#### ABSTRACT

In a followup study to collect data which could be used for the evaluation and improvement of secondary occupational education programs in agriculture in New York State, questionnaires were sent to respondents of the original survey (agricultural graduates from the classes of 1968 and 1970 and their employers). From the 1968 class, questionnaires were sent to 537 graduates and 110 employers; response was 364 and 90, respectively. In the 1970 class, 268 graduates and 88 employers were sent questionnaires; returned questionnaires numbered 177 and 54 respectively. The items determined were: graduate occupational status; type of employment selected by graduates; graduate occupational promotions and pay raises; type and extent of on-the-job training; need for agricultural knowledges, skills, and attitudes in the occupation as perceived by employee and employer; reasons for graduate not entering field for which he was trained; graduates' job satisfaction; plans for future employment; and the image of agricultural occupations as perceived by graduates. Data pertaining to those items and additional demographic data are presented in tabular form. From this data, specific conclusions are drawn, and recommendations are made for curriculum revision. The seven questionnaire forms used and additional raw data are presented in several appendixes. (AG)

# THE RELEVANCE OF SECONDARY OCCUPATIONAL EDUCATION IN AGRICULTURE TO OCCUPATIONAL PATTERNS AND IMAGES: PHASE II

#### FORWARD

This is the second of two reports on graduates of secondary Occupational Education in Agriculture and their employers. The first report\* dealt with first-year occupational information on 1966 graduates. This report will provide similar data on the second year status of 1963 graduates, and the first and second year status of 1970 agricultural graduates.

The oackground of the problem review of related literature and methodology included in the first report will be reported in an atbreviated form in this publication.

<sup>\*</sup> The first report was: Berkey, Arthur L., et.al. Final Report: The Relevance of Secondary Occupational Training in Agriculture to Occupational Patterns. Cornell University/N. Y. S. Education Department. Ithaca. New York, June 1969. 77pp.

# ACKNOWLEDGEMENTS

The research reported in this volume was supported by Hatch Research funds through the Agricultural Experiment Station, College of Agriculture and Life Sciences at Cornell University.

The author wishes to express appreciation to graduate students

Dale Schutt, William Lindley and Douglas Capagressi for their assistance in compiling data for the study.

Special thanks are due to the school administrators, teachers of agriculture and agricultural graduates who provided the data that made this study possible.

# INTRODUCTION

# Statement of the Problem

The ultimate "payoff" for occupational education is the extent to which graduates are prepared for success and satisfaction in entry level jobs. In order to assess this "pay-off", comprehensive occupational follow-up data on graduates will be required.

Such data is not currently available for graduates of secondary occupational education in agriculture programs in New York State and therefore research to provide this information is needed.

Data regarding graduates is needed from both "employee" and "employer" if a realistic and comprehensive picture of the graduates' present status and satisfaction is to be provided.

The types of data needed include occupational status, type of job, wage level, any promotions and/or pay raises received -- i.e. advance-ment, job tenure and extent of qualification for the job held. The relevance of knowledges and abilities taught in the occupational education in agriculture courses is also important.

The graduates' feeling about their jobs and agricultural occupations as a whole can be judged by information on job satisfaction and the occupational image held for the farming and off-farm agricultural related industry. Also, employer judgements about the graduates' potential for occupational advancement provides insight into the graduates' occupational future.

In summary, there is a need for an up-to-date data based on the occupational patterns and images of graduates that can be used for the evaluation and improvement of occupational education programs in agriculture.

1<sup>th</sup>.

# Purpose

The purpose of this study is to provide a basis that may be used for the evaluation and improvement of secondary occupational education programs in agriculture through a follow-up survey of agricultural graduates and their employers.

# Objectives

The specific objectives to meet the purpose of the study are to determine:

- 1. The occupational status of graduates.
- 2. The types of employment selected by graduates.
- 3. Occupational promotions and pay raises received by graduates.
- 4. Type and extent of additional training received while employed.
- 5. The need for agricultural knowledges, skills and attitudes in the graduates' occupation as perceived by graduates and their employers.
- 6. The reasons why graduates may not enter the agricultural occupation for which they were trained.
- 7. The graduates' satisfaction with present occupational status.
- ರಿ. The graduates' plans for future employment.
- 9. The image of agricultural occupations as perceived by graduates.

#### Assumptions

- 1. The graduates and their employers can distinguish between the training received through occupational education in agriculture and the training received on the job.
- 2. The ability of the graduate and his employer to evaluate the adequacy of the graduates' occupation in agriculture is limited to the anowledges, saills and attitudes needed in the job by the graduate.

# Operational Definitions

- 1. Employers Management representatives in business establishments reported by graduates as the firm in which they were employed.
- 2. Graduates Persons graduating from New York secondary schools in 1968 and 1970 who earned four units of credit in occupational education in agriculture by completing 2 units in the same specialized agricultural area in both their junior and senior years.
- 3. <u>Occupational Image</u> The sum total of an individual's knowledge and beliefs about farming, and off-farm agricultural related industry as measured by the 14 items on the image instruments.
- 4. Job Satisfaction Attitudes (feelings) which an individual has about his job as measured by the 5 items on the job satisfaction instrument.
- 5. Specialized Area of Agriculture The curricular areas of farm production and management, conservation, agricultural mechanization, and ornamental horticulture for which secondary occupational education in agriculture is provided in New York State Schools.

## METHODOLOGY

This section reports the research methodology used to conduct the study.

# Population and Sample

## 1363 Graduates - Second Year

The study population is graduates who completed four units of secondary level occupational education in agriculture at the junior and sentor level in New York State in 1968 in one of the specialized areas of agricultural mechanics, ornamental horticulture, conservation, or furn production and management; and their employers. Agricultural business was excluded from the population due to the limited number of graduates.

The sample for the second year follow-up of 1968 graduates consisted of the 430 graduates who responded to the study the first year by completing a questionnaire, plus 107 graduates in military service.

Graduates for which no current address was available although first—
year status was reported by home schools were deleted. The total number of questionnaires sent out was 537.

Table 1 in the data collection section that follows show the sample size and percentage return.

# 1978 Graduates - First and Second Year

The population of 1970 graduates is defined similarly to that of the 1968 graduates. One hundred and two central schools and Boards of Cooperative Education Services (B. O. C. E. S.) were identified from the New York State Education Department Basic Educational Data System (B. D. S.) as offering occupational agriculture classes. Contact with the 182 schools determined that 15 either offered non-vocational

classes, had no graduates that qualified due to having a new program, or the school was incorrectly listed as offering occupational agriculture classes. Of the d7 school systems remaining, 11 declined to cooperate in the study. Thus the sample of 1970 graduates the first year consisted of all qualifying 525 graduates from 76 of 87 (87 percent) of school systems offering occupational classes in agriculture. No information was available as to the number of graduates meeting the criteria for the population in the 11 school systems declining to participate in the study.

The sample the second year of the follow-up of 1970 graduates consisted of the 268 graduates who responded to the study the first year by completing a questionnaire.

Table 2 in the data collection section shows the sample size and secondage return for both the first year and second year follow-up of 1970 graduates.

#### Construction of Instruments

Instruments to gather the data to meet the objectives of the study were constructed through modification of those already constructed in the first year. The instruments were pre-coded to allow coding of responses directly on the instrument, and Reypunching of data on IBM computer caros directly from the instruments. Pretesting was carried but to provide reliability and validity. The instruments used are included as Appendices to this report.

A summary of the procedures used in development of the items to measure occupational status, image, job satisfaction, and the need for any adequacy of knowledges and abilities are prosented below. A detailed description is provided in the report of the first year follow-up of 1968 graduates.

# Occupational Status

The d categories used in the New York State Basic Education Data bystem (8. 2. 0. 5.) were delected as occupational status categories in the study. The use of B. E. D. S. categories provides opportunity for comparison of the data from this study with data on non-vocational attudents. Also, as secondary school administrators and guidance personnel are currently reporting into B. E. D. S., this provides the possibility of individual school comparisons.

## Image Scale

An instrument to measure image of agriculture (i.e. Farming and Non-Farm Related Agricultural Industry) was constructed using the following procedure:

- 1. A list of 90 short structured statements which represent favorable or unfavorable knowledge of beliefs about agriculture was compiled.
- 2. The list of statements was screened to eliminate duplication, provide items representative of an area of knowledge clearly different from any other Item, and have general application to the population of the study. Fourteen items were selected for inclusion in the image scale. Six of the selected items were negative and eight were positive.
- 3. A 3 point agreement scale of "agree," "neutral," and "disagree," was devised for use by graduates in rating the image statements. The 3 points of the scale were arbitrarily assigned the values of 3, 2, and 1 respectively for positive image statements; and 1, 2, and 3 respectively for negative image statements.

# Job Satisfaction

The five descriminably different as of job satisfaction identifield by Hulin were chosen based on the selection of criteria of low
verbal level, simplicity for a self-administered questionnaire, representative areas different from other areas, and general application to
most jobs. These areas were (1) the people worked with, (2) the superviolon received, (3) the work done, (4) promotions available in the
job, and (5) the pay received.

A 5 point satisfaction scale was used for graduates to rate each of the 5 job satisfaction areas. Numerical values of 1-5 were arbitrarily applied to the 5 point scale (satisfied was rated "5" and dissatisfied was rated "1").

#### List of Knowledges and Abilities

A representative list of 46 knowledges and abilities was synthesized from the longer list used in the 1968 first year follow-up instrument. The same list of knowledges and abilities was used for both graduates and employers.

#### Rating of Knowledges and Abilities

The knowledges and abilities were rated as to (1) need for the item in graduate's job and (2) the adequacy of agricultural training for the items needed in the graduate's job. The rating scales used were:

Need for training - "E" (ESSENTIAL), "D" (DESIRABLE), and "U" (UNNECESSARY). The values of 3, 2, and 1 were assigned to the three responses respectively.

Thulin. C. L. et.al., "Cornell Studies of Job Satisfaction, II. Madel and Method of Measuring Job Satisfaction." Research Study sunducted at Cornell University, Ithaca, New Yor , 1966.

And Judgey of training - "S" (SUPERIOR), "A" (ADEQUATE), "I" (INADE-JUATE), and "N/A" (NOT APPLICABLE) - i.e., the knowledge or ability was not needed in the job and/or training was not provided in agriculture class. The values of 4, 3, 2, and 1 were respectively assigned to the four responses.

The need for training was rated by both employed graduates and their employers in the second year follow-up of the 1968 graduates and for both years of the 1970 follow-up. The adequacy of training was rated by employed 1970 graduates in the first year follow-up only. Values assigned to the scales used for rating need for the training were the same for both graduates and employers.

# Pretesting of Instruments

The instruments used were essentially those used in the first year follow-up of 1968 graduates. Needed changes identified through this orior work were incorporated in the revised instruments.

The revised instruments were then pretested with a small group of 1966 graduates in each of the 4 specialized areas of agriculture to identify any unclear words, statements and/or instructions for completing the instruments. Personal interviews were held with each graduate taking part in the pretest.

The final revision of the instruments was made through incorporating the changes.

Instruments were then constructed in final form through incorporation of changes indicated by the results of the pretest.

# Date Collection

The data for the study was collected from graduates and their employers through the use of self-administered mail nuestionnaires during 1973-1973.

## Procedures

The basic steps used in data collection are described below.

- 1. The New York State Education Department Basic Education Data System (B. E. D. S.) was used to provide the names of secondary achools offering courses in occupational agriculture. Information regarding type of course, enrollment, and name of school administrator and agricultural teacher were also obtained.
- 2. The schools identified in (1) above were contacted to provide the names and addresses and occupational status (if known) of graduates in the sample. To increase the percent of returns, permission to list schools as sponsors of the study was also requested.

Limiting graduates in the study to those that completed two units of the same specialized area of Agriculture in both the Junior and Senior years considerably reduced the number of graduates included in the sample.

- 3. Questionnaires were pre-coded to identify graduates, schools, and specialized area of training.
- 4. The self-administered type questionnaires were sent to graduates by mail. Graduates reported by schools to be in military service were not sent questionnaires due to their temporary and overseas residence.
- 5. Three follow-up letters were sent to graduates who did not respond within a 14-day period.
- b. Self-administered type questionnaires were mailed to employers as reported by employed graduates. As many as three letters were used to follow up employers not returning questionnaires.

An employer questionnaire was not applicable for graduates reporting self-employed status.

# Percentage Return - 1960 Graduates

The number and percent of instruments returned by 1958 graduates in the study is presented in Table 1.

Number and Percent of Questionnaires Returned by 1905 Graduates and Their Employers the First and Second Year by Specialized Area of Training

\* Rounded to the nearest whole number. Includes 11 graduates (1st year) and 32 graduates (2nd year) reported to be in military service.

# Analysis of the Data

The study data was analyzed through these steps:

- 1. The responses from graduates and employers were coded on the questionnaires and then keypunched on IBM 80-column computer cards.

  Cardo were sorted for analysis.
- 2. The data was summarized as to marginal frequencies, percentages.
  - J. Summary tables to present the data were constructed.
  - 4. Findings were identified and listed.

## FINDINGS

The findings of the study are presented in the sections that fullow.

# Place of Residence Last Two Years of High School

Place of residence during the last two years of high school -- i.e. while enrolled in occupational classes in agriculture, provides a picture of the type of student being attracted into agriculture classes. Table 3 shows the data on place of residence for 1970 graduates as reported in the first year follow-up. The significant findings are:

- 1. The highest percentage of students living on a farm operated full-time by family was highest for farm production and management students (50.7%) followed by agricultural mechanization students (39.4%).
- 2. Over 90 percent of conservation and ornamental horticulture students did not live on farms operated by their family.

Place of Residence Last Two Years of High School for 1970 Agriculture Graduates by Specialized Area of Training

# Location of Agriculture Classes

Agriculture classes are offered in central schools and Boards of Cooperative Education Services (B. O. C. E. S.) area occupational centers. Table 4 presents the location of classes as reported by 1970 graduates in the first year follow-up. The major findings are:

- 1. Three-quarters of farm production and management classes and about one-half of ornamental horticulture classes are offered in central schools. This is in contrast to conservation and agricultural mechanization classes where eighty-nine and seventy-three percent, respectively, are offered in the B. O. C. E. S. centers.
- 2. There is little (maximum of 4%) mobility of students between agriculture classes offered in 8. O. C. E. S. and central schools.

# Uccupational Status of Graduates - (Tables 5 and 6)

The first and second year occupational status of 1968 and 1970 New York State secondary agricultural graduates is shown in Tables 5 and 6, respectively. The important findings in occupational status are:

- 1. Thirty-nine percent of 1968 graduates and 47 percent of 1970 graduates are employed. The increase in percentage of employed 1970 graduates over 1968 graduates is mainly reflected in a lower (13%) percentage of 1970 graduates in military service than for 1968 graduates.
- 2. Eleven percent of second year 1970 graduates reported being unemployed compared to only 2 percent of 1968 graduates.
- 3. Conservation students had the highest percentage of overall unemployment (25%) and farm production and management the lowest (4%).
- 4. Almost one quarter of all graduates went on to college, almost all going to two-year colleges in New York State. Farm production and management graduates had the highest percentage going to college (38-35%) and conservation graduates, the lowest (7-14%).

# Length of, and Reasons for Unemployment - (Tables 7 and 8)

Data on length of unemployment and reasons for unemployment is available for 1970 graduates only. Graduates were about evenly divided in being unemployed three or less months and over three months. One-notif of the unemployment was due to "Slack season lay-off". Only 2 graduates out of 20 were unable to find employment.

# Future Josephianal Plans - (Tables 9 and 16)

The future occupational plans of the 1968 and 1970 graduates are provided in Tables 9 and 10, respectively. The major findings in the data are:

- 1. Thirty-eight to 52 percent of 1979 graduates either were uncertain of their future occupational plans or did not respond to the question on the questionnaire. The range for 1968 graduates was 17 to 40 percent.
- 2. The distribution of occupational plans did not differ greatly setween 1938 and 1978 graduates.
- 3. Of the graduates reporting plans, the area of agricultural specialization trained for was stated by a higher percentage than was any other category. Two exceptions were agricultural mechanization graduates who expressed a higher percentage of plans to enter farming than their specialization and second year plans of ornamental horticulature graduates.
- 4. The percentage of 1968 graduates who planned to enter nonagricultural industry ranged from a low of 12 percent for farm production and management graduates to a high of 32 percent for agricultural
  mechanization graduates. The range for 1970 graduates was from about
  7 percent for farm production and management graduates to 31 percent
  for proamental horticulture graduates.
- 5. About one-quarter of agricultural mechanization graduates planned to enter farming.
- 6. Farm production and management graduates had the highest total percentage of the four areas of specialization for plans to enter farming, off-farm agricultural industry or further education related to agriculture.

## Employed Graduates

This section presents employment related data for graduates that were employed. The percent of employed graduates for the several follow-up years ranges from 41 to 47 percent. Non-employed graduates include those attending college or other post secondary education, those in military service and graduates that are unemployed. Tables 5 and 5 in the earlier sections of this report provide detailed information on the occupational status of graduates.

Applicable table numbers are referenced next to section headings for the reader's convenience.

# Method of Obtaining Employment - (Tables 11 and 12)

The job seek methods used by 1970 graduates to obtain their first full-time job after graduation (Table 11) were primarily of an informal nature. For all graduates, use of friends or relatives was most frequently used (34%) followed by "Other" (29.7%). Use of state or private employment offices was almost nil while only one in twenty gained employment through the school.

The pattern of job seek methods used to locate second year jobs for both 1968 and 1978 graduates (Table 12) followed a pattern similar to that found for first-year positions.

# Time Required to Obtain First Full-Time Job - (Table 13)

An average of over 42 percent of 1970 graduates continued full—time after graduation in jobs held prior to graduation. The remain—ing graduates were about evenly divided in obtaining full—time employment within 4 weeks, and 5 or more weeks, respectively.

Firm prinaction and management graduates had the highest percentage (50.5%) continuing in pregraduation jobs, and ornamental horticulture graduates had the lowest (25%) percentage.

#### Employment Status: Classified and Perceived - (Tables 14 to 17)

The employment status of graduates is presented on two bases. First is a classification by <u>Dictionary of Occupational Titles</u> (D. O. T.) and <u>Standard Industrial Classification</u> (S. I. C.). The second basis used for classification is the graduates' perception as to the relationship of their job to agriculture.

Classification by 0. 0. T. and S. I. C. - (Tables 14 and 15)

A comparison of the second year occupational status of 1968 graduates (Table 14) with that of similar status for 1970 graduates (Table 15) shows the percentage of graduates working in the area of agriculture for which education was received to be 43.9 percent and 23.4 percent, respectively. The comparative percentages of the same graduates employed in related agricultural jobs is 12.9 percent and 16 percent.

Farm production and management graduates had the highest percentage working in their area of education (67% for 1968 graduates and 50% for 1970 graduates). Conservation graduates had the lowest percentage (less than 8%) working in their area of education. The data showed that a much larger percentage of 1970 agricultural mechanization graduates (about 35%) were working in their area of education than were 1968 graduates (only 3%). The questionnaires returned showed a large number of 1968 agricultural mechanization graduates returning to farming.

Understanded Status by Graduates' Perception - (Tables 16 and 17)

When classified by graduates, the number of graduates working in

the area for which education was received is generally higher. In

some cases, the differences are surprising -- sixty percent of 1975

ugr.cultural mechanization graduates perceive their first-year jobs to

be in their area of education (Table 17) where only about 38 percent

are so classified under D. O. T. and S. I. C.

# Reasons for Not Working in Area of Education - (Tables 18 and 19)

Graduates in 1968 listed a variety of reasons (Table 18) at less than 16 percent for not working in their area of education in second year jobs. In contrast, over 50 percent of 1970 graduates responded that "No job available in area of training" was their reason the first year. Other jobs paying more was the next most frequent reason listed.

# Interest in Working in Area of Education - (Table 23 and 21)

In an extension of the topic in the preceding section, graduates were asked if they would be interested in working in their area of education if employment was available. Ninety-two percent of 1968 graduates and a very high percentage of 1970 graduates (95% and 69% for the first and second year respectively) indicated a similar interest.

#### Present Job Position - (Table 22)

Collection of information on the types of positions held began with 1979 graduates. Therefore, data on 1968 graduates is not available.

About two-tnirds of graduates are in hourly wage positions with over one-half of the remaining third in salaried employment. The next two largest categories of positions are "Working on the home farm" and "Self-employed", respectively.

#### Full-Time or Part-Time Employment - (Tables 23 and 24)

Over 93 percent of 1968 graduates reported full-time second year employment. Graduates in 1970 reported 90 percent in full-time employment for a comparable period. These figures are particularly significant due to the seasonal and part-time nature of some agricultural jobs.

## Wages Received - (Tables 25 and 26)

The percentage of 1968 and 1970 graduates working at minimum wage levels the second year is 30.9 percent and 17 percent, respectively. Another interesting finding is that over 27 percent of 1968 graduates and 30 percent of 1970 graduates are making over \$3.00 per hour or are self-employed. A higher percentage (38.8%) of 1968 farm production and management graduates were working at minimum wage levels than were graduates of other specialized areas of agriculture. No such difference existed for 1970 graduates.

#### Tenure in Present Job - (Table 27)

The job molding power of graduates is indicated by the length of tenure in their present (second—year) jobs. Table 27 shows that over 33 percent of 1968 graduates and over 70 percent of 1970 graduates had tenure of seven or more months in second—year jobs. Almost one—half of 1968 graduates and over one—fourth of 1970 graduates had held the same job since graduation.

## Number of Jobs Held - (Tables 28 and 29)

A second index of job holding power is the number of jobs held by graduates since graduation. Data for 1968 graduates is number of full-time jobs held (Table 28). For 1970 graduates, data on both full-time and part-time jobs is provided. As would be expected from the preceding section on job tenure, a large majority of graduated have held only one full-time job since graduation. Twenty percent of 1970 graduates have held one part-time job with a minor percentage nolding more than one. The "No response" category in Table 29 for part-time jobs should be interpreted as the graduates having held no part-time jobs.

## Promotions and/or Pay Raises Received - (Tables 30 and 31)

Over 46 percent of all 1970 graduates reported promotions in second year jobs as compared with only 17.2 percent of 1968 graduates. No 1968 conservation or ornamental horticulture graduates reported self-employed status. For 1970 graduates, self-employed status was reported by graduates in all areas.

Data on pay raises is in contrast to that of promotions. Unly 11.1 percent of 1370 graduates received pay raises the second year (Table 31) while over one-half (52.5%) of 1968 graduates reported pay raises (Table 30).

# <u> Classification of Promotions and Pay Raises - (Tobles 32 and 33)</u>

dine-half of promotions received by all 1968 graduates in second year jobs were to a supervisory capacity. Twenty-live percent obtained partnerships but this reflects only graduates in farm production and management. In contrast, promotions for 1970 graduates were greatest to higher still levels. Table 32 is calculated only on those graduates receiving promotions and/or pay raises. Table 33 is computed on all employed graduates so relative percentages within Tables 32 and 33 will need to be used in order to interpret meaningful comparisons between the tables.

Pay raises received by the highest number of both 1968 and 1978 graduated was for 310.00 per week or less. Some graduates, however, reported pay raises of over \$40.00 per week.

# Education Provided by Employers - (Tables 34 to 36)

Approximately one-fourth of all employed 1968 and 1970 graduated were provided additional education by employers.

The nature of the education provided for 1968 graduates is presented in Table 35. (No comparable data is available for 1979 oraquetes).

After the "Other" category, "On the job" is the most frequent type of education reported as being provided.

#### Jon Satisfaction - (Tables 37 to 48)

Optimal occupational education prepares persons for satisfaction as well as success in the world of work. This section examines graduates' job satisfaction in terms of overall satisfaction and the five component facts of "people worked with", "supervision received", "work required", "promotions available", and "pay received".

It is important to collect data on both overall satisfaction and patisfaction with component factors because the sum of the components is not necessarily equivalent to overall satisfaction. For example, a person could be highly satisfied with pay, supervision, people worked with and promotions available while at the same time very dissatisfied with the work required. This dissatisfaction with work could be great enough to cause low overall satisfaction despite the high satisfaction with the other four components.

The data in this section should be interpreted recognizing this relationship between overall satisfaction and satisfaction with the various component areas.

#### Uverall Satisfaction - (Tables 37 and 38)

The overall job satisfaction of 1968 graduates in second year jobs is nigh. Over three-quarters reported being "satisfied" or "somewhat satisfied" (Table 37). Within specialized areas of education, farm production and management graduates had the highest satisfaction (83.5% in patisfied range) and conservation graduates had the lowest level of satisfaction with 53.9% in the satisfied range.

In comparison with 1968 graduates, the overall satisfaction of 1970 graduates was only slightly lower (Table 36) with 72.8% in the satisfied range. As with 1968 graduates, form production and management graduates has the nighest satisfaction (80.0% in the satisfied range the second year) and conservation graduates had the lowest level of patrafection (86.7%).

# Satisfaction with Component Areas - (Tables 39 and 40)

All 19ed graduates reported no major differences in satisfaction at the component areas. Satisfaction with "promotions available" and "pay received" were alightly lower than other areas (Table 39).

Timle 4J for 1970 graduates shows satisfaction with "promotions available" and "pay received" to be lower than satisfaction with the other three components. Less than one-half of 1970 graduates reported in the satisfied range for pay and promotions while approximately three-quarters of graduates reported corresponding satisfaction for the other components.

## Satisfaction by Specializ of Areas of Education (Tables 41-48)

Were most satisfied with "people with whom they work" and least satis
f ald with "pay received". The 1975 graduates in second year jobs have
approximately 15 percent less "satisfied" in component areas than do
1966 graduates with the exception of in "work required" which is
approximately equal (Tables 41 and 42).

Satisfaction by farm production and management students is the highest of all specialized areas of education. Conservation graduates (Tables 43-44) have the lowest satisfaction of all four specialized areas of education. Satisfaction with "people worked with" and "supervision received" is high (over 2/3 of graduates were in the satisfied range). In contrast, satisfaction with "promotions available", "pay received" and "work required" was considerably lower. Also, satisfaction (in second year jobs) with component areas excepting "people worked with" was 15 bercent or more lower for 1970 graduates than for 1850 graduates.

Graduates in agricultural mechanization were least satisfied with "promotions available" and "pay received". Interestingly, 1968 graduates were less satisfied with "work required" and "people worked with" than were 1970 graduates.

Relative satisfaction with component areas by ornamental norticulture graduates (Tables 47 - 48) was similar to that for agricultural mechanization graduates. The first year satisfaction of 1970 horticulture graduates with "premotions available" was low (45% of graduates were "dissatisfied"). Neither 1968 graduates nor 1970 graduates reported a comparable log satisfaction level for this component in second year jobs.

## Helevance of Education - (Tables 49 to 53)

This section examines the relevance of education in agriculture provided to graduates as perceived by graduates and their employers. Data is presented on the employers' evaluation of graduates' qualification for their jobs, employer evaluation of graduates potential for advancement, and the percentage of agricultural knowledges and abilities perceived by both graduates and employers as "essential" or "desirable" to the graduates' jobs.

In addition, a rank order of individual agricultural knowledges and abilities by need for each of the specialized areas of education is presented in Appendices D-1 to D-4

## Qualification of Graduates for Jobs - (Tables 49 and 50)

The evaluation by employers of the graduates' qualification for their jobs shows only one graduate as not qualified. Approximately three-quarters of all graduates were "well qualified" with the remaining graduates rated as "meets minimum qualifications".

## Potential of Gracuates for Advancement - (Table 51)

Collection of data on graduates' potential for advancement was initiated with 1970 graduates. The data in this section therefore includes only this group -- i.e. 1968 graduates are excluded.

Examination of Table 51 shows that for second-year jobs, 29.7 per cent of all graduates are judged to have potential for advancement to either "partner", "manager" or "owner". The potential percentage of graduates for "salaried worker" is 31.5 per cent and only 36.3 per cent of graduates were rated as having potential limited to hourly worker.

In contrast to graduates in other specialized areas of education, no ornamental horticulture graduates were rated as having potantial for "partner" or "awner".

### Need for Education = (lables 52 and 53)

Graduates and their employers rated the need for 46 agricultural modulates and sollities in the graduates' jobs. Data was collected by specialized area of education in agriculture.

For 1958 graduates, less than 46 percent of knowledges and abilities were rated "essential" or "desirable". Ratings by employers were less than 40 percent of knowledges and abilities (Table 52).

In the ratings for 1975 graduates' second year jobs, graduates rate: less than 37 percent of knowledges and abilities as "essential" or "desirable" and employers gave a response of less than 33 percent in a comparable rating.

In general, the need for knowledges and abilities in farm production and management was greater than was the need for knowledges and abilities in other specialized areas of education. Differences between employer and graduate ratings were present but not in any identifiable outtern.

## Image of Farming and Agricultural Related Industry (Tables 54 to 59)

The occupational image data analyzed in this section of the report provides information on the view (image) held by graduates of farming and off-farm agricultural related industry. The images held may or may not be valid depending upon the validity of data used as a basis for the image and the objectivity with which individuals perceive the data. However, to the individual holding the image, his view is reality and that person makes decisions and takes action on that basis, e.g., future occupational plans, continuation of employment and sharing his image with others.

The image scores reported reflect a cumulative score for 14 items rated on a scale of "agree", "neutral", and "disagree". For each item a positive image was assigned the value of "3", a neutral image a value of "2", and a negative image a value of "1", making the maximum image score 42 (14 items X 3) and the minimum score 14 (14 items X 1).

Data is reported in terms of the percentage of graduates whose image score fell within a range of scores in each of the quartiles of the range of scores from 42 - 14, and the mean image scores by groups of graduates.

### Images Held by 1968 Graduates - (Tables 54 to 56)

Images held by 1968 graduates of farming and off-farm agricultural related industry were mostly positive. All mean scores were higher than 3d for farming and above 32 for agricultural related industry.

As might be expected, graduates in conservation, agricultural mechanization and ornemental horticulture held a more positive image of agricultural related industry than they did of farming. However, the same was true of farm production and management graduates which was not predicted.

# Relationship of College Majors to Secondary Education in Agriculture - (Table 60)

The concluding section of this report deals with the relationship between the major fields of study selected by 1970 graduates and their education in agriculture during high school. This relationship provides information on the "preparatory" dimension of secondary education in agriculture for those graduates aspiring to technical and professional level positions.

Almost one-nalf (47.5%) of 1970 graduates in college the second year had a major field of study directly related to their high school aducation in agriculture. An additional 27.5 percent of graduates had majors related to, i.e. in agriculture, their secondary agricultural study.

In contrast to graduates of other specialized areas, over one-half (55.6) of conservation graduates had college majors "not related" to their study in agriculture during high school.

\* Includes only those graduates attending college the second year FPM - Marm Production and Management; CONS - Conservation; AG MECH - Agricultural Mechanization; and ORN HORT - Ornamental Horticulture

#### SUMMARY OF FINDINGS

- 1. Nost farm production graduates, and the majority of agricultural mechanization graduates lived on family operated farms during high school. Most graduates in conservation and ornamental horticulture did not live on family operated farms during the same period.
- 2. Classes for conservation and agricultural mechanization graduates were mostly offered by Boards of Cooperative Loudation Services

  (8. J. C. E. S.). Farm production and management classes were primarily offered in central schools while offerings of ornamental horticulture classes were about evenly divided between central achapts and B. O. C. E. S.
- 3. About 4. percent of 1968 graduates and 50 percent of 1970 graduates were employed. The balance of graduates were in college or other type of post-secondary education, in military service or unemployed.
- 4. Approximately one-fourth of 1970 graduates and three-tenths of 1968 graduates were in college at the end of the second year.
- 5. Second-year unemployment of 1968 graduates was 2 percent compared to 11 percent for 1970 graduates. The most common reason given for unemployment was "Slack season lay-off."
- sponse as to future occupational plans. The next most frequent response was "The area of agricultural specialization trained for."

  Graduates in 1968 and 1970 did not differ greatly in the nature of their accupational plans.

83

- 7. Almost three-quarters of the 1970 graduates attending college had majors in agriculture. About one-half had majors directly related to their high school education in agriculture.
- nature, i.e. information from friends and relatives.
- o. Ever 40 percent of 1970 graduates continued full-time in jobs held prior to graduation. Another 24 percent found employment in 4 weeks or less.
- 10. Fifty-one percent of 1968 graduates and 33.3 percent of 1970 graduates perceived that they were working in their area of education in agriculture the second year. Classification of graduates jobs by the U. 3. D. L. <u>Dictionary of Occupational Titles and Standard Industrial Graduation Manual</u> showed a lower percentage. Farm production and management graduates had the highest percentage of graduates working in their area of education and conservation graduates had the lowest percentage.
- 11. "No job available" was the most frequent reason listed by 1970 graduates for not working in their area of education. For 1968 graduates.

  "Other job paid more" was listed slightly higher than "No job available".
- 12. Almost all graduates working outside their area of education in agriculture were interested in working in their area if employment was
  available.
- 15. About one-third of 1970 employed graduates were in other than nourly wage pusitions. Almost all employed graduates reported full-time employment.

90

- uates reported making over \$3.00 per hour or self employment. The number of 1968 and 1970 graduates working at minimum wage were 31 and 17 percent respectively.
- 15. Eighty-three percent of 1968 graduates and 70 percent of 1970 graduates had held their second year jobs for seven or more months.
- is. A majority of graduates had held the same full-time job since graduation from high school.
- 17. Seventaen percent of 1968 graduates and 46 percent of 1970 graduates received promotions. The percentages of 1968 and 1970 graduates tecelving pay raises are 52 and 11 percent respectively.
- itional training by employers.
- 19. Approximately three-quarters of 1968 and 1970 graduates reported overall job satisfaction in the satisfied range, i.e. "satisfied" or "somewhat satisfied". Satisfaction with the components of job satisfaction was least for "Pay received" and "Promutions available".
- 23. Farm production and management graduates were the most satisfied with their jobs and conservation graduates expressed the lowest level of satisfaction.
- 21. About three-fourths of all employed graduates were rated by employers as "Well qualified" for their jobs. Only one graduate was rated as "Not qualified".

- 22. Approximately 50 percent of 1970 graduates were judged by their employers as having patential for advancement to either "Partner", "Manager" or "Gweer". An additional 31.5 percent of graduates were rated as having potential for "Salaried worker".
- 23. Graduates in 1960 rated less than 40 percent of agricultural knowledges and abilities as needed in their jobs. A comparable rating by employers was 40 percent of knowledges and abilities. Nineteen-seventy graduates and their employers rated the need for the knowledges and abilities at 37 and 33 percent respectively.

Both employers and graduates rated positive job habits and attitudes as being highly needed in the graduates' jobs.

24. Occupational images held by graduates of farming and off-Carm agricultural related industry were generally positive. The mean scores were about 30 for farming and 32 for off-farm agricultural related out of a score range of 14-42. Farm production and management graduates held the most positive image of both farming and off-farm agricultural related industry and ornamental horticulture graduates held the least positive image. Surprisingly, the image held by farm production and management graduates of farming was somewhat lower than far off-farm related industry. Graduates in other areas held images in a similar relationship.

#### CONCLUSIONS AND RECOMMENDATIONS

From the analysis of the data, the following conclusions and recommercations are drawn:

- i. The relatively high number of graduates without defined future occupational plans indicates a need for increased career guidance services by schools.
- 2. Over one-fourth of agricultural graduates are attending college. This trend needs to be acknowledged in the planning of course curricula. The positive contribution of education in agriculture to the career goals of graduates in college is reflected in three-quarters of these graduates pursuing a major field of study in agriculture.
- 3. The reason for the greater percentage of farm production and management graduates going on to college may be due to the practice of offering farm production and management courses in central schools. Other specialized courses in agriculture are offered primarily in area occurational centers which may limit the opportunity for academically inclined students to take occupational education while at the same time taking college preparatory courses.
- 4. The study showed that most employed graduates used informal means to secure their job, i.e. "friends" and "relatives". This indicates that increased emphasis needs to be given to education for job seek skills. Also, schools played only a minor role in placement of graduates. This means that the placement and follow-up role of the school needs to be strengthened.

93

### BEST COPY AVAILABLE

- b. Most engroved egricultural graduates are prepared to earn a good living as indicated by relatively high wage levels, good job holding power, and high employer ratings on graduates' qualification for present jobs and potential for future promotions.
- the higher percentage of 1970 graduates than 1968 graduates that were employed (50% versus 40%) probably reflects the lower percentage of 1970 graduates entering military service. The difference in percent employment would be even greater if the unemployment rates were comparable rather than 11 percent for 1970 graduates and 2 percent for graduates in 1968.
- 7. The higher percentage (11%) of unemployed 1970 graduates than 1968 graduates (2%) may reflect the depressed economic conditions that prevailed during the period. This is supported by 1970 graduates listing "side, season lay-off" as the major reason for being unemployed. Unity graduates were unemployed may also be a function of limited mobility. Take of adequate placement, lack of job skills and/or the availability of jobs.
- o. The finding that less than one-half of 1973 graduates were working in their area of education in agriculture indicates a need for surveys of local job sphortunities, job placement services and education for job seek shills. The school's role in placement should be increased. Inia recommendation applies particularly to conservation graduates in other areas, a high level of unemployment, short job tenure, a non-vercentage of graduates working in conservation jobs and relatively low job satisfaction primarily due to dissatisfaction with the "type of work performed".

Also, a higher percentage of 1970 graduates than 1968 graduates were employed outside their area of education in agriculture. Also, more 1970 graduates gave "no job available in area of training" as a reason for working outside their area than did 1968 graduates. This indicates that the depressed national economy in the early 1970's may have been a causal factor in placement.

- 9. Agricultural graduates have good job holding power as evidenced by the high percentage having long job tenure and holding the same full-time job since graduation. The relatively high percentage of graduates (42%) continuing full-time in jobs held prior to graduation indicates effective placement for job and/or occupational work experience during the high school period. Also indicated is employer satisfaction with the job performance of students. Another factor that may be involved is limited geographical mobility of students (either by choice or circumstance) for initial employment.
- 10. The shorter job tenure reported by conservation graduates as compared to graduates in other areas may reflect greater seasonality in conservation jobs.
- 11. Almost all agricultural graduates employed in jobs outside their area of education expressed an interest in working in their area if employment was available. This indicates good student selection and mature career interest.
- 12. About 40 percent of 1968 graduates and 30 percent of 1970 agricultural mechanization graduates entered farming. This decreasing percentage may show improved student selection procedures and/or more relevant course content resulting in graduates with more saleable skills.

farms during high school. Also, many farms are now of sufficient wire to require major responsibility by one or more persons for maintenance and repair of farm machinery and equipment so the decreasing trend may level off.

- 13. Employers feel agricultural graduates are qualified for their present jobs. Considering that many graduates are working outside their area of education, this may show a transfer of basic skills and/or consitive job attitudes and habits being taught as part of occupational amount on in agriculture. The level of the jobs and positions reported as held by graduates indirates employment at a level where occupational education would be important.
- Descentage of graduates in salaried positions (12.3 the first year to 16.5% the second year). The increase in self-employed graduates from 3.5 percent to 6.2 percent also supports this advancement. In addition, the data showed that over 27 percent of graduates in second year joes were making \$3.33 more per hour or were self employed.
- by the end of the second year. This along with promotions and pay ranges indicates willingness by employers to invest in graduates as employees with potential for advancement. Also, potential for advancement is indicated by employers rating 62 percent of 1970 graduates as dister as having patential for positions other than at hourly wage levels.

¥1,

- The relatively low meed for agricultural knowledges and abilities in graduates, jobs would be expected for the low number of graduates working in their area of education. However, this might also indicate the need to increase emphasis on involvement of employers in determining course content.
- 17. The emphasis by both graduates and employers on the need for positive work habits and attitudes demonstrates that this area should be stressed in occupational education.
- 13. The overall job satisfaction reported by graduates indicates that they have been generally able to obtain satisfying employment.
- 19. Conservation graduates have the lowest job satisfaction of graduates in the specialized areas of agriculture primarily due to dissatis—faction with the type of work required in the job. This may reflect the low percentage of conservation students working in conservation jobs.
- 21. Image scores held by graduates for farming and off-farm agricultural related industry were generally positive. Both farm production and management graduates and graduates in other areas held more positive image of off-farm agricultural related industry than they did of farming. This may indicate that agricultural graduates will notentially be career workers in agricultural business and industry.
- 21. Continuing and regualized follow-up of graduates is essential to objective evaluation of occupational programs.

<sup>\*</sup>Knowledges and spilities were rated as to need in the graduates' present job. The three point rating scale of "E - Essential," "D - Desirable," and "U - Undesirable" were assigned the values 3, 2, and 1 respectively. Thus a score of 3.0 would indicate a knowledge or ability most needed and 1.0 an unnecessary knowledge or ability.

TABLE

			1 40	25	pieces, corsages, and Christmas decorations Maintaining trees and shrubs
9 9	0.88	9	1.40	25	Knowing how to make up soil mixtures for
9	83.0	11	1.00	27	larowing mlants in the greenhouse
9	88.0	9	1.40	28	iplanting and transplanting nursery Stock
9	88.0	9	1.40	29	Preparing soils for the establishment of turf
7	10.00	1	1		1, 1, 26, 21, 1, 1, 2, 2, 2, 3, 3, 4, 4, 4, 4, 4, 4, 4, 4, 4, 4, 4, 4, 4,

<sup>\*</sup>Knowledges and abilities were rated as to need in the graduates' present job. The three point rating scale of "E - Essential," "D - Desirable," and "U - Undesirable' were assigned the values 3, 2, and 1 respectively. Thus a score of 3.0 would indicate a knowledge or ability most needed and 1.0 an unnecessary knowledge or ability.
