#### ABSTRACT

This research was aimed at determining the success of the program approach of a rather unique prevocational training program designed to meet the needs of young adult American Indians from low income backgrounds. The Great Lakes Apprenticeship Center (GLAC) approach utilizes some education principles which have wide support in adult education literature. The criterion used to judge program success were the former students own evaluations and job improvement after training. The trainee evaluations were generally positive. Also, substantial improvements were made in the trainees pay levels and hours worked after training. The study reveals that: (1) some important adult education principles facilitate effective programming for the disadvantaged learner and (2) if such principles are properly implemented, it is possible to reduce the gap between the underemployed and those with relatively better employment records. #### **SUMMARY**

Vast sums of money have been spent in recent years on programs for the disadvantaged adult. However, equal efforts have been lacking in evaluating the effectiveness of the few programming innovations developed.

This research was aimed at determining the success of the program approach of a rather unique prevocational training program designed to meet the needs of young adult American Indians from low income backgrounds. The Great Lakes Apprenticeship Center (GLAC) approach utilizes some education principles which have wide support in adult education literature.

The criterion used to judge program success were the former students' own evaluations and job improvement after training. The trainee evaluations were generally positive. Also, substantial improvements were made in the trainees' pay levels and hours worked after training.

The study reveals that: (1) some important adult education principles facilitate effective programming for the disadvantaged learner and (2) if such principles are properly implemented, it is possible to reduce the gap between the underemployed and those with relatively better employment records.

# An Evaluation of the Great Lakes Apprenticeship Center: Some Insights Into Educational Programming for Disadvantaged Adults\*

### INTRODUCTION

Traditional education programs have failed to meet the needs of the disadvantaged. American Indians in particular have lacked equal educational opportunity. The Special Senate Subcommittee on Indian Education (14) described Indian education as a "national tragedy." Coleman (2) and others concur with these findings. The scope of the problem is revealed by some of the statistics cited by President Nixon (8) in his address on Indian Affairs. American Indians have an average education of only six years. The dropout rate for Indian students is twice the national average. Unemployment among Indians is ten times the national average. The average income of Indians is only \$1,500 per year. It is clear that generally American Indians are educationally and occupationally disadvantaged.

Educators must find alternative approaches to educational programming for the disadvantaged such as American Indians. What can be done?

In discussing job training for American Indians, Minear (7) suggests that success can only be achieved by programs designed specifically for the Native American. Others concerned with the education of disadvantaged adults emphasize certain principles in program development and implementation. Priority principles can be summarized in two general guidelines: (1) programs must be specifically designed to meet the needs of small homogeneous groups of disadvantaged learners (1:62, 11:51, 15:277), (2) the value set of the learner must be respected and his selfesteem enhanced by the learning experience (1:59, 10:112, 13:187).

# THE GREAT LAKES APPRENTICESHIP CENTER (GLAC)

The Great Lakes Apprenticeship Center (GLAC) located in Green Bay, Wisconsin began operations in July, 1969. It is funded by a grant from the U.S. Department of Labor and administered cooperatively by the Great Lakes Inter-Tribal Council and the Northeast Wisconsin Technical Institute. The project staff includes a director, teacher, counselor and two job developers.

The GLAC program was designed specifically to serve the needs of disadvantaged Native Americans (16). The clientele, young Indian men, are from low income backgrounds, primarily high school dropouts, and were unemployed for up to one year prior to entering the program. The GLAC program aims at helping participants qualify for, obtain, and hold better jobs.

### **Program Services**

Training, counseling and placement are the three basic services of the program. Depending on the participant's need, he may receive any or all of these services.

About 13 percent of the participants are considered qualified for on-the-job training at the time they come to the center and are placed directly when a suitable position is available. If not ready for placement, they enter training. About 15 trainees are accepted for each eight week training/counselling session.

Training depends on the individual's needs. Two weeks are devoted to orientation and evaluation to determine competency and vocational goals. The training from the third through the eighth week aims at improving basic skills in reading, vocabulary and math. General knowledge about the work world is acquired through field trips, films, guest speakers, written material and discussion groups. A variety of materials and approaches is used throughout the program.

<sup>\*\*</sup>L. M. Swan is assistant professor, Department of Agricultural and Extension Education, University of Wisconsin-Madison. Jim De Vries is a graduate student in that department.

<sup>\*</sup>Partial funding for this project study from the Center for Applied Sociology.

Learners choose materials and work on areas which they feel best meet their individual needs and learning styles.

The job developers work closely with the trainees in obtaining jobs and do some follow-up after placement. Job placement may come at any point in the eight week period depending on the trainee's qualifications and availability of position. Many receive on-the-job training after being placed. Trainees not considered qualified for placement after eight weeks in the program may be held over for further training or placed in other institutions such as the Northeast Wisconsin Technical Institute.

Personal contact with the trainee and a respect for his cultural heritage are emphasized. Personal contact is facilitated by keeping the program small. Respect for heritage is achieved through the sensitivity of the staff who are mostly Indians. Also, the program is under the control of an Indian Council, The Great Lakes Inter-Tribal Council. Regular sessions on Indian history, and culture, help the students with self understanding and evaluation. Extensive individual and group counseling is available to the trainees throughout the program. Program flexibility places responsibility on the learner to choose not only the content and method of training but also his personal vocational goals.

#### Trainees

#### **Background**

The GLAC serves American Indians throughout Wisconsin. The typical trainee is an 18-21 year old American Indian male who is classified as a disadvantaged person, but who is not receiving public assistance at the time he enters the program. He is single with no dependents but classified as a head of a household and a primary wage earner. He is as likely to be a high school graduate as not, but not likely to have received previous job training. He had been in the labor force from one to nine years. During the last year before training he was unemployed for more than fifteen weeks and earned less than \$3,000. The reasons for being unemployed were primarily a lack of education (of the right type or not enough) and transportation. The incidence of unemployment due to personal problems such as excessive drinking or trouble with the law was not great. A more detailed description of trainee background appears in the Appendix.

# How They Learn About the Program

Trainees learn about the program primarily through close personal contacts (Table 1). Forty-six percent of the trainees said family and friends were their primary source of information about the GLAC.

TABLE 1
SOURCES OF INFORMATION ABOUT THE GLAC

N = 49							
Source	Number	Percent					
Friends	14	29					
Family	8	17					
Inter-Tribal Council	7	14

Employment Service	7	14					
Other Government Officials	2	4					
Other Sources	5	10					
Don't remember	3	6					
	49	100					

# Why They Join

The trainees initially view the program as a source of job mobility. Asked to identify the reason(s) for joining the program, the large majority listed some work related motive (Table 2). Very few said they joined because the program provides the trainees with income or because of family pressures.

TABLE 2
REASONS FOR JOINING THE PROGRAM

N = 48							
Reason	Number*	Percent					
To obtain work	36	75					
To obtain better work	27	56					
To learn necessary skills	29	60					
To get some money	11	23					
Was told to go by family	2	4					
	105	100					

<sup>\*</sup>Trainee could list several reasons for joining.

# Program Completion

An examination of the relationship between trainee background characteristics and success in completing the program revealed that those trainees who had been most successful before training in terms of employment and education were the most likely to complete training. Table 3 shows that trainees who failed to complete high school were twice as likely to drap out or be terminated from the program as those who completed high school.

TABLE 3

RELATIONSHIP BETWEEN EDUCATION AND PROGRAM COMPLETION

N = 168*								
Program Completion Education (years completed)								
	Less than	n 12 years	12 years	or more				
	Number	Percent	Number	Percent				
Completed	59	63	61	81				
Did not complete	34	<u>37</u>	_14	<u>19</u>				
	93	100	75	100				

<sup>\*</sup>Does not include 25 participants who were placed directly on a job.

A similar relationship was found between annual income prior to training and program completion (Table 4).

TABLE 4

RELATIONSHIP BETWEEN ANNUAL INCOME
PRIOR TO TRAINING AND PROGRAM COMPLETION

N = 152*									
Program Completion Annual Income									
	Less th	an \$750	\$750-	.2,999	\$3,000 & over				
	Number	Percent	Number	Percent	Number	Percent			
Completed	29	64	44	70	34	77			
Did not complete	<u>16</u>	36	<u>19</u>	30	<u>10</u>	_23			
	45	100	63	100	44	100			

<sup>\*</sup>Does not include 25 participants who were placed directly on a job and 16 others for whom datum was not available.

While trainees with previous income of less than 750 dollars had a 36% dropout rate, only 23% of those with income of 3,000 dollars or more failed to complete the program. Other employment variables such as weeks worked annually and years in labor force showed similar trends. These findings are similar to those of Wolfbein (18:156). He notes that occupational training programs are usually most successful with those students who were initially most employable.

### THE STUDY PROBLEM

GLAC is an on-going program which implements some educational principles which have wide support in the literature. It is designed for small groups of rather homogeneous learners and strives to respect their integrity and background. While vocationally oriented, the program places great emphasis on the individual and his self-concept. The question then arises: How well has the pro-

<sup>\*\*</sup>Includes no response. This figure is relatively high because a number of trainees completed training very early and were therefore not exposed to many parts of the program.

gram succeeded? Has it been a positive influence on its participants? Educational researchers (1, 3) believe further investigation of programs using formats similar to the GLAC is needed. This was the primary aim of this study.

# STUDY DESIGN AND PROCEDURES

Two measures, job improvement after training and the trainees' evaluation, were used to evaluate the GLAC program. Improvement in the trainees' job situations was determined by comparing annual income, hourly wage on most recent job, and weeks employed annually before and after training.

To determine the relationship between training and job improvement, a number of other factors such as the trainees' education, social and economic status and the number of jobs available had to be taken into account. Previous research has shown that these factors affect both job improvement and training success (4, 5, 6, A limiting factor of the study is that the number of jobs available could not be controlled.

The second measure, trainee evaluation, was a more subjective criterion used in evaluating the program. Only those who completed the entire program were selected for this portion of the study. Those who were placed directly on a job (25) and those who quit or were terminated from the program (48) were not included as they had not received all the services of the GLAC. Data were collected via a questionnaire mailed to 113 trainees. Forty-three percent (49 out of 113) of the

questionnaires were returned. This low return rate was partially due to a lack of current addresses. Questionnaires returned and those known not to have been delivered to former trainees constituted over 70 percent of all questionnaires sent. A study of demographic background characteristics found no significant differences between respondents and non-respondents.

# FINDINGS-PARTICIPANT EVALUATION

Trainees were asked to evaluate each part of the curriculum in terms of its helpfulness in preparing the trainee for work or school after training. Table 5 shows trainees felt that the programmed materials in math, vocabulary and reading were the most helpful. Group and individual counseling also received high ratings. Money management and budgeting was considered the least helpful. Field trips, records and tapes and the two week orientation program also received low ratings. Apparently trainees considered education in the more academic subjects better preparation for work (very few returned to school) than training in such practical subjects as Interviewing Techniques and Money Management.

Overall trainees were not very critical of any part of the program. Very few felt that various parts were of no help at all. When asked what they liked most about the program, most chose the counselling, Indian history and culture, and basic skills education. There was no clear agreement of weaknesses of the program. Seven respondents felt that job training could be improved and ten

TABLE 6
TRAINING BENEFITS PERCEIVED BY TRAINEES

Points*

<sup>\*</sup>One point was given when a benefit was noted as "important" and two when it was noted as "most important."

suggested changes either in staffing or teaching and counselling methods. Six respondents felt that trainee discipline was a problem which needed attention.

When trainees were asked to list the most important way the program helped them, slightly less than half (46 percent) named some work related benefit and 36 percent named benefits related to personal development. Table 6 shows what trainees considered the six most important benefits of the program. The benefits are directly in line with the objectives of the program.

When trainees were asked to indicate the most important way to improve the GLAC program, 51 percent cited some aspect of the academic training while 16 percent named improvements of staff or facilities. Ten percent named improvements in on-the-job follow-up. An additional 16 percent felt that students should be provided with more information about the program before coming to Green Bay. Table 7 shows the six specific improvement suggestions given highest priority by participants in the GLAC program.

TABLE 7
PROGRAM IMPROVEMENTS SUGGESTED BY TRAINEES

	N = 49					
Rank	k Suggested Improvements					
1.	Teach more about what one does on the actual job	39				
2.	Having more field trips to see actual jobs	39				
3.	Giving students more information about the program					
	before coming to Green Bay	39				
4.	More training for a longer period of time	23				
5.	Having either more or better teachers and staff	21				
6.	Helping students after they get on the job	21				

<sup>\*</sup>One point was given when a benefit was noted as "important" and two when it was noted as "most important."

Since the trainee's evaluation of the program and how it benefited him might have been influenced by how well his new job turned out, attempts were made to control this variable. Data were examined to determine any possible association between the trainees' post-program incomes, weeks employed, and hourly wages on their last jobs and their evaluation of the program. Overall, the trainees' responses to (1) the way in which the program helped them, and (2) the way it could be improved were not related to measurements of differences between jobs held before and after training.

#### FINDINGS-IOB IMPROVEMENT

Many trainees were successful in finding and keeping jobs during the year following training (Table 8). At the time of the follow-up study, 79 percent were employed or in school while 21 percent were unemployed. Ninety-five percent of those employed were working full time. About half of the respondents stayed on the first job they

obtained after training. Overall, 46 trainees reported holding a total of 81 jobs since training. They reported being fired from only two of these jobs, while being laid off from 20 and quitting 21. Reasons given for quitting jobs varied widely. They included such things as finding the jobs different from what they had expected, not liking the town or area where they were working and having the opportunity to obtain a better job. About 20 percent of the trainees returned to school or received further training since the program. (see Table 8)

Trainee jobs improved substantially after training (Table 9). Annual income rose by about \$1,400 an increase of more than 60 percent over the pretraining level. Trainees worked an average of seven weeks more, an increase of 22 percent. Trainees earned 32 cents an hour more, or 11 percent, better than on the last jobs they held before training. (see Table 9)

TABLE 8

Weeks worked annually	31	38	+7					
Hourly wage on last job	\$ 2.38	\$ 2.70	+\$ 0.32					

<sup>1</sup> Group averages.

The relationship between job improvement and background characteristics was also examined. Trainees were grouped according to six background characteristics: (1) age; (2) marital status; (3) education; (4) annual income; (5) weeks of unemployment prior to training; and (6) years in the labor force. Table 10 shows that almost all groups showed improvement in hours worked and pay levels. More importantly, the trainees with poorest pre-program jobs experienced the greatest post-program gains. As a result, the gap

between the "underemployed" and those with relatively better jobs prior to the program was substantially reduced.

As no control group was included in this study, conclusions about the relationship between the GLAC program and job improvement after training need some qualification. Part of the changes noted may have been due to a regression effect (see Table 10).

3 Years and over	3,304	3,975	+ 671	31	41	+10	2.56	2.68	+.12

<sup>\*</sup>This measure is independent of the others. It is not an average of hourly wages over the year. It is therefore possible to have a fall in income while hourly wage shows an increase.

For example, given the type of job available to these trainees, it may be easier to raise their income from \$1,000 to \$3,000 than from \$5,000 to \$7,000. Maturation of the trainees may also have been a factor. As the majority of trainees were from 19 to 24 years old, improvement might be expected regardless of training. Possibly both of these factors had some influence. But as the changes were large, it appears that the program helped trainees to get steadier jobs with higher pay. This was especially true for those with poorer employment records.

# CONCLUSIONS

Overall, the GLAC program was successful in helping trainees to get steadier jobs with higher pay. Since improvements were largest for those with the poorest pre-program employment record, it is clear the program is helping those who need help the most. By itself, this accomplishment is rather unique for a program of this nature.

The trainees' evaluation of the program was also positive. They felt it assisted them in obtaining better jobs and also noted increased self-confidence as an important benefit of the program. Thus substantial evidence exists that the program is successfully meeting some important needs of its clientele.

Was the success of this program due to the fact that it was specifically designed to meet the needs of a small homogeneous group of disadvantaged learners and because the learner's value set was respected? The changes in the trainees' job situations and their positive program evaluation suggest program design and cultural sensitivity were contributing factors. Evaluation of similar programs, although often informal and based on very short term evidence, lend further support to this conclusion (7, 9, 12). Pope (9:156) describing a basic education and prevocational orientation program for Montana Indians concludes: "There seems to be no doubt among Indian Americans that this is the type of program the people need." Final evidence in support of this approach comes from adult education literature which generally concurs that observing these basic principles contributes to program success.
