ABSTRACT

This 10-year strategic plan for the period 1975-85 is one of three interrelated plans developed for the North Carolina Community College System. Population projections, along with projections of labor force participation rates by age, race, and sex are used to project the total labor force in 1985. Projections of employment by industry and of occupational and related training requirements for the 1970-1985 period are made for the state and its 17 official multi-county planning regions, as well as estimates of training needs unmet in 1970. This information is translated into statewide projections of graduates and enrollments in broad instructional areas (college transfer, general education, technical, and vocational) and in extension programs, with associated costs, and construction and faculty/staff requirements. Considerations of the system's goals, assessment of economic and educational environment, and projections of output from other sectors of the state's educational system are discussed in detail. A description of the projection procedure is appended. (MJK)

Documents acquired by ERIC include many informal unpublished

materials not available from other sources. ERIC makes every effort

to obtain the best copy available. nevertheless, items of marginal

reproducibility are often encountered and this affects the quality

of the microfiche and hardcopy reproductions ERIC makes available

via the ERIC Document Reproduction Service (EDRS). EDRS is not

responsible for the quality of the original document. Reproductions

supplied by EDRS are the best that can be made from the original.

SUMMARY

NORTH CARGLINA COMMUNITY COLLEGE SYSTEM STRATECIC PLAN

The North Carolina Community College System is legislatively mandated to provide comprehensive educational opportunities to the State's adult citizenry insofar as is financially feasible and to provide training opportunities for the development of skills necessary to support the smooth functioning and advancement of the North Carolina economy. A total of 57 educational centers—39 technical institutes and 18 community colleges—are available for these purposes.

In keeping with the philosophy of total education, the System has maintained an open-door policy toward all persons interested in educational pursuits. Rapid enrollment growth has resulted from this policy. Unduplicated headcount enrollments have grown from 52,870 in 1963-1964 to more than 400,000 in 1973-1974. Approximately 75 percent of the current enrollments are in noncredit extension courses, including adult basic education courses. which provide services to help adults learn to read and write; the adult high school program, which enables adults to obtain a high school certificate or diploma; short-term occupational classes, which provide upgrading and updating of occupational skills of persons who are currently employed, and in academic short courses. Many of these program areas are financially self-supporting. The majority of the instructional effort and the expenditure of budgeted funds is for curriculum degree and diploma programs. Technical (two year) and nocational (one year or less) programs represent the major effort within the curriculum program area.

The information presented in this report represents a ten-year strategic plan for the Community College System for the 1975-1985 decade. This information will be combined with information in the five-year-plans prepared by each institution in the System to develop a systemwide five-year operating program for the period 1975-1980. The operating program will provide the framework from which a budget request for the 1977-1979 period will be prepared.

This strategic plan calls for the following Systemwide annual average unduplicated headcount enrollments by broad instructional area over the 1975-1985 decade:

- (1). Curriculum Programs
 - (a) College Transfer -- 17,880
 - (b) Technical -- 53,475
 - (c) Vocational -- 29,190
 - (d) General Education -- 33,620
- (2) Extension Programs.
 - (a) Occupational -- 215,000
 - (b) Adult High School 106,765
 - ` (c) Adult Basic -- 60,465
 - (d) Adult General -- 165,000

These estimates are based primarily on manpower requirements and do not fully reflect the level of effort required of the System to meet its comprehensive education mandate. Thus these numbers may be construed as lower limits for planning purposes, representing only one input—manpower requirements—to the planning for comprehensive education incumbent upon the Community College System.

These lower-limit enrollment figures represent growth from current levels in every category. This enrollment growth is placed in historical perspective in Figure S-1, which portrays enrollment growth continuing absolutely, although the rate of enrollment growth is projected to decline over the planning decade. This growth translates into increased staffing requirements: if current staffing patterns continue, 7,600 instructional staff will be required on an annual average basis over the decade.

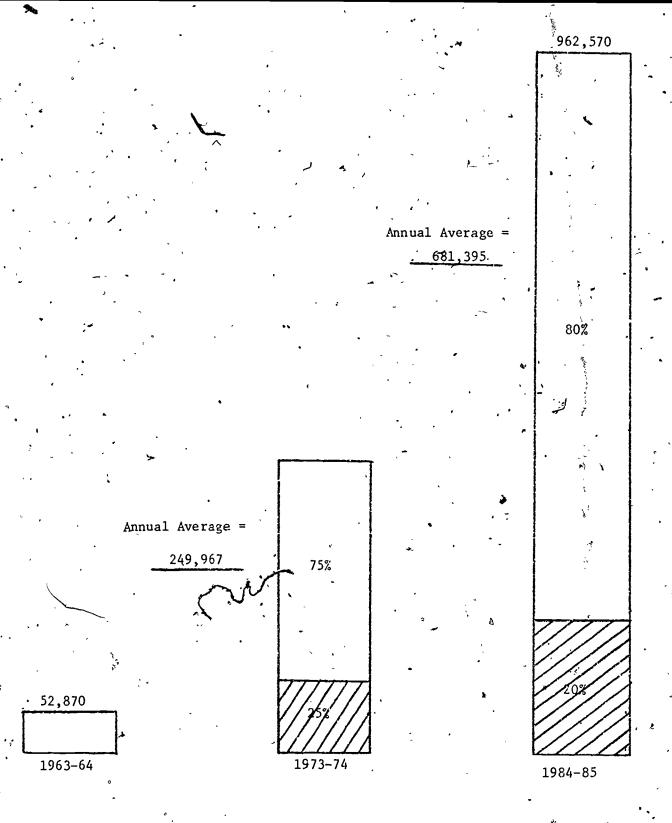

Annual average instructional expenditures over the 1975-1985 decade required to support this growth may be expected to rise to \$72,244,000 in 1973-1974 dollars. Similar growth may be expected in noninstructional expenditures, to \$48,002,000 in 1973-1974 dollars.

Annual average equipment expenditures over the 19,75-1985 decade required to support enrollment growth may be expected to rise to \$72,255,000 in 1973-1974 dollars. With current provisions of floor space per student, construction expenditures may rise to \$103,874,000 in 1973-1974 dollars; if recommended space levels are adopted, construction expenditures could rise further to \$168,179,000 in 1973-1974 dollars.

These figures are offered for long-range planning purposes. They represent implications for Community College System growth, assuming continued growth in the North Carolina economy and a continuation in patterns of

11

System operation. Accomodation of this enrollment growth without the attendant growth in expenditures projected by a continuation of past expenditure patterns may require innovation by the System to increase its productivity and thus lower the unit cost of its outputs. The North Carolina Community College System is well prepared both to accomodate enrollment growth and to develop and implement innovative educational approaches, as is evidenced by its history. Based on the figures presented in this report, the System should continue to advance on both these fronts, with additional emphasis on innovation with the passage of time. This changing emphasis will then represent a gradual shift from quantity to quality growth, although both aspects of growth will continue to be important throughout the long-range planning period.

Legend:
Unduplicated headcount enrollments
Curriculum Program Enrollment
Extension Program Enrollment

Note: No separation of enrollments into curriculum and extension programs is available for 1963-64.

Figure S-1. Growth in North Carolina Community College System Enrollments.

I. INTRODUCTION.

This document represents another phase in the continued development of the planning capability of the North Carolina Community College System. A description of the overall planning process as applied to this system is contained in a previous Research Triangle Institute publication. —

The current research effort provides an update of the planning information contained in that document, expands the information base to a larger number of occupations, and provides projections of training requirements that are derived from the projected occupational requirements by multicounty planning regions.

The enrollment projections produced in this effort are essentially manpower based. It is recognized that manpower considerations are but one element in the total postsecondary educational planning process. Equally important considerations include student aspirations and the educational desires of potential students in the general population. Thus, these projections represent lower bounds for enrollment planning purposes; attempts to include considerations other than manpower needs will increase the enrollment projections accordingly.

The ten-year strategic plan presented here for the period 1975-1985 is the first of three interrelated plans. Information presented in this strategic planning effort will be combined with information from individual institution plans to develop a systemwide five-year operating program for the period 1975-1980. This systemwide five year operation program will then be used to develop a two-year program budget for the 1977-1979 biennium. Each of these plans can be updated as new information becomes available, subject to the requirement that the internal consistency among the three plans is not violated by the updating process. These three time-

Alvin M. Cruze, <u>Planning for the North Carolina Community College System</u>, Volume II, "Ten Year Strategic Plan, 1970-80," Research Triangle Institute, Research Triangle Park, N.C., June 1970.

 $[\]frac{2}{1}$ Each institution within the system is required by the State Board of Education to submit a five-year plan designed to meet local needs as well as State needs.

phased plans will then form the first lank in the overall planningimplementation-evaluation chain.

These three plans will be prepared in the following formats.

- (1) The ten-year strategic plan for the period 1975-1985 will provide information on the systemwide number of graduates and students that should be enrolled in each of the broad instructional areas, with associated costs and construction and faculty, and staff requirements.
- (2) The five-year operating program for the period 1975-1980 will be presented in terms of specific curriculum offerings for institutions in the system and of target levels of enrollments and graduates.
- (3) The two-year program budget for the period 1977-1979 will be based on anticipated enrollments as specified in the second two-year period of the 1975-1980 operating program and will be prepared in a format compatible with established budgeting procedures in the Department.

The strategic plan contains information on occupational requirements over the long-range planning period 1970-1985, and on the systemwide numbers of grauates and enrollments during the subperiod 1975-1985. These graduate and enrollment projections are derived under the assumption that current trends in rates of program completion and labor-force participation of program completers continue into the future. The instructional areas addressed in this effort include four curriculum programs—college transfer, general education, technical, and vocational—and four extension programs—occupational, adult basic education, adult high school education, and general adult education.

These occupational requirements and their training implications for the Community College System have been developed with the aid of a manpower directions model similar to one used by the U.S. Bureau of Labor Statistics for the Nation. More confidence can be placed in the relative standings in occupational employment and in requirements projected by this model than in the actual numbers themselves. A description of the modeling procedure is contained in Appendix A.

II. COMMUNITY COLLEGES AND EDUCATION IN NORTH CAROLINA

A. Introduction

The three plans for the Community College System are based on a systematic analysis of the training needs of the entire educational system in North Carolina. The Community College System's training needs are based on a simultaneous consideration of (1) the system's goals; (2) a description of the present status of and past trends in activity of the North Carolina economy and educational system; (3) a projection of the future environment in which the community system will be operating, in terms of the population, labor force, and economic activity in North Carolina, and (4) an implicit projection of the outputs of the other sectors of the educational system in North Carolina. This section presents the first two elements; the next section presents the last two and draws the implication for Community College System training requirements.

B. · Goals

The long-range or strategic planning process of the Community College System consists of the process of deciding on the goals of the system: on changes in these goals; on resources required to attain the goals; and on the policies that are to govern the acquisition, use, and disposition of these resources. In contrast, short-range plans function within the organizational goals and policies and are more concerned with operational control of resources to fulfill a specified time-phased portion of the strategic plan.

For purposes of this planning effort, a goal is defined as a general purpose pursued over a long period of time which is usually not quantified. In contrast, objectives are set for specific, shorter time frames and are usually quantified. It is the purpose of education within the community college system to accomplish certain specified goals, and a systematic formulation of these goals is essential in order to focus resources and energies directly on achieving defined purposes. The search for alternative programs or courses of action designed to achieve the goals, the choice of optimum or preferred programs based on a display of data that presents the benefits of effectiveness and the costs of each, the ranking of priorities among them, and the measurement of progress all must proceed

in logical systematic sequence in the planning, decisionmaking, and evaluating processes.

The primary criterion for selection of the goals is that they must be related to the contributions made to North Carolina's people and economy by the Community College System's educational process and not to the educational process itself. The educational process then becomes the means for achieving the goals. The number of goals selected should be as small but distinct as possible, consistent with the overall purpose and operations of the Community College System. The reasons for this are two-fold:

- (1) many of the educational programs of the System contribute to more than one goal, necessitating the use of multiple measures of effectiveness in program evaluation. The use of a small but distinct number of goals keeps this evaluation process as uncomplicated as possible;
 - (2) many of these goals could be in conflict. The use of a small but distinct number keeps these conflicts to a minimum. In addition, in order to formulate an effective strategic plan for implementation, priorities must be determined among the goals. The specification of a relatively small number of goals simplifies the necessary task of setting these priorities.

Article IX, Section 9 of the North Carolina Constitution states,
"The General Assembly shall provide that the benefits of the University of
North Carolina and of other public institutions of higher education, as
far as practicable, be extended to the people of the State frae of expense."
In meeting this obligation, the State recognizes its responsibility to provide public education at all levels in order to afford an opportunity for
the people to develop as fully as possible commensurate with their abilities. Consistent with this constitutional obligation, the North Carolina
General Assembly has enacted appropriate legislation to provide for the
establishment, organization, and administration of a system of educational institutions throughout the State offering courses of instruction
in one or in a of the general areas of the first two years of college,
occupational education, and adult education programs. These institutions
of the Community College System take their place in the State's total

educational system in a position between the public school system and the · · four-year colleges and universities. Furthermore, these institutions fulfill their responsibilities under the Constitution by opening their doors to all residents of North Carolina.

The philosophy of the open door institution has been stated by Dr. Dallas Herring, Chairman of the State Board of Education, as follows: $\frac{1}{2}$

The only valid philosophy for North Carolina is a philosophy of total education: a belief in the incomparable worth of all human beings, whose claims upon the State are equal before the law and equal before the bar of public opinion, whose talents (however great or however limited or however different from the traditional) the State needs and must develop to the fullest possible degree. This is why the doors to the institutions in North Carolina's system of community colleges [and technical institutes] must never be closed to anyone of suitable age who can learn what they teach. We must take the people where they are and carry them as far as they can go within the assigned function of the system. . .

Within the framework of the above educational policy for the entire State, the purpose and goals of the community college system have been established.

The purpose of the North Carolina Community College System is to fill the gap in a broad range of educational opportunity between high school and the senior college and university and to provide reentrants into the formal educational system with the opportunity to expand their educational horizons, regardless of their previous levels of educational attainment. In carrying out this role, the system of technical institutes and community colleges offers occupational, academic, and cultural education and training opportunities from basic education through the two-year college level, at a convenient time and place and at a minimal cost, to anyone of suitable age who can learn and whose needs can be met by the institutions within the System.

A recent study $\frac{2}{}$ has translated this broad purpose into a set of specific goal statements and has surveyed ten population subgroups who

Progress Report of the Comprehensive Community College System in North Carolina, Raleigh: State Board of Education, April 1969, p. 9.

Terry Tollefson, "An Assessment of Goals and Major Policies of the North Carolina Community College System as a Basis for Long Range Planning."
Unpublished Ph. D. Dissertation, University of Michigan, Arth Arbor, Michigan, 1975.

either have impact on, or are impacted by, the North Carolina Community College System in order to obtain a ranking of these goals. The ten subgroups which were sampled are as follows:

- (1) Member of the State Board of Education;
- (2) Top level administrators of the Department of Community Colleges;
- (3) Presidents of the Community Colleges and Technical Institutes;
- (4) Chairmen of the Boards of Trustees of these institutions;
- (5) Chairmen of academic departments and instructionally related programs in these institutions;
- (6) Members of the State House of Representatives;
- (7) Members of the State Senate;
- (8) Members of the Council on State Goals and Policy;
- (9) Chief executives from the business community; and
- (10) Curriculum students in the Community College System.

Aggregate goal rankings were formed from the rankings submitted by each respondent. These rankings ranged from 1 to 25, with smaller numbers corresponding to higher rankings. Three goals received a significantly low level of support and are not reported here. The remaining 22 goals are grouped into three major categories for purposes of this study:

- (1) Program goals—goals that relate directly to existing Community College System instructional programs;
- (2) Outcome goals—goals that relate to educational or service outcomes for students, the community, or the economy;
- (3) Support goals—goals that are integral to the achievement of either program goals or outcome goals.

The goals are listed below; aggregate rankings follow in parentheses:

- (1) Program goals:
 - (a) To provide short-term vocational entry skills. (5)
 - (b) To provide two years of training for technicians in such fields as engineering, business, and health. (7)
 - (c) To teach reading and mathematics for adults at grade levels 1 through 8, as necessary. (10)
 - (d) To help business and industry by training their employees.
 (11)
 - (e) To teach high school courses for adults over age 18. (13)

1.9

- (f) To provide for career mobility by giving credit for vocational training by students enfolled in related technical programs. (For example, a graduate of a 1-year Licensed Practical Nursing Program would receive up to 1 year's credit in a 2-year Associate degreee nursing program.) (14)
- (g) To assure that all graduates of associate degree collegetransfer programs will be accepted into public university bachelor's degree programs. (15)
- (h) To assure that all graduates of associate degree technical programs will be accepted into public university bachelor's degree programs designed for that purpose. (19)
- (i) To offer the first 2 years of a regular 4-year college education. (20)

.(2) Outcome goals:

- (a) To operate each Community College/Technical Institute at the lowest possible cost consistent with quality. (2)
- (b) To improve educational programs by constantly evaluating their success. (3)
- (c) To help the State grow economically by basing educational programs on the types of employees needed in each community. (6)
- (d) To help each student become self-fulfilled and well adjusted, through teaching and counseling for this purpose. (12)
- (e) To use paid staff time and money from each institution to help solve urgent educational problems of the community, (17)
- (f) To help private 2-year and 4-year colleges to improve and grow. (21)
- (g) To offer such community services as lectures, concerts, and plays for community residents. (22)

(3) Support goals:

- (a) To maintain an "open-door" admissions policy for all North Carolina residents aged 18 or older. (1)
- (b) To provide buildings and equipment which are satisfactory for educational purposes. (4)
- (c) To offer a combination of enough scholarships, loans, workstudy funds, and low tuition so that most people will be able to afford to attend a Community College/Technical

Institute (so that nearly all adults could afford to attend at least on a part-time basis). (8)

- (d) To make it easy for almost any North Carolina citizen to * reach a Community College/Technical Institute by car or bus: (9)
- (e) 'To offer many types of courses for adults, including senior citizens. (16)
- (f) To protect the right of each teacher and student to say what he/she believes about such things as politics or religion without fear of punishment. (18)

Successful achievement of these goals, on a priority basis, requires a broad-based effort on the part of the North Carolina Community College System. This strategic plan outlines the requirements for the achievement of the manpower-needed goals in this goal set. Achievement of the other goals can then be addressed as an extension of the information presented in this plan.

C. <u>Descriptive Analysis</u>

1. Planning Areas

Because the economic and demographic characteristics of North Carolina vary significantly from the mountains to the coast, 17 planning regions designated by the State as official multicounty planning regions have been used to manage the information involved in this planning effort. The descriptive and projection models and strategic plan have been separately derived for each of these 17 regions to identify the long-range needs for institutions located in each region. The boundaries of the 17 planning regions, together with the institutions of the Community College System located in each, are shown in Figure II-1.

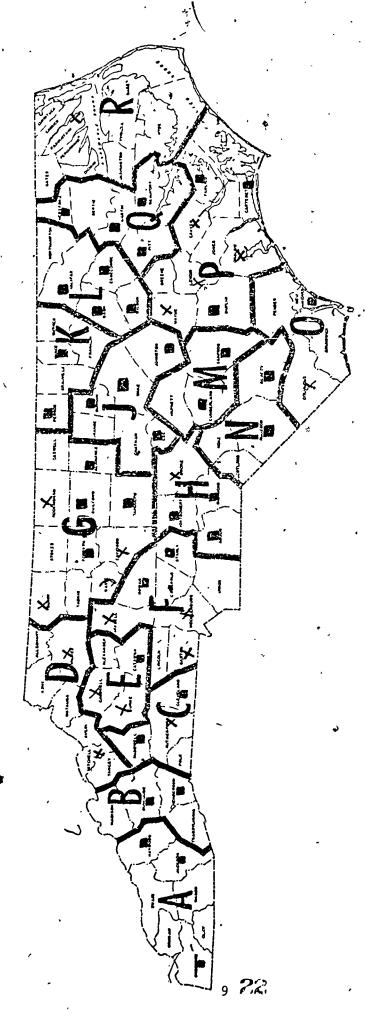

2. North Carolina Population, Labor Force and Economic Activity

Important inputs to the descriptive analysis are data on present and past levels of population, labor force and, economic activity in North Carolina. Characteristics of interest include the total level and the age and sex and educational attainment distribution of population; labor requirements, in terms of the industry and occupational distribution and educational attainment requirements of employment;

Figure II-1.

REGIONS PLANNING CAROLINA MULTI-COUNTY

Technical Institutes

X Community Colleges

and labor availabilities, in terms of the educational attainment distribution of employed workers in North Carolina.

No extensive data collection or survey efforts were undertaken for this effort. Rather, previously published data on the characteristics of population, labor force, and economic activity were used. Summaries of the North Carolina population, are presented to provide an appropriate background for the strategic plan.

Summaries of the North Carolina population for 1960 and 1970 are presented below:

	•	•	<u> Increas</u>	e 1960-1970
	April 1, 1960	April 1, 1970	Number	Percent
Civilian	4,482,200	5,082,059	599,852	13.4
Military	74,000	105,014	31,014	41.9
TOTAL	4,556,200	5,187,073°	630,873	13.8

Civilian Labor Force Availability (aged 16 and over):

April 1, 1960 - 2,879,300 (64 percent of civilian population)

April 1, 1970 - 3,414,502 (67 percent of civilian population)

Further details of the age and sex distribution of North Carolina population for both 1960 and 1970 are contained in Table II-1.

Presently employed workers in North Carolina have training needs and it is necessary to obtain some measure of their currently available training levels to determine these needs. For purposes of this plan levels of educational attainment, as measured by grade completed, are used to provide this measure.

It is recognized that educational attainment is only one way of measuring educational and training requirements and that the actual skills needed may not be related to levels of educational attainment. However, since this effort is primarily for a specific level of educational attainment and since data on educational levels for specific occupations and the educational attainment of the population are

Other concepts which have been used in measuring educational and training requirements are functional or performance requirements, determined by objective job analysis as necessary and sufficient to achieve average performance in specific tasks of jobs and employer or hiring requirements, which reflect conditions in the labor market and may or may not be related to either functional requirements or educational attainment. For an interesting discussion of the use of these three concepts, see Sidney A. Fine, "The Use of the Dictionary of Occupational Titles as a Source of Estimates of Educational and Training Requirements," The Journal of Human Resources, Vol. III, No. 3, Summer 1968, pp. 363-375.

The total population aged 16 and over for each year includes persons who have completed their schooling and persons who are enrolled in school. The 1970 numbers include aged 14 and over.

^{2/}U.S. Bureau of the Census, "North Carolina Detailed Characteristics," U.S. Census of Population, 1970, PC(1)-C35 N.C., Table 148.

Table II-2 presents the educational attainment distribution of the North Carolina civilian population aged 16 and over in both 1960 and 1970. The 1960 figures were obtained from the 1960 Census of Population, and the 1970 figures were obtained from the 1970 Census of Population.

The figures in Table II-2 reflect a substantial gain in the educational attainment of the North Carolina population during the 1960-70 decade. For example, 44.3 percent of the population had eight or less years of schooling in 1960; in 1970 this percent declined to 32.1. Conversely, the percent of the population with some college education increased from 12.8 in 1960 to 16.3 in 1970. Even though these shifts have been occurring in North Carolina, the State's overall educational attainment distribution is still below that of the mation as a whole. The implications of these findings for training in the community college system will be highlighted later in this section.

A second important element of the descriptive analysis is the number of workers employed in various occupations in North Carolina. An examination of the occupational distribution of employment yields important insights concerning the types of training that should be provided by the North Carolina educational system in order to prepare workers for these occupations. The 1960 and 1970 occupational distributions of North Carolina employment, in terms of eight major occupational groups, are presented in Figure II-2.

As indicated in Figure II-2, professional, technical and kindred workers have increased from 138,460 in 1960 to 224,350 in 1970; operatives and kindred workers have increased from 436,720 in 1960 to 601,555 in 1970; and craftsmen, foremen, and kindred workers have increased from 204,915 in 1960 to 292,985 in 1970. At the other end of the occupational structure, laborers and farmers have decreased from 305,750 in 1960 to 234,660 in 1970. Thus many of the workers in the increased share of the three previously mentioned occupational groups during the 1960-70 decade come from people formerly employed as laborers and farmers. This finding is of particular importance to the State's edu-

cational system since, if these trends continue, displaced agricultural workers must continue to be provided with the skills to enable them to move to higher skilled occupational classifications, while increased emphasis needs to be focused on the growing number of low-skilled workers in manufacturing occupations, so that they too are provided the opportunity to move up the job ladder through expanded training options.

The concluding element of the descriptive model of North Carolina population, labor force, and economic activity is a comparison of the educational-attainment requirements and availabilities of the 1970. North Carolina employment. The requirements were calculated by applying the 1970 educational-attainment patterns of U.S. workers aged 16-44 in each of 40 occupation groups to North Carolina employment aged 16-44 in each occupation group. These requirements are reported in a previous study. National educational-attainment patterns were chosen as the appropriate requirements in order to illustrate the level of effort required of North Carolina educational institutions to enable the State's citizens to compete more effectively in the national labor market. The age group 16-44 was chosen as the target group for additional education related to labor force needs since this group is more likely to seek this education to improve their job productivity.

Table II-3 compares these requirements by educational-attainment category against the actual educational-attainment pattern of the North Carolina employed labor force in 1970. The training needs are derived by a procedure that compares requirements with availabilities at each level. This procedure begins with the highest level first, and then proceeds to lower levels successively; whenever excess requirements exist at any level, workers are drawn from the availabilities pool at the immediately lower level to perform the balance. The single exception to this situation is that both the college 1-3 group and the high school graduates with postsecondary technical and vocational training draw workers from the high school graduate pool to perform the balances at each level; no workers are drawn from the college 1-3

Alvin M. Cruze, et al. North Carolina Educational Policy Plans for the 1970's, Research Triangle Institute, Research Triangle Park, N.C., April 1974.

pool to balance availabilities with requirements at the high school postsecondary technical and vocational level, and vice versa.

As can be seen from this table, the major training needs for the 1970, employed labor force aged 16-44 exist at the high school graduate level. Training needs at this level represent approximately 37 percent of total training needs of 216,718. Additional needs are indicated at all but the lowest educational attainment level. These additional needs are enupuntered primarily at the college 1-3 level, the high school 1-3 level, and the eighth grade, in that order. College 4+ and high school graduate with post secondary technical and vicational training needs are less in number, representing only 12 percent of the total training needs.

3. Community College System

Beginning with a single two-year college established in Asheville in 1928 and supported from local funds, Community Colleges and Technical Institutes in North Carolina have grown to the present total of 57 institutions, distributed across the State. (See Figure II-1.) However, during this 46-year period, the major activity in building the system occurred relatively recently, subsequent to the establishment of a community college system and a Department of Community Colleges under the State Board of Education by the 1963 North Carolina General Assembly. The present (1974) Community College System consists of 18 community colleges and 39 technical institutes. The State Board of Education has approved college transfer programs and the resulting conversion to community college status for Vance-Granville and Martin Technical Institutes subject to approval by the General Assembly.

The system has grown from 52,370 unduplicated headcount enrollments in 1963-1964 to 400,220 in 1973-1974, a compound annual rate of growth of 22.4 percent. Preliminary figures for fall quarter 1974 indicate that enrollment growth has rebounded sharply from depressed 1973-1974 levels (apparently in response to a greater availability of gasoline).

Current program offerings in the Community College System are divided into two broad categories, curriculum and extension. Curriculum programs include college transfer, general education, technical, and vocational programs. Extension programs include occupational extension,

adult nigh school extension, and general adult extension. all of which are supported by regularly budgeted State funds; other extension programs include learning laboratory, adult basic education extension, CETA (Comprehensive Employment Training Act); new and expanding industry, and recreational extension, all of which are either self—supporting or are financed by Federal funds. A brief description of each of these program areas is as follows:

(1) / Curriculum

- (a) College transfer—planned academic programs of at least 96 quarter hours of credit leading to either an Associate in Arts or an Associate in Science degree and designed to allow for transfer to the junior year of a senior institution.
- fine arts, philosophy, social science, science, and mathematics. This program is designed principally for students who desire two years of goderal education beyond the high school. Successful completion of 96 quarter hours, of credit leads to an Associate Degree in General Education. Students who are not enrolled in a regular curriculum degree program are listed as special credit students and are included in the general education category. Special credit students currently comprise approximately 88 percent of the enrollments in general education. General education associate degree programs are currently offered at approximately 20 technical institutes.
- (c) Technical—two year occupational programs designed to prepare individuals for employment. Successful completion leads to an Associate in Applied Science degree.
- (d) Vocational—occupational programs designed to prepare an individual for employment in a specific occupation. These programs consist of a sequence of courses that generally can be completed in one year or less by a full-time student. Successful program completion leads to the award of either a diploma (one-year programs) or a certificate (programs of less than one year).

(2) Extension

- (a) Occupational—single courses, each complete in itself, designed for the specific purposes of training an individual for employment, upgrading the skills of persons presently employed, and retraining others for new employment in occupational fields.
- (b) Adult high school—classroom instruction, or learning laboratory courses, or a combination of both designed to qualify a student for an adult high school diploma under an Agreement of Affiliation or to prepare him successfully to demonstrate competency in the General Education Development Tests and to receive a High School Equivalency Certificate from the State Department of Public Instruction.
- (c) General adult--short courses designed to refresh or otherwise serve the general educational interest of the adult population in the community.
- (d) Learning laboratory—self—instruction using programmed text, audiovisual equipment, and other self—instructional materials. A Learning Laboratory Coordinator, who is always in the lab, has the function of bringing the instructional media and the student together on the basis of objective and subjective evaluation and of counseling, supervising, and encouraging persons working in the lab.
- (e) Adult basic education—classes for adults 18 years of age or older who lack elementary education (grades one through eight). This program is funded 90 percent with Federal funds and 10 percent with State funds.
- (f) CETA (Comprehensive Employment Training Act)—occupational training and basic education as needed for unemployed and disadvantaged persons. Training areas and students are selected by units of local government that qualify as prime sponsors under the legislation, or by the North Carolina Manpower Council for areas without local prime sponsors. This program supercedes the MDTA (Manpower Development and Training Act) program of previous years.

- (g) New and expanding industry—supplies training needs for new industries that are moving into the State and for existing industries whose expansion results in the need for additional skilled manpower.
- (h) Recreational—short courses providing instruction in various athletic areas, games, and hobbies designed to serve the general vocational interest of the community.

These categorizations do not reveal the full thrust of Community College System activities. Two notable areas of instructional programming include training programs for inmates of correctional institutions and the recent emergence of college transfer options offered by technical institutes.

Since the fall of 1965, institutions in the community college system have been sponsoring adult education and training programs for inmates in correctional units. Attendance in these programs is primarily on a voluntary basis. These programs include basic, high school, and occupational education and training courses of study.

An expanding aspect of the general education curficular program is the college transfer option. Currently 17 technical institutes are offering such an option by contracting with a senior college or university for instructional services. The instructional courses offered under contract are transferable to a senior college or university and usually consist of one or two years of general education. Additionally, two technical institutes and two community colleges offer the college transfer option utilizing their own instructional resources.

Enrollment growth by summary program area for the State and each multicounty planning region over the 1968-1969 to 1973-1974 period is presented in Tables II-4-State through II-4-R. Extension programs have been combined into occupational extension, adult extension (including adult high school extension, adult basic education extension, and learning laboratory), and general adult extension (including all other extension programs). Since program areas were redefined slightly between 1972-1973 and 1973-1974, the enrollment figures for adult extension and general adult extension are combined for 1973-1974 and placed in a separate (aggregate) category.

33

All enrollment figures are on an unduplicated headcount basis. This enrollment definition places each curriculum student in a single curriculum program, so that the sum of curriculum program enrollments equals the curriculum total. However, extension students may enroll and be counted in more than one extension program, although each extension student appears only once in the extension total. This results in the sum of extension program enrollments either equalling or exceeding the extension total.

Financial support for institutions in the community college system is provided from four sources: Federal government, State government, local (both private and public) sources, and students. In the beginning stages of operation, the distribution of operating costs was approximately as follows: State and Federal—35 percent, local—15 percent, and students—20 percent. However, the following distribution applies at the present time: State and Federal—85 percent, local—78 percent, and students—7 percent.

Equipment and library books are provided by the State and as of 1974 the State may also provide matching funds without limit for capital or permanent improvements. Additional capital funds may also be provided to qualifying institutions through Federal acts. Salaries and travel of administrative and instructional personnel and the cost of supplies and materials are also paid by the State.

Acquisition of land and erection of buildings is a local responsibility beyond any assistance which may be provided by the State or Federal government. Current expense involved in the operation and maintenance of the plant is also a local responsibility. Local funds may also be used to supplement any State budget item.

III. UNMET NEEDS IN 1970 AND PROJECTIONS OF ECONOMIC ACTIVITY FOR LONG-RANGE PLANNING

A. Introduction

This section presents unmet training needs in 1970 that are relevant for Community College System planning for the 1975-1985 decade and discusses the projection results for 1975-1985 from the manpower-directions model. As indicated by the discussion of this model in Appendix A, the model is demand oriented and does not consider the structure of wage rates among occupations and how this structure may affect either the career decisions of labor force new entrants or the movement among occupations by presently employed members of the labor force. It is further recognized that economic activity projections represent but one input into the planning process for educational offerings; this input is certainly less important for college transfer curriculum planning than for either technical or vocational curriculum planning. These projections are then directly relevant to the Department of Community College's legislative mandate to provide education and training opportunities supportive of the North Carolina labor market, but only indirectly relevant to the primary legislative mandate to provide comprehensive education opportunities for the adult citizens of North Carolina.

B. Summary of Total Training Requirements

1. Results

Table III-1 presents a summary of training requirements facing the Community College System over the 1975-1985 decade. Training requirements in each broad instructional area are listed and broken down by source; and two sources considered here are 1970 unmet needs (labor force related and nonlabor-force related) and requirements projected to arise from labor force and employment projections over the 1970-1985 period.

The average annual unduplicated headcount enrollments in Table III-1 for the 1975-1985 decade represent increases above the enrollments prevailing in 1972-1973 in each program area. This result is consistent with continued growth in the role of the North Carolina Community College System in the total educational picture.

Source: Research Triangle Institute.

Sharpest increases above 1973-1974 levels are indicated in the following areas:

(a) Curriculum Programs

- (1) Vocational--projected enrollments are 29,190 compared with 21,711, a 34-percent increase.
- (2) technical--projected average annual unduplicated head-count enrollments are 53,475 compared with 42,503 in 1973-1974, a 26-percent increase.

(b) Extension Programs

- (1) fundamental education—projected enrollments for adult basic education and adult high school education are 167,230 compared with 56,532, an increase of 196 percent.
- (2) occupational--projected enrollments are 215,000 compared with 201,280, an increase of seven percent.

College transfer programs and general education curriculum programs are also increased substantially, but the numbers presented here may actually underestimate total requirements in these areas since no attempt has been made to estimate nonlabor-force requirements over the 1975-1985 decade. The extent of this downward bias is unknown at this time.

These increased enrollments imply continued growth in Community College System staffing and expenditive requirements. Assuming a continuation in current staffing patterns this enrollment growth will require an annual average instructional staff of 7,600 persons over the 1975-1985 decade, an increase of over 31 percent from the 1973-1974 level of 5,786 persons.

Instructional expenditures are expected to grow from \$53,195,564 in 1973-1974 to an annual average of \$72,244,000 (in 1973-1974 dollars) over the 1975-1985 decade. This figure is exclusive of any inflation allowance. Noninstructional current expenditures are expected to grow from \$35,345,982 in 1973-1974 to an annual average of \$48,002,000 (in 1973-1974 dollars) over the 1975-1985 decade. Both increases represent a rate of growth of 36 percent.

Equipment expenditures will likely grow from \$53,204,442 in 1973-1974 to an annual average of \$72,255,000 (in 1973-1974 dollars) over the 1975-1985 decade if current equipment requirements per student

prevail into the future. Construction expenditures required to support enrollment growth are likely to rise from \$78,428,932 during the 1973-1975 biennium to a biennial average of \$103,874,000 (in 1973-1974 dollars) over the 1975-1985 decade if the current ratio of floor space per student is maintained. If the recommended level of 150 square feet per Sull-time equivalent student is to be attained during the planning period, construction expenditures would rise to a biennial average of \$168,179,000 (in 1973-1974 dollars) over this same period. Neither of these construction expenditure projections include expenditures to renovate or to replace any existing facilities.

2. Methodology

The procedures used to develop the entries in Table III-1 are described in the following paragraphs. As discussed previously, these entries were derived by estimating unmet education and training needs in 1970-both labor market needs and needs in the general population—and adding these to requirements projected over the 1970-1985 period. These total training requirements are estimated for broad instructional areas relevant to Community College System long-range planning.

Total training requirements in each broad instructional area are divided by 15 to place these requirements on an annual basis. These numbers are net in the sense that they represent the training requirements that remain after the output of the systems of secondary schools and higher education have been taken into account. To translate these numbers into numbers of graduates required, estimates of labor-force participation by broad instructional area were applied to 1975-1985 requirements in each category and then added to the requirements carried forward from 1970. These estimates were developed from estimates of labor force participation by age, sex, and educational attainment extracted from the U.S. Census public use sample one-in-one hundred files for county groups in North Carolina; they will be refined when program-specific information becomes available from student followup information currently being processed by the Department of Community Colleges. The estimates accepted for this effort

Finally, broad instructional area enrollments are derived from the numbers of graduates required by applying estimates of program completion and related measures maintained by the Department of Community

Colleges. The estimates accepted for this effort were for all students who either completed, transferred, continued, or else withdrew early with marketable skills. The application of any subset of the estimates (such as program completions alone) to the number of graduates required produced unrealistically large estimates of broad instructional area enrollments, so that estimates of students who did not withdraw before at least obtaining some marketable skills were substituted for estimates of program completers alone.

Three exceptions to this general estimation procedure were employed. These exceptions included estimates for requirements in the occupational extension, general adult extension, and general education curriculum programs. To estimate occupational extention training requirements, it was assumed that these needs are primarily related to the desires of the employed labor force to either change jobs or to upgrade their skills in their present positions. Estimates of occupational mobility over the projection period were made with the aid of the 1970 Census of Population $\frac{1}{2}$ as a crude means to approximate these desires. An occupational mobility rate of 3.3 percent per year was computed as the number of workers who shift jobs per year over the 1965-1970 period divided by the average number of jobs over the entire period. Application of this rate to the average number of jobs prevailing over the 1970-1985 period, and assuming that training will be required for jobs into which these persons move as well as for the jobs these people leave behind (so that other persons may be trained for them), yielded training needs averaging 172,000 per year over the projection period for the occupational extension program; this number does not refiect completion rates in this program, so that actual program enrollments would be larger than the 172,000 figure.

The training needs for occupational mobility as estimated here were not subtracted from the training needs estimated by the manpower , directions model, since the latter did not expressly consider geographic mobility. Again referring to 1970 Census of Population $\frac{2}{}$ estimates,

^{2/}U.S. Bureau of the Census, "Migration Between State Economic Areas," U.S. Census of Population 1970, PC(2)-2E, Table 2.

 $[\]frac{1}{U}$.S. Bureau of the Census, "North Car lina Detailed Characteristics," <u>U.S.</u> Census of Population 1970, PC(1)-D35 N.C., Table 178.

multiplied by the 1970 aggregate labor-force age between 1965 and 1970 multiplied by the 1970 aggregate labor-force participation rate was in extremely close balance with the number of persons changing jobs over the period. Thus if one assumes rough balance between job openings that occur as labor force members outmigrate from the State and occupational mobility over a similar period of the resident labor force, then no adjustments need be made in the occupational requirements projected by the manpower directions model. It is recognized that some of these training needs for occupational mobility may be served outside the Community College System—such as through private institutions or on—the—job training—but inasmuch as using the census results to estimate occupational mobility, which does not include mobility within major occupation croups, underestimates the true occupational mobility rate, then it is assumed that the errors in the opposite direction are to some extent offsetting.

General education curriculum program requirements were estimated by applying the 1972-1973 ratio between general education unduplicated headcount enrollments and those for the college transfer program.

This particular procedure was adopted for two basic reasons:

- (a) the objectives and offerings in this program area are very similar to those in the college transfer program area;
- (b) this has been a rapidly growing program area since 1969, so that trend extrapolation would have produced unrealistically large requirement results.

General adult extension program requirements were estimated in a similar fashion; since this program area caters primarily to the avocational interests of persons in each community, the 1972-1973 ratio of unduplicated headcount enrollments in this program area to those in all other areas combined was employed.

Translation of requirements in each of these three areas to graduates and then to enrollments was made in the following fashion:

- (a) the labor force participation rate of occupational extension graduate was assumed as 90 percent in the absence of any other information;
- (b) since general education curriculum and general adult extension programs do not typically cater to labor force needs,

these requirements were translated into graduates on a onefor-one basis;

(c) program completions (or more precisely, nonwithdrawals) in each area were assumed to be 90 percent in the absence of further information; these rates are larger than comparable rates for other programs because of the typical short duration of course work in these areas.

Finally, State-level expenditure projections associated with these enrollment projections were made with the aid of expenditive per full-time equivalent enrollment planning factors provided by the Department of Community Colleges and with conversion factors from unduplicated headcount enrollments to full-time equivalent enrollment for each program area derived from the last four years of System operating experience. Starfing projections were made on the basis of average pupil-staff ratios prevailing over this same period.

C. Total Training requirements by Source and Region

1. 1970 Unmet Needs

Unmet needs existing in 1970 were computed by comparing the educational-attainment distribution of the North Carolina population aged 16+ in 1970 with that of their 'U.S. counterparts' This population includes persons both in and cut of the labor force. Although some of these persons can be expected to enroll in curriculum programs, the great majority are likely candidates for extension offerings.

Table III-2 presents the unmet training needs for the State and for each multicounty planning region for the following four educational attainment categories:

- (1) 0-7 years of elementary school,
- (2) 8-11 years of junior high and high school,
- (3) high school graduate (including persons with postsecondary training not leading to an academic degree),
- (4) some college (which leads to an academic degree).

 Availabilities at each level were obtained from special tabulations of data from the U.S. Census of Population. 1/ Requirements were derived

 $[\]frac{1}{N}$ North Carolina Manpower Council, "Manpower Planning Papers," 1973.

by applying the educational-attainment distribution of the U.S. population aged 16+ in 1970 to total availabilities in the geographical area of interest. Unmet training needs were then derived by comparing availabilities with requirements at each level. A reconciliation procedure used to balance availabilities with requirements first withdrew persons from the "high school graduate" availabilities pool to balance availabilities with requirements at the "some college" level. Persons were then withdrawn from the 8-11 availabilities pool to balance the adjusted availabilities pool at the "high school graduate" level with "high school graduate" requirements, and so forth. Whenever availabilities (even after adjustments) exceeded requirements at a given level, no training needs were recorded.

Training needs at the "some college" level can be addressed through extension offerings in the system of higher education and through curricular offerings in the college transfer and general aducation programs in the Community College System. These needs were allocated on a 50-50 basis between the system of higher education and the Community College System at the State level in a previous RTI planning effort. A similar allocation can be performed here after taking into account differential completion rates between similar college-level programs in the two systems.

Training needs at the other levels are primarily the domain of adult high school education extension and adult basic education extension programs in the Community College System at the present time. The one exception to this statement is the night high school program recently initiated by the secondary schools in North Carolina. The study previously referenced (Cruze, 1974) allocated 25 percent of training needs at the high school level to the night high school program and the remainder to the adult high school education extension program in the Community College System on a statewide basis.

2. 1970-1985 Occupational and Fraining Requirements

Occupational and training requirements for the 1970-1985 period as projected by the manpower-directions model are presented in Tables III-3

^{1/}Alvin M. Cruze, et al., North Carolina Educational Policy Plans for the 1970's, Research Triangle Institute, Research Triangle Park, N.C., April 1974.

through III-5. A list of the 128 individual occupational categories and the 36 industry groups for which projections were made at the State and the multicounty planning region level is presented in Appendix B. Full detail on the output of the modelling effort is presented in Appendix C for the State only; similar output is available for sulticounty planning regions but is not presented in this document, although summaries of this information are presented in Tables III-3 through III-5. This information is intended for more detailed planning at the State level and for institutional planning purposes.

The separate projections of employment by industry for the State and multi-county planning regions as reported in Table III-3 and explained in Appendix A include estimates of multiple-job holding by industry. These industry "job" projections are converted into occupational employment projections by the manpower projections model, and the latter are reported in Table III-4 as 1985 occupational employment. Occupational requirements in this table are computed as the sum of two components, as follows:

- (1) jobs opening up as a result of industrial growth, or conversely, jobs closing as a result of industrial decline,
- (2) jobs becoming available as presently employed workers die, retire, or otherwise permanently separate from the labor force. Educational attainment projections represent projected educational attainment patterns of U.S. workers aged 25-34 for the individual occupations in which they are employed. This target was chosen for the following reasons:
 - 1) it is the youngest age cohort for which aggregate educational attainment patterns are projected at the national level,
 - 2) this age cohort typically embodies higher levels of educational attainment than older age cohorts.

Thus these educational attainment targets, occupation by occupation, were deliberately set high and represent the levels of training that should be provided to labor-force new entrants in North Carolina to put them on an equal footing with their national counterparts.

Appendix A

Description of Projection Procedure

Description of Projection Procedure

This appendix provides a brief description of the procedure used to project employment by industry and occupation and to use these projections in projecting educational-attainment requirements. Figure A-1 indicates how population projections prepared by the North Carolina Office of State Planning were used, along with independent projections of labor-force participation rates by age, race, and sex, to project the total labor force in 1985. The total number of jobs were then projected from the total labor force projections by assuming a trend of 3.5 percent unemployment rate and a 1.10 ratio in 1970 between jobs defined on an Employment Security Commission basis and employment defined on a census basis (the former includes, but the latter excludes, seasonal employment and multiple-job holding). The jobs concept is used here because craining is more typically related to jobs, so that a multiple-job holder could receive training in more than one area of emphasis.

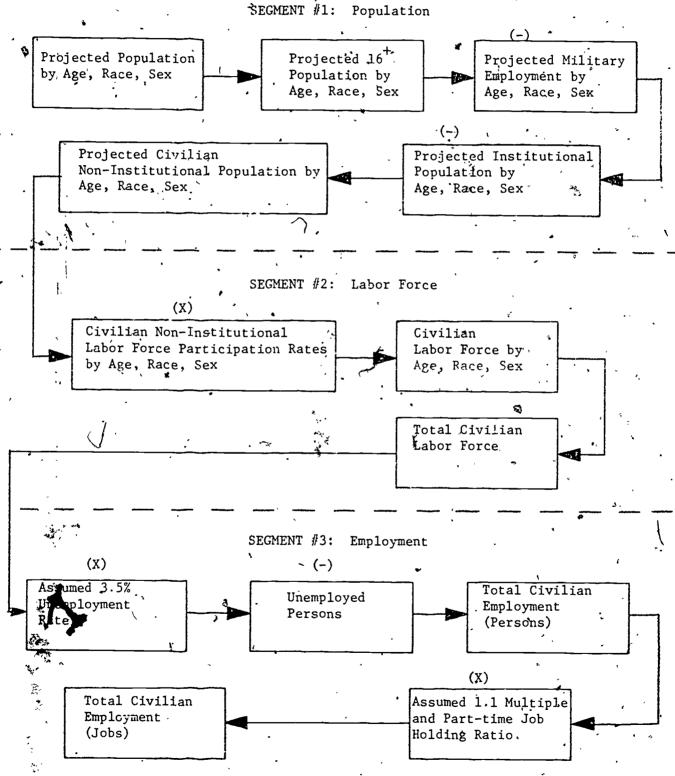

The population projection program maintained by the North Carolina Office of State Planning has the capability of projecting population by sex, race, five-year age cohorts for an indefinite period into the future by using the ratio-correlation method of projection. These projections basically reflect trends over the 1960-1970 census periods. Labor-force participation-rate projections were independently developed by observing age, race, and sex-specific trends in labor-force participation rate relatives between North Carolina and the U.S. over the 1960-1970 periods, and then extropolating these trends through 1985 and applying them to projections of U.S. rates supplied by the U.S. Bufeau of Labor Statistics.

Since population and labor-force participation rates were projected independently, a consistency check was made by regressing net migration rates against rates of employment gain for North Carolina counties over the 1950-1960, and again over the 1960-1970 periods. Parameter estimates from both periods were highly similar; these estimates were then used to make adjustments in both the projections of employment and the projections of labor-force participation through 1985. The net effect of these adjustments was to raise the rate of labor force participation, total popu-

19:7

Methodology for Projecting Employment from Projected Population: North Carolina 1985

.

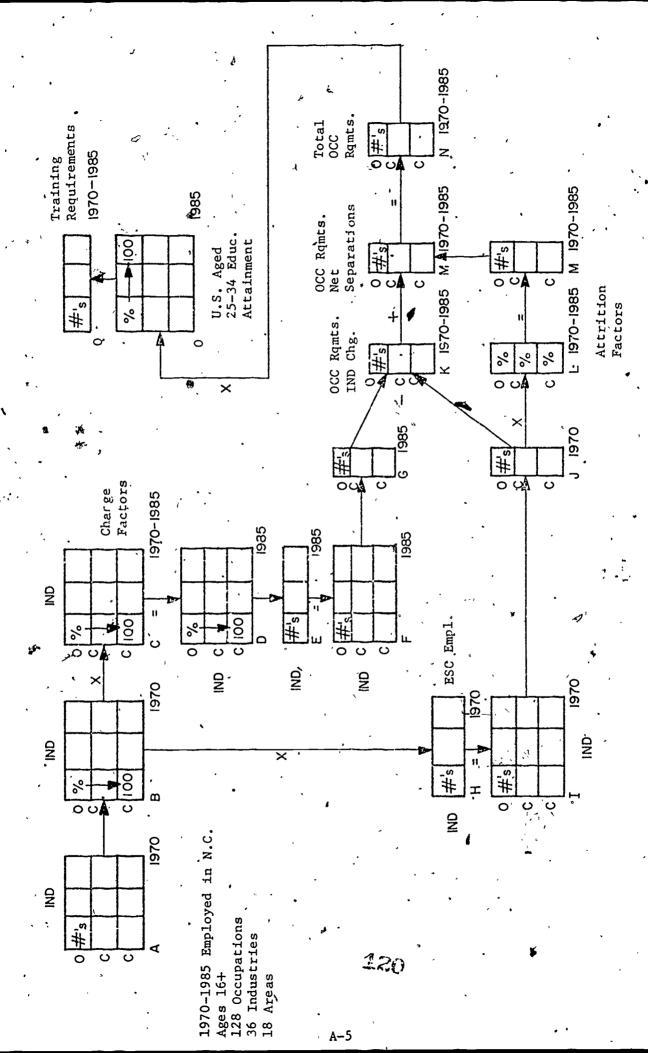

lation, and total employment as a result of increased projections of net immigration. These adjustments yield a final projection for 1985 population of 6,010,300 and a final projection of 1985 jobs of 2,948,000.

The distribution of this job total by industry group and by multicounty planning region was performed with the assistance of growth rates in employment by industry and economic region implied in the 1972 OBERS projections. 1/These rates were applied to employment data through 1972 and then disaggregated to the multicounty planning region level after analyzing trends in multicounty planning region constituent-county shares of OBERS economicarea industry group employment. These projections were then summed to yield a multicounty planning-region job total which was compared with the population projected for that region. Differences between the ratio of jobs to population were eliminated by an iterative procedure, which made slight adjustments to the projections of jobs by industry group at the regional and, thus, at the State level. This procedure preserved regional economic base and total employment growth characteristics consistent with the projections of industry group employment and population at both the regional and the State levels.

The projections of industry group employment to 1985 for the State and its 17 official multicounty planning regions were then used as a basis for the occupational employment and requirements projections as illustrated in Figure A-2. These results are presented in the main body of this report in Table III-3. Staffing patterns by industry group were projected by applying staffing-pattern "change factors" by industry group developed from U.S. occupational-employment computer tapes for 1970 and 1980 supplied by the U.S. Bureau of Labor Statistics; these factors were then extended to cover the 1970-1985 period and were applied to 1970 staffing patterns within industry groups. The projected 1985 staffing patterns by industry group were then applied to the projected 1985 industry group employment totals to yield projected 1985 occupational employment. The employment changes due to industrial growth (or decline) over the 1970-1985 period then form the first component of total occupational requirements over this period. The projections are for

U.S. Bureau of Economic Analysis and U.S. Economic Research Service, <u>The 1972 OBERS Projection of Economic Activity in the U.S.</u>, Vols. 1-5; U.S. Water Resources Council, September 1972.

Total Occupational and Training Requirements 1970-1985 Figure A-2.

128 occupations in each of 36 industries for the State and its 17 official multicounty planning regions. Up to 83 industry and 200 occupation detail is theoretically possible in these projections, since the 1970 census special tabulation computer tape maintained by the Department of Public Instruction Management Information System contains this detail by county, but statistical reliability would foreclose responsible use of this level of detail for all but perhaps the State level of aggregation.

Since job openings also occur as turrently employed workers die, retire, or otherwise permanently separate from the labor force, a vector of separation rates based on the age and sex distribution of employment within each occupation supplied by the North Carolina Employment Security Commission was applied to 1970 occupational employment converted to a job basis to yield an estimate of job openings due to separations. Occupational requirements from this source were added to occupational requirements from industrial growth (or decline) over the 1970-1985 period to yield total occupational requirements.

Projections of educational attainment by occupation were made for U.S. workers aged 25-34 from 1970 census estimates and from an extrapolation to 1985 of educational-attainment changes for all workers projected over the period 1970-1980 by the U.S. Bureau of Labor Statistics These projections were adjusted to include a separation of the standard census high school graduate category into its two major components: graduates who pursue no further training and graduates who pursue postgraduate technical or vocational training that does not lead to a regular baccalaurate degree. The addition of workers across all occupations for each level of educational attainment then produced an educational-attainment vector labeled "training requirements" as the final output of the modeling procedure.
