A BS TRACT

This publication is an annual catalog of abstracts of research reports published by the institutes of psychology and education at teacher training colleges and universities in Sweden, complete to June 1, 1976. The reports are grouped into twenty-seven broad subject fields according to the rules of PSYCHOLOGICAL ABSTRACTS and EUDISED THESAURUS. Abstracts contain: (1) author's name; (2) institutional source; (3) title; (4) bibliographic reference; (5) project title; (6) key descriptor vords; (7) abstract: (8) publication date; (9) pagination; (10) language of report; (11) report status; (12) degree requirement information; and (13) research sponsor. The survey is indexed by author, subject, and institution. The subject index is based mainly on the BUDISED THESAURUS and the THE SAURUS OF PS TCHOLOGICAL INDEX TERES, with the ERIC THE SAURUS as a supplementary reference. (M.B)

Documents acquired by ERIC include many informal unpublished * naterials not available from other sources. ERIC makes every effort * * to obtain the best copy a vailable. Nevertheless, items of marginal * reproduct bility are often encountered and this affects the quality * * of the microfiche and hardcopy reproductions ENIC makes available * * via the ERIC Document Reproduction Service (EDRS). EDRS is not * * responsible for the quality of the original document. Reproductions * * supplied by EDRS are the best that can be made from the original.

INTRODUCTION

The present volume of the Swedish Behavioural Science Research Reports was prepared by the National Library for Psychology and Education, Sweden. Financial support was added by the Swedish Council for Social Science Research. The collection of data was completed on June 1, 1976.

Contributing institutions are responsible for the selection of the reports.

The reports are grouped into broad subject fields according to Psychological Abstracts and EUDISED Thesaurus. Subject fields containing less than two reports are brought under the heading Miscellaneous.

The survey is indexed by author, subject, and institution. Subject index is based mainly on the EUDISED Thesaurus and the Thesaurus of Psychological Index Terms. The ERIC Thesaurus has been used as a completion.

Additional copies of this survey can be obtained from

The National Library for Psychology and Education P.O. Box 23099 S-104 35 Stockholm

Title: The telephone as an instructional aid in distance education. A survey of the literature. Bibliographic reference: Pedagogical Reports, No 1, Lund 1975.						
Two-way comm	Title of project: Two-way communication in correspondence education. Key words: Distance education, telephone instruction, adult education.					
Abstract: In the report the concept of distance education is analyzed and defined. The main part of the report presents a survey of the literature concerning the use of the telephone in education. Four different ways are pointed out where the telephone is used either as a substitute for other instructional forms or as a supplement to conventional instruction, such as classroom instruction, correspondence instruction. The four modes: teleteaching, telelecturing, dialaccess, and teletutoring, are presented on the basis of previous research carried out.

Brigging at the court but kerkerch Author: Inst. s Department of Psychology University of Stockholm Berglund, Birgitta, Berglund, Ulf. Bo-x 6.706 & Lindvall, Thomas 8-113-85 Stockholm, Swedin Title: On the evaluation of community odors with sensory methods. Bibliographic reference: Verunreiningung der Luft - mit organischen Verbindungen, Lösemitteln und Geruckst offen. Stockholm: IVA -rapport 78, 1975, pp. 45-56. Title of project: Key vords: Measurem ent, Environment, Perception, Hygiene, Abstract: This paper discusses the relevance of the odor criterion for community health and measurement of factory odors at the source and in the ambient air. The annoyance reactions to malodors are assumed to be dependent on the perception of these odors. The perception itself may be influenced by , e.g., the perceived strength, frequency and duration of the odors, transients of concentration and the adaptive state of the observer. At present no modelisa vailable that handles the comjoint effect of these factors. As lorg as the relationship between the exposure conditions and the perceptual effects in the individuals is unknown, it is important that the dose is expressed in a way that is related to human responses. Sensory measurements at the source are often simple and straight forward provided mobile odor laboratories are available. In combination with suitable atmospheric dispersion calculations, prognoses may be made of both frequency and strength of odor events in the ambient air. For direct ambient analyses, the number of available sensory (and chemical-physical) techniques are limited because of practical reasons.

Author: Borg, G, Edgren B, & Noble, B Title: Effects of physical conditioning on perceived exertion and working capacity Bibliographic reference: Reports from the Institute of Applied Psychology, the University of Stockholm, 1975, No. 63 Title of project: Effects of physical conditioning - a project within the AIP-programme

(AIP = arbets- och idrottspsykologiska forskningsprogrammet)

Physical fitness, physical performance, physical training

Abstract:

Key words:

For two months conscripts were exposed to a conditioning programme consisting chiefly of running. For the study of training effects, a battery of tests on a bicycle ergometer was carried out before and after the conditioning programme. The levels and the changes in perceived exertion were analyzed in addition to physiological and performance variables. The analysis revealed training effects in all variables measuring aspects of endurance fitness. The quantitative changes differed between variables. Group homogeneity seemed to play a part in the training effect, which supports the general opinion that individuals respond differently to training. There is probably specificity, depending both upon what training programme is used and upon what test is applied to measure the effect of training. For some variables there seemed to be qualitative differences between the changes, illustrating the complexity of training effects.

Title of project:

Den högre utbildningens roll i individens utveckling. (The role of higher education in the individual s development.)

Key words:

Vocational choice, educational choice, career choice, higher education, high school, cost-benefit analysis, cost-reward analysis

Abstract:

The study consists of a theoretical and an empirical section. In the theoretical section, cost-benefit analysis was discussed as a model for the individual's educational and vocational choice. The traditional, strictly economic model was analyzed and criticized. A psychological-economic alternative was proposed. based on the individual's perceptions and expections regarding costs and benefits. As a third step, a purely psychological cost-reward model was suggested. This model was tested in the empirical section of the study, in which psychological cost, benefit, and profit scales were constructed on the basis of question naire data from approximately 400 high-school students. The analyses showed that there was a clear, positive relationship between psychological benefit-profit and level of aspiration for higher education. This was regarded as an indication of construct validity for the psychological components. Further, groups with differing career choices (further education vs start working) after high school differed markedly im psychological cost-benefit-profit. Thus, the model showed high predictive validity with respect to career choice, which was also illuminated by by a probability analysis. Further empirical analyses showed that psychological cost and reward were meaningsfully related to two other aspects of the individual's career choice. In all analyses, the results were more pronounced for boys than for girls.

utrymr dual «	utrymmesdimensionerande offekt. Study of movement behaviour as an individual characteristic and its effect on spatial dimensions. BFR 730062-0.					
Key words: Space requirement, movement behaviour, description system,						

Abstract: A previous analysis of individual characteristics which are relevant to the determination of functional measurements, an inventory of aviable information regarding the respective characteristics and empirical measurement studies have together with empirical measurement studies indicated thet there existed add ${f i}$ tional variables of description which are of importance. One of them is a persons invidual way of moving - movement behaviour. This qualitative variable is to be considered as an individual characteristic which should be described and quantified to be put in relation to other characteristics and functional measurements. A verbal description of movement behaviour constitutes the basis of a descriptive and classification system for movement behaviour. Through a rating stydy of filmed examples ϵ^{\pm} different forms of movement behaviour, which were judged by a number of subject, the assumption was confirmed that movement behaviour contains certain dimensions, by the help of which such behaviour can be described. The dimensions can be gratuated accordning to intensity and thereby given a quantitative value. By transforming the qualitative variable into a quantitative, it is possible to relate movement behaviour to other individual attribute and to functional dimensions.

Trötthet i t	ratiken			,
Key words: Behaviorth	nerapy, fati	gue, driving		
Abstract: A case of fatigue in driving was analysed. It was shown that the subjective feeling of fatigue developed parallel to a chain of overt behavior (stimuli and responses). The treatment consisted of an attempt to break up this chain of responses as early as possible. Furthermore a controlling response was trained in imagination (c.f. systematic desensibilization).

Key words: Fatigue, dr	riving, person	ality,reaction	time, heart-ra	te, car-radion	
Abstract: An attempt to counteract performance decrement in longterm car driving was undertaken. 12 subjects drove 4 hours in each of the three conditions, music, talk, and a silent control condition. Reaction time and heart-rate were recorded during driving. There was a significant main effect of stimulation on time on task and personality (Eysenck Personality Inventory) and drivers experience. Extroverts benefited more from stimulation than experienced. Heart-rate had no functional connection to neither of the above mentioned factors. The results are explained in the framework of an arousal theory and contrasted to a fatigue interpretation.

Key words:				
Physical Act	civiti es, Recre	ational Activi	ties, Sport A	ctivities.
Abstract:				i
39 subjects who hadn't been active in leisure time sports were recruited in order to examine the effects of regular sport-activity. One half of the participants were active in outdoor sports and the other half had indoor sports. The sport-activities were leaderled and were carried out twice a week during an eight month period. Three women and three men gave up participating in the regular and leaderled activity. The oxygen uptake of the participants were increased on the average with 20 per cent with the largest increase occuring during the first three months. Women with outdoor activities had the largest increase of all. One fourth of the participants stated that their sleep had been better and about one half that they had felt less stressed and more relaxed as a consequence of the physical activity. In spite of this the regular activity decreased very markedly during the period September 1974 - May 1975 compared with the regular physical activity period in 1973 and 1974. As reason for the non-activity many persons assigned the loss of leaders and training companions. It is stated in the study that one year of schooling in physical activity is insufficient to create an "internal" need or motive for physical exercise. Methods used in the collection of data were tests, interviews, observations and questionnaires.

Two aspects of job content are shown to be of critical importance for the satisfaction of basic human needs at work. These are the degree of discretion given to the individual to determine pace and working methods and the possibility to use a variety of human resources in the performance of work. Workers whose jobs are severely circumscribed in these two respects are shown to react with strain and feelings of monotony and with different signs and symptoms of impaired mental health. Mechanisms of adaptation tend to be characterized by passivity, non-participation and withdrawal of human resources. They may or may not be combined with symptoms of ill-health but appear to come into conflict with values in the larger society related to active participation in democratic processes in working life. It is concluded that the problems of monotony and stress in industrial work call for an organization of work that widens the scope for self-determination, democratic participation and leadership and the exercise of occupational skill.

Title of project: Stress reactions to overstimulation and understimulation
Key words:

Monotony, overload, stress, psychosomatic disorders

Abstract:

Social psychological theory on relations between production technology and work satisfaction was combined with arousal theory based on psychophysiological stress research in a study of workers in a highly mechanized production industry. A group of workers whose tasks were characterized by repetitiveness. physical constraint, machine-regulation of work pace and high demands for continuous attention (risk group) was compared to a control group who performed their work under less monotonous and more flexible working conditions. Both groups were studied at work and during free hours with regard to urinary excretion of adrenaline and noradrenaline as well as self-ratings of mood and alertness. During work the risk group excreted considerably higher amounts of catecholamines than the control group. The results suggest that the combination of monotony and mental overload experienced by the risk group demands continuous mobilization of biochemical adaptation mechanisms which in the long run may prove harmful to the individual's health and wellbeing. This assumption was supported by the fact that the risk group showed a higher frequency of psychosomatic illness and absenteeism than the control group.

Perspec	tive film in u	rban and highwa	ay planning.			
Key words:						
Perspec	tive film, hig	hway design, co	omputer animat	ed, perception.		
Abstract:				į		
A computer program was constructed to achieve a computer generated perspective film from data taken from an isarithmic map of a road. The result was a three dimensional film of the road, as seen from future drivers' eyepoint. Objects in the picture like trees, bushes, houses etc., were presented in a standardized manner. Subjects differing in knowledge and background were shown this film and a film of the real road. An interview and discussion followed which covered impressions of this way of presentation. Depending upon background, subjects noticed different points of the picture. Architects spoke mostly about the houses and the impression they gave compared with real houses. Road engineers remarked mostly on the road and its design, bends etc., while laymen discussed the total picture with trees, bushes etc. The report concludes that a demand exists for films of variable degrees of complexity when planning urban areas and roads.

A reaction which six for passenger of there was a was a progressions, independent to the art-rate conditions, three sessions.	Abstract: A reaction time (RT) task was used in three conditions, each lasting 2 h, during which six female subjects: (i) drove on a 5km closed track, (ii) were driven as passenger on the same track; and (iii) were tested in a stationary vehicle. There was an increase in RT only in the driving condition. Furthermore, there was a progressively greater increase in RT over the three successive test sessions, independent of the order in which conditions were tested. Measurement of heart-rate (HR) showed that HR decreased only in the driving and the passenger conditions, and that the decrease in HR became progressively smaller over the three sessions. Consequently RT-data and HR-data (interpreted as indicating level of arousal) provided contra-indications of changes in driving proficiency.

Crowdedne	ess, catechola	mine excretion	n, train stres	s, commuting	
Male passengers regularly commuting by train on the Stockholm-Nynäshamn line were investigated on two morning trips to Stockholm. These trips were made under different levels of crowding, before and after a period of gas rationing during the oil crisis in 1973-74. One group of subjects boarded the train at its first stop (Nynäshamn), the other midway on its route (Västerhaninge). Physiological reactions were assessed from the rate of catecholamine excretion in urine and the subjective experiences were measured by self-ratings. The results showed that feelings of discomfort grew more intense as the train approached Stockholm and the number of passengers increased. Perceived crowdedness increased as the square of the number of passengers. During both trips the subjects from Nynäshamn (longer trip) had a lower rate of adrenaline and noradrenaline excretion on the train than those from Västerhaninge. Furthermore, it was found that the rate of adrenaline excretion was higher for both groups during Trip 2, when the train was more crowded. The results support previous findings indicating that the stress involved in travelling by train varies more with the social and ecological conditions of the trip than with its length or duration.					ense rs. ite - n

Key words: "visually h	andicapp e d", "	labor marke t (stati	ctics)",	''vocational handicap''.
Abstract: A survey of the labor market situation for the visually handicapped in Sweden is reported. The survey was made during 1975 with the local officers of the Swedish Association of the Blind as reporters. The main results of the survey are the following: The survey shows that there are 1 490 visually handicapped on the labor market in Sweden. This is to be compared to 9 100 visually handicapped in all in the age-group 16-67 (which is the age for old-age pension in Sweden). 811 of the 1 490 are working on the open market without a pension as economical support. A comparision with the labor market structure in total shows an over-representation for the visually handicapped among "Clerical and related workers" and an underrepresentation among "Construction-workers" and "Transport and communication workers". "Agricultural work" and "Production and related workers" has about the same share among the visually handicapped in Sweden as among the sighted. The extent and nature of blindness as a "job handicap" as well as the need for special measures to improve the situation is discussed in a final section of the report.

Title:
The diurnal pattern of some physiological and psychological functions in permanent night workers and in men working on a two-shift (day and night) system.
Bibliographic reference:
In P. Colquhoun, S. Folkard, P. Knauth & J. Rutenfranz (Eds.), Experimental Studies of Shiftwork. Opladen: Westdeutscher Verlag GmbH, 1975, pp. 131-141.
Title of project:
The relation between working hours, biological rhythms and work satisfaction.
Key words:
circadian rhythms, performance, alertness, catecholamine excretion, two-shift work (day-night), permanent night work

Abstract:

The gains of permanent or longer periods of night work is discussed in terms of "short-term" and "long-term" adaptation, where the latter refers to a decrease in the time required for attaining the best possible night curve on successive periods of night work. Results are presented from two studies involving 24 printers with permanent night work and 13 type-setters working in twoshift with alternate days and nights. Data on catecholamine excretion, body temperature, performance and subjective state were collected in the beginning, in the middle and at the end of the night shift period for both groups. The results indicated that permanent night workers showed signs of better long-term adaptation in the sense that their night curves did not improve during the night period as much as those of shift workers. It appears that permanent working hours may be a requirement for the development of long-term adaptation to night work.

Upplevda restidsdifferenser och medelhastigheter - faktorer som kan antas påverka förares hastighetsanspråk.

Experience of travel-time and mean speed - factors of importance for drivers' speed demands.

Bibliographic reference: National Swedish Road and Traffic Research Institute, Linköping, 1976, Report No. 79

Title of project:

Cognitive aspects of information integration and decision making.

Key words:

Traffic safety, time perception, velocity perception.

Abstract:

The vehicle speed in traffic is a factor affecting both the number of accidents and their damage consequences. Therefore, it is of interest to investigate the way different factors may affect the driver's choice of speed. The effect of the speed on the travelling time is a factor which may be assumed to be a central part of the driver's speed demands. This report states the results of several investigations showing that persons overestimate — when in a symbolic form being presented different distances and speeds — the effect on the travelling time of a given acceleration of the high speed levels comparatively of the low speed levels.

Similar results have been obtained in an investigation where the subjects visually were presented actual speeds and distances in a laboratory experiment. Finally, the results of an investigation were presented where the subjects were supposed to estimate the mean speed of different visually presented speeds on distances of different lengths. This was also a laboratory experiment and the results indicate that people generally overestimate the average speeds. The way these divergences of objective and subjective differences in the travelling time and the mean speeds may affect the drivers speed demands are discussed in this report.

Effects of studded tyres on road, traffic and safety				
Key words:				
road traffic, driver behaviour, risk taking, safety, studs, tyres, speed				
road traffic, driver benaviour, risk taking, sarety, studs, tyres, speed				

Abstract:

An investigation has been carried out in order to find out if drivers of vehicles with studded tyres are making use of possible increased coefficient of friction at icy road conditions to maintain a higher speed or to drive at a higher level of safety than drivers with unstudded tyres. Speeds, distances to the vehicle in front and possession of studded tyres have been measured during early morning hours. The sample of drivers studied have been driving in pendulum-traffic to the town of Uppsala. The measurements have been carried out with traffic analyzers and studded tyre indicators in two consecutive curves. Studies have been made at both dry and icy road conditions. The safety level has been calculated in the following ways:

- 1. the quotient between coefficient of friction made use of and the maximum friction available in the curve
- the quotient between actual speed and the highest possible speed in the curve.

The results show that although drivers with vehicles equipped with studded tyres are driving somewhat faster than drivers with unstudded tyres at slippery (icy) road conditions this increase in speed is not leading to lower safety margins. On the contrary drivers with studded tyres are on the average driving with larger safety margins than drivers with unstudded tyres. In dry road conditions no clear differences are found.

The results could also be interpreted to show that drivers use an introduced safety measure mainly in the way it is intended to-not for other proposes like comfort, speed etc.

ABSTRACT OF CURRENT RESEARCH Inst.: Author: Department of Psychology Singer, J.E., Lundberg, U. and University of Stockholm Box 6706, S-113 85 Stockholm Frankenhaeuser, M. Title: Stress on the train: A study of urban commuting. Bibliographic reference: Advances in Environmental Research, 1976. (In press.) Title of project: Psychophysiological stress research Key words: Train stress, commuters, crowdedness, catecholamine excretion Abstract: Regular male passengers commuting on the Nynäshamn-Stockholm line participated in a four day investigation aimed at studying the stress, which arises from day-to-day commuting from a suburban home to a central-city job. All subjects rode a morning train: one group boarded the train at its first stop, and the other midway on its trip. The time of travelling was 79 and 43 min, respectively. On each day the subjects made quantitative reports concerning the travelling conditions on the train, and on the third day urine specimens from each passenger were also collected and analyzed for adrenaline and noradrenaline. The mean number of passengers/car increased progressively as the train approached Stockholm and a corresponding increase occurred in the magnitude of the estimates expressing various forms of discomfort. The subjects with the longer trip (Nynäshamn) were found to have a lower rate of adrenaline excretion on the train than the subjects with the shorter one (Västerhaninge). The results indicate that the stress involved in travelling varies more with the social and ecological circumstances of the trip than with its length or duration.

Abstract:  The legibility of 170 mm high white text on road signs was investigated during rural night driving. It was shown that reading distances were greatest for text with effective reflective intensities in the approximate range of 2-10 mcd/lux · cm .In order to maintain an acceptable readability of the road signs in use, it was recommended that retroreflective materials used on signs have a reflective intensity above 4 mcd/lux · cm .

In order to study head movements in driving a special car mounted equipment was constructed. The apparatus registers drivers head movements in three dimensions using three potentiometers as sensing unit.  In a pilot study it was found that in urban road crossings the sum of maximum horizontal head movements to the left and to the right (head angle) seems to be a consistent and reliable measure of head movement activity. Head angle seems to differentiate well between crossings and to correlate negatively with vehicle speed. Suggestions for continued studies are made.

special education, ability structure, vocational choice

Abstract: The aim was to study ability structure of special school pupils, comparing the results with those of earlier investigations, and to study the prognostic value of ability testing in the process of vocational choice. A test battery was designed and tried out in a first study and followed up in a second study 4 years later. The tests were chosen on the basis of Thurstone's factor theory with the addition of some psychomotor tests. They were administered to all pupils of grades 7, 8, 9 and 10 in special schools within the county of Stockholm (n=96) and to a group in the special vocational school for retarded (n=61), attending the carpenter and workshop mechanic classes. Factor analysis gave the following factors: spatial-logical, verbal fluency, psychomotor, numerical-perceptive and verbal comprenhension. The results were in agreement with earlier studies. Correlations between test results and school marks were higher for the vocational school pupils. In the follow-up the vocational school pupils were studied with respect to their current work situation. Those working in the open marked were markedly superior in spatial and psychomotor abilities and had higher mean scores in all tests. A profile analysis showed that those who had an even profile or spatial ability higher than verbal were to a significantly higher degree working in the open market. By combining profile analysis and cut-off, a correct prediction could be made in 44 out of 49 cases. (Biseral correlation analysis showed high correlations between work in the open market on one hand, and spatial ability and school marks in some practical objects on the other.) IQ according to Terman-Merrill had practically no relation to work situation.

Abstract:						
models that	t aim to facil	re planned and litate the rea	l administrate dization of t	ed with the help of functional properties		
in the environment.  In this report the possibility of complementing these models of planning and administration with consideration of man's relationship to his environment is analysed. Dwellers' competence to utilize and develop their own dwelling situation is treated as such a relational property. A structural view on human development is presented as a possible tool in order to understand the development of dwelling competence as a realizable possibility. The applicability of a pedagogical frame of reference is analysed as a point of departure for the formation of different planning and administrative procedures in order to identify measures that can contribute to the realization of an integrated individual and collective competence.						
Different studies and experiences in connection with problems of dwelling are taken up as illustrative examples.

Author: PAL, ORBAN	Inst.: Department of Sociology University of Gothenburg					
Title: Reklamen i ett sociologiskt perspektiv Advertising in a sociological perspective						
Bibliographic reference: Report from the department o No 35, Gothenburg, June 1975	sociology, University of Gothenburg,					
Title of project:						
Key words: advertising man, mass communication, culture						
The following paper tries to show a new way to analyse mass communication. Advertising is seen as a part of society. The basic idea is that the effect of mass communication is dependent on the organisation of society, the organisation of perspectives of members of society, and the message of the communication. One cannot understand the meaning of mass communication from the psychological point of view or from an individual point of view, nor can one look merely at one part of the communication processes. To begin with I construct a theory which makes it possible to analyse a communicator, his message, the organisation of society, and the organisation of perspective of the members of society. Next I discuss the particular culture of 3weden and perspectives of its citizens. Later I make a content analysis of advertising messages and make a study of the communication (advertising man). Finally I make some conclusions abot the effect of advertising in Swedish society.

COMPULSORY EDUCATION

ABSTRACT OF CURRENT RESEARCH

Author:	Inst.:
Bergling, Kurt	Institute of International Education, University of Stockholm

- Title: 1) Assessment of logical thinking as part of the evaluation and evolution of an integrated curriculum.
 - 2) Verifiche di pensiero logico nel processo di valutazione ed evoluzione di un curriculo integrato di Scienze.

Bibliographic reference:

- 1) In B. Segre (Chair), Physics, biology, mathematics: Different cognitive approaches in an integrated curriculum. Rome: Accademia Nazionale dei
- 2) In V. Cappelletti, L'insegnamento integrato delle scienze nelle scuola primaria. Roma: Enciclopedia Italiana, 1976.

Title of project:

MOGNAD-projektet

Key words:

Curriculum, Science, Item analysis, International studies, Piaget.

Abstract:

Two new indices of item analysis were developed and tried out in order to estimate the relative importance of logical thinking as measured by Bergling's Reasoning Level Test (which is a Piaget-test) for answering the 40 items of the IEA Science Tests 1A and 1B. The mean level of thinking of the group who answered each item correctly was used as an index of difficulty. The pointbiserial correlation of item performance and results on the Piaget-test was used as an index of discriminating power.

Samples of ten-year-old students from England and Wales (N=3 680), Federal Republic of Germany (N=1 740), Sweden (N=2 041) and the United States (N=5 550).

Low negative correlations were found between the two indices of item difficulty, the conventional p and the mean level of thinking (-.33, -.28, -.39 and -.31) indicating that the two indices do measure different characteristics of the items

Very similar profiles of item difficulties for the four countries were found indicating that the effect of various school systems is of minor importance as determinant of item difficulty as related to level of thinking.

Logical thinking was found to be of major importance in the entire field of science education.

The study was part of an attempt at developing an integrated curriculum for the primary school.

Rapporter från pedagoriska institutionen, Göteborrs universitet, nr. 138, januari 1976.
Title of project:
Studier av socialisationsprocessen i skolan. (SOS-projektet) (Studies in the Socialization Process in Schools)
Key words: Class-room observation, Work batterns, Teacher-bubil interaction

Abstract: Two class-room observation studies are presented in this report. The first investigation is concerned with the work patterns in the class-room. At two occasions classes in grades 1-6 were observed by check-list techique. The number of classes studied were 41 and 33 respectively. Observation results show that pupils for the most part worked ing advantage on identical to ks. Besides this work mwthod, the hours i class were dominat by the teacher speaking. Classes om work was steers ainly by the textbooks and teaching mater als used, and to a country degree by the teacher. Work in groups and pupil-initialed activities were rare. In the second investigation the interaction between the teacher and different groups of pupils were studied. The puri s were rated on general ability by their teachers. The two boys, in each of seven classes, given the top and bottom ranks were observed. The observations show that publis with high ranks interact comparatively more with the teacher. The group with low ranks receive proportionally more reactions from the teacher on their activities in the classroom. This hold for both positive and negative responses. The difference between the high and the low groups is more marked concerning the negative responses.

Title:	

Title: An experiment with variations in group size and team teaching for gymna rum seniors majoring in Economics Försök med varierande gruppstorlekar och lagundervisning i ekonomiska ämnen i årskurs 3 på gymnasieskolan				
Bibliographic reference:				
Rapport nr 56, 1976. Ped inst Lärarhögskolan i Uppsala				
Title of project:				
PEDO				
Key words: Economics, gymnasium, teamteaching				

Abstract:

In their senior year (arskurs III), students following an Economics major have three specialities: distribution, administration and accounting. Hitherto, instruction in these subjects has to a great extent teen given separately, and this has been found to be unnatural and troublesome, particularly for business economic and law (i.e. legal knowledge), One natural improvement can be achieved by placing business economics and law in their appropriate relation, such that these two subjects are integrated with the above three specialities and distributed throughout the school year. In this manner the "accountant", "administrator" and "distributor" would be able to study and delve into those sections of business economics and law which appertain to their respective specialities, while the other sections of business economics and law could be merely surveyed. / Long instruction periods (4+4+4 hours), varying group sizes, many study visits, team-teaching are characteristics of the project. Important presuppositions for success: there exist good contacts with the business and administrative communities including knowledge of their personnel involved in this program; the teachers are on a good personal footing and have approximately the same fundamental views on education; there exists an interest for experimental activities; additional work loads can be accepted; the physical locales are adequate; there available three teachers who cover all the economic subjects and legal knowledge.

The effect of introducing set theory in the 1 grades 1-9.	Mathematics curriculum for			

Attitude, classroom observation techniques and vidualized teaching,

mathematics, number concept, programmed reading.

Abstract:

Key words:

The book reports three studies of the teaching of mathematics: two dealing with programmed instruction and one dealing with achievements in mathematics in classes following different teaching plans. In the first study a comparison is made between the effect of maximum use of Programmed instruction (PI) and the effect of conventional instruction (CI). Results were about the same in regard to achievement, preference for mathematics and general behavior during lessons, but the attitude of the pupils to PI deteriorated. In the second study, therefore, a comparison was made between a modified form of PI (punctuated by teacher-supervised small group instruction and CI. No significant differences in achievements in mathematics or preferences for mathematics could be demonstrated between the two main groups. The attitudes toward PI seemed now to be more moderate: The pupils felt that the PI was fatiguing, but were of the opinion that they had learned a great dea! It should be added here that there were more disturbances in classes with CI. Tendencies toward a better understanding of instructions and a more independent working method during other lessons could be noted in classes receiving Pl. - In a third study the effects of a new teaching plan for mathematics (LGR 69) on certain aspects of the development of the number co-cept, mathematical ability and attitudes to the subject were investigated. These studies were made in grades 3, 6 and 9. Results varied for different grades and divisions of the subject,

Different typed by John model and twand writing committee meinstruction	Abstract: During the two last decades there has been a substantial increase in the number of immigrant children attending Swedish schools. The official regulations from 1973 stress that the primary aim in the teaching of immigrant children is to promote bilingualism. Bilingualism is here taken to mean not merely the children's ability to comprehend and to express themselves in two languages, but also to participate in the culture communicated by both languages. The aim is to produce a functional bilingualism in the children. Different types of bilingual education are described based on the models proposed by John and Horner (1.71): informal model, supplementary model, transition model and two-vectoredel. The importance of teaching the basic steps in reading and writing to the callot a mother-tongue is supported by arguments from an UNESCO committee meeting in Hamburg 1969. Finally the project Models for bilingual instruction of immigrant children's mentioned as an example of the transition model and the expected effects are discussed.

Abstract: This book investigates the attitudes of pupils and teachers to different ways of presenting and handling subject matter in science and social studies. In addition, the extent to which the recommendations of the teaching plans agree with preferences displayed by pupils and teachers was examined. Finally, a number of textbooks on the subject were analyzed to determine how successful they were in satisfying teacher and pupil desires. Special interest was devoted to pupil reactions to pictures. - As the main tool for collecting data, a teacher and a pupil questionnaire were constructed as well as a picture test with a special judgment scale. Pupils from 10 classes in grade 3, about 50 regular elementary school teachers and a small group of experts for picture analysis participated. - The general impression is that teachers and pupils to a very great extent agree in their judgments insofar as that which the pupils consider interesting and attractive, the teachers also judge to be suitable for use in teaching. Pupils take a definitely negative attitude to listening to classmates and to individual work assignments based on degree of difficulty. Among those aspects to which they were more positive than the teachers can be mentioned working together in groups. In a comparison of different types of illustrations, the pupils expressed a decided preference for large, distinct, realistic pictures in color. Although science and social studies textbooks published recently satisfy to a somewhat greater extent pupil and teacher preferences than do the older editions, there is still room for improvement in, for example, size and amount of text and work assignments. The author feels that a development project in which different solutions could be tried out in practice would be of great impor-

After the "Nordic committee for the modernization of school mathematics" had carried out extensive preparatory in vestigations in Scandinavia, the curricula in mathematics were changed in the Nordic countries during the latter years of the sixties and the beginning of the seventies. There is still an intensive debate, however, on the effects of the reform. The writer presents a theory on the use of mathematics in so ciety and the daily existence of the adult. Finally an assessment is made of the future need for mathematics in the school system on the basis of this theory.

1	ttitudes, fati	lgue, 9-year compre	hensive so	chool,	
Abstract: This is the first progress report from the project. A cross-sectional study of 1 600 pupils attending school during 1969/70 was carried out. Questionnaires given at intervals of half a year, and interviews and data from records were used. In order to measure how tired pupils were of school, questions like "Would you leave school if possible?" were asked. One group of pupils who wanted to leave school, one group who wanted to stay in school and one group known to be truants were interviewed. Main results: Five per cent of the pupils wanted absolutely to leave school, and eight per cent would probably do this before the official time to leave school had come. Interest in school decreased with higher grades. This tendency showed up later for girls than for boys. Pupils wanting to leave school differed from those who wanted to stay in that they had a lower IQ, lower marks even in the first grades, their experiences of school were worse, and their homes showed less interest concerning school matters. In many cases, when trying to contact pupils for interviews, it was not possible to find those who were defined as being tired of school. Attitudes changed greatly over a half year period. The results of the survey have been used for planning a follow up study now in progress.

Abstract: An empirical study of the allocation of resources among schools in ten countries was carried out. The ten countries included England, the Federal Republic of Germany, Finland, France, Israel, Japan, the Netherlands, Scotland, Sweden, and the United States. Allocation of resources was examined in connection with the socioeconomic status and level of achievement of students served by the schools. An attempt was made to assess the instrumental value of the school system in reducing achievement differences associated with socioeconomic status. In each country the sample of schools was partitioned into groups on the basis of socioeconomic status variables. Groups of schools were compared within countries to determine the extent to which resource allocation varied. On the basis of these comparisons and multivariate analyses based on the total sample of schools, countries were classified as having either Elitist or Egalitarian Resource Allocation. A cross-national comparative analysis was then used to explore the impact that Mode of Resource Allocation and School System Structure had on the level and social distribution of student achievement. No evidence was found of an effect of Mode of Resource Allocation or School System Structure on the level and social distribution of student achievement. It was therefore suggested that societal factors have the dominating influence on both the school system and the school outcomes. Some analysis problems and policy implications are discussed.

Abstract: The purpose of this work is among other things to throw light upon some problems related to the prediction of success in secondary school ('gymnasium'). The difficulty to achieve relevant criteria, the fact that the prediction is influenced by the size and composition of the investigated groups and the adequacy of the statistical methods of analysis are examples of problems discussed here. Another purpose was to investigate to what extent the prediction of success in secondary school may be improved by the use of ability and/or achievement tests which might then replace or supplement marks. The predictors analysed here are, a part from points of admission (the final marks in the 9 th), ability tests consisting of a verbal and a non-verbal part, achievements tests in social subjects. Swedish, English, mathematics and in physics and chemistry. The achievement tests have been made especially for the purpose of this investigation. It appears among other things from the empirical results that the admission point has the highest value of prediction. It explains about 35-45 % of the variance of the criterion depending on which group that has been investigated, and in combination with ability and achievement tests the explained variance of criterion is increased by 10-15 %.

ABSTRACT OF CURRENT RESEARCH Author: Inst.: Institute for the Study of Astrid Nyström International Problems in Education University of Stockholm Title: French as a Foreign Language (Franska som främmande språk) Bibliographic reference: Stockholm: Liber Läromedel/Utbildningsförlaget. Fou 22, 1975 Title of project: International Association for the Evaluation of Educational Achievement Key words: French, foreign language, French achievement, comparative education curriculum planning Abstract: The Swedish IEA results in French as a foreign language are studied. In analyzing the French data from a national perspective you get a fair idea of what differences exist between countries, what questions are most relevant to investigate for the national curriculum work and in which areas the teaching of French in other countries could be useful study of Swedish researchers. The analysis shows that, in the process of deciding about students' French marks Writing Proficiency, as a rule, is given less weight by Swedish teachers of French than any of the other skills. Consequently, any conclusion about strategies to improve French instruction, based on Swedish data, would have to consider the problem of properly weighing different skills. Organization and methods used in French instruction in Sweden, social background, sex, and French achievement, and the accumulation of French achievement over time are some of the topics studied.

Abstract:						
The report describes a comparative study of some cognitive results in the comprehensive school. Analyses are made of pupils' development from grade 7 to 9. For the comparison the pupils were divided into groups, approximately equivalent in ability and socio-economic level, but from schools with different organization and shaping of premises. The analyses of pupils' cognitive results indicate only small differences between schools with different organization. The results are primary referred to intellectuel abilities.

Key words:	Civic education, Civic achievement, Civic attitudes, comparative

Abstract:

The study sets out to describe Civic Education cross-nationally. The report deals with methodological problems in cross-national assessment of Civics achievement and attitudes. It conveys a detailed picture of student knowledge in Civics and of attitudes such as support of democratic values, support of the national government, and interest/participation in civic affairs at three age levels. An attempt is made to assess the relative impact of home and school on civic knowledge and attitudes. Selected characteristics of the schools and the national political systems are related to the affective and cognitive outcomes of Civic Education. Finally, the place of a comparative study of Civic Education in research on political socialization is considered.

Key words: Preschool education, elementary education, childhood interests, childhood attitudes, moral values, emotional development.					
Abstract:					
The report deals with the results from a mail questionnaire distributed during spring 1974 to 1726 randomly selected preschool teachers, primary school teachers and recreation leaders. The purpose of the investigation was to obtain information about difficulties which may be connected with the treatment of subjects concerning ethics, belief and ideology at the preschool and junior levels.					
The report is mainly based on the distributions of answers on different items. Answers from the three different groups of teachers are compared with one another. Some results are also analysed in the light of four background items, namely teachers age, locality of job, religious activity and political interest.					
The results reveal that questions and subjects of ethical and ideological matter are common at the preschool and junior levels. This may, according to the answers, cause considerable difficulties, especially when the matters are of controversial nature. Adjustment to individual differences concerning maturation and social background seems here to be the main problem.

Abstract:

The total sample consists of 323 twin pairs and 1 194 matched controls to the twins. MZ and DZ same-sexed twins and opposite-sexed twin pairs tend to be very similar in physical growth from 10-18 years. The comparison between the twins and their controls show a lag for the twin girls, who tend to be somewhat below average in height and weight. For the twin boys this difference is not evident.

The twin girls also seem to have their growth spurt at a later age, on the average, than their controls. The opposite trend can be seen for the twin boys. Possible explanations to this sex difference is discussed in the report.

Abstract:

The in-estigations reported are concerned with the part played by adrenaline and noradrenaline in the regulation of behaviour in normal, healthy children. Results from a series of studies suggest that the concept of adrenaline as an "emergency hormone" facilitating flight and fight reactions under conditions inducing rage and fear, should be extended to include also the coping behavior of healthy individuals exposed to psychosocial stressors in everyday life. Thus, the ability of children to cope with various stressful influences in the environment is positively related to their adrenaline output. On the whole, children who secrete relatively more adrenaline tend to be socially and emotionally better adjusted, and to perform better in their school work than those who secrete less adrenaline. There are large differences between individuals in their ability to respond to stressful influences by an increased adrenaline secretion and, in general, adrenaline "increasers" show superior coping behavior as compared with adrenaline "decreasers". Furthermore, boys secrete more adrenaline than girls when exposed to moderately stressful environmental influences.

Adjustment, coping, psychosocial stress, adrenal-medullary activity

Abstract:					
Reaching behavior in 18 - 32 weeks old infants was studied as a					
function of binocular convergence. The infant looked at the					
object to be reached for through prism arrangements which changed convergence only. The reaches obtained were nearly always directed					
at the virtual object defined by convergence. Corrections of the					
reaches, if any, were made rather late and often not before the					
hand arrived at the place of the virtual object.

Preschool Child: Anguage Development, Grammar, Semantics

bstract:

In this longitudinal study based on the spontaneous speech of a Swedish girl (Embla 20-42 mo.) the method of scoring presence and absence of preposition in obligatory contexts was used, in order to describe her acquisition of prepositions. Noréen's classification of status (= roles, cases) was considered as the most fitting semantic system to account for Embla's constructions (Noréen, A. Vårt språk, 5:III, Lund 1904). The semantic classification made it possible to describe - in chronological order - the rather complicated inter-relationship between form and function.

Finally, Clark's complexity hypothesis was tested against data and was found valid to explain the appearances of locative and temporary found.

Finally, Clark's complexity hypothesis was tested against data and was found valid to explain the appearences of locative and temporal prepositions.

Title of project:
Development and Training of Attention and Memory
Key words: Attention, memory, development, training, concept learning,
active touch

Abstract: In a reviewed series of spontaneous and learning-set studies of adults and children, we have monitored active-touch overt attending during concept learning. Adults solved the problems even if they attended to four dimensions in the same trial; however, young children failed when attending so broadly but solved when attending to a single dimension in each trial.

In the present training study, 18 six-year-olds solved all problems when restricted to attend to only one dimension. After a special pretraining program pro eeding through the subprocesses of stimulus familiarization, discrimination, labeling, "attentional broadening", and memorization, 13 of the children managed to attend to all four dimensions in one trial and solve faster than adults. Findings suggest a developmental hypothesis that learning grows with spontaneous "tailoring" of attention to memory capacity.

The Örebro	Project							
Key words:								
1 -	dren 12 years o	old, electroence	phalography,	paroxysmal activity				
Abstract: This investigation is part of a longitudinal project on adjustment. It has been undertaken primarily to make it possible to relate EEG-variables to personality traits. This first part, however, describes only EEG-examinations on 105 boys, 118 girls, 12 years old, from schools at Örebro. The result is to some part compared with EEG-Olofsson's (1970) normative Swedish EEG-investigation on children and adolescents from the age of 1 through 21. EEG was recorded at rest and at hyperventilation. The records are evaluated with consideration paid to deviations outside the normal boundaries for age and sex. Deviations are expressed according to a code with six positions, (1) degree, (2) extent, (3) location, (4) static type, (5) dynamic type, (6) condition when a deviation is registered. The first digit of the code gives a value on a continuous scale from 0 to 6, the other digits designate categories only. Children characterized by paroxysmal activity have been identified as a subgroup. Alphafrequency has also been measured. 43.5 % (39 boys, 58 girls) showed some degree of deviation. 23.1 % of these boys and 24.1 % of these girls (9 boys, 14 girls) were characterized by paroxysmal activity.

11/ ABSTRACT OF CURRENT RESEARCH Author: Inst.: Ola Svenson , Maj-Lene Hedenborg & General Psychology Unit Department of Psychology Lena Lingman University of Göteborg Title: Analysis of children's verbal reports about strategies for solving simple addition. Bibliographic reference: Göteborg Psychological Reports, 1975, 5, No., 25 Title of project: Cognitive aspects of information integration and decision making. Key words: Problem solving, arithmetics, information processing Abstract: Children in the third grade in a normal class and children poor in mathematics in the fifth grade in a special class solved all (105) additions of two addends with a sum smaller than 14. After each one of 50 problems (whose addends were unequal and none of which was 1 or 0) verbal reports were given by each child about his way of handling the numerical information in arriving at the solution. The results showed that retrospective verbal reports may be interpreted so as to give meaningful information about cognitive processes in children when solving arithmetic problems. The reports indicated that the answers were obtained either by direct retrieval from memory (in about 1/3 of the cases) or in reconstructive memory processes, of which almost all (94%) started with the greater addend. Most answers indicating reconstructive processes were classified as one of three major types of strategies (a) one-step counter strategy (57% of the reconstructive reports), (b) counter strategies with greater units than one counted (25%), and (c) tie reference strategies (12%). The use of (a) tended to decrease with increasing mathematical ability and the normally achieving group tended to use strategy (c) more often. Finally, the data suggested that children poor in mathematics should be taught only a few general reconstructive strategies suitable for their short-term memory capacity. Abstract:							
The effects of feedback and feedforward on subjects preferences among gambles were studied in 2 experiment. Subjects were given feedforward and different amounts of feedback about the probabilities in the bets. No effects of feedback and feedforward were found however. The conclusion was that some methodological improvements were required in order to make a valid test of the original hypothesis.

Scaling loudness, noisiness, and annoyance of community noises.
Bibliographic reference:
Rep. Dep. Psychol., Univer. Stockholm, 1975, No. 461.
Title of project:
Key words:
Perception, Noise, Scaling,

Abstract:

The contribution of type and sound levels of community noises to the perception of loudness, noisiness, and annoyance was studied in a laboratory situation. The psychological attributes were precisely defined to the 30 observers, the method of magnitude estimation was used for scaling the attributes, and the scales were colibrated to a common unit of measurement. It was demonstrated that observers in carefully designed laboratory experiments are able to use and produce scales of loudness, noisiness, and annoyance for community noise. The relationships between the attributes were satisfactorily described by linear functions, the parameters being specific to the type of community noise. In general, community noises are judged to be more noisy (or annoying) than loud although the importance of noisiness relative to loudness varies with type of noise as well as loudness level. A linear model is suggested that describes community noises with regard to perceptual attributes. The model states that annoyance and noisiness are proportional to loudness, thus encouraging the viewpoint that psychoacoustical research may well concentrate on the attribute of loudness.

Contours, Brightness perception, Luminance gradients	
Abstract: It was hypothesized that the effect of contours on a brightness dox earlier reported by Bergström and Rubenson (1070) was due to contours inhibiting the blurred border between the two areas constituting the paradox thus making them look more alike in bright. The same luminance gradient in space was used as in the early study but it was extended to a maximum width of 64 degrees of viangle to eliminate the "Fry and Bartley border inhibition". The paradox measured by a constant sum method still appeared the contours inserted still reduced the paradox significantly. The results are discussed in relation to recent findings on modulation transfer function for sinusoidal gratings and its degence on the number of cycles presented at low spatial frequencies.	the tness ier isual and the pend-

Kontrast och konstans i ljushets-, färg- och hastighetsperception
Contrast and constancy in the perception of brightness, colour, and sp

Abstract: According to Kirschman's third law the induced colour is at its maximum when the inducing and induced fields are of equal luminance. Later studies (Kinney, 1962) show the induced colour to be most pronounced at a luminance ratio (inducing/induced) of about 4/1. In the present study the amount of colour induced into an achromatic test field was determined for one inducing colour, red, by letting observers judge the colour strength of the induced field. The test (or induced) field luminance was varied to give luminance ratios between 0.5/1 and 2/1. The results show that both colour strength and blackness increase as the luminance ratio is increased. The fact that the test field was judged even to have maximum chromatic colour strength and maximum blackness at the same time is discussed in relation to the method used and in relation to earlier studies on the "mode of appearance" of colours and the bidimensionality of achromatic colours.

Abstract:	
A hypothesis-sampling theory for rule learning	ng predicts that only those rules
that are available for sampling can be learned	ed. Earlier results show that sub-
jects have a very limited set of hypotheses	about rules relating scaled cue
and criterion variables, consisting mainly of	f linear and symmetric quadratic
functions, but not of complex functions, such	n as J-shaped rules. Tasks re-
quiring the use of such rules should, therefore	ore, not be learned. The results
of the present experiment show, however, that	subjects are able to find J-
shaped relations. The results were interprete	ed to mean that subjects are
able to construct hypotheses, and that they a	1 0
hypotheses from a preestablished set of possi	ble hypotheses.

learning, inference, behavior					
Abstract:	i				

Subjects' ability to find the parameters for the functional rule relating cue to criterion in probabilistic inference tasks was investigated in a 2 (levels of cue validity: .98 vs. .56) by 4 (function forms: positive linear, negative linear, inversely U-shaped, and U-shaped) factorial experiment. The subjects found the mean and standard deviation for the criterion values about equally well for nonlinear and linear functions. The slope of the subjects' functions varied with both cue validity and function form, however. In the low cue validity condition, the subjects' slopes exceeded those for the task, indicating that the subjects did not use the least squares criterion appropriate for these tasks. The subjective slopes were about equally accurate for all functions in the high validity condition, but in the low validity condition, the subjective slopes were for the nonlinear functions than for the linear functions.

Abstract:						
-Interplace etudiac baye actablished that cubiacta postave long wall in informace						
Earlier studies have established that subjects perform less well in inference tasks with nonlinear rules than in tasks with linear rules, and that one source						
of the lower level of performance in nonlinear tasks is that the subjects cannot						
utilize a nonlinear rule as well as they utilize a linear rule. The four experiments in this paper investigate whether utilization of a nonlinear rule can be						
improved by traning. The results show that there is some improvement with train-						
ing, but the improvement could not be attributed to practice, feedback, or to						
the learning of specific cue and criterion values. Cognitive feedback did not						
~						
produce higher performance than ordinary outcome feedback.

Speed and accuracy of orientation performance in verbally presented two-segment route tasks as a function of direction of routes, length of route segments, and angle of turn.

Bibliographic reference:

Umeå Psychological Reports No. 92, 1975

Title of project:

Cognitive representation of the spatial environment as related to movement regulation.

Key words:

Architectional psychology, environmental psychology, perception, spatial orientation, built environment.

Abstract:

In order to investigate performance in maintaining orientation whilst moving about in layouts of buildings, structures and cities, the triangle completion task employed in previous research on geographical orientation skills was simulated by means of tape-recorded descriptions of routes containing information about length of two route segments and an angle of turn. Direction of routes (indicated by arbitrarily defined compass directions), length of route segments, and angle of turn were varied in a factorial design, requiring the subjects to estimate distance and direction to the starting-point of the simulated route. Omissions, error scores, and response times suggested highly efficient performances, though between-subjects variance was substantial. The effects of length of route segments, angle of turn, and first-order interactions on errors were significant but could langely be accounted for by negative correlations with the correct values. The possible facilitating effect of visual imagery for symbolization of the route patterns is discussed as a plausible explanation of the efficient performance in the task, and the need for further experiments pointed out.

The interest has been focussed an qualitative differences in learning. The greater part of the research on learning that has neither to been carried out has concentrated on quantitative properties of the learning process. The main difference between these two approaches is that in the former case the main question is "what is learned?", i.e. learning is described in terms of its content, while the latter deals with "how much is learned?". The twofold purpose of this study was (a) to study the effects of a set of experimental manipulations aimed at influencing the learning process in a qualitative sense and (b) to describe the outcome of these manipulations by identifying the various conceptions of the concepts and principles dealt with in the text passage. The main result on the instructional side is a superiority of the E-group on the retention test after the second chapter of the text while those is a tendency in favour of the C-group on the retention test after the first chapter of the text. Thus, the experimental manipulation seems to have had a slightly negative effect while in function but a positive effect after its termination.

Abstract:					
A review is given of the research on different aspects of information processing in bilinguals. Experiments are described on reaction processes, perception, attention and memory, as well as on general efficiency of information processing in dominant and nondominant languages as a function of mental load, language set and interlingual switching. Relationship between the language structures of a bilingual is discussed mainly in view of the issue of whether he has shared or separate storage systems.

Short-term recognition of simple pictures and their visually presented
onote term recognition of simple pictures and their visitally presented
verbal names was studied in an experiment involving two conditions.
In Experimental condition, the subjects had to perform a mental task
with high information load while they were presented with pictures and
words. In Control condition, they attended only to the pictures and words
themselves. As expected, recognition performance in Experimental
condition was much poorer, but the deterioration was markedley more.
pronounced with pictures. While subjects in Control condition could
recognize significantly more pictures than words, the opposite was true
of Experimental condition. The results are discussed in terms of dual
coding theory and interpreted as being due mainly to the fact that reading
is a more straightforward process than naming.

Motivationens inverkan på validiteten hos fysiska arbetsprov (Motivation in physical performance)

Key words:

Title of project:

Motivation, working capacity, physical worktests

Abstract:

In a study concerning the validity of physical work tests on a bicycle ergometer for cross-country runs fairly good validity was found for 44 subjects in a group of 95 military conscripts. For other subgroups the vaudity was low or absent. No significant differences were found between subgroups for results on bicycle tests and cross-country runs. The lack of validity for the subgroups was therefore interpreted as an inter-individual variance in motivation. In the 44-group the level of motivation was assumed to have been more constant between subjects.

The results on the bicycle tests and the run were analyzed according to a model by Borg for quantifying the effects of motivation in a physical performance. In the model the physical endowments and the physical performance are the independent and dependent variables. The effect of motivation is mirrored in the deviation from the performance expected on the basis of the individual's endowments. This residual was computed for the physical endowments being the circulatory capacity (heart rate at work load 150 W). Multiple correlation analysis was undertaken to relate the performance and residual on a bicycle test to the corresponding variables in the cross-country run. For the group which had shown the lowest validity for the performance variables, the validity increased to, 62 for the work test variables indicating endurance fitness. Validity was only slightly increased for the 44 group.

Human time	perception				
1	cal measuremer me estimation	its, time perce	ption	, mathema	atical modeling, psycho-
Abstract: Three models concerned with the behavior of subjects estimating two successive durations are proposed. The accepted model assumes that the subjective total duration (sum of first and second durations) and the second duration are each accumulated in a separate sensory register. In a duration-matching experiment, for instance, the difference between the contents of the two registers is matched to the content of the second register. This model is accepted because (a) it does not include any memory, thereby eliminating certain difficulties connected with coding and storing of duration, (b) it copes with characteristic features of duration discrimination, and (c) it can satisfactorily explain data obtained in four scaling experiments, namely magnitude estimation, matching, halving, and doubling of 10 durations between 1.3 and 20 sec. As a by-product, Stevens' power law is uniquely derived, and exponents are computed from matching data, thus eliminating the subjects' numerical behavior. The model also accounts for the time-order error for time.

The bibliography comprises 158 references to investigations carried out by members of the Experimental Psychology Research Unit of the Swedish Medical Research Council. The main theme of the research program is the experimental study of human behavior as related to physiological functions under psychosocial stress conditions. Several projects have focussed on the part played by peripheral catecholamines in adaptation to various forms of stimulus underload and overload as studied in hiboratory and field experiments. Major problem areas concern sex differences in stress reactions, cognitive determinants of psychophysiological accusal, and temporal patterns in adaptation to psychosocial stressors. Another area of research concerns drug-behavior interactions at different arousal levels, in particular effects of alcohol and nicotine under various psychosocial conditions.

The influence of cognitive set on performance and arousal under different noise loads.

Bibliographic reference:

Reports from the Department of Psychology, University of Stockholm, 1975, No. 457.

Title of project:

Psychophysiological stress research

Key words:

Expectation, adjustment, environmental stress

Abstract:

Three groups of 12 subjects each were exposed to white noise of either 56, 72.5, or 85 db(A) while performing a complex arithmetic task. Performance declined and heart rate rose with increasing noise intensity whereas adrenaline output showed the same increase at all noise levels. In a subsequent session, all subjects were exposed to the medium noise (72.5 db(A)) but each group was induced to adopt the same cognitive set as in the first session. Although the objective load was exactly the same for all groups, performance differed: the higher the noise intensity in Session I, the poorer the performance in Session II. Heart rate rose in response to changes in noise level in Session II relative to Session I, regardless of the direction of the change. The overall picture of self-estimates indicated that effort was related to performance and discomfort to noise intensity. The results were discussed in terms of selective sensitivity of different arousal indices to cognitive set versus environmental load.

Key words: Audition, neurophysiology, temporal resolution, vibrotactile discrimination

Abstract:

Threshold for vibrotactile discrimination of pulse interval were determined for pulse frequencies between 1 and 384 Hz. The results point to a temporal resolution significantly more accurate than that demonstrated in earlier studies. Although touch as a vibratory sensor is in general much inferior to audition, the present results show a striking resemblance to those obtained on auditiory pitch. The neurophysiological implications for the tactile as well as for the auditory system are discussed.

observational learning, skin resistance, sympathy, vicarious experiences

## Abstract:

Three groups with 16 Ss each and run in pairs, participated in a differential, successive components, long interstimulus interval conditioning paradigm with the skin conductance response as dependent variable. For the problem solving group the task was described as guessing which of two lapms (CS2s) would follow after two different tones (CS2s). In the observer group they were further informed that the other subject in the pair, the model, would receive shocks "' CS+ offset, which actually was the case for the model group. Skin conductance responses were scored in five intervals during and after the non-overlapping presentations of the two CSs with a duration of 8 sec each. The results indicated no differentiation in any interval for the problem-solute, and parallel instigation to shock and threat of shock, and conditioning in the observer and model group, with the exception of conditioning in the 1st interval for observers only. The results were interpreted as parallel instigation and conditioning between vicarious and direct learning, the reported difference being due only to different UCS-intensities causing a blocking of first-order conditioning in the model but not in the observer group.

Title:
Paced and unpaced work under salary and piece-rate conditions.
Bibliographic reference:
Reports from the Department of Psychology. University of Stockholm 1975. No. 459.
Title of project:
Stress reactions to overstimulation and u. was imulation
Key words:  Piece rate, machine-pacing, arousal, period ince, subjective wellbeing

## Abstract:

Eighteen male students participated in a laboratory experiment, performing a repetitive but complex choice-reaction task at piece-rate and at salary payment. In each of these conditions three levels of individual control of work pace were introduced; machine-controlled pace, partial individual control, and full individual control. Performance, ratings of the various work conditions, and estimates of subjective time were obtained during work, and catecholamine excretion, heart rate, and self-ratings of mood and alertness were obtained during work as well as in a subsequent relaxation period. Although performance was maintained at a relatively constant level, man-controlled work pace was judged more favorably and was associated with lower heart rate than machine-controlled work. Piece-rate, as opposed to salary conditions, tended to accentuate feelings of rush as well as of drowsiness. This tendency is assumed to reflect behavioral compensation for lowered arousal jn a repetitive task.

visual space during the experiments pretation could the theoret on invariant	The article gives a review of the main outcome from the research on visual space and motion perception carried out at the Uppsala laboratory during the last decade. It is underbuilt by descriptions of some basic experiments. A theory of perceptual relativity with regard to interpretation of the stimulus flow is advanced. Furthermore, arguments about the theoretical advantages of geometrical anchorage in a model founded on invariances in perspective transformations in the stimulus flow rather than in the traditional metric orthogonal one are advanced.

Abstract								
Males and females from a Swedish local organization for international peace and understanding estimated their intensity of involvement in two potential future events assumed to occur in different years between 1974 and 2048. They also estimated the importance, probability, influenceability, and their knowledge of 16 future events, and the number of years before the events will occur. The results showed that males were less involved than females in an event which would increase the life span in developing countries, if this event were to occur during the next 20 yr, while males and females were about equally involved in an economic depression. Compared with males, females considered that most future events were more important than males and they gave higher estimates for the probability of undesirable events and lower for desirable events.

Key words: Verbal lear	ning; learning p	rocess, qual itati	ve and	alysis				
Abstract:  This paper describes an attempt to identify different levels of processing of information among groups of Swedish university students who were asked to read substantial passages of prose. Students were asked questions about the meaning of the passages and also about how they set about reading the passages. This approach allows processes and strategies of learning to be examined, as well as the outcomes in terms of what is understood and remembered. The starting point of this research was that learning has to be described in terms of its content. From this point differences in what is learned, rather than differences in how much is learned, are described. It was found that in each study a number of categories (levels of outcome) containing basically different conceptions of the content of the learning task could be identified. The corresponding differences in level of processing are described in terms of whether the learner is engaged in surface-level or deep-level processing.

Abstract:  It is suggested that a decision in a complex situation can be described as a sequential process in which different decision rules and information processing strategies can be used at different points in time. Examples of possible decision rules are presented in an approximate order of complexity. Two ways for processing the information in a decision situation, viz., breadth-first or depth-first strategies, are discussed and suggestions are made about their relationship to particular decision rules. Finally, it is proposed that the order of application of particular rules in a decision process is guided by a tendency to minimize cognitive effort.

## ABSTRACT OF CURRENT RESEARCH

Author:	Author:			sykologiska Inst. ppsala Universitet ppsala Sweden			
Title:	Title: Constant Velocity - Not Perceived as Such -						
Bibliograph	Psychological Research Vol 37, 1 1074 p. 3-27,						
Title of pr	coject:	Dynamic Eve	ot Perceptio	vn.			
Key words:	Visio	on, Motion p	erception, V	Velocity, Acceleration			
Abstract: Most students of visual velocity perception implicitly assume that constant velocity is seen as such. This notion was challenged and shown to be wrong in four experiments. A CRT-generate bright spot moved in a linear path according to different velocity—time functions. Observers compared these movements pairwise as to their perceived constancy of velocity, or drew graphs describing perceived velocity along the track. Objects moving with constant velocity appear to move fast in the beginning and suddenly slow down to a much lower velocity. There is also a qualitative difference between the start phase and the rest. To be seen as constant, a movement must start smoothly with a certain acceleration and later level off to a constant velocity (natural motion). Such movements also look slower than others with the same average velocity. The results are taken to imply the existence of a perceptual concept of velocity which includes or presupposes a natural start. Consequences for velocity scaling, acceleration thresholds, and other motion perception studies, as well as relations to eye movements and conceptual problems, are discussed.

	Title:  The perceptual concept of velocity tested with strong frame of reference, observer-determined start, and partly occluded track.					
Bibliograph:	Reports from the Dept. of Psychology No. 187 1976 University of Uppsala. Sweden					
Title of pro	oj <b>ect:</b> Dy	namic Event	Perception			
Key words:	Vision,	Motion perce	ption, Veloc	city, Occlusion		
Abstract: The results of a previous study (the PCV-phenomena; Runeson, 1974) were checked and extended under different conditions in two experiments. In the first experiment it was found that the PCV-phenomena occur also when a bright ring moves partly occluded by an irregular hedge forming a strong frame of reference. Similar results were also obtained when the observer was allowed to trigger the movements. In the second experiment it was shown that the last third or two thirds of the movements can be screened off without destroying the main effects. It is concluded that track length can be varied without affecting perceived velocity only if an appropriate natural motion is used. Occluding the middle third did not lead to any reappearance effects. On the other hand, appearance effects similar to the PCV-phenomena were found when the start position was occluded. The appearance effects are discussed as a possible incompleteness in the attunement of motion perception to the ecology.

	Psychologists have studied a judge's confidence in his conclusions or diagnoses (subjective probability). Human experience of probability can be compared with that calculated according the the theory of probability (Bayes' theorem). The following results have emerged: a judge pays far too little at ten tion to incoming information, he does not attach sufficient weight to general background data, he experiences his judgment as far more comprehensive than it really is, and greatly exaggerates his ability to deal successfully with large amounts of information; by a model analysis of the judgments the expert's strategy can be elucidated and explained to others. A more complete analysis of rational decision making also calls for a discussion of how decisions should be influenced by values, how the values are to be measured, whose values are to be allowed to influence the decisions etc.

Key words:	g och val.	tidimensional s	scaling.		
Abstract:  Previous work on content models on multidimensional similarity have mostly been concerned with the case of only qualitative variation. In this study a set of emotion words that varied both in content and intensity was used as stimuli. Subjects have multidimensional ratio estimations, similarity estimations and also unidimensional ratings of intensity. Both extensive individual data and group data were collected. Five different previously suggested content models of similarity failed to fit these data that showed large individual idiosyncratic variability. It is pointed out that previous work, where some of the models fitted rather well, was concerned with cases that were largely insensitive to deviations from the models.

<u></u>						
In the psychology of learning the most frequent conception of the phenomenon of learning is essentially of a quantitative nature. Interindividual differences in learning, whether in experimental situations or not, are in most cases merely described in terms of a total number of right answers obtained on a test. In the present study the primary interest is focussed upon analyzing and describing qualitative differences in learning, i.e. instead of regarding the differences in outcome in terms of how much is learned the interest is concentrated upon an analysis of what is learned.  The present study deals with two highly interrelated problems; first, how to describe qualitative differences in learning, and secondly, how the qualitative characteristics of the process and outcome of learning are affected by the nature of the questions used to evaluate learning.

Title: An attributional analysis of responsibility for a happy accident: Effects of ability, intention and effort.						
Bibliograph	nic reference:					
Göteborg	Psychological	Rep. or ts , 1976 , 6	, No. 8			
Title of pr	oject:					
Key words: Attribution	ion of responsi	bility, self-pro	tective mot	ivation, achievement		
Abstract: Two experiments concerned with attribution of responsibility for a happy accident were conducted in order to distinguish defensive attribution theory from an attributional model of achievement evaluation. The principal findings were: (1) in both experiments responsibility judgments decreased as the severity of the happy accident increased (the "happy accident" effect); and (2) this effect was attenuated when the stimulus person (SP) had been described as exerting effort in the situation, but it was not affected by information about SP's ability or his intentions. These data are interpreted as support for the attributional model of achievement evaluation as well as an attributional formulation derived from equity theory. Sex differences were also discussed.

It is assumed that there is a positive correlation between correlation and similarity. Within the framework of a Thurstonian approach to social choice frequencies, such an assumption predicts smaller standard deviations of utility differences for more similar choice objects, provided that the correlation between utilities is positively correlated with the similarity between the choice objects. This prediction was supported in two studies of similarity and preference, one concerned with social science disciplines and the other with Swedish political parties. Implications for understanding social choice phenomena in politics and marketing are discussed.

Abstract: This report presents the psycholinguistic model underlying the development of a method for a computer-based content analysis, called ANACONDA. A program-flow diagram for the construction of concepts illustrates basic steps in the analysis. Linguistic elements have been scaled according to the Semantic Differential technique. Some metric properties of the scales applied are discussed. The empirical approach of scaling linguistic elements (adjectives and verbs) taken out of context are described. The results of the scaling procedure are given together with examples of the scaled linguistic elements, showing how these are to be used in the next developmental step.

Abstract: The first part of the work deals with ways to improve conditions of students in medical schools in Iraq. A study of student flow through the Medical schools showed that a large number of students face difficulties which are often disasterous to their studies. To study academic, financial and social conditions of the students and to get their suggestions for improvement, two questionnaires were distributed to samples of students in the three medical schools in the country. The questionnaire dealt with the education of the parents, the occupational status of the fathers, the financial status of the students and the influence of financial difficulties on their studies, the social life in the colleges, and ideas expressed by the students about college teaching and suggestions for improvement. Interviews were held with assistant deans of the colleges. Certain aspects of a planning model were discussed. The second part summarized the previous work. After that a planning model for the planning of higher education was introduced, and the educational planning activity as such discussed in its various steps.

Learning, study conditions.

Abstract: A survey among doctoral students (46 ss) was undertaken in order to examine their perception of their own study conditions. The survey was carried out against the background of the reform of the higher educational system, decided upon in the late sixties, Among other things, students were opposed to the domination of the examiners view in questions of admission to doctoral studies. Instead they wished a board, where also students were represented, to decide on these issues. Among the more distinct criteria for admission, prior research ranked highest. Admission, it was held, should be restricted. The most common motives for pursuing a doctoral degree were intellectual interest and intellectual stimulation, considerations for the future labour-market were not pertinent. Only a minority of students studied on a full-time basis. Most students felt that the division of the institute into different departments dominated by a professor did not facilitate cooperation. Since nost students held lower jobs at the institute on a part time basis, security was felt to be very low. Their jobs depended, among other things, often on the number of students registered each term, or otherwise restricted in time. Most students were, in their own opinion, doing applied research and only a few thought that a division of research into applied and basic was not very meaningful. Students expressed the idea that a dissertation not necessarily had to make use of advanced methods, but that a lack of advanced methodology could be compensated for by an interesting problem. Also, they regarded empirical work not as a 'sine qua non' for a dissertation, instead a thorough theoretical analysis was regarded as sufficient,

Abstract: The aim of this study is to compare two different forms of instruction and examination in a course of political science. This report is the second part of the final report. In the first part, published in 1974, we tried to show that the educational goal in courses of political science ought to be formulated as "good political belief systems". In this report we first deduce instructional conditions from such a goal. As those conditions and our two forms can be characterized as "group-centered" we also look in the literature at the results from comparisons between such a form and other forms of instruction. After that we penetrate the thoughts behind group-centered instruction and presents findings of relevance from the research on small groups. From the literature we continue to the results from our own empirical comparison. The results show that when the students are examined through continous groupdiscussions this have a more positive influence on self study and instruction than when they are going through written examination at the end of the course. At the fullfillment of the goal, however, we could not find any differences between the two forms. Finally the problem of control is also treated.

Z 1 8 ABSTRACT OF CURRENT RESEARCH Author: Inst.: Department of Education Fil dr Sigbrit Franke-Wikberg University of Umeå and Fil dr Martin Johansson Umeå School of Education Title: EVALUATION OF TEACHING - An Analys**is** of Problems and some Empirical Studies at the University Level Utvärdering av undervisning. En problemanalys och några empiriska studier på universitetsnivå. Bibliographic reference: Akademisk doktorsavhandling, Umeå universitet, Pedagogiska institutionen, 1975 Title of project: Evaluation of university teaching at institutional level Key words: Evaluation, university teaching. Abstract: The empirical studies have been carried out within a certain model. In one study we have tried to use the model as a whole. Courses in Mathematics, English and History have been evaluated. Background information has been gathered about teachers, students and about content, organization and general setting. Observations of the teaching process have been an important task and the students have taken down the time for their home studies. Several types of output-data have been used. Support for working within a model like this is given from an investigation carried out in a more extensive way. By using the critical-incident technique the study situation is described primarily from the view of the students. Some studies concern the field of preknowledge. A survey of which departments at the Faculty of Arts and Science that use pretests has been carried out. Reasons for having such tests are discussed. Demands from teachers about the preknowledge of the students are investigated and a technique for making pretests better has been tried out. The overall picture we have got of university teaching is discussed in connection with its intentions. Experiences of our evaluation strategy and of the techniques we have used are given.

Key words:

Recruitment, transition, qualification, secondary school, higher education, educational choice, longitudinal, prediction.

Abstract:

The project is carrying out a follow-up study on a sample of Swedish students who graduated from upper secondary school in 1970.

The report describes the development of a model for the transition from secondary school to higher education. A major feature of this model is that the analysis was performed on homogeneous subgroups of students, i.e. on groups who possessed the same formal school leaving qualifications. The empirical analysis focused on those students with the lowest average grades who therefore had a limited choice of university faculty. Multiple Classification Analysis (MCA) was used to identify factors that discriminate between students who continued their education at university and students who did not. The results show that educational aspirations played a decisive role for both girls and boys. However, the other important factors were different for girls and boys. Amongst girls social class was important, but for boys the effect of social class disappeared when other factors were taken into account. The boys'pleasure in reading and their perception of their parents' encouragement to read were important mediating factors. The results differed slightly for each type of secondary school course.

Perceptuell snabbhet has mentalt retarderade. En analys genom visuellt enkelt reaktionstidsexperiment.
Perceptual speed of mentally retarded. An analysis through a visual simple RT experiment.
Bibliographic reference:
Rapp. Psykol.avd., Ulleräker
Title of project:
Mental Retardation Project
Key words:
reaction time, mental retardation, perceptual speed

Abstract:

In the search for factors explaining the difference in speed found between mentally retarded persons and normals, simple reaction time experiments have frequently been used. In the present study geometric form was introduced as the stimulus dimension in a simple RT experiment. Two conditions were used:

1. Dissimilarity between WS - warning signal - and RS - reaction signal - (triangle and circle respectively).

2. Identity WS/RS (circle).

An effect related to condition emerged in the initial state of the experiment. This result was contradictory to those found in studies varying intensity and modality. Further analysis showed that the effect remained with IQ-level kept under control. Data indicated however a general difference in RT between two groups of different IQ-levels.

In a second experiment, a design with an earlier shift of stimulus condition was used to reduce the possible effect of adaptation to the experiment situation. The results point to the importance of considering the subjects earlier experience of the experimental situation, as well as their intellectual level, in choosing the moment of introducing stimulus variation in experiments of this kind. The results were analysed in terms of "response set" and "perceptual shift" hypotheses.

Rapp. Projekt Mental Retardation, Ulleraker

Title of project:

Mental Retardation Project: Evaluering av öppna vårdformer

Key words:

mental retardation, parent education, evaluation

Abstract:

The purpose of this study is to evaluate parent education, which have been arranged for parents with mentally retarded children by Östergötlands county council. Participants from 9 courses (50 families) answered a questionnaire about the lasting effects and their evaluation of the courses.

The results indicate that the terapeutic effect for parents of handicapped children was the opportunity to meet and exchange views. What they learned during the courses about the possibilities for their children also gave them hope for the future. The courses also make it easier for parents to establish contact with staff and thereby develope relations between family and institution, for the benefit of the child.

Though the results indicate that this kind of parent education should and can be improved in many ways, they fill a function in their present form, namely that the parents are given an opportunity to face their own feelings towards the child and they consider that attending the course has made it easier for them to accept the child's handicap.

Bibliographic reference: Gleerup, Lund, 1975	
Studia psychologica et paedagogica, No. 29	
Title of project:	
Psychological studies of the deaf. Methodolo group. Structure of abilities and cognitive st	gical problems specific to the yle.
Key words: Cognitive style, deaf, latent profile analysis sex difference.	, personality assessment,

Abstract: The investigations form part of a larger project with the overall purpose of developing methods for psychological assessment of deaf students. The objectives of the report is to describe various characteristics in the deaf and study the performance in different subgroups. Results are reported of various measures of abilities and achievements, teacher ratings and cognitive style (defined by performance in the Rod and Frame test). The data were analyzed with regard to level and structure. Subgroups were isolated by means of latent profile analysis. The predictive power of teacher ratings was described by linear multiple regression analysis of the teacher ratings versus different test variables. The performance in the Rod and Frame test was analyzed in the series of trials in an attempt at mirroring adaptive processes. - Results: A stronger association between deafness and poor language ability was obtained for the boys than for the girls. The study of subgroups illustrated that mean values of results in deaf groups may give a false picture. The means were reduced by a group of very low performers. This subgroup contained a majority of students who se medical records indicated complicating disorders. The analyses of teacher ratings gave different factor structures for the differents sexes and showed differences in the arediction of test results. The analyses of an entries style indicated different adaptive processes in deaf and hearing subjects. The results were related to descriptions of personality characteristics in the deaf and the question raised whether common principles in education and training of the deaf offer the best opportunities for personality development.

and adjustme retarded and tion is base compulsory e	nt between a g a group of bo d mainly on se	roup of hoys wl ys with average lfdeclared data military servio	no are borderl e intellectual a collected as	differences in background ine or mildly mentally functioning. The description a normal routine at the 8-year-old boys. A sample		
The results indicate that the low-level group has a larger frequency of severe background circumstances and inferior personal as well as social adjustment. In addition to the description, a criterion of social adjustment is constructed, with the purpose of investigating the correlation between, on the one hand, background factors and personal adjustment and, on the other hand, social adjustment. The results indicate a strong such correlation in both of the groups concerned. The adjustment criterion is also used in an effort to isolate factors predestinating poor social adjustment. The results can, however, not be given an unequivocal interpretation in this respect.

performance

The effects of tobacco smoking on psychological and physiological functions were studied in human habitual smokers. The results showed that cigarette smoking may lead to the same kind of changes in verbal learning as have been observed for other arousing treatments (e.g., task-induced arousal, noise, high incentive, etc. Smoking a cigarette is thus found to cause a significant decrement in serial recall, but items learned seemed to be better remembered in comparison with non-smoking at a 45-min delayed retention test. It was also shown that the attentional field might be more narrow and focused during cigarette-induced arousal.

Effects of tobacco smoking on psychophysiological functions

Cigarette smoking, alcohol intake, arousal, learning, memory,

Furthermore, the results implicated that the effects of smoking may interact with smoking habits and situational factors. The psychological effects of smoking differed characteristically for habitual "low-arousal smokers" and "high-arousal smokers" when examined under laboratory conditions designed to induce either low or high levels of arousal.

Finally, the results supported the hypothesis that smoking may modify effects induced by alcohol, the interaction being synergistic for peripheral arousal and tests of motor coordination, but antagonistic for tests of reaction time and mental arithmetic.

Reports from the Department of Psychology, University of Stockholm, 1975, No. 455.

Title of project:

Effects of tobacco smoking on psychophysiological functions

Key words:

Cigarette smoking, arousal, free recall, incidental memory

Abstract:

The effects of cigarette smoking on an immediate memory task were studied in two groups of 25 female students (habitual smokers) tested either under a control (no smoking) condition or after smoking one cigarette. The memory task, requiring immediate serial recall of eight words, showed no differences between the two groups. Subjects were, however, also tested on recall of the position of words on the screen (each word could appear in any of the four corners). On this measure of incidental recall, the non-smoking group was far superior to the smoking group. This finding is in agreement with results obtained with noise-induced arousal and with the view that attentional selectivity is greater during increased arousal.

Abstract: Olfactory bulbectomy of sexually inexperienced male rats prevented the occurrence of sexual behavior in most of the operated animals. This effect was observed in rats bulbectomized before puberty as well as after puberty. Bulbectomized rats which had heterosexual experience prior to the operation did not deviate from intact rats. Males living in cohabitation with intact males prior to the operation showed only minor deficits in their mating performances. It was concluded that the olfactory lobe while of only minor importance for maintenance of mating once sexual behavior has been initiated, plays an important role in initiation of sexual behavior of the male rat. Furthermore, since treatment with testosterone of prepuberally bulbectomized rats and not stimulate the animals to sexual activity, it was concluded that the sexual impairment following bulbectomy of isolated males presumably is not due to an impaired production of gonadal secretions.

Effects of tobacco smoking on psychoph siological functions
Key words:
Cigarette smoking, alcohol intake, catecholamine excretion, heart rate, hand steadiness, reaction time

Abstract:

Effects of alcohol intake (single dose, 0.72 g/kg body weight) and cigarette smoking (5 cigarettes smoked within 175 min) were examined during a 3-hr period in 12 healthy male subjects with moderate alcohol and tobacco habits. The results indicated synergistic interaction between alcohol and cigarettes for the variables heart rate (increase) and hand steadiness (impairment), but antagonistic interaction for skin temperature and reaction time. The cigarette smoking tended to counteract the deleterious effects of alcohol on performance in simple as well as choice reaction-time tasks. Blood-alcohol levels were not significantly influenced by smoking.

Title:
Involvement of monoamines is the medicator of lordosis behavior.
Bibliographic reference:
Sexu Behavior Pharmacology and Biognomistry,M. Sandler and G.L. Gessa (Eds.) New York: Raven Press, 1975
Title of project:
Key words:

Abstract: Sexual receptivity in the female rat is strictly regulated by ovarian hormones (cf. Young, 1961). The most prominent feature of this behavior is the lordosis response, this response in combination with other signs of female receptivity is correctely abolished by removal of the ovaries. Receptivity in spayed animals can be restored by appropriate treatment of estrogen alone (Davidson, Smith, Rogers, & Bloch, 1968) or, more reliably, by a single estroger injection followed by an injection of progesterone (Boling & Blandau, 1939; Beach, 1942). It has further been shown that in the latter case the progesterone injection can be replaced by drugs known to interfere with central monoamine (Meyerson, 1964a,b). A major objective in the work with such neurotransmission neuropharmacologic agents has been to determine the relative importance of the monoamines, norepinephrine (NE), dopamine (DA), and 5-hydroxytryptamine (5-HT) in the mediation of the estrogen-drug-induced lordosis response. Studies on the effects of tetrabenazine, reserpine, and parachlorophenylalanine, drugs known to deplete brain-tissues of nomoamines, as well as studies on the effects of a monamine-oxidase inhibitor in combination with various monoamine precursors led to the suggestion that primarily central 5-TH has a regulatory function in the mediation of the lordosis response in the female rat (Meyerson, 1964a, Meyerson & Lewander, 1970). Experiments performed in this laboratory on a possible additional role of the catecholamines, NE or DA or both in the mediation of estrogendrug-induced lordosis are reviewed, followed by a discussion of the possible mechanism by which drugs known to interfere with central monoamines may act to in duce a lordosis response in estrogen-primed ovariostomized rate.

The paper is focussed on consequences of new developments in communications technology on man as a biological organism and social being. The inability of the regulatory mechanisms in the brain to maintain an optimal level of functioning at low and high levels of stimulus input is emphasized, and methods for monitoring physiological reactions to stimulus underload and overload are outlined. Social and psychological implications of information overload are discussed, and a distinction is made between overloads of information, pseudo-information, and noise. Pub. date: Pages: Swedish Final Piss. (Akad. avh.) English Progress Master's thesis (Psykologex.arbete)

ABSTRACT OF CURRENT RESEARCH 26				
Author: Frankenhaeuser, M. and Johansson, G.	Inst.: Department of Psychology University of Stockholm Box 6706, S-11385 Stockholm			
Title: Task demand as reflected in catech olamine	excretion and heart rate.			

Key words: Stress, arousal, compensatory reactions, Stroop test
Abstract: Immediate effects and aftereffects of exposure to a color—word conflict task were studied in two groups of subjects, one of which performed the task without auditory interference ("single conflict"), the other with auditory interference ("double conflict"). Phy siological arousal indices were more susceptible than performance measures to the level of task demand. Thus, the higher task demand of the "double conflict" was reflected in relatively larger increases of adrenaline excretion and heart rate, both during the conflict task and during the subsequentarithmetic task, whereas the performance measures remained unaffected.

Abstract: Human psychophysical data were compared with the activity in single mechanoreceptive afferents in man and monkey during dynamic displacement of the glabrous skin of the palm and sole both of which are richly indowed with rapidly adapting intra-cutaneous receptors. The apparent velocity was an inverse function of the interspike interval. The central nervous system seems to interpret a decreasing spike interval as an increasing velocity of the deformation of the peripheral tissue.

Biopsy samples, expletal muscle fibre distribution, capacity, interest in physica
activities, oxygen uptake, 9 -minute run/walk

Abstract: The aim of the investigation was to study skeletal muscle fibre distribution, capacity and interest in different physical activities and the relations between these variables among students in grade 1 i high school. Biopsy samples were taken from matus lateralis of 69 boys and 47 girls. The students performed a submaximal and a maximal ergometer test in order to estimate their maximal oxygen uptake. One test of endurance (9-minuter run/walk), four tests of dynamic strength and three tests of static atrength were carried out. They were also give a questionnaire aiming at finding out their attitudes to different types of physi cal activities and what physical activities they participate in during their spare time. The human skeletal muscles substantially consist of two tyres of fibres frequently called type I and type II. In the results of this investigation the skeletal muscle fiber distrubution is given as the percentage type I fibres in the investigated sample. The results showed that the percentage type I fibres was normally distributed and that the standard diviation was very large among the students. For the boys there were significant relations between the percentage type I fibres on one hand and result in the 9-minute run/walk test, attitude to cross-country and long distance running on the other. For the girls a corresponding relation did not occur. The relations between estimated maximal oxygen uptak on one hand and result in the 9-minute run/walk, attitude to cross-country and Long distance running on the other were higher for the girls than for the boys. Students with high percentage type I fibres considered themselves as being more active than their schoolmates of the same ages than was the case with students with low percentage type I fibres.

BjörnF lis ing		Pedagogi ska institutionen Lärar högskolan i Mölndal		
Title:				
	NING-HANDLING. En s ngspunkt i personalens a	studi e a v s ocialisation spr ocess <i>e</i> n aktivitet		
INSIGHT-GOALS-A	ACTIONS. A study of the cial attention to the acti-	e socializationsprocessinday-care vity of the personnel.		

Abs tract: This study is part of a research project in which the socialization in nursery: schools was studied. The report deals with the problems of collectivism versus and ividualism in day-care socialization. The cemtral que stion was: How does the day-care institution influence child socialization and what part does the personnel play in this process? The researcher has, together with personnel at one day nursery institution (5-7 year-olds), analysed and in some parts reformulated the working methods, the personnel's goals, their opinions and knowledge of children and of therms elves and their own work. The study can be defined as a kind of action research and used unstructured interviews, discussions, participant observation and a number of attempts to test the discussed ideas. The main goal of the present study was to raise both the personnel's and this investigators understanding of day-care problems and children's situation in day nurseries. This understanding was expected to stimulate the personnel to formulate their own goals for their work and, as a consequence, to reform their activities. The report consists mainly of discussions of some examples and hypotheses. The examples are seen in relation to the personnel's awareness and understanding. The activities, rules and routines in the day mursery and the influence of these factors upon child socialization are discussed.

Abstract: The report present sintroductory lectures, summaries of discussions and introductory documents (summaries of the advance material that was sent out) from two conferences antitled "Cooperation preschool-primary school". Both conferences were initiated by the National Board of Education and arranged by the FOL-project at the Malmö School of Education during the spring term of 1975. The first conference dealt with questions of methodology and policy of research and development work in connection with preschool-primary school. The conference was directed primarily at researches and was based on the work of the project. The purpose of the second conference was to discuss with the consumers of the project's activities ways in which the preschool and the primary school can cooperate. Representatives from national and local authorities, teachers' trade unions, parents' organizations, teachers and researchers participated in this conference.

Title of pr Socialisati The Social	onsprocessen	i förskolan ss in Pre-schoo	1		
Key words: Socializati	on, Day Nurs	ery, Child rear	ing		
Abstract: The report describes and analyzes interviews with the parents (mostly mothers) of 30 children, 5-7 years old, in two day care centres. The study was part of a project in which the children were observed for about 8 months. The aim was to analyze what function day care plays for the child and his/her family. The questions were open ended, the following problems were penetrated: 1) The relations between the parent's social and emotional relations with the child (e.g. type of contact, awareness of problems) and his/her experiences of the degree to which the child's needs (emotional, social and intellectual) are satisfied in the day care centre. 2) In what way, according to the parent, day care has influenced the child. 3) The parent's experience of the cooperation with the personnel and suggestions for improving it. The results showed that the experienced effects of day care are closely related to family life conditions, the parent's relations to and his/her ambitions and expectations for the child. Most parents felt that day care was not sufficient to satisfy the child's emotional needs fully, while social and intellectual needs were well fulfilled. Most parents whished to see the function of day care as an "extended home". Better integration between day care and family socialization was emphasized. The function of day care in relation to child development, parental needs and social policy is discussed in the report.

Abstract: Demands and expectations made on class and special subject teachers are used as variables in three sections of a questionnaire. The variables are described at different levels of verbal abstraction. Some 750 school-leaders and teacher trainers have evaluated the variables in relation to the importance to the teacher's occupation and to the adequacy of present-day teather education. The results vary according to levels of description, indicating possible conflicts between the abstract formulations of demands and expectations and the more practically anchored situation with reference to the teacher's occupation.

Abstract: The report describes the experiences of a staff discussion-group on a ward in a home for mentally retarded adults. The purpose of the group was to discuss problems which the staff experienced in their working situation. The description concerns a) how the group developed and how the authors functioned in it and b) how the staff described their working situation. This gave an increased understanding of how the organizational structure influenced the work on the ward and the behavior of the staff.

			·····		
Abstract: The report summarizes answers to a questionnaire given in 1973 to all teachers at eight upper-grade schools with different types of organization and building design in the Malmö-region. Among these are two openplan schools. Goal priorities and attitudes towards different teaching functions are explored and also the teachers' demands and expectations on the pupils. The attitude towards certain organizational traits, grouping of the pupils, organization of the teaching matter, planning and shaping of the remedial teaching has also been studied. Generally speaking teachers in the different school types have shown a similar attitude towards most of the questions studied. The biggest differences have been found between teachers in different subjects. Cognitive and cooperative aims have been valued higher than creative aims by most teachers in theoretical subjects. Creative aims have been valued higher than cognitive by teachers in practical subjects and by remedial teachers. Traditional ways of organizing the teaching have on the whole been valued higher than flexible grouping, integration of subjects and team teaching by most teachers in all schools. Yet teachers in schools with most experience of flexible organization and younger teachers have been more positive towards such organization of the schoolwork than other teachers.

			<u></u>		
Abstract: Two variants of a simple run-test was used for determining physical working capacity. In the first one the subjects ran three 800-meter courses and in the other two 1200-meter courses. The velocities were steered by means of verbal instructions and the subjects' perception of velocity. The velocity actually used to cover the distance was utilized as a measurement of the performance. The pulse frequency and the subjective exertion taken immediately after the run was used as measurements of the individual effort to accoplish the performance. On a later occasion a 1500-meters race was performed individually with maximal velocity and on still another occasion a bicycle test was carried out. The results in the two courses were plotted in a diagram with the pulse frequency or the subjective exertion against the velocity. Through the individual points "fitting curves" were drawn related to the results of the whole group. The velocity at a certain "exertion-level" was then calculated. High correlations were found between the two run-tests, and between these and the ergometer test and the 1500-meter run. The run tests thus seem to be valuble methods to determine physical working capacity.

Life change	e, diagnostic g	r o ups, scaling	g, experience	d and non-experienced		
Abstract:						
Myocardial infarction (MI), neurosis, and lower back pain patients, and matched control subjects estimated the subjective importance of 46 life change events. They estimated (1) the degree of effort necessary in adjusting to them, and (2) how upsetting they were. The estimates of "adjustment" were on average higher than those of "upset". The neurosis patients gave higher values than their controls. Total life change scores were calculated (1) according to the subjects' estimates of recently experienced life events, and (2) according to their estimates of non-experienced events. It was found that the first type of scores discriminated better between the two groups than the second type. The results indicate that different forms of psychological scaling may be used to improve the predictive value of life change data.

Title: Förekomsten av test-wiseness och möjligheten att påverka den via instruktion En tvärsnittsstudie. The occurence of test-wiseness and the possibility of inducing it via instruction A cross-sectional study.
Bibliographic reference:
Pedagogiska rapporter, Umeå, 1975, No 51
Title of project:
Test Theoretical Research/Principles of construction for objective tests
Key words: Test-wiseness, item-construction, reliability, empirical validity, item difficulty, instruction, cross-sectional

Abstract:

In the present study the occurence and the possibility of inducing "test-wiseness' have been studied. The study has been cross-sectional and has been carried out in grades 6 and 9 in the compulsory school and in grade 3 in the gymnasium. Two experimental multiple-choice tests, one correctly constructed (PART I) according to existing item construction principles and a parallel version to this but imperfectly constructed (PART I') and a control test (PART II) were given under two different instructional conditions, viz. "neutral" and "reinforced" instruction. The results showed among other things that students who took the imperfectly constructed test (PART I') achieved better than those who took the correct one (PART I). With the "reinforced" instruction this difference was still more expressed. An ANOVA showed that no significant "Instruction" existed. An ANCOVA with the result on PART II as control variable showed that received differences in testresults between groups with different experimental tests were not a reflection of actual differences in knowledge between the students. Finally, some implications of the obtained results are discussed. Among other things some recommendations for item construction and test use are given.

Abstract: The dimensions of perceiving other people were compared from two types of data, one representing a person's individual constructs and indexed by two different rating methods (Reptest technique and Similarity Ratings), the other constructs provided by the experimenter, also measured by two methods (Semantic Differential and Personality Differential). Thi rty-one female psychology students, rated fifteen role figures by using the four methods. Indices of factorial and cluster similarity of roles showd that the different rating methods yielded highly similar role structures. Each congruent factor and cluster could also be characterized by identical trait properties, but there were also important differences between the methods. Especially family roles formed factors and clusters that were not similar in the four sets of data. The results are discussed within the context of Kelly's personal construct theory.

Cognitive variables on personality

Key words:

Socialization, role taking, CPI, personality scales, maximum likelihood factor analysis

Abstract:

The California Psychological Inventory Socialization (So) scale is assumed to measure a dimension of socialized behaviors based on role-taking ability (Gough, 1960). Some studies have reported that the internal structure of the So scale may be complex. The present study tested its dimensionality in three groups of male and female, criminal or noncriminal subjects. All So items except one were used, divided into six subscales (Rosén & Schalling, 1974). The number of factors producing the correlations of subscales was tested in maximum likelihood factor analyses made separately for the groups. The results made a single factor seen reasonable. The variance-covariance matrices differed significantly for the groups. The fit of a one-factor model for all three groups was therefore tested in a simultaneous factor analysis for several populations (Jöreskog, 1971) and good fit obtained.

Factor analysis	s, elderly, old	people,	attitudės			
Abstract: The major objectives of this study were to explore the factorial dimensionality of 42 attitudinal items designed to measure attitudes concerning old people, and to compare these factor structures in two groups. Respondents were divided into a younger group (370 persons aged 30-65) and an older group (337 persons aged 70 and 75). Factor analyses were run independently for each group, providing obliquely rotated factors. Six pairs were judged to be congruent and sufficiently reliable: Work, Welfare, Social Work, Dwelling, Gatherings, and Administratorship. One postulated factor emerged in the older group alone and was named Housekeeping, the conceptual counterpart of which split into two conjugate factors in the younger group. Second-order factor analyses yielded two comparable sets of three second-order factors: Social Activities and Self-Care Ability, whereas the third factor connected high welfare with age-segregated dwelling (and low welfare with age-integration).

				· · · · · · · · · · · · · · · · · · ·	
Abstract:					
The problems discussed have their origin in research on methods concerning measurement of mood by means of adjective check lists. Effects of different types of response-formats on correlation—structure and factorpolarity were discussed. A symmetric and ordinal format was thereby put forth as giving the most parsimonius description of the mood-dimensions. Because of the list construction, with hidden pairs of opposites, the within pairs correlations were especially scrutinized. They were found rather small and not to be considered completely polar opposites according to the semantic differential scales. In comparison between rated degree of opposition within the adjective pairs and correlations extracted from different response-formats a symmetrical and ordinal format produced the highest relation. Thus, the relation between correlation and similarity, produced in a number of studies, can be transferred to opposition and negative correlation as well. Considering homogeneity of processes the relations referred to were found of importance in that they indicated a common underlying process steering different overt behaviors.

1812, whose major task was to produce a new ordinance to replace the then- current School Ordinance. Reports from consistories, etc. and the results of questionnaries furnished important starting points. Various factors in- fluenced the Commission, which emphasised the develoment of the person and the personality as a whole, respect for others, and patriotism. The econo- mic aspects were considered. Conservative utterances were opposed by demands from eager reformers. Considerable interest concerned the relative weights given "formal" and "material" education. To a certain extent external ideas such as "new humanist" thinking, were also accepted. According to the Com- mission's suggested Ordinance, made law in 1820, the former trivial schools were replaced by 2- or 3-class "apologist" schools and 3- or 4-class grammar schools. The gymnasiums (4-class schools) remained unchanged. Teaching in the apologist schools was concentrated to above all general educative sub- jects and modern languages. The grammar schools emphasised Latin, Greek and mathematics. This concentration was somewhat lessened in the gymnasiums, allowing more time for e.g. the natural sciences: Considerable emphasis was given Church oriented instruction in music and singing. Gymnastics also be came recognised.

ABSTRACT OF CURRENT RESEARCH Author: A. Harry Passow, Harold J. Noah, Imst.: Institute for the Study of International Problems in Education, Max A. Eckstein, John R. Mallea Stockholm University Title: The National Case Study: An Empirical Comparative Study of Twenty-One Educational Systems Bibliographic reference: International Studies in Evaluation VII. Stockholm: Almqvist & Wiksell International; New York, London, Sydney, Toronto: John Wiley & Sons. Halsted Press, 1976. Title of project: International Association for the Evaluation of Educational Achievement Key words: National educational systems, social systems, comparative education Abstract: The study is a large-scale attempt to elucidate the close and intricate relationship between the educational sub-system and the socio-politico-economic system at large. For example, comprehensive schools are said to "lower standards"; centralized educational administration is believed to raise student achievement; achievement is supposed to gain from a high innovative capacity of the school system. The National Case Study is an attempt to find out if such "conventional wisdom" is supported by the facts. Previous volumes from the Six Subject Survey reported analyses focussed on students and schools, and took a micro-approach in explaining differences in cognitive outcomes, whereas the present volume takes a macro-approach in looking at entire national systems of education. It makes a pioneering contribution to empirical comparative education.

Recruiting Folitical Elites in Sweden	
Key words:	
Recruitment Elites Party activity	
Abstract: The central purpose of the stuquestion of why individuals enter politi	cs in Sweden and to identify and
explain the forces at work in molding the participate in political life. According	e pool of candidates who will activel ly, we do not discuss the internal
party selection process but rather focus	on the more difficult problem of
why individuals turn to politics in the extent analogous to those models used wi	first place. Our model is to some thin modern economic theory. As
a point of departure we recognize that a	t a given point time. the society
can be said to supply a given number of that the set of individuals actually inv	political posts. We recognize further
(and those considering involvement) must	consider the "costs + berefits"
connected with continuing and entering p	olitics. From measurement of these
factors, the "demand" of politically inc	lined individuals for the available
political posts can be estimated. In Swe elite is almost entirely a function of t	he political parties. Accordingly
the data used in our analysis is almost	exclusively derived from interviews
with party representatives ( $N=1200$ ). Thos	se interviewed were presented with
a set of written questions. These were f viewee judgements as to what considerations	ormulated to elicit from the inter-
involved in and/or considering political	careers. The questions asked for
indirect judgements, and were not intende	ed to probe the reasons that the
interviewee himself entered politics. Ra	ther they were intended to elucidate

Socialization into Sport Involvement: A Cross National Study (The Swedish part of the project)					
Key words:					
Socialization, athletics, olympic games, attitudes, youths					
Abstract:					
Background: In 1971 a research group a	t the University of Waterloo,				
Canada under the direction of professor	Canada under the direction of professor Gerald S. Kenyon started an				
international research project on socialization into sport. About 15 countries take part in the project. The Swedish part of the project started					
in 1973. The major objectives of the project as a whole are: to determine					
the degree of socialization into sport involvement; to explain the process					
of socialization into sport involvement as it applies to the general population and the elite athlete.					
and the elite athlete. Method: Structured interviews with a random sample of 472 adolescents					
(age 15-16) in grade 9 in the Swedish school system.					
Results: This report is restricted to the	e questions (items) which measured				
attitudes to olympic games (affective sport involvement). Among the results can be mentioned that a great majority (90%) are positive to olympic					
games. The adolescents think that the olympic games should be continued

''Det är inte lätt att göra sej så säker". Utvecklingsstördas upplevelser av att bo på integrerat inackorderinghem. ''It's not easy to make oneself confident". How mentally retarded experience their situation in integrated group homes.
Bibliographic reference:
Rapp. Projekt Mental Retardation, Ulleräker, Uppsala
Title of project:
Mental Retardation Project: Evaluering av öppna vårdformer.
Key words: mental retardation, integrated group homes

#### Abstract:

The study is based on interviews with 61 mentally retarded adults living in integrated residential units, group homes. The main purpose of the study was to describe how they experience their situation in integrated group homes. The result are given in three parts: 1. The interviewees experiences of this kind of residency. 2. Effects of integration. 3. Change in self-image.

The study shows that: normalized conditions of living, i.e. physical and functional integration, are important for the mentally retarded personally. Normalized conditions of living do, however, not automatically lead to selffulfillment or social integration.

The study indicates the importance of the quality of treatment for reaching the goal of normalization. A treatment that is based on the experiences of the retarded is required in order to fully take advantage of the possibilities which integration offers.

Abstract:  There seems to be a pessimistic attitude in many countries as to the effects of public schooling, and this seems to apply also to special education. But studies which have led to a pessimism concerning the efficacy of special education are often open to criticism. We need more discussion on a theoretical basis than we have had. We have to contemplate research data constructively and with this approach work for improved future strategies. Two theories of treatment are compared. They are called (1) The simple integration theory and (2) The intensity theory. The author suggests that the latter theory is the more promising one for research directed at analyzing optimal conditions for different aspects of remedial teaching.

Key words:
Microfiche, partially sighted, reading aids.

#### Abstract:

The purpose of the present investigation was to study whether microfiche technique may be considered as a practicable reading aid for the partially sighted. Two studies were carried out in this connexion. The first consisted of a selection of the 3 microfiche apparatuses (out of the approximately IOO commercially available) which could be considered most appropriate for the partially sighted. The second consisted of an evaluation of the usefulness of these selected apparatuses for the partially sighted. In order to asses this, microfiche was examined together with other commercially available reading aids (in this particular experiment, optical aids and closed-circuit TV). The subjects consisted of 9 partially sighted persons, all of whom had received adequate optical equipment and teacher-led reading training before the test took place. Four had been trained in the use of closed-circuit TV. The tasks for the subjects consisted of reading running text and consulting reference works. The results showed that after 5 hours' training in microfiche, almost all the subjects had improved their reading speed. Of the 9 participants, 6 read running text faster with microfiche than with optical aids; 3 of the 4 "TV-readers" read faster with microfiche than with TV. On the other hand, optical aids were superior to microfiche for the use of reference works. In other words, the microfiche technique would seem to be useful for certain partially sighted persons and can thereby furnish a good complement to already available aids

Development, cognition	n, school education	n		
Abstract: The report is to be viewed as a contribution to the discussion on the relationship between pedagogical requirements and theories of development. Mainly attention is focused on cognitive theories.  Two principal questions are analysed: 1) Which pedagogically useful problem areas can be identified with the help of a cognitive frame of reference?  2) In what way can concepts within this frame of reference help to identify actions that can solve pedagogical problems?  In part one of the report concepts within the developmental frame of reference are discussed. The concepts of learning, motivation, communication and development are analysed with regard to pedagogical relevance.  In part two three pedagogical problem spheres are presented. Within these spheres cognitively oriented concepts can be used as relevant pedagogical tools. These spheres have been identified by observations and interviews with children in a special school, i e children with diagnosed learning problems. The first problem sphere is identified as Experiences and Comceptions. The second sphere is characterized as Relating oneself. The third pedagogical problem area falls under the heading of Communication. In part three of the report follows an analysis of the previous parts with regard to pedagogical problems that arise in the practical educational process involving children with problems of learning as well as children who show a more normal pace of learning.

Key words:
Special education; Self instruction; Slow learners; Remedial teaching

#### Abstract:

The purpose of the SISU project has been to develop individualized methods and materials for pupils with learning difficulties. The project started with an inventory of the most pressing needs of self-instructional methods and materials for low achievers. On the basis of this inventory a number of basic skill areas in Swedish and Mathematics were selected for method development. The skill areas represented lower levels of the elementary school curriculum. Within each area instructional objectives were given concrete formulations. Then followed construction of material for some hundred learning items. These were first preliminarily tested on smaller groups of pupils, then revised and later evaluated in a more comprehensive one-year field study with pupils in special classes and clinics. During this period the pupils were observed when working with SISU (process analysis). In addition learning effects as well as pupil and teacher reactions to the material were measured (product analysis). The field evaluation gave evidence to the effect that low achievers with marked deficiencies in basic skills which are fundamental for all further learning can be brought to an acceptable level through SISU-training. Observations of the teaching and learning process showed that the material is largely self-instructional. Only to a limited extent did the teacher have to intervene and give support. Pupil and teacher attitudes to SISU were positive. Parts of the SISU material are presently being produced for implementation in schools.

Title of project: Utvärdering av försöksverksamhet med nya samverkansformer i lärarutbildningen (UFNYS) /Evaluation of experimental work with new forms of co-operation within the teacher training sector/

#### Key words:

Teacher training, student influence, co-operation, co-planning, democracy.

#### Abstract:

During 1971 experiments with new forms of co-operation and student influence were started at the teacher training institutions throughout Sweden. The activities have included giving the students the opportunity of co-operating with the teachers and school administrators on the disposition of the subjects, the forms and the contents of teaching, the scheduling of examinations and other matters concerning the students' school situation.

An evaluation of these experiments is reported and discussed in the present report.

Method: 480 students, 119 teachers and 19 school administrators at nine different teacher training institutions were interwiewed individually and/or in groups. 34 meetings in the different cc-operation bodies were observed.

Some results: Most of the students feel no particular motivation for working in the different co-cperation bodies, but consider that a good way of motivating them would be to give them more real influence. However, an increased student influence in the classroom is considered as the most important thing. Even if the experiments with new forms of co-cperation have had a small positive effect towards an increased student influence, there are still obstacles to reach the desired goal, for example: the marking system and the organizational frames of teacher training.

#### Title of project:

The influence of personality, variables on the individual's perception and evaluation of his own video-recorded behaviours

Behavioral change, closed-circuit television, personality, interaction, simulation, teacher education, theories.

#### Abstract:

This report presents two simulators, an chored to behavioral theories, that are based on an interaction between teacher behaviors and videorecorded student reactions. The purpose is to study student teachers' choice of action in school situations and the degree of flexibility in these actions. In order to check the way in which the student teachers worked with the simulators, the student teachers and the simulators were recorded simultaneously for later self-confrontation via CCTV and videorecording. A detailed description is given of the simulators and their construction, together with the results from a first testing.

ABSTRACT OF CURRENT RESEARCH Author: Inst.: Department of Educational Gestrelius, K. & Gran, Bertil and Psychological Research Malmö School of Education Fack S-200 45 Malmö Title: Lärarutbildning i teori och praktik. /Teacher education in theory and practice./ Bibliographic reference: Esselte Studium, Stockholm, 1975 Pedagogisk orientering och debatt, No. 49. Title of project: Key words: Cooperation, planning of education, schools of education, teacher role, teacher education Abstract: During the late 1960's and at the beginning of the 1970's, a fairly comprehensive research program has been carried on in Sweden dealing with teachers and those in charge of training teachers. The authors of this book have been deeply involved in research activities of this type and present here some of their experiences for teachers and administrators at the schools of education and for tutors connected to the schools of education. A basic theses can be said to be the following: Teacher education should be founded on the concrete tasks with which a teacher is confronted and on those development tendencies which are discernible in the community and in the school. With the support of their teachers, the student teachers should be given the possibility to develop problem-awareness through experience or simulated practice cases. Their own active participation and co-responsibility can be seen as lessons in the practical use of independent learning and interlearning among pupils. Pub. date: Pages: Final x Swedish report Diss. Title of project: The influence of personality variables on the individual's perception and evaluation of his own video-recorded behaviours. Educational search strategies.

Key words: Closed-circuit television, micro-lesson, microteaching, perception, personality, assessment, self-confrontation, teacher education.

#### Abstract:

During the spring term of 1969 and 1970 an experiment was conducted at the Malmö School of Education with the aim of investigating how student teachers" perception and evaluation of their own teaching was influenced by traditional tutoring and self-confrontation, in which the student teachers' watched their own video-recorded micro-lessons. In connection with this experiment a comprehensive test battery was administered, consisting of different personality tests. The aim of the present report is to give a detailed description of eight of the tests and then to relate these tests to the student teachers' perception and evaluation of their own teaching. Taken as a whole, the results indicate that personality variables with a content reflecting an interest related to the subject's own person are important for both perception and evaluation of one's teaching. The various sub-analyses show, however, that other variables of a cognitive and communicative nature have a certain measure of importance in the second micro-lesson. This suggests that at the first confrontation the student teachers react emotionally and with defence mechanisms in the perception and evaluation of their teaching, but that they gradually acquire the ability to be more objective. In other words, the student teacher becomes more aware of various aspects of the interaction between teacher and student.

Abstract: The use of self-instructing materials has labour market training especially, there is because of the variation in the course partledge, and also because course participant courses Self-instructing materials may be course participant's pace and needs. However, the course participant's pace and needs.	ic a great need of such materials rticipents' abilities and previous know-ts are accepted continuously for the used to adjust coursesto the individual

special difficulties when using self-instructing materials because of language difficulties. Therefore, special attention has been paid to thin group when investigating course participants' attitudes to self-instructing materials. 466 course participants who were immigrants and who were atudying at 7 labour market training centres in 1973 took part. A questionnaire, which had been translated to Finnish, Serbo-Croatian and Greek, was used to collect information.

The amount of self-instruction materials being used varied a lot between different courses. In general course participants would have liked less self-instructing materials and more instruction from teachers. 35 f of the course participants felt that self-instructing materials made you work more efficiently. A third (36 %) said that it was difficult to learn things with the materials, but just as many (34 %) felt that using the materials wasn't difficult. The longer the immigrants had taken part in the courses, the easier they felt it was to use self-instructing materials. Almost all said that a good knowledge of the Swedish language was necessary in order to be able to manage self-instructing materials.

residential care				
Abstract: The normalization principle was introduced in a ward of a special subnormality hospital, otherwise run on traditional custodial lines. Four working principles were developed: individualization, systematization, decentralization and integration.				
The programme symmeted in introducing and establishing many improvements and the pattern of care changed towards a more normal way of life.				
This report evaluates the taramme from three aspects. Firstly, the process of change which occurred to any the period. Secondly, an account of staff and patient turnover and their characteristics, conference activities and the ward's relationship to the rest of the bospital. Finally the extent to which the four working principles were fulfilled is accounted for.

Pedagogiska	a rapporter, No	o 2, Lund 1975.				
Title of pr Clientrelat	oject: ced supervision	n.				
Key words: Practicum,	professional (	education, supe	rvision.			
Abstract: A preliminary definition of clientrelated supervision is given. Characteristic of this teaching method is that a supervisor has the responsibility for the treatment of a client and for the instruction of a trainee (group of trainees). The situation should further be of such a nature that the trainee acts more or less as a professional practician.						
A short description is given of the search for literature concerning client-related supervision. Clientrelated supervision is included in the training of e.g. social workers, psychologists, physiotherapists, doctors and dentists. The main part of the report consists of an attempt to view clientrelated supervision from different perspectives. The method is related to purposes of society, professional roles and the organization of the training program. Roles and steps in clientrelated teaching are discussed. The problem of avoiding educational lags in relation to rapidly changing and diffuse professional roles is accentuated. Another problem that is pointed out concerns difficulties in offering the student a richly varied set of supervised training courses — possibly combined with a great freedom of choice for the student — and at the same time avoiding a program which is incoherent and without a profile.						
The report concludes with a short review of the opinions of different researchers concerning accomplished efforts to collect knowledge about the teaching method clientrelated supervision.

Key words: Practicum,	clinical educ	ation, superv	ision, educ	ational objectives.		
Abstract: This paper commences by mentioning some ways of creating relevance in goals for different educational training programs.  How to define goals for different supervised training sequences is discussed. Among other things, agreement between client and practician as to treatment goals and agreement between student and supervisor as to educational goals is touched upon. Information and examples are given of goal documents and the use of behavioral terms and taxonomies in the stating of objectives. There seems to be a need for a specially designed comprehensive scheme of goals for client-related aducational systems.  The following goals are judged as common goals for different university training programs with client contact: to perceive and enter into the professional role, to evaluate one's work, to deepen existing knowledge and acquire new knowledge, to establish and maintain a human and effective communication with the client. Different researchers' opinions of these goals are presented.

Key words: Practicum,	clinical educ	ation, supervis	sion, evaluati	on.
Abstract: The present paper gives a survey of literature concerning the evaluation of supervised education where a client/patient is involved.  Problems and questions have been grouped under three main headings: evaluation of the individual student's progress, evaluation of practical/clinical supervised training, and aids and information used in connection with evaluations.  Under the first heading, problems of grading practical/clinical work are discussed. The question as to the best time for evaluating the student's professional ability is then considered. A survey of different advantages and disadvantages of having the supervisor, the client, a committee, peers or the student himself function as an evaluator is given.  Some twenty designs of different studies from the literature with the purpose of evaluating aspects of clientrelated supervision are presented under heading two. Attention is called to the necessity for crossvalidations, less narrow measurements and efforts to study the long term effects of training.  Under heading three, examples are given of among other things check lists and rating scales used in practical/clinical training and work situations. Risks involved in the use of badly constructed aids are mentioned. The support that a good device can give learning and evaluation is, however, also pointed out.

The purpose interviewing	Abstract: The purpose of this report is to examine some possible ways of drawing up an interviewing training program that could be used in different basic curriculums, where practical work with a client or patient is involved.				
Various kinds of research about interviews and possible goals for interviewing training are reviewed. Truax and Carkbuff's research regarding facilitative interpersonal dimensions is accentuated. Different methods and programs for interviewing training are mentioned. Attention is called to demands for a systemat: approach and goal direction in programs.					
Starting from four criteria for choosing programs to be given special consideration to the project, two such programs are suggested. The programs are laterpersonal Process Recall" by Kagan et al. and "Microcounseling" by Ivey et al. Some characteristic traits of these programs are presented. Empirical work within the project based on the Ivey microcounseling model is shortly described.					
The report concludes with some suggestions for further work with interviewing the uning.

#### Abstract:

Many women have difficulties finding work on the Swedish labour market, often because they lack previous work experience and vocational training. However, labour market training can often be a way out of the jobless situation. The section of occupational education has already published a series of introductory reports about women in labour market training (Y:55-58, K-L Harland). The present investigation is about women's situation during and after labour market training. Comparisons with men are also made. Data concerned 20 412 persons who were taking courses during the autumn of 1972. It was taken from Labour Market Administration records. 47 % of the persons were women.

The women were comewhat older than the men. Fewer women than men had been granted the training because of a handicap (18 vs. 35%). More men had previous vocational training (21 vs. 13%). Men and women usually attended different types of courses. For example, women attended more preparatory non-vocational courses. More men than women had dropped out of courses (25 vs. 14%). Three months after the course, just as many women as men were employed. Not being employed of tack of appropriate work was more usual where women were concerned. The amount of women who were employed after the course varied within different sub-groups. Former house-wives were employed more often than the others while less of the immigrants were employed.

#### Key words:

Companies, education in companies, educational grants, employment policy, labour market training, occupational education, vocational training.

Abstract:
A lot of the vocational training in Sweden takes place at different companies.
Certain forms of this education receive grants from the government. The purposes of these grants often concern regional, labour market or educational aspects. The companies must apply for grants at the county employment board. The trade unions are also bodies whose opinions have considerable weight. They also supervise most forms of company education with governmental grants.

In order to find out more about different types of education in companies, a pilot study was carried out at nine companies in Alvsborgs län, in consultation with the State Commission for Education in Companies. Interviews were held with the administrative staff at three county employment agencies and with employees at the educational office of the Labour Market Administration in order to survey possible problems. Data was then collected from manufacturers, supervisors, teachers, and course participants through interviews and questionnaires.

There are many different types of labour market training in companies. It was sometimes difficult for the companies to find out about rules and administrative procedures. On the whole, people were satisfied with the labour market training and felt that the proposed goals had been achieved. Some problems that were mentioned: Difficulties fulfilling the rule that 40 % of all new employees should be women. Difficulties concerning appropriate educational materials for the courses. Difficulties fulfilling the purpose of offering more general types of education in the companies.

Title of project:
Försöksverksamhet med integrering av svårt rörelsehindrade och andra svårt handikappade i gymnasieskolan. / Trial integration of the severely crippled and
other severely handicapped students in the upper secondary school.

#### Key words:

Attitudes, environment, handicapped, integration of the handicapped, secondary education, study obstacles, vocational training.

Abstract: In May, 1974, the Swedish government and the Stockholm Local School Authority agreed to let severely handicapped students attend the Skärholmen upper secondary school. The purpose of this experiment was integration of the crippled students with the rest of the students. Sweden's parliament had decided that further expansion of upper secondary schools for crippled students ought not to be made before this experiment had been evaluated. The reported investigation is a part of this evaluation.

Eleven severely handicapped student; and two non-handicapped ones took part in the investigation. Questions (in structured interviews) were asked about students background and handicals, choice of main course, the outer environment, living conditions, integration, student care facilities, attitudes towards school and other students, activities during free time, and future plans.

All students felt that they liked attending an integrated school and that they got on well with their studies. They were also pleased with the possibilities of getting around at school. Contacts with non-handicapped students were few and superficial. Many handicapped students had difficulties finding things to do in their free time, mainly because it was hard to get around in the city in their wheel-chairs. Most handicapped students wanted to start work after finishing school, but could also consider continuing their studies. Many were afraid of ending up sitting in their wheel chairs with nothing to do.

#### Key words:

Attitudes, adjustment to work, employment, evaluation of education, follow-up study, labour market training, occupational education, vocational training.

#### Abstract:

Labour market training is a political means of helping those who have a weak position on the labour market, as well as a way of supplying the need of labour with appropriate vocational training. Since labour market training has expanded greatly during the last few decades, it is increasingly necessary to evaluate its effects. The FAMU-group has carried out about 30 follow-up studies of former course participants. As well as a survey of the actual employment situation after the course, the person's adjustment to work and the probable duration of employment have been investigated. Through the follow-up studies, it is also possible to gather useful viewpoints about the course's curriculum and its contents, seen against the background of the working experience that the person has been through after the course.

One of the basic principles of the FAMU group's work is that occasional studies of for example the course participants' employment after the course are of limited value. Therefore, in order to find out more about the effects of the labour market training, different types of studies where the same persons are investigated upon several occasions have priority. So far, over 6 000 course participants from a lot of different courses have taken part in the FAMU group's follow-up studies - mainly by answering questionnaires and occasionally through telephoned interviews. In addition, certain studies of records have been made. In the report about the follow-up studies, results from the studies are summarized.

#### Abstract:

The expansion of labour market training in Sweden means that it is increasingly necessary to evaluate its effects. In occupational education, a stronger connection is needed between the courses and the actual tasks that the person will be confronted with upon employment. Methods of evaluation that have been related both to the goals of the education and to future tasks could help to bring about a more complete evaluation of the education. The purpose of the investigation is to describe the use of goal-oriented milling tests in labour market training. It is possible to compare course participants' results with those of trained milling workers on the same tasks. Information about the course participants' results on the tests (speed, scrapping) was collected from teachers at 69 labour market training centres. At 19 of these centres, milling tests had been used.

All course participants who had taken part in the milling tests during a one-year period were included in the investigation. 139 course participants had taken 695 subtests during this time. Thus the use of the tests are still rather limited. 19% of the course participants were women and 39% were immigrants. Compared with trained milling workers, the course participants were somewhat slower. In general, the course participants' amount of scrapping would be acceptable in industries. There were no differences concerning speed between age groups or between Swedes and immigrants. The men were slightly faster than the women.

Utveckling av läroplaner för yrkesinriktad vuxenutbildning (LYVUX). / Development of curriculums for occupational education for adults.

#### Key words:

Adult education, curriculum, labour market training, municipal adult education, occupational education, telecommunications repairmen, vocational training.

#### Abstract:

Curriculums for vocational training have to be continuously adjusted to changes within the trade, especially when the changes happen quickly. The purpose of the LYVUX project is to produce information necessary for curriculum adjustments both for municipal adult education and for Labour market training. In the reported investigation, occupational requirements were analyzed for telecommunications repairmen specializing in the area of home electronics. 100 repairmen from different parts of Sweden answered a questionnaire about their work. Interviews were also made at different companies with supervisors, administrators, designers and others. There were two reference groups: One concerned with technicalities of the trade and one group specializing in work analysis.

To work as a telecommunications repairman, it is necessary to have a thorough understanding of the electrical circuits in the apparatus. There are considerable numbers of courses offering further training and most repairmen have taken part in such courses. Contact with customers is a very important aspect of the work. The work and the working environment entail both physical and mental strain, which is especially felt by those repairmen who work in homes. In spite of dissatisfaction with wages, most repairmen like their work. Over half plan to continue as repairmen. Most of those who have other plans for the future are considering more technically advanced positions within the field of electronics.

Key words: Attitudes, criterion-referenced tests, goal training, lathe, occupational education, vo	-oriented tests, labour market cational training.

#### Abstract:

Labour market training is training for which a special kind of training allowance is granted by the Labour Market Administration. Since the mid-1960s it has expanded rapidly in Sweden. The cost has increased accordingly. 1973/74 some 100,000 persons took such courses. The main goal of the training is to enable participants to obtain steady jobs.

This is the first in a series of reports about goal-oriented tests and their use in labour market training. Thus the report begins with a survey of the theoretical background. In evaluation of education, more emphasis is placed now upon the course itself, rather than upon the students' achievements. In many cases, goaloriented tests, which measure what the person knows according to certain criterions, may be used for this type of evaluation. 39 course participants from eight labour market training centres answered a questionnaire about the tests. Eight teachers were interviewed and 17 other teachers also answered a questionnaire.

The majority (86 %) of the course participants felt that it was an advantage to be able to take the tests. Over half (69 %) of the course participants felt that taking the tests was more like real industrial work than regular course assignments. All of the teachers felt that the tests helped them to instruct the course participants. A certain amount of insecurity about how to apply the tests during instruction was evident on the part of the teachers. The results of the investigation indicate that use of the tests could for example be increased through a more extensive teachers' manual.

#### Abstract:

The expansion of labour market training in Sweden means that it is increasingly necessary to evaluate its effects. In occupational education, a stronger connection is needed between the courses and the actual tasks that the person will be confronted with upon employment. Methods of evaluation that have been related both to the goals of the education and to future tasks could help to bring about a more complete evaluation of the education. The purpose of the investigation is to describe the use of goal-oriented lathe tests in labour market training. It is possible to compare course participants' results with those of trained lathe workers on the same tasks. 423 course participants took part. Data was mainly collected by a questionnaire that the teachers filled in.

The use of the tests was rather limited: During a period of one year, less than half of the participants in the lathe courses had taken the tests. Only 5 % had taken all ten sub-tests. Compared with trained lathe workers, the course participants worked more slowly, although sometimes they were just as fast. The course participants had a slightly larger amount of scrapping. Older course participants were slower than younger ones. Women had just as good, and in some cases, better results on the tests than the men. No differences were found between immigrants and Swedes. Drop-outs had poorer results on the tests. Those who had been faster on the tests were also employed to a greater extent after the course. Suggestions to help teachers use the recults of the tests in their instruction are made in the report.

#### Title of project:

Forskning om arbetsmarknadsutbildning (FAMU)./Research on labour market training.

#### Key words:

Attitudes, follow-up study, labour market training, office training, occupational education, vocational training.

#### Abstract:

During 1973 six labour market training centres offered as an experiment a new basic course in office work lasting 40 weeks. The group for research on labour market training (the FAMU-group) was requested to evaluate this course before its general acceptance as a labour market training course. Questionnaires were given to 145 course participants during the course (work report Y:46 from the section of occupational education). In the follow-up study, questionnaires were given at various intervals after the course: 1½ months, 6 months and 1 year afterwards.

The number of employed persons had increased from 67 % to 82 % during the year that had passed after the course. The majority had office jobs, many with rather qualified tasks. However, usually typewriting, telephone servicing, book-keeping and/or care of mail was included. Most said that they liked their work, although almost half wished that they could have more qualified tasks. More than half (58 %) were interested in further education. A third thought that such education would make it easier for them to obtain higher positions. A year after the course 7 % were out of work, 4 % were studying and 5 % were taking care of their homes and children.

Departmen		al and Psycholog problem, No. 2		ch, Malmö, 1975;
Title of project: Vocational problems				
Key words: Attitude change, personality change, nursing training, nursing education, patient centeredness				
Abstract:  The report describes a study of changes in attitudes and personality during nursing training. The study deals with an available population from term 1, term 3 and term 5, a total of 290 students. The attitude measurements have been carried out with five Likert scales intended to measure the following attitude factors: (1) Duty-conscious and extrovert attitude to the patient; (2) Concrete, anti-intraceptive attitude to the expressive side of the care; (3) Problem-belittling attitude to the patient's psychological situation; (4) Rational, instrumental attitude to the expressive side of the care; (5) Propensity for over-simplified generalizations and regulation-dependence concerning the expressive side of the care. Personality characteristics have been studied by means of the CMPS test, constructed by Cesarec and Marke. The test is based on the psychogenic needs in Murray's personality theory Analysis of variance shows that significant differences exist between the term groups, concerning both attitudes and personality factors. The differences have been studied more closely by means of discriminatory analysis.

ABSTRACT OF CURRENT RESEARCH Inst. : Department of Educational Author: and Psychological Research Malmo School of Education Sjödahl, L. Fack S-200 45 Malmö Title: En modell för mål sökning vid planering av yrkesinriktad utbildning. /A model for goal seeking when planning vocational training./ Bibliographic reference: Department of Educational and Psychological Research, Malmo, 1976; Reprint Series, No. 193. Title of project: Educational planning for the forestry line in the upper secondary school Key words: Models, job analysis, vocational training Abstract: In the work psychology literature many theories about the work role are pr sented. Some of these theories are normative while others have amore descriptive character. The author presents a model specially adjusted for the planning of vocational training. From this model the following groups of variables are generated: 1. Goal a spe cts 2. Subject aspects 3. Organizational aspects 4. Training aspects 5. Future aspects 6. Situation aspects 7. Motivation aspects 8. Decision aspects 9. Feed-back aspects 10. Consequence aspects.

Title of project: Educational planning for the forestry line in	n the upper secondary school.				
Key words: Models, research method, research planni	ng, systems analysis, theories.				
Abstract:  Choice of models by the researcher is discussed in relation to the goal of the research and to those who make use of it. System analytic points of view are discussed, among others, and the author emphasizes that the usefulness of system models is closely connected with how the system in question is delimited.

#### Abstract:

adjustment problems, vocational training.

Author:

Labour market training means that large adjustments have to be made by many individuals. This is especially the case where immigrants are concerned, who often come from countries with completely different educational systems. Many need support and help during their studies. Where labour market training is concerned, special assistents give such help to all course participants. This investigation is about the experiences of 50 assistents while working with immigrant course participants.

Most (70 %) had worked at the employment agencies before their jobs as social workers with course participants. Only a few worked full-time with immigrant matters, but a third felt that full-time jobs working with these matters should be available. Many pointed out that there was not enough time to take adequate care of the immigrants' needs for information and help. Guidance work and information were the most usual services given to the immigrants. Many assistents also helped the immigrants to get jobs. Almost two thirds of the assistents needed interpreters during their daily work, but a third of them couldn't get such help. The assistents (70 %) felt that there was a lack of printed information in the immigrants' own languages, and that they had not received enough information before the course. They suggested that immigrants should receive a better introduction to labour market training courses, for example through a special course, "Vocational life and education" (Arbetsliv och utbildning) which can help them to choose appropriate courses and vocations.

#### Key words:

Attitudes, immigrants, labour market training, language difficulties, occupational education, opinions, vocational training.

#### Abstract:

Since the 1930:s, Sweden has been considered a country with many immigrants. On Dec. 31st, 1973, the number of immigrants was 397 452. Many immigrants need occupational education in order to become functioning employed members of the Swedish society. All are entitled to 2 months of free instruction in the Swedish language. There are many immigrants in labour market training courses. In the reported investigation, a description is given of a group of immigrants taking vocational courses. Among factors described are: Background and abilities, opinions about the course, adjustment concerning the training. Data was collected during 1973 with the help of questionnaires, records, tests and teachers' evaluations. 636 immigrants (49 nationalities) took part in the investigation.

There were more men (79 %) than women (21 %) in the group. Ages varied from 17 to 60 years old. Large variations were also found concerning previous schooling. 30 % had up to 7 years of elementary school. 22 % had gone to school for 10 years or more. About half of the immigrants lacked previous vocational training. Half had had at least 10 years working experience. 52 % said that they had not received enough previous information about the course that they were attending. Many had difficulties with the Swedish language. 57 % felt that they had difficulties understanding the textbooks. However, 62 % said that they knew enough Swedish to manage the course. The majority (80 %) of the immigrants said that they were satisfied with the course. 46 % felt that they would have good chances of getting a job after the course.

#### Key words:

Choice of course, immigrants, information, labour market training, occupational education, vocational guidance, vocational training.

#### Abstract:

In order to choose an occupation and/or an appropriate education, it is necessary to have information about the possibilities op-the labour market as well as about one's own abilities. The purpose of the course "Vocational life and education" is to help the course participants with such information. In the reported investigation, we wanted to find out how two courses, one lasting four weeks and the other lasting ten weeks, functioned. Data was collected through the use of structured interviews during 1974-1976. 195 immigrants took part in the investigation.

Over half (57%) of the course participants were women. Many different nationalities were represented. The immigrants had lived in Sweden for periods of a few months to 15 years. Their previous education varied from four years of elementary school to university studies. Course participants taking both types of courses (78%) felt that the theoretical part of the course had been very useful. They were usually pleased with the information about the labour market and possibilities of getting vocational training. 71% of the course participants taking the short form of the course felt that their practical work experience was useful, compared with 88% of the persons taking the longer form of the course. After the course, 71% planned to continue with further education, 18% were going to start work and 11% had no definite plans.

Key words: Developmen Latin Amen		nternationaliza	ition of Educa	tion, Teacher Training	,
Abstract: A group of Swedish teachers, teacher trainers and others, under the sponsorship of SIDA and the Swedish National Board of Education, participated in a field-trip to South America in June 1973 visiting Chile, Ecuador and Peru, as part of a pilot-program which has been in progress for several years. It's aim is to contribute to internationalization of education within the Swedish school system. Data were collected by means of questionnaires, group discussion interviews and participant-observation.  After a dramatic arrival in Santiago with tear-gas and demonstrations the group discussed the idea that fear if overcome, through contact and identification with people, can create understanding. Identification, a necessary condition for understanding, builds confidence.  Also discussed are the causes of underdevelopment, possible solutions and the extent to which people in the developing countries are conscious of their state of dependence, lack of autonomy. Seeing that one's perception of others' self-respect or dignity is an imp. factor in the recognition of similarity, it is an insight which can provoke dissonance between our ideals and our practice. But, identification alone is not enough. Insight and intellectual understanding are required to assess the situation realistically and deal with it.  This report evaluates only the start and the first phases of a process that hopefully will continue for several years.

Abstract: The part of the enthology written by the editors is an analysis of two basic functions of the capitalist educational system: the celection on a social class basic and the qualification of the labour force for capitalist production. Two theoretical systems are discussed in relation to Swedish reality: to structuralism of Bourdieu and Passeron, which concentrates on the effects of school's transmission of the dominant culture, and Altvater's capital-logic angular value is primarily concerned with the consequences for the educational system of the technological transformations of the work process.

The authors' conclusion is that maither of these theories can serve as overall analyses of the echool states in advanced capitalist societies. However, they are otarized points for a new educational theory which can combat the bourgeois idealogical things; in this field.

# Förteckning över fonder, hos vilka anslag kan sökas för psykologisk och pedagogisk forskning^x)

#### Arbetarskyddsfonden

Adress: Sveavägen 166, 8 tr., 113 46 Stockholm, tel: 08/15 13 00 Upplysningar: Kanslichef Bo Oscarsson,

Byrådirektör Waldemar Nyström

Fonden har till uppgift att stödja sådan forskning och utveckling samt utbildning och upplysning, som kan motverka uppkomsten av yrkesskador och annan av arbetsmiljön betingad ohälsa eller förbättra arbetsmiljön och därigenom främja hälsa och säkerhet i arbetslivet.

Ansökan i 25 ex å särskilt formulär före 1/3 resp 1/9.

#### Magnus Bergvalls Stiftelse

Adress: Skandinaviska Enskilda Banken, Notarieavd., Box 16067, 103 22 Stockholm, tel: 08/763 50 00.

Främjar vetenskaplig forskning genom anslag till svenska vetenskapsmän samt svenska vetenskapliga och kulturella institutioner.

Ansökan i 12 ex å särskilt formulär senast 15/9 (bilagor endast i 2 ex). Utdelning 15/1. Bestämmelser finns.

## Byggnadsindustrins Arbetsforskningsstiftelse (BAS)

Adress: Statens råd för byggnadsforskning, Fack, 102 30 Stockholm, tel: 08/24 81 00

Stiftelsen är ett samordnande organ för främst beteendevetenskapliga och produktionstekniska projekt inom arbetsforskning.

Ansökan på särskilt formulär. Utdelning under året, dock endast vid tre tillfällen avseende belopp över 50.000 kronor.

T)
Uppgifterna i förteckningen har så långt möjligt kontrollerats i augusti 1976. – Kompletterande synpunkter beträffande förteckningen emottas tacksamt av samhällsforskningsrådets kansli (adr. Sveavägen 166, 16 tr., 113 46 Stockholm).

# Ollie och Elof Ericssons stiftelse för vetenskaplig forskning och för välgörande ändamål

Adress: Facit AB, 597 00 Åtvidaberg

Främjar genom anslag och stipendier i första hand teknisk, ekonomisk och medicinsk forskning. Även annan vetenskaplig forskning kan efter styrelsens beprövande erhålla bidrag.

Ansökan före maj månads utgång, utdelning juni-september.

#### Folksam

Adress: Fack, 104 60 Stockholm, tel: 08/22 01 00

Försäkringsbolaget Folksam har tidigare haft fristående organ som t.ex. Folksams trafiksäkerhetsnämnd och Folksams rehabiliteringsråd, vilka delat ut anslag inom sina verksamhetsområden. Dessa
har nu upphört och anslagsfrågorna handläggs centralt vid Folksams
sociala råd och Folksams vetenskapliga råd.

Ansökningar, som skall ställas direkt till Folksam, kan inlämnas under hela året.

Upplysningar: sekreterare Arne Brundell eller sekreterare Stig Åhs, tel: 08/22 01 00

## Stiftelsen Lars Hiertas Minne

Adress: Stiftelsen Lars Hiertas Minne, Eriksbergsgatan 3, 1 tr., 114 30 Stockholm

Upplysningar: Frih. Inger Leijonhufvud, tel: 08/10 94 01

Utdelar anslag för vetenskaplig forskning och för sociala ändamål till såväl enskilda personer som föreningar och institutioner, vilkas verksamhet kan anses vara till allmänt gagn. Ej studiestipendium.

Ansökan före l oktober.

Utdelning i november. Bestämmelser finns.

## Hierta-Retzius Fond för vetenskaplig forskning

Adress: Vetenskapsakademien, Fack, 104 05 Stockholm

tel: 08/15 04 30

Upplysningar: Fru Elisabet Björkman

Syftar att genom understöd främja den vetenskapliga forskningen, framför allt den biologiska, men även ändamål, som tillhör akademiens övriga klasser.

Utdelning i mars vart tredje år. Nästa tillfälle blir 1979. Ansökan på särskilt formulär före 1/1 samma år.

#### Hierta-Retzius Stipendiefond

Adress: Vetenskapsakademien, tel: 08/15 04 30

Upplysningar: Fru Elisabet Björkman

Syftar att medelst utdelning av understöd och stipendier främja i vetenskapligt eller socialt hänseende viktiga ändamål.

Ansökan på särskilt formulär senast 31/12. Utdelning i mars.

## Humanistiskt-samhällsvetenskapliga forskningsrådet

Adress (tills vidare): Sveavägen 166, 113 46 Stockholm, tel: 08/15 15 80

Statens råd för samhällsforskning, som beviljar anslag för socialvetenskaplig, rättsvetenskaplig, psykologisk och pedagogisk forskning eller för publicering av vetenskapliga forskningsresultat inom sagda områden, kommer fr.o.m. den 1/7 1977 att vara sammanslaget med statens humanistiska forskningsråd till ett humanistiskt-samhällsvetenskapligt forskningsråd.

Ansökan på särskilt formulär och bilaga om forskningsprogram insändes i 13 ex (andra bilagor i 2 ex) före den 1/2. Utdelning sker under våren. Bestämmelser finns.

399

#### Idrottens forskningsråd

Adress: Riksidrottsförbundet, Strömsborg, Box 1216,

111 82 Stockholm

Upplysningar: Artur Forsberg, tel: 08/23 37 20

Idrottens forskningsråd inrättades 1970 för att inom Riksidrottsförbundet genom fördelning av anslag initiera och leda forskning av betydelse för idrotten. Rådet stöder både beteendevetenskapliga och fysiologisk-medicinska projekt.

Ansökan senast 31/3. Utdelning i maj. Särskilda formulär finns.

#### Harald och Greta Jeanssons stiftelse

Sekreterare: Advokat Mats Bendrik, tel: 08/14 12 50

Har till ändamål att främja vetenskaplig forskning inom medicinens område samt sådan forskning inom andra naturvetenskaps-grenar, vilken är avsedd att komma läkarvetenskapen till godo.

Ansökningstid kungörs i april-maj i Svensk Läkartidning. Offentliggörande av tilldelning i regel l november. Bestämmelser finns.

#### Helge Ax: son Johnsons Stiftelse

Sekreterare: Advokat Lennart Heijne, Birger Jarlsgatan 18, 114 34 Stockholm, tel: 08/10 95 21

Ändamål ...., att främja vetenskaplig forskning samt att understödja undervisnings- och studieverksamhet inom landet. Anslag till både enskilda och institutioner.

Ansökan senast 28/2. Utdelning 22/6. Bestämmelser och formulär finns.

### Karolinska institutets forskningsfonder

Adress: Karolinska institutet, Medicinska fakulteten, Fack, 104 Ol Stockholm

Alla ansökningar, som gäller de av Karolinska institutet förvaltade forskningsfonderna, behandlas numera gemensamt vid ett tillfälle årligen.

Ansökan skall vara inlämnad senast den 1/10 på särskilt formulär, vilket kan rekvireras från Registrator på telefon 08/34 05 60.

#### Kungafonden

Konung Gustaf VI Adolfs 80-årsfond för svensk kultur, Box 16216, 103 24 Stockholm, tel: 08/10 00 15

Ansökan vilken tid som helst på året.

Fondens ändamål att verka för befästande och främjande av svensk kultur.

#### Längmanska Kulturfonden

Adress: Universitetskanslersämbetet, Box 16334, 103 26 Stockholm Sekreterare: Byrådirektör Hans Björk, tel: 08/24 85 60

Uppgift att stödja vetenskap, konst och litteratur bl.a. genom understöd för vetenskaplig verksamhet samt understöd för offentliggörande av resultat.

Ansökan senast 31/12. Utdelning i maj månad.

## Carl-Bertel Nathorsts vetenskapliga stiftelse

Adress: Nybrokajen 5, 111 48 Stockholm, tel: 08/23 05 25 Stiftelsen har till ändamål att främja avancerad vetenskaplig forskning, i regel över doktorandnivå. Utbildnings- eller studiestipendier samt resestipendier beviljas i regel ej. Ansökan före 15/10 på särskilt formulär. Styrelsens beslut meddelas i regel under december månad.

### Ograduerade forskares fond

Vid samhällsvetenskapliga fakulteten i Stockholm sker fördelningen av medel inom resp. institution. För upplysningar om fördelningsnormer vid andra lärosäten hänvisas till resp. universitetsförvaltning.

#### Stiftelsen Riksbankens Jubileumsfond

Adress: Riksbankens Jubileumsfond, Box 1649, 111 86 Stockholm, tel: 08/24 32 15

Stiftelsen skall ha till ändamål att främja och understödja till Sverige anknuten vetenskaplig forskning.

Ansökan på särskilt formulär i 30 ex senast 1/2 och 15/8 (bilagor i 5 ex ).

Utförliga bestämmelser finns.

#### Stockholms stads forskningsstipendier

Adress: Stadskollegiet, Stadshuset, 105 35 Stockholm Upplysningar: Sekreterare Lars Lindblad, tel: 08/54 05 00

Bidrag till vetenskapligt forskningsarbete - företrädesvis av samhällsvetenskaplig och allmän kulturell art - som bedömes vara av särskild betydelse för den kommunala verksamheten inom Stockholms stad.

## Svenska Handelsbankens Stiftelse för Samhällsvetenskaplig forskning

Adress: Svenska Handelsbanken, 103 26 Stockholm Upplysningar: Kamrer Åke Wennman, tel: 08/769 10 00

Främjande av forskning rörande .... samt andra områden av intresse för den svenska affärsbanksverksamheten (endast ekonomiska frågor).

Ansökan senast l april. Nämnden sammanträder som regel i maj. Bestämmelser finns.

#### Trygg-Hansas 80-årsfond

Adress: 106 26 Stockholm

Upplysningar: Direktör Åke Magnusson, tel: 08/785 10 00

Huvudsakligt syfte att verka för att hindra uppkomsten av och lindra följdverkningarna av trafikolycksfall.

Ansökan före 1/2 på särskilt formulär.

#### Knut och Alice Wallenbergs Stiftelse

Adress: Box 16067, 103 22 Stockholm, tel: 08/763 50 00

Har till huvudsakligt ändamål att främja vetenskaplig forskning och undervisnings- eller studieverksamhet av landsgagnelig innebörd.

Ingen bestämd ansökningstid. Bestämmelser finns.

## Åke Wibergs stiftelse

Adress: Torstenssonsgatan 3, 114 56 Stockholm, tel: 08/67 50 50 Utdelar anslag för främjande av vetenskaplig forskning, vård och uppfostran av ungdom ävensom undervisning och utbildning.

Ansökan senast den 1 november på särskilt formulär.

## Åhlén-Stiftelsen

Adress: Kungsgatan 44, 111 35 Stockholm Sekreterare: Nils Åhlén, tel: 06/44 90 00 eller 20 49 92
