsibility of individual teachers, who recommend whatever revision they deem necessary to their superintendent and/or principal.

In some cases, such review is undertaken prior to the start of each new academic year; in others, curriculum review is done at intervals of two, three, or four years. Not one of the sample districts updates its curricular offerings less often than once every five years.

The basic curriculum staff of only twelve of the fifty-nine districts

surveyed operate under any kind of formal organizational structure such as curriculum departments or committees. As might be expected, ten of these twelve districts have large enrollments for their type, since small school districts with few staff have little need for such formal arrangements. In the balance of the sample districts, decisions on the structure and organization of the basic curriculum are the result of informal personal contact between teachers and superintendent.

Few of the sample districts show evidence of a well-developed program of enrichment offerings which might complement and enhance the basic curriculum. The twelve districts which do offer something out of the ordinary typically limit access to such enrichment programs to gifted students only. Notable exceptions to the rule include: an elementary district which enrolls fewer than one hundred pupils which employs an outside consultant who provides the district's older students with instruction in creative writing and ecology; a large elementary district which offers a special "world of work" program to students from poverty families; a large suburban high school district which offers an extensive art and drama program; and a small rural unit district which offers its students a broad selection of mini-courses plus release time from regular classes for individual study. Extracurricular programs offered by the sample districts vary little in nature, regardless of the districts' size, type, or location. (Larger districts have a wider range of such activities chiefly because their larger enrollments make a wider range of such activities possible.) Typical extracurricular activities include: clubs (FFA, GAA, service clubs, etc.), recreational activities (intermural and intramural athletics, gymnastics, etc.), and music (choir, band, etc.).

The nature and availability of formal remedial education programs varies widely from district to district throughout the survey sample. Of the fifty-nine districts surveyed, for example, only seventeen offer some kind of remedial reading program at some level of their instructional program. Only nine districts provide students with an opportunity for remedial instruction in mathematics. A scattering of districts offer programs for the educable mentally handicapped, the trainable mentally handicapped, and those with learning disabilities. Some additional services such as speech therapy are provided, but the incidence of such programs is low. Eight districts make use of Federal Title I monies to provide remedial instruction. Five of the sample districts do not offer remedial education of any kind at any level.

Thirty-two districts provide some kind of remedial education personnel. In the larger districts, such personnel are often full-time professionals; in others, the in-house remedial education staff may consist of a regular teacher who devotes a few hours per week to remedial education (in one small elementary district, for example, the art teacher is available during study-halls for such duty).

Formal provisions for individualized study are limited, regardless of districts' size or type. Those programs which are offered are typically limited to the gifted student only. Exceptions to the rule are the larger districts, particularly those located in or near major metropolitan centers. One large elementary district in the Chicago area, for example, offers a program of individualized reading instruction in Grades one through eight. Junior high school students in the same district have the option of contracting with individual instructors for independent study. Similar

programs are offered in two large high school districts, one of which also provides its students access to a well-equipped learning resource center. In nearly all cases, learning in the sample districts is accomplished in the classroom under the direct supervision of the teacher as part of the usual classroom routine.

The range of opportunities for the expression of student creativity is similarly limited throughout the survey sample. Outside of the limited creative outlets available in the course of routine classroom work, the expression of student creativity is confined to assorted public displays of art work and occasional science fairs and competitions. Programs such as those offered by a small Central Illinois elementary district, which offers pupils the chance to write and produce original dramas, or the large suburban elementary district which gives seventh and eighth graders the opportunity to produce their own television programs, are rare.

With the exception of elementary level activities scheduled by teachers in self-contained classrooms, sample districts use the traditional schedule which divides the school day into equal length periods of forty-five to sixty-minute duration. Some minor variations are evident, such as one district's limited use of modular scheduling, but in the main daily activity schedules show little flexibility beyond adjustments made for such activities as science labs or industrial arts shops.

Instructional Materials

The bulk of the districts surveyed have procedures for the periodic review and revision of textbooks and other instructional materials.

In most cases these procedures are extremely informal--in many of the smaller districts, individual teachers are given the responsibility of deciding when and how such materials are to be updated. In no case is such review undertaken less often than every four to five years.

Seventeen of the districts surveyed (29%) do not have a full-time librarian. Many of the smaller districts do not have a central library facility, relying instead on collections of books stored in individual classrooms. The situation is complicated by the fact that most of these districts are located in small towns or rural areas, where most pupils do not have easy access to the resources of a city library. (Thirteen of these districts are small and four are large).

Few of the surveyed districts have a well-developed collection of nonprint instructional materials such as films and recordings. Such materials are usually expensive to purchase, and further require the purchase of equally expensive projection and play-back equipment. Districts which cannot justify a sizable investment in nonprint materials sometimes take advantage of county or regional film cooperatives. By pooling their limited financial resources, many small districts are thus able to gain at least temporary access to such instructional tools.

Staff

Overall staff qualifications in the sample districts are adequate in terms of minimum state standards. In no case is a district administrative staff less than fully certified, and the greatest majority of districts employ superintendents with at least a Masters' Degree. Supervisory and

instructional personnel on the average are fully certified. The incidence of nondegree certified teaching personnel is low, in no case amounting to more than a very small portion of the total staff.

Two sample districts are unusually well-staffed. One elementary district enrolling over six thousand students, supplements its regular teaching staff with fifty-two teacher aides, and seven out of every ten staff members of a secondary district which enrolls nearly two thousand students have a Master of Arts Degree. A small unit district includes three Ph.D.'s on its payroll, an unusually high number for a system of its size.

Eighteen sample districts have no policy regarding the upgrading of staff credentials. Of this number, fourteen are small for their type, the balance large. Four districts insist that personnel upgrade credentials periodically as a condition of continued employment (one large elementary district, for instance, requires that staff accumulate at least six credit hours toward a masters degree before tenure is granted). Incentives for upgrading are typically built into the salary schedules of the sample districts.

Opportunities for continuing education of staff at all levels is limited throughout the sample. Eight districts of the fifty-nine sampled provide their staff with financial assistance for continuing education. Such assistance takes the form of tuition payments, travel expenses for trips to conventions, workshops, etc. (of these eight districts, seven are large, one is small). The remainder of the districts rely upon the usual county and state workshops and institutes. Nearly every sample district cited their proximity to nearby colleges and universities as the principal opportunity for their staff's continuing education.

The level of staff involvement in professional organizations varies widely through the sample. The determining factor seems to be not size or type of district, but the attitude of the district board and superintendent toward such involvement. Many districts encourage membership in a variety of professional organizations, in some cases by paying membership dues for district staff members. The staff of such districts tend to have a relatively high level of involvement. Staff of districts which do not offer such financial or policy incentives tend to show little involvement in any but the most routine professional associations, committees, and organizations.

Administration

Six of the sample districts do not have a full-time superintendent. In such cases, the districts are small, and use the superintendent either as a teacher (as in the case of three small elementary districts whose superintendents teach half or full time every day) or as an attendance center principal. All other sample districts have at least a superintendent who devotes all of his time to district administrative duties. In many cases, this superintendent is responsible for the performance of practically all of the district's administrative functions, and serves as a one-man personnel director, academic planner, and public relations expert. As districts grow larger, superintendents are aided in their work by a variety of additional officers and assistants. Specialization in central administration does not occur until districts reach a considerable size (5,000-10,000 students), when budget officers, curriculum specialists or

coordinators and data processors can be used to maximum advantage.

All but three of the districts sampled have policy and rules statements which are clearly defined and in written form. (Such policy statements usually take the form of teachers' and parents' handbooks.)

Only eleven of the sample districts have any planned procedures for changes in organization or program. Responsibility for planning in such cases resides with academic councils, curriculum committees, or advisory committees operating under a superintendent or (in the case of large districts) an attendance center principal. The balance of the districts rely upon informal daily contact among various school personnel to exchange information and opinion, devise alternatives, and recommend any changes deemed advisable.

Procedures for articulation of program at all levels are limited. Articulation within attendance centers is accomplished by the usual means of faculty meetings, bulletins, and informal contact between teaching staff and district administrative officers. Articulation between attendance centers in the same district is accomplished in much the same manner--contact among staff is frequent, and covers a broad range of school operations.

Articulation between school districts, however, is much more infrequent and limited in scope. Contact between districts is often limited to meetings of county or regional special education cooperatives or vocational education centers. Dual districts which send or accept students from nearby districts meet on a regular basis (once or twice a month on the average). Routine articulation of program with nonschool agencies and organizations is practically nonexistent, with the exception of contact with nonschool participants in assorted vocational education programs.

Opportunities for the in-service training of district administrative personnel (including attendance center personnel) are limited. All districts rely on the county and state institutes and workshops cited previously. Beyond that, only two districts (both large suburban districts) offer any special in-service training program for district administrative personnel. In one case, for example, the district offers an eight-week course for attendance center principals and related staff taught by central administrators. In another, weekend in-service workshops for administrators are provided by the district.

Community Factors

Five of the districts sampled make no use of community resources in school programs. The remaining districts do to varying degrees. Typical ways in which community resources are used include recreational resources such as city parks and swimming facilities used as sites for physical education classes or competitive athletics and field trips to area nature preserves, lakes, and museums made as part of a wide range of course offerings. Many districts (particularly those which are small or financially limited) are not able to make full use of their community's resources. The number of field trips, for example, is limited in many districts by a lack of transportation facilities or money. A few districts make an extra effort to broaden the scope of school programs to include the community. One large unit district in the central part of the state provides each attendance center with its own budget for such activities. Another large unit district, this one in Southern Illinois, limits the use

of community resources only to the initiative of individual classroom teachers, who are encouraged to plan any activities they deem beneficial. A small elementary district in the East Central region of the state provides for ten field trips per year for the entire school in the immediate area, and another ten per year to more distant points of industrial, recreational, and historical interest.

The nature and frequency of community use of school resources also varies throughout the sample districts. One district notes no use at all, while another opens its buildings to the public five nights a week for a variety of activities. In general, school resources are used for recreational programs, club meetings, and limited adult and continuing education programs. The incidence of use typically increases in the case of rural and small town school districts, where school gyms and assembly rooms are often the only facilities of that size and nature in the area. In some such cases, the schools are focal points of community activity, serving as the meeting place of village boards of trustees, service clubs, dance groups, etc.

Twenty-five sample districts have no formal school programs conducted wholly or in part in the community (of this total, fifteen are small districts). The balance of the sampled districts do have programs, which are limited almost without exception to some kind of vocational training or work-study program which require the use and access to equipment or personnel not available in most school settings. Beyond these programs, districts of all sizes and types limit instruction to the classroom or school building.

Fifty-three of the sample districts have some kind of formal community

relations program. In nearly all cases, such programs are limited in scope, typically amounting to little more than regular press releases issued by the superintendent to area newspapers and radio or TV stations. A scattering of larger districts publish a regular newsletter which is mailed or delivered to parents detailing school activities, changes or proposed changes in school programs, additions to the staff, etc. One large high school district provides a speakers' bureau and news coordinator for each attendance center. Nine of the sample districts have no community relations program of any kind; seven of these districts are small for their type.

Complaints from the community are handled in a variety of ways by the districts sampled. In many of the smaller districts, the superintendent and board members are known personally to large numbers of local citizens. Contact with school personnel is frequent and informal, and provides many opportunities for the expression of grievances. In such cases, formal procedures for the handling of complaints are unnecessary and superintendents and board members usually handle such problems personally. This kind of personal service is impossible in larger districts. In these cases, complaints are referred to the lowest administrative level possible as a matter of policy, where they are processed through the administrative chain of command until they are resolved to the satisfaction of those involved.

Opportunities for two-way communication between school district personnel and the public at large are limited throughout the survey sample. Such opportunities are limited or nonexistent in eleven of the sample districts. Most small districts cite the frequency of formal and informal contact with school personnel as opportunities for such communications.

In six of the sample's larger districts, where such person-to-person contact is difficult, an assortment of formal mechanisms to facilitate two-way communications have been established. Such arrangements take the form of community school councils, parents' advisory committees, etc. In many cases, school-related organizations such as PTAs serve as the means by which communication is accomplished.

Educational Support Services

Thirty-eight of the districts sampled offer only those educational support services required by state law. District personnel in several cases noted that their services programs were limited by a lack of money with which to finance them--full-time speech correctionists, social workers, or health care personnel are expensive, and many districts simply cannot afford them. Twenty-one districts rely upon the part-time professional services made available through Special Education Cooperatives. A great many of these districts would find the support of their own remedial education programs financially impossible; membership in such county or regional cooperatives makes it possible for districts with limited financial resources to provide their pupils at least some special services of this type.

Only eleven of the districts sampled have any sort of diagnostic testing program to identify pupils suffering from physical, mental, or emotional learning handicaps. The remaining districts in the sample rely upon referrals by classroom teachers, school administrative staff, and occasionally parents in deciding upon the placement of such students.

Without exception, the sample districts provide transportation to those students living more than $1\frac{1}{2}$ miles from school. Two districts offered special supplementary transportation service to kindergarten pupils and special education pupils, but the overwhelming majority provide bus service only to the extent required by law.

Only five of the sixty sample districts do not offer hot lunch to their students (of this number, four are small for their type, one large).

Twelve of the districts surveyed do not make any professional guidance personnel available to their pupils. (Eleven of these districts are small for their type.) A few of these districts do provide some kind of counseling, but it is handled on a limited part-time basis by regular classroom teachers, or (in the case of one district) by the superintendent. All other sample districts have at least one full-time guidance staff member. The ratio of guidance personnel to students in these districts is high.

Sixteen of the districts sampled rely upon occasional visits by county nurses or county health department personnel for the provision of basic health care for district pupils. The remaining districts provide their own health care personnel. Although most of these districts limit such personnel to a single full-time nurse, there are exceptions (such as the district which provides free dental care to all students who require it).

Fifty-one of the fifty-nine sample districts offer their students at least limited psychological counsel or diagnosis. In all cases these services are provided through special education cooperatives. A scattering of larger districts employ their own full-time social workers, vocational education diagnosticians or speech therapists, but such instances are rare. It is more common for districts to rely upon local social service

agencies or special education cooperatives to provide such additional support services.

Fifty-six of the districts surveyed have some type of periodic testing programs used to determine the scholastic achievement levels of district students. The exact nature and extent of these testing programs vary from district to district and tend to broaden as districts increase in size. Three of the sample districts have no testing program of any kind.

Eighteen of the sample districts list no follow-up data of any kind dealing with the scholastic achievement or job performance of former students. One large unit district in Southern Illinois undertakes a yearly follow-up study of vocational education students and periodic follow-up studies of the general student population. A large elementary district, also in Southern Illinois, maintains an extensive microfilm data file on all former students consisting of information collected from a wide variety of sources. A small elementary district in Central Illinois is near the end of a special five-year study of district graduates. Aside from these exceptions, follow-up data is limited to grade reports furnished to feeder elementary districts by secondary districts.

Students in the sample districts typically have limited input into the processes of curriculum development. Four sample districts offer students unusual opportunities to assist in the shaping of the curriculum. In one large metropolitan unit district, student opinion concerning curriculum is surveyed annually, and students serve on task force committees responsible for curriculum review. In a large unit district in Southern Illinois, students serve on an evaluation committee which reviews the district's courses of study. In a small unit district, students are allowed

to devise their own curriculum to an extent by petitioning individual instructors to offer mini-courses dealing with topics of student interest.

In a large suburban high school district, student opinion about the curriculum is surveyed annually, and students sit on committees responsible for the planning of the school curriculum. In all other cases, students' input is limited to informal suggestions to teachers and administrators or the slightly more formal means of recommendations from student councils.

The involvement of students in the development of disciplinary guidelines and procedures is also severely limited. If students are allowed input at all, it is limited to suggestions and requests made through student councils. Exceptions such as that of the large suburban high school district, which seats students as members of the committee responsible for the formulation of disciplinary rules, are rare.

School governance is almost exclusively the province of school personnel. Fifty-seven of the sample districts do not grant students an opportunity to formally participate in the process of school governance beyond the limited role played by student councils. Two large metropolitan districts are exceptions to this rule. One seats students on a joint faculty-student human relations commission. A second allows students representation on principals' advisory boards in the high schools, which make recommendations concerning school rules, curriculum development, social activities, etc.

Extracurricular activities are one facet of school life over which students exercise some control. Specific activities are commonly planned by the students in cooperation with a faculty advisor. In a few cases, student councils or other representative student groups are given the

opportunity to develop the schedule for speaker programs or special assemblies.

Facilities

An overwhelming majority of the districts surveyed operate with buildings and building sites which are at least adequate for the programs now in use. This is not to say that present facilities completely meet educational needs. Most districts are forced to operate in facilities which lack the flexibility which allows the accommodation of a wide variety of instructional and recreational activities under a single roof. Many districts lack facilities for specific types of activities such as workshops for industrial arts classes or science labs. Nearly all district facilities surveyed meet minimum comfort standards, and only 12% are not in total compliance with current Health and Safety Code requirements.

Facilities are generally considered to be conveniently located for use by both student and general populations, and nearly all are located on sites ample enough to provide sufficient space for a variety of school-related outdoor activities.

Generally speaking, most district facilities are adequate to meet the needs of the handicapped, although a few could use building space designed specially for the instruction of handicapped students.

Relatively few districts (12 or 20%) have a written long-range plan for meeting future facilities needs. Several of those districts which lack such a plan are situated in areas of static population growth, and do not foresee the need for expansion of their physical plant.

SUMMARY

The information collected in the course of the school district survey reveals a great deal about Illinois public schools. It is the common judgment of the survey consultants and staff that the basic curriculum offerings in most Illinois school districts are little more than adequate. The range of instructional programs rarely extends beyond the traditional offerings in English, science, mathematics, and social studies. The depth of course offerings within each of these broad subject areas is likewise limited. Enrichment programs which might supplement the basic curriculum are limited at best, particularly in the smaller districts sampled. The small enrollments of the sample's smaller districts make specialization of program difficult. The needs of students whose academic interests or abilities differ significantly from the average tend to be served badly or not at all. Districts of all sizes and types keep course materials and content reasonably up-to-date, but there is little evidence that most districts have been able to keep their curricula as current as their textbooks.

Remedial education programs are limited in number and scope, and few districts are able to meet the remedial education needs of all their students. Small districts in particular either find it difficult to fund a full range of remedial programs or do not have enough students to make such programs feasible. The result is a patchwork of inadequately staffed programs.

One of the stated aims of the Action Goals is the increased individualization of the education process, yet few of the districts sampled offered more than minimal opportunity for such individualized study. A scattering

of large metropolitan districts do offer such opportunities, but even here the chance to learn in anything but the traditional group-oriented classroom is limited to a handful of students.

The small teaching staffs typical of smaller districts make specialization of function within the staff impossible. The result is the frequent assignment of instructional personnel to tasks for which they are inadequately prepared by training or experience.

Although nearly every sample district encourages its staff to upgrade their credentials through continuing education (chiefly through salary incentives and tuition payments), few districts require it. Opportunities for continuing education are limited to extension courses offered by nearby colleges and universities--few districts have the resources to provide such opportunities.

The enrollment of most districts sampled is too small to justify the employment of more than a single central office administrator. Specialists in business management, curriculum development, etc., are beyond the reach of these small districts, and district superintendents typically perform all such duties unassisted. Significant specialization in the performance of district administrative functions does not occur until districts reach a size considerably larger than that maintained by the majority of Illinois school districts.

Less than a quarter of the districts sampled in the survey implement planned procedures for change. Articulation within and between attendance centers in the same district is typically very good--meetings of school personnel at all levels are frequent and cover a wide range of topics. Articulation between school districts is less thorough, and is usually

limited to those dual districts which send or receive students from nearby districts. Coordination of programs and services with nonschool agencies and organizations is very limited except in the general area of vocational education, mainly because few districts need or choose to make use of resources outside the school system itself.

Few districts have formal community relations programs. Complaints from the community are processed in a variety of ways, depending chiefly on the size of the district. Opportunities for two-way communication between schools and the public are limited throughout the sample--a few of the sample's larger districts have established formal community advisory boards or committees, but in general there is little evidence of systematic attempts on the part of school districts to afford the public an opportunity to ask questions, air grievances, or make suggestions.

The greatest part of the districts surveyed provide only those special educational support services which are required by law. Were it not for their membership in county or regional special education cooperatives, many of these districts could not provide even minimal services to students suffering from physical, emotional, or learning disabilities. Again, it is only in the larger districts that programs of adequate breadth are encountered, and it is probably safe to say that even here programs often fall short of meeting the need.

Students typically are given little opportunity to participate in the processes of school governance in any meaningful way. With few exceptions, student involvement in the processes of curriculum development, policy making, and school administration is nonexistent or restricted to a limited advisory role.

Nearly every district sampled used facilities judged adequate for the types of programs now in operation. There is little evidence, however, that school buildings depart from the traditional design featuring many separate self-contained rooms of fixed function and capacity, and inflexible or outmoded school facilities too often give rise to inflexible or outmoded school programs.

The relationship between a district's wealth and the breadth of its program was a faint one. Small districts which offer minimal programs and larger districts which offer broad programs ranged from very poor to very rich in terms of the district's assessed valuation per pupil.

There is little evidence in the survey results indicating that the quality of educational opportunity differs significantly between dual and unit districts. Among both the sample's dual and unit districts, program and service offerings ranged from very limited to comprehensive in scope.

In conclusion, it is noted that school district size (as measured by enrollment) is apparently a more critical factor in determining the scope and overall adequacy of a district's programs and services than its wealth (as measured by AVPP) or its organizational type. This is not to say that a large enrollment will of itself guarantee that a district be able to provide a wide range of learning opportunity to its students, or that large districts as a group necessarily provide their pupils with a better education than small districts. In those cases in which significant trends in programs, practices, and policy developed, however, those trends developed along lines of size.

CHAPTER V

AGENDA FOR CHANGE

CONCLUSIONS:

Of the measurable factors affecting the quality of local educational opportunity, district size is most critical. The results of the school district survey outlined in Chapter IV indicate that districts of minimal size are generally inadequate to the task of providing the increasingly broad range of educational programs and services demanded of today's schools. This situation is largely true regardless of the wealth, organizational type, or geographic location of such districts. School programs of the breadth and depth described in Chapter III as desirable are typically found only in those districts which enroll enough students to make such programs administratively feasible and which can provide the financial resources necessary for their support.

Chapter II cites examples from the growing body of research indicating that small school districts are unable to derive maximum benefit from their investment in education. Overly small teacher-pupil ratios, limited facilities, and disproportionate administrative costs cause operating costs per pupil in small districts to run higher than those of larger districts. Even in cases in which small and large districts expend equal amounts of money per pupil, the operating inefficiency of the small districts prevents their making maximum use of the education dollar. The result is that small districts often provide limited programs at a disproportionately high cost.

The unequal distribution of local school revenue resources is a serious problem in Illinois. Districts whose territories encompass areas of uniformly high wealth (or poverty) have a distinct financial advantage or disadvantage compared to other districts. Since (as is pointed out in Chapter II), sizable differences in local wealth result in sizable differences in the amounts of school revenue generated at the local level, pronounced disparities presently exist in the ability of local districts to provide the level of personnel, facilities, and services necessary for a quality school program. Furthermore, residents of wealthy districts are able to provide more local school revenue with lower tax rates than residents of poor districts. To the degree that the present patchwork pattern of fragmented districts tends to isolate pockets of both poverty and privilege, many small school districts perpetuate fiscal injustice. Equal opportunity cannot become a reality in Illinois until such fiscal inequities are remedied.

The report does not attempt an analysis of the differences in operating costs between unit and dual school districts. This is a complex question, and although some studies have indicated that dual districts tend to cost more to operate on a per pupil basis than unit districts of comparable size (see the reference to Hickrod and Sabulao's "Optimum Size of School Districts Related to Selected Costs" cited in Chapter II), the evidence on the subject presented in this report should not be considered conclusive. Further study of the effect of district organizational type on operating costs is needed. The findings of the report do establish, however, that the quality of educational programs, services, and personnel offered

by both the sample's dual and unit districts ranged from very limited to comprehensive in scope.

GOALS

Schools and school districts provide the means by which the state meets its constitutional obligation to provide a "high quality" education to Illinois children. Any school district reorganization plan therefore must have as its ultimate goal the enhancement of educational opportunity. As is noted in the conclusions outlined on the previous page, reforms in the structure, financing, and operation of the Illinois public school system are urgently needed if the state is to accomplish this goal with economy and effectiveness.

The conclusions of this report lead to this statement of goals for reorganization:

TO ENABLE EACH ILLINOIS SCHOOL DISTRICT TO PROVIDE A RANGE OF HIGH QUALITY PROGRAMS ADEQUATE TO MEET THE EDUCATIONAL NEEDS OF EVERY PERSON.

Illinois school districts as presently structured are too often unable to provide their students with the teachers, instructional materials, learning resources, and facilities required for basic programs of instruction in communicative, mathematical, and problem-solving skills. Such instruction is an essential part of a quality education, and a school system which fails to provide it for all regardless of ability fails its responsibility to the public.

TO MAKE IT POSSIBLE FOR EVERY DISTRICT TO PROVIDE A COMPREHENSIVE RANGE OF EDUCATIONAL SUPPORT SERVICES.

The scope of the public schools' responsibilities has broadened immensely since the start of the century. Today's schools cannot fully discharge their obligations to the children they serve without providing those children with a variety of services intended to help them reach the limit of their potential. Reorganization should help make it possible for every Illinois district to provide its pupils with a broad range of guidance, counseling, psychological, transportation, and food services. Reorganization should also help local districts provide their staffs with adequate in-service training, supportive research and development, supervisory, and administrative services to enable them to function at the peak of their professional capacity.

TO INSURE THAT EVERY ILLINOIS CHILD IS ASSURED AN EQUAL OPPORTUNITY FOR A QUALITY EDUCATION.

Providing all Illinois school children an equal educational opportunity is a major goal of school district reorganization. Any reorganization of school districts which in any way results in children being deprived of an equal chance for a quality education for racial, social, or economic reasons must be considered unsatisfactory.

TO PROVIDE FOR A MORE EQUAL EXPENDITURE OF EDUCATIONAL RESOURCES AMONG DISTRICTS.

Illinois school districts currently spend from \$500 to \$2,500 per pupil annually. While it is true that money spent is not itself a valid measure of the quality of school programs, it is equally true that a lack of adequate financial support for school programs often cripples their potential effectiveness. Significant differences in educational expenditures at the local level is one of the prime causes of inequality of educational opportunity.

TO ACHIEVE THE MOST EFFICIENT USE OF EDUCATIONAL RESOURCES AT
THE LOCAL LEVEL.

Limitations of size, type, or operations prevent many Illinois districts from making maximum efficient use of the physical, human, and financial resources at their disposal. Helping each Illinois community to realize the greatest possible benefit from each education dollar spent is one major goal of school district reorganization.

RECOMMENDATIONS

In order to insure that all Illinois children attend school in districts able to provide a quality program, and to further insure that school district reorganization proceeds in an efficient and orderly manner, the following recommendations are made:

Recommendation 1

TO DEVELOP A MANDATED PLAN FOR THE REORGANIZATION OF ILLINOIS SCHOOL DISTRICTS CONSISTENT WITH ENROLLMENT STANDARDS OF THE STUDY.

Many of the problems now plaguing the Illinois public school system are the direct result of conflicts and inefficiencies caused by the tangle of districts that have resulted from the various patchwork reforms implemented over the past several decades. A mandated state plan for reorganization would insure that all new districts brought into being as a result of future reorganization will be not only different from, but better than existing districts.

Recommendation 2

ALL PHASES OF REORGANIZATION ACTIVITY SHOULD BE PRECEDED BY LOCAL STUDY AND PLANNING.

Each Illinois community has unique problems and potentials. School district reorganization plans must take local social, economic, and geographic factors into account if it is to successfully accomplish its purpose. Data concerning all facets of community life affecting (and affected by) school district organization should be collected and analyzed, the implications of reorganization examined, and possible alternatives developed and discussed before any final action is taken. The Office of the Superintendent of Public Instruction should make available to local groups whatever professional and technical assistance is required to insure that such local study and planning efforts are thoroughly and efficiently carried out.

Recommendation 3

THE STATE SHOULD HAVE THE AUTHORITY TO REVIEW AND APPROVE ALL SCHOOL DISTRICT REORGANIZATION PROPOSALS.

The purpose of school district reorganization is compromised if unsupervised local reorganization efforts result in the creation of inadequate new districts or the continued existence of presently inadequate districts. The state should have the responsibility for the overall supervision of local reorganization activity to insure that such reorganization proceeds in an orderly fashion and meets stated goals and guidelines. Review and approval authority is essential for this task.

Recommendation 4

A STATEWIDE REORGANIZATION COMMITTEE SHOULD BE ESTABLISHED BY LEGISLATION TO MONITOR THE REORGANIZATION PROCESS AND BE RESPONSIBLE FOR SCHOOL DISTRICT REORGANIZATION WHEN LOCAL EFFORTS HAVE NOT BEEN SUCCESSFUL.

This committee shall bear the major responsibility for monitoring and supervising the reorganization efforts of the Educational Service Region

Committees. The Committee shall develop guidelines and standards for a statewide reorganization plan within six (6) months after its appointment.

The State Committee shall be expected to:

- a. Develop a manual of procedure to be printed and distributed to all Superintendents of Educational Service Regions and reorganization committees.
- b. Perform either by itself or by its authorized representatives any or all of the duties required to be performed by the Educational Service Region Committees in case of local efforts not successful by any or all of them to perform these duties.
- c. Provide for interaction and cooperation between Educational Service Region Committees for the purpose of considering districts which should include territory of more than one educational service region.
- d. Review and approve or reject reorganization plans within sixty (60) days after receipt of plans from the Educational Service Region Committee.
- e. Report to each Educational Service Region Committee the acceptance or rejection of the proposed plans with recommendations for changes.

- f. Utilize the Office of the Superintendent of Public Instruction staff to conduct analysis, research, statistical, and clerical tasks as necessary to implement the legislation.
- g. Present a reorganization progress report to the General Assembly at the earliest feasible date.

Recommendation 5

THE SUPERINTENDENT OF PUBLIC INSTRUCTION SHOULD BE RESPONSIBLE FOR WORKING WITH SCHOOL DISTRICTS TO ASSIST IN THE IMPLEMENTATION OF THE MANDATE.

Recommendation 6

REORGANIZATION COMMITTEES IN EACH EDUCATIONAL SERVICE REGION SHOULD BE RESPONSIBLE FOR THE IMPLEMENTATION OF REORGANIZATION OF SCHOOL DISTRICTS.

These Educational Service Region Committees should be regarded as the reorganization agencies that will assume leadership responsibilities of the reorganization of school districts until reorganization plans are fully implemented. The committees should work under the general direction of the State Reorganization Committee. The Educational Service Region Committees should consider the unique factors affecting school district reorganization in local areas. Twelve (12) months is the recommended time limit for the completion of the first reorganization plan, except in those cases in which the State Reorganization Committee grants a deviation.

In carrying forward the program of school district reorganization, the Educational Service Region Committees should:

- a. Prepare a plan for the reorganization of school districts in the educational service region into administrative units that conform to acceptable standards and that have the potential for providing the kind of educational program needed in the area.
- b. Submit this plan to the State Committee for approval.
- c. Take the leadership in submitting the proposals for approval of a majority of voters in the proposed new district once state approval is granted.
- d. Be required to start over again in an orderly procedure if the plan is rejected.

Recommendation 7

REORGANIZATION SHOULD BE ACCOMPLISHED ACCORDING TO THE FOLLOWING PHASES AND TIME SCHEDULE:

Phase I

The reorganization of those school districts which presently fail to meet both minimum criteria of wealth and size by June 30, 1975.

As reorganization efforts get underway, priority attention should be given to those 339 Illinois school districts which presently have both less than average wealth for their type (as measured by assessed valuation per pupil) and less than minimum enrollments established for their type in this report. Phase I of any state reorganization plan should set as its first goal the reorganization of such districts into larger administrative units capable of providing more adequate educational programs and services.

Phase II

The reorganization of those school districts which fail to meet minimum size criteria by June 30, 1977.

Phase II of the reorganization plan should be directed toward the reorganization of those remaining 344 Illinois school districts which, although they are of above-average wealth, do not have enrollments sufficiently large to enable them to put that wealth to efficient and effective educational use.

Phase III

On or before the conclusion of Phase II the responsibility of reassessment of school district organization in Illinois should be transferred to the State Board of Education.

Recommendation 8

ADEQUATE FINANCIAL SUPPORT FOR THE ACTIVITIES OF COMMITTEES AND AGENCIES RESPONSIBLE FOR THE IMPLEMENTATION OF REORGANIZATION PLANS AT ALL LEVELS SHOULD BE PROVIDED BY THE STATE.

Recommendation 9

EVERY ATTEMPT SHALL BE MADE TO ESTABLISH NEW SCHOOL DISTRICTS WITH THE FOLLOWING MINIMUM ENROLLMENTS:

Unit Districts	1,500 pupils
Elementary Districts	1,000 pupils
Secondary Districts	500 pupils

The student population of each district should be sufficiently large to insure that the district's human, physical, and financial resources can be used to maximum educational advantage. It should be stressed that these enrollment standards are minimum standards, and are still substantially smaller than what many persons consider optimum. School districts with these minimum enrollments should have the capability to provide the program

breadth, support services, and staff basic to quality education. In addition, reorganization of present school districts into larger administrative units will (1) make possible more efficient use of school resources; and (2) reduce inequalities in local wealth.

Recommendation 10

NEW SCHOOL DISTRICTS SHOULD NOT BE REQUIRED TO BE LARGER THAN ONE (1) COUNTY IN AREA.

In many of the state's rural areas, low population densities make the establishment of districts of more than minimum size a practical impossibility. Transportation time to and from school sets an effective upper limit on the geographic size of such districts. (This recommendation is not intended to prohibit reorganization across county lines.)

Recommendation 11

A STATEWIDE REORGANIZATION PLAN SHOULD INCLUDE FINANCIAL INCENTIVES FOR REORGANIZATION. PROPOSED INCENTIVES FOR REORGANIZATION MAY INCLUDE, BUT ARE NOT LIMITED TO, THE FOLLOWING:

- a. Optional provision for a new district to assume bonded debt and receive state support for retiring the debt incurred by component districts before reorganization.
- b. State aid for repayment of principal and interest incurred for school construction if needed as a result of reorganization.
- c. Aid to districts which are organizationally sound, but which may be financially troubled as a result of reorganization.

- d. Provisions which guarantee aid from the foundation program and other state aid programs at a level no less than the total which would have been received by the component districts prior to reorganization.

Recommendation 12

STATE AID FORMULAS SHOULD BE BASED UPON A REALISTIC EVALUATION OF LOCAL NEEDS AND LOCAL ABILITY TO GENERATE REVENUE TO MEET THESE NEEDS.

The findings of this report reflect the conclusions stated in A New Design: Financing for Effective Education in Illinois, the report of the Finance Task Force of the Governor's Commission on Schools, which recommends that the state's system of allocating aid to education should be modified in order that present disparities in the degree of local effort required to support school programs may be remedied.

MEMORANDA OF COMMENT

Mr. Robert Beckwith - page 42

The reader might conclude that a unit district is entitled to levy a higher tax rate than the elementary and secondary districts combined. The tax rate stated (.9200% and 3.000%) for the elementary and secondary districts applies to each. The effect upon the tax bill of the local property owner who must support both districts is to permit a minimum rate of 1.8400% without voter approval and up to 6.000% with voter approval. This combined rate results in the dual district tax payer carrying a larger local tax burden than if the elementary and secondary districts were organized as a unit.

Mr. Lynn Wiley - page 79

Many districts are not currently meeting the minimum requirements of the law. The statement on page 79 implies that they are.

Mr. Robert Beckwith -

As of January 1972, 119 elementary districts sent their pupils to two high school districts and 16 sent them to three high school districts. Such an arrangement impairs sound curriculum development and coordination with the high school districts. The report does not address itself to this problem perhaps upon the assumption it would be resolved by the proposed reorganization committees. Nevertheless, I recommend that any mandate regarding school district reorganization include a provision that the territory of all elementary districts must be wholly within the boundaries of a single high school boundary.

Honorable C. H. Thoman -

The student size of school districts cause me some concern. Other factors such as tax base, square miles of district, roads, location, ability to conduct a good educational system should also be considered.

What happens if a district has the required student numbers and then drops below the minimum, would the district then reorganize?

The important issues are the efficiency and effectiveness of a district regardless of size.

EXHIBIT A
ENROLLMENT AND FINANCE DATA
FOR
ILLINOIS SCHOOL DISTRICTS

Definition of Terms, Sources of Data, and Methodology:

EXHIBIT -

"Enrollment and Finance Data for Illinois Public Schools," is intended to provide a comprehensive profile of the size and wealth of each Illinois school district both in absolute terms and relative to other districts in the State. The item-by-item descriptions that follow describe the terms, data sources, methodology, and general organization of the enrollment and finance tables of Exhibit A.

COUNTY -

The data tables list all Illinois operating school districts by county. Counties are arranged alphabetically.

SCHOOL DISTRICT -

School districts are denoted by the legal title and number.

DISTRICT TYPE -

District type is determined by the scope of the program offered by the district. Districts which offer K-8 programs are designated elementary districts. Districts with a 9-12 program are designated secondary districts. Districts offering a K-12 program are referred to as unit districts.

TOTAL ENROLLMENT -

Total enrollment is the total number of pupils enrolled in all grade levels in all schools operated by a district.

Source: Enrollment data is from the 1971-72 school year, and is taken from "Fall Pupil Enrollment and Teacher Statistics," Circular Series A, Number 307, published by the Office of the Superintendent of Public Instruction, Division of Research, Planning, and Development, Springfield, Illinois.

Note: This source includes the latest data on enrollment available in published form at the time of writing. Enrollment data for those districts organized since the publication of Circular Series A, Number 307, was obtained by telephone from the respective district offices.

ENROLLMENT RANK -

Total enrollments were ranked consecutively in descending order regardless of district type. Districts with identical enrollment totals were assigned the same rank number. The range of total enrollments comprised a total of 890 different values.

TOTAL TAX -

A district's total tax rate is defined as the sum of all the separate taxes for education levied by a district. Total tax rate thus includes separate levies for the support of the educational fund, building, operation, and maintenance fund, transportation fund, etc.

Source: The latest tax rate data available in published form at the time of writing is contained in "1970 Assessed Valuations and 1971 Tax Rates," Circular Series A, Number 292, published by the Office of the Superintendent of Public Instruction, Division of Research, Planning, and Development, Springfield, Illinois. As was the case with enrollments, tax rate data for those districts organized since the publication of Circular Series A, Number 292, was obtained by telephone from the respective district offices.

TAX RANK-

Total tax rates are ranked consecutively in descending order according to district type. Among unit districts, the range of total tax rates encompasses a total of 393 values. Among elementary districts, the tax rates included a total of 428 different values. Secondary district tax rates ranged over a total of 139 different values.

ASSESSED VALUATION PER PUPIL (AVPP) -

The assessed valuation per pupil is defined as the quotient of the total equalized assessed valuation of a district and that district's best six months' average daily attendance. The AVPP is expressed in dollar amounts, and is useful as an index of the amount of taxable wealth available to a district for the local support of education.

Source: AVPP data is from 1970, and is taken from "1970 Assessed Valuations and 1971 Tax Rates," Circular Series A, Number 292, published by the Office of the Superintendent of Public Instruction, Division of Research, Planning, and Development, Springfield, Illinois. As was the case with enrollments and tax rates, AVPP data for those districts organized since the publication of Circular Series A, Number 292, was obtained by telephone from the respective district offices.

AVPP RANK -

Assessed valuations per pupil are ranked consecutively in descending order regardless of district type. AVPP rankings for all Illinois districts ranged over a total of 1,072 different values.

EFFORT RANK -

An effort index is a statistical tool designed to portray the actual financial strength of a school district by drawing a correlation between a district's potential wealth (as measured by assessed valuation per pupil) and the degree to which that district draws upon that wealth for the support of local schools (as measured by the district's total tax rate). The effort index is obtained by dividing a district's assessed valuation per pupil by that district's total tax rate.

The resulting number is meaningless in itself. When ranked appropriately, however, this effort index serves to indicate the relative status of Illinois school districts in terms of their ability to generate local money for the support of education.

Effort indexes are ranked consecutively in descending order regardless of district type.

CURRENT OPERATING EXPENSE PER PUPIL (OEPP) -

A district's Current Operating Expense is defined as the total expenditures from the Educational, Building, Bond and Interest, Municipal Retirement and Rent Funds less expenditure for the following: Tuition paid to other districts, Building payments to other districts, Adult Education, Summer School, Economic Opportunity Project, Capital Outlay, Transfers Out, and Bond Principal Retired. The Operating Expense Per Pupil is the quotient of a district's current operating expense and that district's best six months average daily attendance.

Operating expense per pupil is a measure of the amount of money each district is spending to educate each of its pupils.

NOTE: Asterisks mark districts for which current operating expense per pupil was unavailable at the time of writing. In such cases, per capita tuition charge is used in place of the OEPP as an indicator of per pupil expenditure.

^aSubject to possible backdoor referendum (Section 17-2.2, Chapter 122).

^bHouse Bill 4495 changed the name of the Building Fund to the Operations, Building, Maintenance Fund. (Signed August 30, 1972. Effective October 1, 1972.)

^cHouse Bill 4261 authorizes the county clerk to extend a tax rate in excess of .05 percent in certain situations (Law August 29, 1972).

Interest rate limitation for Tax Anticipation Warrants, Teachers' Orders, Working Cash Fund Bonds, Building Fund Bonds, and Refunding Bonds is six percent.

Interest rate limitation for tax anticipation notes is seven percent or less through the passage of House Bill 4628 which was signed into Law on July 27, 1972.

Debt limitation is six percent in dual districts and 12 percent in K-12 districts through enactment of House Bill 2375, August 27, 1971.

EXHIBIT I

STATE AID FORMULA AND ELIGIBILITY REQUIREMENTS*

General State Aid Formula

House Bill 4465, enacted during the 1972 Session of the Seventy-seventh General Assembly, provides the formula for determining the amount of General State Aid school districts shall receive in 1972-1973. The Law retains the basic provision of the 1971-1972 State Aid Formula, which is a foundation level of \$520 for each best six months' weighted average daily attendance (WADA) pupil. The qualifying tax rates for districts are as follows:

Best 6 Months WADA	Elementary %	High School %	Unit %
Less than 100	.90	.90	1.08
100 or more	.84	.84	1.08

The flat grant remains at \$48 for each WADA pupil and weighting of all 9-12 grade pupil attendance by 1.25. The Law further provides that if the amount of State Aid calculated is less than \$120 per WADA pupil, the amount of State Aid per pupil in WADA for the best six months shall be computed by multiplying the quotient of the assessed valuation per pupil necessary to produce \$120 State Aid per WADA pupil under the Formula, divided by the district's assessed valuation per WADA pupil, multiplied by \$120. However, in no case shall a district receive less than \$48 per WADA pupil. The general apportionments and equalization quotas, as computed in this Law, shall be increased 19 percent.

In addition, districts with a WADA of 10,000 to 19,999 shall have their WADA increased by four percent, districts with a WADA of 20,000 to 29,999 are increased eight percent, districts 30,000 to 200,000 are increased 12 percent, and districts over 200,000 WADA are increased 16 percent provided that a plan is submitted with the district's Annual Claim for State Aid showing how the funds shall be used by the district for improvement of instruction, according to rules and regulations established by the Superintendent of Public Instruction. The General State Aid payments include \$54,160,220.40 for the 24 districts with 10,000 or more WADA. The Superintendent of Public Instruction shall determine the General State Aid apportionment for school districts operating a full year school program under Section 10-19.1, The School Code of Illinois. The Office plan allows the respective districts to compute their State Aid entitlements upon the average of the best six months of the twelve months of pupil attendance. This method may provide a minimal advantage to districts operating a full year school program.

Requirements for Participation in General State Aid Funding

Any school district, or one or more of its attendance centers, which fails to meet the standards as established for recognition by the Superintendent of Public Instruction for any given school year, is not eligible to file any claim upon the Common School Fund for such school year. Also, any district with an ADA for the school term of less than 15 for Grades K-8 or less than 60

for Grades 9-12 must obtain special approval from the Superintendent of Public Instruction and the superintendent of the educational service region to be eligible to receive General State Aid. Pupils enrolled in nonpublic schools may be concurrently enrolled in public schools on a shared time or dual enrollment plan and may be included as claimable pupils by districts. Nonpublic pupils are counted as 1/6 ADA for each class hour in attendance in a public school. Special education pupils attending approved private institutions, either inside or outside the State, may be included as claimable pupils on the basis of days attended. Kindergarten pupils may be counted for a 1/2 in attendance or for a full day under special situations.

Beginning with the 1972-73 school year, all handicapped children 3 to 21 years of age, including physically handicapped, maladjusted, educable mentally handicapped, trainable mentally handicapped, and speech defective children are eligible. They qualify as claimable pupils for General State Aid purposes. They are eligible to be claimed for 1/2 day of pupil attendance when in attendance one-clock-hour or more if approved by the Superintendent of Public Instruction.

Estimated State Aid payments to all eligible districts during 1972-1973 shall be based on the districts' 1971-1972 attendance data and the 1970 assessed valuation applied to the 1972-1973 State Aid Formula. The net State Aid Claim amount considers adjustments to previous Claims and/or audit adjustments. Districts shall receive one payment in July 1972 for June from the 1971-1972 Formula; two in August for July and August; and one payment each month thereafter through June 1973 except for March when no payment shall be made. This is a total of 12 payments in Fiscal Year 1973, one from the 1971-1972 Formula and 11 from the 1972-1973 Formula.

Districts with more than a two percent increase or decrease in ADA during the first calendar month of the 1972-1973 school year compared with the best six months' ADA of 1971-1972 are eligible to file a Supplementary State Aid Claim with the respective educational service region superintendent on or before October 15. Districts filing Supplementary State Aid Claims will receive increased or decreased State Aid payments during 1972-1973. These are estimated payments, and adjustments will be made to Fiscal Year 1974 payments after the Annual Claim in filing of a Supplementary State Aid Claim for districts that have been newly organized for 1972-1973, districts that have annexed adjacent districts and/or a portion of an adjacent district(s), and districts that have had a portion annexed to an adjacent district(s).

NOTE: This sample of fifty-nine (59) school districts could best be described as being a proportionate stratified sample. That is, it is stratified as to the type, size, etc., of district with the percentages of districts represented in each strata of the sample being essentially the same as the percentages of districts classified that way statewide. For example, approximately 47% of the districts in the State are elementary districts; likewise, approximately 47% of the districts in the sample are elementary districts.

GLOSSARY

ASSESSED VALUATION: A valuation determined by a governmental unit upon real and personal property which provides a basis for levying taxes.

ASSESSED VALUATION PER PUPIL (AVPP): The quotient of the total equalized assessed valuation of all taxable real property in a district and the weighted average attendance of that district.

AVERAGE DAILY ATTENDANCE (ADA): One unit counted for a pupil who attends school every day for five or more clock-hours that school is in session during the computation period. The latter may be for the year or the highest six months. Fractional days of attendance may be counted in some instances, and certain exceptions are allowed in the length of the school day.

CATEGORICAL AIDS: Financial aid provided local school districts for the support of specific educational programs such as driver education, school lunch programs, special education, etc. Categorical aids are provided out of either the General Revenue Fund or the Driver Education Fund.

COMMON SCHOOLS: Used interchangeably with local educational agencies, local school districts, and public schools.

COMMON SCHOOL FUND: Fund appropriated by the General Assembly out of the General Revenue Fund from which general state school aid is apportioned.

DUAL SYSTEM: Any given geographical area where there is a separate elementary (K-8) grade district and a secondary (9-12) grade district as opposed to a unit (K-12) grade district.

EDUCATIONAL FUND: Fund provided by local school districts to pay the basic costs of instruction.

EFFORT: The amount of local education revenue generated by a local school district. Effort is determined by the related factors of local taxable wealth and total tax rate for education.

EFFORT INDEX: Statistical tool designed to measure the relative effort of local school districts.

ELEMENTARY DISTRICT: A school district which offers instruction in Grades kindergarten through eight only.

EQUALIZED ASSESSED VALUATION: The total value of the real property of a district as determined by assessment and application of multipliers, calculated, and assigned by the county board of review and the State Revenue Department. Theoretically, this system of multiplication "equalizes" property assessments throughout the State.

EQUALIZATION GRANT: One of two basic forms of general state education aid (the second is the flat grant). Equalization grants are apportioned to local school districts and are intended to supplement local financial resources to the degree necessary to maintain the foundation level of financial support.

FLAT GRANT: One of the two basic forms of general state education aid (the second equalization grant). Flat grants are apportioned to local school districts on a per capita basis (as measured by weighted average daily attendance) without regard to district financial need.

FOUNDATION LEVEL: Level of financial support defined by the General Assembly as that necessary to provide a minimum educational program for Illinois public school students. The current foundation level stands at \$520.00 per pupil.

FOUNDATION PROGRAM: The present program provides that a school district shall receive at least \$520 per pupil in best six months' WADA through a combination of local revenue, plus the flat grant or special equalization aid. The alternate method of computation, the 19 percent factor, and the density bonus increases the foundation level to an amount in excess of \$520.

GENERAL AID: That part of the apportionment of the Common School Fund to the school districts which, at present, cannot be less than \$48 multiplied by 119 percent for each pupil in WADA.

LEVY: (1) To impose taxes or special assessments; (2) the total of taxes; or (3) special assessments imposed by a governmental unit.

NONFEDERAL REVENUE: All revenue, other than that from Federal sources. This includes local taxes, General State Aid, State categorical aids, tuition, admissions, fees, and rentals.

NONOPERATING DISTRICT: A school district which does not own or maintain schools, but pays tuition costs to nearby districts for students residing within its borders.

OPERATING EXPENSE PER PUPIL (OEPP): The total expenditures from the Education, Building, Bond and Interest, Municipal Retirement and Rent Funds less expenditures for the following: tuition paid to other districts, Building payments to other districts, Adult Education, Summer School, Economic Opportunity Project, Capital Outlay, Transfers Out, and Bond Principal Retired, divided by the best six months' weighted average daily attendance.

PROPERTY TAX RATE: The percent per \$1 extended on the equalized assessed valuation of property.

QUALIFYING AMOUNT: The equalized assessed valuation of the district multiplied by the qualifying tax rate to arrive at a dollar amount.

QUALIFYING TAX RATE: The minimum tax rate a school district may have extended to qualify in full for special equalization aid. The rate is legislated by the General Assembly.

SCHOOL PROBLEMS COMMISSION: A commission created by the General Assembly to survey and to study the problems pertaining to the public schools in Illinois.

SECONDARY DISTRICT: A school district which offers instruction in Grades nine through twelve only.

STATE AID FORMULA: The Formula legislated by the General Assembly for apportioning the Common School Fund to the various school districts.

SUPERINTENDENT, EDUCATIONAL SERVICE REGION: The chief school officer for the county or counties in an educational service region, who exercises supervision and control over a school district within that region.

TAX RATE LIMIT: The tax rate limit is the maximum tax rate that the county clerk may extend. The limit may apply to taxes raised for a particular purpose, or to taxes raised for all purposes, and may apply to a single government, to a class of governments, or to all governments operating in a particular area. Overall tax rate limits usually restrict levies for all purposes and for all governments, state and local, which have jurisdiction within a given area.

TOTAL TAX RATE: The sum of all the separate taxes for education levied by a local school district.

UNIT DISTRICT: A school district which offers instruction in Grades kindergarten through twelve.

WEIGHTED AVERAGE DAILY ATTENDANCE (WADA): Average daily attendance computed by weighting the average daily attendance of the secondary grades (9-12) by 1.25.
