ABSTRACT

The performance of all 200,000 examinees on the Professional and Administrative Career Examination (PACE) in fiscal year 1975, its first year of administration, is presented in 10 graphs and 100 tables. The data describe the ratings obtained by six groups of competitors: by series of written test, by Veteran Preference status, by Outstanding Scholar status, by sex, by current federal employment, by geographic region, and by college major. A second set of tables shows the interaction of Veteran Preference, Outstanding Scholar, sex of competitor, and written test performance on the probability of consideration for federal employment. The final tables indicate the proportions of competitors at or above certain ratings--hence the probabilities that such groups will be given employment consideration -- as a function of current federal employment, geographic region, and college major. This report is part of the planned documentation of the PACE, describing characteristics of the PACE competitor population in terms of this employment program and its written test. The report should also be helpful to Commission personnel concerned with staffing patterns in PACE occupations, and to college recruiting officials. (Author/CP)

ABSTRACT

The Professional and Administrative Career Examination (PACE) was introduced by the United States Civil Service Commission during the fall of 1974. Tables and figures are presented which describe the ratings obtained by various groups of competitors on this examination: by series of written test, by Veteran Preference status, by Outstanding Scholar status, by sex of competitor, by current Federal employment, by geographic region, and by college major. A second set of tables shows the interaction of Veteran Preference, Outstanding Scholar, sex of competitor, and written test performance on the probability of consideration for Federal employment. The final tables indicate the proportions of competitors at or above certain ratings—hence the probabilities that such groups will be given employment consideration—as a function of current Federal employment, geographic region, and college major.

This report is part of the planned documentation of the PACE, describing characteristics of the PACE competitor population in terms of this employment program and its written test. The report should also be helpful to Commission personnel concerned with staffing patterns in PACE occupations, and to college recruiting officials.

ERIC

The Professional and Administrative Career Examination (PACE) was introduced by the United States Civil Service Commission (USCSC) during the fall of 1974. It is the successor to the Federal Service Entrance Examination (FSEE). PACE is used to select individuals for entry-level positions in a variety of occupations which are administrative, technical, or professional in nature, have entry levels of GS-5 or GS-7, and have a normal progression for successful employees to a full performance level of GS-9 or above. Occupations such as scientists or engineers are currently filled through other examinations. There are two basic requirements in the PACE: appropriate experience or a baccalaureate degree, and adequate levels of abilities to deal with the complexity or difficulty of the journeyman level of the occupation, as indexed by performance on a written test.

The written test of the PACE measures five abilities that have been determined by extensive job analyses to be important for superior performance at the journeyman level of the occupations filled through PACE. These abilities are:

Ability I. Ability to understand and interpret complex reading material and to use language where precise correspondence of words and concepts makes effective oral and written communication possible.

Ability II. Ability to make decisions or take action in the absence of complete information and to solve problems by inferring missing facts or events to arrive at the most logical conclusion.

Ability III. Ability to discover underlying relations or analogies among specific data where solving problems involves formation and testing of hypotheses.

Ability IV. Ability to discover implications of facts and to reason from general principles to specific situations as in developing plans and procedures.

Ability V. Ability to perform arithmetic operations and to solve quantitative problems where the proper approach is not specified.

Scores on the test parts measuring these five abilities are combined in six different ways to yield ratings in six occupational categories. The weighting combinations, also based on extensive job analyses (McKillip, Corts, Trattner, and Wing, Note 1), are:

		Abili	ty		
Occupational Category	Ī	II	III	<u>IV</u>	<u>v</u>
Α.	2	2.	2	2	1
В	2	2	2	2	2
С	1	2	2	2	2
D /	2	2	1	2/	
E	3 -	2	· 1	2	1
F	2	2	1	2	\2

Position types included in each occupational category are:

Category A. Personnel Management,
Social Insurance Claims Examining, General
Investigating, Criminal Investigating,
Immigration Inspection, Passport and Visa
Examining, Customs Inspection, Social Insurance Administration, Social Services, Management Analysis, Public Health Program
Specialist, Veterans Claim Examining, Public
Information Specialist.

Category B. Economist, Psychologist, Tax Technician, Budget Administration, Financial Institution Examining, Control and Procurement, Internal Revenue Officer, General Supply.

Category C. Computer Specialist.

Category D. Contact Representative.

Category E. Writing and Editing.

Category F. Alcohol, Tobacco and Firearms Inspection.

During the first year of operation well over 200,000 persons applied for employment under PACE and took the written test. Over ninety percent of these people had (or were about to receive) the baccalaureate or higher degree; over seventy percent of these competitors were under thirty years of age. Four different versions of the written test were administered: Series 110 in November, 1974; Series 120 in January, 1975; Series 130 in March, 1975; and Series 140 in May, 1975. Equivalent versions were constructed and then statistically equated. The equating is based on Series 110 as administered to the November, 1974 population. Virtually all the data presented here represent ratings earned at one of these four administrations. The few remaining cases are from \ versions of the written test prepared for deaf and visually handicapped competitors which were also equated to the November, 1974, administration. Given the high (0.93) reliability of the written test (Martin, Notes 2, 3, and 4) a person's test scores would remain stable regardless of which test series were used.

Although the data described 219,947 cases, there were not 219,947 different individuals taking the written test of the PACE during FY 1975. Preliminary analyses of recompetition indicate that approximately 10,000 individuals took the written test more than once. About ninety percent of these recompetitors took the written test only twice. In the data presented here, it was not possible to identify recompetitors; therefore, generalizations about test performance will require appropriate qualification. With a reliability of 0.93 the standard error of measurement for the final ratings is approximately four points. A more complete study of the score changes in recompetition is in progress by the author.

* An additional aspect of recompetition concerns practice effects. The written

test of the PACE incorporated many item types. The psychometric literature contains little mention of the change in test performance as a function of experience with the test and what mention is made suggests that changes are minimal. The construction of the written test of the PACE permitted the collection of data to illuminate such practice effects. Preliminary analyses show that these effects exist in the written test; the effects are not large—well within the standard error of measurement—but they are consistent and replicable. They are most pronounced in Ability III but are also evident in Abilities IV and V.

The following tables present information about the ratings earned by competitors in the six occupational categories. Performance on the written test determines the values of preliminary ratings, which can vary between 40 and 100. These preliminary ratings are augmented, if appropriate, for Outstanding Scholar status and Veteran Preference. If a competitor claims Outstanding Scholar status (a 3.50 grade point average or a class standing in the upper 10% of the graduating class) the preliminary rating is averaged with 100 to produce a final rating. Thus, a preliminary rating of 40 produces a final rating of 70; a preliminary rating of 70 produces a final rating of 85; a preliminary rating of 85 produces a final rating" of 93 Competitors claiming Veteran Preference also have their preliminary ratings augmented: 5 points for Tentative Preference (TP) and 10 points for either Compensable Preference (CP) or Other Preference (XP).

Final ratings below 70 are not used in placing persons on competitive registers and are reported only to those competitors who specifically request them. All competitors claiming Outstanding Scholar status receive final ratings of 70 or above and can placed on competitive registers. While all those claiming Veteran Preference have had their preliminary ratings augmented by the appropriate 5 or 10 points, only those whose preliminary ratings were 70 or above or who claim Outstanding Scholar status have their names placed on competitive registers.

Performance of PACE FY 1975 Competitors

The data describing the performance of the PACE FY 75 competitors are presented here in a number of ways. Data are presented separately for the occupational categories A, B, C, D, E, and F. Tables 1 through 6 present the percentile equivalents for all ratings from 40 to 110, for Series 110, 120, 130, 140, and the total group, separately for each occupational category. These tables also include the mean, standard deviation, and number of cases for each group. Figure 1 displays the mean ratings by occupational category for each test series. There are differences in mean ratings for the four series which represent real differences in measured abilities, as the series are equated. Hence, the obtained differences indicate that the compe itors who take these series of the written test differ from each other. Those taking the first series in November, 1974, included many individuals who wished to regain eligibility for the occupations previously covered by the FSEE; such FSEE eligibility ended in the spring of 1974. This first administration did not include recompetitors, this is not true of the remaining administrations. The preliminary recompetition data suggest that the most popular sequence was Series 110 followed by Series 130, although the other pairs of these four series included many cases of recompetition.

The differences in performance among the four series are most pronounced in the comparison of mean ratings in Occupational Category C (Computer Specialist) and Category E (Writer and Editor). That is, although all three later series show increases relative to the first series in each occupational category, this increase is largest for Category C and least for Category E. (These two categories are also most different in the weighting patterns, with Abilities III and V more important in Category C and Ability I more important in Category E. Recall that Ability III and to some extent Abilities V and IV are most subject to practice effects, and that these Abilities. III and V are heavily weighted in Category C.) There is a maximum difference of 2.67

rating points in the mean ratings of Category C over the four series but a maximum difference of only 1.21 rating points in in Category E. For the large number of cases included a test of statistical significance would be meaningless.

These changes could be due to the practice effects of recompetition but other possible explanations exist. All competitors for all series were provided a booklet of sample questions to use in preparation for the written test. However, competitors who took later series might have had more time to study these sample questions and might have learned from their friends who had already taken the written test that it contained many item types. Also, there is quite a sizable industry devoted to selling the service of helping people score higher in large-scale testing programs. Products of this industry include publications as well as training courses. Members of the staff developing the written test of the PACE frequently received requests for information from a number of authors of such publications. Accurate, commerciallyprepared study guides for PACE did not become widely available until the spring of 1975. These hypotheses--recompetition, more effective use of sample questions, commercially available study guides--are all possible reasons for the difference in scores. These hypotheses are not mutually exclusive. However, only recompetition can be systematically analyzed.

Tables 7 throug. 50 list, for various subgroups of the PACE FY 75 competitors, the ratings equivalent to a range of percentiles. Again, these are separate for each occupational category and include means, standard deviations, and numbers of cases.

Tables 7 through 12 present the data separated by Outstanding Scholar status and series. Approximately fourteen percent of these competitors claimed Outstanding Scholar status. Figure 2 displays the mean ratings by Outstanding Scholar status and buseries, for each category. The mean used in drawing Figure 2 are not the e in Tables 7 through 12 but were obtained by

"unaugmenting" the actual means to reverse the averaging procedure discussed above. Thus, Figure 2 shows the differences in written test performance between these two groups using the same rating scale. Clearly, Outstanding Scholars perform better on the written test. The difference in ratings would be larger if the augmented ratings for Outstanding Scholars were to be used.

The data for non-Outstanding Scholars are very similar to those of the total group as displayed in Figure 1 although they are lower. This is hardly surprising as they comprise 86% of this total group. Of more interest are the advanced elevations and different shapes of the curves for Outstanding Scholars. These persons perform at a higher level on the written test, and in a different fashion. Again, Series 110 is the lowest, but the means in Series 140 overlap those of Series 110. Series 120 and 130 are still the higher but there is no distinctive profile for any of these four curves. Perhaps Outstanding Scholars are less likely to recompete. Perhaps their performance is already at such a high level that practice or extra study can provide little additional improvement.

Tables 13 through 18 present the data separated by Veteran Preference and series. The mean ratings are displayed in Figures 3a, 3b, 3c, and 3d. Again, the graphs are based on unaugmented ratings: the mean ratings for nonveterans were not changed; the mean ratings for 5-point TP veterans were reduced by 5 points; the means for the 10-point CP and XP veterans were reduced by 10 points. Thus, these graphs reflect written test performance. The majority of competitors (77%) do not claim Veteran Preference but a sizable minority (almost 20%) claim 5-point - TP. Of the remaining three-plus percent, about 3 out of 4 claim CP; the others claim XP.

The functions for the nonveterans and the 5-point TP are similar to those for the total group, with the veterans scoring consistently about four rating points lower. The performance of the two 10-point veteran groups is much lower and the patterns of the four series are not the same. For Series 110, performance in Category C is lower than that in Category E, but by Series 140 performance in Category C is higher than in

Category E. CP veterans perform at a slightly higher level than XP veterans

Tables 19 through 24 present the lata separately for male and female competitors by series. Slightly over 40% of these competitors are women. Figures 4a and 4b display the mean (augmented) ratings for occupational categories by test series, separately for men and women. For men, the profiles are similar to those of the total group: flat for Series 110, an improved level of performance in later series with a marked difference between $Categories\ C$ and The data for women show a performance level which is not as high as that for men, and the difference between Categories C and E is less. Indeed, for Series 110 performance in Category E, Writing and Editing, is superior to that in Category C, Computer Specialist. The difference in overall level between men and women is not totally, or perhaps even primarily, a difference in test performance. It will be shown below that female competitors in PACE are far less likely to claim Veteran Preference than men, hence much less likely to have 5 (or 10) points added to their ratings. The profiles displayed in Figures 4a and 4b are based on data which include points for Veteran Preference.

Tables 25 though 30 present data separated by Outstanding Scholar status and Veteran Preference, for each occupational category. Figure 5 displays the mean ratings across occupational categories for these groups, unaugmented first for Veteran Preference and then for Outstanding Scholar status. These two variables are not independent: while the majority of PACE competitors are neither veterans nor Outstanding Scholars, those who are Outstanding Scholars are less likely to claim Veteran Preference. This point will be discussed in more detail below.

Figure 5 shows that the Outstanding Scholar groups perform at a higher level than do non-Outstanding Scholars, regardless of veteran status. Nonveterans, as a group, perform at a higher level than do TP veterans, who in turn perform at a higher level than the 10-point CP and XP veterans. There are differences in the shapes of the profiles: the non-Outstanding Scholars show the performance shift between Categories C

and E, particularly for those non-Outstanding Scholars who are also either nonveterans or TP veterans. On the other hand, the profiles for the Outstanding Scholars are again fairly flat. While the profiles for the 10-point veterans groups are interesting it is not clear what they might mean. These profiles, particularly for the Outstanding Scholar groups, are probably much less stable than those of the former groups as the group sizes here are fairly small.

Tables 31 through 36 present the data separated by sex of competitor and Veteran Preference. Over one-third of all male competitors claim Veteran Preference; virtually no women do. Thus the twenty percent of competitors who claim Veteran Preference are almost entirely men. Figure 6 displays the mean ratings for the subgroups, with the means for the veteran groups being unaugmented as appropriate. As before, the performance level is highest: for nonveterans, next highest for TP veterans, and lowest for the 10-point CP and XP veterans. Within each veteran status group, men show slightly higher levels of performance than women. (The profiles for the female 10-point veterans are based on far fewer cases than those for other profiles.) For all veteran groups male competitors show higher performance in Category C than in Category E. The performance of female competitors is either level, or. ... higher in Category E than in Category C. Figure 6, and the Tables, show that among the 10-point veterans, women perform at a higher level in Categories A, D, and E. Overall, however, the performance of women is slightly below that of men; for all ; occupational categories. These differences are not large--about a rating point or two for nonveterans and somewhat more for 5point veterans -- but they are consistent. Recall that these ratings have been corrected for Veteran Preference but not for Outstanding Scholarship. It will be shown below that women are somewhat more likely to be Outstanding Scholars than men. Hence, the actual difference in test performance is slightly greater than than indicated by Figure 6.

Table 37 shows the data broken out by the variables Outstanding Scholar status and sex of competitors. As suggested above, twenty percent of all female competitors claim Outstanding Scholar status while only ten percent of all male competitors do. Figure 7 displays the profiles of the mean ratings across occupational categories. These profiles reflect data corrected for Outstanding Scholar status but not for Veteran Preference. The actual difference in test performance between the sexes is less than that indicated, as men are more likely to have the extra rating points from Veteran Preference. There are two items of interest here: men perform at a slightly higher level than women; there is little difference in performance across occupational categories.

Table 38 and Figure 8 show the rating data as a function of whether competitors are currently employed by the Federal government. About eleven percent of these FY 75 competitors are Federal employees, and ... their performance is below that of the other competitors. Both profiles show some differences between Categories C and E. Many positions covered by PACE are filled by Federal employees who are not necessarily required to take the written test on a competitive basis. Each Federal agency can establish its own noncompetitive programs for its own employees. Additional series of the written test, constructed and equated to be parallel to the November, 1974 series, are used in the noncompetitive programs. The author did not collect information concerning these Federal employees who take the competitive versions of the written test. Therefore, a tentative hypothesis is that they may have less education but more experience than the competitors who are not presently employed by the Federal government. They may be taking the written test for upward mobility and other jobchange reasons.

Tables 39 through 44 present the ratings of competitors according to the geographic region of the United States where
they applied for, and took, the written test
of the PACE. These regions include all
areas of the United States, as follows:

Atlanta Region: Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee.

Boston Region: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont.

 I_{ε}

Chicago Region: 111inois, Indiana, Michigan, Minnesota, Ohio, Wisconsin.

Dallas Region: Arkansas, Louisiana, New Mexico, Okiahoma, Texas.

San Francisco Region: Arizona, California, Nevada.

Seattle Keyion: Idaho, Oregon, Washington, Alaska.

Philadelphia Region: Delaware, Maryland (excluding suburbs of Washington, D. C.), West Virginia.

Denver Region: Colorado, Montana, North Dakota, South Dakota, Utah, Wyoming.

New York Region: New Jersey, New York.

Honolulu Area Office: Hawaii.

San Juan Area Office: Puerto Rico.

St. Louis Region: Iowa, Kansas Missouri, Nebraska.

Washington Area Office: District of Columbia, suburbs in southern Maryland and northern Virginia.

While these regions are predominantly composed of their associated states, urban areas on a regional border may be incorporated into the adjacent region for administrative convenience. For example, Moorhead, Minnesota should be in the Chicago region but is included in the Denver region as it is across the Red River from Fargo, North Dakota, the North Dakota area office.

As might be expected, different regions test different numbers of competitors with the Atlanta, Chicago, San Francisco, Philadelphia and New York regions having the highest volumes; Boston, Dallas, St. Louis and Washington, D. C. have a moderate number while Seattle and Denver show the lowest numbers of competitors. Honolulu technically belongs to the San Francisco region, and San Juan is part of the New York region, but their distances from the regional offices can give them

an independence other area offices do not have. Washington, D. C. is also an area office, not a region—it is part of the Philadelphia region. But, for administrative reasons it can be considered a separate unit.

There are regional differences in written test performance. As shown in Figure 9, Seattle and Denver competitors have the highest levels of performance among the regions while competitors from Atlanta and Dallas have the lowest. It should be stressed that the profiles shown include points for Outstanding Scholar status and Veteran Preference. It may be that different regions have different rates of recompetition as well. Some of the profiles show the shift in performance between Categories C and E; some do not. The flatness of the profile does not appear to be related to the number of competitors in a region: Seattle and Denver are comparable, in terms of numbers of competitors but not in shapes of profiles; Atlanta and Dallas have different numbers of competitors but. the same shapes of profiles. The performance in Washington, D. C. is somewhat above the national average. Closer inspection of the tables reveals that variability in ratings also varies from region to region. Denver and Seattle have low variability which Washington, D. C., Dallas and Atlanta have high variability. The amount of this variability is not directly related to either level of performance or number of competitors: Washington, D. C., performance is higher than that of Atlanta or Dallas; there are about the same number of competitors in the New York region as in Atlanta. in the Boston region as in Dallas.

The remaining way of categorizing PACE FY 75 competitors is by college major, as shown in Tables 45 through 60 and Figure 10. Competitors are asked to indicate which one of 107 fields represents the "major field of study at the undergraduate or graduate level." These 107 fields are combined into twenty-two more general groups as follows.

Agriculture and Natural Resources:
Agriculture, general; Fish, game, and wild-life management; Fórestry; Natural resources management; Agricultural economics.

Architecture and Environmental Design: Environmental design, general; Architecture; City, community, and regional planning.

Biological Sciences: Biology; Botany;
Zoology; Ecology.

Business and Management: Business and commerce, general; Accounting; Business statistics; Banking and finance; Business management and administration; Hotel and restaurant management; Marketing and purchasing; Transportation and public utilities; Real estate; Insurance; International business; Business education; Personnel, management; Labor and industrial relations; Supply; Claims examining; Bank examining; Production control; Industrial management; Quality control.

Communica ions: Communications, general; Journalism; Radio/television; Advertising; Printing management.

Computer and Information Sciences: Computer and information sciences, general; Data processing; Computer programming; Systems analysis.

Education: Education, general; Elementary education; Secondary education; Junior high school education; Adult and continuing education; Special education; Counseling, vocational training.

Engineering: Engineering, other; Industrial engineering.

Fine and Applied Arts: Fine and applied arts; Music and drama; Dramatic arts.

Foreign languages; Foreign languages.

Health Professions: Health professions, general; Hospital and health care administration; Pharmacy; Therapy; Public Health.

Home Economics: Home economics; Home decoration; Consumer economics; Food and nutrition.

: Law: Law, general.

Letters: English, general; Literature, English; Speech, debate, and forensic science (rhetoric and public address); Creative writing; Teaching of English as a foreign language; Philosophy.

Library Science: Library science, general.

Mathematics: Mathematics, general; Statistics, mathematical and theoretical.

Physical Sciences: Physical sciences, general; Physics; Chemistry; Geology; Earth Sciences; Cartography.

Psychology: Psychology.

Public Affairs and Services: Community and social services; Public administration; Park management; Law enforcement and correction; Environmental protection; Investigations, intelligence security; Recreation; Industrial safety.

Social Sciences: Social sciences, general; Anthropology; Archaeology; Economics; History; Geography; Political science and government; Sociology; International relations; Afro-American (black culture) studies; American Indian cultural studies; Latin-American cultural studies; Urban studies/planning; Demography.

Theology: Religious studies ...

Other fields: Other.

As can be seen from Tables 45 through 50, the largest numbers of competitors are from the study fields of Business and Management, Education, and Social Sciences. Intermediate in size are the fields of Letters, Psychology, and Public Affairs and Services. Smaller groups include Biological Sciences, Communications, Fine and Applied Arts, Foreign Languages, Mathematics, Agriculture and Natural Resources, Computer and Information Sciences, Engineering, Health Professions, Home Economics, Law, and Physical Sciences. Very small numbers of competitors are from the fields of Architecture and Environmental Design, Library Science, and Theology. Not all competitors claim a major education field: about one percent of this group of competitors state that their major fields of education are other than those cited in the PACE application form while about ten percent of all PACE FY 75 competitors state no major field of education at all. Recall that about ten percent of PACE competitors do not claim to have the baccalaureate degree--this may be the same

ten percent. They have not completed a major field of study.

Figures 10a and 10b display the mean ratings for each college major across occupational categories. Interesting differences in both shape and level of profile can be observed. Figure 10a displays the profiles for the non-scientific areas: Letters, Foreign Languages, Law, Theology, Library Science, Psychology, Social Sciences, Fine and Applied Arts, Business and Management, Public Affairs and Services, and Education. While there is a range in level of performance, most profiles are either flat or show an increase in performance from Category C to Category E. The major exception to this is the profile for Business and Management, and this, also, is likely the only major field displayed which does not include a sizable number of women. Figure 10b displays the profiles for the more scientific or "harder" areas: Mathematics, Physical Sciences, Biological Sciences, Architecture and Environmental Design, Agriculture and Natural Resources, Engineering, Communications, Computer and Information Sciences, Home Economics, Healt's -Professions and Other. Nearly all of these show profiles with a drop from Category C to Category E. The only exception is Communications, a major field more similar in content coverage to many of the fields displayed in Figure 10a. The fields in Figure 10b emphasize the sciences and tend to be predominantly male with the exception of Home Economics.

In terms of level of performance it appears that competitors claiming liberal arts as a major field (Mathematics, Physical Sciences, Letters) show the highest performance across all occupational categories. For all but Category E the majors in Mathematics and the Physical Sciences show superior performance; individuals majoring in Letters are on top, by a slight margin, only in Category E, Writing and Editing. The largest gap in performance levels occurs for Category C, Computer Specialist, where Mathematics majors show exceptionally high performance.

Majors in other traditional liberal arts fields perform at a lower but still above average level: Foreign Languages, Biological Sciences. Majors in Fine and Applied Arts may or may not have an extensive liberal arts background--their performance is below average. The fields of Law, Theology, Library Science and Architecture and Environmental Design are professional rather than liberal arts fields, but individuals in these fields are likely to have the liberal arts in their educational backgrounds.

Next in overall level of performance are the Social Science fields: Psychology, Social Sciences, Communications. The numbers of competitors in these fields are far larger than the numbers in the traditional liberal arts. Showing slightly lower performance are the applied fields of Engineering, Agriculture and Natural Resources. The lowest level of performance is by competitors in the most applied fields: Business and Management, Public Affairs and Services, Education, Computer Science and Information, Home Economics, Health Professions. Three of these fields--Business and Management, Education, Public Affairs and Services--include among them over one-third of all PACE FY 75 competitors.

These data should not be interpreted . as saying that candidates who major in the traditional liberal arts are the top performers in written tests such as those required in PACE. Recall that these data include additional rating points for Veteran Preference or Outstanding Scholar status. Further, it should be noted that competitors are self-selected and they may not represent the total U. S. collegiate population. For comparison purposes, data from the Office of Civil Rights, Department of Health, Education, and Welfare, which periodically collects information from colleges and universities concerning the composition of their student bodies, were analyzed. The most recent publication of these data is Racial and ethnic enrollment data for institutions of higher education: Fall 1972 (Note 5). To be asked to supply data for this compendium an institution had to be "receiving or expecting to receive some form of Federal financial aid or assistance." Given the distribution of Federal support to higher education it is a safe assumption that nearly all college students in the United State's are enrolled in institutions meeting this requirement.

Of interest here is the report (hereinafter referred to as "HEW") categorization of students by state and by "strata", or

type of educational program (for example, Liberal Arts, Engineering, etc.). The PACE data can be compared to the HEW data for total undergraduate enrollment, where HEW defines undergraduates as "full-time undergraduate students...at least 75% of normal work load...(includes programs in) vocational and technical education requiring a high school diploma." Thus, HEW undergraduates include students working for certificates or diplomas in addition to working for baccalaureate degrees while PACE competitors typically are college graduates. However, it is likely that geographic regions do not differ widely in the proportions of such non-degree students among their undergraduate populations. And, the "strata" categorization of HEW will differentiate such students.

To look first at the geographic distribution; the composition of the HEW regions must be compared with those of USCSC and used in PACE. USCSC regions encompass approximately the same groups of states as the HEW regions with the exceptions of the urban areas on borders of USCSC regions, noted above. The USCSC Washington area office, encompassing the District of Columbia as well as the adjacent suburban counties in Maryland and Virginia, is separate from the USCSC Philadelphia region. However, the District of Columbia is incorporated in the HEW Philadelphia region, so PACE data for these two groups were combined to match the HEW groups. -The relative proportions are as follows:

Proportion of Population per Region

卷 .		
•	· ·	USCSC - FY 75
; ·	HEW - 1972	PACE
Region	Undergraduates	Competitors
Atlanta	13.9	13.6
Boston	6.6	7.6
Chicago	21.5	13.0
Dallas	10.4	8.7
Denver	3.6	3.4
New York	10.8	14.8
Philadelphia	: 10.8	18.5
St. Louis	6.4	4.8
San Francisco	12.2	12.5
Seattle	3.8	3.1 .

^{*}Includes metropolitan Washington, D. C.

The proportion of the total number of undergraduates attending universities and colleges within the geographic boundaries of a region may be approximately the same as the proportion of the total number of PACE FY 75 competitors taking the test in an examining office under its jurisdiction. Such equality appears to be present for the Boston, Atlanta, Denver, San Francisco and Seattle regions. Three regions have proportionately more students than competitors: Chicago, Dallas, St. Louis. Two regions have proportionately more competitors than students: Philadelphia and New York.

There are several plausible explanations for both the equivalences and discrepancies. First, PACE is not limited to college students and recent college graduates, although the tendency for a college senior to apply to PACE may vary from region to region. Second, the number of competitors per region is not known and a region ostensibly "in balance" may actually have fewer competitors, but those fewer competitors take the written test more Third, the rate of application frequently. for Federal employment is related to the labor market which is not uniform over the continental United States For example, Dallas has fewer PACE com stitors than HEW has college students but it may also have lower unemployment rates than other regions. Fourth, students may be attending a college or university in one region while applying for Federal employment in their home region. Two regions showing fewer PACE competitors than HEW undergraduates are Chicago and St. Louis, and they may also have more colleges and students, than the regions of New York and Philadelphia. It may be that there are many students from the Northeastern United States who are educated in the Midwest but apply for permanent employment closer to home. Fifth, the region showing the most discrepancy is Philadelphia, which includes Washington, D. C. The large number of PACE competitors here can be explained by noting that the Federal government is the major employer in this area, and there may be many young. " people who move here in hopes of finding Federal employment, or any employment in this particular city.

Comparing PACE college majors with HEW "strata" is more problematical. PACE categories are based on competitor self-report, indicating the major field of study at the undergraduate or graduate level. The HEW report notes that "...educational programs of all institutional components have been stratified into (fourteen) discrete categories." Three of the HEW "strata" refer to professional education and have no counterpart in PACE major fields of study: Medicine, Veterinary Medicine and Dentistry. Another three HEW "strata" refer to institutional groupings of major fields of study which probably do not correspond to the major fields of study indicated by PACE competitors: Liberal Arts/Arts and

Sciences, Physical Sciences/Engineering/ Applied Technology, Social Sciences and Behavior. It is plausible that few American universities have administrative or institutional units such as Colleges of Social Sciences and Behavior or Colleges of Physical Sciences/Engineering/Applied Technology, although there are many undergraduate students majoring in the social and physical sciences. Most of these students would be found in an institutional unit encompassing all the liberal arts and sciences. Thus, HEW "strata" were combined to match the combinations of PACE college majors in order to compare the relative proportions in each population; as follows:

HEW	Proportion of	Population :	PACE.
	Undergraduates 1972	Competitors FY 1975	TAGE
Stratum			Major Field
Liberal Arts/Arts and Sciences; Social Sciences and Behavior	77.5	50.4	Biological Sciences; Letters; Communications; Mathematics; Foreign Larguages; Physical Sciences; Psychology;
63			Social Sciences.
Physical Sciences/ Engineering/Applied Technology	3.9	1.5	Computer and Information Sciences; Engineering
Agriculture	1.3	1.5	Agriculture and Natural Resources
Business	4.9	22.4	Business and Management
Professional: Law	1.3	1.0	Law
Professional: Theology	0.4	~ 0.3	Theology
Other Professional/ Semi-Professional	0.5	8.5	Home Economics; Library Science; Public Affairs and Services; Other
Fine Arts, Architecture	1.9	2.6	Architecture and Environmental Design, Fine and Applied Arts
Nursing and Health Services/Sciences	1.1	0.8	Health Professions
Education	5.8	. 11.1	Education

Although there are similarities, the population of PACE competitors is not identical proportionally to the population of HEW undergraduates in terms of major field of study. Some of the larger discrepancies may be more apparent than real. PACE competitors are over-represented, comparatively, in the fields of Business and Other Professions, but these two areas may represent graduate training for individuals whose undergraduate background is liberal arts and sciences. Recall that over 10% of PACE competitors have some graduate training. Also, the liberal arts and sciences are under-represented among PACE competitors while education is over-represented. The professional groups, with the exception of Engineering and Applied Technology, are roughly equivalent in the two populations.

The Federal occupations filed through PACE generally do not require extensive preparation in specific educational fields. It is not surprising that few engineers compete in PACE as there is a separate examination program for the entry level positions in scientific and technical occupations within the Federal government. What remains to be explained is the under-representation in PACE of liberal arts and science majors and the over-representation of business, public affairs, and education. Recall that the under-represented group has a high performance level on the written test while the over-represented groups have performance levels below average. Obviously, majors in . Public Affairs and Services have less latitude in choice of employer than do majors in Business, and would focus on Federal and other public employers rather than private industry. Business majors may be making application for employment in the biggest business in the United States -- the Federal government with close to three million employees. The abundance of education majors is plausibly explained by noting that the opportunities for teaching positions have been drastically curtailed/. in the past few years and that majors in education, as majors in the liberal arts. have the necessary general background required for PACE occupations but not the specific training required for other positions open to recent college grady ates.

Whatever may be the explanation for the difference between the PACE and HEW populations—and they may just be different populations—such explanation should incide the differential performance on the written test of these various groups of PACE competitors. Majors in the liberal arts may be better performers, or the better performers in the liberal arts are more likely to apply for Federal employment under PACE. How likely it is for a competitor with a given college major to be selected for a PACE occupation will be discussed below.

Performance on the Written Test and the Likelihood of Federal Employment

A different way of looking at these data is to determine the proportions of different groups of PACE competitors at or above certain ratings. Individuals apply for PACE in order to be considered for Federal employment. In general, ratings are based on the performance on the written test, and the higher the written test scores, the higher the rating. The standards of merit system employment, as elaborated in Federal regulations, require that offers of employment be given in order, of rating -- an individual with the highest rating is the first to whom employment consideration is given. During FY 75 there were approximately 220,000 test takers. Over half of these earned an eligible rating (70 or above) in one or more occupational category. However, approximately 11,000 positions were available, or about one job for every twenty applicants. Since not every person who can be offered a position actually accepts, consideration for employment is extended to more than the top five percent. Current estimates are that competitors in the top eleven to thirteen percent can have a realistic expection of being offered Federal employment. The percentage of competitors actually certified (considered for employment) varies across occupational categories, and occasionally a specific position has unusual requirements. In general, however, a rating of 90 or above is necessary for job consideration.

To complicate matters, ratings can reflect more than written test performance. By law (Veteran Preference) or by policy

(Outstanding Scholar) certain individuals can have their ratings augmented by certain amounts. Veteran Preference points are used only if the individual is eligiblein PACE, eligibility requires the achievement of a certain winimum based on the weighted sum of the scores on the test parts of the five abilities. Most individuals claiming Veteran Preference claim the 5point Tentative Preference, but a few individuals claim 10 points, either for Compensable Preference or for Other Preference. CP's have service-incurred disabilities while XP's are relatives of veterans who were killed or totally disabled during military service. For occupations and entry-levels covered by PACE not only do eligible veterans have their ratings augmented by the appropriate number of points but qualified CP eligibles must be extended offers of employment before all other individuals. Persons claiming Outstanding Scholar status have their ratings augmented by a varying amount, as described above. The transformation serves to give the lower-scoring Outstanding Scholars more of a rating increase than the higher scoring. That is, an Outstanding Scholar whose original rating is 70 will have a final rating of 85; an original rating of 85 will have a final rating of 93; an original rating of 93 will have a final rating of 97.

Of all PACE competitors, 14% claim Outstanding Scholar status and 23% claim Veteran Preference; but 59% of all PACE competitors are men. Therefore, men and women do not benefit from the two augmentation provisions in equivalent ways. the 23% of PACE competitors who claim Veteran Preference, virtually all (96%) of these competitors are male: they make up 37% of all male competitors. The female veteran claimants make up 2% of all fomale competitors. Of the non veterans 48% are men. This relationship is statistically significant ($\chi^2 = 36439.65$, df = 1, p< .01) and sizable (C = 0.38). Outstanding Scholars, on the other hand, tend to be women. Outstanding Scholar status is claimed by 20% of the female PACE competitors but by only 10% of the male competitors. There are, however, more male PACE competitors than female so the proportions of men and women among the Outstanding Scholar group are less different than for Veteran

Preference. (Forty-two percent of the Outstanding Scholars are male; 62% of the non-Outstanding Scholars are male.) This relationship, too, is statistically significant $(\chi^2 = 4145.05, df = 1, p < .01)$ but is less than (C = 0.14) the relationship between Veteran Preference and sex (C = 0.38).

There is also a slight relationship between Outstanding Scholar status and Veteran Pre erence. Nonveterans are twice as likely to be Outstanding Scholars (16 out of every 100) as are veterans (8 out of 100). Of those PACE competitors who claim Outstanding Scholar status, 13% are also veterans, compared with the 24% of all non-Outstanding Scholars who are veterans. With the numbers of cases here the relationship between Veteran Preference and Outstanding Scholar status is statistically significant $(\chi^2 = 1937.66, df = 1, p < .01)$ but it is small (C = 0.09). It may also be an artifact of the two other relationships: men are much more likely to be veterans than women; women are much more likely to be Outstanding Scholars than men; hence veterans are less likely to be Outstanding Scholars.

Thus, Tables 51 through 86 were developed to show the impact of Veteran Preference, Outstanding Scholar and sex of competitor on potential hiring, as indicated by the proportions of these various groups of competitors at or above certain ratings. Half of these tables (51-56, 63-68, 75-80) were prepared using the ratings as given but moving all the eligible CP competitors to a level equivalent to a rating of 110. \ While these competitors actually have ratings of from 80 to 110, they must be given preference over all other groups, hence their effective rating is 110. Those claiming TP or XP are placed at the levels of their augmented ratings.

In the remaining tables (57-62, 69-74, 81-86) the ratings are unaugmented by first correcting for Veteran Preference, then Outstanding Scholar status, as appropriate. This latter step required further estimation as each augmented rating could result from two different original ratings. For example, a final rating of 100 would result from original ratings of 99 and 100; a final rating of 96 would result from original ratings of 92 and 91. Cumulating frequencies from the high scores on down, the unaugmentation

process produces inaccurate values for the even-valued ratings. A procedure was developed to smooth the frequencies. For the unaugmented ratings of 100 and 99, frequency of competitors earning the augmented rating of 100 was split so that 75% of these competitors were assigned unaugmented ratings of 100 and 25% were assigned to 99. (The original scoring was truncated at 100 and the distributions of original ratings follow this 3:1 split.) For all other pairs of unaugmented ratings, the frequency of competitors earning the appropriate augmented rating was split such that five-elevenths of the scores were assigned to the higher and sixelevenths of the scores to the lower.

To illustrate the use of these tables consider first Tables 51 through 62. Presented here are the cumulative proportions of competitors at or above certain ratings as differentiated by levels of Veteran Preference and by Outstanding Scholar status. The first six tables include the effects of these two variables on final ratings, hence possible hiring, while the second six tables show what the proportions would be, were the ratings not augmented:

The data for Occupational Category A are found in Tables 51 and 57. In Table 51 almost 13% of all PACE competitors earn ratings of 90 or above. These are about equally divided between Outstanding Scholars and non-Outstanding Scholars, although the proportion of PACE competitors who are Outstanding Scholars is small. Slightly over one quarter of these high-rated competitors claim Veteran Preference while slightly less than one-quarter of all PACE competitors are veterans.

Using Table 57, one can estimate what these proportions would be were there no augmentation for Veteran Preference or Outstanding Scholar status. To be in the top 13% of competitors requires an unaugmented rating of 85. The proportion of this group who are Outstanding Scholars would be reduced from one-half to one-quarter while the proportion of veterans would be reduced from about 30% to about 20%. Outstanding Scholars are still over-represented but veterans are now under-represented, relative to their proportions in the total population of PACE FY 75 competitors. Table 57 also

shows that Outstanding Scholars are more likely to pass the written test, and veterans less so. However, the point augmentation does improve their representation in the higher rating groups.

These comparisons can be made for the other occupational categories by the use of Tables 52 through 56 and Tables 58 through 62. While the percentages vary slightly from category to category, the trend is consistent.

Tables 63 through 74 present the same data but here separated by the variables of Veteran Preference and sex of competitor. Again the first six tables (63 through 68) present ratings as actually earned while the second six tables (69 through 74) present the data based on estimated test scores along. In this set corrections were applied for Veteran Preference only, since Outstanding Scholar status was not identifiable. Since women are more likely to be Outstanding Scholars than men, the proportion of women at or above certain ratings, based on estimated test scores, is somewhat inflated.

For Category A, again a final rating of 90 or above includes the top 13% of competitors. Over one-quarter of these high acores are veterans, over 60% are male. Both veterans and men are over-represented in terms of their numbers in the total population. However, an unaugmented rating of 89 or above includes about half as many, veterans as the augmented rating of 90 or above, as well as more women--from 38% to 45%. In the unaugmented groupings women and nonveterans are over-represented, but these two groups pass the written test at a higher rate than do men and veterans. (These two groups also include more Outstanding Scholars who all "pass" the written test.)

The careful reader will note that this comparison utilizes an unaugmented rating of 89 to obtain the top 13% while the prior comparison utilized one of 85 or above. The discrepancy is due mainly to the inclusion of Outstanding Scholar increments in this second comparison. The remaining occupational categories (Tables 64-68, Tables 70-74) show approximately the same results.

12

A third comparison, Outstanding Scholar status and sex of competitor, is displayed in Tables 75 through 86. For Category A, again an augmented rating of 90 or above shows approximately an even split between Outstanding Scholars and non-Outstanding Scholars; a 60-40 split between men and .women. (The proportions differ somewhat from the first comparison to the second and this third as not all competitors coded the sex variable indicator properly.) An unaugmented rating here shows that removal of the Outstanding Scholar provision would cut the numbers of Outstanding Scholars in this top group by half. This removal would also increase the number of male competitors from 60% to 67%.

To summarize, the Outstanding Scholar and Veteran Preference provisions greatly influence the composition of the toprated--and potential PACE work force-group. Wit' it these provisions Outstanding Scholars would still be overrepresented. On the basis of written test performance alone, the proportion of Outstanding Scholars among the top performers is twice their proportion in the total PACE FY 75 competitor population. The augmentation of ratings by the Outstanding Scholar provision further increases the ratings so that the final proportion is over three times that in the total population. On the other hand, veterans are less likely to be in the top group based on their written test performance alone. The addition of Veteran Preference points reverses this. On written test performance alone the proportion of veterans in the high level rated group is about three-fourths of the proportion of veterans in the total group. With Veteran Preference, however, the proportion of veterans in the high group is 120% of the proportion in the total. The impact of the Outstanding Scholar provision appears to be greater than that of Veteran Preference.

Since both Outstanding Scholar status and Veteran Preference are related to sex of competitor, these tables show that removal of either provision would have a disproportionate impact on one sex. The data do not tell us about the relationship between written test performance and sex of competitor. What is unavailable is the

joint effect of Outstanding Scholar status, Veteran Preference, and sex of competitor. on written test performance. Recall Figure 7 showing the mean ratings across occupational categories separated by Outstanding Scholar status and sex of competitor. The average written test performance of female PACE competitors is less than that of men. On the basis of written test performance alone, women would be slightly less likely to receive employment consideration than ' men. Veteran Preference would reduce this possibility greatly, while the Outstanding Scholar provision almost but not quite balances out the impact of Veteran Preference and the slight superiority in written test performance shown by male competitors.

The Likelihood of Federal Employment--Other Variables

The remaining tables (87 through 100) display the ratings data of the PACE FY 75 competitors as divided by levels of other variables—current Federal employment, Civil Service region, and college major. All data are in the form of cumulative percentages or proportions at or above certain ratings; these ratings always vary from 85 to 106. Since it is not possible to isolate either Outstanding Scholars or Veterans in these data, the ratings are not changed to reflect these provisions. Nor does any table reflect the preference given to eligible CP competitors.

The first two tables compare ratings for two groups of competitors: those currently employed by the Federal government (Table 87) and those not so employed (Table 88). Of interest is the composition of the groups with ratings of 101 and above compared to the groups at or above lower ratings. At the higher level current Federal employees are over-represented relative to their proportion in the total group while at lower levels this group is underrepresented. As only veterans can have ratings over 100, one possible explanation is that the competitors who are current Federal employees are also more likely to be veterans. Another explanation, for which supporting data are unavailable, includes the hypothesis that the current Federal employees are less well educated than the others.

14

Tables 89 through 94 present the percentages of competitors at or above certain ratings for the thirteen regions and area offices of USCSC. The construction of this set of tables differs from those discussed before in that the percentages displayed refer to the percentage of competitors at or above certain ratings within the designated region. For example, in Table 89 one may compare the percentages of competitors in different regions earning ratings of 100 or above. In Boston, 3.0% of all competitors are in this group and in Philadelphia, 1.5% of all competitors are. Suppose that within a certain region the top ten percent of competitors could be certified for employment. In Chicago, competitors with ratings of 92 or above would be certified while in Seattle a rating of 94 or above would be required. Although PACE is nationwide in scope, examining is done on a regional basis. Competitors must indicate that one region where they wish employment consideration, although all competitors can also indicate that they wish consideration in Washington, D. C. These tables show that a competitor's likelihood of consideration can vary from region to region. A competitor would also need to know which regions were hiring greater proportions of PACE competitors, an event necessitating consideration of lower-rated competitors. information is not available here.

The final set of tables (Tables 95 through 100) displays the composition of various groups of competitors scoring at or above certain ratings according to college or field of major study. These data are based on the 90% of the total competitor group that indicated a major field of study. It is plausible that those not providing this information were not college graduates, and that they performed at a lower level on the written test. To illustrate, compare the rightmost column of Table 51 with that of Table 95, both columns indicating the proportion of the total group of competitors scoring at or above certain ratings in Occupational Category A. In Table 51, less than 13% of the total group had ratings of 90 or above in this category, but Table 95 shows that well over 13% of those indicating a major field of collegiate study had ratings of 90 or above.

This final set of data permits the comparison of the relative proportion ofthe different groups of college majors at various levels; of performance for the different occupational categories. This perspective on the data leads to conclusions similar to those from the display of mean ratings across occupational categories for the different majors, displayed in Figure 10. First, the level of performance varies with the type of college major, in that competitors in the liberal arts and sciences, the less applied disciplines, perform at the highest levels and are over-represented at the high ratings; competitors in semiapplied fields perform at a middle level and are presented proportionally at high ratings; competitors in applied fields perform at a lower level and are under-represented at high ratings. Second, the pattern of performance varies with the type of college major, with the more scientific, more maleoriented fields showing over-representation in Category C relative to Category E; the more humanities, female-oriented fields showing under-representation in Category C relative to Category E; the fields in the middle showing about the same representation in all occupational categories.

What Tables 95 through 100 provide in addition is information about various levels of performance other than the mean. Hence, one can compare the pattern of performance at various levels for the different college majors. Consider three levels: that of ratings of 101 and above, by definition including only those claiming Veteran Preference; of ratings 90 and above, including most of the competitors with realistic opportunities for Federal employment; and of ratings 95 and above as a point in between.

For most college majors the pattern of performance across occupational categories is the same for the three levels. A few fields show shifts: Education, Psychology, Public Affairs and Service, and Theology show one kind of shift while Public Affairs and Services shows another. Two fields, Fine and Applied Arts, and Health Professions show inconsistent shifts.

The first group of four majors includes about one-quarter of all PACE FY 75 competitors. At the 101 level and above,

Education, Psychology and Theology have greater proportions of competitors in Category C than in Category E, while at the two lower levels the proportions are larger for Category E. This is also the case for those few competitors in Other fields. A plausible explanation is that these fields, no among the natural or physical sciences, include more equal numbers of men and women. At the highest rating level the competitors are necessarily claiming Veteran Preference, hence are predominantly men. At the two lower rating levels women, and nonveteran men, are included, and the pattern shifts.

This explanation breaks down for majors in Public Affairs and Services, who at the highest level show an increase from Category C to Category E but no shifts at the two lower levels. Competitors in this field, as in Fine and Applied Arts and Health Professions, may simply be more heterogenous than those in other fields which show consistent patterns.

Another perspective is gained by comparing the proportion of competitors indicating certain college majors across the three rating levels. Again, for most groups there is no change. Certain groups are consistently over-represented: Architecture and Environmental Design, Law, Letters, Library Science, Mathematics, Physical Sciences, Engineering, and Foreign Language. Social Science is proportionally represented at the highest level but is over-represented at the two lower levels where the effect of Veteran Preference is less profound. Communication, Agriculture and Natural Resources, and Other majors are about evenly represented at all three levels while four fields--Education, Health Professions, Home Economics, and Public Affairs and Services -- are under-represented at all three levels.

Again, a few fields show shifts in relative representation from level to level. Four of these increase, from an under- or equal representation at the highest level to an equal or over-representation at the lower levels: Fine and Applied Arts, Pshchology, Theology, Biological Sciences. Within the range of test scores represented by these levels, the increase in numbers of competitors reflects more the diminishing impact of Veteran Preference than a change in written test performance. Two fields show decreases in representation, probably for the same reasons. At the highest level majors in Business and Management are present in numbers equivalent to their numbers in the total population. At the two lower levels the proportion or Business and Management majors decreases. Majors in Computer Science and Information also show a decrease from the highest to lowest level -from an over-representation to a proportionate representation. Since both of these fields show below average mean ratings for each occupational category, it is plausible that both groups have high proportions of veterans, and lower test scorers.

Other comparisons are, of course, possible. If such comparisons are made with any of these data, the impact of Veteran Preference and Outstanding Scholar status should be evaluated. Both of these variables interact with sex of competitor but in different ways. They may also interact with the variables of practice effects, region, current Federal employment, and college major, which in turn may interact with each other within this population. Hence, conclusions and generalizations should be qualified accordingly.
