Projekttitel:

Mål och utvärdering i gymnastikundervisningen

Nyckelord:

Evaluation, strength, endurance, attitude, physical education, upper secondary school, test

Referat (på engelska):

A random sample of 218 teachers of physical education in upper secondary school was given a questionnaite, whose aim was to arrive at an appreciation of the need of these teachers for different measuring instruments and their view on the use of measuring instruments. Most teachers have great need of instruments for measuring the endurance of the pupils. More male than female teachers have great need of instruments for measuring strenght while the opposite condition is present for motoric functions. More than 50 per cent of the teachers has great need of instruments for measuring skills of pupils in certain activities their attitudes to and intercut in physical education. The teacher will use the instruments, which measure physical status of the pupils as a motivating factor for the pupils.

Projekttitel:

Mål och utvärdering i gymnastikundervisningen

Nyckelord:

Evaluation, strength, endurance, attitude, physical education upper secondary school, test

Referat (på engelska):

The report discusses the need for and the use of measuring instruments in physical education. The discussion is completed with results from a research, whose aim was to arrive at an appreciation of the need of the teachers of physical education in upper secondary school for different measuring instruments. Measuring instruments can serve as an aid to student analysis at the commencement of grade 1 of upper secondary school and through it facilitate the teachers planning and individualising of the education. Well proved, standardised and normed measuring instruments can also be a foundation for an individual adapted information about the progress and the changes in the students. Such an information can replace the mark in physical education.

Some Aspects of the Introduction of Reading in Foreign Language Teaching in the Primary School
Reference: Rapport nr 46, 1974. Pedagogiska inst, Lärarhögskolan i Uppsala
Title of project: Läsinlärning i engelska, LINE
Key words: 1. Reading 2. Foreign language 3. Primary school
Abstract: The report discusses some principles for the introduction of reading in a foreign language in the primary school. Since very little research has been done in the field of reading in a foreign language, these principles should be looked upon primarily as working assumptions, for which there is so far little or no empirical comfirmation. The introduction gives a survey of foreign language teaching in the primary school in the member states of the Council of Europe. Problems such as interference with other school subjects are also discussed.
Besides stressing the importance of some generally accepted assumptions concerning the introduction of reading in a foreign language, the report deals with some principles that are not sufficiently taken into consideration when teaching materials are produced. In particular, it emphasizes the importance of linguistically structure reading material and of the theory that the reading process must start from the active vocabulary and grammar of the students and that therefore, with the aid of pictures and in conversation with the teacher, the students must produce the sentences they will later see in print and read.
A brief summary of the ways in which reading is introduced in the seven teaching-materials used in Sweden today indicates the degree to which they conform to the principles discussed. The experimental reading material produced within the EPÅL project is given as an example of how reading could be introduced in accordance with these principles.

Title of project: Skolklassers sociala inlärningsklimat
DECIRIES SOCIAL INTERNITIONS ATTENDED
Key words:
Climate of learning, classroom climate, social climate, learning environment interaction in the classroom group, social system.
Abstract:
The report presents a theoretical-methodological analysis of the concept climate by review of previous research. By this analysis a theoretical model viewing the classroom group as a unique social system was accepted.
An instrument for assessing the students' perceptions of the climate of the class as a group was constructed and used in 38 schoolclasses in the second grade of the Swedish gymnasium (corresponding to grade 11 in Am. high school). Data was collected from both students and teachers by question naires and interviews.
The results from several factoranalysis led to the construction of climate scales describing classroom climate along various dimensions. In the report the reliabilities of the scales and the validity of the climate concept are discussed.
In a coming report further testing of the theory will be presented

Title o	of project:
	Social utveckling och fostran i grundskolan. /Social development and training in the comprehensive school./
Key wo	rds:
	Social influence, age difference, authority, measuring instrument, teaching aids, educational level: grades 5, 7 and 9.

Abstract: As part of a project on "Social development and training in the comprehensiva school" a series of studies have been made on the ability of the students to differentiate between different types of information, to make independent decisions and to resist "non-objective" attempts to influence them. As a first step, this has involved the construction and testing of measuring instruments. The experimental test batteries have included: (a) methods intended to give information as to how far the students choose, pass on or are influenced by "non-objective" information, (b) perception experiments with group pressure, (c) ratings, (d) various personality tests (related to anxiety, rigidity, authoritarianism, dogmatism, self-evaluation and field dependence). Most of the test data were subjected to factor analyses. As a second step, detailed analyses of age and sex differences have been made (studies over grades 5, 7 and 9). Thirdly, a preliminary teaching material unit (intended to increase the students' ability ot protect themselves when exposed to non-objective influence) has been constructed and tried out. - The present report summarizes the studies mentioned and outlines some recommendations for continued research and practical application. The ability of the students to evaluate information critically is not related particularly strongly to their personalities, which seems to give increased possibilities of influencing this ability educationally. At the same time, however, the actual development of the students' evaluative ability does not seem to increase noticeably between the ages of 10 and 16. This undoubtedly gives a relatively discouraging picture of the ability of the present teaching to respond to the intentions of the curriculum. This underlines the need, mentioned by teachers, of special training exercises. (Related journal article appeared in: Didakometry and Sociometry.

Individualized mathematics teaching: Results from the IMU project in Sweden Reference: Studia psychologica et paedagogica, No. 21. Lund: 1973 Title of project: Individualiserad matematikundervisning, IMU. /Individualized mathematics teaching./ Key words: Mathematics, individualized teaching, work attitude, organizational change, team teaching, educational level: grade 7-9 Abstract: This book in English summarizes major results from the IMU project on individualized mathematics teaching. The main aims of the project have been to construct highly self-instructional study material in mathematics, to test the material, and to try out suitable ways of organizing the teaching when using such method and material (including different kinds of large classes and single classes with and without a teacher assistant). During the years that the project has been underway (1964/65-1972/73), extensive experimentation has taken place, especially in grades 7-9 of the comprehensive school. The main experiment, called the investigation of effects, was started in 1968, included ten different substudies and was finished in 1971. About 12.000 pupils took part in this phase. This is the part of the project upon which the present book focuses. The "IMU Upper Level" system is at present in its fifth version. The method has on the whole been received positively by the teachers and students, although there was a wish for increase in the amount of teacher-led instruction (group teaching). The organizational experiments have shown that many different types of organizational models can be used, with few differential effects on achievement and attitudes. Irrespective of the model used, the participation of a teacher assistant has been considered most valuable. The book contains an appendix which lists major results from the ten substudies. Abstract: This book in English summarizes major results from the IMU project on indivualized mathematics teaching. The main aims of the project have been to construct highly self-instructional study material in mathematics, to test the material, and to try out suitable ways of organizing the teaching when using such method and material (including different kinds of large classes and single classes with and without a teacher assistant). During the years that the project has been underway (1964/65-1972/73), extensive experimentation has taken place, especially in grades 7-9 of the comprehensive school. The main experiment, called the investigation of effects, was started in 1968, included ten different substudies and was finished in 1971. About 12.000 pupils took part in this phase. This is the part of the project upon which the present book focuses. The "IMU Upper Level" system is at present in its fifth version. The method has on the whole been received positively by both teachers and students, although there was a wish for increase in the amount of teacher-led instruction (group teaching). The organizational experiments have shown that many different types of organizational models can be used, with few differential effects on achievement and attitudes. Irrespective of the model used, the participation of a teacher assistant has been considered most valuable. The book contains an appendix which lists major results from the ten substudies.			tinanaci vibili		
Abstract: This book in English summarizes major results from the IMU project on indivualized mathematics teaching. The main aims of the project have been to construct highly self-instructional study material in mathematics, to test the material, and to try out suitable ways of organizing the teaching when using such method and material (including different kinds of large classes and single classes with and without a teacher assistant). During the years that the project has been underway (1964/65-1972/73), extensive experimentation has taken place, especially in grades 7-9 of the comprehensive school. The main experiment, called the investigation of effects, was started in 1968, included ten different substudies and was finished in 1971. About 12.000 pupils took part in this phase. This is the part of the project upon which the present book focuses. The "IMU Upper Level" system is at present in its fifth version. The method has on the whole been received positively by both teachers and students, although there was a wish for increase in the amount of teacher-led instruction (group teaching). The organizational experiments have shown that many different types of organizational models can be used, with few differential effects on achievement and attitudes. Irrespective of the model used, the participation of a teacher assistant has been considered most valuable. The book contains an appendix which lists major results from the ten substudies. So	ocial development and training in the comprehensive school.
	ocial development, age difference, student interaction, roup work, educational level: grades 2, 5 and 8
	
qu w to	n the basis of exploratory data from interviews with teachers, uestionnaires addressed to students were constructed, dealing ith, among other things, the students experience of and attitude wards various ways of organizing group work at school. The
di al di gr co st se th se ha	nestionnaire data were collected from classes representing grades, 5 and 8. The report primarily presents information about age ifferences in attitudes towards group work and cooperation, but so gives comparisons between the sexes, urban-rural areas, and ifferent class compositions. The degree of teacher influence on roup composition, division of tasks, and the handling of group conflicts diminishes with increasing age. Similarly, the wish for tudent participation in these decisions grows stronger. Sex exparation in grouping is more common among older students, but in his case attitudes develop in the opposite direction, so that enior students are more positive to inter-sex groups than juniors. Once degree of teacher regulation seems necessary in order to avoid ex-homogeneous grouping. Students in the intermediate stages ave the most positive attitude towards group work as well as towards ormal group leaders.
di al di gr co st se th se ha	destionnaire data were collected from classes representing grades, 5 and 8. The report primarily presents information about age differences in attitudes towards group work and cooperation, but also gives comparisons between the sexes, urban-rural areas, and different class compositions. The degree of teacher influence on roup composition, division of tasks, and the handling of group conflicts diminishes with increasing age. Similarly, the wish for tudent participation in these decisions grows stronger. Sex exparation in grouping is more common among older students, but in his case attitudes develop in the opposite direction, so that enior students are more positive to inter-sex groups than juniors. Abstract:
An observation system intended for the assessment of students' behavior in group-work situations (esp. behaviors related to "cooperation" and "independence") has been constructed and used in a series of studies. The basic data consist of videotape recordings of students while working in small groups. The report presents results on observer agreement, examines methods of making different kinds of observation
data more comparable, and reports a validation study, an investigation of the connection between observation data and some other background data, and an analysis of structure. (Related journal article appeared in: Didakometry and Sociometry, 1973.)

A research project ordered from the Parliamentary

ABSENCES FROM SCHOOL Commission or working conditions in Swedish schools
S I A

Key words:

ABSENCE - SCHOOL STRUCTURE - SECONDARY SCHOOL

A	ha	tra	c	t:	•

PURPOSE A. From a macro-pedagogical point of view analyse, from intentions in the Parliamentary Commission on working conditions in Swedish schools, the possibilities to use information about abscences in relation to school administrative units as problem indicators and to guide from that information some distribution of resourses in the school system in order to prevent school problems related to urbanization.

B. To investigate (1) the figures of abscences in the integrated upper secondary school in a rural region in relation to school administrative units a)line b)grade c)school unit under autum term and spring term. (Earlier studies have been carried ont on apper secondary level and senior level of 9-year compulsary school in I. sparsely populated areas and II. in urban districts, Nilsson march 1973, may 1973, december 1973.) (2) how the registration of abscences is carried out, how the information is used and for which purposes. (3) instructional factors in relation to truancy.

1. Information about the figures of abscences for all 2224 pupils in 134 classes in 5 school units under autumn term 1971 and spring term 1972.

2. Information from 1150 pupils in grade 1 (87% of all in grade 1), 112 form masters (84 % of all form masters) from the 5 headmasters and persons working with pupil wellfare were picked up with questionnaries, may 1972.

SOME RESULTS

DATA

The figures of abscences were 1) lower in the 3-year theoretical lines than in the 2-year vocational lines, 2) larger in economic line, liberal art line and social line than in natural line and technology line, 3) larger under spring term than under autumn term and mostly in the end of the spring term, may-june, 4) mondays abscences is larger than other days, 5) there is rural region no difference related to grade, but in relation to school unit, 6) in physical training the abscences are especially large. From the pupils point of view the trunney is mostly related to evaluating factors, especially in the lines they play truant in order to either avoid tests or prepare tests.

In	vocational lines the	ov palv truant relat	ively more becomes	of uninteresting content.

Author, Inst. Nilsson, Lennart H.S. Institute of Education, University of Gothenburg, Sweden Title: Information från skolpersonal och elever angående frånvaron Information related to absences from school given from school staffs and pupils Reference: Rapport nr 4 från projektet Elevfrånvaron i skolan - SIA (Fedagogiska institutionen, Göteborgs universitet)

A research project ordered from the Parliamentary

Commission on working conditions in Swedish schools.

Key words:

ABSCENCE---SIMIOR LEVEL---SECONDARY LEVEL--- STAFFS---PUPIL.

Purpose	To investigate the abscences from school from form masters, head- masters, pupil wellfare workers and pupils point of view. 1) the purposes with registration, how the information is used, how the registration is desired to be carried out 2) the extention of work for the staffs because of abscences 3) in which way the abscences are re- lated to school structure from the point of diff. groups in school 4) the reasons for truancy 5) what steps diff. groups recommend to prevent truancy 6) the consequences of abscences for gradings.
Data Some results.	Questionnaries to 120 headmasters, 120 pupil wellfare workers, 700 form masters and 7.300 pupils in grade 8 and 9 on senior level and grade 1 on upper secondary level. The school units are sampled in relation to urbanization. The data is collected in spring 1972. 75, of pupils prefer not to inform school before abscence, 40-50% don't think that teachers registrate all abscences. The extention of work for staffs is related to urbanization; more work in urban district The abscences are related to school structure: subject, schedule, in struction and evaluation. On senior level truancy is relatively more related to evaluative factors in schools among villa quarters than among tenement houses, on secondary level truancy is related to a) selection of pupils to diff. lines; 6) the more theoretical the more related to evaluative factors, the more practical the more related to the lack of interesting content in school work.

Title of project: Gymnasisternas arbetsförhållanden (The students' work load)
Key words: Students' work Senior high school Educational environment
The students in the Swedish "gymnasium" (roughly corresponding to the American senior high school) are said to have a great work load. This part of the project aims at making a broad survey of the total working situation - not only the amount of homework - of the students in the "gymnasium" schools in Stockholm. A questionnary was answered in april 1972 by all students in grade 2 of the 3-and 4-year lines of the senior high schools in Stockholm: 24 schools, 128 classes, 3149 pupils. This report describes the group (age, sex, grades etc)

/ .
The present report gives an account of a study made of students' experiences during the school conflict in February-March 1971. During the conflict, questionnarie data were collected from two groups: (a) a random sample consisting of every sixth student in the first and last years of all the Malmo upper secondary schools; (b) a special group, consisting of five classes from the last year of the upper secondary school, who had two years previously taken part in mapping studies carried out as part of the Student cemocracy project. The questions concerned both the working situation during the conflict and the student influence at the school. There was nothing in these data to suggest that any marked change towards increased student fluence had come about during the period between the two studies. In general, the will to organize and pursue studies appeared to have been relatively strong, not least in the last grade. At the same time, a great deal emerged that showed that the students were far too little trained in organizing and taking the responsibility for independent study. It should he possible for the school to do more in the course of normal work to train the students in independent planning and co-planning.

Title: Några lararsynpunkter på grupparbete, samarbete och social fostran på grundskolans låg- och mellanstadium. / Teacher opinions on group work, cooperation and social training in grades 1-6 of the comprehensive school. /				
Reference: Pedagogisk-psykologiska problem (Malmo: School of Education), No. 232, 1974				
Title of project: Social fostran och utveckling i grundskolan. /Social development and training in the comprehensive school./				
Key words: Social development, group work, cooperation, level: grades 1-6 of the comprehensive school.				
Abstract:				
The present study, which has been carried out within the framework of the research project "Social development and training in the comprehensive school", presents interview data obtained from about forty teachers, who had been chosen because they could be said to be particularly interested in group works methodology and other methods within the school likely to promote cooperation. Among other things, the interview data take up different aspects of group work as a form of work (group size, group composition, group leader, techniques for presentation of results, dealing with conflicts etc.) Further, some comparisons have been made with student responses on the same areas, reported earlier by B. Liljegren in the report "Attitudes towards group work and cooperation on different age levels in the comprehensive school" (Pedagogisk-psykologiska problem, No. 173) The most common group size in grades 4-6 was four student in grades 1-3 two students per group. The teachers considered it an important principle to have both girls and boys in the same group. The duration of the composition of the groups was usually "more than one piece of group work but less than one term". With regard to other methods than group work for encouraging social training, the teachers referred primarily to activities outside the class-room, such as study visits, school trips, school camp, but also to the value of class councils, discussion lessons and a general right of co-decision. As an example of the differences between the "expert group" in question and a "normal group" of teachers can be named that the "expert group" to a greater degree than the "normal group" let the students participate in the planning processes.

Abstract: The report contains an account of a series of studies made in grades 1-6 in	order			
I to illuminate the attitudes of the students towards co-initionice at school.				
Among the results presented here are suggestions made by students for				
improving the school, the assessments made by different student groups of their present and desired influence, comparisons between the opinions of				
teachers and students on these issues and the development within this area				
I during a two-wear period. A more general discussion of the problems of				
l co-influence, is also included. Some of the statements made by the student	В			
suggest that the decision situations registered can be graded according to the criterion "accessibility for decentralized decision-making". This gradi	ng			
I could then form one of the bases on which a program for systematic training	g			
hin democratic decision-making at this school level could be drawn up (ci.				
l Pedagogisk-psykologiska problem. No. 172). As was expected, the student	S nts			
at Eira School had stated that they had more actual influence than the stude in Malino; they give only a very small increase in their influence as the ide	eal			
I situation however which indicate that a "saturation point" exists. Compar	7 2011 2

Abstract:				
A study in	n connection with an experiment on organised after school s by the youth club "Vi Unga" in Södertälje.			
The purpos	se of the study was to illustrate social conditions for			
schoolchil	ldren 7-12 years of age and evamine how after school programs			
can meet i	important needs of the children and their families. The needs for contacts with the world of adults and their			
onnortuni	ties for meaningful activities make the critical bases, social			
and /educat	tional. for the study. In different sections of the report			
interviews	s with group leaders and families are illustrating childrens! to each other, to group leaders and to family. A study-circle,			
as an atte	emnt to meet the reed of a dialogue between investigators and			
group lead	ders, is described. One of the conclusions is that activities			
which line	k torether different aspects of the social world should be Another conclusion with reference to social and educational			
goals is	that there are great opportunities still unused in the			
develormen	nt of activity programs.

. 4.					
Abstract:				1	
The personality development in 59 diabetic children, 27 boys and 32 girls, 7-15 years old has been studied. The duration of the disease exceeded one year in all cases. The personality assessment included an intelligence test, projective techniques and interviews with the children, their parents and teachers. The projective techniques consistently indicated a much higher frequency of emotional disturbances and adjustment problems in the diabetic children than in a control group of healthy children matched for age, intelligence and social group. These emotional disturbances concerned fundamental personality processes such as the development of the body image perception, and the ego structure, and the progress of the identification process. These personality data have been correlated to clinical variables such as age at onset of the disease, duration and degree of control, and to some electroencephalographic data. Althoug this analysis gave some interesting correlations between clinical data and personality, the interviews with the parents showed a more apparent relation between the personality structure of the diabetic children and the attitudes and reactions of the parents to the disease and its impact on the family situation.

This report is part of a longitudinal study of adjustment and development the Örebro project. The present study comprises three parts. In the first the purpose is to describe how a total group of adolescents, aged 16, in one town experienced the time they have spent in school. The description covers the following domains: perception of schoolwork, perception of own capacity, choice of career after grade nine, information and influence, and considerations on choice of occupation. The results described in the second and third parts stem from a substudy of adolescents. In these it is shown how parent-child relations covaries with other aspects of the childs behavior. It was found that students with bad contact with their parents did not work so hard at school. They underachieved significantly compared with other students. They often shoce a shorter education, and had not faith in their chances of successfully pursuing a theoretical education after compulsory school.

Abstract: The bulk of Swedish educational research is at present being carried out at the Departments of Educational Research of the universities and schools of education. A large proportion of the research results are published primarily and often solely in unprinted theses for higher degrees and in mimeographed departmental report series. In addition some of the department also publish printed publication series for research monographs and series of a debate or compendium nature. All those wishing to follow the research activities and debate at these departments need to keep in touch with these departmental publications, but can find some difficulty in keeping track of all that is published. To make it to some extent easier, lists are given here with regard to the calendar year 1973, covering (1) mimeographed work published in departmental series, (2) printed work published in departmental series, (3) licentiate theses, (4) doctoral theses The lists have been compiled on the basis of answers received to a written enquiry sent to all departments in Sweden. (Corresponding collections for the years 1970, 1971, and 1972 are to be found in Pedagogisk dokumentation, Nos. 4, 11, and 16.)	8

Title:

Method of data-collection. Some thoughts from a methodological study

Studiebehov och studiehinder i vuxenutbildning. II. Datainsamlingsmetod - några synpunkter utifrån en metodstudie.

Reference:

Report from School of Education, Stockholm, nr 86, june 1973

Title of project:

The SOS-VUX project Study needs and study obstacles in Adult Education

Key words:

Questionnaires. Question answer interviews. Measurement techniques

Abstract:

A preliminary study was undertaken in which data were collected by personal interviews carried out by interviewers from the National Central Bureau of Statistics.

93 % of the investigation group (N=600) took part. This result was better than expected. Such a high rate of participation was obtained by a careful but timetaking procedure which led to higher costs than expected. Because of this it was decided to attempt the use of a combination of mailed questionnaires and personal interviews before the ultimate decision concerning method for data-collection in the main study was reached.

A sample of 200 was selected on the same criteria as in the interview study (1. born 1920,1934 and 1948, 2. employed in occupation which required less than 1 year theoretical education beyond compulsory school, 3. Swedish citizens. 4. living in the county of Westmanland).

Those persons who after three reminders had not answered the mailed questionnaire where personally contacted by an interviewer. The response rate after the mail phase was 76 % and rose to 88 % after the interviews. From this point of view the combination method had stood the trial. However further analysis showed that many persons had left out single questions and that the quality of the answers on the open questions was lower than from the earlier interview study. Because of this it was decided to use personal interviews in the main study in spite of the fact that the investigation group had to be considerable smaller.

Referat (på engelska):

In this report, we have taken four actual data sets from ongoing research, and described in detail how each might be analyzed. 'We describe the research problem which gave rise to each data set. We have attempted to give a detailed description of the data analysis problems which are encountered, the statistical models which might be employed, the computer setup, and interpreting the results of the computer runs. Because these are real data, the analyses are not simple. Instead they were selected to demonstrate a variety of analysis models which are, or should be, commonly employed in educational research, with all of their complexities. In a section in .ach chapter entitled "special considerations required by the data set," we have tried to separate the particular complexities which arise, from the more common basic models. These include unequal N's and empty cells in analysis-of-variance designs, ordered dependent variables, growth trend analysis on repeated measure data.

	The report discusses problems connected with the filing of research data in the behavioral sciences. Relevant factors include the provisions laid down in Swedish law about public and secret documents, copyright issues and the building up of data archives: what, how and for how long? Interviews have been held with representatives from Swedish research departments in education, and opinions are presented. The report should be seen as a staring point for further work on the handling of research data.

Hardware Gone Soft. Teaching Under Strong Frame Conditions
at an Institute of Technology.
Reference:
Report from the Institute of Education, University of Lund,
no 48, September 1974. Mimeo. 61pp.
Title of project: "Studies concerning the relative merits of various teaching methods at the university level" in cooperation with the project 'Direct observations of teacher and student behaviour in higher education".
Key words: Teaching method, Teaching aids, Higher education, Observation, Educational theory, Technical education.

Abstract: A jount study between the two project groups mentioned above is reported. The study concerns certain relations between frame factors and teaching in an innovatory teaching system. The teaching system which is described in detail was developed by the π -group at the Royal Institute of Technology. In this report spe emphasis is given to the small-group sessions in the teaching system. 10 small group sessions consisting of appr. 18 students and each of appr. 3 hours duration were directly observed using a specially developed observational instrument. Data were recorded at the level of the individual. The actual teaching is described in terms of teacher and student activities. Differences between teachers and student groups are discussed in terms of the theoretical framework presented, stressing the relations between various constraints (pedagogical frame factors) and the resulting teaching situation. Special emphasis is given to the individualizing activities, i.e. questions about to whom the teacher directs his individualizing activities and how the students steer this process. The influence of the materialmethods system used in teaching is described in relation to selection of contents, time devoted to various content areas, the character of the interactive situation between teacher and students etc. The strategies used by teachers when moving from one content unit to another is described, and the teaching tempo is related to performance data, demonstrating how teachers are steered by the actual performance by the students during the small group sessions. Some data concerning the attitudes of students towards the teaching observed is also included.

Universitetsstudier i arbetsgrupp (UIA-projektet) University studies in teams (UIA-project)

Key words:

Higher education, examination, team work, small groups, independent study

Abstract:

The reason for the experiments on examination in groups — described and discussed in this report was a growing dissatisfaction with conventional written examination both from teachers and students in two applied courses included in the basic training for psychologists in Göteborg.

The aim of the experiments was to develop examination forms which make examination an integrated part of the training program and not just a final control. Examination forms which promote problem orientation and independent critical processing of course material were sought for.

In one of the courses the examination form tested consists of three parts and covers a full day. One of the parts is a rather comprehensive practical task which has to be planned, implemented and reported during the examination day. In the other course the examination form tested consists of oral reports of teamwork on a number of problems of applied nature. In the beginning of the course the groups were allowed to choose a prescribed number of problems from a list composed by the course leader.

The students participating in the experiments have been invited to describe effects of the examination forms tested on their ways of study in a questionaire composed of both open and closed questions. The students unanimously maintain that both of the examination forms tested have led to better knowledge, deeper insight, better cooperation, less competetion, better contact between students and teachers and more intense involvement in work than convention: written examination. The generalizability of the results obtained are discussed.

· ·
Projekttitel: Utbildnings- och elevanalyser

Referat (på engelska): This report is the third of the project Education and Student Analyses and describes how many of 996 students - that in the autumn term 1968 began their studies at Umeå university - after four years of study were graduated, had interrupted their studies, or were still studying. The results of the follow-ups are related both to the findings of previous Swedish research and to the results of some foreign investigations.

Evaluation - wastage - drop-out - study efficiency

The rate of drop-outs was very close to that reported in previous Swedish investigations, and also to what has been reported by researchers in England, Canada and Australia. But more thorough analyses of the interruptions showed however that they were largely the results of mobility within the educational system and of transfers to other kinds of education.

Differences were found between different groups of students concerning their motives and inclination to study, their accomplishments, and also for their tendencies to interrupt the studies. Certain subjects were more often than others "waiting-rooms" to the lines of study with a restricted intake. As to the flow of students this follow-up gives better studyresults than the official statistics.

The results of the follow-up are in the final discussion taken as the startingpoint of a discussion of the relevancy of the quantitative measures of efficiency used as a base for decisions in reformative programs for the higher education in the 60's and the 70's in Sweden.

Projekttitel:

Utbildnings- och elevanalyser

Nyckelord:

Evaluation - wastage - drop-out - study efficiency

Referat (på engelska): The report is the fifth produced by the project: "Educational and student analyses". It describes the results of a follow-up during two study-terms of 488 students, who started their studies in the autumn-term 1971 at the University of Umeå.

The follow-up was performed with the use of special questionnaires to students, at the time of encolment and at the end of their second term, and through available registers. Previous studyresults and for certain subjects the results of diagnostic tests, motives, aspirations, study- and vocational plans of the students were assessed.

During the time of study the intensity of study, that is full- and part-timestudies, dropouts, has been controlled. Studyresults were related to background variables, intensity of study and to the varying-degrees of student participation in lessons. The results gained have also been compared to the official statistics of education in Sweden.

The picture given in the former reports from a population - who started their studies 1968 - concerning the flow of students and dropouts has in general been confirmed by this follow-up. Many dorpouts were explained by the mobility within the educational system. The flow of students through the educational system was satisfactory according to the prevailing standards. More complex evaluation-models, that also take into consideration the characteristics of students before entrance and the things that happen to them during education, seem to be needed.

Abstract:

The teamwork experiments were planned as a two-step project. The first step was started with the main aim to develop suitable forms for teamwork and to strike a good balance between more conventional teacherled instruction and teamwork. The main aim of the second step was to evaluate effects of participation in teams on study results, study proficiency and on the students social and private situation. At the beginning of the autumn term 1971 two teams were created, each consisting of 8 students from the A 1 course in Education. The teams met once a week during the whole term led by the same turor in addition to their regular instruction. This system with team-meetings as a complement to regular instruction turned up to have a number drawbacks. Coordination was a difficult problem. It was also felt that the same amount of teaching resources should be spent on teams and control groups during the evaluation study.

Higher Education, teaching methods, Small group, Tutoring, Team work

The team model tested during the evaluation study consisted of regular tutorled team-meetings, tutor-less team-meetings planned by the teams themselves and participation in one regular lesson used as an introduction to each section on the Al cource. Four teams were formed for the evaluation study and compared by two types of control groups: students interested and students not interested in paricipating in teams. Evaluation data emanates from: ordinary exams, a comprehensive test given at the end of the term, tests designed to measure study proficiency, questionaires, tutors working notes. Results are promising, expecially the effects of teamwork on the students social situation.

In the later years student progress has decreased at the aerotechnical line. A project was therefore started in 19721973 to collect statistical information on students and their results and also to try new methods for better results. The following changes were tried: lectures and exercises combined into "lessons", intensive training periods, meetings with teachers and assistents and questionaires to the students. Statistical analysis on collected data has been made and correlations, between background data, attendance and results on tests and examinations are reported. The "lessons" gave clearly a better result compared to lectures and exercises the previous year. Overall results from examinations were about the same though. The project has given us much valuable experience and the project has been used as a pilot project for a larger undertaking in 19731974.

Abstract:					
In this report an analysis of goals for higher education is presented. The analysis is based on a sample of 337 articles in the daily press and the student press in Sweden during the period 1967-69. Leading articles, cultural and debate articles in these publications have been examined in order to map e.g. the relative importance which the writers attach to different educational goals. One of the main results of the investigation is that in the articles analysed great importance is given to non-subject-specific goals, and among these "equality" and "democracy" dominate.

The debate on goals for higher education in leading articles, cultural and debate articles in the Swedish daily press and student press during the years 1967-69 has been the subject of a special study within the project "Non-subject-specific goals for university education" (cf. Idman, P. Debattanalyser som målsökningsinstrument. /Debate analyses as goal-seeking instruments. / Pedagogisk-psykologiska problem, No. 235, 1974 and Idman, P. Equality and democracy: Studies of teacher training. Lund: Gleerups, 1974). The special study mentioned aims at mapping e.g. the relative importance goal-debaters/publications in question attach to different kinds of goals. The material analysed consists of 337 articles divided on 11 different publications. In this documentation report, short summaries of the articles are presented, primarily to give an orientation about the goal debate during the years mentioned.

Title of project:

"Studies concerning the relative merits of various teaching methods at the university level"

Key words:

University teaching, University students, Independent study, Absenteism, Teaching methods.

Abstract: The aims of the study were to describe planning and decisions concerning presence, absence and independent study at the university level and relate planning and decision-making to various pedagogical frame-factors.

Data were collected by means of a systematic non-standardized interview with 93

students in languages, religion and business-administration at the university level. A major part of the presentation consists of direct quotations from the taped interviews, thus using the language of the students as a point of departure. Appr. 61 % report an absenteism of less than 10 %. Appr. 15 % of the students report an absenteism of 25 % or more.

Presence in teacher-led classes is to a large degree pre-planned and is governed to a decisive extent by the fact that the students perception of the importance of being present. Teaching is regarded as a pre-requisite for final examinations. Absenteism is more seldom the result of a planned decision. It is influenced by factors lika illness, the weather etc. The decision to be absent is rather often a change of an earlier decision to be present.

Independent study (home-work, reading of material to be covered in the examination etc) is pre-planned by a majority of students but almost half of the students read on a day-to-day schedule governed by "inspiration". Independent study reaches its maximum immediately before the examinations.

The interplay between independent study at the one hand and presence and absence in teacher-led classes at the other isapparent, even if preparations in the form of reading etc before lectures, small group sessions etc is comparatively small if such preparation does not take the form of a requirement.

Referet (på engelska): The overall aim of the project is to study recruitment to higher education. The intent is to describe the transition from secondary school to post-secondary education and to analyze those factors which are instrumental in these transitions.

The present report deals with data on 2300 students who graduated from upper secondary school ("gymnasium") in the spring 1970. The sample is nationwide and approximately representative for the actual gymnasium

cohort. Information on post-secondary enrollment during 1970-1972 has been related to the average marks of students upon leaving gymnasium, their gymnasium track, social background, educational aspirations and performance on achievement tests.

Author, Inst. Borg, Gunnar Institute of Applied Psychology, the University of Stockholm. Title: Perceived exertion: A note on "history" and methods. Reference: Medicine and Science in Sports, 1973, Vol. 5, 90-73. Title of project: Physical Work, Effort and Performance. Key vords: Perceived exertion, Ratings scales. Physical activity. Ergopsychology. Abstract: Early studies of subjective force estimates for short-time work on a bicycle ergometer are reviewed. Res. Its showed that perceived pedal resistance followed a positively accelerating function with an exponent of 1, 6. A model for interindividual comparisons using subjective range as a frame of reference is explained. Results of two experiments comparing four different rating methods are reported. Two methods involved the original Borg Scale and a variation, one graded from 1 to 21 and the other from 6 to 20. The third method utilized a line scale while the fourth scale was graded from 1 to 9 with 2 anchored by the expression "Not At All Stressful" and 8 with "Very, Very Stressful". These two experiments show that good correlations between heart rates and ratings are obtained independently of which scale is used. Since the Borg (6 to 20) Scale is the one most often used and gives values that grow fairly linear with work load and heart rate it is proposed that this scale be used in most cases. Perceived Exertion during walking and running.	
Reference:	
Pr-ceedings, 17th International Congress of Applied Psychology, (R. Pir Bruxelles, 1972, pp 387-392.	et, Ed),
Title of project:	
Physical Work, Effort and Performance.	
Key words: Perceived exertion, Physical Activity. Heart rate. Speed of locomotion.	
7	
Abstract: Expenditure of energy during human locomotion is dependent up complex psychophysiological feedback system. The psychological and pgical components of this system most likely in concert, each acting to faci inhibit the other, and therefore, the locomotor act. For instance, when a engages in physical training programs, decisions to alter walking or run ities involve psychological factors since perceptions of the exertion play tant role and physiological factors since mechanical and metabolic alteral required. The present authors conclude that a more complete explanation man locomotion can be achieved by utlizing measurements of perceived a complement to standard physiological measurements. An experiment is reported, in which the variation of perceived exertion is to that of oxygen uptake and heart rate during walking and running on the mill. The results show that the two curves describing the intensity variat walking and running, respectively, intersect at point 8.18 km x hour for heart rate. However, no intersection poperceived exertion was found i.e. running was always perceived to be sigless exertive than walking at the same speed. The fact that no perceived intersection point was observed in the velocity range utilized in this study km x hour to 8.9 km x hour obes not preclude the possibility that sucmenon may cour at a lower veclocity. Walking at a speed of about 6 km thus seems to elicit about the same degree of perceived exertion as running spite of the fact that the heart rate when running is about 20 beats x min be during walking. The practical significance of this results lies in its applit the prescription of exercise, e.g. for cardiac patients.	chysiolo- cilitate or person ing veloc- an impor- tions are on of hu- xertion as s compared tread- cion for or oxygen int for missionantly exertion y (6.4 ch a pheno x hour ing, in migher than

Title: Intraindividual variation in the temporal pattern of sympathetic-adrenal medullary activity
Reference: Reports from the Psychological Laboratories, The University of Stockholm, 1973, No. 389.
Title of project: Temporal aspects of psychoendocrine relations.
Key words: Mental work, adrenaline, noradrenaline, temporal pattern, subjective well- being, intraindividual variation,
Abstract: Sixteen male subjects performed an audiovisual-conflict test during 1 hr of an ordinary day of work. Adrenaline and noradrenaline excretion and subjective reactions were measured before, during, and after the test period as well as at corresponding points in time in a control day of ordinary work without interruption. This program was carried out on two occasions, which were expected to differ with respect to the subjects' general mental condition and wellbeing. There were large intraindividual as well as interindividual variations in the rate at which adrenaline output decreased after the stress period. The results support the hypothesis that rapid recovery to baseline levels is positively related to a relaxed, alert and subjectively pleasant state of mind.

Abs	tract: /						
	The secular trend in physical growth of Swedish school children aged 10-17						
	years is shown by comparing growth data from three investigations, of 1883						
	1938-39 and 1965-71. These data include height and weight as well as height						
	and weight velocity. A proportionally larger increase in height than in						
	weight was detected which is more pronounced for girls than for boys between						
<i>;</i> ·	the two later studies. In girls the adolescent growth spurt occured about						
	six months earlier in the late 60's than in the late 30's and the maximum						
	rate of height increase was about 1 cm/year greater. Boys also show an earlier growth spurt now than in 1938-39, although the height peak is only						
ļ	slightly greater. The weight peaks of boys and girls were of about the same						
	magnitude as in 1938-39.						
	Comparisons of other Swedish investigations, on menarche, show a declining						
	age of onset of puberty of about 4,5 months per decade from 1950 to 1968.

Finally, subjective scales were constructed for the area, the number of people and the average population density of 44 countries. The subjective scales could be described roughly as simple power functions of the corresponding physical scales. A few interesting deviations appeared in the data. The correlations between the subjective scales exceeded the corresponding correlations between the physical scales.

Title of project. Person by situ		tions						
Key words: Stressful situa	ations, situati	on perception	, situation reac	tion				
Abstract: Two approaches to the study of the psychological significance of situations were compared, one using data for individuals' perceptions of situations, and the other using data for individuals' reactions to situations. Perception and reaction data for 40 subjects were used for multidimensional classification of 12 situations, which were selected so as to cover four different types of stressful situations. For three of the a priori groupings of situations the congruence in outcomes between the two methods was high. The implications of the congruence and the discrepancies in outcomes for the two approaches are discussed. The main conclusion is that one should distinguish clearly between situation perception factors and situation reaction factors in further research on the psychological significance of situations.

	Psychological and physiological aspects of the menstrual cycle.					
Key wor	ds: menstrual cycle, mood, alertness, catecholamine excretion					
	Six salthy women were studied during daily work routine for a period covering two menstrual cycles. Urinary catecholamines and body temperature were measured each morning of ordinary weekdays. On each occasion estimates of subjective mood and alertness were obtained. Four periods of the menstrual cycle, premenses, postmenses, ovulation, and postovulation, were compared in respect of physiological and subjective variables. No significant differences in adrenaline and noradrenaline excretion between periods were found. Estimates of subjective states did not generally differ between periods except for feelings of restlessness. Night sleep was most disturbed during premenses, coinciding with the longest sleep duration All physiological variables exhibited a high degree of intraindividual constancy during the cycle.

Reference:	ect:			, ,		
Key words: Percept-gen	etic, injury to	the body				
Abstract: The purpose of this investigation was to explore if a percept-genetic method is useful when studying reactions of injury to the body. Relevant terms and concepts are discussed. A small, homogeneous group injured in a definite part of the body has been studied by means of a percept-genetic method, a interview and a questionnaire. The results of the group injured in a definite part of the body were compared with those of the control group which had been injured in a different part of the body. The percept-genetic method showed a relationship between group category and signs of body image distorsion. There was a very weak relationship between group category and certain interview ratings concerning the subjects' experience of their trauma. There was no relationship between group category and attitude to the trauma. The results were interpreted as verifying Kragh's assumption that direct reconstruction measures are more influenced by external factors like social values etc than percept-genetic methods.

Abstract:

An experiment we sperformed to examine whether arousal induced by white noise would affect short-term motor memory. Two groups of subjects were tested under either control of arousal conditions on a linear slide task. Each group participated in two session with twelve target locations presented within each session. There was a 10 minute interval between the sessions. Examination of recall errors for Session 1 revealed no differences between groups. For Session 2 constant error revealed that performance in the arousal condition was significantly better than in the control condition. The results were discussed in terms of the role arousal plays in motor memory.

Title: An analysisd the Emetional Centent of Musical Excerpts and Poems. Reference: Psychological Laboratories, University of Stockholm, Eex 6706, S-113 85 Stockholm, Sweden. Title of project: Key words: Emetional Centent of Musica. Abstract: The present paper reports an experiment on the subjective qualitative experience of musical—and verbal stimuli. The musical stimuli consisted of 16 short poems especially written for the experiment and assumed to be enotionally adequate to the musical excerpts. The experiment attempts to uncover whether or not musical stimuli modiate an emetional centent, in a manner similar to verbal stimuli (peems). The results clearly indicate the existence of a common experience of emetional to the main

Title: An asymm	Title: An asymmetric model for the equal-sensation function in orfaction.						
Reference:			<u> </u>				
Reports fr 1974, No.		logical Labora	itories, Univer	rsity of Stockholm,			
Title of proje	ect:		; /	,			
			nstancy, Regre sensation functi				
Data from various intramodal matching experiments in olfaction were analyzed with regard to an Asymmetric Model for the equalsensation function. The Asymmetric Model was discussed in relation to a Symmetric Model. In all, 11 equal-sensation functions were investigated, and of these were 9 with different pairs of odorants. The following odorants were investigated: hydrogen sulfide, pyridine, dimethyl disulfide, and 5 odoran obtained by different combustion procedures of animal manure. It was found that the equal-sensation function can be written in the following asymmetric form; $\phi_i = b_{ik}^{ \lambda} \phi_k^{ bik} , \psi_i = \psi_k$ where ϕ_i and ϕ_k are proximal stimuli expressed in multiples of respective absolute thresholds. λ is a general constant invariant of experimental matching method and matched attribute (perceived unpleasantness or intensity). The constant λ was calculated both for group data and individual data. The value of the constant was determined to -2.6. The asymmetric form of the equal-sensation function was interpretated in terms of relativity and it was discussed in terms of the so called regression effect and the process of crossadaptation.

obtained from simple vector addition of the percept of each of the odor components. The vector model could also be formulated as a cone with orthogonal axes for each of the percepts of the mixture components and the percept of the mixture. Given the percepts of two odorants, the mixture percept will be found on the surface of the done

matching stimulus to judge. The results from the matching, experiments yields an asymmetric intransitive equal-sensation function that contradicts the possibility of using a standard odorant. The interpretation is made that all judgements are relative. However, from a practical point of view a standard odorant can be used for clusters of similar odorants. An alternative symmetric description that approximates data form matching experiments is proposed and permits the usage of a standard odorant. The results of the mixture experiments could be handled within the content of a vector model, stating that a perception of a mixture is

,	<del></del>
Abstract:	
	After a review of the different attempts to relate physiological mechanisms to discomfort glare, brief summaries are given of all encountered techniques of subjective scaling. The summaries are given in order of appaearance in the literature, from 1900 to 1973, so as to show the steps in the evolution of the scaling of discomfort glare. The main sources of assessment variance, as we as means of controlling them, are also discussed. It is found that none of the scaling techniques presently in the use can be appointed the rank of final standard, expecially as individual variability has not been dealt with properly.

Title of proje Person by si	est: tuation interac	tions						
Key words: Interactionis	m, situation p	erception, sit	uation reaction					
Abstract: The report is a dissertation which summarizes and integrates 8 studies bearing on the person x situation interaction issue, including situation perception and situation reaction. Using analysis of variance components, the interactionist hypothesis was empirically tested on anxiety data which showed that the trait and situationist views should be discarded in favor of an interactionist conceptualization. Using multidimensional scaling techniques it was shown that(a) people's perceptions of neutral situations could be described by the dimensions "active", "passive", "positive", "negative", and "social", and (b) people's perceptions of stressful situations could be described in terms of type of threat (e.g. egothreat, threat of pain, etc.). Using 'S-R' inventories of anxiety, people's reactions to anxiety-evoking situations were studied with respect to intensity and structure in situationally conditioned anxiety reactions. Relating the situation perception approach to the situation reaction approach, it was shown that the congruence between these two types of data was considerable. It was concluded that interactionism can be seen as a distinct conceptualization in personality and that situations should be described in terms of psychological dimensions within this view.

Abstract:									
A review was made of recent studies employing different S-R inventories of anxiety and fear. The review pointed to the need for studies of sex differences for inventories where both situations and modes of response are selected separately. Such an analysis was made in the present study with regard to sex differences in both level and variability of self-reported anxiety for both total scores factor scores, and single situation and response scales. The Ss were 116 adolescents, about 16 years of age. The inventory comprised 17 situations and 18 modes of response. With a few minor exceptions the analyses showed consistent sex differences throughout, with girls scoring higher than boys and showing greater interindividual variability in reported anxiety. Among other things, the results are discussed in relation to sex differences reported for physiological variables.

Thematic Apperception Test (TAT) stories for 46 male students were rated by four TAT experts with regard to 16 personality variables. The judges gave also a confidence rating for each personality rating. A three-way analysis of variance was applied, and the relative magnitude of the different variance sources was estimated. The main sources (Subjects, Judges, Variables) contributed together only about 10 % of the total variance, whereas the different interactions plus the residual accounted for the rest.

Cathartic effects as a result of non-aggressive activities	i
Key words:	
Catharsis, reduction of hostility	
	,
Abstract:	
An attempt was made to find alternative ways for reducing hostility to the traditional aggressive acting out. There were four groups of 3s in the experiment, each consisting of 10-18 male and female high school students. All four groups were assigned a creative task and then strong criticized for their "poor performance" (anger condition). Then an assistant to the E explained the E's very negative attitude (cognitive restructuring) to one group. The second group watched an absorbing but nonaggressive film (absorption), and the third group had an opportunity to counteraggress indirectly (acting out) against the E. For the controgroup there was no experimental manipulation. At the end of the experiment a mood questionnaire and part of the TAT were administered to all groups. The experimental manipulations created significant differences between the groups. There was a slight trend toward a reduction of hostility in the cognitive restructuring and film absorption groups. "Acting out" did not involve a reduction but enhancement of aggression. The problem of demand characteristics was also discussed.	ol.

Title: Hostility catharsis revisited
Reference:
Göteborg Psychological Reports, 1973, 3, No. 9.
Title of project:
Cathartic effects as a result of non-aggressive actitivites
Key words:
Catharsis, reduction of hostility.
The present paper is an attempt to systemalize theories and empirical studies of the phenomen of catharsis. The drainage model is examined and criticized. Studies on viewed violence - symbolic catharsis - as well as actual catharsis are reviewed and the effects of aggression-eliciting stimuli are discussed. One section deals with the application of principles of learning theory to catharsis, and another section concerns different arousal states in relation to aggression. Emphasis is placed on the many misconceptions of catharsis in most Western languages. The discussion concludes with suggestions for a planned study on cognitive relabeling of the emotional state of anger.

Abstract:				
This paper includes a number of viewpoints regarding the extent to which existing general-purpose computers can be applied to simulate human mental processes (intelligence). It is maintained that due to fundamental structural differences between the brain and a computer, such as the non-binary firing of the neurons - the latter must be regarded as essentially a tool for increasing human mental and/or physical efficiency rather than for explaining natural intelligence. Furthermore, it is advocated that the brain is basically a pattern recognizing apparatus for which the metric characteristics of natural or symbolic patterns are not essential and consequently new mathematical techniques are probably required for modeling the non-metric regularities of the brain function. Data are presented concerning the incapability of man in processing numerical information as well as some aspects of pattern recognition as a reduction process.

Two experiments were performed, where the consensus was analyzed by the lens model equation, which has been related to the non-criterion situation b. Naylor and Schenck (1966). The amount of information (two, four, and six tests) was found to have an effect on the consensus, whereas type of information available (access to the validities of the tests and their intercorrelations or not) did not have a significant effect on the consensus. The results imply that consensus among pairs of judges decreases when number of tests increase. However, the difference between four and six tests was not significant in one of the experiments. The changes in consensus as the number of tests increased was mainly a function of a decreased matching between a pair of judges with respect to the linear aspects of their judgment processes. A further analysis of the linear aspects of the judges' judgment processes indicated that policy similarity contributed more to consensus than policy consistency. The contribution of the nonlinear aspects of the judgment process to consensus was negligible in these experiments.

Abstract:  An experiment was performed on the effect on individual judges' predictive efficiency of information about the relevance of cues for clinical judgments. The information patterns were such that the task may be characterized as a multiple-cue probability task. The predictive efficiency was shown to be substantially and significantly higher with access to the ecological validity coefficients than without such information. Feedback in the form of utilization coefficients and functional validities had no additional positive effect.

The intention is to describe the work of activity centers, that is a day facility for occupation and training of the mentally retarded living in the community, and to see to what extent and in which areas they fulfill the goals set up for them.  A descriptive model of the activity center's work was drawn up and a description-chart and questionnaire compiled. The model and the chart include the five following areas: physical integration of the center, functional integration of the center, the policy of the center, the degree of planning of activities, and finally, the forms of teamwork for staff and participants.  Eleven centers were studied. This first version gives a clear differentiation between different centers: Group 1: centers providing the participants simply with a daily occupation mainly such things as weaving, sewing, games and other forms of entertainment. Group 2 are characterized by a greater insight into the intentions of an activity center and an awareness of the goals to be fulfilled. They had even developed methods for trying to attain these goals. Group 3 had come furthest and had a well planned and systematically prepared programme which took into consideration the needs and wishes of each

The M patients had significantly lower pain thresholds and consistently, although a significantly, lower tolerance levels than the control group. In order to strelations between pain tolerance and scores in personality inventory scales the MDS group was divided into one higher and one lower pain tolerances group, consisting of subjects with scores above and below the median in the pain tolerance measures. The lower tolerance group had significantly high scores in the Psychic Anxiety and Neuroticism scales and higher scores is some scales indicating "psychasthenic" traits. No significant differences were found between the subgroups in the aggressiveness and extraversion scales.  Date:    Pages:
Response to noxious electrical stimulation, increased in discrete steps, we studied in a group of 26 female patients with manifest mandibular pain dys function syndrome (MDS) and a control group of 27 healthy women. The M patients had significantly lower pain thresholds and consistently, although a significantly, lower tolerance levels than the control group. In order to strelations between pain tolerance and scores in personality inventory scales the MDS group was divided into one higher and one lower pain tolerances group, consisting of subjects with scores above and below the median in the pain tolerance measures. The lower tolerance group had significantly high scores in the Psychic Anxiety and Neuroticism scales and higher scores is some scales indicating "psychasthenic" traits. No significant differences were found between the subgroups in the aggressiveness and extraversion scales.  Date:    Pages:

Refere	t (på engelska):
	The report presents various programs for the prevention of learning difficulties and emotional disturbances in the school. A large part of the report deals with the concept of "prevention", its ideological basis and its practical consequences. Some Scandinavian and some American projects are presented and discussed in the report. The discussion focuses on each project's relevance for Swedish society, the description of the programme, problems of introduction, staffing and follow up, administration and costs. There is also a discussion of different research methods and their merits and limitations.  The report ends with 11 recommendations concerning registration contra therapy, family therapy, infant identification and training, parents as educators, home training and integration of the school with the rest of society. , , , , , , , , , , , , , , , , , , , ,
Title of project:
Socialstyrelsens försöksverksamhet ir m barnstugeområdet (FIB)
Key words:
Immigrant infants' language and training before school
Immigrant intants language and training before school
Abstract:
There is a great need for research about the linguistic and personal
development of immigrant children. The world is full of them. In
most countries the problem is noticed, and there is a growing con-
cern about what will happen to these children if they grow up with-
out having developed sufficient abilities as regards both language
and other knowledge. Few countries, though, have as yet started to
tackle the problem in full.
This report tells briefly about an attempt to facilitate immigrant
childrens school start by training them before school in Swedish
as well as their own mother tongue in a playful way, suitable for
small children. The outcome of the experiment is reported in another
report, Invandrarbarn i Norrköping, "Immigrant children in Norrköping
written in summer 1974. The trained children gained well, linguisti-
cally as well as regards social and personal development.
oully up not up logared by order and portional developments

Nyckelord:

Referat (på engelska): The following report is part of a research project called Client-related supervision. The report is a survey of economic and personal resources for offering psychologists' internship. It also tries to cover what such a training consists of, as well as what is desired. The survey covers the situation in Sweden during the academic year of 1971-72.

The main questions of the survey were: 1. To what extent is supervised training required in order to obtain license as a psychologist? 2. What

Supervision, practicum, internship.

institutional and personal resources for such a training exist in Sweden?

3. What does such an internship actually consist of? 4. What is desired from such a training by the supervisors?

The data were collected by questionnaires. The results were presented in

The data were collected by questionnaires. The results were presented in frequency tables.

The main results of this report were: 1. Practical training with supervision of an experienced psychologist is considered necessary in order to work as an independant psychologist. 2. The number of trainees an institute could offer intermsnip was mainly restricted by economical factors and by shortage of localities. 3. Diagnostic work dominated. It was generally considered difficult to meet the demend for intensive as well as extensive training. 4. Most supervisors were content with the distribution of time used by the trainees for different assignments. Those who wanted to change the contents would prefer an increase of therapeutic work and of supervisory conferences at the expense of other duties.

Analys av lärarbefattningar inom arbetsmarknadsutbildningen som grundval för utbildning: Självobservation och enkat. /Analysis of teaching jobs in läbor market training as a basis for training: Self-observation and questionnaires / Key words:
Labor market training, job analysis, self-observation, information saturation, assessment questionnaire
The purpose of the study is to analyse the special problems that face teachers in labor market training. The procedure followed in the study can be divided into three different phases. The first one consists of the collection of data by means of self-observation of the critical incident type. The second phase is a content analysis of the situations collected. This section also contains a check of information saturation. The third phase has the form of an assessment questionnaire in which a representative sample of the material collected earlier is assessed from five different aspects, namely occurrence, training need, time, present and future, which are considered to provide indicators of the training urgency. 132 teachers, 78 students and 61 administrators have participated in this part of the investigation. The rapid technical development causes the teachers to feel a need for training in their own trade. Another large problem stems from the heterogeneity of the students, which in combination with the successive in take and the language difficulties of immigrants necessitates special measures. The social difficulties that many of the students have also lead to the jobs of teashers in labor market training having a strong element of welfare work.

Self-observation, content analyses, assessment questionnaire, information
saturation
Abstract:
Part I: School principles and tutors. Different kinds of self-observation methods have been experimentally investigated. The material has been examined
by means of content analyses and job discriptions have been formulated
on the basis of collected data.
Part II: Teachers in labor market training. The data collection methods
used have been self-observation of the critical incident type and interviews.
The material has been analysed for content and assessed. Information
saturation has been checked. In the assessment phase, data were collected by means of questionnaires. In the questionnaires the material has been
assessed from five aspects, namely occurrance, training need, length of
time, present and future

Abstract:	,					
As a part of a project of evaluating open forms of services for the mentally retarded this exploratory study aims at comparing the situation of work and the attitudes of attendants in integrated living units (hostels) and in traditional institutions. The method used is a self administered questionaire to a sample of attendants at a large institution and to all attendants in the hostels in the county of Stockholm. Main variables were integration, involvement and perception of purpose of the institution.  The hostel group was found to be elder, more experienced in work with the retarded, more actively integrated in the hostel system favourable to active integration of and influencing the society to accept the retarded.

200 pupils in primary school, ages 9 and 12, were given the Ljung Test Anxiety Scale, the Wechsler Intelligence Scale for Children (WISC) and a group intelligence test. Children with a higher degree of test anxiety had poorer results on the intelligence tests, with the exception of a specially constructed short form of the WISC. Girls had a higher degree of test anxiety than boys, and older childdren had a higher degree of test anxiety than younger children. A hypothetical model of the test anxiety variable is presented and discussed in the dissertion.

Key words: Similarity, Ratio Estimation					
A betwa etc					
Data obtained in four sets of experiments involving pitch, heaviness, greyness, and circular area were re-analyzed. It was found (1) that similarity estimates \mathbf{s}_{ij} are power function of stimulus ratios \mathbf{S}_{ij} with the exponent \mathbf{n}_{s} , (2) that ratio estimates \mathbf{q}_{ij} are also a power function of stimulus ratios \mathbf{S}_{ij} with the exponent \mathbf{n}_{q} (i.e. Stevens' power law), (3) that the exponent n of similarity estimates as power function of ratio estimates is equal to the ratio $\mathbf{n}_{g}/\mathbf{n}_{g}$, and (4) that, inversely, the exponent m of ratio estimates as power function of similarities is equal to the ratio $\mathbf{n}_{q}/\mathbf{n}_{s}$.

Referat (på engelska): This report deals with item construction and in connection with that effects on test results and psychometric properties in tests. Two multiple-choice tests were constructed for each of the grades six and nine in the compulsory school and grade three in the gymnasium. One test was correctly constructed according to existing item construction principles. The other, test was constructed with certain faults and/or cues interspersed in the items. Besides, the items were identical for each grade. For each test condition two different instructions were presented, one neutral and one aiming at making the subjects attentive to the faults in the items. Regarding the test means the results for the two test conditions were approximately equivalent for each grade. The correct versions showed on the whole a lower reliability but a higher empirical validity than corresponding versions with faults and/or cues interspersed in the items. Only in the case of grade nine the non-neutral instruction resulted in a higher mean compared with the neutral instruction. Finally, some possible explanations are presented of the obtained results. .

	The study begins with an account of the development of criterion-referenced tests and different definitions of them. After that fundamental problems of criterion-referenced measurements are analysed. In that part the effect of the objectives on the construction of the tests, the homogeneity of the items and the cutting-scores for what should be regarded as satisfactory knowledge are dealt with. In the following part the construction of items is accounted for. Then different fields of application for criterion-referent tests are discussed. The report ends with some views on the future work with criterion-referenced tests.	icec

Referat (på engelska):	
The present report is a summary discussion of tion with the following problems: a) analyst of some test theoretical formulae and princi multiple-choice questions and c) criterion- empirical implications. In studies associate how some test theoretical formulae and princi formation in the inter-item-covariance matri	is and empirical investigations ples, b) differential scoring of referenced tests: theoretical and ed with the first problem is shown ciples can be derived from the in-

can be used to explain empirically found relations. Studies carried out within the second field of problems account for reliability and validity effects with differential scoring of multiple-choice questions. Systematically ordered alternatives gave higher reliability with differential scoring compared to conventional scoring. In connections with the third field of problems the development of criterion-referenced tests, their qualities and restrictions are discussed. In the empirical study especially low and moderate correlations between norm- and criterion-referenced discrimination indices were received, as well as between different criterion-referenced discrimination indices.

Multiple-choice items, scoring, reliability; Validity

Referat (på engelska):

In the present report three studies will be accounted for, where differential scoring of the alternatives of multiplechoice questions has been tested and as for reliability and validity has been compared to conventional dichotomous scoring. Empirical as well as a priori weights have been used. The basis of the former ones consisted partly of (biserial correlations between every alternative and the total score and partly of the mean of the total score for those who had chosen the actual alternative (Guttman weights). The a priori weights were received through different judgement procedures. Tests with ordered alternatives showed higher reliability with differential than with conventional scoring. The highest reliability values were received with the more stringent weight systems. When the comparisons were made with the reliability recieved with conventional scoring of a parallel test, constructed without ordered alternatives, this positive effect was eliminatet exept for the stringent weight systems. As for validity, differential scoring showed on the whole lower values than conventional scoring. When commenting on the received results the importance of the construction of the test to receive positive reliability effects with differential scoring is pointed out. Finally the restrictions of the study are accounted for and suggestions for furture research are given.

This study has, theoretically and empirically, dealt with reliability, validity and discrimination measures in connection with criterion-referenced tests. The purpose of the empirical study was to investigate relations between different discrimination measures and what effects on reliability and validity that selection of items gave with the help of these measures. The different discrimination measures were on the whole moderately intercorrelated. It was especially interesting to observe the moderate intercorrelations between the three discrimination measures defined as the difference in item difficulty between a) the upper and lower 27 per cent of the subjects according to the results of the posttest, b) the results of the preand posttests and c) the results from an expert group as well as a nonexpert one. The reliability defined as the agreement between the results of two posttests was positively influenced no matter which one of the three discrimination measures a), b) or c) that was used for the selection of the items. As for the decision-oriented reliability measures the effects were, however, sumewhat different for the different selections of items. Moreover, the results showed that an increase in reliability does not necessarily imply an increase in validity defined as the difference between the results of pre- and posttests. Finally restrictions of the study are dealt with and suggestions for further investigations are made.

Title:
The influence of cigarette smoking on learning and memory
Reference:
Master's thesis from the Psychological Laboratories University of Stockholm, 1974
Title of project:
The effects of tobacco smoking on psychophysiological functions
Key words:
Smoking, verbal léarning, memory, arousal
Abstract:
The present thesis forms part of a long-term research program concerning effects of tobacco smoking on psychophysiological functions. The

The present thesis forms part of a long-term research program concerning effects of tobacco smoking on psychophysiological functions. The thesis consists of three parts, a survey of the relevant literature, and two experimental investigations dealing with effects of cigarette smoking on learning and memory.

- 1. On the tobacco smoking habit: A survey of the literature relevant to psychological research.
- 2. Effects of cigarette smoking on verbal rote learning and physiological arousal (together with B. Post).
- 3. Effects of cigarette smoking on learning and retention.

The main aim of studies 2 and 3 was to investigate effects of cigarette smoking on learning and retention in humans and to relate possible changes in these processes to conconitant changes in physiological arousal. On the basis of a theory advanced by Walker (1958) it was argued that cigarette smoking, acting as a CNS stimulant, might intensify the consolidation of the memory trace. According to the theory, high arousal is assumed to make the trace process more intense leading to an inhibition of immediate recall but an improved ultimate memory.

Title o	f project:
,	Studier av generationsmotsättningar (Stug-projektet) /Studies of the generation-gap (The Stug-project)/
Key wor	ds: Data-collection, non-answers, generation-gap
Abstrac	t: The Stug-project is a follow-up-study from the YG-project (Youth in Gothenburg) 1965.
	The sampling procedures of the different data-collections make it necessary to analyse the effects of the non-answers. The connection between the YG- and the Stug-project gives us an opportunity to trace back the non-answers of the Stug-data-collections to the YG-data-collection in 1965. Some data of the non-answers 1965 are also collected.
	The non-answer-group in the YG-project is just slightly negatively selected.
	The results of the analyses show that the Stug-material is not especially affected by the existence of quite a high frequency of non-answers as long as we don't work with too many and too small groups.

Malmöundersökningen (The Malmö-study)

follow-up, ability, social back-ground, educational career, occupational

career, education and income, multivariate analysis

Abstract:

Key words:

The investigation material consists of those 1 544 indivuduals who, in 1938, were enrolled in grade 3 of public or private schools in the city of Malmo. These individuals have been continuously followed up till 1972. This report presents several multi-variate analyses concerning relations between family back-ground, ability, education and different criteria relevant to adult life. The aims of the analyses were the following: 1. To study the relative explanatory power of different predictors for variandce in adaptation- and success-variables measured during adulthood. 2. To study the importance of sex-differences with regard to relative explanatory power. 3. To attempt to condense investigation results previously presented ind the form of cross-tables. 4. To compare the results of different techniques of analysis. 5. To test, in a practical application, data-processing methods, and programs for use with longitudinal data. Multiple Stepwise Regression, Multiple Classification Analysis (MCA), and Automatic Interaction Detector (AID) was uses. The results stress the importance of interaction effects to be regarded when dealing with explanation of variance. The differences between the sexes which have come forth in the analyses are primarily concerned with levels in the criteria. · However, there were no such differences in either explanatory power of different predictor variables or in the patterns of interaction. The aim of condensing previously presented material has been successfully achieved with those metods of analysis which were chosen. Cross-tables are, however, an important complement. MC4 combined with AID is recommended for analyses of the kind used here.

·
Title of project: Malmöundersökningen och Projektet "Studieavbrott i grundsbalan"
(vid Pedagogisk centrum)
Key words: educational disadvantages, longitudinal, adult education, occupational
career, mental retardation, social back-ground, drop outs
Abstract: This report gices a brief summary of seven previous reports, six
from the longitudinal "Malmo-study" and one from a drop out study. The aim for the summarizing analysis is fourfold: an inquiry into what happens to
educationally desadvantaged students during both their period in school
and in their adult life, and an analysis of the importance of the school
in either compensating for or crearing new problems for individuals; a
discussion of the implications of the findings for education and schooling
in modern Swedish society; and finnaly, suggestions about strategies for further research and ideas about cracial problems that ought to be studied
Persons are considered educationally disadvantaged if: (a) they are mentally
retarded. (b) their home background was classified as the lowest social
stratum and/or (c) they dropped out of compulsory schooling. The results
stress the importance of the initial years of schooling. Many of those who fail during that period risk experiencing school as a period of repeated
failures, and in turn have less probabilities of success in adult life.
The results are discussed at som length from two points of view: 1. Formal
and compulsory schooling is regarded as a part of the individual's life-
span development. 2. Theoretical reference is made to two models - organismic and mechanistic - for that development. It is argued that schooling
is heavily anchored in a mechanistic view of development. The basic goals
for compulsory education, however, are more representative of an organis-
mic way of thinking. This causes a conflict, which makes it practically
impossible to fulfill the aim of giving a stimulating and enriching milieu for individual development. A need for more research from this broad edu-

Abstract: The choice of coding strategy made by severely hard of hearing students learning visually presented verbal material, on the one hand at a syntactic level, on the other at a phonological level, was studied in two experiments. Subjects were students 17-18 years old with severely impaired hearing. The results were analyzed in relation to degree of hearing impairment, functional (speech)hearing, IQ and knowledge of some locical and syntactic rules. In the first experiment Ss learned paired associates with two digit numbers as stimuli and phrases, with correct or incorrect syntax, as responses. The results show that the deaf Ss in the examined group did not have sufficient knowledge of syntax to be able to efficiently use a syntactic coding strategy. In the second experiment Ss learned paired associates with two digit numbers as stimuli and trigrams, half of them easy to pronounce and the other half difficult to pronounce, as responses. Ss generally learned trigrams which had a high pronounceability more easily. Those who attained the best results on the easy-to-pronounce trigrams had superior results on the grammar test, and at the same time better hearing. Those who performed best on learning trigrams of low pronounceability had, however, a greater hearing loss, which supports the notion that they had applied some coding strategy other than a phonological one, probably a visual or a motor one with the help of finger spelling.

Pedagogiska Institutionen Lärarhögskolan i Göteborg
Rapport nr 41
Mars 1973
SISU-projektet: Rapport 7 Title of project:
SISU-projektet Self-Instructional Special Education
<u> </u>
Key words:
Me, thod and materials systems - Swedish, mathematics Remedial instruction, Educable mentally handicapped
Abstract:
SISU (Self Instructional Special Education) has developed remedial
materials in basic parts of Swedish and Arithmetic for slow learners
at the primary stage. One hundred teachers and 700 pupils took part in an evaluation of the material during 1971-72. This report treats
the pupil attitudes to the material. Most attitudes were positive to
the material and the way of working with it. Pupils prefer SISU to other
teaching. Most pupils uncerstand the instructions better than ordinary textbook instructions, and believe that the SISU tests are easier than
other tests. There is no special attitude to the self correction prin-
ciple. The teacher seems to trust SISU, she does not check the pupils
often when they work with the material. The pupils are not unduly disturbed by the other pupils when working with the SISU remedial
material. Most pupils had not used a tape recorder earlier in school.
They were not unduly tired by the way of working with a tape recorder,
had time enough to finish their tasks, did well without a teacher's help, and wanted to go on using a tape recorder. The pupil attitudes
are on the whole positive to the SISU material. A source of error may
be that the teachers took part in the evaluation on a voluntary basis,
and their attitudes may have influenced the pupils. The SISU material
was new to the pupils, and it was used a comparatively short part of their total time at school.

Title of project: Kvalitativ utvärdering av lärarutbildningen. Qualitative evaluation of teacher training.
Key words:
Teacher education, evaluation, follow-up study.
Abstract:
These reports are based on intensive interviews with administrative personel involved in the education of class- and subject-teachers at all teachers' colleges and schools of education in Sweden. The number of respondents are 35. Complete transcripts of the interviews are published in two reports (nos.82 and 83). One report (no 100) is composed of summaries of the interviews. Most of the respondents interviewed underline the great organizational difficulties surrounding collaboration between the different parts of trainin Some respondents are apprehensive of an increasingly centralized direction of schools of education. Certain teacher trainer categories have had insufficient elementary school experience, and the majority of respondents consider this a patent disadvantage. Reference is made to inadequate tutor training a d the difficulty of recruiting tutors. Many respondents observe that trainees have insufficient knowledge of English and mathematics. The trainees genuine opportunities of joint influence is regarded as limited. Schools of education appear to lack the facilities to produce the openness to change required by the curriculum.

Title of project: Kvalitativ utvärdering av lärarutbildningen, klasslärarlinjerna (KUL-K) Qualitative evalution of teacher training, class teacher lines Key words:
Teacher education, evaluation, follow-up study.
Abstract: This report is based on interviews with 93 class teacher trainees and 31 class teacher trainers at two teacher training colleges. On the basis of material collected previously in the course of the KUL-K project, an attempt is made to penetrate central problem areas of class teacher training. Important findings presented in this report include the following: Trainees criticize the content of subject studies - they would like more school level adjustment. A relatively large number of teacher trainees are unduly preoccupied with the direct usefulness of their subject studies. Trainees experience the different parts of their training as ceparate entities, hardly as integral units. Some teacher trainers query the need for training to be experienced as an integral by the trainees. Tcacher trainers find that collaboration presents a variety of problems. As a rule trainees feel that they have no real opportunities of influencing the form and content of their training.

Referat (på engelska):

The purpose of this report was to study the results of a systematically carried out training to work in groups. Three pre-experiments were carried out in grade four in general subjects and Swedish integrated in these subjects. In the main experiment the independent variable consisted of a detailed training programme. This programme consisted of teaching methods for individual and cooperative skills. Eight (8) classes were used as experimental classes. Measurements were carried out in these classes before, in the middlo of and after the training. The training went on for eight (8) weeks, and 12 lessons per week were used. Eight (8) classes were used as control classes. In these classes the teachers used their ordinary teaching methods. The dependent variables were measured by systematic observation, knowledge test and questionaires. In most cases data were analyzed in connection with high, middle and low achievers. The main results show that remarkable increases were received primarily as for the ability of the experimental pupils to distribute the work within the groups, to communicate within the groups and to report the results of the group work in front of the class. The attitudes of the pupils and the teachers were on the whole very positive. Negative results were received primarily as concerns goaldirected behaviour. In the last chapter a contribution to a theory of instruction for group work training is presented.

disordon The the the second available of the the the the the the the the the the	er: The effect of suggestive therapy in children with concentration ers has been investigated. Everetical introduction gives arvey of different forms of attention disorders and methods of suring them, method of treatment a theoretical frame of reference, cial views regarding suggestive therapy in children. field experiment tape-recorded texts were used, edited by Thoren aliable at Skandinaviska testforlaget, tockholm. fect of the treatment has been measured by means of a battery of tration and personality tests. The classroom behavior has also been ed by systematic observations and parents and teachers have been elewed. The results show that the treatment did not have the inten- fect regarding the children's ability to concentrate. The children' for has, however, to some degree chansed in a positive way. There has been an increase in the self-esteem, openess and confidence in vironment of the experimental group as well as a decrease in emo- tension. The treatment has also had positive effects with regard chosomatic and psychomotoric symtoms like sleer disturbances, sto- insorders and tics. Inclusion is that concentration disorders should probably be treated mother method than the one opplied in this investigation. The lates and the research of hypnosis support this view and recommend a of hypnosis with suggestions of a more alert type.

	nal phenomena					
Abstract: The emotional dependency on special objects displayed by children, especially at bedtime, anxiety, etc., has been termed "transitional phenomena" (tr-ph) within psychoanalytic literature. Also certain behaviors like hummings and rockings are designated "transitional phenomena". The basic characteristics of the phenomenon have here been investigated. Special attention has been given to tr-ph as possible defence against separation anxiety. Seventy-seven mothers were interviewed about their children who at the time of investigation were 6 years of age. Most typically, the children used sounds, movements and pieces of cloth, beginning already during the first year of life and also continuing for several years. The strong emotional dependency appeared i.a. in the fact that tr-ph became more important than the mother, expecially at bedtime. We found that great possibilities for close physical contact with the mother promoted the development of tr-ph, therefore considering a simple model of substitution to be unapplicable.

"]	ords: Psychoanalytic Theory. Object Relations Theory. Projective Techniques. Film strip.
lbstr:	act: In what way does your personality influence the first impression of unother man?
3	0 students were individually shown a two minutes film and interviewed

30 students were individually shown a two minutes film and interviewed about their impressions of the man that appeared on the screen. The subjects were of very different opinions, and it is clear that a film of this type might be used as a projective test. E.g. one subject that later went through a psychotic episode, thought that the man was cross-examined and near brake-down. In contrast another subject found him to be a brilliant professor, lecturing to his students. The differences are interpreted in terms of the Object-Relations Theory. Among nine typical cases, three interviews are reproduced in unabridged form, together with thorough interpretations. Three main response-categories could be discerned: l.Normal: sensitive to the real personality of the man. 2. Neurotic: putting him into all sorts of wish-fulfilling fentasies. 3. Schizoid: withdrawal of all personal feelings for the man.

To make it possible for non-informed readers to follow the discussion, the Object-Relations Theory is presented extensively for the first time in Swedish and can be read separately. There is also a discussion of the metascientific status of this theory, which is seen to be a consequent human-studies-type of theory, in contrast to the natural science ideal of psychoanalytical ego-psychology.

# Referat (på engelska):

Literacy, Popular Education, Illiteracy

In order to bring representatives of current literacy-research of western societies together, a conference in Uppsala, in May 1972, was established by the departments of History and Education in Uppsala and the department of Education in Lmeå.

Four of the papers, which were presented at the conference, have been gathered into the present volume and also a fifth paper is included written by professor Kenneth A Lockridge, Ann Arbor, USA. The purpose is to sum up and give information about the contents of the conference and simultaneously offer a contribution to the discussion of the problems and results of the literacy research in the current humanistic and sociological research situation.

Title:  Undervisningsmålen for amnet engelska i Lgr 69. En måldokumentanalys/ An analysis of the objectives for the teaching of English in the Swedish Comprehensive School Authorized Curriculum of 1969/							
Reference:							
Rapporter från Pedagogiska institutionen vid Lararhögskolan i, Goteborg nr 54							
Title of project:							
Key words:							
Curriculum research, Educational (instructional) objectives, Goal document analysis, Swedish Comprehensive School, Teaching of English as a foreign language							
*							
The analysis was carried out as a basis for a discussion of how the goal descriptions for the teaching of English in the Swedish Comprehensive School could be more clearly defined. The text of the authorized curriculum has been scrutinized in detail. All passages which contain explicit goal descriptions or which could be interpreted as containing implicit goal descriptions have been noted and objectives have been formulated from them. The objectives have been catalogued with the aid of a classification scheme. The generality level and the scope of the objects of behaviour in the objectives have been examined. A more readable presentation of the objectives defacto met with in the authorized curriculum has been attempted. Observations are further made of points, at which new objectives should perhaps be inserted, and of points, at which it would seem advisable to define the objectives more clearly. As far as possible, all objectives are expressed in the words of the authorized curriculum, and suggestions given only emanate from a logical analysis of the material derived from the curriculum itself. There are also some recommendations on the building up of a list of objectives.  A similar analysis of the objectives for the teaching of English in the authorized curriculum for the "gymnasieskola" (upper secondary level comprehensive school) is in progress.

Title: Educational Flow Models with Applications to Arab Statistical Data Linköping Studies in Education. Dissertations, No. 3, 1974	
Reference:	$\dashv$
Reference:	
Title of project:	
Key words:	コ
Educational Planning, Educational Statistics, Educational Models	
Abstract:	$\neg$
The thesis first discusses characteristics of Educational Statistics. Educational flow models are then discussed on the basis of the concept of education accounting. The mathematical theory behind flow models is developed, and the development of new models, their adaptation to existing data, and their use is discussed. Stationary population models are developed and discussed. The models are finally applied to data from six Arab countries.

demokrati	
Key words:	
Freedom and equality, history of education, mass education, monitorial method	
Abstract:	
The monitorial method seems to have been discussed especially from two main points of view:	
a) as a cheap instrument for attaining an enlarged public education and b) as means to both an intellectual and a moral education.	
The project aims at illustrating the growth and extension of the	
monitorial method in different countries with respect to Swedish public	
education both in regard to secondary and public school education.	
The project intends to form a basis for future study of the monitorial method as an instrument for the realizing of the ideas of liberty and	
equality.

from applying compared in a agreement is regardless of raters as a so between relati. When using ab five-interval s relative scale. constructing a we get different incidents and the fairly similar own relative for	different operational definitions to the concept "frequency" are in empirical investigation. The result shows that the inter-rater higher for relative than for absolute rating. This result is valid whether one treats the differences in mean level between the surce of true or error variance. There is also a clear difference we and absolute rating with regard to the level of the means. It is obvious from these results that one major difficulty when absolute scales is to define interval boundaries in such a way that intiating and stable measurements. The frequencies of reported the means from relative and absolute rating of frequencies give frequency profiles with regard to structure. The respondents requency ratings of their own incidents seem, however, to be the incomparison with ratings (absolute and relative) from indesented.

#### SUBJECT INDEX

English terms used for the different school stages:

Preschool
primary school
lower secondary school
upper secondary school

förskola lågstadium mellan- och högstadium gymnasieskola

Ability 264, 296

Absences from school. Project
(Elevfrånvaron i skolan - SIA)
103-104, 106

Absenteeism 103-106

Access to education 159

Achievement 73

- test 73, 87-88, 147-148,
270, 321

Activity center 245

Adaptation 179

ADL (Activity of daily living/ Anpassning till dagligt liv) 302

Adjustment 89, 108, 125, 185
Adolescence 167, 189, 292
Adolescent 122-123, 125, 127, 129

Adrenaline (See Epinephrine)
Adult education 1-4, 136, 297-299
Aeronautics 151
Africa 291, 352

Age difference 82, 101, 130, 265
Aggression (See also Hostility)
227-228, 230, 253

Aging 124

Aftereffects 179

Aims of education 3, 98, 153-154, 319, 323, 347

Air pollution 161, 163-164, 214 Aircraft 165 Alcohol 180, 182, 290

Alcoholism 287

Androgens 6

Anxiety 129, 193, 219, 222, 249

- scale questionnaire 221

Aptitude 327-329

- test \$29

Arab states 351

Arithmetic 73

Arousal (See Physiological arousal)

ASPRO committee (The associated schools project in education for international understanding and cooperation) 555

ATI (Aptitude-treatment interaction) 155

Attendance (See also Absenteeism) 81, 156

Attention 43, 46, 73, 250

Attitude (See also Parental attitude, Youth attitude) 15, 17, 29, 61, 82-83, 91, 107-108, 198, 263, 272, 307, 323

- change 17

Audio video laboratories 325
Auditory perception 304
Authority 65, 96, 350
Autoinstructional aid 305-307
Autonomous groups 28

Beginning learning 74
Behaviour therapy 340
Behavioural sciences 139-140
Bernstein, Basil 58-59

Biblography 67, 133-135, 246, 330

Bilingualism 252

Blind (See also Visually handicapped) 309-310

Book for youth (See also Children's book) 120

Book review 120

Boredom 357

Braille 309

Brain damage 287

California psychological inventory: Socialization scale 356 Career (See Profession) Castration 6 Catecholamines 182, 194-195, 224, 290 Catharsis 227, 229-230 Cathexis 237 CERI-project (International transfer of minicourses) 314 Change of residence 107-109 Child language 58, 256-257 Child psychotherapy 335 Children 126 Children's book \ (See also Book for youth) 120, 348 Choice (See Option) Cigarette smoking (See Tobacco smoking) Circadian rhythms 195 Classroom observation 102, 333 Clinical judgment 36 Closed-circuit television 325. 332 Cluster analysis

Cognition 51, 178, 241 Cognitive development 79, 131 Cognitive processes 32-38, 49, 53**-**54**,** 303 Collective settlements 353 Colour perception 207-211 Colour word test 276 · Composition 324 Computer 140 Computer-assisted instruction 142, 157 Computer programs Computer simulation 233 Concentration (See Attention) Concept formation 55, 112 Conception of number (See Number concept) Conference reports 139-140 Conflict 37 Conflict of generations (See . Generation gap) Conformity 129 Consumer education 98 The Consumer project (Konsumentprojektet) Content analysis 260-262 Cooperation (See Group work, Social interaction) Coping behaviour Cost analysis 1 Cost of education 1 Counselling (See Guidance) CPI (See California psychological inventory) Creativity 23, 70, 86, 131 – test 85–86 Crime \ 289 Criminal (See Delinquent)

Criminality 289 Critical incidents method 259, 261, 338, 360 Curriculum 347 Cybernetics 325 Data collection 136. 141. 293**, 3**01 Data processing technique 157 Deaf 44, 303-304 Decision making 35, 38, 53-54, 331; *3*50 Delinquency (See also Juvenile delinquency) Delinquent 336, 340 Democracy 350 Democratic values 114, 116-117, 319, 320 Democratization 66 Dependency 266-267, 287 Depression 242 - research project Deprived 297-298 Developing country 352 Development (See Physical development, Social development)

Developmental psychology Diabetes mellitus 126 (Sèe Educational Diagnosis diagnosis) Didactics 79 Differential psychology 271 Difficulty (See Perceived difficulty) Discrimination 280 Divergent thinking 23 Documentation 1.32 Dropout 145-146, 160, 297 Drug 291

Drug addiction 289 Dyslexia 71

Ecology -121, 292, 343 Economics of education 294 Educational career (See Sociology of education) Educational choice (See Option) Educational diagnosis Educational film 330 Educational information Educational objectives (See Aims of education) Educational research 133-135, Educational statistics (See Statistical data) (See Electroencephalography.) Electroencephalography 126, 177, 192, 204 Embedded figures testing 267 Emotional content 206 Emotional development 339 Emotional disorder 255 Emotional response 190 Emotional states 194, 277 Emotionally disturbed (See Maladjusted) Empirical methods 183 English 4, 72, 93-94, 321, 347 Environment (See also School environment, Social

environment, Social environment) 121 Environmental effects 188

Epinephrine 178, 180-181, 185-186

EPÅL-project (Engelska på lägstadiet) 94

Ergonomics (See Human factors engineering)

Estimation (See also Ratio estimation, Time estimation') 49 Estradiol 5, 11 Estrogens 10 Ethnic group 61-62, 82 Evaluation 145-148, 151-152, 245, 307, 313, 315, 317-318 Examination 144 system 144 Exercise 169, 174-175 (See Perceived Exertion exertion) Experimental psychology 358 Experimental school Eye-head movements

Factor analysis 14, 31, 138, 177, 237, 267 Family background 300 Family mobility 108 Feedback .48, 235 Female animals 5, 10 FIB-project (Socialstyrelsens. försöksverksamhet inom barnstugeområdet) 256-257 Film strips 341 Finger reading 309 Fingers 187, 196 Fishes 7-9 Flexible working hours 195 Follow-up study 18, 63, 84, 89, 125, 128-129, 146, 159, 294-296, 298-299, 317

Foreign language English 4, 93-94, 321, 347 Freedom and equality 354 Future 231-232

(Gymnastic GAIS project Activities In Schools) 60 Game (See Simulation game) General subject 70, 85, 92 Generation gap 127, 293, 301 Génétics 131 German 83 Goal document analysis (See  $\Lambda^{r} \rightarrow \iota$ .cation) Gra . Group dynamics 95, 349 Group instruction 🔾 See: Team teaching) Group psychotherapy 238 Group work 101-102, 115, 144, 149-150, 326, 349 The Growth study (Educational testing service) 63 Guidance GUME-tests (Göteborg, Undervisningsmetoder i engelska, delprojektet för provkonstruktion och utvärdering)

Habituation 187
Hammond's lens model 34, 37
Head teacher 260-262
Health service 254
Heart rate 172, 175, 183
Height (See Physical development)
Higher education (See also University studies) 123,

- Aeronautics 151

143, 153-154, 159

- Computer-assisted instruction 142
- Data processing technique
- Electrical engineering 158
- Human/factors engineering 27
- Mathematics 152

History of education 354 Hostility (See also Aggression) 227, 229 .Housing 239-240 Human factors engineering 26-27 Hypnosis 335 11literacy 346 Illumination 217 Immigrant 78,/252, 256-257, 355 IMU-project (Individualiserad . matematikundervisning/Individualized mathematics teaching) 77, 99-100 Inattention 335 Income 296 Independent work 113, 144, 156 Individual differences 181, 186, 191, 328-329 Individualized teaching 77, 99-100, 155 Inductive inference (See also Inference) 32-36.38 Industrial democracy 28 Ineducable 302 Infarctions (See Myocardial infarctions) Inference (See also Inductive inference) 37 Influence (See Social influence) Information 40, 234 - network 132

- processing 132 --∕sýstem 132 Injuries 197 Institutionalization 244 Instructional material (See teaching aids) Instructional programs Intelligence 50, 130, 200, 233, 296, 300

Intelligence test 130, 265 Intensity (See Perceived intensity) Interaction (See also Social interaction) 327-329 Interactionism 218, 220-221, 223, 334 Interest 31 International understanding 61, 64-66, 68, 348 Internationalism 62, 355 Interpersonal processes 341 Interview 30, 59, 95, 110, 122, 136, 262, 301, 313, 317, 342, 352 Involvement 190, 231-232

Job-analysis 14, 21-22, 29, 259-262, 316, 360 Job description 260 Job performance 264 Job satisfaction 15, 29-30, 84 Judgment 38, 234-235 - \ Juvenile delinquency 125, 337

ITV-LHS-project (Intern TV i lärarutbildningen) 332

KRAVU-project (Kostnads- och resultatanalyser inom vuxenutbildningen/Cost and result analysis in adult education)

KUL-project (Kvalitativ utvärdering av lärarutbildningen/Qualitative evaluation of teacher training)

KUL-K-project (Kvalitativ utvärdering av lärarutbildningen, klasslärarlinjerna/ Qualitative evaluation of teacher training, class teacher lines) 317-318, 322-323

KUL-Ä-project (Kvalitativ utvärdering av lärarutbildningen, ämneslärarlinjen/ Qualitative evaluation of the training of Secondary school

Labour market training (See Retraining)

Language 43

- development 58, 254
- teaching 4, 83

Learning (See also Verbal learning) 32-34, 45, 48, 55, 181, 285

- test 71
- theory 112, 326

Leisure 80-81, 119, 342

Life change (See Social change)

LIGRU-project (Litteraturläsning i grundskolan)

Likert-scale 15

LINE-project (Läsinlärning i engelska) 93

-Linear regression 268

Linguistics 56-57

Literacy 346

Literature 75

Lockout 113

Logical thinking 50

Longitudinal studies (See Follow-up study)

Lower secondary school 329

- Absenteeism 104-106
- Achievement 73
- Adjustment 89, 108
- Arithmetic 73
- Autoinstructional aid 307
- Cognitive development 79,
- Consumer education 98
- Critical ability 96
- English 72, 347
- General subject 70, 85
- German 83
- Group work 101-102, 115, 326
- Leisurc 119

Lower secondary school Literature 75

- Mathematics 63, 70, 77, 85, 91, 99-100, 112
- Occupational choice 128
- , Option 300
  - Performance 109
  - Physical education 60
  - Practical vocational guidance 12-13
  - Sex difference 118
  - Slow learner 84, 305-307
  - Social development 61-62, 64-66, 68, 82
  - Socialization 79
  - Student participation 67, 114, 116-117
  - Swedish 70, 85, 120
  - Teaching aids 120

Maladjusted 78

Male animals 6, 11

The Malmö study (Malmöundersökningen) 296, 298-299

Man-machine systems 25

Map 308

Mass education 354

Mathematics 55, 63, 69-70, 77, 85, 91, 99-100, 333

Meaning 31

Measurement 96, 138, 183, 264, 271, 274, 277, 279, 343

- technique 136, 309, 312

Media-Method-project 331

Memorizing 303

Memory (See also Short term memory) 39-41, 44, 46, 124, 202, 241, 285-286

Memory trace 47

Förteckning över fonder, hos vilka anslag kan sökas för psykologisk och pedagogisk forskning^x)

#### Arbetarskyddsfonden

Adress: Sveavägen 166, 8 tr., 113 46 Stockholm, tel: 15 13 00 Upplysningar: Kanslichef Bo Oscarsson,

Byrådirektör Waldemar Nyström

Fonden har till uppgift att stödja sådan forskning och utveckling samt utbildning och upplysning, som kan motverka uppkomsten av yrkesskador och annan av arbetsmiljön betingad ohälsa eller förbättra arbetsmiljön och därigenom främja hälsa och säkerhet i arbetslivet.

Ansökan i 25 ex å särskilt formulär före 1/3 resp 1/9.

#### Magnus Bergvalls Stiftelse

Adress: Skandinaviska Enskilda Banken, Notarieavd., Box 16067, 103 22 Stockholm 16, tel: 24 65 00

Främjar vetenskaplig forskning genom anslag till svenska vetenskapsmän samt svenska vetenskapliga och kulturella institutioner.

Ansökan i 12 ex å särskilt formulär före 15/9. Utdelning 15/1. Bestämmelser finns.

# Byggnadsindustrins Arbetsforskningsstiftelse (BAS)

Adress: Statens råd för byggnadsforskning, Fack, 102 30 Stockholm 6, tel: 24 81 00

Stiftelsen är ett samordnande \organ för främst beteendevetenskapliga och produktionstekniska projekt inom arbetsforskning.

Ansökan på särskilt formulär. Utdelning under året, dock endast vid tre tillfällen avseende belopp över 50.000 kronor.

# Ollie och Elof Ericssons stiftelse för vetenskaplig forskning och för välgörande ändamål

Adress: Facit AB, 597 00 Åtvidaberg

Främjar genom anslag och stipendier i första hand teknisk, ekonomisk och medicinsk forskning. Även annan vetenskaplig forskning kan efter styrelsens beprövande erhålla bidrag.

Ansökan före maj månads utgång, utdelning juni-september.

Uppgifterna i förteckningen har så långt möjligt kontrollerats i augusti 1974. – Kompletterande synpunkter beträffande förteckningen emottas tacksamt av forskningsrådets kansli (adr. Sveavägen 166,

#### Folksam

Adress: Fack, 104 60 Stockholm 20, tel: 22 01 00

Försäkringsbolaget Folksam har tidigare haft fristående organ som t.ex. Folksams trafiksäkerhetsnämnd och Folksams rehabiliteringsråd, vilka delat ut anslag inom sina verksamhetsområden. Dessa
har nu upphört och anslagsfrågorna handläggs centralt vid Folksams
sociala råd och Folksams vetenskapliga råd.

Ansökningar, som skall ställas direkt till Folksam, kan inlämnas under hela året.

Upplysningar: sekreterare Arme Brundell eller sekreterare Stig Åhs, tel: 22 01 00

## Försäkringsaktiebolaget Fylgias 80-årsfond

Adress: Fack, 102 40 Stockholm 5

Upplysningar: Direktör Åke Magnusson, tel: 14 00 60

Huvudsakligt syfte att verka för att hindra uppkomsten av och lindra följdverkningarna av trafikolycksfall.

Ansökan före 1/2 på särskilt formulär.

# Svenska Handelsbankens Stiftelse för Samhällsvetenskaplig forskning

Adress: Svenska Handelsbanken, 103 26 Stockholm Upplysningar: Kamrer Åke Wennman, tel: 22 90 20

Främjande av forskning rörande .... samt andra områden av intresse för den svenska affärsbanksverksamheten (endast ekonomiska frågor).

Ansökan senast l april.

Nämnden sammanträder som regel i maj. Bestämmelser finns.

#### Stiftelsen Lars Hiertas Minne

*Adress: Stiftelsen Lars Hiertas Minne, Eriksbergsgatan 3, 1 tr., 114 30 Stockholm

Upplysningar: Frih. Inger Leijonhufvud, tel: 10 94 01

Utdelar anslag för vetenskaplig forskring och för sociala ändamål till såväl enskilda personer som föreningar och institutioner, vilkas verksamhet kan anses vara till allmänt gagn. Ej studiestipendium.

Ansökan före 1 oktober.
Utdelning i november. Bestämmelser finns.

#### Rierta-Retzius Stipendiefond

Adress: Hierta-Retzius Stipendiefond, Eriksbergsgatan 3, 114 30 Stockholm

Upplysningar: Professor Arme Vestgren, tel: 11 22 18

Syftar att medelst utdelning av understöd och stipendier främja i vetenskapligt eller socialt hänseende viktiga ändamål.

Ansökan senast 31/12. Utdelning i wars.

# Hierta-Retzius Fond för vetenskaplig forskning

Adress: Vetenskapsakademien, tel: 31 05 55 Upplysningar även genom professor Arne Vestgren, tel: 11 22 18

Syftar att genom understöd främja den vetenskapliga forskningen, framför allt den biologiska, men även ändamål, som tillhör akade-miens övriga klasser.

Utdelning i mars vart tredje år. Nästa tillfälle blir 1976. Ansökan före 1/1 samma år.

#### Idrottens forskningsråd

Adress: Riksidrottsförbundet, Strömsborg, Box 1216, 111 82 Stockholm Upplysningar: Artur Forsberg, tel: 23 37 20

Idrottens forskningsråd inrättades 1970 för att inom Riksidrottsförbundet genom fördelning av anslag initiera och leda forskning av betydelse för idrotten. Rådet stöder både beteendevetenskapliga och fysiologisk-medicinska projekt.

Ansökan senast 31/3. Utdelning i maj. Särskilda formulär finns.

#### Harald och Greta Jeanssons stiftelse

Sekreterare: Advokat Björn Bygge, tel: 14 12 50

Har till ändamål att främja vetenskaplig forskning inom medicinens område samt sådan forskning inom andra naturvetenskapsgrenar, vilken är avsedd att komma läkarvetenskapen till godo.

Ansökningstid kungörs i april-maj i Svensk Läkartidning. Offentliggörande av tilldelning i regel l november. Bestämmelser finns.

## Helge Ax:son Johnsons Stiftelse

Sekreterare: Advokat Lennart Heijne, Birger Jarlsgatan 18, 114 34 Stockholm, tel: 10 95 21

Ändamål ...., att främja vetenskaplig forskning samt att understödja undervisnings- och studieverksamhet inom landet. Anslag till både enskilda och institutioner.

Ansökan senast 28/2. Utdelning 22/6. Bestämmelser och formulär finns.

#### Kungafonden

Konung Gustaf VI Adolfs 80-årsfond for svensk kultur, Box 16216, 103 24 Stockholm 16, tel: 10 00 15

Ansökan vilken tid som helst på året.

Fondens ändamål att verka för befästande och främjande av svensk kultur.

#### Längmanska Kulturfonden
