ABSTRACT

Produced as part of the Targeted Outcomes Field Development Project, this handbook provides basic guidelines that can be used by community colleges for organizing and conducting community impact studies. An introductory chapter touches on the broad range of economic, educational, social, and technological impacts which community colleges have upon their service areas. Chapter 2 discusses the following topics concerning planning and managing a study: choosing a project leader; determining the preliminary scope of the project; involving constituencies; designing the study with respect to data-collection tools, sampling, personnel considerations, and scheduling; and managing the study. Data collection procedures are discussed in Chapter 3. The section on survey instruments covers questionnaire design, use of open- or closed-ended items, wording and arrangement of items, pilot testing, distribution of costs, and follow-up studies; in addition, this chapter deals with record searches and interviews. Chapter 4 describes the tabulation, analysis, and dissemination of study data. Appendices cortain the following: record search forms, examples of survey questionnaires and cover and follow-up letters, and an overview of the National Center for Higher Education Management Systems cutcomes structure. A bibliography is included. (MB)

Foreword

In 1973, Dr. Edmund J. Gleazer, Jr., President of the American Association of Community and Junior Colleges, made the following statement:

The community college that defines itself as a community-based, performance-based, postsecondary institution will have four basic continuing objectives

- 1 Current, accurate, and comprehensive information about the community and how the institution is serving its community
- 2. Access to information that enables the college to develop its human resources consistent with national needs and trends
- β . A comprehensive plan expressed in terms that can be understood and supported by the community
- 4. The ability to justify its need for resources and to demonstrate that they have been used effectively

At the 1978 convention of the AACJC, Dr. Gleazer stated:

A new and vital mission is forming for the community college. That new mission, new not in direction, but in the extent of expression, views the community college as a central agent in organized community systems for lifelong education. We may be close to a breakthrough in lifelong education with the community college playing a key role. There is plenty of evidence that a groundswell of a variety of factors is forming capable of even greater effect on the teaching-learning clientele and patterns of this country than the GI Bill of the Forties and the community college explosion of the Sixties. In fact, both of these epochs have contributed to the force of this gathering

χi

wave. Obviously, what we are becoming aware of and beginning to experience results from is the maturing conviction that during his lifetime every American has an entitlement to appropriate education.

If the objectives of a community-based, performance-oriented community college are to be met, and if lifelong learning is to be spotlighted in the 1980s, every community college must determine the impact it is having on the community it serves and then fine tune its service to better meet the educational needs of that community.

The process of conducting an impact study described in this *Handbook* can become the cornerstone for continuing needs assessment and long-range planning. Such efforts will be essential for any community college that wants to stay on the growing edge and make a more significant education contribution to its community.

Preface

Conducting Community-Impact Studies: A Handbook for Community Colleges was produced as a part of the Targeted Outcomes Field Development Project, conducted by the National Center for Higher Education Management Systems (NCHEMS) and funded by the National Institute of Education. To develop methods for assessing community-college impacts, staff from NCHEMS and three community colleges—Kalamazoo Valley Community College in Kalamazoo, Michigan; Eastfield College in Mesquite, Texas (a Dallas suburb); and Valencia Community. College in Orlando, Florida—devised data-collection tools and study procedures. These tools and procedures were then tested at the three colleges, and the results incorporated in the Handbook. Assessing Community-College Impacts: Three Case Studies, a forthcoming NCHEMS publication, will provide more information about the community-impact studies conducted at the three colleges. It should be noted that the Handbook is not a conceptual monograph. Its purpose is to provide a set of basic guidelines that can be used by community colleges for organizing and conducting community-impact studies.

Directors of institutional research, assistants to the president, public-relations officers, and others interested in assessing institutional impacts will find the *Handbook* most useful. Policymakers, including presidents and trustees, may also be interested in it, especially chapters 1 and 2, which describe the uses of such a study and strategies for planning and managing

one. Though the *Handbook* describes specific procedures and instruments for conducting an impact study, each institution should modify them to meet its own needs.

Procedures in the Handbook were developed and tested and the Handbook itself reviewed by the Community-Impact-Study Task Force, which included Dale Lake, President of Kalamazoo Valley Community College, and Richard Olivanti, Assistant to the President; Byron McClenney, President of Eastfield College, and Callie Struggs, Assistant to the President; and James Gollattscheck, President of Valencia Community College, and William Michael Hooks, Dean, Open Campus. Two members of the Kalamazoo Valley Cornmunity College staff, Nancy Woods and Thomas Boynton, provided invaluable assistance in implementing the study at their institution. The authors also extend special thanks to Candido de Leon, former President of the City University of New York Hostos Community College and Visiting Scholar at NCHEMS, for reviewing these materials, and to Nathan Gans, who edited the Handbook. Several members of the NCHEMS staff provided the authors of the Handbook with comments and suggestions: Robert Gray, Leonard Romney, Kent Weldon, and Kathy Campbell, who also coordinated its production and typed it.

CHAPTER 1

Introduction

Community colleges, according to the Board of Directors of the American Association of Community and Junior Colleges at their 1973 meeting, should be "community based" and "performance oriented." The first of t'ese terms means that the mission of the college should be determined by the needs of the community; the second means that the college should monitor the effect of its programs and services on the various individuals and communities it serves. Furthermore, increased pressures on community colleges from inflation, shifting enrollments, and intensified competition for public funds make it now more important than ever for community colleges to assess their impacts. These impacts can be:

- Economic (affecting institutional expenditures, changes in income, standard of living, access, mobility, and job security)
- Educational (affecting development of new skills and competencies)
- · Social (causing changes in family, recreational, or cultural activities)
- Technological (affecting technical developments, syntheses and reformulations of knowledge, and so on)

These impacts might affect individuals or groups (students, former students, family and relatives, faculty, and staff); interest-based communities (businesses, social and civic groups, governmental units, and service organizations); and populations defined according to age, education,

1

income, occupation, or sex. For a more in-depth, conceptual discussion of the types of impacts of a college and the array of audiences that potentially are impacted, see appendix 3—An Overview of the NCHEMS Outcomes Structure.

Regardless of which populations from the community are selected for monitoring, a community college probably will want to investigate the awareness and use of its programs and services, the extent to which they meet the needs of the community, and the existence of any unmet needs. Furthermore, a community college should assess its indirect as well as direct impacts. For example, a college might impact its community directly through institutional expenditures or course offerings, and indirectly through expenditures by its faculty, staff, and students or better job performance by employees in the community as a result of courses taken at the college (see figure 1). In this handbook. community is defined as the geographic area served by the college—that is, the college's service area.

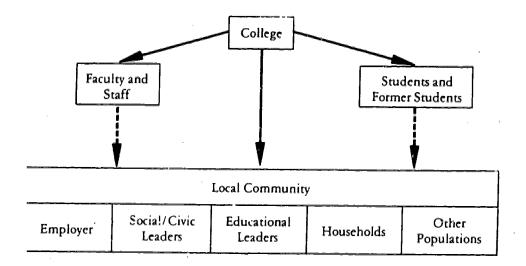

Following are some of the ways in which the three institutions participated in the development of this handbook have used community-impact-study information:

- Written comments, as well as tabulated data, have been used to review the effectiveness of existing programs and to examine the potential for new ones
- Student-services personnel are using study findings to improve their student-recruitment program
- Information collected on faculty and staff impact has been used to improve college public relations
- After identifying the lack of awareness of institutional services and facilities as a problem, a college has begun a program to improve awareness of its services and facilities
- A college that discovered that users of its facilities were, in general, very satisfied used this information to enhance its public relations
- Information concerning where and how people were learning about an institution and its programs has been used in improving promotion and advertising
- A college has begun a program to explain its services to community educators who did not understand them

A more detailed description of the uses of community-impact-study information is contained in Assessing Community-College Impacts: Three Case Studies (Armijo forthcoming).

ERIC

Most impact studies so far have focused on economic factors, such as the impact of college expenditures for local goods and services. These studies (Portland State College 1965; Miernyk et al. 1967; Merchant 1969; Kruekeberg and Vaugn 1970) demonstrated that in most cases, college expenditures benefited the community. More recently, Caffrey and Isaacs (1971) provided guidelines for obtaining a variety of economic-impact information. A significant improvement over previous efforts, their work suggests procedures for searching institutional records to assess the total economic impact of a college on its community. It does not, however, suggest how to gather qualitative information, such as community attitudes toward an institution. Institutions that have implemented the Caffrey and Isaacs guidelines include the University of Wisconsin (Daellenbach 1976), the University of Pittsburgh (University of Pittsburgh 1972), and the Metropolitan Community Colleges of Kansas City, Missouri (Manning 1975).

Though useful, descriptions of economic impacts constitute only a part of the descriptive information needed by college administrators and planners. Consideration must also be given to the other types of impacts described above. Thus community-impact studies conducted at Northwest Alabama State Junior College (Phillips and Owings 1974), in Hampden County and Amherst, Massachusetts (Watchel and Morehouse 1971), and the University of Colorado at Boulder (Rautenstraus 1974) attempted to assess social and cultural as well as economic impacts. These studies found that colleges attract knowledge-based industries, such as data-processing or research companies, and that colleges provide local citizens with opportunities for professional development and a range of facilities and services, such as concerts, gymnasiums, and athletic fields.

Except for the work of Caffrey and Isaacs, little has been written heretofore about the methodology of community-impact studies. This Handbook describes procedures and instruments to help community colleges assess qualitative as well as quantitative impacts on all populations they serve. Chapter 2 presents guidelines for planning and managing a study; chapter 3 describes three data-collection tools; and chapter 4 discusses ways of tabulating, analyzing, and disseminating study data. The procedures described here are flexible and can easily be modified. An institution does not need sophisticated equipment, a specialized staff, or a great deal of money to measure its impacts.

CHAPTER 2

Planning and Managing A Community-Impact Study

The decision to conduct a community-impact study should be made by the college president and senior administrators. Once such a decision is made, the following activities might be undertaken to successfully plan and manage the study:

- Choosing the project leader
- Determining the preliminary scope of the study
- Involving constituencies
- Designing the study

Data-collection tools

Sampling

Personnel considerations

Scheduling

Managing the study

Although these activities are discussed separately, they might be performed concurrently (for example, staff might determine the scope of the study while involving constituencies).

5

CHOOSING THE PROJECT LEADER

Choosing the project leader is crucial to success of the study. In making this decision, the following points should be considered:

- The role of the project leader should be clearly defined and made known to all segments of the college community.
- The project leader should be chosen as early as possible, preferably before any detailed planning begins, so that he or she can help determine the scope of the project and the data-collection tools to be employed.
 - The project leader should have prior management experience or, at least, demonstrable management abilities. He or she needs to be familiar with research and evaluation principles and with the organization, staff, and services of the institution. Top-level administrators, such as vice-presidents, assistants to the president, or directors of institutional research, would be good candidates for the position.
- Because a community-impact study is a direct link to the community, the project leader ought to report directly to the president.
- The project leader ought to be released, as necessary, from other duties and temporarily reassigned to the project. The extent of time the project leader should be assigned will depend on the size of the project.
- The necessary resources, including staff, printing, computing, and postage, need to be made available to the project leader. If the project leader does not already supervise a staff, then a sufficient one should be provided. In order to maintain project continuity, it is essential that the project leader directly supervise the staff.

DETERMINING THE PRELIMINARY SCOPE OF THE PROJECT

The president, senior administrators, and project leader should develop the preliminary scope of the project. In doing so, they might consider three major parameters:

- Geographic area to be studied: The geographic area to be studied could range from a town or city to a county or region. In most cases, it will be the service area of the college.
- Populations to be studied: These might include students, former

- students, employers, civic leaders, social-agency administrators, educators, or service-area households.
- Impacts to be assessed: These could be economic, educational, environmental, social, cultural, recreational, or technological. They might include impacts of the college's programs, its services and facilities, and faculty, staff, and student spending.

In determining the scope of the study, an institution needs to make sure that the range of the three parameters is not too broad or too narrow. For example, a study of all impacts on all population groups in the service area would be unmanageable and would produce data that might not be used. On the other hand, a study of only a single impact or a single population would not be likely to produce data that adequately describe the college's impact on the community.

Since the parameters determine the information the project will produce, their choice should reflect institutional priorities. If parameters are chosen without proper consideration and fail to address important issues, the college administration may find the results of the study useless. The importance of properly defining the scope of the project cannot be overemphasized, since how well the project is defined at the outset can determine the difference between money well spent and money wasted.

INVOLVING CONSTITUENCIES

As community-based, performance-oriented institutions, community colleges should involve constituents, from both within and without the institution, in the community-impact study. Such involvement not only provides valuable advice but also enhances community understanding of and support for the institution. When involving constituents, the institution should define their role as clearly as possible. For example, an institution should specify whether it wants constituents to provide advice only.

One institution participating in the development of the *Handbook* found that an advisory group composed of persons external to the institution was quite helpful. Such a group can:

- Provide reactions to proposals for the impact study
- Identify key issues and sources of information
- · Help choose populations to be surveyed
- Help disseminate the findings

The president and senior administrators should select such an advisory group. Except for the president, who should chair it, and the project leader, this type of advisory group would consist of community leaders from outside the institution. Members of the group might include:

- Trustees
- Political leaders, such as the mayor and city-council members
- Business leaders, such as bankers, merchants, and chamber of commerce officials
- Labor leaders
- Professional persons, such as lawyers and doctors
- Educators, such as school-board members and school administrators

A similar type of advisory group might include faculty, staff, and students from within the institution, as well as persons external to the institution.

Many community colleges have advisory groups for various programs, particularly those in occupational areas. As a result, it would be relatively easy to form a community-impact-study advisory group by selecting a representative from each of these program advisory groups.

External constituencies can be involved in a number of ways. For example, during pilot testing of the data-collection tools, such as survey instruments and interviews, leaders within each population might be selected to promote understanding and acceptance of the study among other members of that population. In developing a survey instrument for employers, one institution asked certain employers to participate in the pilot test of the instrument. Their participation and consequent understanding of the study encouraged them to explain the study to colleagues and friends.

Internal constituencies can also be involved by forming a separate task force, composed of faculty, staff, and students. Each member might be made responsible for collecting data from a particular population. The project leader would chair and coordinate the task force.

The composition of any advisory group will determine in part how well it can publicize the existence of the study and disseminate the study results.

DESIGNING THE STUDY

The first step in designing the study is to involve constituents in the refinement of its preliminary scope. Refinement will involve reassessing the project parameters (the geographic area to be studied, the populations

•

to be surveyed, and the types of impacts to be assessed) to make sure that the project will provide the information the college needs and can use.

DATA-COLLECTION TOOLS

Having refined the scope of the study, decisions must be made concerning sampling, personnel, and scheduling. The choice of data-collection tools is determined by the type of information desired, project parameters, quality of information desired, funds available, and the level and number of staff available. Three data-collection tools—search of records, mail-out surveys, and interviews—were found especially useful in developing the *Handbook*. How to implement them is discussed in chapter 3. Some institutions, however, may find that other data-collection tools best meet their needs.

The three data-collection tools do not all produce the same quality of information, and thus the project leader needs to consider what quality is acceptable or desirable. The quality and cost of information, including the degree of specificity, increases progressively in the sequence of record search, mail-out surveys, and interviews. Unfortunately, records frequently do not conform to information needs. For example, the researcher who might want to analyze certain data by voter precinct may discover that data have not been collected by precinct. In most cases, therefore, mail-out surveys and interviews will be more useful. However, mail-out surveys can be biased by the self-selection of respondents. In any case, one should collect only the information that is needed, not all that is available. In most cases, mail-out surveys can meet community-impact-study information needs more easily and cheaply than interviews.

The practical considerations of staff, time, and money all influence the choice of data-collection tool. The project leader must consider what the institution can as well as wants to do. A small institution with limited staff should not undertake an extensive mail-out or interview survey unless it is willing to halt some other activities, hire additional staff, or subcontract the work. Though a seemingly easy way of collecting a large amount of data, a mail-out survey requires staff and time to tabulate and analyze the data. Even if funds are available for machine tabulation, staff might first have to prepare the data for processing, a task almost as time-consuming as manual tabulation. This problem can be alleviated by proper survey design, which is discussed in chapter 3. Availability of funds is another consideration. Development and reproduction of survey questionnaires can be expensive. If the size of the survey sample is large, then the availability of a computer or funds for computer time is an important consideration.

The project leader needs to weigh all these factors in choosing datacollection tools. If possible, more than one tool should be used, to offset individual methodological disadvantages, acquire complementary data, and strengthen the validity of the study.

SAMPLING

Surveying the total population generally increases the reliability of the findings, provides a hedge against the inevitable less-than-perfect response rate, and eliminates the often time-consuming process of designating a random or representative sample. Such a sampling strategy, however, is usually too expensive. Thus when the survey is restricted to a sample of the total population, careful procedures should be followed to ensure that the sample is large enough to permit valid inferences.

A survey sample represents a subgroup of elements (for example, a small group of students) selected from a large population (for example, all the students enrolled in the college) to obtain information about it. Most surveys in postsecondary education require some type of sampling, for three reasons. First, it is less expensive to survey a sample of a large population. Second, sampling reduces time needed to collect and process data. Third, sampling is usually more efficient than surveying the entire population, since it permits the development of higher-quality instruments and produces more manageable data.

Samples are of two types, probability and nonprobability. The first is based on the use of random sampling in the selection of elements from the larger population; the second is not. Probability samples avoid biases in the selection of the elements of the population by making sure that all elements have an equal chance of being selected. Such a guarantee allows the researcher to assume that the sample will closely resemble the population. Probability samples also permit estimates of sampling error. Nonprobability samples, on the other hand, are useful when probability sampling is too expensive or when a sample cannot be randomly selected because the population members cannot be individually identified.

Elementary Survey Sampling (Mendenhall, Ott, and Scheaffer 1971) and Sampling Techniques (Cochran 1963) are especially helpful in developing sampling procedures. Following are techniques that might be used with selected populations:

Population Faculty or staff Students

Techniques
Total population
Random sample of classes
Random sample of students
Total population

10

Citizens Stratified random sample of registered

voters by district, systematic sampling

(every fifth household)

Educators Purposely chosen

Simple random sample

Employers

Simple random sample

Civic leaders

Purposely chosen

Social-agency leaders

Purposely chosen

While the size of a sample depends on a number of factors, generally it should be large enough to obtain a sufficient number of responses to support reliable conclusions. According to Kish (1965),

Exact control of sample size is unnecessary and impossible in most situations. It may be too difficult to obtain either the information or procedures for firmly controlling even the initial sample size. Moreover, nonresponses and subclasses introduce additional sources of variation. We should aim at an approximate control that is both feasible and desirable. The degree of control depends on the situation. [p. 217]

Because the answer to this key question depends on the situation at hand, any further discussion here may be more confusing than helpful. As a result, one should consult the references in Mendenhall, Kish, and Cochran.

PERSONNEL CONSIDERATIONS

The size of the staff will depend on the scope of the study. Most studies will need:

- A project leader
- Secretarial time for typing questionnaire and cover-letter drafts and final copies
- Typesetting and printing time for questionnaire
- · Computer-personnel time for creating survey sample lists and address labels (or clerical time, if lists are created by hand, plus typist time for typing envelope names and addresses)
- · Clerical time for stuffing and mailing each questionnaire
- Clerical time for recording and tracking returned questionnaires
- Keypuncher time for punching responses to returned questionnaires
- Computer-data-analyst time for analyzing returned questionnaires
- Report-writer time
- Secretarial time for typing report

Training the staff requires particular attention. The experience of developing the *Handbook* indicates that the importance of adequate training cannot be overemphasized. Many implementation problems and defects in results can be directly traced to inadequacies in the training program. The value of interviews, for example, can be severely limited by inadequately trained staff.

The scope and time of the general training will depend on the data-collection tools selected and the size of the staff. This training should provide adequate information about the nature of the study, develop and enhance necessary skills for carrying it out, and generate positive, productive attitudes about the study. This last point requires particular attention, since staff attitudes will have a substantial impact on the quality of the study. Staff who believe that the study is a waste of time, that the institution cannot be improved, or that the findings will not be used can jeopardize the entire project. Conversely, those who understand the purpose and value of the project and who believe the institution can be improved can increase the chances of success.

The project leader, who has direct knowledge of institutional conditions and project staff, should design and direct the training program and be present at all training sessions. If possible, the president should open the training session with a statement indicating full institutional commitment. The training sessions should be informal and dynamic and, if possible, be held in small groups. Role playing and group discussion usually will foster understanding and enthusiasm more effectively than will lecturing. In short, when designing and directing the training program, the project leader needs to be careful not to take desirable attitudes and skills for granted.

SCHEDULING

Once the staff has been selected, the project leader can schedule the various activities of the study. The institution may desire to create a small task force or working group to design the questionnaire or interview schedule for each population. The project leader may prefer to head each task force or to have a person from each report to him. Because there will likely be problems common to the survey of several populations, the project leader must become thoroughly familiar with all the methods employed and coordinate the various task forces. The project leader should also describe each task in terms of institutional needs and resources and should try to anticipate contingencies, such as the need to cooperate with another institution or to purchase computer time. The project leader will also

have to anticipate the various decisions that will have to be made in the course of the study. For example, at some point, the project leader may have to designate the samples and determine whether the questionnaires will be printed, photocopied, or mimeographed. Failure to anticipate such decisions early is quite likely to produce trouble later.

Next, the project leader needs to plan the specific tasks, in the order they are to be performed. He or she should designate which tasks are independent and can be done simultaneously, which are independent and must be done separately, and which are dependent. For example, training the staff and drawing the sample are independent and can be done simultaneously. Editing collected data and training staff are also independent and can occur at different times. However, editing collected data obviously is a postcollection activity. Different activities may or may not be synchronized but must be coordinated. For example, it is usually more efficient to combine sampling activities for different populations.

In defining the tasks and their interrelationships and in anticipating decisions, the project manager will quite likely modify and refine survey data-collection tools. Such modification and refinement are essential; the tools described here should be viewed as guides to be modified to meet the needs of the individual institution. The project leader or designated staff should also refine the data-collection instruments contained in appendix 2. While these instruments can be used without further revision, most institutions will choose to modify them. However, it is not recommended that institutions develop completely different ones, since those in the *Handbook* have been tested and revised.

Data-collection tools described here were designed to be implemented according to a two- to four-month schedule. However, three months would probably be too short for one of the more complex tools, such as a set of interviews, unless staff were assigned full time. On the other hand, one year would be too long to sustain enthusiasm and wait for the results of the study. The schedules for the individual tasks that constitute the study should be realistic, allowing for contingencies but free of slack.

MANAGING THE STUDY

If a project is well planned, managing it will be relatively straightforward. Most management problems result from poor planning or inadequately trained staff. Following is a discussion of general project management, independent of any particular data-collection tool.

- Being responsible for the success of the study, the project leader must be knowledgeable about all its phases. The project leader must act decisively and, after making a decision, should communicate it in writing to all appropriate persons, not just to those who may have raised the issue.
- The project leader should continuously monitor all activities with the aid of a task chart. By charting the various tasks, the project leader can eliminate scheduling conflicts and slack time. Contingencies should be anticipated and the plan made as flexible as possible. There are several methods of charting a project (for example, PERT [Program Evaluation Review Technique] or Gantt charts). Three easy-to-use task chart are shown in figures 2, 3, and 4. Figure 2 presents a chart that is useful in general project management—it highlights major phases of the project. Figures 3 and 4 show examples of charts that can be used to highlight specific activities within the major phases. In most circumstances, the simpler the chart, the better.
- Besides monitoring all phases of activity, the project leader must ensure the continuing administrative support essential for the success of the project, even when more specific tasks seem more pressing. He or she must also coordinate the work of the staff, communicate with them about tasks to be performed, and encourage them to communicate with one another. Staff meetings need to be held to discuss problems and criticisms. The project leader should not be surprised when, during these meetings, persons ask questions already answered in the training sessions.
- The project leader must delegate much of the work to others, but should personally participate in the analysis of data. Data analyzed only by statisticians would be of limited value, since proper analysis requires an administrative perspective. Similarly, the editing of data-collection instruments, though often tedious, is too important to be delegated to untrained personnel and should be performed by a responsible person who understands the conceptual design of the project. Most important, the project leader should participate to some degree in each aspect of the project, including the collection, tabulation, and analysis of data, since only through such participation can he or she understand the project and communicate its findings.

CHAPTER 3

Data-Collection Procedures

This chapter describes three approaches—record searches, surveys, and interviews—that can be used to collect community-impact data. Specific collection procedures are presented in appendix 1.

RECORD SEARCHES

Data on community-college impacts may be found in institutional and noninstitutional records. Table 1 summarizes some of these sources and the types of data they might yield.

Since the review of institutional records alone can produce an unmanageable amount of data, one should first determine what data will best answer the questions posed at the beginning of the study. One must also consider the availability of different types of data. For example, how easily can the data be located? Are they machine readable? Will they have to be tabulated, or are they already summarized? Are they open to public review? Is permission necessary to obtain them? Other considerations might include the cost of personnel, supplies, and computer time. Staff at one institution that conducted an impact study as part of the NCHEMS project searched records for data on institutional enrollment (credit hours produced, students admitted, degrees granted), community use of college facilities, community employment of graduates, and institutional

 ${\tt TABLE\,1}$ Examples of Information Types and Their Sources That Might Be Gathered in the Record Search

·	INFORMATION TYPE	SOURCE	
ECONOMIC: 1. Local expenditures by the college: Taxes Utilities Local goods and services Capital construction Institutional payroll		Institutional Business Office	
	2. College revenue	Institutional Business Office	
SERVICE:	Community participation in institutional social, cultural, and recreational programs	Appropriate institutional office (e.g., Community Service Office)	
	2. Community use of institutional facilities	Appropriate institutional office (e.g., Institutional Facilities Office)	
DEMOGRAPHIC:	1. Description of college community	Institutional literature, census data (census tract and Standard Metropolitan Statistical Area [SMSA] data), socal government data, Chamber of Commerce data	
	2. Description of students	Student Affairs Office, Institutional Research Office, Academic Affairs Office	

Note: Caffrey and Isaacs offer useful suggestions for determining what types of economic data are important for a community-impact study and how they can be effectively tabulated.

income and expenditures, including the amount of money the college brought into the community through salaries, purchase of goods and services, capital construction, and state aid.

The NCHEMS Outcome Measures and Procedures Manual (Micek, Service, and Lee 1975, pp. 171-79, 205-24) contains procedures and forms that could be used to assess:

- Enrollment of nondegree and noncernificate seeking students (measure I-1)
- Community patteripation in community education programs (measure I-2)
- Community participation in extension services (measure 1-3).
- Institution's payment of local and state taxes and tax compensations (measure K-1)
- Institution's purchase of locally provided utilities (measure K-2).
- Institution's purchase of locally delivered goods and services (measure K-3)
- Institution's capital equipment expenditure relevant to the local community (measure K-4)
- Institution's capital construction expenditure relevant to the local community (measure K-5)

Figure 5 contains procedures and forms relating to measure K-3; appendix 1 contains the rest.

COUNTY

NATIONAL CENTER FOR HIGHER EDUCATION MANAGEMENT SYSTEMS

Outcome Measures and Procedures Manual

K-3 MEASURE NUMBER

MEASURE NAME

Institution's purchase of locally delivered goods and services

DEFINITION

Total amount of dollars expended on goods and services that are purchased by the institution from the local community during a certain time period. Goods and services are distinguished from capital equipments generally defined by each institution in terms of dollars and duration (see COMMENTS). Also, goods and services, as referred to here, do not include utilities purchased from the local community (see Outcome Measure K-2)

DATA SOURCES

Institutional Business Office

PROCEDURES

Search of Institutional Records

COMMENTS

This outcome measure is identified as a potential measure of an institution's Financial Impact on the Community (3.2.0.04) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures—see Appendix A.

In separating "goods and services" from "capital equipment" each institution uses different criteria of dollars and duration. The user of the manual should consult the institution's business office to determine the criteria for distinguishing goods and services from capital equipment.

ACQUISITION PROCEDURES FOR OUTCOME MEASURE K-3

Considering the potential diversity in purchasing methods and record keeping among institutions, it is expected that users of the manual will have to make several decisions during the course of gathering the data for this measure. For the purpose of clarifying the process of searching institutional records to obtain the desired information, a simple flow chart is presented in Figure K-3.1 on the next page. The user may consult the information search process suggested in the figure and make a general plan applicable to his or her particular situation prior to engaging in the data collection activity.

Figure K-3.1

INFORMATION SEARCH PROCESS FOR OUTCOME MEASURE K-3

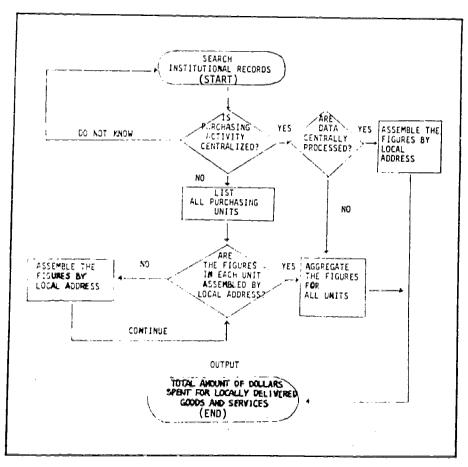

FIGURE 5 -- Continued

Procedures for Use of Institutional Records

- Identify the time period during which the foral amount of dollars expended on goods and services that are purphased by the institution from the local community are to be determined.
- Determine the boundary of the institution's functional local community.
- a. Lonsuit the institution's business diffice to determine whether the burchasing activity of the institution is general out by a sentral purchasing office or by subunits (departments and other organizational units) within the institution.
- 4. If the purchasing activity is centralized, determine whether the purchasing records contain the addresses of the suppliers in the designated local community. If they do, it is simply a matter of retrieving the information according to the planned format. If, however, the record files do not contain the local supplier's addresses, the user of the manual will have to obtain such information from the existing files that contain the vendor register or invoice vouchers.
 - If, by chance, the user attempts to use an aggregate figure that already has been developed by certain offices, care should be taken about the reliability of that information. For example, the user might check the aggregate information against the original data or check the information generated by one office against that generated by another office.
- 5. If the purchasing activity is not centralized or the needed information is not centrally available, the following steps should be taken:
 - a. Consult the institution's business office and identify all purchasing units within the institution.
 - b. Contact the person in charge of each purchasing unit's expenditure records and obtain the needed information for deriving the measure.
- Calculate the total amount of dollars paid by each purchasing unit in the institution to suppliers in the designated functional local community within the specified time period.

The mail-out survey has two main advantages. First, it can be administered more easily and cheaply than can a series of interviews, since much of the work involved can be performed partly by volunteers or work-study students. Its relatively low cost makes it especially attractive to institutions with limited budgets. Second, it permits an anonymous, and possibly more honest, response than an approach that identifies the respondent. At the same time, however, the mail-out survey has its limitations, Because the questionnaire must be relatively short and the questions easily understood, the mail-out survey does not usually allow for the collection of detailed information. Moreover, because mail-out surveys often produce low response rates, their findings sometimes cannot be generalized to the total population. Such generalization usually requires additional steps, such as a second mailing, telephone survey, or interviews (ways of assessing response bias are discussed in enapter 4).

After deciding to conduct a mail-out survey, the project leader and the project staff will develop and test the survey instruments. Development includes deciding which impacts to measure, designing the questions to measure them, formatting the questionnaire, and pilot testing the instrument. Figure 6 contains an example of the type of form developed in the NCHEMS Outcome Measures and Procedures Manual to assess institutional participation in community affairs. Appendix 1 includes procedures contained in the Outcome Measures and Procedures Manual (pp. 185-95, 197-201, 225-40) and its supplement (Micek, Armijo, and Renkiewicz 1977, pp. 63-73) for collecting data about the following impacts, together with instructions for their use:

Institution's participation in community affairs (measure J-1)

Community use of institutional facilities (measure J-3)

Local expenditures by faculty and statt (measure K-6)

Local expenditures by students (measure K-7)

Local expenditures by visitors (measure K-8)

Community awareness of, use of, and satisfaction with instructional programs (measure I-5)

Community awareness of, use of, and satisfaction with institutional services (measure J-4)

Institutional goal attainment (measure J-5)

Community unmet educational needs (measure J-6)

NATIONAL CENTER FOR HIGHER EDUCATION MANAGEMENT SYSTEMS

Outcome Measures and Procedures Manual

J-1 MEASURE NUMBER

MEASURE NAME

Institution's participation in community affairs

DEFINITION

The number of faculty, staff, and students who participate in various types of off-campus activities in the community, such as workshops, consulting, or giving lectures.

DATA SOURCES

Heads of departments or organizational units in the institution, faculty, current students

PROCEDURES

Administration of a Survey Questionnaire

COMMENTS

This outcome measure is identified as a <u>proxy</u> measure of an institution's contribution to the community through services provided by the faculty, staff, and students to various community groups and organizations. See outcome variable <u>Extension Services</u> (3.2.0.01), <u>Personal Services</u> (3.2.0.02), and <u>Extramural Cultural and Recreational Services</u> (3.2.0.03) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures—see Appendix A.

FIGURE 6 -- Continued

ACQUISITION PROCEDURES FOR OUTCOME MEASURE J-1

Two alternative procedures are suggested for obtaining data about the extent to which persons in the institution (faculty, staff, and students) participate in various kinds of community activities. The first procedure attempts to identify the extent of participation in community activities by faculty, staff, and/or students as a result of an institutional assignment.

The second alternative for obtaining data for outcome measure J-1 involves the administration of a faculty activity analysis survey. Both procedures, as presented here, have major limitations. The major deficiency of the first procedure is that it does not identify those community activities in which faculty, staff, and students participate on a <u>voluntary</u> basis. The major limitation of the faculty activity analysis procedure is that it is restricted to faculty activities.

FIGURE 6—Continued

Procedures for a FACULTY ACTIVITY ANALYSIS Questionnaire

If this alternative is chosen, it is believed that the user will wish to identify faculty activity as it relates not only to community service activities, but also to teaching, scholarship, and internal service activities. Therefore, it is recommended that the user consider implementation of the Faculty Activity and Outcomes Analysis (FAOA) survey procedures which have been developed by NCHEMS (Manning and Romney, 1973). These procedures have been designed to collect activity data that should be useful for a variety of institutional planning, management, and evaluation functions.

In the FAOA survey instrument, Section D, Public Service Activities, is for those activities faculty engage in principally outside the institution. For example, the following activities would be included:

- consulting
- giving professional advice
- directing or participating in community training
- urban extension
- giving lectures or seminars for the general public
- patient care
- agricultural extension

For the users's information, a copy of the FAOA questionnaire follows. Section D of the questionnaire concerns faculty Public Service Activities.

PAGE(S) 31-34 WAS (WERE) MISSING (REMOVED) FROM
THIS DOCUMENT PRIOR TO ITS BEING SUBMITTED TO
THE ERIC DOCUMENT REPRODUCTION SERVICE.

In developing the survey questionnaire, the project leader and project staff should consider (1) the design of the questionnaire, (2) the use of open- or closed-ended items, (3) the wording of the items, (4) their arrangement and instructions for completing them, (5) pilot testing, (6) distribution costs, and (7) follow-up strategies.

QUESTIONNAIRE DESIGN

An attractive questionnaire format can help achieve a high response rate. To make the questionnaire attractive, one should:

- Keep it as brief as possible; when many questions are asked, one
 may want to consider giving parts of the questionnaire to different
 samples of the same population to make each questionnaire as
 short as possible
- 2. Use high-quality paper and printing whenever possible, and make sure that the type is large enough to be easily read
- 3. Design the cover of the questionnaire so that it is distinctive, aesthetically appealing, and easy to read
- 4. Make it easy for respondents to record their answers
- 5. Have a logical and easily followed order and organization of questions; for example, provide clear instructions when subsequent questions are contingent on an earlier response
- 6. Use plenty of white space between items

A final point to be considered in questionnaire design is how the responses will be coded once it is returned. For example, if the responses are to be keypunched directly from the questionnaire, the staff will need to make sure the keypuncher can easily recognize the number or letter assigned to questionnaire items and their responses. (A good rule is to have the questionnaire draft reviewed by a data-processing expert to make sure it can be accurately keypunched.)

USE OF OPEN- OR CLOSED-ENDED ITEMS

In an open-ended item, the respondent supplies his or her own answer; in a closed-ended one, he or she selects answers from a list supplied by the researcher. Whitney (1972) listed the following advantages for each type:

Open-ended items:

- Are relatively free from the researcher's influence
- Elicit a wide variety of responses
- · Are useful for introducing new parts of the questionnaire

- Provide background for interpreting results
- Give respondents a chance to express their opinions
- Are more courteous
- Can aid in drafting questions and coding responses (when used in pilot work)
- · Give detail and credibility to the final report

Closed-ended items:

- Are more uniformly interpreted by respondents
- Produce easily tabulated responses
- Are unaffected by the respondent's verbosity
- Eliminate problems of vocabulary and definition
- Permit more questions

WORDING OF ITEMS

Items must be clear and unambiguous, so that respondents understand exactly what the researcher wants to know. The following points should be considered:

- Items should be kept as short as possible, because those that are too long often will cause the respondent to forget their purpose; long items can also jeopardize questionnaire reliability and response rate by irritating respondents
- Language should be simple, clear, and straightforward; items should be written so that the respondent is addressed respectfully and courteously
- Whenever possible, simple sentences should be used
- Biased words or phrases should be avoided
- If questionnaire items offer alternative responses to be checked by the respondent, the set of responses should include all possible and distinct responses to the question in focus to avoid confusion (in other words, the set of responses should be exhaustive and mutually exclusive)
- "Double-barreled" items that, in fact, ask two questions should be avoided; Babbie (1973) suggests that whenever the word and appears in a questionnaire item, the item should be reviewed for unity

ARRANGEMENT OF ITEMS

As a general rule, a questionnaire should begin with the set of questions most likely to make the respondent want to respond. Usually, questions

about attitudes and satisfaction are better for this purpose than ones about demographic subjects. Items that deal with the same topic should be grouped together. For example, questions concerning educational progress and plans might constitute one group and questions about occupational status and plans another. After this rule has been considered, one should group items according to format; for example, all sentence-completion items on a particular topic should be arrayed together. Most researchers feel that items that are more difficult to answer should come at the end of the questionnaire, unless they are crucial for setting the tone or introducing the substance of the questionnaire. Besides helping the respondents complete the questionnaire, well-phrased instructions can establish and maintain rapport with them.

PILOT TESTING

The project leader and project staff should present the developed questionnaires first to the institutional administration for comment and criticism. When presenting them, the project leader should review the objectives and extent of the study and the uses of the data, to consolidate support for the study. After the administration has approved the questionnaires, an advisory group might review them. Each questionnaire should be tested on a small subset of the target population. On the basis of these pilot tests, the survey questionnaires are then revised.

DISTRIBUTION COSTS

A cover letter should be included with each questionnaire. This letter might stress the importance of receiving a response, affirm its confidentiality, and emphasize the value of the study to the community as well as the institution. The cover letter may be printed on institutional stationery, or the letter may be printed on the questionnaire itself (see appendix 2). A recent NCHEMS study suggests that the former may produce a higher response rate. Whichever is chosen, the letter should be signed by the president.

Table 2 lists the materials required for the initial contact in mailand hand-out surveys, along with estimated costs of each. Estimated costs are based on a survey of 1,000 participants; costs of larger or smaller surveys should be roughly proportional. Survey research literature indicates that personalizing the survey materials substantially increases the response rate (see Linsky 1965, for an overview of this literature). In particular, studies have shown that using first-class postage, particularly commemorative stamps, can increase the response rate by as much as 10 percent (Hensley 1974 and Champion and Sear 1969). Because a high response rate is essential, first class should be used instead of bulk-rate postage on

TABLE 2 ESTIMATED COSTS (AS OF 1977) OF MATERIALS FOR INITIAL MAIL- OR HAND-OUT CONTACT WITH 1,000 PARTIC PANTS

			ESTIMATED COSTS				
MATERIALS	NUMBER	NUMBER EXPLANATION		Nonprofit- Permit Mail	Hand-Out		
Questionnaires	1,000	Printing costs estimated at \$.10	\$100.00	\$100.00	\$100.00

Return Envelopes	1,000	Business-reply return envelopes					
•		(a) Printing costs(b) Postage costs at \$.15 each x 300 returned	15.00 45.00	15.00 45.00			
Mailing Envelopes	1,000	Standard business size	15.00	15.00			
First-Class Postage	1,000	First class commemorative stamps at \$.13 each	130.00				
Nonprofit Permits with First- Class Postage for Undeliverables	1,000	(a) Nonprofit permits at \$.02 each (b) Estimated 10 percent undeliverables at \$.13 each		20.00 13.00			
TOTAL			\$ 315.00	\$218.00	\$110.00		
Per-Participant Contact Costs		•	.32	.22	.11		
Per-Participant Response Costs (estimating 300 responses)				.73	.37		

Note: The hand-out method, wolves distributing a survey to a participant who fills it out and returns it on the spot.

^{*}Estimated costs for more or fewer than 1,000 participants should be approximately proportional.

the outside mailing envelopes. First-class mail has the added advantage of being forwarded by the post office. Hensley also showed the importance for the inner return envelope to be different from the outer mailing one, and that the least expensive choice, a business-reply, printed return envelope, achieves the highest response rate when combined with the commemorative stamp outside.

Other mailing costs not shown in table 2 are those required for either typing names and addresses of participants on the envelopes or generating computer-printed name and address labels. These costs will vary depending on the institution but should be included in cost estimates for the survey. At least one study (Carpenter 1974-75) showed that personalizing the cover letter by manually typing names and addresses increased the response rate, though not greatly, over computer- or machine-produced names and addresses. One would expect, therefore, a similar effect from typing envelope addresses; thus if all other factors are equal, typing the participants' names and addresses would be preferable. However, if the institution can address the crivelopes more cheaply with computers, then computer-produced labels would be a reasonable alternative.

Other costs incurred in conducting a survey, primarily those of personnel, are difficult to estimate, because they will vary from institution to institution, depending on salaries and staff time invested. Distributing the survey by hand often produces a higher return rate than by mail. The method of the hand-out will vary according to the population to be surveyed; faculty, for example, could be surveyed at a faculty meeting, students at registration or in classes. Whatever-methods are employed, a site that might bias the response, such as a counseling center, ought to be avoided. Moreover, possible respondents need to clearly understand that they are not required to complete the survey, since responses from unwilling respondents could be deliberately inaccurate.

FOLLOW-UP STRATEGIES

Since follow-ups usually increase response rates, they are recommended when feasible. Plans for follow-up, with or without tracking, need to be made before the initial mailing of the survey questionnaires. A follow-up with tracking consists of a second mailing to all participants who have not yet responded. If a follow-up with tracking is planned, a list of participant identification numbers, names, and addresses will be made before the initial mailing. If a computerized data file is used to produce mailing labels for possible respondents; tracking sheets can probably be produced by the computer; otherwise, they must be typed. One person should record on a tracking sheet the return of each questionnaire (figure 7 contains a sample tracking sheet). All returned materials, even undelivered questionnaires, should be kept until the end of the survey.

FIGURE 7 TRACKING SHEET

	, *		49						

If the follow-up is not tracked, and if the sample selected for the study is not too large, each person included in the initial mailing could receive a second questionnaire with a note asking for a response if one has not already been sent. A variation of this approach would be to send all persons included in the initial mailing a postcard reminding them to return the questionnaire, if they have not already done so. If this method is chosen, the postcard should also advise the respondent how to get a second questionnaire if the first has been misplaced. One of the schools that participated in the NCHEMS project found this method moderately successful and avoided the cost of printing a complete set of additional questionnaires.

Telephone follow-ups are usually quite effective in increasing return rates. These would be especially appropriate in a community-impact study, because the geographic area of the study would usually involve only local calls. Before choosing this approach, however, the project leader and project staff need to consider the availability of appropriate staff to make the telephone calls.

INTERVIEWS

In an interview, the researcher can pursue the same types of questions as in a mail- or hand-out survey. Interviews can also obtain a great variety of information through follow-up questioning. However, they are time consuming and expensive and require considerable skill, sensitivity, and effort. Furthermore, interviewer bias—systematic errors sometimes introduced by even trained interviewers—is difficult to correct and may distort the findings. Telephone interviews have the additional disadvantage of requiring extra time to find current telephone numbers and to contact respondents.

Each of the three types of interviews—individual, group, and telephone—requires basic preparation. First, questions must be formulated. These may refer to the history of the person interviewed as well as that person's opinions. Next, the researcher should decide how to arrange the questions and when to use open- or closed-ended items. The interview questionnaire should then be pretested in simulated interviews, to improve technique, develop a standard set of procedures, and eliminate confusing items. Then, for each type of interview, a sample needs to be selected, and, for the individual and group interviews, contacts made by letter or telephone to establish times and locations. One institution that participated in the NCHEMS project conducted group interviews of social and civic leaders by holding breakfast and lunch group-interview sessions, moderated by

the college president, at which the participants exchanged ideas and reactions about the college's impact. Participants completed questionnaires prior to meetings, and comments were recorded and transcribed. This method enabled the college to interview a large number of social and civic leaders at one time and to establish a dialogue on important issues. By bringing community leaders to campus, the study was able to enhance interest in the college and its programs. Figure 8 contains an example of the interview schedule used by the president of this college in the interview sessions with social and civic leaders.

In addition, personal and telephone interviews can be used by researchers to pursue selected issues and individual responses in greater detail. Names and telephone numbers can be voluntarily obtained from many questionnaire respondents by asking on the survey form whether the respondent would be willing to discuss his or her response in a follow-up interview.

Tabulation, Analysis, and Dissemination of Study Data

TABULATION

Tabulation can begin as soon as the questionnaires are returned. Whether the data are tabulated by hand or by computer will affect the extent to which they can be analyzed.

In manual tabulation, the staff will visually edit the questionnaires, hand code them when necessary, transfer the data from the questionnaires to the tabulation sheet, count checkmarks by column, and, for cross tabulations, count and record pairs of checkmarks. Open-ended responses might also require hand coding. For example, an item on the questionnaire might require students to list their field of study. Response could be converted to a numeric code to facilitate tabulation. Figure 9 is a sample tabulation sheet that can be used in manual tabulation.

For example, item 1 might read:

y.)

I ≠ Blank

50

It the respondent checked option 2, a checkmark would be placed in the cell described by questionnaire number 0001, age category 2. The number of checkmarks in each column can be totaled as each tabulation sheet is completed. After all sheets have been returned, grand totals for each column can be obtained by adding the totals of the same column on the different sheets. This procedure will yield the data necessary to complete a summary by item. For example, the summary for the age question might look like this:

Age Category	Number of Respondents
1	2
2	12
3	7
4	2
5	1
Blank	I

Additional frequency distributions, cumulative frequency distributions, and such can be derived from this information. If possible, however, the data should be processed by computer rather than by hand, since computer processing expedites tabulation and cross tabulation.

The tasks involved in computer tabulation are visually editing questionnaires, hand coding when necessary, keypunching, and verifying and editing data. If computer processing is planned, keypunching codes and column numbers should be designated on the questionnaire (the questionnaires in appendix 2 are so designed). The punched cards should also be verified by the keypuncher. Even though verification will nearly double the cost of keypunching, it will eliminate many punching errors. The keypuncher should call the project leader about any ambiguities found while punching responses.

Computer editing will improve the quality of the data by reducing the likelihood of errors. (See the *Outcome Measures and Procedures Manual*, appendix E, for a detailed discussion of computer editing.) In any questionnaire survey, errors are bound to occur in recording responses. These errors may have been made by the respondent, in not following directions, the hand coder, or the keypuncher. Computer editing can detect two kinds of errors:

1. Responses may be out of acceptable ranges for an item. For example, one or two respondents may have sex codes of 3. This type of error can be detected by inspection of a preliminary frequency distribution of all responses to the questionnaire for all students using a package program such as the Statistical Package for the Social

- Sciences (SPSS). Alternatively, a special computer program can be written that checks for out-of-range responses to each item for each questionnaire and prints a message when an error is found Correction of errors consists of locating the original questionnaire for which an error occurred and then correcting the appropriate card columns.
- 2. Logically inconsistent responses may be found among pairs or sets of responses to the questionnaire. One such inconsistency is a student responding to a "current degree-sought" item with "doctoral degree," for example, and also indicating that he or she is a sophomore. These types of errors can be detected only by a special program written to compare pairs or sets of responses for each respondent and programmed to write an error message when an inconsistency occurs. Correction consists of changing the keypunched cards after checking with the original questionnaire to see what the correct responses are. In many cases, these types of errors exist even on the questionnaire (because the respondent made a mistake). If this is the case, a judgmental decision must generally be made as to which response is correct, and other responses changed to "blanks" or "no response" by deleting responses from the appropriate card columns.

From the above editing suggestions, it can be seen that one should keep the original questionnaires sorted in the same order as the cards, generally in respondent identification number order. By keeping the questionnaires sorted, it will always be easy to find quickly a particular questionnaire needed for editing verification or any other purpose. It is suggested that a person with data-processing background be included on the project staff to handle the above-mentioned type of problem.

DATA ANALYSIS

This phase of a community-impact study consists of deriving a set of descriptive statistics (such as absolute and cumulative frequencies, percentages, means, and standard deviations) that summarizes the questionnaire responses. It might also include a summary of open-ended responses and a determination of the degree of response bias. This basic descriptive analysis is then followed by as much additional analysis as time, money, and interest permit. Guidelines are suggested below for performing statistical analysis, summarizing open-ended responses and core questions, and assessing response bias.

STATISTICAL ANALYSIS

Descriptive analyses of the returned questionnaires usually consist of frequencies (counts) and percentages of the number who responded to each option of each question. Thus each item would be tabulated as in this example:

The overall purpose of (name of institution) is to provide educational programs and services as needed by the residents of (name of community) beyond the high-school level. The education and training provided by (name of institution) are intended to help students obtain the knowledge and skills needed for educational and occupational career advancement, personal developerant, and recreational enjoyment.

Given this overall purpose of (name of institution), how well is (name of institution) achieving this goal?

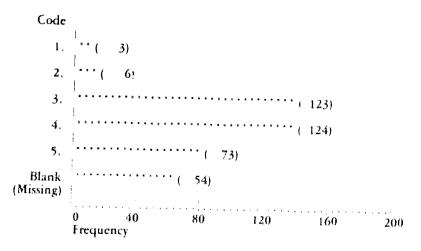

- ____1. Very poor job
- __ 2. Less than satisfactory job
- .__3. Satisfactory job
- 4. More than satisfactory job
- . 5. Excellent job

Code	Absolute Freq	Relative Freq (Pct)	Adjusted Freq (Pct)	Cum Freq (Pct)
1	3	.8	.8	.9
2	6	1.6	1.8	2.7
3	123	32.1	37.4	40.1
4	124	32.4	37.7	77.8
5	73	19.1	22.2	100.0
Blank	54	14.1		100.0
Total	383	100.0	100.0	

In the above table, the "Code" column lists the possible options for the item; the "Absolute Freq" column lists the number of responses to each option (the three respondents who chose option 1); the "Relative Freq" column lists the percentage of respondents choosing each option, including those who left this item blank (14.1 percent of those who returned a questionnaire left this item blank); the "Adjusted Freq" column shows the percentage of respondents choosing each option, excluding blanks; and the "Cum Freq" column gives the percentage of respondents who chose that res—se or a response listed prior to it (2.7 percent of the respondents—hose options 1 or 2, 40.1 percent chose options 1, 2, or 3, and so forth).

If possible, it is also useful to produce a histogram for each item, similar to this:

This histogram depicts what is listed in the "Absolute Freq" column of the previous table. It tells the reader very quickly that the respondents think that the institution has been very successful in achieving its goals. The mean and standard deviation should be calculated for questionnaire items that have an underlying scale, like the following item asked of institutional faculty and staff:

Please estimate your <u>average monthly expenditures</u> in the local community for the following:

	anny on the toniowing:	
		(please fill in estimated monthly dollar amount)
a.	Rent or house payment	
b.

Summary of Responses:

insurance)

toilet goods)

Health (doctors, hospital, dental,

k. Insurance (other than car or health)

Magazines and newspapers

m. Personal items (such as jewelry,

Other types of descriptive statistics, such as medians, modes, and variances, can be used in analysis when appropriate (Mendenhall, Ott, and Scheaffer 1971).

All the basic descriptive analyses suggested above can be performed for various subgroups of the sample that may be of interest as well as for the total sample. Below are examples of subgroup analysis that might be performed on populations included in a community-impact study:

Population Citizens	Subgroups Geographic location S
	Age category
	Income category
Faculty and Staff	F :- vs. part-time
	Age category
	Income category
Students	Geographic location
	Sex
	Ethnic group
	Major field or program
	Full- vs. part-time
Employers	Type (e.g., manufacturing, construction)
	Location

Whenever a subgroup analysis is performed, the number of respondents in the subgroup should be large enough to make valid inferences possible. This number depends on the size of the population, the sample selected, and the subgroup. Sometimes it may be necessary to oversample certain subgroups, to assure that the number of cases is sufficient to support analysis (Mendenhall, Ott, and Scheaffer 1971, Cochran 1963).

Data can also be cross tabulated (subgroup analysis is one type of cross tabulation). If the data are to be cross tabulated manually, only a few of the most important tabulations can be selected. Computer processing, however, removes this constraint and permits the scope of analysis to be expanded to include areas of interest as well as importance.

The following is an example of cross-tabulation analysis applied to a community-impact study:

100

	TOT PCT	IVERY IPOOR JOB		BOLYB O T		TJOB	ROW TOTAL

	TOTAL	0	4,1	23.0	47.4	25.5	100.0

*0 DENOTES BLANK

As a faculty or staff member of (name of institution), have you given any of your time to community-service activities such as consulting, art exhibits, lectures, or seminars for the public?

_1. Yes

___2. No

The overall purpose of (name of institution) is to provide educational programs and services as needed by the residents of (name of community) beyond the high-school level. The education and training provided by (name of institution) are intended to help students obtain the knowledge and skills needed for educational and occupational career advancement, personal development, and recreational enjoyment.

Given this overall purpose of (name of institution), how well is (name of institution) achieving this goal?

____1. Very poor job

____2. Less than satisfactory job

____3. Satisfactory job

____4. More than satisfactory job

___5. Excellent job

 U_{\perp}

One interpretation of the data might be that faculty and staff involvement in community-service activities is unrelated to their perception of how well the college is achieving its goals.

SUMMARIZING OPEN-ENDED RESPONSES

In some situations, it is desirable to use an open-ended item rather than one that allows only certain responses. Analysis of open-ended questions, however, is usually more difficult. Following is an example of an open-ended item:

Name two things you feel that (name of institution) is not doing well.

After a review of all responses, the following categories were developed and each response placed in one of them:

Academic Standards

- 1. Retaining low achievers
- 2. Requiring high enough standard of performance of students
- 3. Monitoring students not really seeking education but simply qualifying for social-security benefits

Community Relations

- 1. Advertising the advantages of attending
- 2. Providing more information for public
- 3. Developing enough industry contact
- 4. Sharing information
- 5. Meeting with agencies in the community before certain courses are offered
- 6. Communicating with high-school students as to what is available to them
- 7. Communicating with the public at large
- 8. Publicizing its presence and capabilities to the immediate community
- 9. Promoting itself
- 10. Publicizing its programs in the community at large
- 11. Increasing its credibility in the eyes of the community rapidly enough

Curriculum and Programs

- 1. Developing vocational programs
- 2. Making available academic night courses to a greater extent
- 3. Meeting all the vocational needs of the area
- 4. Strengthening material (business, management material)
- 5. Appearing adequate in skills training leading to jobs
- 6. Providing enough job training for industrial subjects
- 7. Developing sufficient depth of subject matter

Resources

- 1. Improving library
- 2. Improving level of academic teaching
- 3. Improving counseling

Miscellaneous Other

- 1. Improving intercollegiate athletics
- 2. Stimulating adults to participate
- 3. Clarifying the need for education in leisure and recreational enjoyment

Program Coordination

- 1. Coordinating with offerings of four-year institutions
- 2. Coordinating with other universities in the area

In developing an open-ended item, the instrument designer will usually anticipate most of the categories of responses that will be received from the study participants. Nevertheless, all responses should be reviewed before categories are established. See Selltiz et al. (1951) for a good discussion of content analysis.

CORE QUESTIONS

In a community-impact study, most institutions will find it beneficial to compare responses across the surveyed populations. For this to be done, some items on each survey instrument should be identically worded. An example of such an item and the organization of data collected from it follows:

Are there educational needs in (name of community) which you feel (name of institution) should be attempting to meet but is not meeting at the present time?

___1. Yes

____2. No

Analysis (the numbers in the following table are percentages):

Population	Response		
	Yes	No	Blank
Faculty and Staff	36.2	58.2	5.6
Citizens	13.6	59.3	27.2
Employers	20.2	61.7	18.1
Educators	22.6	60.8	16.6

One interpretation might be that the faculty and staff are more aware than are the other populations of unmet educational needs.

ASSESSING RESPONSE BIAS

Response bias exists when respondents to a questionnaire survey differ systematically from the total sample to whom the questionnaires were sent. Respondents usually tend to be more concerned, more interested, or more enthusiastic than nonrespondents. Respondents also tend to have stronger views and to feel more positively about an institution.

Response bias can usually be assessed in two ways. The researcher can isolate a small random sample of nonrespondents and strive to obtain valid questionnaires from them, to compare with the questionnaires of the original respondents. A good approach for a community-impact study, this method requires careful tracking of returned questionnaires, and hence additional costs.

Response bias can also be assessed by examining the characteristics of respondents and nonrespondents by using demographic data. This approach requires especially good planning in choosing the populations to be surveyed, because certain demographic data, such as sex, ethnic category, and age, must be available on the population, and, as in the previous approach, returned questionnaires must be tracked. Whichever way of assessing response bias is chosen, the researcher should remember to document any comparisons between respondents and nonrespondents and to interpret the results of the survey castionsly, since the respondents may represent a biased group.

DISSEMINATION

Unfortunately, institutions sometimes conduct a research study such as a community-impact one and never publish or disseminate their findings. This wastes time and money for others and makes it more difficult to obtain funding and support for other types of research. The project manager should therefore disseminate the findings of the study to all interested persons, not only to ensure that the findings will be used but also to make people aware of the value of such studies.

If potential uses and users of the findings are identified during the planning stage of the study, as chapter 2 advises, then actual use will be easier. Close coordination with the president of the institution and the senior administrators solves much of the problem, since these people are precisely the ones for whom the findings will be most useful. One way to indicate potential uses of information is to list the title of each administrator and, by the title, possible uses of the findings.

Usually a community-impact study will be defined so that several populations within the community participate in the study (see chapter 2). Based on the experience of developing this *Handbook*, it is recommended that a separate document be prepared that gives all the relevant data for each population. Below is an example of what the table of contents might look like for a document describing an employer population.

Table of Contents Survey of Employers' Views

	Page
Cover letter	1
Questionnaire	2
Follow-up letter	3
Type of employer	4
Frequencies	-
Item 1 - Goal	-
Cross tabulated by items 2, 3, 5-8.	()
Item 2 Needs	:5
Cross tabulated by items 3, 5-8.	1-
Ircm 3 - Serving	22
Construction = 0	
Cross tabulated by items 5-8	24
Item 4 - Services/facilities—awareness, use, and	
satisfaction,satisfaction	28
Item 5 = Employment of former students	88
Item 6 Related courses	92
Item 7—Quality of training	94
Item 8—Specific training	96

Comments on tell 2:	
Comments on item 7	103
	104
Position titles—item 9	107
······································	114

In the example, employers were surveyed through a mail-out questionnaire. The first item is the letter used in the initial mailing. It is followed by the questionnaire used in the survey and by the follow-up letter sent to non-respondents after two weeks. Responses to each of the items were then tabulated and summarized in table form (see page 49 for an example). Selected cross tabulations are then listed by item number (see page 53 for an example). This analysis is followed by summaries of all open-ended questions (items 2, 7, and 8) and a list of respondents' position titles. The last item in the table of contents contains all additional comments made by respondents.

The important findings from each population then might be brought together in an executive summary. The table of contents for this document might be:

Introduction (this should include the background and purpose of the study)
Citizens
Employers
Faculty and Staff
Educators
Civic Leaders
Other Information
Conclusion

For each population that participated in the study, a section should be included that describes the method of selecting respondents, the data-collection tool used (questionnaire or interview), and findings about that particular population. "Other Information" might contain enrollment statistics for several years, revenue and expenditure trends, and other items that describe the impacts the institution is making on its community. The executive summary could then be distributed to the president and senior administrators and perhaps to the advisory group. Several copies of the appendixes should be made available for those interested.

This distribution will generate interest in and requests for other reports using data gathered in the study. If core questions were used in the study, then certainly someone would want to see comparisons across populations for these questions (see page 55 for example). The length of these additional reports should correspond to the position of the user; in general, the higher the administrator's position, the shorter the report. Researchers should be wary of including too much detail. Reports to senior administrators should be especially brief; administrators who find something of special interest can easily request more information.

Preparing a useful report requires time and experience. The researcher should ask the user what he or she wants from the report before beginning to write. After the report has been distributed, it is good to solicit criticisms so that the researcher's technique can be improved.

THE CASE STUDIES

The experience of the authors and the information gleaned from study of the appropriate literature obviously influenced the formulation of the procedures for conducting community-impact studies described in this handbook. But the strongest shaping influence was the experience of the three community colleges whose administrations collaborated with NCHEMS in developing and testing the ideas incorporated in the Handbook. These experiences are documented in a forthcoming NCHEMS publication, Assessing Community-College Impacts: Three Case Studies.

The case-study institutions:

Kalamazoo Valley Community College (KVCC), Kalamazoo, Michigan, Established in 1966, KVCC now serves more than 14,000 students on a 187-acre campus, KVCC offers 55 instructional programs, mostly in vocational and technical education. It serves a community of 210,000 residents, mainly employed in automotive manufacturing and allied business and industry.

Factfield College, Dallas County, Texas, Eastfield is one of seven colleges operated by the Dallas County Junior College District. Its service area includes 350,000 residents. More than 8,000 students are enrolled in its 55 instructional programs and another 4,500 in community-service programs. Eastfield emphasizes alternative styles of learning, ranging from private, personal contact with instructors to self-based programs.

Valencia Community College, Orlando, Florida, Established in 1971. Valencia now has three campuses and is serving over 12,000 student in its instructional programs. An additional 5,000 central Florida residents are enrolled in its noncredit continuing-education courses. The service area of the college includes more than 190,000 residents.

The case studies, prepared by college personnel directly involved in testing the NCHEMS approach to community-impact studies, each cover these topics:

- Institutional history and current environment
- Reasons for undertaking a community-impact study
- Organizing for and anticipating problems in conducting a community-impact study
- · Achieving constituency involvement
- Methods of sampling and data collection
- Analyzing findings
- Making use of findings

Assessing Community-College Impacts: Three Case Studies is a record of practical experience, in representative settings, that users of the Handhook will want to study carefully.

MEASJRE
NUMBER

MEASURE NAME

Enrollment of non-degree and non-certificate seeking students

DEFINITION

The number of persons, who are not seeking a degree or certificate (nonmatriculating students), enrolled in regular credit-producing instructional programs or courses, as defined by subprograms 1.1 and 1.2 in the NCHEMS Program Classification Structure (PCS)

DATA SOURCES

Institutional Student Records

PROCEDURES

Search of Institutional Records

COMMENTS

This outcome measure is identified as a <u>proxy</u> measure of an institution's contribution to Community Educational Development (3.1.0.01) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures--see Appendix A.

ACQUISITION PROCEDURES FOR OUTCOME MEASURE I-1

The data acquisition procedures developed for outcome measure I-l are relatively straightforward in the sense that they require a single headcount of "nonmatriculating" students, that is, of those students who are not working toward a degree or a certificate, who are enrolled in credit-producing programs or courses. The procedures suggest that the NCHEMS Program Classification Structure (Gulko, 1972 and Collier, 1975) be used to organize the different credit-producing programs in which the "nonmatriculating students" are enrolled.

Procedures for Use of Institutional Records

- Determine the time period during which the number of non-degree and non-certificate seeking students enrolled in <u>credit-producing</u> instructional programs will be ascertained.
- Examine the individual student files and identify all "nonmatriculating students."
- For the students identified in 2 above, identify those who are enrolled in the PCS Instructional Subprograms:
 1.1--General Academic Instruction, and
 1.2--Occupational and Vocational Instruction.
- Next identify the PCS Subprogram Categories in which they are enrolled, such as 1.1.0201--Environmental Design or 1.2.5007--Photography Technologies.
- 5. For a descriptive summary of the data, total the number of "nonmatriculating students" enrolled in each Subprogram Category of the PCS.

Outcome Measures and Procedures Manual

I-2 MEASURE NUMBER

MEASURE NAME

Community participation in community education programs

DEFINITION

The number of persons, who are not seeking a degree or certificate (non-matriculating students), enrolled in non-credit-producing instructional activities that are offered on or off campus

DATA SOURCES

O

PROCEDURES

Search of Institutional Records

COMMENTS

This outcome measure is identified as a <u>proxy</u> measure of an institution's contribution to <u>Community Educational Development</u> (3.1.0.01) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures--see Appendix A.

ACQUISITION PROCEDURES FOR OUTCOME MEASURE I-2

The procedures for obtaining data for outcome measure I-2 require a simple headcount of those persons enrolled in those <u>non-credit-producing</u> instructional activities as defined by Subprogram 1.3--Community Education in the revised Program Classification Structure (Collier, 1975). In the revised PCS, the definition of Subprogram 1.3--Community Education is defined as follows:

Community Education--1.3 includes those instructional activities that are noncredit and are therefore not applicable towards a post-secondary degree or certificate. These instructional activities may be offered both on or off campus and may be taken by either matriculated students or members of the general community. Any work that produces credit toward the high school diploma should be included in 1.4--Preparatory and Adult Basic Education.

Examples of Community Education include:

- Avocational Education (wine testing, weaving, guitar, and so forth)
- Adult Education
- Professional Review Courses
- Refresher Courses

In the procedural steps that follow, a distinction is made between matriculating students who are enrolled in such activities and nonmatriculating students who are enrolled.

Procedures for Use of Institutional Records

 Determine the time period during which the number of persons participating in non-credit-producing Community Education

instructional activities (as defined by Subprogram 1.3 in the NCHEMS revised Program Classification Structure) will be ascertained.

- List all instructional activities that would be classified in the PCS Subprogram 1.3--Community Education during the time period in focus.
- 3. Examine the individual student files and identify the matriculating students who have enrolled in each Community Education activity identified in 2 above, and then the nonmatriculating students who have enrolled in each of those activities.
- 4. The data should now be organized for outcome measure I-2.

Outcome Measures and Procedures Manual

I-3 MEASURE NUMBER

MEASURE NAME

Community participation in extension services

DEFINITION

The number of persons from the community who have participated in cooperative extension service activities as defined by Subprogram 3.3 in the NCHEMS Program Classification

DATA SOURCES

Institutional records maintained in the office responsible for cooperative extension service activities

PROCEDURES

Search of institutional records

COMMENTS

This outcome measure is identified as a proxy measure of the extent to which the community receives direct assistance and services of various types from the primary programs of the institution. See Extension Services (3.2.0.01) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures, presented in Appendix A.

ACQUISITION PROCEDURES FOR OUTCOME MEASURE I-3

This outcome measure represents one indicator of the impact the institution and its programs have on the community. In developing the procedures for obtaining this measure, the following definition of Cooperative Extension Service, as defined by the NCHEMS <u>Program Classification Structure</u> (Gulko, 1972), was used:

Cooperative Extension Service (subprogram 3.3) is established as a separate subprogram to accommodate the program elements that are established as the result of cooperative extension efforts between the institution and outside agencies, e.g., agriculture extension, urban extension. This subprogram is intended primarily for land-grant colleges and universities. The distinguishing feature of program elements in subprogram 3.3 is that the programmatic and fiscal control is shared by the institution with one or more governmental units. Historically, agriculture extension and increasingly certain urban extension programs represent a significant commitment of resources that are not necessarily under the control of the institution in terms of the programmatic direction of the activities. These cooperative extension programs are often a cross between independent operations and public service in that they represent a mix of resources belonging to the institution and resources under the control of an agency external to the institution.

Procedures for Use of Institutional Records

- Identify the time period during which the number of community members participating in Cooperative Extension Service activities (PCS Subprogram 3.3) will be determined.
- List all the Cooperative Extension Service programs that have been available to members of the general community during the period of time in focus.

- Identify the number of participants in each program. (Do not include persons who participate in these programs for purposes of seeking credit toward a degree or certificate.)
- 4. For a descriptive summary of the data, list the total number of community participants for each cooperative extension service program offered during the period of time in focus.

K-1 MEASURE NUMBER

MEASURE NAME

Institution's payment of local and state taxes and tax

DEFINITION

All local taxes and tax compensations (payment made in lieu of taxes) that an institution pays to local governments (e.g., city, county, state) including school districts, towns, cities, counties, and so forth

DATA SOURCES

Institutional Business Office

PROCEDURES

Search of Institutional Records

COMMENTS

This outcome measure is identified as a potential measure of the institution's Financial Impact on the Community (3.2.0.04) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures--see Appendix A.

Most educational institutions are free from local tax assessments except for an institution's commercial or related activities. However, exceptions do occur. For example, some institutions may enter an agreement with the local government to pay certain amounts in order to compensate for the eroded tax-base due to their presence in the community.

ACQUISITION PROCEDURES FOR OUTCOME MEASURE K-1

The data for outcome measure \underline{K} -1 can be obtained through a search of institutional records, generally maintained in the institution's business office.

Procedures for Use of Institutional Records

- Identify the period of time during which data for the measure will be examined.
- 2. Contact the chief business officer in the institution and determine:
 - a. If the institution paid any <u>locally assessed taxes</u> during the time period in focus. If so, the following table should be completed:

Type of Taxes Paid	Name of Local Governments To Which Taxes Were Paid	Amount Paid
Property Tax		
Sales Tax		
Income Tax		
Other (please specify)		
	TOTAL:	

٤...

b. If the institution paid or donated any amount of dollars to the local government(s) in lieu of taxes (for example, in compensation for the eroded tax base) during the time period in focus, the following table should be completed:

Type of Payments or Donations	Name of Local Governments To Which Payments or Donations Have Been Made	Amount Paid
	TOTAL:	

ر, ن

Outcome Measures and Procedures Manual

K-2 MEASURE NUMBER

MEASURE NAME

Institution's furchase of locally provided utilities

DEFINITION

Total amount of dollars expended on utilities (such as gas, electricity, garbage collection, sewage treatment) which were purchased from the local community during a certain time period

DATA SOURCES

Institutional Business Office

PROCEDURES

Search of Institutional Records

COMMENTS

This outcome measure is identified as a potential measure of the institution's Financial Impact on the Community (3.2.0.04) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures--see Appendix A.

ACQUISITION PROCEDURES FOR DUTCOME MEASURE K-2

Most institutions pay standard rates for locally provided utilities and the payments generally are made by the business office. Therefore, cost data on utilities purchased from the local community should be obtainable by simply searching the institution's utility payment records.

Procedures for Use of Institutional Records

The following procedural steps are suggested for obtaining the total dollar figure for locally provided utilities:

- Identify the time period during which the amount of dollars expended on locally provided utilities will be determined.
- Determine the boundary of the institution's <u>functional</u>
 local community.
- Identify the types of utilities that have been purchased from the defined local community.
- 4. Tabulate payment figures by using the following format:

Type of Utility	Name and address of the businesses in the local community from which utilities have been purchased	Amount of Dollars
	TOTAL:	

Outcome Measures and Procedures Manual

K=4 MEASURE NUMBER

MEASURE NAME

Institution's capital equipment expenditure relevant to the local community

DEFINITION

Total amount of dollars expended in the local community by institutions as a result of an institution's capital outlay expenditure. Lapital outlay is usually defined in terms of a "good" with the cost exceeding (1) a certain amount of dollars and (2) the duration of useful life of the "good" years. The critoria may vary somewhat among institutions. (See COMMENTS)

DATA SOURCES

Institutional Business Office

PROCEDURES

Search of Institutional Records

COMMENTS

This outcome measure is identified as a potential measure of an institution's Financial Impact on the Community (3.2.0.04) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures-see Appendix A.

The user of this procedure is advised to follow the definition of "capital outlay" used by the institution. Although the criteria may vary somewhat among institutions, the margin of error will be much less significant than that stemming from imposing a new definition which would inevitably disrupt the standard operating procedure developed in each institution.

ACQUISITION PROCEDURES FOR OUTCOME MEASURE K-4

In obtaining the data on the total amount of dollars expended in the local community by the institution for capital equipment, the user should consult the institution's business office and apply the same information search procedures as that developed for outcome measure K-3.

As pointed out earlier (see procedures for outcome measure K-3), "capital outlay" is distinguished from "goods and serivces" for expenditure analysis purposes. A conceptual distinction is therefore made in the definition of outcome measure K-4.

Outcome Measures and Procedures Manual

K-5 MEASURE NUMBEE

MEASURE NAME

Institution's capital construction expenditure relevant to the local community

DEFINITION

Total amount of dollars expended in the local community by an institution as a result of its capital construction expenditure. The capital expenditures include (1) purchase of land, (2) land improvement, (3) construction (building and parking lot), (4) building repair and improvement, (5) architect's fees, and (6) others that are specifically designated by each institution as "capital construction."

DATA SOURCES

Institutional Business Office

PROCEDURES

Search of Institutional Records

COMMENTS

This outcome measure is identified as a potential measure of an institution's Financial Impact on the Community (3.2.0.04) in the NCHEMS Inventory of Higher Education Cutcome Variables and Measures--see Appendix A.

ACQUISITION PROCEDURES FOR OUTCOME MEASURE K-5

It should be pointed out at the outset that the complexity of the data acquition procedures for outcome measure K-5 is dependent upon the level of detail the user wishes to explore regarding capital expenditure. For instance, the institution may contract with a firm that in turn may subcontract with other firms. Therefore, the original contractor may disperse its capital over several localities through a subcontract process. The potential complexities involved in this process suggest that for analytic purposes some constraints must be placed on the level of detail associated with the flow of an institution's capital expenditures out to the designated functional local community.

The following procedure calls for examination of only those capital expenditures associated with the <u>original</u> contracts arranged between the institution and the local firms. In addition, it is recommended that the focus be limited to the original amount of dollars specified in the contract.

Procedures for Use of Institutional Records

The following procedural steps are designed to obtain that portion of an institution's capital dollars that are spent in the local designated functional community:

- Identify the period of time in which the capital expenditures
 in the local community are to be examined.
- 2. Determine the boundaries of the <u>functional local community</u>.

 Consult the institution's business office to examine the institution's State of Changes in Fund Balance and its supporting documents.

The Statement of Changes in Fund Balance shows the total amount of capital expenditures including the major components over a given year. It does not, however, provide the localities in which the capital budget has been spent. The supporting documents will show in detail from whom the land was purchased, if any, what specific projects were financed, and to whom contracts were awarded.

- 4. Examine carefully the upporting documents and identify for each project (or fiscal transaction):
 - a. The address(es) of the firm(s) (or individuals) from which land was purchased, if any;
 - The address(es) of the firm(s) to which contracts were awarded; and,
 - c. The amount of dollars associated with each financial transaction.
- Select the projects and the firms located in the designated local community.
- 6. The following table is suggested for organizing the capital expenditure data:

Type of capital expenditures	Name of the localities in which capital budget is spent	Amount of dollars
	TOTAL:	rak tahungan gagasa

Mail-Out Survey Forms

Outcome Measures and Procedures Manual

J-3			
MEASURE			
NUMBER			

MEASURE NAME

Community use of institutional facilities

DEFINITION

The number of persons from the community utilizing facilities maintained by the institution such as libraries, language labs, testing centers, computer centers, health services, recreation and athletic facilities, museums, and so forth

DATA SOURCES

Managers of the Institutional Facilities, Members of the Community

PROCEDURES

Search of institutional records or administration of a questionnaire to members of the community $% \left(1\right) =\left\{ 1\right\}$

COMMENTS

This outcome measure is identified as a <u>proxy</u> measure of the extent to which individuals in the community receive various types of personal services from the support programs and facilities of the institution. See <u>Personal Services</u> (3.2.0.02) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures in Appendix A.

ACQUISITION PROCEDURES FOR OUTCOME MEASURE J-3

The extent to which community members use the educational or support facilities in an institution can be determined either by a questionnaire survey of a sample of the community population or by a survey of those persons in the community. As a result, two alternative procedures have been developed for obtaining data for this measure.

Procedures for a Facility Use Questionnaire Survey

Alternative #1--Survey of Facility Managers:

- Select the time period during which the number of persons from the community using the institution's educational and support facilities will be determined.
- List the facilities that are to be included in the study.
- Identify the persons in charge of each facility (or who are in the best position to provide the information that is needed).
- 4. Administer the following "Facility Use Questionnaire" to each of the persons identified in 3 above. If a person is responsible for more than one facility, that person should complete a separate questionnaire for each facility.

Alternative #2--Survey of Community Members:

The following questionnaire item is designed to obtain self-reports from persons in the community to two questions concerning facility use:

(1) Do persons in the community know about certain institutional facilities

FACILITY USE QUESTIONNAIRE

by.	purpose of this short que which per s from the com [Name of institution]. Yo most appreciated. Please	munity make use of th ur cooperation in com	ne facilities maintained

	Official Name of Facilit	.y:					
	Name or Description of Estimated of Events or Number of description of how Activities Community you made your estimate.						

being available to them? and (2) How many of those persons have used the facility or attended or participated in events held in the facility? In using this item, it will be necessary to develop a <u>list of the individual facilities</u> (health centers, libraries, counseling-developmental centers, computer centers, gymnasiums, and so forth) to which persons will be asked to react in the survey. Also, it will be necessary to determine the <u>time period</u> in which the respondent will identify if he or she used the facility.

 The purpose of this questionnaire item is to help us learn about the extent to which persons in the community "know about" and "make use of" various facilities at [Name of Institution]. For each facility listed in the left-hand column, please answer questions "A" and "B:"

Name of Facility	Question 'A" Check (*) each how below if you were aware, prior to receiving this quastionnailm, that the facility was open to the public.	Ouestion "8" Check (1) each hox below if you have used or have attended or narticipated in an event at the facility during the last months.

MEASURE NAME / Local expenditures by visitors

DEFINITION

A total amount of dollars that visitors to an institution spend in the local community during a certain period of time

DATA SOURCES

Faculty, staff, students, and academic units, (such as departments and institutes) and visitors

PROCEDURES

Administration of a Survey Questionnaire

COMMENTS

This outcome measure is identified as a potential measure of an institution's $\frac{1}{2}$ Financial Impact on the Community (3.2.0.04) in the NCHEMS Inventory of Higher Education Outcome Variables and Measures—see Appendix A.

ADDIVISITION PROCESURES FOR CUTCOME MEASURE was

Administration of a survey questionnaire is suggested for obtaining an estimate of the total amount of dollars that visitors at an institution spend in the designated functional local community during a given period of time.

Three alternative sets of question line items have been developed for consideration. The first set is appropriate for administration to faculity, starr, and students. The second set is designed to be administered to the heads of departments or other organizational units in the institution that have sponsored activities attended by visitors from outside the designated functional local community. The final set of items is designed to be administered directly to visitors.

Procedures for VISITOR-EXPENDITURE Questionnaires

[SEE FOLLOWING PAGE]

FACULTY/STAFF/STUDENT QUESTIONNAIRE

INSTRUCTIONS: The following survey questionnaire is intended to learn how much money your non-local visitors have spent during [Period of Time] in [Name of the local community]. For each type of visitor identified below, please give your best estimates about (1) the number of non-local visitors you have had during [Period of Time]--grunt each visitor's visit as one visitor; (2) the average length of their stay--count days; and (3) the average amount of train saily specding.

Outcome Measures and Erocedures Manual Supplement (1977)

J-4 MEASURE NUMBER

MEASURE NAME

Community awareness of, use of, and satisfaction with institutional services

DEFINITION

The degree of satisfaction expressed by members of the community concerning services provided by the institution

DATA SOURCES

Persons living in the community; managers of institutional services

PROCEDURES

Administration of a questionnaire to members of the community, or a search of institutional records

COMMENTS

This outcome measure is identified as a <u>proxy</u> measure of the extent to which individuals in the community are aware of, use, and are satisfied with the various types of services provided by the institution. This measure is an alternative to Measure J-3. If it is used, J-3 should be modified to include only facilities.

ACQUISITION PROCEDURES FOR OUTCOME MEASURE J-4

The extent to which community members <u>use</u> educational or support services in an institution can be determined by an institutional record search or by administering a questionnaire to members of the community. Surveying the community also provides information concerning awareness of and satisfaction with the services. The two alternative procedures for obtaining data for this measure are:

- I. Record Search (Survey of Service Managers)
 - Select the time period during which the number of persons from the community using the institution's educational and support services will be determined.
 - 2. List the services to be included in the study.
 - Identify the persons in charge of each service--the person in the best position to provide the needed information.
 - 4. Administer the "Service Use Questionnaire."
- II. Survey of Community tembers

The questionnaire item on the following page is designed to obtain self-reports from persons in the community to three questions concerning service use:

- Do persons in the community know about certain institutional services?
- Do persons in the community use institutional services?
- Are persons who use institutional services satisfied?

Survey of Civic Leaders

15.

See the process with the second secon

111

March, 1977

Dear

You are invited to be my guest at a luncheon to be held at Kalamazoo Valley Community College on March 29, 1977, at 12:00 noon in room 4006. At that time we will discuss with you and other civic leaders your perceptions of KVCC's impact on the community.

The college is currently engaged in a cooperative research study with the National Center for Higher Education Management Systems, an independent, nonprofit organization located in Boulder, Colorado. The purpose of the study is to better understand some of the important impacts KVCC has had on students and the community, so that we can more effectively plan programs, services, and facilities.

Enclosed you will find a short questionnaire regarding your evaluation of KVCC. Please complete this questionnaire and bring it with you to the luncheon.

During the luncheon, the results of the questionnaires sent out to you and other civic leaders will be quickly hand-tabulated by our research specialists. Although no individual responses will be identified, the trends for the entire group will be projected on a screen for everyone to view and analyze. This should provide the basis for a lively discussion on how KVCC has affected the community and how we might further improve our programs and services.

Thank you for your continuing interest in KVCC. Your contribution is needed and will be greatly appreciated. Please let me know right away if you can participate by calling me at 375-5000, extension 200.

Sincerely,

Dale B. Lake President

Enclosure

Survey of Educators

Kalamazoo Valley Community College

A STORY OF THE SECOND PROPERTY OF THE SECOND PROPERTY.

#

Dear Fellow Educator:

The enclosed questionnaire is part of a major study Kalamazoo Valley Community College (KVCC) is undertaking in order to better understand some of the important impacts its programs, services, and facilities are having on students and the local community, which, of course, includes other educational institutions in the area. The study is being carried out jointly by KVCC staff and the National Center for Higher Education Management Systems, an independent, nonprofit organization located in Boulder, Colorado.

The purpose of this particular questionnaire is to collect information from other area educators so that KVCC can learn how well its programs, services, and facilities are meeting their needs and expectations. Based on the information you provide in the questionnaire, KVCC will be in a better position to more effectively plan its programs, services, and facilities.

The questionnaire is brief, and your response to it is extremely important to our study. The responses you provide will be treated confidentially, but for analysis purposes, please identify your institution or school district on the questionnaire. For your information, a summary report of the total community impact study will be available in August, 1977.

We would appreciate it if you would complete the questionnaire, and using the enclosed pre-paid envelope, please return it by

Respectfully,

Dale B. Lake President

BOARD OF TRUSTEES

Note: Your responses will be kept confidential.

ROY ETHE WIFS Drigon Var Vario of Higher Program April 6, 1977

The National Center for Higher Education Management Systems (NCHEMS), an independent, conprofit organization located in Boulder, Colorado, is conducting a community impact study in cooperation with Kalamazoo Valley Community College. This research study is designed to provide KVCC information to improve its programs and services as well as help NCHEMS develop a community impact study model for community colleges.

The general theme for the study seeks to answer the question: "What impact does KVCC have on the community?" Several major groups from the community are being asked questions about the College's impact. Since you are a member of one of these major groups, we need to know how you, as a member of the KVCC staff, impact upon the community.

Please let me emphasize that your responses are extremely important to the study. Also, please note that your responses will be treated as confidential information and will be reported in summary form only.

Please return your completed questionnaire in the enclosed, prepaid envelope by Apr. 20, 1977.

Thank you for your time and cooperation.

Sincerel, yours,

Sidney S. Micek, Ph.D. Senior Staff Associate

SSM:jb enclosures

ABOUT KVCC:

Kalamazoo Valley Community College Faculty-Staff Survey

1	The overall purpose of Kalamazoo Valley Community College is to provide educational programs and services as needed by the residents of the Greater Kalamazoo community beyond the high school level. The education and training provided by KVCC are intended to help students obtain the knowledge and skills needed for educational and occupational career advancement, personal development, and recreational enjoyment.
	Given this overall purpose of KVCC, how well is KVCC achieving this goal?
	Very poor job Less than satisfactory job Satisfactory job More than satisfactory job Excellent job
1-	Satisfactory job

Survey of Social Service Agency Administrators

Kaiamazoo Valley Community College

PATENCE AND SERVED BY THE SERVED SERVED

A

March, 1977

· Dear

You are invited to be my guest at a breakfast to be held at Kalamazoo Valley Community College on March 29, 1977, at 7:45 a.m. in mam 4006. At that time we will discuss with you and other social agency directors your perceptions of EVCC's impact on the community.

The college is currently engaged in a cooperative research study with the National Center for Higher Education Management Systems, an independent, nonprofit organization located in Boulder, Sclurado. The purpose of the study is to better understand some of the important impacts KVCC has had on students and the community, so that we can more effectively plan programs, services, and facilities.

 Enclosed you will find a short questionnaire regarding your evaluation of KVCC. Please complete this questionnaire and bring it with you to the breakfast.

During the break Cast, the results of the questionnaires sent out to you and other social agency directors will be quickly hand-tabulated by our research specialists. Although no individual responses will be identified, the trends for the entire group will be projected on a screen for everyole to view and analyze. This should provide the basis for a lively discussion on how KVCC has affected the community and how we might further improve our programs and services.

Thank you for your continuing interest in KVCC. Your contribution is needed and will be greatly appreciated. Please let me know right away if you can participate by calling me at 375-5000, extension 200.

Sincerely,

Dale B. Lake President

Enclosure

MEMORANDUM

February 21, 1978

TO:

Selected Faculty

FROM:

James F. Gollattscheck

RE:

NCHEMS Student Survey

By now you may be aware of the impact study being conducted jointly by Valencia and the National Center for Higher Education Management Systems. A major clientele to be surveyed are our students. The Study Steering Committee has found that those students who are enrolled for classes at 10:00 a.m. MWF and at 7:00 p.m. on Wednesday evenings comprise a representative sample of our entire student population: 67% in advanced and professional courses; 33% in occupational courses; 36% evening students; 64% day students.

We are requesting all faculty who teach during these hours to reserve fifteen minutes of class time on March 1 to administer the enclosed questionnaire. Students in the pilot study completed the survey in from 8 to 12 minutes. Reading of the instructions to the class will take less than a minute. Please return the forms to your cluster office as soon after class as possible. If this presents a major conflict with the activities you have planned for March 1, please call your Provost.

In late spring we will receive results from the survey and will share them with you.

Thank you for helping in this important endeavor.

Enclosures

MEMORANDUM

(TO BE READ TO STUDENTS)

Valencia Community College has been selected as one of three community colleges in the nation to take part in a major study to measure the impact of the community college on its community. The major client group of Valencia is its student body. The college is vitally interested in your assessment of the college's impact on you as students and educational consumers. You can assist with the study by completing the survey.

Please be honest and candid in your responses. In addition, feel free to write in any comments needed to accurately describe your feelings.

(AFTER ALL STUDENTS HAVE FINISHED THE SURVEY FORM, PLEASE PUT THEM IN THE ENVELOPE AND RETURN THEM TO YOUR CLUSTER OFFICE AT THE END OF CLASS.)

5*1*∵

APPENDIX 3

An Overview of the NCHEMS Outcomes Structure

21

PART I AN OVERVIEW OF THE NCHEMS OUTCOMES STRUCTURE

Postsecondary education outcomes are the end results of the processes that occur within postsecondary education institutions and programs. They include both the direct results of these processes and any short-term and longterm consequences of those direct results. Furthermore, some of them may be intended outcomes while others are unintended-and while outcomes are generically neutral, people will be attaching positive and/or negative values to them. In using the NCHEMS Outcomes Structure, information about outcomes is organized according to three dimensions: (1) the persons, groups, or things that receive and/or are affected by the outcome(s) of concern, or that are intended to receive or be affected by it; (2) whether or not the outcome involves a change in status-maintenance versus change-and the basic, specific entity that is maintained or

changed and (3) when the outcome occurs or is intended or expected to occur. These dimensions have been named "audience," "type-of-outcome," and "time," respectively, and each (except for time) has been assigned a number of specifically defined categories and subcategories. It is intended that those dimensions and categories not of serious concern to a particular user of the Structure will be ignored, or will be modified and adapted to better meet local needs and situations. (The same is true of the various procedures for using the Structure that are described later in this document.)

The Outcomes Structure is illustrated graphically below. For keeping straight the three dimensions, it may help to talk in terms of three Ws—who, what, and when. Who is receiving or being affected by what outcomes and when?

AUDIENCE

(Who or what receives or is affected by the outcome, or is intended to receive or be affected by it?)

TIME DIMENSION

(When is the outcome expected to occur, or when does it occur?)

TYPE OF OUTCOME DIMENSION

(What basic entity is, or is intended to be, maintained or changed?)

The Audience Dimension

Table 1 lists the major (first level of detail) categories of the "audience" dimension. Table 2 shows subcategories (second-level categories) separately for each of the major categories. For those who need a shorthand for referring to specific categories or for developing filing systems for particular categories of outcomes information, code numbers are also provided in Table 2 for each category and subcategory. (The coding scheme for the Structure is discussed in detail in Appendix A.) For many applications of the Structure, particular subcategories of this dimension will need to be further subdivided into even finer categories—such as, dividing students in a program into those majoring in the program and those just taking courses in the program, or into disabled students and nondisabled students Such "extending the Structure," as this additional subdividing of categories of any of the dimensions is called, depends on the philosophy and purposes of the user of the Structure and on the context in which the application is taking place

(for example, someone using it in curricular development will probably need different additional categories from someone using it in program administrative planning). Specific procedures for extending the Structure are provided in Part III of this document.

The Type-of-Outcome Dimension

Table 3 presents names, definitions, and code numbers for the five overall (first level of detail) categories of the "type-of-outcome" dimension. Table 4 provides additional levels of detail by indicating names and code numbers for the categories and subcategories into which each of the five broadest categories has been divided. Standard definitions along with example outcome measures and indicators are provided in Appen dix B for each category and subcategory identified in Table 4. As with the audience dimension, the structure will often need to be extended on the type-of-outcome dimension. For example, in curriculum development it may be desirable to

Table 1

MAJOR CATEGORIES OF THE "AUDIENCE" DIMENSION

- 10. Individual/Group Clients—This category refers to persons or groups of persons who are direct clients of the postsecondary education unit of concern and/or their immediate associates, such as family and relatives or peers.
- 20 Interest-Based Communities This category refers to large groups of people that are identified as entities working toward a well-defined interest or mission.
- Geographic-Based Communities This category refers to large groups of people defined on the basis of functional territorial boundaries.
- 40. Aggregates of People This category refers to subpopulations of people distinguished by particular characteristics that may indicate common concerns, needs, or wants, but who do not necessarily have a common interest or mission, and therefore do not constitute communities.
- 50. Other Audiences—Examples would be the natural environment that is affected by university-sponsored research (which in turn would be expected to have impacts on audiences such as individuals and communities) and populations of animals (such as the animals affected by efforts to keep depleted species from becoming extinct or by the development of veterinary medicines).

Table 2

SUBCATEGORIES OF THE "AUDIENCE" DIMENSION

- 10 Individual Group Crients This category refers to persons or groups of persons who are direct clients of the post-accordary education unit of concurr and/or their immediate associates, such as faithful and relatives or peers.
 - 11 Students Individuals of groups of individuals who currently are enrolled in the program, institution, or system of postsecondary education
 - 12 Former Students individuals or groups of individuals who formerly were enrolled in the program institution, or system of postsecondary education.
 - 13 Family and Pelatives of Students of Former Students
 - 14 Peers and Associates of Students or Former Students
 - 15 Faculty
 - 16 Statt Other than Faculty
 - 17 Other Individual/Group Clients An example would be an individual who is none of the above but is served by an advisory service offered by the college.
- 20 Interest Based Communities -- This category reters to large groups that are identified as entities working lowerd a well-defined interest or mission.
 - 21 Private Enterprise Communities Communities where a major purpose is financial remuneration and profit—for example, corporations, small businesses, and farmers.
 - 22 Association Communities = Communities where members belong on the basis of affiliation rather than employment, such as unions and professional societies.
 - 21 Government Communities Communities designed to administer government regulations and service), such as city half, state department of elucation, and legislative communities
 - 24 Nongovernmentati Public Service Communities Other than the Institution Producing the Outcome:—Noncrolal service organizations, such as schools, hospitals, whiter algencies, phylanthropic foundations, culleges (other than the college producing the outcomes, and research organizations.)
 - 25 Institution or institutional unit Producing the Outcome the postsocondary isocation institution and/or units within that institution that are perceived as the print June "tacilitation" of the Subcomers of Special
 - 36 Other Interest Based Communities An example would be an ad hor, coalition task force of representatives from two or more of the above areas.
- 30 Geographic Based Communities This sategory refers to large groups defined on the basis of functional territorial boundaries...
 - 11 Local Community: A township into country mintropolitan and contribution of locality having particular boundaries. It is not necessarily instituted to the legal or production become any contribution or one in which the impact of the institution is for should be principly and providing feet. The boundaries will say with the institution program and outcome of concern.
 - 32 Ine State
 - 13 A Region An appregation of status or parts of states
 - 34 The Nation
 - 35 An International Community
 - 36 Other Geographic flased Communities An example would be a inserich discovery that affects primarily people living in the coldest liability or effect it shows their its shows the visit of the coldest liability.
- 40 Aggregates of People This sategory refers to subpopulations of people distinguished by particular characteristics that may indicate common concerns, needs, or wants but who do not necessarily have a common interest or mission, and therefore do not constitute communities.
 - 41 Ability Level Subpopulations—Subpopulations definest according to level of ability/proficiency on general intellectual functioning of specific skills—for example, gitted, typical, disadvantaged, or skilled, semi-skilled, unskilled.
 - 42 Age Subpopulations
 - 4.) Educational Level Subpopulations
 - 44 Income Level Subpopulations
 - 45 Occupation Subpopulations
 - 46 Physical Disability Condition Subperpulations
 - 47 Race Subpopulations
 - 48 Ser Subpopulations
 - 49 Other Such Aggregates
- 50. Other Audiences—Examples would be the natural environment that is affected by university sponsored research (which in full would be expected to have impacts on audiences such as individuals and communities) and populations of animals (such as the animals affected by efforts to keep depleted species from becoming extent or by the development of veterinary medicines).

divide "intellectual skills" (code number 2250) into the following categories of Bloom's Taxonomy (1956): ability to translate (code 22501), ability to interpret (code 22502), ability to extrapolate (code 22503), ability to apply (code 22504), ability to analyze (code 22505), ability to synthesize (code 22506), and ability to evaluate (code 22507).

One thing should be made clear. No program or institution can hope to *locus* on outcomes within

all the categories of Table 4, or perhaps even on many of the categories. Rather, this is a universe of possible outcome categories from which one must pick and choose those that are most important, in the light of factors such as philosophy, resources available, and clientele needs. To try to devote primary effort toward accomplishing too many types of outcomes could have disastrous consequences.

Table 3

THE MAJOR CATEGORIES OF THE "TYPE OF OUTCOME" DIMENSION

Category Code Number	The Major "Type-of-Outcome" Category Names and Definitions
1000	Economic Outcomes — Maintenance or change in economic characteristics and conditions of individuals, groups, organizations, and communities, e.g., in economic access, in economic mobility and independence, in economic security, and in income and standard of living.
2000	Human Characteristic Outcomes—Maintenance or change in human makeup and characteristics (other than knowledge and understanding) of individuals, groups, organizations, and communities, e.g., aspirations, competence and skills, affective characteristics, perceptual characteristics, physical and physiological characteristics, personality and personal coping characteristics, recognition and certification, and social roles.
3000	Knowledge, Technology, and Art Form Outcomes—Maintenance or change in the knowledge and understanding, technology, or the art forms and works possessed or mastered by individuals, groups, organizations, and communities, e.g., discoveries and inventions, technical developments, syntheses and reformulations of knowledge, new schools of thought in art and works created in those new traditions, renovation of art works.
4000	Resource and Service Provision Outcomes—Maintenance or change in the direct resources and services (other than those included above) provided to individuals, groups, organizations, and communities, e.g., providing facilities, events, advisory assistance, analytic assistance, teaching, health care, and leadership.
5000	Other Maintenance and Change Outcomes—Examples would be: maintenance or change in the format, arrangement, activity, or administrative operation of an organization or institution; maintenance or change in the aesthetic/cultural level of the local community; maintenance or change in family or community activities, practices, and traditions.

Table 4

CODED LISTING OF THE SECOND AND THIRD LEVEL SUBCATEGORIES FOR EACH FIRST LEVEL CATEGORY OF THE TYPE OF OUTCOME DIMENSION

Calegory Code Number Entity Being Maintained or Changed	Category Code Number Entity Being Maintained or Changed
1000 ECONOMIC OUTCOMES 1100 Economic Access and Independence Outcomes 1110 Economic Access 1120 Economic Fiesibility, Adaptability, and Security 1130 Income and Standard of Living	2000 HUMAN CHARACTERISTIC OUTCOMES (continued) 2780 Fower and/or Authority 2770 Job, School, or Life Success 2780 Other Status, Recognition, and Certification Outcomes 2800 Social Activities and Roles
1200 Economic Resources and Costs 1210 Economic Costs and Efficiency 1220 Economic Resources (including employees)	2810 Adjustment to Retirement 2820 Affiliations 2830 Avocational and Social Activities and Roles 2840 Career and Vocational Activities and Roles
1300 Economic Production 1310 Economic Productivity and Production 1320 Economic Services Provided	2850 Cilizenship Activities and Roles 2860 Family Activities and Roles 2870 Friendships and Relationships 2880 Other Activity and Role Outcomes
1400 Other Economic Outcomes	2900 Other Human Characteristic Oulcomes
2000 HUMAN CHARACTERISTIC OUTCOMES	3000 KNOWLEDGE, TECHNOLOGY, AND ART FORM OUTCOMES
2100 Aspirations 2110 Desires, Aims, and Goals 2120 Dislikes, Likes, and Interests 2130 Motivation or Drive Level 2140 Other Aspirational Outcomes	3100 General Knowledge and Understanding 3110 Knowledge and Understanding of General Facts and Terminology 3120 Knowledge and Understanding of General Processes 3130 Knowledge and Understanding of General Theory
2200 Compelence and Skills 2210 Academic Skills 2220 Citizenship and Family Membership Skills 2230 Creativity Skills 2240 Expression and Communication Skills 2250 Intellectual Skills 2250 Interpersonal, Leadership, and Organizational Skills 2270 Occupational and Employability Skills 2280 Physical and Motor Skills 2290 Other Skill Outcomes	3140 Other General Knowledge and Understanding 3200 Specialized Knowledge and Understanding 3210 Knowledge and Understanding of Specialized Facts and Terminology 3220 Knowledge and Understanding of Specialized Processes 3230 Knowledge and Understanding of Specialized Theory 3240 Other Specialized Knowledge and Understanding 3290 Research and Scholarship
2300 Morale, Satisfaction, and Affective Characteristics 2310 Attitudes and Values 2320 Beliefs, Commitments, and Philosophy of Life 2330 Feelings and Emotions 2340 Mores, Customs, and Standards of Conduct 2350 Other Affective Outcomes	3310 Research and Scholarship Knowledge and Understanding 3320 Research and Scholarship Products 3400 Art Forms and Works 3410 Architecture 3420 Dance
2400 Perceptual Characteristics 2410 Perceptual Awareness and Sensitivity 2420 Perception of Self 2430 Perception of Others 2440 Perception of Things 2450 Other Perceptual Outcomes	3430 Debate and Oratory3440 Drama3450 Literature and Writing3460. Music3470 Painting, Drawing, and Photography3480 Sculpture3490 Other Fine Arts
2500 Personality and Personal Coping Characteristics 2510 Adventurousness and Initiative 2520 Autonomy and Independence 2530 Dependability and Responsibility	3500 Other Knowledge, Technology, and Art Form Outcomes. 4000 RESOURCE AND SERVICE PROVISION OUTCOMES
2540 Dogmatic/Open-Minded, Authoritarian/Democratic 2550 Flexibility and Adaptability 2560 Habits 2570 Psychological Functioning 2580 Tolerance and Persistence 2590 Other Personality and Personal Coping Outcomes	4100 Provision of Facilities and Events 4110 Provision of Facilities 4120 Provision or Sponsorship of Events 4200 Provision of Direct Services 4210 Teaching
2600 Physical and Physiological Characteristics 2610 Physical Fitness and Traits 2620 Physiological Health 2630 Other Physical or Physiological Outcomes	4220 Advisory and AñalyTic Assistance 4230 Treatment, Care, and Referral Services 4240 Provision of Other Services 4300 Other Resource and Service Provision Outcomes
2700 Status, Recognition, and Certification, 2710 Completion or Achievement Award 2720 Credit Recognition	5000 OTHER MAINTENANCE AND CHANGE OUTCOMES 5100 Aesthetic-Cultural Activities, Traditions, and Conditions
2730 Image, Reputation, or Status 2740 Licensing and Certification	, 5200 Organizational Format, Activity, and Operation
2750 Obtaining a Job or Admission to a Follow-up Program	5300 Other Maintenance and Change

[🕴] The fourth level categories, into which any of the categories listed here lag the divided lare limite channel (a lourth digit of 1.1 and, shange (a fourth digit of 2.1).

The Time Dimension

No formal categories and subcategories were assigned to the time dimension because no time categories would apply across all audience categories. Furthermore, evan at the broadest level, the time categories of interest would be expected to vary depending on the philosophy of the user of the Structure and the particular need in his or her context. Time is so important in planning, however, that it was still made a dimension of the Structure-and the categories to use were left completely up to the user.

To illustrate how specialized the taxonomy for the time dimension may need to be, Ms. Jean Endo of the University of Colorado at Boulder reported to this writer on recommended times during the year for collecting student outcomes and related data using survey questionnaires—as based on their experiences—and when during the students' college and alumni career different data should be collected. These can be transformed into a "Taxonomy of Times to Consider for Collecting Undergraduate Student Outcomes Data Using Survey Questionnaires," as shown in Table 5.

Table 5

TAXONOMY OF TIMES TO CONSIDER FOR COLLECTING UNDERGRADUATE STUDENT OUTCOMES DATA USING SURVEY QUESTIONNAIRES*

- 100 Data from Lower Division Students
 - 110 Data from Freshman Students
 - Data Collected Pror to Fall Registration
