## ABSTRACT

While the dental education expansion in Illinois has been notable, some problems remain to be addressed in the last half decade of the 1970's. There is a geographic maldistribution of dentists, with more dentists per capita in the urban areas, particularly Chicago, than in the downstate rural areas. While some progress has been made, considerable growth of ethnic minority enrollments must occur before such students are proportionately represented in the state's dental schools. The expansion of dental education in Illinois undertaken in 1968 will result in substantially more dentists. The increase should maintain and will likely improve Illinois' position among the top 15 states in terms of dentists per capita. In recognition of the substantial increases made to date and some of the dental care problems in Illinois, the following recommendations build upon the progress made to date: The three Chicago-area dental schools should meet their current enrollment projections. The necessary state funds for completing the expansion of dental education in the public dental schools should be provided through the usual budget review and appropriation processes. The private dental schools should be awarded an annual operating grant of \$3,000 per Illinois resident student. Affirmative action efforts in each dental school should be continued and expanded. Each school should attempt to enroll and retain a student mix that ethnically and geographically reflects the population base from which it draws its Illinois students. (Included are statistics on supply of dentists, enrollment, and graduates.) (JT)

## I. INTRODUCTION

The dentist is the health professional who deals with the prevention and treatment of diseases and malformations of the teeth, gums, and oral cavity. Dental activities include the diagnosis and treatment of tooth decay, periodontal disease, malocclusion, and other oral disorders.

The dental schools in Illinois have responded to their mandate to increase enrollments so as to provide more adequate numbers of dentists to meet the oral health care needs of the people of Illinois. By increasing enrollments they have also broadened the opportunity for Illinois residents to enter dental school.

## II. SUPPLY OF DENTISTS

Illinois ranks 15th among the states in active dentists per capita (Table II-1), having about six percent more active dentists per capita than the national average. There has been a decline in the absolute number of active dentists per capita and the Illinois rank among the states since 1966. At that time Illinois ranked 10th in the nation and had about 14 percent more dentists per capita than the national average. In the period 1966 to 1972, only 26 states had an increased ratio of active dentists to population. Nationwide, the ratio fell about four percent.

The number of dentists per capita in a state is related strongly to the presence or absence of a dental school in the state. For states with more dentists per capita than the national average, two-thirds have a dental school. In contrast, only two-fifths of the states below the national average have a dental school.

Dentists within Illinois are not distributed uniformly (Table II-2). The total number of dentists per capita ranges from 60 in the Chicago region to 36 in the East St. Louis region. There has been some change in the relative distribution of dentists since 1966, with more being active per capita in the East St. Louis and Rockford regions.

One of the reasons for the decline in active dentists in Illinois is suggested by the age data displayed in Table II-3. In 1966 about 42 percent of the active dentists were 55 years or older. In the eight intervening years to 1974, it is safe to assume that a large number of these practitioners left active status. By 1974 the percent of active dentists over 55 fell to 32. Conversely, the percentage of active dentists under

Health Resources Statistics, DHEW Publication No. (HSM) 73-1509, June, 1973.

40 rose from 26 percent to over 33 percent by 1974. The age of active dentists in Illinois is still comparatively high relative to the ages nationally. As more young dentists begin practice in Illinois, the age distribution should continue to shift toward the younger end of the scale.

About one of every eight dentists in Illinois has one or more specialties (Table II-4). Approximately one-third of the specialists are orthodontists and one-quarter are oral surgeons. Nationwide, one in ten dentists is a specialist. The specialists in Illinois tend to be younger than the average dentist active in Illinois. About 44 percent of all the Illinois specialists are under 40 years and only 18 percent are 55 years or over.\*

In summary, Illinois has more active dentists per capita than the national average, but has experienced a decrease in dentists per capita since the mid-1960's. One reason for the decline was the relatively large number of older dentists who presumably are no longer active. There is a geographic distribution problem in Illinois. The Chicago area has two-thirds again as many active dentists per capita as does the East St. Louis region. The percentage of dental specialists in the dental manpower work force in Illinois exceeds that nationally. Thus, Illinois has more specialists per capita than the nation as a whole. Well over half of the specialists are orthodontists or oral surgeons.

### III. DENTAL EDUCATION

There are four dental schools in Illinois, three in Chicago and one in Alton. Two are public and two are private. The enrollments and graduates from these schools are shown in Tables III-1 and III-2, respectively. The enrollments have increased nearly 50 percent since 1967-68 and Illinois resident enrollments have increased by 68 percent. The number of graduates had increased by 22 percent in 1974 over 1968, with a 23 percent increase in Illinois resident graduates.

As in medicine, the State's commitment to expanded dental education is not yet reflected fully in the enrollment and graduate figures. The new school in Alton will graduate its first class in 1975 and the expansion at the University of Illinois is not yet realized fully. Its College of Dentistry will occupy Phase II of a new building in the summer of 1975.

The projected enrollments and graduates of the State's dental schools (Tables III-3 and III-4) reflect more accurately the commitment made to dental education in Illinois. By 1979 total enrollments will have increased by 68 percent and Illinois resident enrollments will have doubled. Total and Illinois resident graduates will have increased by 74 percent and 90 percent, respectively.

Illinois students had a slightly better chance than their cohorts nationwide to enter dental school in 1973: 2.7 Illinois students per 100,000 population entered a dental school versus 2.6 per 100,000 nationally (Table III-5). By 1979-80, about 3.2 Illinois students per 100,000 population will enter school as compared with 2.8 nationally. Thus, in

terms of opportunity to enter dental school, Illinois residents will have about a 15 percent better chance than the average student nationwide by 1979.

In 1974 Illinois ranked behind only Pennsylvania, Missouri, and Minnesota, among the largest and Illinois-border states, in terms of enrollments and graduates per capita (Table III-6). Illinois had 40 percent more dental students enrolled per capita than the national average and graduated 31 percent more per capita. By 1979-80 Illinois will be graduating about 3.8 dentists per 100,000 population as compared with about 2.5 dentists per 100,000 population nationwide.\*

Ethnic minority enrollment in Illinois dental schools has risen from less than three percent in 1969-70 to about seven percent of total enrollments by 1974-75 (Table III-7). This percentage is still far below the 17 percent minority composition of the Illinois population. Nationwide, ethnic minority enrollments comprise 9.0 percent of the total. Black students comprise 4.7 percent of the total nationwide.\*\*

#### IV. PROJECTED SUPPLY OF DENTISTS IN ILLINOIS

The projection of the supply of dental manpower for Illinois is inexact at best. Some recent data, however, suggest a means of assessing a range of probable dental manpower for the State.

Historically, approximately 70 percent of the graduates of the University of Illinois College of Dentistry have remained in Illinois for their practice. If the same percentage holds and also applies to the graduates of the Southern Illinois University School of Dental Medicine, then by 1980 the two public schools will be adding approximately 150 new dentists to the practice pool in Illinois. It also appears reasonable to assume that about 70 percent of the Illinois resident graduates of the private schools will remain in the State to practice and about 10 percent of the non-Illinois residents will remain (Table IV-1). The two private schools will then add about 90 dentists for practice in Illinois. The combined addition to Illinois dentists will be, then, about 240 annually.

The data displayed in Table IV-2 show that only 46 percent of the Illinois dentists in 1974 were graduates of Illinois schools. Thus, well over half of the current dentists were educated outside of the State. Approximately 5 percent of the total are graduates of the now defunct St. Louis University School. It can be expected that as the Illinois' schools educate more dentists and as other states' schools begin to admit a larger number of their own residents, the in-migration rate of dentists to Illinois will fall relative to the number of graduates of the Illinois schools. For purposes of projection, assume that there will be

one in-migrant for every two graduates of Illinois' schools which practice in the State (as compared to over one in-migrant per one Illinois graduate, historically). Then, the net annual increase of dentists in Illinois would be about 360 annually.

If the average dentist works 30 years, then by the end of the century there would be in the neighborhood of 90 to 100 dentists per 100,000 people in Illinois, a larger number per capita than any other state in the country at present.

## V. RECOMMENDATIONS

The report, Education in the Health Fields for State of Illinois, recommended the expansion of dental education in Illinois to meet the need for more dentists. Since 1968, substantial expansion has occurred.

- .. A new dental school has been started by the Southern Illinois University-Edwardsville. It will graduate its first class in August, 1975.
- .. Total dental student enrollments have increased from 1,017 to 1,508 since 1968; enrollment of Illinois resident students has increased from 609 to 1,022.
- .. The number of graduates of the State's dental schools has increased from 246 in 1968 to 300 in 1974.
- .. The opportunity for Illinois residents to enter dental school has nearly doubled since 1968.

The dental schools in the State are still in a period of enrollment expansion. The University of Illinois College of Dentistry will occupy Phase II of its new facility in time for the 1975 entering class. The College is not projected to reach its full enrollment until 1977. The Southern Illinois University School of Dental Medicine currently is projecting a class size of 48, with intentions to increase its class size to 64. The two private dental schools will meet their projected enrollments in about one year. By 1980, if the dental schools' present projections are realized:

- .. the annual number of graduates will be 428, nearly a doubling since 1968;
- .. the annual number of Illinois graduates will be 307, nearly a doubling since 1968.

These results are the product of considerable State financial support for Illinois dental education expansion, including new facilities for

the University of Illinois, a totally new school in renovated facilities for Southern Illinois University and State grant support for the Loyola University and Northwestern University schools of dentistry. In each case, except Southern Illinois University, most of the necessary capital expenditures to accommodate the larger classes have been made.

While the dental education expansion has been notable, there remain some problems which must be addressed in the last half decade of the 1970's.

There is a geographic maldistribution of dentists, with more dentists per capita in the urban areas, particularly Chicago, than in the down-state rural areas. The location of a dental school in Alton and the Federally funded rural dentistry project at the University of Illinois will help to address some of the distribution problems.

An important problem in dental education is the recruitment and admission of students from groups historically underrepresented in the dental profession. While some progress has been made in Illinois, considerable growth of ethnic minority enrollments must occur before such students are proportionately represented in the State's dental schools.

The expansion of dental education in Illinois, undertaken in 1968, will result in substantially more dentists for Illinois. The increase should maintain and will likely improve Illinois' position among the top 15 states in terms of dentists per capita. In recognition of the substantial increases made to date and some of the dental care problems in Illinois, the following recommendations build upon the progress made to date.

1. Enrollments

The three Chicago-area dental schools have expanded their enrollments considerably since 1968. The space needs for their projected expansion are all now met, or nearly so. It is recommended that these schools plan to maintain their projected levels of enrollment through 1980. The new Southern Illinois University school is currently projecting a class size of 48. This level of enrollment is probably not as efficient as a larger class size. The geographical location and the mission of this School, coupled with its desire, suggest that it should expand its class size to more adequately meet the dental needs of the southern part of Illinois.

At the recommended levels of graduates, Illinois will be graduating 50 percent more dentists per capita than the country as a whole. This production rate will increase the number of active dentists per capita in Illinois over the next two or three decades.

Recommendation 1: The three Chicago-area dental schools should meet their current enrollment projections. In particular,

- .. the Loyola University School of Dentistry should plan to graduate about 130 dentists per year;
- .. the Northwestern University School of Dentistry should plan to graduate about 100 dentists per year;
- .. the University of Illinois College of Dentistry should plan to graduate about 150 dentists per year.

The Southern Illinois University School of Dental Medicine should plan to expand its class size to approximately 64 as soon as is feasible. The necessary facilities to accommodate the expansion should be provided, including clinical sites removed from the Alton campus, as well as adequate facilities at Alton.

2. Financing

The funding of the State portion of the expansion of dental education in the public schools has occurred as part of the annual budget review and recommendation process. This method of budgeting is recommended to continue.

Recommendation 2: The necessary State of Illinois funds for completing the expansion of dental education in the public dental schools should be provided through the usual budget review and appropriation processes.

State of Illinois financial support for the private dental schools has been made by the use of formula grants for capital expenditures and for annual operating expenses. The grants have been made in recognition of commitments by these schools to enroll specified levels of Illinois resident students:

It is recommended that the State of Illinois continue to provide annual operating grants to offset partially the costs of dental education in the private schools. The contribution of these schools to the production of dental manpower for Illinois has been substantial. The private dental schools have come to depend

increasingly on State financial support. To withdraw such support now could seriously impair their financial stability.

The recommendation for providing State grants for annual operating support via a formula based on total Illinois resident enrollments is consistent with Recommendation 1 to stabilize enrollments at currently projected levels. The recommended level of support is approximately one-third of the annual cost of educating a dental student, as calculated by the Institute of Medicine.

Recommendation 3: The private dental schools should be awarded an annual operating grant of \$3,000 per Illinois resident student. The total number of Illinois students to be used in the computation should not exceed that number which will result in the graduation of 81 Illinois resident students per year at Loyola University and 31 Illinois resident students per year at Northwestern University. The formula amount should be reviewed annually and adjusted, as appropriate, for inflationary increases.

### 3. Minority Enrollments

The number of ethnic minority students enrolled in the State's dental schools has increased from about 30 to about 100 since 1969-70. While this increase is substantial, less than 7 percent of the total enrollments are students from various minority groups, as compared to an Illinois non-white population of about 17 percent. The State's dental schools should continue to increase

ethnic minority enrollments with the goal being a mix of students reflecting the mix in the Illinois population.

Recommendation 4: Affirmative action efforts in each dental school should be continued and expanded. Each school should attempt to enroll and retain a student mix which ethnically and geographically reflects the population base from which it draws its Illinois students.
