**ABSTRACT**

As one of the first steps in developing a statewide environmental education plan for the State of New Hampshire, the Environmental Education Planning Council conducted an environmental education needs assessment, which was designed solely to order the state's environmental education needs. The purpose of this publication is to report the results of that educational assessment. A Needs Assessment questionnaire was developed for distribution to 1,563 persons thought to be representative of groups which should be involved in environmental education. The results reported in this document represent the opinions of 452 respondents. Examination of the returns indicates that 46 percent of the respondents were engaged in some phase of professional education, and that an additional 15 percent of the returns were sent in by persons representative of organizations involved to some extent with environmental issues.

ENVIRONMENTAL EDUCATION PLANNING COUNCIL OF NEW HAMPSHIRE

William B. Ewert	Chairman, Consultant, Science Education State Department of Education
DeWolf Merriam	<u>Executive Secretary</u>
David N. Allan	Biologist, USDA Soil Conservation Service
Peter Allen	Research Forester, Department of Resources & Economic Development
William Ayer	Assistant Director, Municipal Services Water Supply & Pollution Control Commission
Floyd Barker	Environmental Specialist, Cooperative Extension Service, University of New Hampshire
Robert L. Brunelle	Deputy Commissioner, State Department of Education
Leslie S. Clark	Educational Director, Society for the Protection of New Hampshire Forests
Arthur G. Dodge, Jr.	Area Forester, North Country Resources Conservation & Development Project
Paul Fisco	External Affairs Coordinator, Cooperative Extension Service, University of New Hampshire
Sister Mary Robert Griffin	Vice President, Mount St. Mary College
Jane Grant	Chairman, Dunbarton Conservation Commission
Stephen Harper	Information & Education Staff Officer, White Mountain National Forest
William Henry	Chairman, Resources Development Center, University of New Hampshire
William R. Humm	Assistant Resources Director, Office of Comprehensive Planning
John E. Landry	Assistant Professor of Biology, Merrimack Valley Branch, University of New Hampshire
John Loughlin	Principal, Seabrook Elementary School
Martin Mitchell	Consultant, Agricultural Education State Department of Education
James Mullins	Assistant Director, Audubon Society of New Hampshire
Kurt N. Olson	Director, Beaver Brook Association
Rhoda Peck	Program Specialist, 4-H Youth Development Cooperative Extension Service, University of New Hampshire
Blanche Smith	Fifth Grade Teacher, Eastman School, Concord
John Damon	Area Agent, North Country Resources Conservation & Development Project (on leave 1972-1973)
	<u>Former Members</u>
Morton Goulder	Vice President, Sanders Associates, Inc.
David Scott	Director, Lakes Region Planning Commission
Ruth Stimson	Home Economist, Cooperative Extension Service, Rockingham County Office

## INTRODUCTION

The Environmental Education Planning Council of New Hampshire is convinced that environmental education is not only important but that it is essential. Furthermore, the Council feels that environmental education is necessary for all citizens from school age through adult. As one of the first steps in developing a statewide environmental education plan, the Council has conducted an environmental education needs assessment which was designed solely to order the state's environmental education needs, and in no way to rank the many environmental issues facing our State. The purpose of this publication is to report the results of that educational assessment.

In order to collect pertinent data, a Needs Assessment questionnaire was developed for distribution to 1,563 persons representative of groups which, in the Council's opinion, should be involved with environmental education (see Appendix B). The results reported herein represent the opinions of the 452 respondents who were concerned enough to return completed questionnaires. Examination of the returns indicates that 46% of the respondents were engaged in some phase of professional education, and that an additional 15% of the returns were sent in by persons representative of organizations involved to some extent with environmental issues.

## NEEDS ASSESSMENT REPORT

The Environmental Education Planning Council, comprised of 23 leaders from a broad spectrum of interest groups throughout the state, has been meeting for two years. It is co-sponsored by the Society for the Protection of New Hampshire Forests, the New Hampshire Charitable Fund and Affiliated Trusts, the Audubon Society of New Hampshire, the Cooperative Extension Service, and the State Department of Education, and has the support of a broad spectrum of additional agencies, groups, individuals, and organizations. The Council is funded by grants from the Spaulding-Potter Charitable Trust and the United States Office of Education's Environmental Education Act of 1970 (USOE-EE).

The Council's goal is to develop an environmental education plan for the State of New Hampshire. This plan will assess the state's environmental education needs; include an evaluation of statewide and regional resources for environmental education available to local communities; and serve as a guide to assist local communities in implementing environmental education programs (see Appendix A).

Assessment of the state's environmental education needs was initiated to obtain both input information for the state plan and direction for the Council's activities, as well as to motivate public interest, awareness, and action. As a result of meeting with George Lewis, of the State Department of Education's Planning and Evaluation Unit, and discussing various needs assessment techniques, the Council decided to employ a closed-ended, two-dimensional questionnaire similar to the institutional goal inventories developed by Norman P. Uhl.<sup>1</sup> Each Council member then prepared a list of environmental education needs and goals pertinent to his area of competence. At a series of subsequent subcommittee meetings the various lists were refined, expanded, and carefully revised to conform to Uhl's format. Simultaneously, a second subcommittee developed a preliminary mailing list of individuals, groups and agencies which would be given the opportunity to rate the composite list of needs.

After receiving the USOE-EE grant, the Council hired a full-time executive secretary who began work on September 15, 1972. In consultation with Mr. Lewis, the executive secretary further revised the Council's list of needs and organized it into two lists, one with 22 goal statements and one with 22 implementation strategies. He also expanded the mailing list. The executive secretary then developed a preliminary format of the

<sup>1</sup> Uhl, Norman P. Identifying Institutional Goals National Laboratory for Higher Education, Durham, N.C., 1971.

questionnaire and field tested it with 31 individuals from the mailing list. As a result of this field testing, minor changes were made in the wording of several statements and major changes were made in the instructions to recipients and in the format. In addition, provision was made to include space for the solicitation of respondent comments.

As required by the Uhl format, the questionnaire was designed so that respondents would be asked to rate the importance of each goal statement and implementation strategy in two dimensions. First, "How much emphasis do you think is being placed on this goal at the present time?" Second, "How much emphasis do you think should be placed on this goal?" The Uhl rating scale was also utilized. This is a numerical scale ranging from 5 (of extremely high importance) to 1 (of low importance), with 0 indicating no opinion.

As the questionnaire was to be sent to a broad based sample of New Hampshire residents concerned with the environment and with environmental education, the Council felt that the results of the should be ratings would provide reliable data on the relative importance respondents attached to the various goal statements and implementation strategies. The is rating was called for, not as an end in itself, but to provide a means of comparison. The Council hoped that a comparison of the differences between the average should be rating and the average is rating for each statement would provide sufficient information for a preliminary ordering of priorities.

The revised Needs Assessment Questionnaire was printed and sent in January 1973 to 1,563 individuals, groups and agencies representing 18 broad categories. Four hundred fifty-two questionnaires were returned, providing an overall response rate of 29%. Appendix B lists the number of questionnaires sent to, as well as the number, distribution, and percentage of return for, each of the 18 categories. Appendix C tabulates respondent comments added to completed questionnaires.

Data processing of returned questionnaires was carried out by the Bureau of Educational Research and Testing Services (BERTS) Center at the University of New Hampshire which supplied the Council with computer print-outs compiling for each should be statement and each is statement rating information for all respondents as shown on the replica pages included in Appendix D.

A brief statistical analysis of the results was then carried out with advice from Dr. Robert Schweiker of the Department of Education's Planning and Evaluation Unit. This consisted of using the average should be ratings of the total response group to rank goal statements and implementation strategies in decreasing order, from highest to lowest (see Appendices E and F, Rank Order - All Respondents).

The total group was then divided into two subgroups consisting of respondents who were engaged in some phase of professional

education and respondents who were engaged in all other professions (see Appendix B). Next, the BERTS Center compiled computer print-outs listing for each goal statement and implementation strategy the distribution and average should be ratings of each subgroup (see Appendix D). This distribution data was used to develop 2x6 chi square matrices comparing responses of the two subgroups. Because the calculated chi square values indicate that there is no more than a 37% chance, on the average, that these two subgroups represent the same population, their ratings must be considered separately.

As with the total response group, the average should be ratings of both the educator and non-educator subgroups were used to rank the goal statements and implementation strategies in decreasing order (see Appendices E and F). Tables 1 and 2 list in decreasing order the five goal statements and the five implementation strategies which received the highest average should be ratings of each of the two subgroups.

Table 1

Five Goal Statements

Receiving the Highest Average SHOULD BE Ratings of:

Educator Subgroup

1. To encourage the development of environmental education programs in schools at all grade levels, kindergarten through Grade 12.
2. To promote total community involvement in the identification and solution of local environmental problems.
3. To encourage local groups, organizations and agencies to utilize professional assistance in planning water, air and land use.
4. To encourage educational programs which will assist in the identification of local environmental problems and the development and implementation of solutions to these problems. (Ranked 7th by non-educators)
5. To encourage use of public lands (local, state, and federal) for environmental education. (Ranked 11th by non-educators)

Non-Educator Subgroup

1. To encourage the development of environmental education programs in schools at all grade levels, kindergarten through Grade 12.
2. To encourage local groups, organizations and agencies to utilize professional assistance in planning water, air and land use.
3. To encourage governmental agencies, educational institutions, businesses and industries to make use of available technical data and environmental information. (Ranked 11th by educators)
4. To encourage communication between environmental agencies and organizations. (Ranked 12th by educators)
5. To promote total community involvement in the identification and solution of local environmental problems.

Table 2

Five Implementation StrategiesReceiving the Highest Average SHOULD BE Ratings of:

<u>Educator Subgroup</u>	<u>Non-Educator Subgroup</u>
1. To develop an environmental awareness in the total population.	1. To develop an environmental awareness in the total population.
2. To provide teachers and school administrators with environmental information and classroom techniques in environmental education.	2. To provide assistance in the development of environmental legislation. (Ranked 10th by educators)
3. To involve youth in the implementation of action programs to improve the environment. (Ranked 8th by non-educators)	3. To make use of all media for the dissemination of environmental information.
4. To make use of all media for the dissemination of environmental information.	4. To provide teachers and school administrators with environmental information and classroom techniques in environmental education.
5. To compile and disseminate information about local, regional and statewide organizations, agencies, institutions and businesses which will provide speakers, literature, resource people, information or financial assistance to support local environmental activities. (Ranked 9th by non-educators)	5. To provide technical assistance to local groups, organizations, and agencies in the development and implementation of their goals and priorities. (Ranked 12th by educators)

These tables list New Hampshire's most important environmental education needs as observed by the two subgroups. It can be noted that both educators and non-educators agree in ranking three of the same goal statements and three of the same implementation strategies in their top five. Parenthetical notations appearing in Tables 1 and 2 indicate how those goal statements or implementation strategies ranked in the top five of only one subgroup were ranked by the other subgroup. It would seem that the design of any environmental education program should take into consideration the goal statements and implementation strategies which both subgroups rank in their top five. However, environmental education programs which address themselves to or are designed primarily for use by one or the other of these populations should emphasize those needs particular to that subgroup.

As mentioned previously, the Council had hoped to use the difference between the average is and the average should be ratings as a means of identifying and ordering the State's environmental education priorities. However, a number of

respondents either stated flatly that they were not qualified to rate the is responses or suggested that they felt uneasy about making these ratings. In fact, on some statements up to 22.5% of the respondents either circled "0" for "no opinion" or did not respond at all to the is rating, making their statistical validity questionable. However, it becomes quite clear that either a real or imagined lack of current information about environmental education is felt by a significant number of respondents. This fact alone indicates a priority need for increased public information, both in the area of environmental problems and environmental education programs. Surprisingly, a number of the qualifying comments and no opinion-no response ratings were encountered on questionnaires returned by persons associated with environmentally concerned groups or organizations. Thus it would seem that there is a need for increased environmental reporting not only in the mass media but also within and between environmental groups. This, of course, is a two-way process and increased reporting and availability of information is only effective if it is read and assimilated into the actions of the target populations.

In summary, the administration of this needs assessment has uncovered the need for a greater degree of communication on environmental matters, not only for the general public through mass media but also within and between environmentally concerned and active groups. It is interesting to note that both educators and non-educators list among their top five implementation strategies the need for increased use of the media in disseminating environmental information. Educators and non-educators both call for the development of environmental education programs at all grade levels in the schools and both subgroups agree on the need for providing schools with environmental information and environmental education techniques. Both subgroups emphasize the need for increased public awareness to and involvement in the identification and solution of local environmental problems, utilizing professional assistance whenever necessary. Educators place a high priority on: the development of educational programs to assist local citizens in solving their environmental problems; the use of public land for environmental education programs; the involvement of more youth in environmental action; and the need for gathering information on speakers, literature, and materials to support local action. Non-educators indicate a need for increased communication between environmental agencies and groups, and for assistance in the development of environmental legislation. They also call for the increased use of available data and technical assistance in solving local environmental problems.

APPENDIX CComments Added to Questionnaires by Respondents

<u>Comment</u>	<u>Number of Times Added</u>
Not qualified or felt uneasy about making <u>is</u> ratings	20
Need for public motivation and change of social values	15
Educate students	14
Public must learn to understand intricacies, balances, and social implications of environmental problems	14
Non-biased information and technical assistance needed	12
Need planning and/or money	12
Political action and/or legislation needed	12
Coordination needed between agencies and groups	11
Critical of crash, shortsighted, or biased programs	10
Public awareness to problems must be increased	9
Educate teachers	7
Educate adults	5
Programs and actions must come at the local level	5
State should have an environmental education consultant	5
Increased public involvement needed	4
Critical of questionnaire or Environmental Education Planning Council	4

Comments Added by less than Four Respondents

Too many unqualified persons working in the field  
 Educate public to assume tax burden of open land  
 Create new nature centers  
 Industry must be more responsive  
 Extend existing programs rather than create new ones  
 Develop school site study areas  
 Train teacher's aides  
 Develop an effective lobby  
 Change priorities of all media with respect to the environment  
 Educate legislators  
 Develop techniques to identify local pressure points
