ABSTRACT

This analysis of the stimulus-response characteristics of reading comprehension tests was undertaken in order to determine the factors which are generally measured in the standardized tests of reading comprehension. It was assumed that such an analysis might provide a clearer notion than presently exists in the educational literature as to what educators consider to be included in the construct of comprehension. A second purpose of this analysis was to provide a concise reference to reading comprehension tests with their appropriate age-grade levels, as well as to supply information regarding intercorrelations between tests. AN ANALYSIS OF THE STIMULUS-RESPONSE CHARACTERISTICS OF STANDARDIZED  
READING COMPREHENSION TESTS

AUTHOR Charles Berdiansky and Paula Mindes

I. INTRODUCTION

While there is no widely accepted definition or theory of reading comprehension, test publishers and educators have constructed and used a large number of tests which purport to measure reading comprehension. In consonance with the systematic approach to the investigation of the comprehension of connected discourse, this analysis of the stimulus-response characteristics of reading comprehension tests was undertaken, in order to determine the factors which are generally measured in the standardized tests of reading comprehension. It was assumed that such an analysis might provide a clearer notion than presently exists in the educational literature as to what educators consider to be included in the construct of comprehension.

A second purpose of this analysis was to provide a concise reference to reading comprehension tests with their appropriate age-grade levels as well as to supply information regarding intercorrelations between tests. As a reference source, this paper may aid the researcher in selecting test material appropriate for particular purposes.

### Tests Included in the Analysis

Buros' Sixth Mental Measurement Yearbook (1965) was used as the primary source for compiling the test material. Generally, the tests included in the analysis were those labeled Vocabulary, Reading Comprehension, Reading Achievement, Diagnostic Reading Tests, and Reading Readiness Tests. Only those tests still in print and obtainable through the publisher were included. An alphabetical list of the 113 tests included in the analysis is given in Section II.

A number of general achievement tests have been included but only those subtests which purport to measure some aspect of reading achievement were considered in the analysis.

### Stimulus-Response Forms

The items within tests or subtests have been conceptualized as consisting of a stimulus presented to the student, in either oral or visual form, and a required response. The stimulus-response forms were organized in a hierarchy of increasing difficulty as follows:

Word Comprehension - recognition or recall of word meaning.

Sentence Comprehension - recognition or recall of information from a phrase or sentence.

Passage Comprehension - recognition or recall of information from two or more connected and related sentences.

Although this hierarchy may be intuitively correct, it is nevertheless possible that a word comprehension test (vocabulary test) could be more difficult than a passage comprehension test, depending upon the content of each. Given that the vocabulary is identical and that the passage is written in a linguistic form which is not beyond the language development of the student, the proposed hierarchy appears reasonable. More will be said about this in the following discussion.

### Stimulus Forms

Length: Difficulty of responding. That is, in word comprehension, the student is only required to respond to a single word with a definition, in either a recognition or a recall task. In passage comprehension, the student is required to respond to two or more sentences which may involve complex factual and relational information, as well as complex linguistic structures. Given that vocabulary is held constant across word, sentence and passage comprehension tests, it is possible that a student will know the entire vocabulary set but be unable to extract

or recall the information given in a sentence composed of a subset of this vocabulary. Likewise, a student may comprehend the individual sentences but be unable to comprehend or recall the relationships which hold between the individual sentences. A tenable hypothesis, therefore, is that stimulus length varies as a function of the age-grade for which the test or subtest is designed. This hypothesis is supported by the fact that word, sentence, and passage stimuli were used with students whose ages were 9 yr. 6 mo., 10 yr. 5 mo., and 11 yr. 2 mo., respectively in the tests analyzed.

The difference in task difficulty as a function of stimulus length argues for the need for a more precise taxonomy to describe and name tests. For example, a test should not be described as a measure of word meaning if the stimulus is more complex and actually involves sentence or passage comprehension. In 33 tests, subtests were inappropriately labeled "vocabulary" or "word meaning" when they actually measured passage comprehension. These 33 subtests were designed for students whose average age was 10 yr. 7 mo., which is higher than the average age for sentence comprehension.

Mode of Stimulus Presentation. Three modes of stimulus presentation can be differentiated: (1) Pictorial, (2) Verbal, (3) Written. The stimulus form which included pictures were presented to the youngest students in both word and sentence comprehension tests. With the next youngest groups pictures were used in passage comprehension tests. The stimulus in which the tester orally presented all or part of the stimulus occurred with the next youngest group in the word and sentence comprehension tests. Thus, earlier acquired modes of comprehension were used to facilitate reading. Interestingly enough, the tester's presentation of the stimulus occurred with the next to the oldest group in passage comprehension. This might be explained by the fact that in passage comprehension, rate of presentation and backtracking become important factors. Oral presentation of the stimulus provides a control over rate and prohibits backtracking. Therefore, oral presentation of passages may be more difficult than written presentation.

Letter, Syntactic and Semantic Cues. Tests which provided the student with letter, syntactic, and semantic cues were typically in what might be described as a cloze test form. In these tests the stimulus consisted of either a word, sentence or passage with certain letters or words deleted. The student's task is to correctly complete the deletion by using the surrounding context. The experimental literature is replete with evidence on the difficulty of cloze tests. It is not surprising, therefore, that in sentence and passage comprehension this stimulus form was most often administered to older students. However, word comprehension tests employing this "cuing" method were given to younger students than word comprehension tests without such cues. This may be a function of the much greater constraints on letter sequences than on word sequences such that on the word level, letter cues facilitate responding.

Duration of Stimulus Presentation. Only two tests made any attempt to control the actual rate of presentation of each stimulus item. One test for word comprehension presented each word for 1/25 of a second. One test of passage comprehension required the student to skim the passage by controlling stimulus presentation time.

#### Response Forms

The responses were either a recognition (multiple-choice) or recall type. The experimental literature is in demonstrations of the greater difficulty of the recall task compared to the recognition task. The proportions of recall to recognition responses in the tests analyzed were: 0:88, 1:17 and 1:6 for word, sentence and passage comprehension, respectively. The proportion of recall to recognition responses increased with age-grade. The ages for the recall responses for sentence and passage comprehension items averaged 11 yrs. 7 mo. and 11 yrs. 4 mo. as compared to 10 yrs. 4 mo. and 11 yrs. 1 mo. for the recognition responses.

The remainder of this paper is devoted to a more detailed analysis of the tests. Section II lists the tests in alphabetical order with the numbers used to designate the tests in Sections III & IV.

Section III gives the basic stimulus-response forms found in the tests. Each entry contains a definition of the stimulus-response pair and lists the tests in which it occurs. The aim of this Section is to allow the reader to specify the general form of the stimulus-response of interest and to select the tests which include that form.

Section IV lists each test individually by number and name. Under each listing are given all the stimulus-response forms included in each test. This enables the reader to obtain a rapid survey of what type of items are included in each test.

Section V is a listing of intercorrelational data between the tests and other reading tests, achievement tests, and general intelligence tests. The data for this Section were obtained solely from the test manuals supplied by the publisher. As such this data should be approached with caution.

A more detailed description of each of the following Sections is given as a preface to each Section.

#### SECTION II TEST INDEX

Section II is an alphabetical listing of all the tests analyzed in this paper. In the righthand column is the number assigned to each test.

To find the analysis of a specific test when the name is known, locate that number on the test index. (Section IV).

### SECTION III DEFINITION OF INDIVIDUAL STIMULUS-RESPONSE UNITS

Section III is a listing of the components of the reading tests broken down into stimulus-response units. They are ordered in subsections dealing with words, sentences and passages. Within each subsection the order is numerical (i.e., A1 - A12).

Stimulus-response pairs labeled A deal in most cases with the comprehension of single words as stimuli. The responses may or may not also be single words.

Stimulus-response pairs labeled B deal with sentences as stimuli. Responses may or may not be complete sentences. (The word sentence is used advisedly; it may mean phrase, sentence or question in a given context. The definition of individual pairs is explicit.)

Stimulus-response pairs labeled C deal with aggregates of sentences (passages).

The use of lower case letters in the labels (A2b, for example) means that either the stimuli or the responses are slightly different from each other. One component is always stable. Thus A2a may be "S reads a word" / "S marks an alternative" and A2b may be "S reads a word"/ "S supplies an alternative." The other possibility is: B3a "S reads a sentence with a word underlined" / "S chooses a multiple choice answer" and B3b "S reads a question with a word underlined" / "S chooses a multiple choice answer."

The age ranges listed apply to the ages of the subjects to whom the test is administered. If only the age range was given in the test, it is given here. If only the grade range was given, it is converted to an age range (First grade = 6 years). The grade range is given in parentheses. If both grade and age were given, both are given here in their original form.

**SECTION IV**  
**STIMULUS-RESPONSE CONTENTS OF INDIVIDUAL TESTS**

This is an index of tests in numerical order. The stimulus-response pairs which occur in each test are listed opposite the test number, in alphabetical and numerical order. If an s/r number is listed more than once, it occurs in more than one section of the original test. If the reader wants to find out how many tests contain a particular type of item, he should refer to the s/r definition listing, which contains the test numbers.
