ABSTRACT

This report indicates financial support of higher education in Washington as compared to other states. Tables are presented concerning: (1) combined state and local expenditures for higher education per equivalent full-time students; (2) percentage of student enrollment in public institutions to total population; (3) percentage of private enrollment to total student enrollment; (4) combined state and local appropriations per \$1,000 of per capita personal income; and (5) combined state and local appropriations on a per capita basis. (MJM)

FINANCIAL SUPPORT OF HIGHER EDUCATION IN WASHINGTON

A NATIONAL COMPARISON

Two years ago, the Washington Council on Higher Education developed national comparative information concerning several of the major factors which influenced financial support for public higher education. This effort began as a response to comparisons of per capita state appropriations and expenditures for higher education which had been published in the Chronicle of Higher Education. The State of Washington has consistently ranked among the top three or four states in the nation when only per capita state appropriations are considered.

It was, and is, our contention that national comparisons of higher education support must include other measures in addition to per capita appropriations. These are:

- 1. The proportion of the state's population enrolled in the state's public higher education institutions.
- 2. The proportion of total student population in the state enrolled in private institutions compared with enrollment in public institutions.
- 3. The tax support obtained from local taxing districts as well as that which comes from the state.
- 4. The amount of an Institution's revenue that is obtained from student charges.
- 5. The contribution being made per capita compared with the state's per capita personal income.

The Council was gratifled when the National Association of State Universities and Land Grant Colleges published the study results. 1/ We are also pleased to see additional efforts being made to produce more meaningful comparisons such as the work of Lyman Glenny and James Kidder; 2/ the National Center for Higher Education Management Systems at WICHE through its Information Exchange Procedures project, and in the recommendations of the National Commission on the Financing of Postsecondary Education.

We have received several requests to update our 1972 study and have been happy to again complie the information and prepare the ranking tables. We have also updated the 1970-71 comparisons using the official 1970 census information and actual local expenditures, not available when the first report was prepared. This information is included in the appendix.

It is our hope that these comparisons will assist in understanding the many factors which affect support of higher education and will help stimutate additional efforts in this area.

For Your Information", Circular No. 173, March 13, 1972, Washington, D.C.

EXPLANATION OF THE TABLES

Genera<u>l</u>

The tables are based on published data (sources are listed following the tables) which are assumed to be accurate. The local component of the 1972-73 appropriations is estimated based on actual reports for 1971-72 and the experienced relationship with reported appropriations for aid to local institutions. This approach has proven to be quite accurate in the majority of cases, however, some distortion will occur in cases where state expenditures have offset local commitments or vice-versa.

Table 1: "Combined State and Local Expenditures for Higher Education Per Equivalent Full-Time Student"

not represent a unit instructional cost. They are, rather, the total state and local appropriations for higher education divided by a uniformly derived student measure, "equivalent full-time students". The appropriations include funds for research, hospitals, student aid, etc. which are not necessarily related to enrollment. In analyzing several of the major changes in ranking which have occurred since 1970-71, it appears that the majority are more directly related to enrollment factors such as significant increases in two-year enrollments (which generally are associated with lower unit costs) or stabilization of four-year enrollments while appropriations continue to rise in response to inflationary pressures.

Tables II and III: "Percentage of Student Enrollment in Public Institutions to Total Population" and "Percentage of Private Enrollment to Total Student Enrollment"

The enrollment figures used in these tables are based on reports to the U.S. Office of Education and have been converted to equivalent full-time students. This measure differs from "full-time equivalent" students (normally derived from student credit or contact hours) in that it represents the sum of reported full-time students plus one third of reported part-time enrollments. Population figures are from U.S. Census reports as of April 1, 1972.

Regarding Table II, it is interesting to note that the states which rank in the top twenty, with a few exceptions, tend to rank in the bottom 20 in appropriations per student. The reverse is true of those states with a lower percentage of their population enrolled in public institutions. In Table III there is also an indication that states with large proportions of private enrollment have lower appropriations per \$1,000 of per capita income.

Tables IV and V: "Combined State and Local Appropriations Per \$1,000 of Per Capita Personal Income" and "Combined State and Local Appropriations on a Per Capita Basis"

In reviewing Table IV, one will note the relationship between the "high effort" states and public enrollment pressures, high per capita appropriations and generally lower per student appropriations. Similar patterns are evidenced in Table V, however, the relationship of the top twenty states in this category and lower private institution enrollments should also be noted.

Observations Concerning the Overall Pattern

The states with high per capita appropriations tend to be in the western United States, have a larger proportion of their population enrolled in
public institutions, fewer private educational resources, lower than average
appropriations per student and devote a higher than average percentage of
their per capita income to higher education. The reverse is generally the
case for states with low per capita appropriations. While these generalities
do not apply equally to all states, the patterns are important to keep in
mind when reviewing comparisons based on a single index.
