ABSTRACT

The National Science Survey of Scientific Activities of Institutions of Higher Education, the subject of this report, is designed to provide national statistics that cast light on these issues. Through analyses of the data, a better picture is purported to be produced on the impact of Federal policy in support of scientific endeavors. The report shows that since 1973, increases in the growth in funding of academic research have been less than 3 percent per year. The report is divided into three main sections: (1) current research and development expenditures in the sciences and engineering; (2) dapital expenditures for research, development, and instruction in the sciences and engineering; and (3) current direct expenditures for instruction and departmental research in graduate, degree-granting institutions in the sciences and engineering. Statistical tables show current research and development allocations according to: (1) source of funds, (2) distribution among fields of science, (3) type of activity, (4) type of control, (5) type of institution, (6) geographical distribution, and (7) expenditures. Details regarding scope, coverage, methods of estimating, and limitations of the data are presented in the technical notes in the appendices. (Author/EB)

Surveys of Science Resources Series
National Science Foundation

### **FOREWORD**

Many economic and social forces have emerged that have a significant impact on academic research and graduate education. Prominent among these forces are the changing nature of the role that universities play in the Nation's R&D picture, reliance on Federal agencies as sources of support, and, in recent years, the financial distress facing institutions resulting from declining rates of growth of research support and spiraling inflationary conditions.

From 1953, when the National Science Foundation (NSF) statistical series on academic R&D expenditures began, to the present, the proportion of U.S. research and development performed in universities and colleges nearly doubled. Throughout this period, the Nation has turned increasingly to its academic institutions for basic research. Joday, more than one-half of the U.S. basic research is conducted in the academic sector, compared with about one-quarter in 1953. The main catalyst for this growth has been the Federal Covernment, which doubled its support of academic basic research in the last decade.

In recent years the growth in funding of academic research has slowed considerably. For more than a decade before 1969, annual increases were in double digits. Since 1973, however, increases have been less than 3 percent per year, as Federal support peaked and leveled off. These past two years saw actual declines in real terms with rates of inflation exceeding the growth of revenues. There are indications that in 1975, for the first time, the rate of inflation of academic R&D outstripped that for higher education in general since research requires heavier investment in capital equipment items and contracted services, items recently subject to higher price increases than salaries and wages.

The NSF Survey of Scientific Activities of Institutions of Higher Education, the subject of this report, is designed to provide national statistics that cast light on these issues. Through analysis of these data, a better picture is produced on the impact of Federal policy in support of scientific endeavors.

The report was prepared in the Division of Science Resources Studies, Charles E. Falk, Director.

H Guyford Stever, Director National Science Foundation

### general note

- The fiscal year 1974 NSF Survey of Scientific Activities of Institutions of Higher Education covered 603 academic institutions and 22 university-administered Federally Funded Research and Development Centers (FFRDC's). All institutions that grant doctorate or master's degrees in the sciences or engineering, or performed \$50,000 or more separately budgeted research and development, were surveyed.
- Over 95 percent of the surveyed organizations returned usable question-naires. All of the 100 largest R&D performers responded (accounting for 83 percent of all academic R&D expenditures). Estimates for nonrespondents were made by NSF with the imputation rate amounting to only 0.9 percent of the R&D total. Thus, figures shown in this report represent universe totals of scientific and engineering disciplines.
- R&D expenditure data presented in this report refer to separately budgeted research and development in the sciences and engineering and exclude departmental research expenditures which are analyzed separately as part of the instructional programs of universities and colleges. Excluded is research performed in the arts and humanities.
- Separately budgeted research and development includes all funds expended for activities specifically organized to produce research outcomes and commissioned by an agency either external to the institution or separately budgeted by an organizational unit, within the institution.
- Departmental research (nonsponsored research) is "personal" or "faculty" research supported by general funds of the department as a specifically assigned, departmentally planned, or mutually understood part of the faculty member's total activity.

- "Current expenditures", includes all expenditures made by the institution during the reporting period (fiscal year beginning July 1, 1973, and ending June 30, 1974, or the institution's equivalent accounting period) from both the unrestricted current fund and the restricted current funds. Included are both direct and indirect cost. Direct costs include the salaries and wages of those working on a research project, expenditures for small equipment items, materials used, and other expenses specifically identified with the project, Indirect costs are those incurred by an institution in implementing and supporting the entire research project, including "unreimbursed indirect costs."
- The term "expenditures" differs from the Federal accounting term "obligations," which reflect actual awards of funds by the reporting agency during a fiscal year (July 1 to June 30) regardless of when these funds were actually spent by recipient institutions.
- Statistics shown in this report may not add to totals or subtotals because of rounding.
- All percentage changes in trend statistics represent compound annual rates
- Unless constant dollars are specified, data shown in this report are in terms of current dollars.
- In the absence of a reliable R&D cost index, the gross national product (GNP) implicit price deflator was used to convert R&D expenditures to constant dollars. The GNP deflator includes the effects of the price changes of all goods and services in the economy and therefore can only approximate changes in costs of inputs specifically related to R&D performance.

# acknowledgments

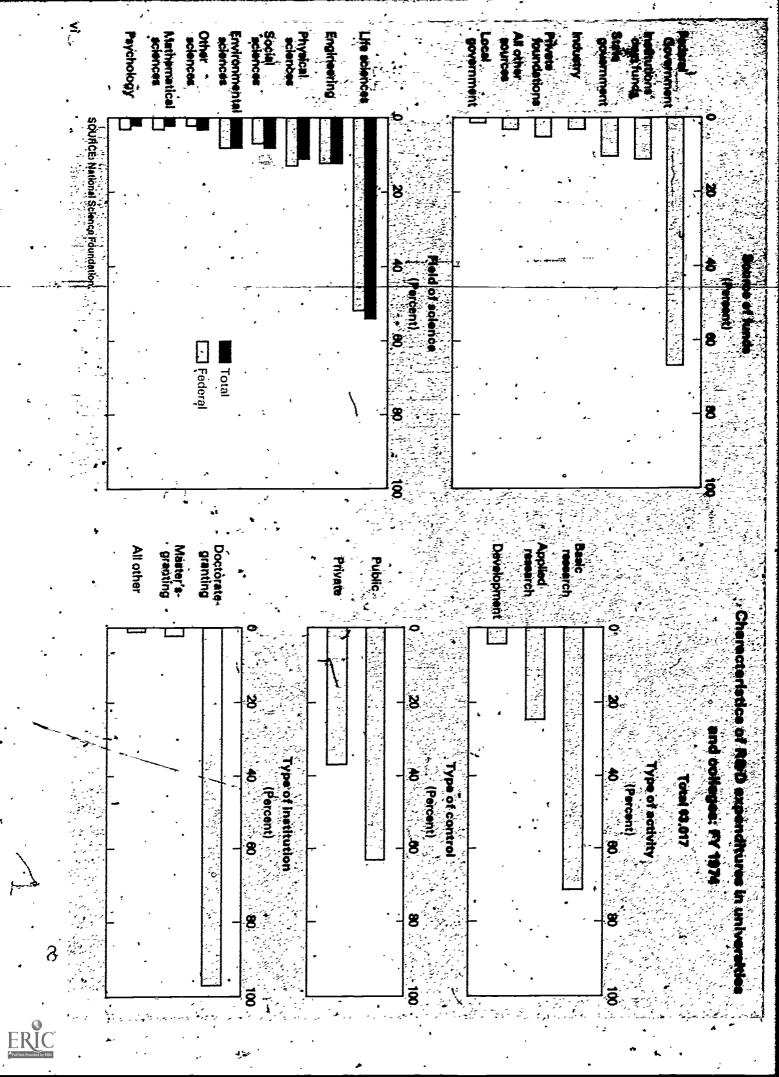

This report was prepared in the Division of Science Resources Studies. Universities and Nonprofit Institutions Studies Group by Ronald S. Biggar and James B. Hoehn. M. Margé Machen participated in the preparation of statistical material. The survey was conducted and the report written under the supervision of Richard M. Berry, Study Director. William L. Stewart, Flead of the R&D Economic Studies Section, provided special guidance.

### HIGHLIGHTS

- Total R&D expenditures in the academic sector reached \$3.0 billion in 1974, up nearly 3 percent over 1973; this growth rate is expected to continue through 1975. When measured in 1967 constant dollars, the 1974 total represents a 5-percent decline.
- A slight drop, less than one-half of 1 percent (8 percent in constant dollars) in Federal funding, which accounts for about two-thirds of the R&D expenditures in universities and colleges, was the major factor in this reduced rate of growth. In 1974 Federal funding for R&D activities in all sectors increased less than 3 percent (a 2-percent decrease in constant dollars).
- The separation of the Charles Stark Draper Laboratory from the academic sector into the independent nonprofit sector was a significant factor in the small increase in total R&D expenditures and the slight decline in Federal support.
- Between 1973 and 1974 basic research increased 5 percent to \$2.1 billion, compared with a 2-percent decline in applied research and development. Between 1970 and 1973, however, basic research increased 5 percent per year while applied research and development increased 18 percent annually. In constant dollars 1974 basic research expenditures were 6 percent below 1972 funding levels.
- percent during the decade ending in 1974, this rate of growth varied significantly among fields of science. R&D expenditures in the environmental sciences increases at the most rapid rate—16 percent per year, while the physical sciences increased at the slowest rate—5 percent annually.

- Between 1968.and 1974 R&D expenditures of publicly controlled academic institutions increased 8 percent per year, compared with a 3-percent annual increase in private institutions. The share of academic research and development performed by private universities and colleges dropped from 43 percent in 1968 to 37-percent in 1974.
- The top 100 universities, in terms of R&D funds, accounted-for 83 percent of both total and Federal R&D funds in the academic sector in 1974. This share dropped steadily since the high of 87 percent was recorded in 1966. The 20 largest R&D performers dropped from 46 percent of the academic sector's total in 1966 to 36 percent in 1974. The exclusion of Draper Laboratory from the academic sector in 1974 accounts for a 2 percentage point reduction in the concentration of R&D expenditures among the top 100 institutions.
- Institutions granting doctorate degrees accounted for 97 percent of current R&D expenditures in 1974. This percentage has remained constant for the last 10 years.
- Capital expenditures for scientific activities in universities and colleges totaled \$837 million in 1974, 2Z percent below the \$1.1 billion spent in the peak year of 1968. Since 1968, Federal funds used for capital purchases declined 33 percent, from \$340 million to \$228 million in 1974.
- R&D expenditures in university-administered. Federally Funded Research and Development Centers (FFRDC's) totaled \$865 million in 1974, up 6 percent over the \$817 million expended in 1973. Most of the increases came in the physical sciences and engineering which together accounted for 83 percent of all R&D activities in FFRDC's during 1974.

# NTRODUCTION.

The National Science Foundation serves as the national statistical center for data on scientific R&D resources covering the four major sectors of the economy: (1) Federal agencies; (2) private industrial firms; (3) colleges and universities; and (4) independent nonprofit organizations. This report deals exclusively with R&D expenditures of U.S. institutions of higher education and presents the results of the Survey of Scientific Activities of Institutions of Higher Education, FY 1974. This survey series was instituted in 1954 to obtain statistical information on science and technology activities of universities and colleges. Detailed statistical tables based on the 1974 survey results were published in advance of this report in order to provide timely data for interested users.<sup>1</sup>

The following principal characteristics of R&D expenditures are examined in this report: Source of funds; distribution among fields of science; and type of R&D activity (basic research, applied research, and development). Institutions are grouped by highest degree granted, type of control (public, private, etc.), and ranked by total and Federal R&D expenditure size, with subtotals for every 10 institutions. Separate data are summarized for FFRDC's administered by universities and colleges. Also included are separate chapters dealing with capital expenditures and instruction and departmental research in the sciences and engineering. Details regarding scope, coverage, methods of estimating, and limitations of the data are presented in the technical notes in appendix A.

Part I
UNIVERSITIES AND COLLEGES

The Nation's universities and colleges reported \$3 billion in current R&D expenditures for 1974, or 9 percent of the estimated total research and development conducted by all sectors of the economy. Although this percentage has doubled over the last 20 years, the 3-percent annual growth between 1973 and 1974 marks a considerable slowdown from the 10-percent annual growth rate reported in the 1964-73 period. Two significant factors contributed to the small increase in R&D expenditures in the 1973-74 period: (1) a leveling off of Federal R&D support to the academic sector in 1973 and (2) a reclassification of Draper Laboratory, formerly part of the Massachusetts Institute of Technology (MIT) into an independent nonprofit corporation, resulting pera \$55 million decline in academic R&D expenditures. Based on NSF projections, another small increase of about 3 percent is expected in 1975, largely because of the leveling off of Federal support.<sup>2</sup>

Measured in terms of constant 1967 dollars, R&D experiditures in the academic sector declined 5 percent between 1973 and 1974, when the national rate of inflation was 8 percent. As a result, in actual terms, the total 1974 R&D effort is only 4 percent above 1968 expenditure levels compared with 10 percent in 1973. Federally financed R&D expenditures are 4 percent below 1968 levels when converted to constant dollars.

# R&D expenditures in the sciences and engineering universities and colleges: FY 1964-74

Based on GNP implicit price deflator.

<sup>2</sup> See National Science Foundation, National Patterps of R&D Resources. Funds & Manpower in the United States, 1953-1975 (NSF 75-307) (Washington, D.C. 20402, Supt. of Documents, U.S. Covernment Printing Office), 1975.

Revenues from extramural sources support nine-tenths of all expenditures for R&D performance in universities and colleges. The Federal Government provided \$2 billion, or 67 percent, of all academic R&D expenditures in 1974, down from the 74-percent peak recorded in 1966. Reduced growth in R&D funding from Federal agencies, up only 1 percent between 1972 and 1973, and the reclassification of Draper Laboratory in 1974, have resulted in zero growth in federally financed R&D expenditures.

State and local government R&D support combined increased from \$172 million, or a low of 8 percent of the R&D total-in 1968, to a high of 11 percent, or \$329 million in 1974. R&D support from industry, although accounting for only 3 percent of the academic total, increased from \$86 million to \$96 million between 1973 and 1974, the fastest rate of any funding source—12 percent.

Institutional funds that universities and colleges were free to designate for research and development amounted to \$340 million in 1974—up 8 percent over the \$314 million reported in 1973. In the 1964-74 decade institutional funds have increased from a low of 8 percent in 1964 to 11 percent of all academic R&D funding in 1974.

In the 1964-74 decade federally financed R&D expenditures dropped from a high of 74 percent of all academic R&D expenditures in 1966 to a low of 67 percent in 1974. Reduced growth in federally financed R&D expenditures and greater reliance on industry and State governments as sources of R&D funding has increased the non-Federal share of academic research to a high of 33 percent in 1974.

Dospor Laboratory with an estimated #55 million tures reclassified into the independent nonprofit at SOURCE; National Science Epundation. Based on GNP implicit price defletor.

#### LIFE SCIENCES

R&D expenditures in the life sciences totaled \$1.6 billion in 1974, or 54 percent of all academic research. Between 1964 and 1974 both life science R&D expenditures; and total academic research increased at an average rate of 9 percent annually. Between 1972 and 1974, however, life science expenditures rose 9 percent annually, while total academic R&D expenditures increased only 6 percent.

Within the life sciences, clinical medical research accounted for \$709 million, or 44 percent of the total in 1974. The biological sciences ranked next with 33 percent, followed by the agricultural sciences with 20 percent and all other life sciences with 4 percent. Between 1972 and 1974 the biological and agricultural sciences combined increased 12 percent per year, while the clinical medical sciences increased 8 percent annually.

The federally financed share of life science expenditures remained relatively constant throughout the 1964-74 decade. The Federal share of 67 percent in 1964 increased to a high of 70 percent in 1968 before declining to 65 percent in 1974. Within the life sciences in 1974, the federally financed share rapked from 31 percent in the agricultural sciences to 76 percent in clinical medical fesearch. The low proportion of federally financed agricultural research is due to the fact that most agricultural research is State supported and is performed in agricultural experiment stations located at State controlled academic institutions (table 1).

<sup>4</sup> Separate datasfor biological and agricultural sciences are available for the first time in 1974. Islimates for 1972 and 1973 were developed by NSF based on data reported in the survey in 1974 and secondary sources for earlier years.

### PHYSICAL SCIENCES ...

Expenditures for research and dévelopment in the physical sciences totaled \$339 million in 1974, or 11 percent of all academic research, down from 17 percent in 1964. The 5-percent annual rate of growth for all physical sciences and the 4-percent growth in physics alone from 1964 to 1974 were the slowest growth rates of any major fields of science.

Throughout the 1964-74 decade the physical sciences recorded the highest share of Federal support, ranging from a high of 86 percent in 1966 and steadily dropping to a low of 80 percent in 1974. Federally financed physical science expenditures increased at an average annual rate of 4 percent during this decade, far below that of any other science area (table 2).

### SOCIAL SCIENCES

R&D expenditures-in the social sciences accounted for \$245 million, or 8 percent of all academic research in 1974, up from a 6-percent share in 1964 (charty 9). The 12-percent average annual growth rate sustained during this 10-year period was second only to the 15-percent annual rate recorded for the environmental sciences. The tripling of social science R&D expenditures since 1964 was primarily due to large increases in multidisciplinary social science research and research in education.

The federally financed share of social science R&D expenditures varied significantly in the 1964-74 decade. The Federal share increased from a low of 52 percent in 1964 to a high of 60 percent in 1968 before dropping to 55 percent in 1974. Nearly two-thirds of all sociology research was federally financed, while Federal support in political science and economics was 42 percent and 45 percent, respectively (table 3).

During, 1973-74 R&D expenditures of publicly controlled universities and colleges increased 6 percent to \$1.9 billion, Research and development in private institutions declined 3 percent, primarily because of the reclassification of Draper Laboratory. Between 1968 and 1974 public institutions maintained an 8-percent annual rate of growth in R&D expenditures, nearly triple the 3-percent growth achieved by private institutions. In 1974 private matitutions accounted for 37 percent of all academic research; down from a 43-percent share in 1968.

### R&D expenditures at universities and colleges. by type of control; FY 1968-74

Federally funded R&D expenditures accounted for a decreasing share of the total in both public and private institutions (table 4). By 1974 the Federal Covernment supplied 78 percent of the R&D funds used by privately controlled institutions and 61 percent in public institutions, compared with 83 percent and 66 percent, respectively, in 1968. In the 1973-74 period Federal R&D expenditures in public institutions increased 3 percent compared with a 4-percent decline in public institutions (because of the reclassification of Draper Laboratory).

In 1974 public institutions, supported heavily by their respective State governments, spent \$303 million for agricultural research performed primarily in agricultural experiment stations. Since most of agricultural research is performed in public, State supported institutions, private institutions spent only \$21 million on agricultural research.

Because doctorate-granting institutions accounted for 97-percent of all R&D expenditures in the academic sector, the R&D expenditure characteristics of the group coincided closely with the overall pattern for all institutions. The dominant characteristics of nondoctorate-granting institutions are as follows:

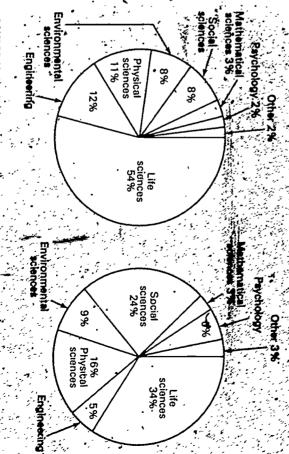

(1) In the 1973-74 period research and development in master's-granting institutions increased 7 percent, while a 7-percent decline was registered in both bachelor's and nonscience degree-granting institutions.

(2) In all nondoctorate granting institutions; the life sciences accounted for 34 percent of the R&D total, followed by the social sciences with 24 percent.

(3) Federally financed R&D expenditures amounted to 61 percent of the nondoctorate total. The Federal share, however, ranged from 56 percent in master's-granting institutions to 79 percent in institutions not granting science dogrees.

Ceographic Distribution

The Middle Atlantic States consistently ranked first in academic R&D expenditures over the last decade. Their rate of growth during this period, however, was 8 percent per year compared to an 11-percept rate in the Pacific States and West South Central States. During 1973-74, the Middle Atlantic States, although still accounting for the largest amounts—\$543 million—showed only a 2-percent growth rate. The New England States reflected a decline of 12 percent in academic R&D expenditures since Draper Laboratory in Massachusetts was reclassified into the independent nonprofit sector.

# Geographic distribution of total R&D expenditures in the sciences and engineering at universities and colleges: FY 1974

In 1974 California and New York together accounted for nearly one-fourth of all Lacademic R&D expenditures. These two States Iplus five others—Massachusetts, Pennsylvania, Illinois, Michigan, and Texas, each with \$100 million or more in R&D expenditures—accounted for one-half of all such expenditures in 1974 (table 5). In contrast, 23 States with less than \$25 million in R&D expenditures accounted for only 9 percent of the academic total.

Since 1972 California moved ahead of New York as the leading State in terms of academic R&D expenditures. Massachusetts, although remaining third, declined in relative importance. In the 1973-74 period South Carolina reported the largest rate of increase—25 percent. Thirteen other States reported increases of at least 10 percent, while Massachusetts, New Hampshire, and Hawaii reported discolutions of more than 10 percent.

a Includes outlying areas and-offices abroad

grouping, ingreased their share of both total and to 17 percent in 1974. Between 1973 and 1974, 77 of the 100 largest R&D performers reported an increase in R&D expenditures and 36 of these reported increases of at least 10 percent. The 23 institutions that reported declines showed rates ranging from less than 1 percent to 15 percent (table B-3). These same top 100 institutions show a much more neutral growth pattern when Federal R&D rates of change are analyzed. Only 59 institutions reported R&D increases with 22 showing increases of at least 10 percent. Forty institutions, however, reported declines in Federal R&D expenditures ranging from less than 1 percent to 20 percent.

# INSTITUTIONS IN THE SCIENCES AND ENGINEERING DEPARTMENTAL RESEARCH IN GRADUATE-DEGREE-GRANTING COKKENT DIKECT EXPENDITORES FOR

Institutions granting graduate degrees in the sciences and engineering allocated \$3.9 billion of current funds to direct costs of instruction and departmental research expenditures in the sciences and engineering in 1974. This represents a 9-percent increase over the \$3.6 billion expended by these institutions in 1973.

The life sciences accounted for the largest share (39 percent of the total) and the largest growth rate (13 percent between 1973 and 1974), of any area ofscience. The social sciences ranked second and accounted for a constant 21-percent share in the 1972-74 period. Engineering and the physical sciences each accounted for an 11-percent and a 10-percent share, respectively, down slightly from 1972.

The percent distribution of these funds between instruction and departmental research activities, is at best a rough estimate because of the accounting and conceptual problems involved. In fact, many institutions did not attempt a estimate. In view of the resulting high-imputation rates, these data must be used with caution. (See appendix A, p. 24).

It is worth noting, however, that the total and most individual areas of science show slight increases over the 3-year period 1972-74. If Federal R&D support continues to decrease, it is not illogical to expect at least a short-term continuation of very slight increases in departmental research funding in order that institutions can retain high-quality research staff (table 7).

### Part II\*

AND DEVELOPMENT CENTERS
ADMINISTERED BY UNIVERSITIES
AND UNIVERSITY CONSORTIA

Federally Funded Research and Development Centers (FFRDC's) are R&D -performing organizations substantially financed by the Federal Government to meet either a particular R&D objective or to provide major facilities at universities for research. Federal agencies funds accounted for 99.6 percent of R&D expenditures by FERDC's in 1974. This section is devoted to summary data on FFRDC's administered by universities and university consortia and does not include data for universities and colleges shown in part 1 of this report.

Each FFRDC is a separate operational unit conducting R&D work upon direct request of, or under a broad charter from, the sponsoring Federal agency. Organizationally, the 22 centers are separate from the administering academic institution and are self-contained entities insofar as their R&D work is concerned.

### Type of R&D Activity

Thé 22 university-administered FFRDC's covered in this survey expended \$865 million for research and development in 1974, an increase of 6 percent in current dollars from the \$817 million spent by 23 [FFRDC's in 1973.

R&D expenditures in this sector have increased at an average annual rate of a percent over the last decade. When converted to constant dollars, however, R&D expenditures have declined at an average annual rate of 1 percent during the same period.

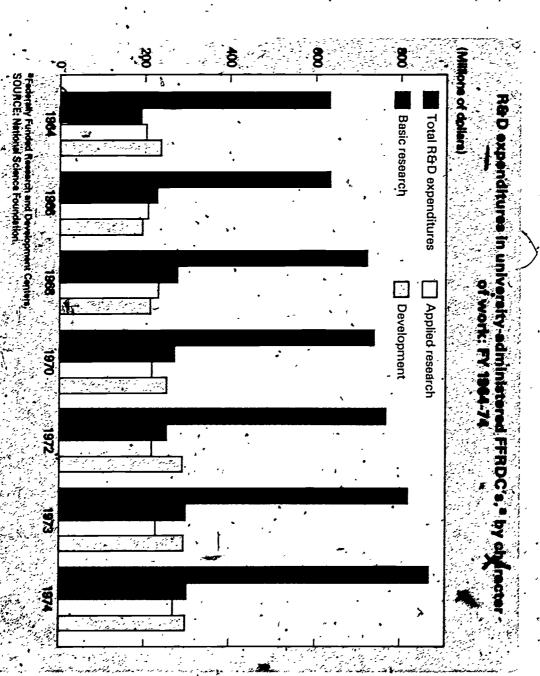

Basic research expenditures in 1974 increased for the second consecutive year to \$300 million, although the growth rate in current dollars was modest compared to the 19-percent rate between 1972 and 1973. The Los Alamos Scientific Laboratory

and Lawrence Livermore Laboratory accounted for most of the 1972-73 increase in basic research. Spending for basic research accounted for 35 percent of the total R&D effort in 1974, and continued to surpass outlays for development or applied research.

Expenditures for applied research increased 18 percent in 1974 to \$267 million. However, applied research expenditures fluctuated considerably

1 percent since 1966.

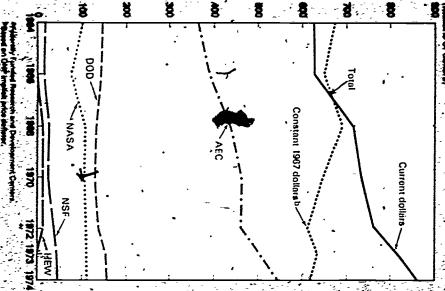

since 1964, with increases peaking at \$231 million in 1968, a drop in 1970, followed by steady increases finally surpassing the 1968 level in 1974. In constant dollars, applied research expenditures in 1974 remained slightly above the 1970 level. Expenditures for development increased continuously since 1966, at an average rate of 5 percent per year, to a total of \$298 million in 1974. In constant dollars, development increased at an average annual rate of

<sup>•</sup> The number of university-affiliated FRDC's was reduced by one in 1974 when the Applied Physics Laboratory was organizationally assimilated by the University of Washington.

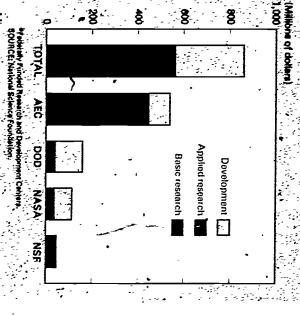

During the past decade R&D expenditures at FFRDC's sponsored by the National Science foundation (NSF) increased at an average annual growth rate of 10-percent, from \$17 million in 1964 to \$46 million in 1974. In 1974, the National Cénter for Atmospheric Research accounted for over one-halt of NSF-sponsored research and development (\$24 million).

## Current R&D expanditures in university administered PPRDC's, by aparenting Federal agency: FY 1994-74

Energy Commission's (AEC) FFRDC's increased at an average annual rate of 3 percent, from \$366 million in 1964 to \$547 million in 1974. During this period both the Department of Defense (DOD) and National Aeronautics and Space Administration (NASA) increased R&D outlays at their centers by \$12 million to \$159 million and \$113 million, respectively. AEC-sponsored centers spent 43 percent of their 1974 outlays on basic research and 39 percent for-development. This sharply contrasted with the portions of total R&D expenditures for development at DOD centers, 75 percent, and NASA centers, 70 percent. The five NSF-sponsored centers concentrated all of their outlays (\$46 million) in basic research.

# Distribution of current R&D expenditures in university-administered FFRDC's, a by character of work and sponsoring Federal agency; FY 1974.

### rield or ocience

The physical sciences and engineering accounted for five-sixths of the total R&D efforts by university-administered FFRDC's in 1974, or 53 percent and 30 percent, respectively. Eighty-five percent of research and development in the physical sciences was sponsored by AEC. Lawrence Livermore Laboratory and Los Alamos Scientific Laboratory utilized one-half of AEC-sponsored funding in the physical sciences. Engineering R&D expenditures were heavily sponsored by DOD (\$112 million) and AEC (\$96 million):

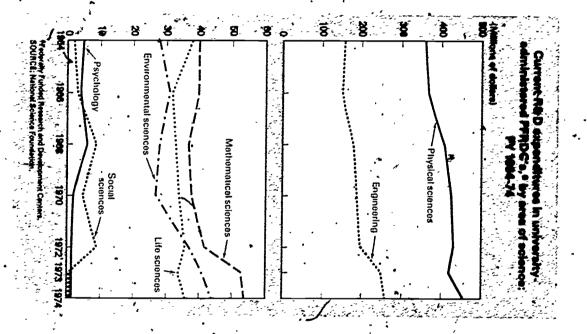

# Third of scheme and spanning of the scheme and scheme and spanning of the scheme and sch

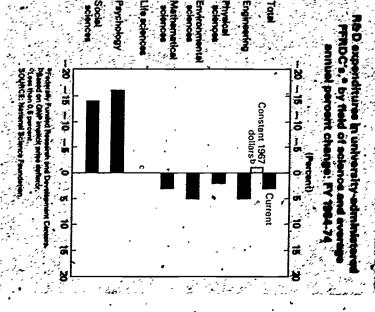

accounted for nearly one-half (\$21 million) of all funds spent by nine FFRDC's for environmental research. R&D expenditures by FFRDC's in the life sciences (\$36 million) accounted for 4 percent of total R&D outlays. This contrasted sharply with the 54-percent life science share in universities and colleges.

Since 1964 R&D expenditures for engineering and environmental sciences at FFRDC's have shown the highest average growth of any field of science, each 5 percent per year. Engineering research and development has increased from \$155 million in 1964 to \$261 million in 1974. Research in energy, defense, and space projects accounted for the bulk of engineering outlays. For example, the jet Propulsion Laboratory's (JPL) R&D work on the communication and orbitor portions of the Viking Project helped to boost JPL's engineering R&D outlays to \$52 million,

Physical science expenditures increased 2 percent per year and the mathematical sciences showed R&D expenditure increases of 3 percent annually during the 1964-74 decade. R&D outlays in the social sciences decreased rapidly from 1972 (\$9 million) to 1973 (\$0.2 million), when the Office of Education (OE) began awarding, on a competitive basis, obligations that previously went to eight FFRDC's. These OE-sponsored centers had expended \$10 million in 1972.

The targest FFRDC performer was the Lawrence Livermore Laboratory (\$147 million). Nine-tenths of this center's research and development was in the physical sciences, with over one-half devoted to nuclear research. Some other areas of this center's physical science research include a laser fusion project, controlled thermonuclear research (using magnetic confinement), and applied technology for nuclear energy (i.e., coal gasification, oil shale, etc.).

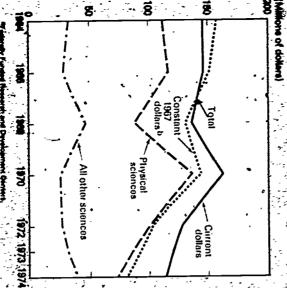

# Capital Expenditures for Facilities and Equipment

Capital spending for scientific and engineering facilities and equipment at university-administered FFRDC's totaled \$115 million in 1974, a decline of \$6 million from 1973. Capital expenditures have been declining since 1970, when they peaked at \$163 million, a trend that is directly related to capital expenditures in the physical and environmental sciences.

The Fermi National Accelerator Laboratory reported the largest capital disbursements (\$25 million) among FFRDC's in 1974. Most of this amount went for the fabrication and installation of major equipment items for future research projects

The imputed dollar volume of separatoly budgeted R&D expenditures of nonrespondent institutions amounted to \$28 million, or .º percent of the \$30 billion universe total for all universities and colleges, both respondents and conrespondents. SOUNCE: MATICIAL SCIENCE FORMOATICAL .

۴

## Methods of Estimating for Nonresponse

Thrty institutions failed to supply usable data for this ceport and, in order to estimate data for these institutions, an imputation program was used to provide nonrespondent estimates. The imputation program used summary data, detailed by respondent characteristic (level of degree granted and type of control) to determine computed inflation factors. These-factors were applied in conjunction with previous years response records to create nonrespondent estimates. R&D estimates (shown in table A-2) for nonrespondents totalled \$28 million; or 0.9 percent of the \$3 billion universe total. Only 11 doctorate-. 15 master's-, and 4 bachelor's-degree-granting institutions failed to respond to the survey.

### Development Expenditures

Development expenditures, which accounted for only 4 percent of total R&D expenditures in each of the years 1964-74, were first collected by field of science in 1973. Estimates for prior years were developed by NSF by: (a) contracting major universities with large development expenditures to ascertain how these were distributed by field of science, and (b) utilizing field of science growth patterns in these institutions to prorate development expenditures in earlier years. The exclusion from the report of the Draper Laboratory caused a decline in development expenditures in 1974.

#### rimitations

The statistic's presented in this report are subject to response and concept errors caused by several factors: Differences between university concepts and survey definitions of R&D activities, and by variations in university accounting procedures. Consequently, the difficulty of defining R&D expenditures in the sciences and engineering adversely affects the accuracy of the data provided by respondents. As the survey series closes its seventh cycle, however, the magnitude of the error attributable to the madequacy of institutional recordkeeping procedures is constantly decreasing, as more institutions, especially the larger ones, refine their procedures to yield the information requested. Since the large funiversities account for the vast majority of R&D activities in the sciences and engineering, the quality of their statistical reports has significant impact on the overall reliability of the survey data.

### Efforts to Improve Data Quality

since analysis of reporting error is essential in determining how the quality of individual institution responses can be improved, the National Science foundation has conducted reliability and validity studies over the last severallyears. The first study was conducted by Dr. Robert Wright of the State University of New York at Albanywho visited over 50 institutions in 1972-73, and his findings were published in a two-volume study. Evaluation of the Survey of Scientific Activities of Institutions of Higher Education 'In 1974, William Morsch of Columbia. Research. Associates conducted a pilot Postfrumeration Test of the 1973 report of 9 institutions and his findings, although not published are available on request to NSI.

In May 1975, the National Center for Higher Education Management Systems (NCHEMS), under a grant from the Division of Science Resources Studies, conducted a systematic analysis of the NSF expenditure and manpower surveys with the objective of ensuring that the data categories, definitions, and instructions are consistent with those in common usage in institutions and with those used in other national data collection efforts. Subsequently, as a result of the NCHEMS findings, NSF drafted revisions of the survey instruments and sponsored a national conference on the NSF University Science Statistics Program in May 1975. The conference brought together NSF survey-data users and university-and-college respondents, and the objectives of the conference were to:

- Identify and discuss specific problems associated with survey instruments and solicit from conference participants suggestions as to how thesoproblems might be solved.
- Describe the significant issues now being faced by NSF and initiate discussions concerning ways of acquiring limited amounts of information needed to address these issues.
- Continue the dialogue between NSF and a group of key data providers concerning the collection of data by the Foundation and the uses to which these data are put.

Many recommendations were made at the conference, and the participants made helpful suggestions about improving the survey instruments and ways to maintain a continuing dialogue between NSF and survey respondents. The revised survey instruments are presently being reviewed by institutional respondents prior to implementation by NSF.

Among the specific items discussed at the conference by institutional representatives were areas of difficulty in responding to the survey, including ambiguity in the taxonomy of the questionnaire. As a result of the discussion, the conferees called for more precise instructions for the exclusion of training grants, subcentracts, and other expenditures not specifically research and development in nature. The conference participants also suggested that R&D expenditures for all academic disciplines be collected as well as for science and engineering disciplines, in order to place R&D activities in proper perspective to the overall functions of the institutions.

The conferees, in addressing a National Science Board request for basic research by field of science data, agreed that such information could best be provided by department chairpersobns, and NSF agreed to develop a departmental worksheet to assist respondents in gathering this information. It was the consensus of the conference participants, that departmental chairpersons could best respond to data requests for departmental research outlays. Accordingly, a departmental data sheet and the fiscal year 1975 questionnaire included an item designed to collect basic research on an optional basis.

fulfinates for nonrespondents for instruction and departmental research (shown in table A. I) were also imputed using the same methodology

Data obtained from the Suids have been published by NN in t Matarion of the Survey of Scientific Artistics of thichtations of Higher Education prepared by Robert R. Wright, 1973

### NATIONAL SCIENCE FOUNDATION Washington, D.C. 20550

### SURVEY OF SCIENTIFIC ACTIVITIES OF INSTITUTIONS OF HIGHER EDUCATION

(Current and Capital Expenditures for Research, Development, and Instruction in the Sciences and Engineering, FY 1974)

Organizations are requested to complete and return this form to:

NATIONAL SCIENCE FOUNDATION 1800 G Street, N.W. Washington, D.C. 20550 Attn: UNISG

This from should be returned by October 31, 1974. Your cooperation in returning the survey questionnaires promptly is very important and will be appreciated.

Financial data are requested for the fiscal year which began on July 1, 1973, and ended on June 30, 1974, or your institution's equivalent fiscal year.

All financial data requested on this form should be reported in thousands of dollars; for example, an expenditure of \$25,342 should be rounded to the nearest thousand dollars and reported as \$25.

Where the exact data are not available, estimates are acceptable. Please complete all items; estimates by colleges officials will be better than NSF estimates. Enter "O" as an item total (lines 1100, 1400, 1500, etc., are item totals) rather than leave the total blank.

Please indiate in a separate letter the *number* of any item that should *not* be published with your institution identified.

Name and address of institution: (Please correct if name or address has changed)

(Includes aggregate data from 603 universities and colleges but excludes 22 university-administered. FFRDC'S)

Include data for branches and all organizational units of your institution, such as medical schools and agricultural experiment stations. Also include hospitals or clinics owned, operated, or controlled by universities, and integrated operationally with the clinical programs of your medical schools. Exclude data for Federally Funded R&D Centers administered by universities. A list of these Centers is shown below. A separate questionnaire will be mailed directly to each Center.

If you have any questions, please contact Ronald Biggar (202-282-7790).

### ITEM 1. CURRENT EXPENDITURES FOR SEPARATELY BUDGETED RESEARCH AND DEVELOPMENT (R&D) IN THE SCIENCES AND ENGINEERING, BY SOURCE OF FUNDS AND TYPE OF ACTIVITY, 1973-74 (include indirect costs)

If your institution did not have any current expenditures for separately budgeted research and development in 1973-74 check "none" in the space provided here.

Go to Item 3 for questions pertaining to instruction and departmental research and Item 4 for capital equipment and facility expenditures

### ITEM 1. GENERAL INSTRUCTIONS

Source of funds refers to immediate sources rather than original sources of funds. For example, funds received from a foundation should be reported under that source, even if industry was the original source of some or all of the foundation's funds

Exclude R&D contracts subcontracted by your institution to be performed by other ogranizations

Include indirect gosts incurred in carrying out R&D programs (e.g. such costs as plant maintenance, executive management, libranes). Include all indirect costs defrayed with institution's own funds in addition to those reimbursed or reimbursable by the sponsoring organization.

### -Federal Government

-include grants and contracts earmarked for research and development by all agencies of the Federal Government.

### 1b-State Government

-include funds designated for R&D by State governments and their agencies. Include restricted funds supporting research and development at agricultural experiment stations

### 1c-Local Government

-include funds designated for R&D by county, municipal, or other local governments and their ageocies

### 1d-Foundations.& Voluntary Health Agencies

-the following funding sources should not be reported in Item 1d; instead report them as noted:

a) Funds from foundations which are affiliated with or grant soley to your institution should be reported in 1f b) Funds derived from State or local government health

agencies should be reported in 1b or 1c.

c) Funds from professional societies such as the American Medical Association should be reported in Ig

### -Industry

-include all grants and contracts earmarked for R&D by profitmaking organizations, whether engaged in production, distribution, research, service, or other activities.

### H-Institution's Own Funds

Linclude any funds your institution was free to designate for R&D. The sources of these funds may include:

- a) Endowment income
  - b) Tuition and fees
- c) Unrestricted State or local government appropriations

d) General-purpose grants from industry, foundations, or other outside sources, provided these were unréstricted funds.

e) Indirect costs on separately budgeted projects funded by your institution as well as unreimbursable indirect costs associated with R&D financed by outside organizations.

### Other Sources

—report any additional funds received from outside sources other than those already noted, and which were earmarked for R&D by the source. Examples include gifts, grants, or contracts received from private individuals or professional societies, and designated for R&D by them.

### ITEM 2. TOTAL AND FEDERALLY FINANCED EXPENDITURES FOR SEPARATELY BUDGETED RESEARCH AND DEVELOPMENT, BY FIELD OF SCIENCE, 1973-74

g. Social sciences	1570		830,202	10.5	%
h Other sciences, NEC	1580		153,864	8.0	%
L Total (sum of a to h)	1500	-, \$	3,883,775	11.0	%

### **INSTRUCTIONS**

In column 1, include the salaries of department heads, faculty members, secretaries and technicians, office and laboratory supplies, and expenditures for degree credit instructional programs in science and engineering subjects

in column 2, departmental research means research activities that are not separately budgeted and accounted for Percentage estimates may be based on consultations with department chairman or estimated from central records If central records are used, take the proportion of time spent by faculty on instruction, organized research, public service, and administration—the residual should yield departmental research. Faculty activity reports may also be used as a basis for estimating departmental research.

Note. The time spent in supervising the thesis work of graduate students should be reported as an expenditure for instruction, not for departmental research. If no departmental research is performed by your organization, please report zero in column 2.

### ITEM 4. CAPITAL EXPENDITURES FOR SCIENTIFIC AND ENGINEERING FACILITIES AND EQUIPMENT FOR RESEARCH, DEVELOPMENT, AND INSTRUCTION, BY FIELD OF SCIENCE, 1973-74

### **INSTRUCTIONS**

Report funds for facilities which were in process or completed during 1973-74. Expenditures for administration buildings, steam plants, residence halls, and other such facilities should be excluded unless utilized principally for research, development, or instruction in engineering or in the sciences. Land costs should be excluded Exclude small equipment items in your current fund account costing approximately \$200 to \$500 or less, as determined by institutional policy.

Facilities and equipment expenditures include the following: (a) fixed equipment such as built-in equipment and furnishings; (b) movable scientific equipment such as oscillosopes, pulse-height analyzers; (c) movable furnishings such as desks; (d) architect's fees, site work, extension of utilities, and the building costs of service functions such as integral cafeterias and bookstores of a facility; (e) facilities constructed to house separate components such as medical schools and teaching hospitals, and (f) special separate facilities used to house scientific apparatus such as accelerators, oceanographic vessels, and computers.

Granting Institutions in the Sciences and Engineering.

## APPENDIX D

# Reproduction of Covering Letter

## NATIONAL SCIENCE FOUNDATION

WASHINGTON, D.C. 20550 October 1, 1974

ar Sir:

The National Science Foundation requests your cooperation in its minth survey of scientific activities of institutions of higher education. Timely statistics from the survey play a vital part in assessing the overall effectiveness of ongoing, Federal R&D efforts to strengthen science and technology in universities and colleges. Your reports will be processed immediately to include the data in (a) the National Science Board's annual report to the President, (b) NSF's "Science Resources".

Studies Highlights", and (c) NSF's report "National Patterns of R&D Resources".

Please note that the questionnaire has been revised without changing the basic survey concepts. The revision now eliminates the collection of R&D expenditures by major cost item and combines the instructions with each item on the questionnaire. Hopefully, these changes will reduce your reporting burden and thereby enable you to provide even more timely information.

Please complete and return the form to us by October 31, 1974. Early responses are critical to the success of the survey. The postcard included in the package should be returned immediately to assure us that the questionnaire has reached you; also, it will provide the names of persons to be contacted if questions arise in the follow-up and editing phases of the survey.

NSF recognizes that your breakdown of expenditures into basic research, applied research, development, and departmental research requires estimates from "soft" data. NSF will publish only national aggregates for these statistics; therefore, your best estimate is perfectly satisfactory.

A copy of a summary of last year's data is enclosed to point out NSF's efforts to provide early release of statistics. A detailed report will be published shortly. If you would like to have any additional data from the survey listings, such as institutional rankings, please let us know and we will try to provide them to you.

Your continued cooperation in reporting timely data to NSF is greatly appreciated. If you have questions, please address them to me or Mr. Ronald Biggar. We may be reached on Area Code 202, 282-7790.

Sincerely yours,

Rich H. Rein

Richard M. Berry, Study Director
Universities and Nonprofit
, Institutions Studies Group
Division of Science Resources Studies
