IDENTIFIERS *Small Engine Repair

ABSTRACT

The general purpose of the occupational analysis is to provide workable, basic information dealing with the many and varied duties performed in the small engine repair occupation. The document opens with a brief introduction followed by a job description. The bulk of the document is presented in table form. Sixteen duties are broken down into a number of tasks and for each task a two-page table is presented, showing on the first page: tools, equipment, materials, objects acted upon; performance knowledge (related also to decisions, cues and errors); safety--hazard; and on the second page; science; math--number systems; and communications (performance modes, examples, and skills and concepts). The duties include: testing performance of engine; maintaining and repairing ignition, fuel system, governors, starter systems, charging system, cooling system, lubrication system, valve train, short block assemblies, crankcase breathers, exhaust system, and shop equipment and tools; storing equipment for off season; maintaining small engine powered equipment; and operating a business. A glossary of terms related to small engine repair is appended. (BP)

FOREWORD

The occupational analysis project was conducted by The Instructional Materials Laboratory, Trade and Industrial Education, The Ohio State University in conjunction with the State Department of Education, Division of Vocational Education pursuant to a grant from the U.S. Office of Education.

The Occupational Analysis project was proposed and conducted to train vocational educators in the techniques of making a comprehensive occupational analysis. Instructors were selected from Agriculture, Business, Distributive, Home Economics and Trade and Industrial Education to gain experience in developing analysis documents for sixty-one different occupations. Representatives from Business, Industry, Medicine, and Education were involved with the vocational instructors in conducting the analysis process.

The project was conducted in three phases. Phase one involved the planning and development of the project strategies. The analysis process was based on sound principles of learning and behavior. Phase two was the identification, selection and orientation of all participants. The training and workshop sessions constituted the third phase. Two-week workshops were held during which teams of vocational instructors conducted an analysis of the occupations in which they had employment experience. The instructors were assisted by both occupational consultants and subject matter specialists.

The project resulted in producing one hundred two trained vocational instructors capable of conducting and assisting in a comprehensive analysis of various occupations. Occupational analysis data were generated for sixty-one occupations. The analysis included a statement of the various tasks performed in each occupation. For each task the following items were identified: tools and equipment; procedural knowledge; safety knowledge; concepts and skills of mathematics, science and communication needed for successful performance in the occupation. The analysis data provided a basis for generating instructional materials, course outlines, student performance objectives, criterion measures as well as identifying specific supporting skills and knowledge in the academic subject areas.

PREFACE

The overall scope of this project was to analyze the different tasks that a Small Engine Mechanic performs in the job. The steps under each task are only specific enough to help select the subject matter for writing a course curriculum. It should be understood that this is a document that another Small Engine Instructor or Mechanic could use to gather information for writing curriculum and is not intended to be used to teach from directly.

It is felt that the main duty of a small engine mechanic is to repair the engine and in this document, the equipment that the engine is used on and the business operating aspects are secondary. The duties of maintaining equipment and business procedures were done very generally and could be separate task analyses of their own.

Because of the complexity and depth of the material covered, it was not possible to handle all of the material in proper sequence.

We hope that our efforts will be of value to other people in the teaching and small engine professions.

ACKNOWLEDGMENT

We wish to acknowledge the valuable assistance rendered by the following subject matter specialists. They provided input to the vocational instructors in identifying related skills and concepts of each respective subject matter area and served as training assistants in the analysis process during the two-week workshops.

JOB DESCRIPTION

The small engine repair mechanic's main duties are to troubleshoot, maintain and repair air and water cooled engines used on different types of equipment such as lawn and garden equipment, agriculture equipment, off-the-road equipment, recreational equipment, etc. The mechanic's other duties are to maintain and repair the equipment that the engines are used on and establish and maintain customer relations. Other aspects that a mechanic has knowledge of is purchasing and selling of engines, equipment and parts, buying and maintaining tools and shop equipment and keeping business records.
