#### ABSTRACT

Anticipating an increase in the determinations of financial need and program eligibility for adult students, a review was undertaken of the current eligibility for aid of adults, the procedures used in determining their financial need, and the policy issues that might arise as the numbers of adults seeking and obtaining financial aid increases. Volume Two of the final report analyzes in depth eight alternative need analysis plans by simulation. Basic data and simulation results are given in tables. (MSE)

#### STATEMENT OF THE PROBLEM

## Introduction

The purposes of this study, conducted by Educational Testing Service (ETS) for the National Institute of Education (NIE), were (1) to identify the values underlying the major systems used to determine the needs of students for financial assistance; (2) to determine which values and procedures most directly affect adult part-time students age 25 or more; (3) to indicate what changes may need to be made to need analysis systems to further the objective of assisting adults to continue their educations; and (4) to simulate the costs of alternative assumptions and procedures. This volume focuses on the fourth objective, simulating the theoretical contributions, and financial needs of adult part-time students if alternative assumptions are incorporated within the uniform methodology system of need analysis, used by the major needs analysis agencies.

Volume I of this report identified several problem areas in the measurement of financial needs of adult part-time students and the unavailability of financial aid to them. The majority of adult part-time students simply do not qualify for financial assistance for their postsecondary experiences, because federal and state program rules and regulations typically exclude persons enrolled on a less than half-time basis from receiving financial aid. The one-half time enrollment stipulation is perhaps the most severe

barrier part-time students face with respect to financing their educations, and is unrelated to any explicit or implicit assumptions of the major systems of need analysis.

The scope of the theoretical financial needs of adult part-time students, though, is directly influenced by certain key assumptions underlying the measurement of ability to contribute toward post-secondary costs.

Need analysis assumptions fall into two groups: Those surrounding the allowable expense budgets of part-time students; and those about the rate at which adults should be expected to contribute from income and assets toward college or vocational school costs.

### Expenses and Negative Contributions

With respect to the expenses of adult part-time students, the major policy question seems to hinge on the extent to which the consumption (living) expenses of adult part-time students should be subsidized through student aid programs. Should living expenses of low income part-time adult students be fully subsidized, partially subsidized, or not subsidized during the periods of enrollment? Within the context of needs analysis, the question would be phrased in terms of whether and to what extent negative contributions should be allowed for adult part-time students. Needs analysis systems broadly define available income as the difference between income and the standard living expense budget appropriate to the student's

family size. If income exceeds the standard budget, the available income is a positive amount which, to a greater or lesser extent, can theoretically be contributed to meet out-of-pocket costs for attending college or vocational school. hand, if the student's income is below the standard living expense budget, available income is a negative amount, which means the student theoretically needs financial aid to meet living costs. as well as out-of-pocket educational expenses. To illustrate, if Student A's income is \$10,500 and the standard living expense budget is \$10,000, the available income would be \$500. B's income is \$7,500, and the budget is \$10,000, however, the available income would be negative \$2,500, implying Student B needs \$2,500 in assistance to meet living expenses. If the out-of-pocket expenses for both part-time students for tuition, fees, books, and transportation are \$500, Student A might have no theoretical need, and Student B could have a need of as much as \$3,000 (\$2,500 to supplement living expenses and \$500 for educational expenses). Admittedly, this is a simplistic example, but it does highlight the importance of the assumption one makes about subsidy of living expenses for part-time students and theoretical financial need. If full subsidy of living expenses for lower income part-time students is assumed by the need analysis system, their theoretical aggregate needs for financial assistance will be much greater than if partial subsidy (partial negative contribution) is assumed. And, logically,

For a full discussion of uniform methodology need analysis proce-

if no subsidy of living expenses is allowed, by truncating negative contributions to zero, the theoretical aggregate need of adult part-time students would be considerably less, because only out-of-pocket direct educational expenses would be subsidized.

The issue of allowing or not allowing subsidy of living expenses is compounded by the budget standards selected for assessing financial needs. Some policy analysts and financial aid administrators argue for use of the more conservative Bureau of Labor Statistics (BLS) lower budget standards; others urge use of BLS moderate (intermediate) budget standards. Thus, large swings in theoretical financial needs of adult part-time students occur depending on the choice of budget standards by needs analysis systems.

## Contribution Rates

The second set of key needs analysis assumptions revolves around the rate at which adult part-time students are expected to contribute from available income toward out-of-pocket educational expenses, for tuition, fees, books, supplies, and transportation. The uniform methodology system of need analysis, which makes no distinctions between full-and part-time independent students, expects students to contribute all of their available income toward out-of-pocket expenses. Stated differently, the marginal expected contribution rate is 100 percent.

On the other hand, parents of dependent students are expected to contribute only a portion (22 percent to 47 percent) of their

available income toward the student's expenses. In summary, then, a policy issue for needs assessment of adult part-time students is whether they should be expected to contribute at a 100 percent rate, like their full-time independent student counterparts, or whether their income should be taxed using a progressive marginal contribution rate schedule, like parents of dependent students.

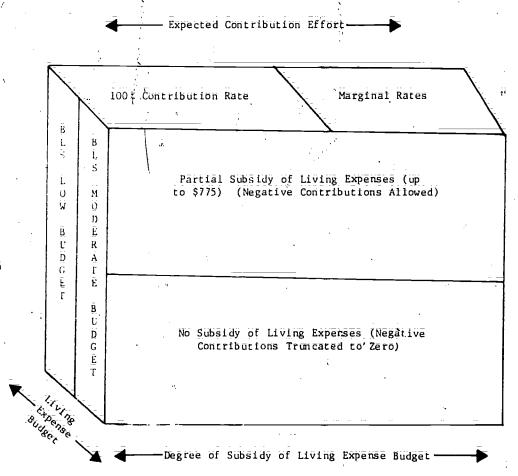

#### METHOD AND PROCEDURE

### Analysis Plan

There are any number of variations in needs assessment procedures for adult part-time students. For purposes of this analysis, eight key needs analysis permutations were selected for in-depth analysis.

The chart below illustrates them.

KEY NEED ANALYSIS PERMUTATIONS FOR ADULT PART-TIME STUDENTS'

The analysis plan for the study involved estimating the numbers of needy adult part-time students over age 24, their average and aggregate need, and their expected contributions, using the following procedures:

- (1) Low budget standards, 100 percent contribution rates, and partial negative contributions (up to -\$775)
- (2) Low budget standards, 100 percent contribution rates, negative contributions truncated to zero
- (3) Moderate budget standards, 100 percent contribution rates, negative contributions (up to -\$775)
- (4) Moderate budget standards, 100 percent contribution rates, negative contributions truncated to zero
- (5) Low budget standards, marginal contribution rates (22 percent to 47 percent of available income), negative contributions (up to -\$775)
- (6) tow budget standards, marginal contribution rates, negative contributions truncated to zero
- (7) Moderate budget standards, marginal contribution rates, negative contributions (up to -\$775)
- (8) Moderate budget standards, marginal contribution rates, negative contributions truncated to zero

In addition, the current uniform methodology procedures for self-supporting students formed the basis for another series of simulations. For these simulations, low budget standards, 100 percent contribution rates, and negative contributions of up to \$25,150 2 were allowed.

<sup>&</sup>lt;sup>2</sup>The low budget standard for a family with 12 members is \$25,150.

The analysis plan called for the eight simulations cited above for each of four subsets of adult part-time students:

- those in public college
- those in private college
- those in public postsecondary vocational schools
- those in private postsecondary vocational schools

In all, thirty-two separate simulations of theoretical contribution and financial need were run, four by type of school for each of eight needs analysis methods.

Results were then summed across school types so that the aggregate differences among methods could be examined.

### Sample

A sample of adult financial aid applicants, age 25 or more, was drawn from the College Scholarship Service (CSS) Financial Aid Form (FAF) population that applied to receive financial aid for the 1977-78 academic year. A two-stage sampling process was followed. First, all 230,911 FAF filers age 25 or more were selected from the 1977-78 population. Separate sampling fractions and random starting points were developed for each of ten predefined gross income classes, to yield 100 systematically drawn cases for each income group. The resulting sample consisted of 1,000 adults age 25 or more, 100 in each of 10 income groups.

Each student record was structured to contain the student's gross (before-tax) income from all sources; the student's adjusted 12-month available (after-tax) income plus contributions from assets

computed according to the uniform methodology procedures for academic year 1977-78; the student's family size, and the number of family members enrolled in college, graduate, or professional school.

Once the adult student sample was selected, it was loaded into the Financial Aid Planning Model (FAPM).

# Financial Aid Planning Model

The FAPM is an interactive computer system designed to provide forecasts of student financial aid funds required for alternative economic conditions and packaging strategies. The Model is designed to be used by policy analysts at federal, state, and institutional levels to provide documentation and justification for funding requests to legislatures, government agencies, and boards of trustees.

The interactive character of the Model allows the user quickly and economically to quantify the interactive effects on aid funding requirements of:

- alternative enrollment projections
- updating parents' or students' contribution calculations for inflation
- increasing student budgets
- adopting alternative packaging strategies
- changing student earnings or savings expectations
- changing minimum standard allowances
- changing parents' or students' contribution rates

For a complete description of the Model, see <u>Financial Aid Planning Model Technical Manual</u>, Educational Testing Service, Princeton, NJ, April 1976.

The user enters the following parameters into the Model: base number of students, student expense budget, negative parents'/
student's contribution option, inflation rate for updating parents'/
students' contribution, income growth rate for inflating parents' or
students' income, student resources constant, Basic Educational
Opportunity Grant (BEOG) estimate option, BEOG student expense
budget, percentage distribution of student's or parents' before-tax
income, and packaging parameters for up to 10 different aid programs
specified by the user. The Model is also designed to permit the
user to enter living budget standards by family size, and alternative rate schedules for computating contribution from adjusted
available income.

When the user enters parameters into the Model, it computes the following for each student record on the sample file: updated parents' or student's contribution, total family contribution, financial need, BEOG award (optional), awards for up to 10 different aid programs, and unmet financial need. These individual amounts are then aggregated within each income group for the 1,000 applicants in the simulation file.

The Model computes a weight for each income group from the user-supplied income distribution. These weights are then applied to the income group totals for contribution, need, BEOG eligibility, financial aid awards, and unmet need to fit the simulation file to the number of students and income distribution supplied by the user.

The basic output matrix consists of selected summary statistics (numbers, averages, and aggregate amounts) for financial need, BEOG eligibility, up to ten different aid programs, and unmet need. In addition, the user may call for three supplementary output tables: average need and awards by income group, numbers of students by income group, and parents' or students' contribution by income group.

# Population Characteristics of Adult Part-Time Students by Type of College or Postsecondary Vocational School

As noted earlier, before simulations can be run, it is necessary for the user to specify the characteristics of the population for which aggregate financial need estimates are desired. For this study, adult part-time students were divided into four subgroups: those enrolled in public colleges, those enrolled in private colleges, those enrolled in public vocational schools and those enrolled in private vocational schools. Statistics were gathered about the number of adult part-time students in each group, about the mean out-of-pocket expenses for each group for tuition, fees, books, supplies, transportation, and about their income distributions.

### Base Number of Adult Part-Time Students

In 1976 the Bureau of the Census conducted its annual Current Population Survey (CPS) and prepared special college and vocational school enrollment tabulations for the National Center for Educational Statistics (NCES). The CPS tabulations revealed that there were an estimated 11,140,000 college students, of whom 7,387,000

were engaged in full-time studies and 3,748,000 in part-time studies. 4 Of the 3.75 million part-time college students, 2.543 million were age 25 or more. 5 Correspondingly, there were 4,081 million persons age 14 or more who had attended postsecondary vocational school sometime during the 12 months preceding the October 1976 CPS. Of this number, 3,036 million were age 25 or more and had been enrolled in vocational school on a part-time basis during the 12-month period preceding the survey.

For purposes of this study, the population of adult part-time students was defined to consist of 2.543 million persons age 25 or more who were enrolled part-time in college, and 3.036 million 25 or more year olds who had attended postsecondary vocational school within one year of the CPS -- or 5.580 million part-time adult students in all. The estimated distributions of adult part-time students by control of institution are shown in Table 1.

See Table 9, Postsecondary Enrollment Status of Persons 14 years old and over by labor forces status, Current Population Survey, 1976.

d Estimated by applying percentages in Column 1 to base numbers of enrollees in colleges and vocational schools.

# Estimates of Out-of-Pocket Educational Expenses of Adult Part-Time Students

In the absence of survey data on the out-of-pocket educational expenses of adult part-time students, it was necessary to develop estimates.

Estimates were developed by first computing the mean number of credit hours per year (12 months) taken by adult part-time students, using the percentage distribution, shown in Table 2, of the number of courses taken by adult education participants.

TABLE 2. PERCENTAGES OF PARTICIPANTS IN ADULT EDUCATION BY NUMBER OF COURSES TAKEN DURING THE LAST 12-MONTHS

	<del></del>		
· ·		Percent	
a e	One Course		
	Two Courses	17.3	
	Three Courses	7 <b>. 2</b>	* 
	Four Courses	5.8	
	Five or More	1.8	

Source: NCES: Participation in Adult Education, 1975, Table 7.

The percentages in Table 2 were used as weights, assuming the typical course was for three credit hours, to compute the weighted average number of credit hours per adult. The derivation of the mean number of credit hours -- 4.7 -- is shown in Table 3.

TABLE 3. ESTIMATED NUMBER OF CREDIT HOURS TAKEN BY ADULT PART-TIME STUDENTS DURING A 12-MONTH PERIOD

Number of Courses Last 12 Months	Assumed Three Credit Hours/Course	Percentage Taking	Weighted Number of Credit Hours
One Course	3	.68	2.04
Two Courses	6	•173	1.038
Three Courses	9	.072	.648
Four Courses	12	.058	<u>.</u> 696
Five Courses	15	÷018	· 2 70
Watabta	d average no. of cred	de hours =	4.69
MetRiffe	a average no. or cled	ir nours -	<b>4•</b> 09

Average costs for tuition, fees, transportation, books, and supplies were computed for full-time commuting students at public and private colleges, and at public and private postsecondary vocational schools. The mean costs for these three items were summed, and converted to a cost per credit hour, assuming 32 credit hours represent the typical academic course load of full-time students. The cost per credit hour for each type of institution was then multiplied by 4.7, the estimated mean number of credit hours taken by adult part-time students. The results of these calculations are shown in Table 4.

TABLE 4. ESTIMATED OUT-OF-POCKET EXPENSES OF ADULT PART-TIME STUDENTS ENROLLED IN POST-SECONDARY INSTITUTIONS

TABLE NOTES

- The source for average costs for transportation and books and supplies for colleges was Table 10 in Student Expenses and Postsecondary Institutions, 1978-79. College Board. 1978, pp vt and vii.
- (2) Expenses for books and supplies and traffsportation for public vocational school students assumed to be equal to those for public college students.
- (3) Expenses for books and supplies for private vocational school students assumed be equal to those for private college students.
- (4) Tuition and fees means for public and private college students extracted from <u>Student Expenses at Postsecondary Institutions</u>. See Table Note 1.
- (5). Tuitton and fees means for public and private vocational schools were extracted from the 1976 NCES Enrollments and Programs Survey, Table 17. Author Lynn Kay. Mimeographed.

## Income of Adult Part-Time Students

Distributions of the gross family income of adult part-time students, age 25 or more, are shown in Table 5. The special CPS tablulations for NCES reported income distributions separately for adult part-time students age 25 or more, in colleges and post-secondary vocational schools, but not by control (public, private) of institution. For this reason, it was necessary to assume identical income distributions by control of institution within type of institution for purposes of the simulations.

#### TABLE NOTES

Numbers exclude adult part-time students not classified as family heads or wives, and therefore do not agree with numbers presented in Table 1 of this report.

Moreover, CPS income intervals and percentages had to be adjusted to conform to the predefined income intervals built into the Financial Aid Planning Model.

The product of the estimates of base numbers of students, their estimated mean out-of-pocket educational expenses, and their income distributions are summarized in Table 6. These base line data served successively as input into the Financial Aid Planning Model and formed the basis for the simulations of contributions and financial needs of adult part-time students by type of college and vocational school and by need analysis method.

# Other Input to the Financial Aid Planning Model: Alternative Need Analysis Methods

Earlier it was noted that this study was designed to investigate the impact of alternative methods of measuring theoretical contributions and needs of adult part-time students.

decause the available data on incomes was for 1976, and the simulations were for academic year 1977-78, incomes on the FAPM sample file were inflated by nine percent to approximate income growth from 1976 to 1977.

To recapitulate, the study was designed to measure the effects of using BLS low budget standards versus moderate budget standards; the effects of using a marginal contribution rate schedule versus expecting students to contribute 100 percent of their adjusted available income toward out-of-pocket educational expenses; and the effects of partially subsidizing or not subsidizing living expenses of adult part-time students whose incomes are below the stipulated budget standards.

The base-line low and moderate budget standards, or standard maintenance allowances, used in the simulations are presented in Table 7. Table 8 presents the 1977-78 marginal contribution rate schedule used in the simulations; and Table 9 presents the 100 percent contribution rate schedule.

2000 < 3000	2000	1.0	
<b>-775</b> < 2000	Õ	1.0	
-775 or less	-777	ð	

Worthy of note is the fact that the marginal rate schedule permits a subsidy of living expenses up to \$775 if available income is \$3,530 below the standard maintenance allowance. On the other hand, the 100 percent rate schedule permits a subsidy of \$777 if the student's available income is \$777 less than the budget standard. Thus, while the 100 percent rate schedule is harsher for students whose income is above the budget standard, it is actually more lenient — and potentially costlier from the government's perspective, for students, whose income falls below the budget standard.

#### Results and Discussion

The eight needs analysis methods were tested within each of four types of colleges or vocational schools. The results of these thirty-two simulations are summarized in Table 10.

The first row of Table 10 is interpreted as follows. It is estimated that there are 2.168 million adults age 25 or more enrolled in public colleges. Of this number, 242 thousand would demonstrate financial need, if need were figured on the basis of low ISAs (budget standards), the expected contribution is 100 percent of adjusted available income, and a maximum subsidy of \$775 is allowed to cover living expenses for students whose income and assets are \$775 or more below the low budget standard. Under these rules (Model 1 - negative contribution allowed), 242 thousand needy students would have an average need of \$853, and an aggregate need of \$207 million.

In order to investigate aggregate differences among the models, the results in Table 10 were summed across rows, and appear in Table 11.

Model 5				٠
Current Uniform Methodology Low ISA, 100% rates, full Subsidy of Living Expenses	; 5580	836	2560	3062

The current uniform methodology procedures (Model 5) for independent students result in the highest estimate of aggregate need for adult part-time students, totaling \$2.56 billion or some \$400 million more than the 1977-78 Basic Educational Grant Program Funding level. This finding is not surprising because the uniform methodology procedures for independent students assume that financial need calculations should take into account the full living expense budget for students having various sized families, as well as direct educational expenses for tuition, fees, books, and supplies. By virtue of this underlying assumption, current uniform methodology procedures assume full-time attendance; that is, that the student would be unable to attend full time in the absence of a full subsidy of the short-fall between income and the family budget.

The next most costly method of figuring part-time adult students' needs, from the government's perspective, is Model 2 -- use of moderate budget standards, 100 percent contribution rates, and a partial subsidy of living expenses, up to \$775. Aggregate theoretical need under Model 2 is about \$1.6 billion. This is followed by Model 4 -- moderate ISAs and marginal rates -- which generates aggregate need of \$1.339 billion. Model 1 is considerably less costly and figures adult part-time students' financial needs using low budget standards, 100 percent contribution rates, and partial subsidy of up to \$775 of living expenses. Model 1 results in an estimated aggregate need of \$762 million.

Model 3, which would treat adult part-time students' resources according to procedures similar to those used in estimating the ability of parents to contribute toward their children's college expenses, would result in about 20 percent of adult part-time students demonstrating financial need, averaging \$571 and totaling \$648 million.

Truncating negative contributions to zero has the effect of not subsidizing any of the living expenses of adult part-time students whose income and assets fall below amounts required to achieve the stipulated Standard Maintenance Allowances (or ISAs). Accordingly, the theoretical aggregate needs of adult part-time sudents are considerably lower if only out-of-pocket expenses for tuition, fees, books, and transportation enter the needs analysis equation than if out-of-pocket expenses are coupled with living expenses. Thus, truncating negative contributions to zero results in a range of estimated theoretical need for adult part-time students from \$210 million to \$454 million.

#### CONCLUSIONS AND POLICY DIRECTIONS

Perhaps the most important policy consideration for the measurement of resources and needs of adult part-time students is whether and to what extent financial aid should be used to subsidize their living expenses. Nested within the living expense subsidy issue is the question of whether low budget standards (low ISAs) or moderate standards (moderate ISAs) should be used in the measurement of their needs. A third issue is whether discretionary income should be taxed for a contribution toward educational costs at a 100 percent rate or by using a marginal rate schedule.

At present, the uniform methodology does not distinguish properly between full- and part-time students. The uniform methodology permits full subsidy of living expenses of the student's family on the assumption that the student would be unable to attend full time without such a subsidy in the form of financial aid (grants, loans, and/or employment opportunities). However, if an adult part-time student filed one of the existing financial aid forms as an independent student, his or her financial need would be figured using the living expense budget standard at full value. Presuming for the moment that financial aid funding levels are adequate for the needs of both full- and part-time students (which obviously is not the case), then this method of determining need could operate to the decided advantage of part-time students, over the span of their educational careers. To illustrate, consider the

single or unmarried student whose annual income after taxes is \$1,500, and for whom the standard living expense budget is \$3,610 -the BLS lower consumption budget standard. Completing a bachelor's degree full time, the student would be eligible theoretically to receive financial aid amounting to \$8,440 to cover living expenses over the four year period:

\$3,610 living expense budget

- 1,500 resources
  - \$2,110 need per year to cover living expenses
- x <u>4</u> years
  - = \$8,440 need for aid to cover living expenses for four year program, in constant dollars

This same student enrolled on a one-quarter time basis, would take 16 years to complete the same educational program, and, in theory, \$33,760 in financial aid to cover living expenses. This example is intended only to illustrate the potential inequities, and considerably higher social costs in the long run, of providing aid to part-time students vis-a-vis full-time students if needs analysis procedures assume full subsidy of living expenses of part-time students throughout their educational careers.

This does not imply the opposite extreme, however, that none of the living expenses of needy adult part-time students should be subsidized. Need analysis procedures should be developed which are neutral with regard to full- or part-time status. What seems to be needed is a methodology which recognizes that without some subsidy

of living expenses neither full- nor part-time adult students from lower income backgrounds will be able to pursue their educational goals. Moreover, to be horizontally equitable, the methodology for adult students should be consistent with the uniform methodology used to measure the ability of parents' to contribute toward college or vocational costs of their children.

Given these postulates, what changes could be made to accommodate measurement of financial needs of adult students?

First, in order to be consistent the living expense budget standards for adult part-time students to parallel those currently used in the uniform methodology; that is, Low Independent Student Allowances should be used in determining expected contributions for adult full-time and part-time students. Because budget standards vary as a function of the age of the household head and by ages of children, separate ISAs by age of head should be built in to the uniform methodology analysis for both full-time and part-time students. Second, BLS lower budget standards (low ISAs) should be used for both full- and part-time adult students.

The alternative -- using moderate ISAs for adult part-time students and low ISAs for full-time independent students -- would result in inequities attributable to using different standards based solely on enrollment status. Low ISAs by age of household head, are presented in Table 12.

TABLE 12. LOW ISAS (LIVING EXPENSE BUDGET STANDARDS) BY AGE OF HOUSEHOLD HEAD, DECEMBER 1977

	Age of	Student
Family Size	20 to 34 years	35 years or more
ī	\$ 3510	\$ 3610
2	4720	6530
ã	6220	8130
<b>4</b>	7430	10040
5	9440	11850
· 6	11140	13860
7	12140 4	15060
	13140	16260

10	15140	18660
11	16140	19860
12	17140	21060

Third, because adult part-time students are probably more similar in their economic characteristics and spending patterns to parents of dependent children enrolled in college or vocational school, it would be logical to tax adult learners' adjusted available income (income in excess of the lower budget standard) for an educational contribution using a marginal rate schedule similar to that used by the uniform methodology for determining parental contributions.

Fourth, if a marginal rate schedule is used to determine adult part-time students' contributions, a question remains with respect to the level of subsidy of their living expenses. Within the context of needs analysis procedures, the question is how negative contributions are computed, because the algorithim for calculating negative contribution specifies the level of subsidy of living expenses.

One approach would be to specify the maximum negative contribution as an amount equivalent to the low ISA (\$3,610) for an unmarried student, to compute contributions, and if they are negative, adjust them according to enrollment status. Taking the earlier example of the single student with \$1,500 in income and \$3,610 living expense budget, the negative contribution would be \$2,110. On a full-time basis, the full value of the negative contribution would be used to figure financial need. On a one-quarter time basis, one-fourth of negative \$2,110, or negative \$527.50 would be the maximum negative contribution per year. Thus, the part-time student would be eligible to receive aid totaling up to \$2,110 to cover the shortfall in living expenses, for the period required to complete the equivalent of one academic year of full-time study.

TABLE 13. MODIFIED MARGINAL RATE SCHEDULE FOR ADULT PART-TIME STUDENTS (1977-78 ACADEMIC YEAR)

4,440 < 5,560	977	• 25
0 < 4,440	0	•22
-3,410 - 0	<del>0</del>	1.0*

<sup>\*</sup> ratio of full-time\_academic course load (maximum negative contribution = \$3,510.)

This procedure would result in the part-time student being in a parity position with respect to his or her full-time counterpart, in so far as subsidy of living expenses is concerned.

Restricting of the maximum negative contribution to the low budget, 12-menth standard for a single person would preclude part-time students from receiving financial aid subsidies for support of other family members. Restriction of the financial aid subsidy to living expenses of the unmarried part-time student, while debatable, would minimize potential abuse of the system by persons who might be induced to enroll on a part-time basis solely for the purpose of receiving a subsidy to raise the family's standard of living.

To put some perspective on this modified method for measuring the resources and needs of adult part-time students, a series of simulations were run, using low ISAs for persons age 20 to 35, and the modified marginal rate schedule presented in Table 13. The results of these simulations are summarized in Table 14.

TABLE 14. SIMULATED THEORETICAL FINANCIAL NEEDS OF ADULT PART-TIME STUDENTS, AGE 25 OR MORE UNDER MODIFIED METHODOLOGY

Private Voc. School	s 2064	332.8	460	153.2
Totals	5580	658.4	432	284.7

## TABLE NOTES

- (1) These simulations assume adult part-time students on the average enroll for 4.7 credit hours per year or 15 percent of a full-time course load. Accordingly, a 14.6 percent rate was used for the calculation of negative contributions. The maximum negative contribution for these simulations, therefore, was .146 x \$3,610 = \$530.
- (2) See Appendix Tables 37 to 40 for details.

The modified methodology for adult part-time students — use of low ISAs, and a modified marginal rate schedule — results in an estimated 658 thousand adult part-time students qualifying as needy, out of a total of 5.58 million adult part-time students. Stated differently, about 12 percent of the adult part-time student population would have financial need, averaging \$432, and totaling \$283.3 million.

In summary, this study has attempted to quantify the order of magnitude of the aggregate financial needs of adult part-time students, under alternative need analysis assumptions. On balance, it concludes that horizontal equity would be enhanced if financial need analysis procedures for adult part-time students were similar to procedures for measuring the ability of parents to contribute toward the costs of their children's educations. More specifically, use of low BLS living expense budget standards in the assessment of adult students' needs, and a marginal contribution rate schedule would appear to be equitable. The marginal rate schedule for adult students and parents of college students would be similar with two The taxation rate for students with negative adjusted available income would be the proportion of a full-time course load taken by the student, and the lower limit for negative adjusted available income would be an amount equivalent to the BLS lower budget standard for a single individual. These two adjustments to the contribution rate schedule would have the effect of permitting a partial subsidy of the living expenses of the part-time student,

as well as out-of-pocket educational expenses. By tying the expected contribution rate for negative incomes to the student's course load as a proportion of the full-time load, the procedure would ensure that full- and part-time adult students would be eligible for equivalent overall financial aid subsidies, even though the length of their educational careers might differ markedly.
