ABSTRACT

The general purpose of this study was to gain information from the 1970 U.S. Census on the social and educational characteristics of rural Appalachian families with preschool children so that effective programs could be planned to meet their educational needs. More specifically, the data were needed to determine if Appalachia Educational Laboratory's Home-Oriented Preschool Education Program (HOPE) was a feasible way to meet these needs. Information was gathered on a number of variables, including educational characteristics of parents and their children, occupational and income characteristics of families, availability of telephone and television, housing characteristics, and other demographic information such as race, sex, and mobility of the population. Procedures used in the study are described, and more than 60 tables of data are included. (MS)

Description of the Survey

The Appalachia Educational Laboratory has long been identified with home-based educational programs. As long ago as 1966, the Laboratory was advocating home-based early childhood education as an alternative to conventional classroom instruction for three, four, and five year old children. The Laboratory has more recently launched a national "Television for Effective Parenthood" program through an arrangement with the U. S. Office of Education. The concept of developing the home as an educational institution has now become a national movement and has many advocates.

In spite of a substantial national history of involvement with home-based education, there is little demographic information available concerning the families of young children. As of the Spring of 1974, the staff of the Laboratory felt that most Appalachian parents were pretty well educated, owned television sets, and had sufficient means of transportation, but the staff had difficulty in convincing educational planners, mostly from outside the Region, that the area was anything but a mecca of ignorance and poverty. There was little "hard data" available in a form that could be used for planning educational programs. The U. S. Census Bureau and the U. S. Office of Education had made available information concerning the total adult population of a region, or all the children of a certain age, but no aggregated information about the rural Appalachian families with preschool children could be found.

The general purpose of this study was, therefore, to gain information from the 1970 U. S. Census concerning the families of Appalachian preschool children, so effective educational programs could be planned to meet their educational needs, if not also their health and other social needs. The specific purpose was to determine if the Laboratory's Home-Oriented Preschool

Education approach to meeting those needs was feasible given the educational occupational, communications, and housing characteristics of the population.

Home-Oriented Preschool Education

The study of demographic characteristics was made possible through a grant from the National Institute of Education and was an extension of the field testing of Home-Oriented Preschool Education (HOPE). Since much of the information was designed to reflect the feasibility of HOPE, a brief description of that innovation is in order.

As indicated previously, HOPE is a process of developing the home as an educational institution. Educational materials produced at a central location are delivered to parents each week by a paraprofessional home visitor, and the parents convene in small group sessions once each week. The children also meet in group sessions once each week, primarily for socializing experiences and to gain other experiences difficult to duplicate in the home. A central part of the HOPE process is a daily television program, aimed primarily at the children, which delivers basic information into the homes. Questions important to HOPE approached in the study were: Is the television available to a majority of the population? Do the parents have sufficient transportation? Are they sufficiently educated to effectively use printed materials with their children?

Location of the Population

An important aspect of the study is the specific definition of often ambiguous terms such as "Appalachia" and "rural." In this paper, Appalachia is the area contained in 397 counties located in 13 states in or around the Appalachian mountain chain. As indicated in Figure 1, West Virginia is totally included within the region, and the other dozen states with counties

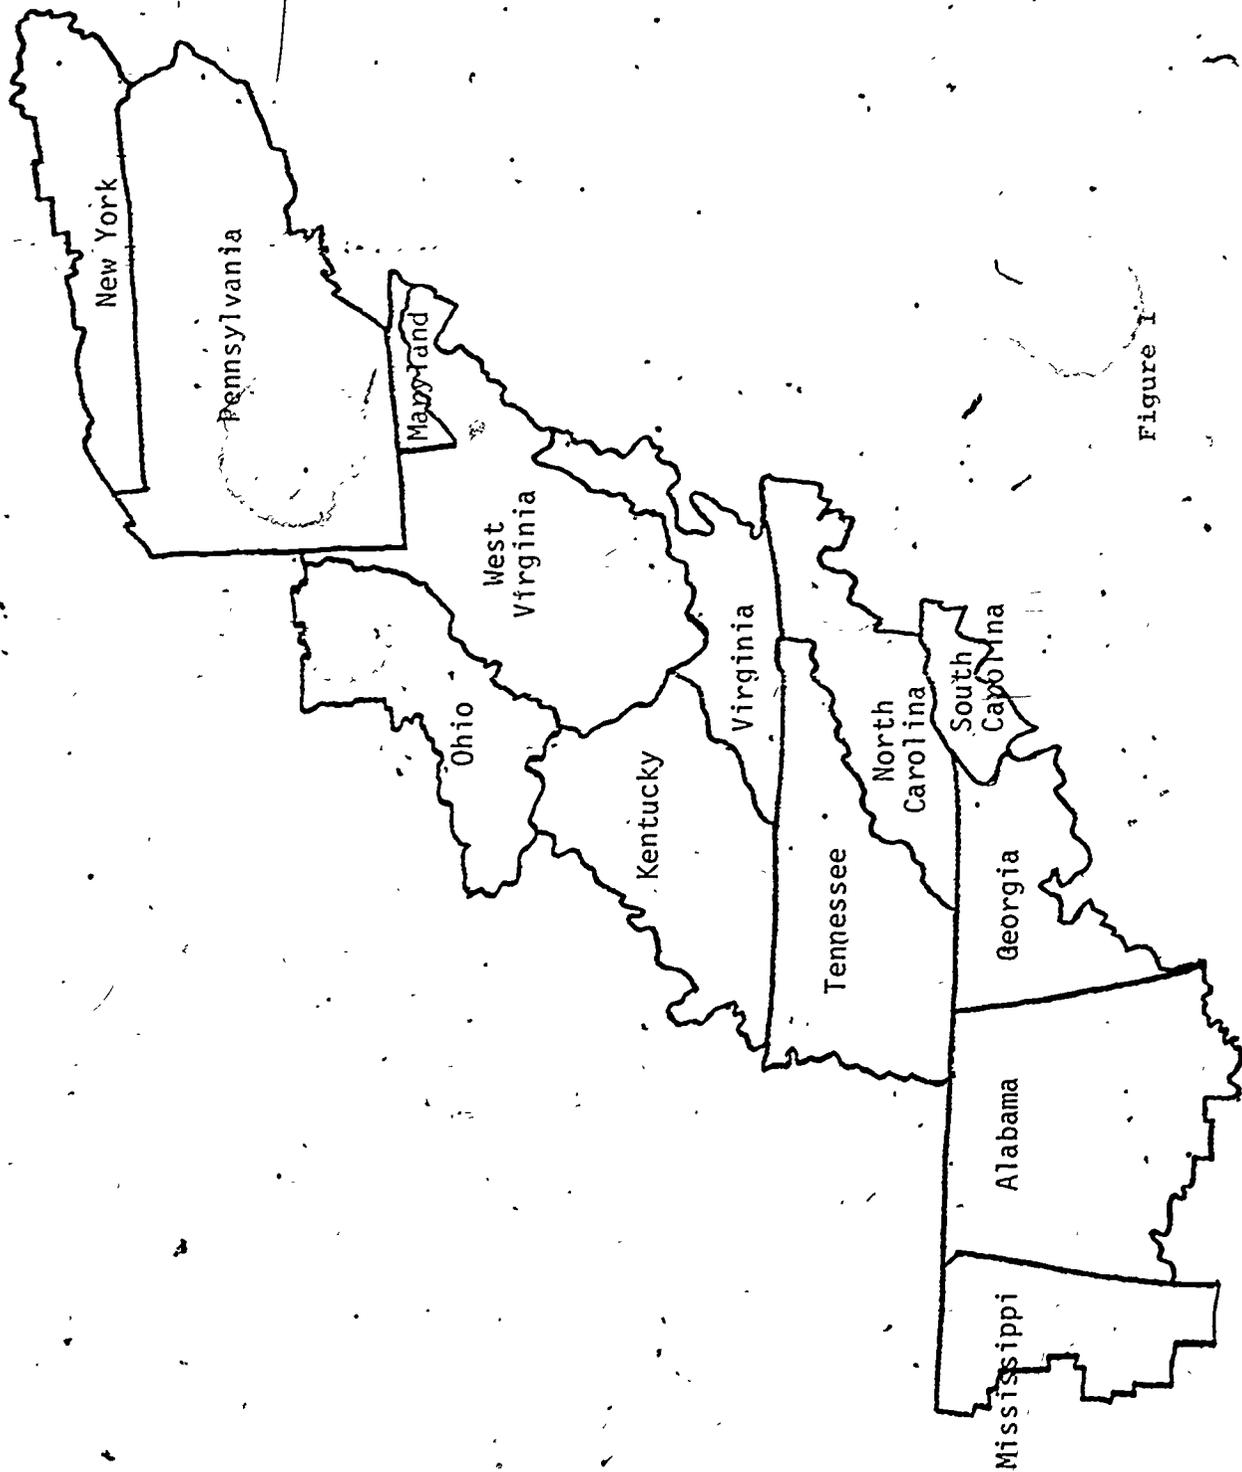

Figure 1

4

in "Appalachia" are Alabama, Georgia, Kentucky, Maryland, Mississippi, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, and Virginia. Appendix A is a state-by-state listing of the 397 counties. This list was established by the Appalachian Regional Commission, Washington, D. C., and serves as a convenient political definition of the Region. Another reason for using the 397 county definition is that these data may be compared with other data collected by the ARC.

The rural, or non-urban population, was defined as all persons living in the Appalachian Region, ~~except those living in cities~~ having a population of 50,000 or greater. This somewhat unusual definition of rural was chosen because the HOPE approach was thought to be suitable for families living in small towns, as well as in more sparsely settled areas. A town of 20,000 in Appalachia is usually considered to be rural, with most of the business and social interactions revolving around rural people and their concerns.

Preschool families included all parents, or guardians, and their children in family units with children between birth and five years of age. The family could include a single parent and child, as well as adults and children living in extended family situations. The age range of birth through two years was not included in the HOPE population, but since the most recent general U. S. Census data available was from the 1970 enumeration, information concerning the families of younger children was considered important for longitudinal study. Those children born in 1970 are coming of school age in 1976.

Since the information in this report is based on an analysis of 1970 U. S. Census data, many other terms have specific definitions. For example, discussion of the exact (and operational) meaning of head of household can get quite involved. The more technical definitions will be added later in

9

the report as required to clarify the meaning of data, but the reader is referred to the 1970 Census Users Guide, prepared by the U. S. Bureau of the Census, for detailed definitions (1970). A more concise set of definitions can be found in the Appendix of the data books concerning social and economic characteristics which are prepared for each state by the U. S. Census Bureau. For example, Appendix B of 1970 General Social and Economic Characteristics, Final Report PC(1)-C50 West Virginia contains an excellent set of definitions, explanations, and a sample of census questionnaires.

Procedure for Obtaining Data

The staff of AEL expended considerable effort in trying to locate information about the population of preschool parents described previously. Most data available from the Appalachian Regional Commission were based on U. S. Census data already processed in a manner such that adult members of families could not be associated with their preschool children, and some sampling areas did not correspond to counties included in the Appalachian Region. Much information was available for total states, but only one state was totally in the Region.

After consulting with the staff of the Appalachian Regional Commission, the U. S. Census Bureau, the National Institute of Education, and a private consulting firm, the only recourse appeared to be a re-analysis and compilation of basic 1970 U. S. Census tapes for each of the 397 counties in the Region. The U. S. Census Bureau was employed to perform this analysis.

The first step was to screen the 67 items on the 1970 Census Questionnaire (1970 Census Users' Guide, 1970, pp. 12-20) for questions which might possibly have implications for educational planning. These items, and possible analyses that might be done with the data from them, were discussed with U. S. Census Bureau staff. Similar discussions were also held with staff

of the Appalachian Regional Commission and the National Institute of Education. A list of individuals who collaborated in the study is included in this report as Appendix B.

The trend was an increase in the number of requested analyses, since each individual had additional insights and desired additional cross tabulations. For example, the relative number of parents owning automobiles in places of different population densities might indicate the ability or inability of the very rural family members to congregate at central locations, so one cross tabulation was the number of automobiles (1, 2, or 3+) against the population of the area in which the family lived, including areas of less than 2,500 population.

Five main areas of interest emerged during the discussions. They were (1) educational characteristics of the parents and their children, (2) occupational and income characteristics of the families, (3) availability of telephone and television, (4) housing characteristics, and (5) a general category which included other demographic items such as race, sex, and mobility of the population.

The 22 variables listed in the accompanying chart were selected as most important to the study. The analysis of data for these 22 variables became the 22 tables appearing in other sections of this report. Similar data were obtained on microfiche for each of the 397 counties and for the aggregation of Appalachian counties in each state of the Region, but presentation of those data is beyond the scope of this report.

Eighteen variables were singled out for cross tabulation, and 42 additional analyses were completed from these. For example, one "cross-tab" was the population aggregation against the availability of television sets. These "cross-tabs" are presented as Tables 23-63 in Appendix C to the report.

*See General Social and Economic Characteristics, pp. B29-B32 for extended definition.

In the following report, the median is frequently used to describe the central tendency of data. The median is the point which divides the distribution into two equal parts, with half of the total number being above the median point and half below the median.

Because the U. S. Census Bureau uses a sampling technique in obtaining data, not all individuals are asked all the questions on the "long" census form (1970 Census Users' Guide, 1970, pp. 21-22). In fact, only five questions are asked of all individuals. As indicated in the accompanying chart, some of the variables are based on five percent of the population, some 15 percent, some 20 percent, and some 100 percent. The data in the tables are therefore estimates of the total population based on the official U. S. Census Bureau sample.

The sampling procedure employed by the Census Bureau introduced a certain measurable amount of variability in the results. The expected variability is small, and a procedure for determining the expected variability (or standard error) of the results for any table is explained in Appendix C of each state data book (e.g., 1970 General Social and Economic Characteristics, Final Report PC(1)-C50 West Virginia). As an example for illustrative purposes, there were 1,081,788 mothers in the (estimated) Appalachian population, and 143,157 or 13.2 percent had at least some college training. According to the above cited reference, the latter, estimated numbers may be expected to vary by as much as 660 (the standard error of estimate) from the "true" number. In this example, the actual count would have a range of no more than 660 persons, two chances of each three times a similar measure was taken. The variation is quite small, usually much less than one percent, but may account for small differences in the tables from time to time.

The Census Bureau also adjusts all data according to certain experience factors which can be applied to improve accuracy. The actual data, even for

100 percent samples, are weighted to improve accuracy. The weighting procedure also accounts for the fact that different analyses may lead to slightly different totals. For example, the number of families was reported to be 1,131,591 (Table 1), while the number of occupied housing units (Table 2), which presumably contained one family each, was 1,132,233, an increase of 642.

This report is based on data obtained from the U. S. Census enumeration of 1970. The analyses were completed by the U. S. Census Bureau on the basic data tapes for each state, since the data were not previously aggregated in a manner such that the population could be identified and described. The Census Bureau imposed safeguards to insure that the confidentiality of individuals was not violated. No names were released by the Bureau, and no data were released in a form that might lead to identification of individuals.

Characteristics of the Population

The characteristics of the families of non-urban Appalachian preschool children are presented in the section in the same order as listed in the previous chart.

According to the U. S. Census Bureau analysis, there were about 1,132,175 preschool families in non-urban Appalachia in 1970. The "about" is because the actual count appearing in the tables is influenced slightly by the census question on which the table is based, and, as described previously, the very specific definitions used for each term in the different tables. As indicated in the following tables, there were 1,081,788 mothers in the population. The mothers are of particular interest in this study since concurrent research studies by AEL indicated that the "person in charge of the child" during weekdays is the mother in 79.7 percent of the cases and the father only 2.1 percent of the time. (A Demographic Survey of Appalachian Parents of Preschool

Children, Shively, 1975, p. 28) Although the home materials should be developed with due consideration for the fathers, the mother is usually the person who would be at home to meet home visitors and use printed materials with their children.

In the following tables, all families have a "household head" by definition. The "household head" may be a father, a mother, or some other person so designated by the census enumerator. "Mother" is the female in the family unit who acts as the mothering one, and the mother may be included as the head of household by the Census Bureau if there is not an adult male acting in that role. In this study, a female appears in both the "head of household" and the "mother" column when the mother is reported to be the household head. The differences between the two column totals (1,132,725 - 1,081,788 = 50,937 or 4.5%) is presumably an indication of the number of family units without the mother present.

Educational Characteristics

The first consideration when planning both adult education and home-based preschool programs should be the current level of education of the adult population. For adult education programs, the level is an indication of current needs, e.g., basic education or advanced training. For home-based preschool programs, the focus of this report, the educational level of the parents or guardians is especially important, since educational planners need to ascertain appropriate conceptual and reading levels at which to prepare materials, and indeed, even if large segments of the population can be expected to understand printed instructions.

As indicated in Table 3, the median years of school completed by both the household heads and mothers was 12.2. In other words, the average educational level was slightly beyond high school graduation. More than

TABLE 3

Median Years Completed	12.2	...	12.2	...

three-fourths of the household heads had at least some high school, and 4.2% had less than a fifth grade education. Only 1.4% of the mothers had less than a fifth grade education, and an additional 2.5% had not attended beyond the sixth grade. These 42,171 mothers (3.9% of the total) might require oral as opposed to written instructions if they are responsible for preschool education in their homes. However, according to the Census Bureau data, at least 96.1% of the mothers could use written materials with little difficulty.

In a separate study conducted by AEL, 20.6% of the 678 mothers in the sample were found to be unable to successfully complete activities written at a second grade reading level (Study of Effectiveness of Materials for Appalachian Parents, Shiyely, Bertram, and Hines, 1975, p. 12). According to the Census Bureau, 14.6% of the mothers had not completed eight grades of school, so the conclusions of the previous AEL study might bear further investigation.

The degree to which the educational needs of young children are currently being met was determined by a second analysis. The number and percent of children of ages three through five who were in different kinds of formal education programs is given in Table 4. Incidentally, these data would have changed more since they were collected in 1970 than any other data in this report, since several of the states have launched or accelerated extensive kindergarten programs.

Of the 837,890 three, four, and five year old children, only 134,827 or 16.1% had been enrolled in some type of program. Most of these (78.6%) had attended kindergarten and the remainder (21.4%) had been enrolled in a nursery school. Since there were 293,329 five year olds in the population, only about one-third (36.1%) of the available children had attended

TABLE 4

Number and Percent of Children (3-5) Enrolled in Presthool
Education by Level and Type of School

	Number	Percent
Total Children	837,890	
Total Enrolled	134,827	16.1
<u>Nursery School</u>	28,894	21.4
Public	12,568	43.5
Parochial	888	3.1
Private	15,438	53.4
<u>Kindergarten</u>	105,933	78.6
Public	85,257	80.5
Parochial	3,018	2.8
Private	17,658	16.7

kindergarten. The number of three and four year olds attending some type of formal education was 28,894, or 5.3% of the available children.

According to the data in Tables C24 and C25 (i.e., Appendix C, Tables 24 and 25), the children of professional level and higher income heads of household tended to have a much better chance of having attended kindergarten or nursery school. The range in percentage enrollment was from 28.9% for professional workers to 9.2% for farm laborers and farm foremen. According to Table C25, less than 10% of the children of household heads with salaries of less than \$4,000 per year attended kindergarten or nursery school, contrasted with a 38.3% attendance rate for the children of those who made \$25,000 or more per year. Also, the children of more highly educated parents attended preschool programs more frequently (Table C26), and the children of household heads who were 26 years of age or older had a better chance of having attended (Table C28). There was little difference in preschool attendance according to whether the head of household was black or white (Table C29), but children living in urban areas were more often found in nursery schools or kindergartens. According to Table C53, 23.7% of the children in places of 10,000 - 49,999 attended nursery school or kindergarten, contrasted with 20.0% in places of 2,500 - 9,999, and only 13.4% in places of less than 2,500 population.

The three categories of formal education were public, parochial, and other private schools. For kindergarten, 80.5% of the enrolled children attend public schools, but 53.4% of those attending nursery schools were in privately sponsored schools and only 43.5% attended public nursery schools (Table 4):

In summary, the data presented in Table 4 indicate that a large majority of three, four, and five year old Appalachian non-urban children were not receiving any formal training. In 1970, there were more than

700,000 children at this very formative age who did not participate in any educational program.

Occupational and Income Characteristics

The heads of household were partitioned into twelve occupational categories plus an "unemployed" classification (Table 5), and most of them were employed (87.8%). More of the heads of household were craftsmen and kindred workers than any other category (22.1%), and only 1.0% of the Appalachians were farm laborers or farm managers. The second largest occupational category was "operative, except transport" (18.7%). The two classifications with the most employees, craftsmen and operatives, undoubtedly include many persons in the manufacturing and mining industries of Appalachia. Of the total heads of household, the percentage of employed (87.8%) plus unemployed (3.1%) add to only 90.9%, therefore, 9.1% were considered not in the labor force, perhaps because of age, disability, or other reasons.

The relative number of disabled or handicapped adults in the Appalachian families of preschool children may be an indication of the general welfare. In the Region, 8.7% of the household heads and 4.1% of the mothers were considered to be disabled or handicapped (Table 6). In comparison, 12.4% of the national population were disabled or handicapped.

The planners of home-based educational programs should be concerned with the relative numbers of mothers and/or household heads who are employed outside the home. As indicated in Table 7, of those 275,214 mothers who were employed, 43.3% worked at least 50 weeks per year. Since there were 1,081,788 mothers reported in the census (Table 3) and 275,214 were employed, 25.4% of the mothers were employed during 1969, the criterion year for the 1970 census. However, 18.7% worked more than 26 weeks during 1969.

13 or Less	10,309	1.0	33,501	12.2
Median Weeks Worked	50.7	...	46.7	...

The median family income for the young families was \$6,689 per year, and 21.7% of the families made less than \$4,000 (Table 8). At the higher end of the distribution, 18.2% of the families made \$10,000 or more per year. Most of the income was acquired by the heads of household, since their median income was only two dollars less than the median family income. A majority of the mothers (70.2%) made less than \$1,000 per year.

The educational planners were particularly interested in the type of income and the proportion of the population below "poverty level." According to Table 9, the mean income of those families which had any income was \$8,441. Since many of the families had more than one type of income, the mean income for individual categories of income may be somewhat misleading. Most of the families had a member with wage and salary income (92.8%), and may have also had a member with another category of income. Most of the household heads and mothers who had any income also earned that income through wages and salaries. From Table 9, 4.0% of the household heads and 6.7% of the mothers gained income through public welfare, and members of 6.4% of the families drew social security payments.

As might be expected, those with higher incomes were also (1) better educated (Table C37), (2) of the professional or managerial occupational ranks (Table C35), (3) had three children per family (Table C40), (4) had three or more automobiles per family (Table C43), (5) had a flush toilet (Table C44), (5) lived in a house with six or more rooms (Table C45), (6) had older children (Table C46), (7) lived in more expensive houses (Table C50) or paid higher rent (Table C51), and (8) lived in larger towns (Table C56). The progression of median income figures in the cited tables in Appendix C is often revealing and a convenient way to interpret the data. For example, in Table C37 the progression of median family income from the category "no

schooling" through the elementary and secondary school categories to the highest levels of college education completed is as follows: \$3,617, \$4,363, \$5,353, \$5,880, \$6,374, \$7,078, \$8,229, \$9,191, \$11,940, and \$12,890. Each step in the educational ladder is accompanied by an increase in income.

As indicated in Table 1, 16.6% of the families were below low-income or "poverty" level.* For 1970, the range in poverty level income for the total country was from \$1,512 to \$6,116 (1970 General Social and Economic Characteristics, Final Report, PC(1)-C50 West Virginia).

Television and Telephone

Of primary importance to the study was the proportion of the population which had access to television; and the geographical location of the television availability. According to Table 2, 96.7% of the families of Appalachian preschool children had a television set in their home, and 20.9% of the families had two or more sets. UHF was present with almost half of the families. This is a much higher rate of television ownership than has generally been acknowledged, and the proportion has probably increased since the time of the 1970 enumeration.

As of 1970, 36,821 of the families living in "occupied housing units" did not have a TV set. Other AEL research has indicated that about 43.3%, or 15,943 additional Appalachian families could conveniently watch a TV program with a neighbor (A Television Survey of Appalachian Parents of Preschool Children, Shively, Bertram, and Hines, 1975, p. 10), so only about 1.8% of the Appalachian families could not have access to a pre-planned and announced television program such as with Home-Based Preschool Education. Nevertheless, other arrangements would be required for the 20,878 children

*This actual level varies according to family size and other criteria, but is generally determined to be a basic subsistence level of income.

who do not have access to TV. Perhaps educational radio or personal visitation should be considered.

The occupational group of families which has least access to TV is the farmers and farm managers (89.2% with TV, Table C30), and that is probably because they live in rural areas. There is a direct relationship between television ownership and income (Table C31), but the range is less than 13%; from 85.8% with less than \$1,000 per year to more than 98% at the higher income levels. There is also a direct relationship between television ownership and years of school completed (Table C32), but the range is even less than with income categories.

There is a direct relationship between the number of children in the family and the rate of television ownership, but except for one category, the range is less than eight percent, from 90.5% through 97.4%. The exception is that for families with ten or more children, the rate of television ownership is only 85.7%. Otherwise, families with greater numbers of children are more likely to have TV. There is also only a small difference in television ownership among different racial groups. According to Table C34, 94.2% of the Negro families and 96.9% of the white families own television sets.

The HOPE planners were also interested in telephone availability since many of the personal contacts with family members can be made by telephone. Surprisingly, only slightly more than three-fourths of the families possessed a telephone (77.6%, Table 10), and there was considerable variability from region to region. For example, only 52.5% of the families of preschool children in the Appalachian portion of Kentucky have telephone service, and the rate is as low as 18.3% for one county. Those contemplating home-based programs should not necessarily depend on telephone service, and incidentally, the credibility of telephone surveys in rural areas can be questioned since they would tend to undersample in sparsely settled areas.

TABLE 10

Number and Percent of Occupied Housing Units
by Availability of Telephone

	Number	Percent
Total Housing Units	1,132,725	100.0
Telephone Available	879,245	77.6
No Telephone Available	253,480	22.4

In summary, television is available to the population, and generally available to different economic, occupational, and racial groups. In contrast, telephone service availability tends to vary considerably from region to region within the total Appalachian Region.

Housing Accommodations

The housing characteristics are not as central to educational planning as some of the previously considered variables, but selected housing characteristics can at least give an indication of the living accommodations which HOPE home visitors might expect to encounter. There are numerous questions concerning housing on the survey form and the unit of analysis is the "housing unit," which is generally the living quarters occupied by a family unit, as opposed to a dwelling which might contain two or more families.

As indicated in Table 11, most of the housing units had five or more rooms. According to Table C48, there is a direct relationship between the number of rooms in the family residence and the number of automobiles, but there was only a slightly positive relationship between the number of rooms and the size of place in which the people lived (Table C59). The small houses are not necessarily just in the rural areas or just in the cities. For example, 47.2% of the families in the places of 10,000 to 49,999 population lived in houses with six or more rooms whereas 40.5% of the families in places of less than 2,500 lived in the larger houses.

From Table 11, 11.7% of the families lived in houses with no flush toilets, which is also an indication that "running water" and sanitary sewage disposal may not have been available. Most of the families (79.7%) lived in single unit structures, and 8.8% lived in mobile homes. More of the owner-occupied housing units were valued at \$10,000 - \$15,000 than any other category, and 23.4% were valued at less than \$7,500 (Table 12). Of those who

rented their living accommodations, most paid between \$40 and \$79 per month, although 21.8% paid less than \$40 per month (Table 13).

Other Demographic Variables

Several additional items of data concerning the Appalachian families were tabulated. These items are descriptive of the roles of individuals within families, social characteristics, mobility of the population, size of families, and other miscellaneous items.

As shown in Table 14, 92.8% of the heads of households were male and 7.2% were female. As indicated previously, there were 1,081,788 mothers. In Table 14, a "primary individual" is an unrelated head of household living with one or more children less than six years of age.

There were 1,611,030 children in the population. The decreasing birth rate seems to have become somewhat attenuated since the fewest number of children were two years of age and the largest number were five years old.

The racial composition of the population is indicated in Table 15. Of the 1,050,407 male household heads, 95.5% were white, 4.3% were Negro, 0.1% were Indian (native Americans), and 0.1% were of other races. The racial groups other than Negro and white were included in the tabulations, but are not elaborated upon extensively in this report since they were represented by so few individuals. Almost one-fifth of the female household heads were Negro, and the racial distribution of the mothers is about the same as the male heads of households. Of the 1,611,030 children, 93.3% were white and 6.5% black.

The population of household heads and mothers was rather mobile. As indicated in Table 16, 17.6% of the heads and 19.2% of the mothers were born outside their state of residence in 1970. A few more of the mothers than household heads were born out of state, possibly because household heads

tended to have married females from out of state and then returned to rear a family. The figures are particularly significant since much of the Region is an area in which the rate of out-migration historically has tended to slightly exceed the rate of in-migration although the flow may have been reversed more recently.

According to Table 17, only slightly more than one-third of the household heads (36.9%) lived in the same house in 1970 and five years previously. An additional 38.6% lived in the same county but in a different house. This would appear to indicate a fairly high migration rate and might be a concern for those planning home-based educational programs; however, the families were young and many of the couples may have not been married five years previously. About one-seventh (14.6%) of the household heads had lived in a different state five years previously. There appeared to be little relationship between types of employment and migration rates (Table C49), although farmers and farm managers seem to have moved more frequently than other groups.

Most of the households with a three to five year old child had only one child of that age in the family (83.3%, Table 18) and only 15.4% of the families had two children of that age. Therefore, educators should expect only one child of ages three, four, or five in each family, and only occasionally find two children of that age.

As for total family size, many families contained four persons (28.4%, Table 19), and almost that many families had three persons (23.6%) and five persons (20.2%). These figures do not necessarily represent the median family size in Appalachia, since families with at least one preschool child are more likely to have additional births than are older families, and other families may not have any children. Families with a total of three children

tend to have higher incomes, probably because they have older wage-earners than families with fewer children, and the median family income tends to decrease according to the number of children from four through eight or nine children per family, and then increase slightly for families with ten or more children (Table C40). As expected, families with more children tend to have older household heads (Table C41). As shown in Table 20, more than half of the mothers had borne one (26.6%) or two (27.6%) children.

According to Table 21, 7.3% of the families do not have an automobile and at least that many would need transportation to a central location if group sessions are conducted. Of course, many of those without automobiles might be transported by neighbors. Those families without an automobile tend to have less income; in fact, the median annual family income is \$3,493 for those without an automobile compared to \$8,083 for those with one (Table C43). There is a fairly strong direct relationship between the number of automobiles owned and the number of rooms in the residence (Table C48), although those families with no automobiles tend to live in houses with at least four rooms. Interestingly, three-fourths (74.7%) of those who own three or more automobiles live in rural areas of less than 2,500 population, whereas only 58.3% of the families without any automobiles live in the very rural areas (Table C58). There is a tendency for those without automobiles to live in the larger towns.

As should have been concluded by this time, the population was essentially very rural in nature. As shown in Table 22, 68.0% of the population lived in areas of less than 2,500 population, and another 15.0% lived in small towns of less than 10,000. However, the fact that the family was classified as "not in a place" by the Census Bureau is no indication that the people lived in isolated areas. The "non-place" may have been three miles outside the Pittsburgh city limits.

Characteristics of State Populations

As indicated previously, Appalachia as defined in this report includes portions of 13 states. The following comparisons are given as an indication of the degree to which specific sections of Appalachia differ from the total description previously presented in this report. Also, the regions of the states included in Appalachia are not necessarily representative of the total state.

Ten data items were selected for comparison across the 13 states. The totals for the Appalachian counties in those states are shown in Table 22-A. The median household heads' educational level varied from 9.0 years of school completed in eastern Kentucky to 12.5 years in western New York. The mothers varied similarly, but thus appeared to have completed more years of school in some states. The reason that this difference failed to show up in the Region totals is possibly due to the method of computation. The five states with higher median years of school completed were New York, Pennsylvania, Maryland, Ohio, and West Virginia, and the five states with a lower median were Kentucky, Virginia, Georgia, Mississippi, and North Carolina.

The range in the proportion of children in preschool education programs was from 5.6% to 28.2%, and similar inter-Region trends were apparent. The states with the largest percentage of three, four, and five year old children enrolled in kindergarten or nursery schools were New York, Pennsylvania, Maryland, and Mississippi, while the states with a lower percentage were Kentucky, West Virginia, Virginia, and North Carolina. To repeat from a previous section of the report, these data were collected in late 1969 and most states have greatly accelerated their early childhood education programs, so the current validity of the comparisons may be

Highest figures have an asterisk () and lowest are underlined.

questioned. However, these comparisons can be made from Census Bureau statistics, and should be updated as new data become available because they do indicate a need for educational programs.

There were differences in the economic characteristics, but they were not quite as noticeable as the educational differences. The range in the percent of employed household heads was from 92.8% to 75.3%. South Carolina, Georgia, North Carolina, and New York had the highest employment rate, and Kentucky, Mississippi, and West Virginia had the lowest employment percentages. The percent of disabled heads of household ranged from 15.6% to 5.0%, and the range of disabled mothers was from 5.6% to 2.9%. Kentucky and West Virginia had more disabled persons, whereas Maryland and Pennsylvania had fewer disabled. Strangely, in proportion to the total group, more of the mothers than household heads in South Carolina tended to be disabled, while in Virginia, far more of the household heads than mothers tended to be disabled or have handicapping conditions.

The median family income in the lowest income state was \$4,685, or 61.7% of the income in the highest income state. The states with higher median family incomes were Pennsylvania, New York, Ohio, Maryland, and West Virginia, or roughly the northern half of Appalachia. The lower income states were Kentucky, Mississippi, North Carolina, Virginia, and Tennessee. The states with lower median family incomes generally tended to also have a greater percentage requiring public assistance or welfare, although North Carolina and Virginia had fewer on welfare and a lower median income, while Pennsylvania and West Virginia had more families on welfare and a higher median income. This finding may be somewhat misleading because of high within-state variation in the general economic conditions of the families in the latter two states, i.e., the rich may be richer and the poor poorer.

Again, there was little deviation among states in the percent of families that possessed a television set. Except for eastern Kentucky's 91.8% television ownership rate, all other states were above 94.5%. In general, all of the states have a sufficient proportion of families with television facilities to warrant implementation of home-based education through TV.

The most rural areas were the Appalachian sections of North Carolina, Kentucky, Virginia, and Georgia, all with more than 79.0% of their families living in places of less than 2,500. The states with fewer families in rural areas were Pennsylvania, Maryland, New York, Alabama, and South Carolina. The states with sections more nearly located in central Appalachia tended to be more rural with one notable exception. West Virginia, which is entirely within the Region, was near the median, so far as the number of young families living in very rural areas was concerned.

The states with the greatest numbers of young children were Pennsylvania, Alabama, and West Virginia. One point frequently overlooked is that Pennsylvania has a greater number of children living in Appalachian counties than any other state.

As a general summary of the state-by-state comparison, a procedure was used by which each state could be given a number representing the general educational and economic welfare of the families of preschool children. From Table 22, items 1, 2, 3, 5, and 8 were considered to be positive indicators of the general welfare, items 4, 6, and 7 were considered negative, and items 7-12 concerning racial distribution, numbers in rural areas, number of children, and number of counties were considered not to be indicative of general welfare. There were, thus, ten indicators since some of the items had two parts, and the states were marked as being conspicuously high

or low on the different indicators as illustrated in Table 22-B. A scale with a possible range of 21 points (-10, 0, +10) was therefore formed and the states were placed on the scale (Table 22-B). One may question the selection of indicators or the selection of most conspicuous extremes, but the procedure provides a distribution not far from any possible logical interpretation of the state-by-state 1970 Census data. Such a procedure may provide useful information for use by educational planners.

According to available data, the families of preschool children residing in the Appalachian sections of Maryland, New York, and Pennsylvania have more opportunity than similar families in other sections of Appalachia. In particular, they have completed more years of school, have fewer disabled or handicapped adults, higher family incomes, fewer families with below-poverty level incomes, and a higher proportion of young families with television availability. The Appalachian children with fewest advantages live in mountainous sections of Kentucky and Mississippi, and to a lesser degree in Virginia, Georgia, and West Virginia. Families in the Appalachian sections of those states have completed fewer years of formal schooling, have lower employment rates for heads of households, more disabled or handicapped adults, lower median family incomes, and more families on public assistance, welfare, or below poverty-level income. In other words, as of 1970, the need for educational improvement was great in these states, and although conditions undoubtedly have improved since the last decennial census, the educational needs highlighted in this part of the report are yet to be met especially in the designated sections of the Region.

TABLE 22-B

General Welfare of the Families of Appalachian
Preschool Children in Each of 13 States

State	Rank	Value of Indicator	No. of Children
Maryland	1.5	+8	20,618
New York	1.5	+8	102,167
Pennsylvania	3	+7	482,294
Ohio	4.5	+4	115,217
South Carolina	4.5	+4	62,200
Alabama	7	-1	165,821
North Carolina	7	-1	85,050
Tennessee	7	-1	146,363
West Virginia	9	-2	156,371
Georgia	10	-3	91,619
Virginia	11	-4	46,337
Mississippi	12	-8	45,517
Kentucky	13	-10	91,456

Summary

As a means of summarizing the information contained in the report, a typical Appalachian family of 1970 is described in the following paragraphs. Certain misconceptions may be introduced by assuming that all families with preschool children resemble the typical family which is assembled from the measures of central tendency, but the alternative procedure of repeating a long string of most important percentages seems less useful.

The year is 1970. Tom and Mary Jones live in a West Virginia community of less than 2,500 near the Pennsylvania border. Tom is about 32, healthy, employed, and works full-time as a craftsman. His income is \$6,689, and since Mary does not work, that represents their total family income. Both Tom and Mary have completed high school. They were born in West Virginia, in Wetzel County, and moved into their present house three years ago. Their house has six rooms, indoor plumbing, and is a single unit structure valued at from \$10,000-\$15,000. Tom and Mary own one automobile, and are not presently considering a second car.

Young Timmy Jones is four years old and does not have an opportunity to attend kindergarten, since only some of the children in the larger towns have an opportunity to learn in an institutional setting. Of course, Timmy can watch Sesame Street, Kaptain Kangaroo, and Misterogers's Neighborhood, since his parents have a television set.

The other member of the family is Jeanie Jones, age two, and beginning to absorb and learn from the many experiences mountain life can offer. Tom and Mary have not placed Jeanie in a part-time nursery school where she might learn certain social and perceptual motor skills, and develop a readiness for the complexities of regular school. No nursery schools are available; neither are any other means of obtaining these skills available to Jeanie and Timmy Jones.
