#### ABSTRACT

A job analysis of vocational cocperative teacher-coordinators in secondary schools in Texas was performed. Five questions were investigated: (1) What tasks were performed and what relative percent of time was spent doing these tasks?; (2) When did coordinators learn to do the tasks they do and then did they feel these tasks should have been learned?: (3) How important to coordinators were the tasks which they performed?: (4) Would coordinators use teacher aides and if sc, would this inhovation result in a potential increase in vocational cooperative course enrollment?; and (5) What tasks are comen to all of the program areas? A list of 211 tasks was compiled, validated, and printed in a questionnaire administered to cooperative coordinators in statewide inservice meetings during the summer of 1977. From 1,510 instruments received, 1,412 usable questionnaires were analyzed. Hajor findings include these: all 211 tasks were reported to have been performed by one or more vocational cooperative cocrdinators; 43% of their time was spent on clerical, youth leadership, and out-of-class coordination activities; the most important tasks arreared to be those requiring a high degree of communication skills; coordinators . believed that most tasks should be learned by personnel before being hired or in a certification course; a sajority of coordinators reported they could use a teacher aide part of the time; and tasks were not performed with significant difference among program areas. - In COLOURING THE SELO) (The entition has successful to the Colour state of the Colou

The idea for this study was suggested by Pr. Billy Pope and Dr. Bill Lovelace, whose previous studies inspired this one and whose excentragement below us begin. Additional assistance in petting stated was provided by Mr. ascar Millican, Mr. Cadar Part, and Br. Leo Schreiner of the Texas Educator Aderc, as vellas by Mr. Millian at Millian and January 2 the United States (States at Educator).

Each of the TEA program directors and many of their associates helped with suggestions and provided us time to administer the questionnaire at the different summer inservice meetings for vocational coordinators. In Agriculture we were helped by Mr. J. A. Marshall and Mr. Raymond Holt, in Coordinated Vocational Academic Education by Mr. Dan Staughter, in Distributive Education by Mr. David Thompson, in Health by Dr. Jim Keeton, in Home Economics by Mrs. Elizabeth F. Smith and Miss Joe Marie Phillips, in Industrial Cooperative Training by Mr. Robert Patterson and Mr. Eugene Fisher, and in Vocational Office Education by Mr. Robert Gordon.

The cooperation and suggestions of many vocational cooperative coordinators and supervisors throughout Texas as well as graduate students at Texas AXM University who provided generously of their time and helped develop both the task list and the questionnaire is gratefully acknowledged. Additionally, without the efforts of the vocational coordinators who completed the questionnaire; this study could not have been accomplished. I thank them.

Assistance in the CODAP processing was given by Mr. Wayne Archer of the Occupational Research Division of the United States Air Force, Dr. Doug Goodgame and Mr. Ken Hogue of Occupational Research Group at Texas A&M University and especially by Mr. Richard Dickinson of the Occupational Research Group whose Imaginative computer programming helped solve many problems.

Continuous assistance was provided by several professors at Texas A&M University among whom was Dr. Donald Barker, who came to the computer center on his own at night to assist in the analysis, Dr. Walter Stenning, whose suggestions belied improve the tables, Dr. Bardin Nelson, whose suggestions and encouragement contributed significantly and Mr. C. J. Leabo, whose precise editing of the original project proposal made it flow.

No project of this magnitude could be completed without the efforts of a dedicated staff. I would like to acknowledge the assistance of Mrs. Regay Middleton, secretary, for her secretarial help and assistance in administering the questionnaire; Mrs. Reneé Schuessler-Laux, research assistant, for, among other things, her help in developing the task list, administering the instruments, auditing the accuracy of the keypunching, and analyzing the data; Mrs. Julia A. Ward, alleretary and editorial assistant, for designing the tables, typing them many other duties stant: and Mrs. Linda Smith, research editorial advices chapters and whose graphics will entations to be mi reatest thanks and appreciati . James E. Christiansen. whose encouragement, guidance, and enthusiastic support insured the reality of product.

Mike Mitchell

## **ABSTRACT**

# **Purpose**

This study analyzed the job of vocational cooperative coordinators in secondary schools in Texas.

## **Objectives**

The study investigated tasks performed, relative time spent on those tasks, when and ideally when tasks should have been learned, how important coordinators thought them to be and if coordinators would use teacher aides to assist in performing those tasks. It was sought to determine if comparable performance areas existed among the seven program areas and whether tasks were performed differently by coordinators in: large vs. small schools; large vs. small communities; coordinators with varying amounts of cooperative experience; and coordinators of full-time vs. combination units.

# Methodology

A list of 211 tasks was compiled, validated and printed in a questionnaire administered to cooperative coordinators in statewide inservice meetings during the summer of 1977 with Texas Education Agency personnel assisting.

From 1510 instruments received, 1412 usable questionnaires provided data analyzed by various computer programs including the Comprehensive Occupational Data Analysis Program (CODAP).

# Major Findings

All 211 tasks were reported to have been performed by one or more vocational cooperative coordinators. Only 16 additional tasks were suggested. The relative time coordinators spent performing these 211 tasks, divided into 11 duty areas, was: 15% clerical and program

management tasks, 14% youth leadership activities, 14% out-of-class coordination activities, 9% teaching lessons, 9% selecting and placing students, 8% testing and evaluating students, 8% planning and developing lessons, 7% guidance and counseling, 6% program publicity, 5% administrature duty assignments and 5% professional development.

Coordinators in some program areas performed certain tasks within duty areas a greater or lesser percent of time than all other coordinators. Ag coordinators varied measurably in seven of 11 duty areas, CVAE coordinators in six instances, Home Ec coordinators in five cases, VOE and Health coordinators in two duty areas, and 16T coordinators in one duty area.

All tasks, but one, were important with a mean value greater than 2.5 on a 4-point scale. The most important tasks appeared to be those requiring a high degree of communications skills. Coordinators believed that most tasks should be learned before being hired or in a certification course and that most teaching skills should be learned before being hired. A majority of coordinators reported they could use a teacher aide part of the time to assist them with clerical and record keeping tasks. They believed the assistance of a teacher aide would permit increased enrollment. Although differences existed, tasks were not performed significantly differently among program areas.

A unique method of evaluating differences in percent of respondents performing tasks was used by combining the group difference techniques of occupational analysis and Fisher's test of difference between proportions and frequency. There were many significant differences in tasks performed between coordinators in large vs. small schools, large vs. small communities, coordinators with varying amounts of experience and coordinators of full-time vs. combination units.

Coordinators reported working an average of 45 hours 21 min per week. They also reported they could perform acceptably or ter as a multi-occupational coordinator as measured on a 5-point scale of very well well, acceptably, poorly and would not try. Overall, coordinators seemed to spend more time teaching entire classes and less time teaching small groups or individuals.

In-service training programs had helped in improving coordinators

-11

job performance at the area or district and state levels. Local inservice training activities did not seem to be meeting the needs of vocational cooperative coordinators in Texas as they perceive it.

#### CHAPTER I

#### . THE PROBLEM

This study was a job analysis of the vocational cooperative coordinator in the secondary schools of the State of Texas. The role of the coordinator in a cooperative vocational education program at the secondary level may include a variety of unique duties and tasks which were not normally required of teachers in either classroom or vocational shop courses. This study proposed to address five questions.

#### Question #1

What tasks did coordinators perform and what relative percent of time was spent doing these tasks? There have been many studies examining tasks performed by people in a multitude of occupational categories. For many years Christal, Archer, and the staff (Christal, 1974) at the Human Resources Laboratory, Lackland Air Force Base, San Antonio, Texas, had been developing and perfecting the Comprehensive Occupational Data Analysis Program (CODAP) as a means of identifying the duties and tasks performed by members of an occupational classification. Using a modification of the Christal methodology, Cotrell (1972) identified 390 performance requirements to be used as guidelines in the development of performance-based core curriculums for in-school laboratory teachers and cooperative secondary program teacher coordinators in vocational and technical education.

In the past, several task analysis studies of educational personnel were conducted by Pope (undated) and Lovelace (1975) in Educational Development Consortium D in Texas. These studies identified the tasks performed and the relative percent of time spent performing these

tasks by teachers, administrators, and guidance personnel in the broad field of vocational education. With respect to coordinators, a Texas 'Education Agency funded project directed by Holder (1976). listed eleven duty areas supported by forty-five task statements which were usually the responsibility of post-secondary instructor-coordinators. However, no study prior to the date of this investigation had been reported that identified the tasks a coordinator did and what relative percent of the time a coordinator spent doing them.

# Question #2

When did coordinators learn to do the tasks they do and when did they feel these tasks should have been learned? Many of the courses conducted by teacher-education institutions for the certification of vocational coordinators have been developed without the benefit of a study of tasks performed and the relative percent of time spent on these tasks by coordinators of cooperative vocational educational programs at the secondary level. Once having identified the actual tasks coordinators performed and the relative time spent performing them, it would seem that implications for curriculum development would emerge.

For years vocational teachers were taught that curriculum or courses of study could not properly be developed without first doing a task analysis. The Texas State Board of Education stated that teachereducation institutions should determine what competencies should be developed by potential teachers and then provide instructional activities that would develop these competencies (Texas State Board of Education, Minutes, June 10, 1972). A recommendation of the Advisory Council for Technical-Vocational Education in Texas states: "Strengthening of . . teacher preparation programs to improve realism: as one of their priority items (Advisory Council for Technical-Vocational Education in Texas, 1975). The Texas Education Agency, Department of Occupational Education and Technology, supported the concept of task analysis in the development of teacher education programs both in principle and through various funded projects mentioned above.

To guide the curriculum developer it would be helpful to know when

the coordinators, who rank ordered the tasks, learned to do these tasks and when they felt that the tasks should have been learned. The respondents answers provided guidance in the following three areas:

- 1. Did practicing coordinators from various program areas feel differently regarding what tasks an applicant should have learned before being hired? Preliminary exploration of tasks that coordinators felt should be learned before becoming employed indicated that different preservice qualifications should be required of applications to various programs. It also seemed that requirements of a coordinator-applicant in different program areas varied among programs.
- 2. Each of the programs required different courses to be taken by new coordinators before full certification was tendered. Did coordinators do the tasks they were taught to\_do in their certification courses and did they feel that the certification course was the best time to learn to do these tasks? Although many coordinators informally had expressed satisfaction with the preparation process for coordinators in their respective program areas, others suggested that modifications could improve the congruence between what is required for certification, what is taught in certification classes, and what is actually being done by incumbents on the job. For example, an examination of the Industrial Cooperative Training Handbook used in the Industrial Cooperative Training program (ICT) reveals that sixty to eighty percent of the students' class time was devoted to occupationally related individual study which left only twenty to forty percent of the class time for group instruction on general job skills (Vocational Instructional Services, 1972). However, sixty-six percent of the first year's certification course for ICT coordinators was devoted to learning how to give a group presentation. This practice was followed in spite of the fact that ICT coordinators were required to have two years teaching experience or to hold a bachelor's degree in an approved vocational education program (Texas State Plan for Vocational Education, 1976).

Yet, nowhere had a study identified what relative percent of the time a coordinator actually spent giving group instruction on general job skills, and what relative percent of the coordinator's time was actually spent in individual study guide activities, or which of these

teaching techniques the coordinator perceived as being more important. This study proposed to examine what coordinators actually do and to provide a rationale for curriculum development which directly addressed the tasks the coordinators perform.

3. Coordinator-respondents provided input into curriculum design for in-service workshops which were required to be conducted for coordinators at the local, district, and state level. The staff of the Texas Education Agency was committed to assisting the teacher-education institutions in the planning and development of preservice and in-service instructional programs based on a wide range of professional competencies (Texas State Plan for Vocational Education, 1976, Table III). The tasks identified by coordinator-respondents as ideally being suited to in-service workshop presentations could be listed and published as guidelines for in-service workshop planners.

#### Question #3

How important to coordinators were the tasks which they performed? Many duties and tasks were required of coordinators which they did even though they perceived those tasks as being unhelpful or unimportant. Tasks which some coordinators have said were unimportant included processing of training plans, filling out follow-up reports, and sponsoring of youth leadership clubs.

#### Question #4

Would coordinators use teacher aides and if so, would this innovation result in a potential increase in vocational cooperative course enrollment? Many experienced cooperative coordinators had expressed the opinion that one of the factors which inhibited an increase in enrollment in cooperative vocational education programs was the number of clerical and record keeping duties which they were required to maintain for each student. Some expressed the belief that they would effectively serve a greater student population if more of their time were available for coordination duties, and if the clerical duties were

performed by a teacher aide. Until a list of tasks had been identified and the relative percent of the time spent performing these tasks had been measured, it was not feasible to state definitively that a teacher aide would or would not be an asset to vocational cooperative coordination,

This part of the study pertaining to teacher aide did three things to address this problem:

- 1. Identified tasks which coordinators felt they would or could assign to teacher aides.
- 2. Determined the relative percent of time the employment of a teacher aide would release to a coordinator to pursue other duties.
- 3. Examined the percentage of increase in program size which coordinators perceived would be possible if they had the assistance of a teacher aide.

The use of teacher aides was believed to be a possible solution to an emerging problem in vocational education. The investigator expects increasing enrollment in vocational education programs due to the increased emphasis on career education in Texas. Also, an increased emphasis has been placed on vocational preparation by the United States Congress, Jexas governor Dolph Briscoe, the Texas State Board of Education, and many others. Many students will seek career preparation activities which are best served by cooperative vocational education programs. Is the ative to plan now to serve future demands. At present cooperative vocational coordinators are supposed to serve a minimum of 20 to a maximum of 35 students. However, many coordinators, feeling the pressure of increasing demand, are enrolling in excess of 35 students.

hire more coordinators. But, the pre-employment qualifications of a coordinator limits the number of available applicants. Also, the cost effectiveness of the twenty-to-one ratio needs to be examined in light of the public's reticence to increase public school funding. A second solution may be to permit increased program enrollment in those programs which have employed qualified teacher aides.

# Question #5

6

What tasks are common to all of the program areas? Many administrators in vocational education and some coordinators have expressed the belief that the tasks of a cooperative vocational coordinator have enough commonalities among program areas that a properly prepared coordinator could effectively coordinate students in any of the program areas, Other equally qualified administrators and coordinators adamantly reject the idea that a coordinator can effectively coordinate across program lines. To date, the experience of coordinators in Texas. has been limited to the diversified occupations program of the past, to the newer coordinated vocational academic education program, and to the experimental multi-occupational program. This study attempted to support or reject the claim that "a coordinator is a coordinator, is a coordinator" by identifying and comparing tasks which are commonly per-. formed among programs. The significance of these findings again related to the potential number of students cooperative vocational education could serve. For if programs in the small communities can be combined under one coordinator, more programs will become eligible for funding, and more opportunities for vocational preparation through cooperative education will accrue a greater number of Texas high school students.

In addition, where the tasks prove to be common in all the program areas, the possibility exists of permitting coordinators to take these core courses outside of their program areas for certification. Presently, many coordinators must travel great distances to take courses offered in their program areas where similar courses are available in another program area closer to home.

This study proposed to discover what evidence exists in the perceptions of the incumbent coordinators about the job of a cooperative vocational coordinator. It also began building a clearer picture of the process of coordination from the baseline of data which were gathered.

# Objectives

From the five questions addressed in this study ten objectives emerged. This study proposed to:

- l. Identify and validate the tasks performed by coordinators of cooperative vocational education programs in the secondary public schools of the State of Texas.
- \* 2. Determine a relative percentage of the time spent by cooperative vocational coordinators on these tasks.
- 3. Identify tasks which coordinators feel should be among preemployment competencies, included in certification courses or taught in in-service workshops.
  - 4. Determine the perceived importance of the performed tasks.
- normally performed by the coordinator may be assigned to a teacher aide.
- 6. Determine the potential percent of increase in student enrollment if teacher aides were employed according to coordinators' present perceptions.
- 7. Determine if comparable performance areas exist among the seven program areas and which could be taught to coordinators in any of the program areas in in-service workshops and/or certification courses.
- 8. Determine whether tasks and relative percent time spent on tasks vary according to the size of the school, the size of the community or the experience of coordinator.
- 9. Determine what tasks are performed significantly differently by full-time coordinators as compared with coordinators of combination units.
- 10. Provide a baseline of data which can be subsequently used in developing an instrument to evaluate cooperative programs.

# Theoretical Base

The following statements represent the theoretical base for this study.

- l. No validated source of tasks performed by secondary cooperative coordinators in Texas seems to exist.
- 2. The relative percent of time spent by secondary vocational coordinators performing different tasks needs to be determined; since this has been done for persons who are not coordinators; it is reasonable to expect that it can be determined for persons who are coordinators also.
- 3. Certification training is conducted separately by each program area and varies in length and content. In programs where teacher certification is a preservice requirement disproportionate emphasis is placed on teaching skill development in the certification training. This implies that different tasks are emphasized.
- 4. Differing preservice requirements for vocational coordinators in each program area exist in Texas. This would seem to imply that tasks expected of vocational cooperative coordinators in the various areas differ. On the other hand, since the structure and objectives of the various secondary cooperative program areas in Texas are similar, it may be theorized also that the tasks performed by vocational coordinators are similar.
- 5. At present, there is apparently little correlation between preservice requirements, certification courses, in-service curriculum, and tasks which should most appropriately be learned on the job. However, no validated data appears to exist to substantiate or to refute statements three, four, and five above.
- 6. Skills are required of coordinators which are not measured\_or considered in either the preservice certification or in-service training program.
- 7. Coordinators may be doing tasks which they believe are unimportant, resulting in diminished performance.
- 8. A career ladder is provided for teacher aides in the <u>State'</u> <u>Plan for Vocational Education</u>.
- 9. It would seem that the use of a teacher aide would result in an increase in student enrollment.

# Research Questions

From the theoretical base summarized above and a review of the literature, the following research questions have been formulated:

- 1. What tasks should be included on a validated task list?
- 2. What relative percent of time do coordinators spend doing the tasks they do?
- 3. What do coordinators perceive is the most appropriate setting in which to first learn a task?
- 4. Are there differences among programs in coordinators' perceptions of which setting is ideally suited for learning to perform particular tasks?
- 5. How important do coordinators believe are the tasks they perform and are their perceptions consistent across program areas?
- 6. What percent of coordinator-respondents would have a teacher aide perform each task?
- 7. What percent of time did coordinators report they would use a teacher aide?
- 8. What percent of coordinators would use a teacher aide in each program area?
- 9. To what degree do full-time coordinator respondents perceive that the use of a teacher aide would result in an increase in enroll-ment?
- 10. Do differences exist among program areas with respect to the percent of coordinators who would use a teacher aide to perform each task?
- 11. What tasks are in common and where do differences lie with respect to various program areas as related to teacher preparation?
- 12. Are tasks performed by teachers significantly different when set in large schools or small schools, large towns or small towns, or performed by more or less experienced coordinators?
- 13. What differences exist between the tasks performed by full-time coordinators as compared with coordinators of combination units?

#### Assumptions

The following assumptions were made pertaining to the research methodology used:

- 1. Coordinator-respondents can respond accurately to the relative time spent scale used in the questionnaire.
- 2. Coordinator-respondents who complete usable instruments are typical of all coordinators who are presently employed in vocational cooperative education in the State of Texas.
- 3. Coordinator-respondents can interpret each task statement as having the same meaning as that intended by the investigator regard-less of the program area in which they taught.
  - 4. The items on the task list were mutually exclusive.
- 5. The task list adequately described the job of a secondary level vocational cooperative coordinator in the State of Texas at that time.
  - 6. The task list was properly validated.
- 7. Coordinator-respondents responded to and rated only the tasks which they did during the preceding year.

#### Limitation

Some coordinator-respondents felt that the instrument was an individual evaluation of their program and inflated the number of tasks checked.

#### Delimitations

This study was delimited to perceptions of coordinators who had completed one or more years of vocational cooperative teaching in a Texas Education Agency approved vocational program in the secondary schools of the State of Texas. Those programs were Agricultural Part-Time Cooperative Training (Ag), Coordinated Vocational Academic

Education Cooperative Program (CVAE), Distributive Education (DE), Health Occupations Cooperative Education (Health), Home Economics Cooperative Education (Home Ec), Industrial Cooperative Training (ICT); and/or Vocational Office Education Cooperative Education (VOE).

This study was delimited additionally to those coordinators who attended the scheduled meetings at the in-service workshops conducted by the Texas Education Agency during the Summer of 1977.

Additionally, this study was delimited to coordination tasks and did not include technical subject matter content.

#### **DEFINITION OF TERMS**

The following operational definitions and abbreviations were used in this study and are provided to assist the reader in understanding how terms were used by this investigator.

- 1. <u>Combination-unit</u> -- a program in which teacher-coordinators teach classes in addition to the cooperative related instruction class, (i.e., an academic class, a pre-employment laboratory class, etc.) and reported fewer than 20 students enrolled in their program.
- 2. <u>Cooperative Vocational Education</u> -- a method of instruction offered in some public secondary schools of the State of Texas designed to provide technical instruction, on-the-job training and work experience for students enrolled in one of the following program areas:
  - Ag. Cooperative vocational education in agricultural related occupations
  - CVAE. Cooperative vocational education in any occupational aréa offered to students identified as disadvantaged
  - DE. Cooperative vocational education in occupations related to the distribution of products (sales)
  - Health. Cooperative vocational education in health re-
  - Home Ec. Cooperative vocational education in occupations

related to home economics skills

- ICT. Cooperative vocational education in occupations re-
- <u>VOE</u>. Cooperative vocational education in occupations related to clerical and office skills.
- Multi Occupational. An experimental program in cooperative vocational education conducted on a limited scale in Texas in which students may learn any salable skill for which employment is available to them in their community.
- 3. <u>Duty area</u> -- That segment of a job supported by a sub-set of related tasks.
- 4. Secondary vocational cooperative coordinators -- Persons certified by the Texas Education Agency to conduct an approved program in the public secondary schools in which they teach one to three related instruction classes to their cooperative students during the regular school day and coordinate all school learning activities with the on-the-job learning activities of the students enrolled in their program. Students of these coordinators go to school part of the time and receive school credit for supervised gainful employment the other part of their time.
- 5. <u>Task</u> -- one of the activities necessary to accomplish the performance of a duty.
- 6. <u>Teacher aide</u> -- An assistant to a vocational cooperative coordinator.

f3

#### CHAPTER II

## REVIEW OF LITERATURE

In addition to the literature cited in The Problem, some studies have identified competencies and analyzed tasks, while others have examined the juestion of what tasks should be taught in different settings and what those settings should be; that is, preservice, in-service, or on-the-job. Coordinators have been questioned concerning their perceptions of the importance of the tasks they perform, and considerable research has been directed to the role of a teacher's aide. Also some studies addressed the question of whether the tasks coordinators perform are in common regardless of the program area in which they work. All of the above are some of the questions examined in the studies that follow.

Studies Pertaining to Coordinator's Competencies and Tasks

The final report on Model Curricula for Vocational and Technical Teacher Education: Report No. IV. A Foundation for Performance-Based Instruction, Cotrell et al. (1972) identified 390 performance elements clustered in 10 categories. These performance elements seem to be analogous to what, in other studies, have been called task statements. The categories apparently are similar to what others have called duty areas. Cotrell identified the performance elements using both occupational analysis techniques and a national critical incident study. Cotrell reported that 92% were in common across all program areas and that all tasks were rated as important by teacher coordinators.

However, Cotrell included tasks which are not time ratable, a fundamental requirement for measuring any task. An example is Cotrell's task number 307, "Express a philosophy consistent with the objectives of vocational-technical education."

Pope (1975), drawing on Cotrell's list, identified 105 tasks and

gram areas, by conduction a Comprehensive Occupational Data Analysis Project (CODAP) (Christal, 1974). Pope drew random, but not proportinate, samples from the seven program areas of Ag, Occupational Orientatation, DE, Health, Home Ec, ICT, and VOE. He concluded that "While a great deal of similarity was noted across program areas, very distinct differences were noted."

Lovelace (1975) conducted a similar study using post-secondary teachers only. Lovelace used 94 tasks which he analyzed using CODAP. He also compared perceived importance with relative time spent. He concluded that "An instructional system development design based on tasks (competencies) performed by practicing teachers can be used as an approach for the development of curriculum for effective and efficient vocational teacher education programs."

Timm (1976) at Temple University designed a study to compare total cooperative coordinators (those similar to full-time coordinators in Texas) with capstone coordinators (those who teach preemployment labs and assist their students in obtaining part-time employment). Using 371 teacher performance elements, he compared the degree of importance associated with each task by total cooperative coordinators and by capstone coordinators. Timm's study did not consider program areas separately. He concluded that "There were no differences in the perceptions of the degree of importance of tasks performed between total cooperative coordinators."

In the project, Attaining Competence for Teaching in Vocational Education (ACTIVE) (Florida State University, 1976), a mine phase project conducted in Florida, the investigators identified 73 competancies, in eight categories, needed by cooperative coordinators. A random sample of 150 coordinators from Florida Schools were questioned concerning competencies and importance. The project concluded that there were numerous competencies considered important by Florida's teacher-coordinators.

In addition to the studies mentioned above, Hudson (1978) is currently conducting a comprehensive study of the whole population of vocational agriculture teachers in New Mexico.

From the variety of task analysis studies cited above, the investigator gladaned many tasks which were then incorporated into the list of possible tasks used to describe the job of a vocational cooperative coordinator in this study. However, none of the above task lists were considered totally useful for this study due to the brevity of the task lists or the inclusion of tasks which are not time ratable. Consequently, this investigator deemed that further study was warranted.

# Studies Pertaining to Teacher Education

Several studies have addressed curricula to educate teacher coordinators. Many of the recent studies are designed on a performance or competency based teacher education model. (Having identified competencies, functions, performance elements, or tasks using a variety of techniques, curricula have been written or guidelines have been prepared to develop curriculum (Budke, undated; Harris, 1965; Andreyka, 1969; Ferguson, 1971; Wallen, 1973; Matteson, 1974).

However, no study was identified in which comparisons were drawn directly between the time when coordinator-respondents first learned to do a task and when, ideally, they felt they should have learned to do it. Therefore, this study also proposed to seek incumbents' perceptions as one input which may be used in designing preservice competencies, certification requirements, and in-service training activities.

# Studies Pertaining to the Importance of Tasks

Task analysis studies frequently request coordinators to rate the importance of tasks (Andreyka, 1969; Murphy, 1972; Gilligan et al. 1974; Florida State University, 1976). Sometimes importance has been compared with time spent ratings as in the study by Lovelace (1975), A Comparison of Perceived and Actual Tasks Performed by Selected Vocational-Technical Teachers in Texas Public Community Colleges. Lovelace found that "There was a difference between the ranks of tasks performed by the sample and the ranks of the perceived

16

importance of the tasks as rated by the population of post-secondary vocational-technical teachers in selected Texas public community colleges."

In view of the possible criticism that relative time spent is not related to the importance of the tasks, the investigator believed it was necessary to examine this variable on a greater number of tasks than was used in Lovelace's study.

# Studies Pertaining to Use of a Teacher Aide

In addition to professions which have traditionally used aides, such as medicine, para-professionals are becoming more widely accepted in the legal profession (Statsky, 1974; Schrader and Knight, 1976). Their use is being examined, or at least advocated, in the field of education as well.

In a study sponsored by the United State Office of Education, Bureau of Research, Larkin and Teeple (1969) summarized that "Employment opportunities for para-professionals and technicians in education in the coming decade are likely to reflect changes within the education system. More than a fourth of the 2.2 million employment growth in education between 1966 and 1975 will represent opportunities for aides, assistants and technicians in the nation's schools."

Pilot activities in the guidance assistance project have produced mixed results and recommendations were made for improvement in the Deerfield Public Schools (1968) from which Zinpfer et al. (1970). have suggested recommendations for training, roles, recruitment, and supervision of personnel.

In other areas, Wolansky (1972) discussed the benefits gained and problems encountered in differentiated staffing patterns as reported in School Shop Magazine. Saylor (1975) reported in the Agricultural Education Magazine on the use of para-professionals in the Future Farmers of America organization.

Some studies described the use of teacher aides in disadvantaged (Crawford, 1976) and special needs (Blanc, 1976) programs but no studies were discovered which reported the use of a teacher aide in a

cooperative education program as an assistant to the teacher-coordinator.

An evaluation of the Aides to Career Education Program (ACE) in Los Angeles public schools reported that "The program was effective in meeting its overall goal of increasing individual assistance to disadvantaged students." (Crawford, 1976) A handbook was developed as part of the ACE program. This handbook provides information on: (1) Classification of aides including job definition, typical duties, and class and entrance qualifications; (2) The use of aides by presenting guidelines for their most effective utilization; (3) A definition of the legal responsibilities to teachers and aides within the program; and (4) Program accountability and evaluation including sample program data sheets.

Another training manual or handbook developed by Blanc (1976) at Boston State Collège is designed to aid in training the para-professionals to assist in the shop, in the resource room, and in counseling. It was not known, however, if the duties listed for aides to perform in either handbook were identified on the basis of task analysis.

No literature was discovered which addressed the training needs of a teacher aide in cooperative education. However, Burns (1971) suggests that the training of para-professional personnel take place in the two year college.

Bowman and Kloph (1966) wrote about the advantages of using teacher aides but cautioned that: (1) Role specifications and perogatives of auxiliaries be clearly defined; (2) That there be preservice training to develop communication and job skills; (3) That there be a continuing in-service training program; (4) That cooperation of community colleges be sought for training auxiliaries; and (5) That use of auxiliary personnel be institutionalized into a program offering job security and being an integral part of the school. In addition, Sager (1974) suggests that teachers who use aides need training in how to work with adults.

As noted above, the role of the teacher aide is apparently not referenced in the literature with respect to cooperative education programs. Therefore, this study would fill that gap by asking coordinators what tasks they would have a teacher aide assist them in

18

parforming and what effect this innovation might have on the number of cooperative students enrolled in their program.

Studies Pertaining to Commonalities Among Programs

Some studies addressed the question of whether the tasks coordinators perform are in common regardless of the program area in which they work.

In <u>An Exploratory Analysis of the Roles and Role Conflicts of Vocational Teachers in Oklahoma</u> Sutker et al. (1967) various program areas were analyzed and substantial differences in attributes were found among trade and industrial teachers, distributive education teachers, and technical teachers. Pope (1975) stated that "While a great deal of similarity was noted across program areas, very distinct differences were noted." Lovelace (1975) reported "There was an observable difference in the percentage of coordinator-respondents performing each task among the vocational program areas."

However, in the three studies cited above, the respondents included a majority of laboratory teachers and a minority of cooperative coordinators. This leaves unresolved the question of whether the tasks performed by a cooperative coordinator are performed in common without regard to program areas.

Interviews with former cooperative coordinators, who are not supervisors, as well as interviews with directors and supervisors of vocational programs in Texas supported the idea that there is a high degree of commonality in tasks performed by cooperative coordinators in Texas; so much so, that an experienced coordinator should be able to function as a coordinator in any program area (Todd, 1976). Further, Duncum (1977), Supervisor of the Cooperative Education Program for the Austin Independent School District, Austin, Texas, has stated that not only does a cooperative coordinator perform common tasks across all program areas but that, "The multi-occupational concept, like the old diversified occupations program, is the reasonable answer to cooperative education in isolated small towns."

Additional information on the commonality of tasks can be gleaned

by reviewing several state guides to cooperative education. In guides for coordinators from Vermont (1978), Illinois (Handbook, undated), and Hawaii (Cooperative, undated) tasks expected of coordinators are suggested for all service areas. In states such as Texas, where a separate guide is published for each program area, an analysis revealed that there was little difference in tasks required of cooperative coordinators among program areas.

Although observed differences have been reported in previously conducted studies these observations did not seem to consider cooperative programs alone and have not been subjected to rigorous statistical evaluation. Thus, it seemed warranted by the investigator; to evaluate the commonality of the rankings of tasks performed by cooperative coordinators only, using an accepted statistical technique to supplement the analyses by observation.

In summary, because of the gaps in the body of knowledge concerning cooperative education cited in this review, it seemed appropriate to design and conduct a research project to answer questions concerning the tasks engaged in by teachers of cooperative vocational education.

31

21

# CHAPTER PII

#### METHODOLOGY

# Developing the Instrument

Since this study was a task analysis of the vocational cooperative coordinator in the State of Texas, the first problem the investigator faced was the assembly of a list of tasks which, when organized into appropriate duty areas, correctly described the job done by a vocational cooperative coordinator. The original task list was developed from the personal experience of the investigator and was further modified by a review of the pertinent literature which included the ICT handbook (Vocational Instructional Services, 1972), vocational agricultural handbook (Texas Education Agency, undated), and Smith (1972).

This task list was further refined by conducting interviews with four incumbent vocational cooperative coordinators (Appendix F) and six first-line supervisors (Appendix G) possessing coordinating experience in six program areas. Each coordinator, supervisor, and director was asked to describe the tasks which they do throughout a typical year. The interview began by the investigator asking, "On a typical day, what do you do between the hours of eight and nine, nine and ten, ten and eleven, eleven and twelve, twelve and one, one and two, two and three, three and four, four and five, five and six, six and seven. . . and beyond? What task do you do on a Monday which differs from those you do on a Tuesday, which differs from Wednesday, Thursday, and Friday? And what tasks do you perform on weekends with respect to your job? What tasks do you perform that are unique to the month of August, September, October . . . and so on?" The interviewees were then asked, "What specific tasks do you do relating to the selection and placement of students, guidance and counseling activities, planning and developing lessons, teaching lessons, testing and evaluating students, program publicity, out-of-class coordination activities, clerical and program

management tasks, youth leadership activities, professional development, and administrative duty assignments?" These duty area categories had been identified from the review of literature cited above.

At the conclusion of each day's interview, the tasks which had been obtained in the interview were compared with the original task list. Tasks which were repetitious were discarded; new tasks which had been discovered from the interview were then added to the task list under an appropriate duty area; and wording was modified, if necessary. This process was continued until it seemed to the investigator that no new tasks were emerging which would modify the existing task list.

After having completed this questioning process with the coordinators, supervisor, and directors, the investigator gave each interviewee a listing of the task statements and asked for comments pertaining to (1) providing additional tasks not listed, (2) modifying any tasks listed, (3) dividing tasks which appeared to be too broad, and (4) combining different but overlapping task statements into one specific statement. This process increased the number of the task statements from the original 178 tasks developed by the investigator to 227 tasks. These statements were then compiled alphabetically under duty areas, except where a sequential grouping of tasks was deemed more appropriate.

On May 31, 1977, a jury meeting was held in Austin, Texas at the Texas Education Agency to discuss and validate the task statements formulated so far. The meeting, attended by program directors or their representatives (Appendix H) from each of the named program areas represented in vocational education, was conducted by the investigator and a research assistant. After a short introduction and explanation, the members of the jury reviewed all tasks for validity, wording, and importance and added or deleted the task statements as they deemed appropriate.

First, the jury members read the total list of the 227 task statements to familiarize themselves with the overall nature of the tasks. Next, they were given an envelope containing an individual sheet for each task statement in each duty area. They were asked on a form for each task statement in Duty Area A, Selecting and Placing Students, and

so on through all duty areas, the following questions: Is this a valid task? If not, modify or reject. Is this duty area assignment correct? After all members had finished evaluating all the task statements, the judges discussed al'1 the task statements individually. Change were made, if necessary, and a consensus wording was worked out. Tasks were deleted only if all members desired deletion. Tasks could be added by any one member of the group. This review was continued for each of the duty areas. The task list as modified by additions and deletions numbered 209 task statements. These task statements were then put into the questionnaire format designed to ask of each task whether the coordinator did that task; what relative time the coordinator spent doing that task on a scale of one to seven (Carpenter et al, 1975); when coordinators first learned to do the tasks they do and when coordinators felt they ideally should have learned to do the tasks they do; how important each task was that the coordinators stated they performed; and finally, whether coordinators could use a teacher aide to assist them in performing that task.

After all the task statements had been validated by the jury, some sample background questions were distributed and discussed with the members. Minor modifications were made to those background questions by the jury. A total of seventeen background questions were included in the questionnaire.

# Pilot Testing the Instrument

The questionnaire was pilot tested in June of 1977 in the vocational curriculum development classes of James E. Christiansen and the second year ICT coordinators' certification class of Joe Norwood at Texas A&M University in College Station, Texas. A total of 22 questionnaires were filled out; seventeen of these were completed by students with at least one year of coordinating experience; and five were evaluated by students with less than one year of coordinating experience in order to test for ambiguities, style, clarity, and visual effectiveness. In addition, one instrument was reviewed by James E. Christiansen of the Department of Agricultural Education, Texas A&M

University, one by Douglas T. Goodgame of the Occupational Research Program of the Department of Industrial Engineering, Texas A&M University, and one by Kenneth Hogue of the Occupational Research Program of the Department of Industrial Engineering, Texas A&M University, and one by the investigator for further improvements. Suggestions were incorporated into the existing format.

Pilot testing revealed that it was necessary to make a modification in the number of responses each coordinator would be asked to make on the questionnaire. The anticipated time frame for completing the questionnaire was one hour. However, coordinator respondents were observed to be taking longer than one hour to complete the questionmaire; therefore, it was decided to arrange the questionnaire in such a fashion that all coordinators would respond as to whether they performed a task or not. All coordinators would rate the tasks with reference to the relative time spent performing those tasks; and all coordinators would respond to all of the background variables. However, only half of the coordinators would be asked when they first learned to do a task and ideally when they should have first learned to do that task; and the other half of the coordinators would be asked to respond to the importance of the task and whether they would use a teacher aide to assist them in performing that task. To avoid two printings of the questionnaire, the booklet was modified so that half of the questionnaires had blue covers and the other half had golden-yellow covers. Appropriate instructions were written concerning which columns the coordinator-respondents would answer depending upon the cover color of the questionnaire.

At the suggestion of Kenneth Hogue, Task Analysis Specialist of the Industrial Engineering Department of Texas A&M University, a revision committee meeting was held on July 7, 1977 to insure that the meaning of the task statements would be unambiguous and clear to all coordinators. The meeting was attended by one ICT coordinator, two DE coordinators, and one Ag coordinator, and was conducted by the investigator and a research assistant. Each participant was given a copy of the most recent task statement list and was asked to read all task statements for clarity, completeness, and possible ambiguities. All

task statements were then discussed by the revision committee to establish that the meanings would be the same to coordinators in different program areas. A few changes in wording were made as necessary. The total number of task statements was increased from 209 to 211. These task statements represented the final wording used for the questionnaire. The final form of the questionnaire used in this study was developed from the insights given and suggestions received from pilot testing and from the revision committee meeting.

# Administering the Instrument

The investigator was offered the opportunity to administer the instrument during the following In-Service Meetings and Workshops:

Health Occupations, Baylor University, Waco, Texas, July 21, 1977
Home Economics, Hilton Hotel, Dallas, Texas, July 26, 1977
Vocational Office of Education, El Tropicana Hotel, San Antonio
Texas, July 28, 1977
Agriculture, Baker Hotel, Dallas, Texas, August 2, 1977
Industrial Cooperative Training, Convention/Center, Ft. Worth,
Texas, August 3, 1977
Coordinated Vocational Academic Education, Sheraton Hotel,
Ft. Worth, Texas, August 4, 1977
Distributive Education, Astrovillage, Houston, Texas,
August 4, 1977.

All of the above in-service meetings, except ICT, were held in one group setting. There were five group settings for ICT coordinators.

The questionnaires were laid out in the assigned meeting rooms on every chair by alternating the blue and yellow booklets. The coordinators were then invited to come in and sit down at any place. At each in-service meeting described above, a member of the project staff took approximately 20 minutes to explain the nature and purpose of the study and to give instructions regarding the completion of the questionnaire. Coordinator-respondents then took from 40 minutes to one hour to complete the questionnaire.

The number of blue and yellow booklets was divided approximately equally in each program areas as evidenced by a t-test of the null hypothesis of no difference in the number in each group. The null hypothesis was rejected with a t = -1.19, p = .09.

# Processing the Completed Instrument

From the 2800 printed questionnaires, 1510 were filled out, 1412 of which were accepted for processing. Each questionnaire booklet was examined individually for completeness. A booklet was considered to have been sufficiently completed for processing if the coordinator had completed columns 1 (check each task you do as a vocational coordinator) and 2 (rate time spent doing each task), and had checked at least one of the tasks in either of the last two duty areas. Each coordinator's response was evaluated to determine if the written number would be clearly intelligible to the keypuncher, and that the numbers were within the limits defined by the scales. Background question 7 was converted from hours and minutes to minutes only. The booklets were numbered according to a numbering scheme used in a questionnaire log.

Each booklet was examined and any tasks or comments which respondents added were listed. The comments were noted but not reported in this study. Each additional task deemed to be mutually exclusive of those printed in the questionnaire is reported in the findings. In addition, those which seemed to be modifications of the tasks listed in the questionnaire are reported in their modified form.

After examination and coding, sixteen boxes of questionnaire booklets were shipped to the Wynne Unit of the Texas State Prison System,
Huntsville, Texas, where keypunchers transcribed the data from the
booklets to computer magnetic tape. The tape was returned to Texas A&M
University and a program called CODEDIT (Dickenson, 1977) was run
through the Amdahl computer. The printout revealed that there were
some errors on that tape; consequently, the booklets were then reviewed
in the following manner.

Every background question of every booklet was examined and compared with the responses on the tape for accuracy. Every 25th booklet was examined in its entirety. This examination revealed that errors were not of sufficient magnitude to require an entire repunching. Errors which had been detected by CODEDIT and errors in the background questions were listed and returned with the tape to Huntsville for

27

updating. The second CODEDIT run was completed which indicated that the overall error rate was less than one-half of one percent; therefore, the tape was considered to be usable.

## Computer Analysis of Data

Dick Dickinson, a computer programmer for the Occupational Research Program, Industrial Engineering Department, Texas A&M University, assisted in running the following programs of the Comprehensive Occupational Data Analysis programs called CODAP (Christal, 1974). The sub-Programs of CODAP used in this study were: Input Standard, JOBDEC, VARSUM, OVLGRP, and PRTVAR.

The CODAP system was selected for analyzing the relative time spent portion of the study based on research performed by the United States Air Force (McFarland,1974). McFarland's study compared time spent on tasks using CODAP and management engineering techniques. Both techniques yield essentially the same information. However, instead of using the questionnaire format of CODAP, the MET measurement phase lasts a minimum of one complete work cycle, which in our study was one year. Since McFarland reported that the correlation between CODAP analysis and MET techniques is r = .79 with N = 1,784, the decision was made to use CODAP considering the savings in time and expense which would accrue.

Input standard was a raw data editing and input program which read the task statements and coordinator responses, and converted this data to a history data format and a history matrix. From this was developed the relative time spent task analysis computer program. JOBDEC calculated and printed composite job descriptions for all responding coordinators and a separate job description for each of the seven program areas: Ag, CVAE, DE, Health, Home Ec, ICT and VOE. This JOBDEC provided the following information: The duty and task number, duty and task title, the percent of members performing each task, the average percent time spent by members performing, the average percent time spent by all members, and a cumulative average percent time spent by all members.

VARSUM produced a summary of the background variables. It printed the frequency and percentages of each of the background variables and each of the secondary variables. Those were: when learned, ideally when learned, importance, and whether or not coordinators would use a teacher aide to perform that task.

The sub-programs Overlap and Group (OVLGRP) were utilized to see if there were recognizable groups which could be identified as the result of their analyses. For clarification, it should be noted that the program OVLGRP generated a similarity matrix of all possible paired comparisons between individual cases. Using over a billion calculations, it continuously evaluated and grouped together coordinators who performed similar type tasks. Similarity is expressed as a percentage of common tasks performed. The program Group used this similarity matrix as computed in the Overlap program to form clusters of cases. This hierarchial grouping detected whether or not coordinators clustered together the tasks they performed around a specific job title.

PRTVAR' printed the background variables which identified the types of coordinators who clustered together and sequenced coordinators' responses according to the programs K-Path number.

In addition to these CODAP programs, a special computer program was written by Barker (1978) at Texas A&M University to produce percentages for each program area, for each task, and for each setting of when and ideally when coordinators feel a task should be learned. Barker also wrote a program called ANSCHEFF (Barker, 1973) which did three things. It developed a mean of the coordinators' responses as to the perceived importance of tasks which they performed; it analyzed, the variance between program areas on these responses; and it tested significant differences using Scheffe's test to detect in which program areas differences existed.

In addition, the statistical analysis systems (SAS) (Barr, et al. 1975) was used to detect differences in four groups. A difference between proportions and frequency test (Guilford and Fruchter, 1973) was then run on each task difference in all of the four groupings to determine which tasks were significantly different. This test took into account not only the proportion of differences in percent

29

performing but also the number of respondents who indicated they performed that task. The four groups were:

Large Schools Versus Small Schools

Differences in percent of members who performed tasks were determined between large schools and small schools. The dividing line was determined by taking the mean of school size. Large schools were those which had an enrollment equal to or in excess of 1492 students and small schools were those having less than 1492 students.

Large Towns Versus Small Towns

The background data identified large towns as having a population equal to or in excess of 50,000. The difference in percent of coordinators performing each task in large schools and small schools was determined in each program area.

More Experience Versus Less Experience

Coordinators who had between one and three years experience were identified and compared with coordinators who had four or more years experience using the group difference process.

Full Time Versus Part Time

There were two criteria for determining full-time cooperative coordinators. First, coordinator respondents must have indicated a total of more than 20 students enrolled in their cooperative classes of the previous year. Second, the coordinator-respondents must not have indicated classes were taught in any area other than a cooperative program.

### Reporting Computer Output

Some of the tables presented are a synthesis of several computer printouts. These printouts have been filed with the Texas Education Agency, Department of Occupational Education and Technology or Texas A&M University, College of Education If the reader wishes to examine the original computer output, please reference project #78230027.

#### CHAPTER IV

#### FINDINGS

An analysis of the data collected from 1412 Texas Cooperative Teacher Coordinators during the 1977 summer in-service workshops revealed the following information.

Findings Pertaining to Research Questions

Research Question 1: What tasks should be included on a validated task list?

All of the tasks listed in the questionnaire were performed by one or more coordinator-respondents. Only 70 coordinator-respondents added tasks to the list which described their job. Sixteen additional tasks seemed to be mutually exclusive and were deemed appropriate to be added to any list of tasks describing the job of a cooperative coordinator. Eight task statements suggested by respondents were incorporated into a rewording of the original related task statements (Table 1). For example: "Visit with school administrative personnel concerning student progress" (G 112) should be modified to read, "Visit with school administrative personnel concerning student progress/problems."

The suggestions for additional tasks received in Duty Area K, Administrative Duty Assignments, were summarized into five additional task statements. It was discovered by the investigator that the school administrators were using coordinators in a wide variety of tasks which were unrelated to their principal employment. Respondents indicated that they performed tasks as substitute teacher, school counselors, school nurse, school janitor, principal or assistant principal, vocational director and department head. Some of them performed duties such as landscaping the grounds, running the school's store, serving as

#### TABLE 1

TASKS WHICH RESPONDENTS SUGGESTED BE ADDED AND/OR A MODIFICATION OF TASKS USED IN STUDY

#### Additional and Modified Tasks

Duty Area A: Selecting and Placing Students

Refer student applicants to programs suited to their vocational needs.

Duty Area B: Guidance and Counseling

Assist students in identifying opportunities for further education and assist students in obtaining post-graduate job placement.

Duty Area C: Planning and Developing Lessons

Modify learning material for individual instruction.

Duty Area D: Teaching Lessons

Teach lessons using periodical literature.

Duty Area E: Testing and Evaluating Students

None

Duty Area F: Program Pubficity

Prepare notebooks, brochures or audio-visual material to publicize program.

Duty Area 'G: Out' of Class Coordination Activities

Visit with school administration personnel concerning students' progress/problems. (Modification to Task G 112)

Duty Area H: Clerical and Program Management Tasks
None

Duty Area I: Youth Leadership Activities

Assist in conducting contests for <u>local</u> level.

Assist in conducting contest for district level.

Assist in conducting contests for area level.

Assist in conducting contests for state level.

Assist in conducting contests for <u>national</u> level.

Assist state and national youth leadership club functions other than contests.

#### Additional and Modified Tasks

Attend/chaperone students at <u>local</u> youth leadership chapter meetings. (Modification to Task I 156).

Attend/chaperone students at district youth leadership chapter meetings. (Modification to Task I 157)

Attend/chaperone students at area youth leadership chapter meetings. (Modification to Task I 158)

Attend/chaperone sutdents at state youth leadership chapter meetings. (Modification to Task I 159)

Attend/chaperone students at <u>national</u> youth leadership chapter meetings. (Modification to Task I 160)

Establish local youth leadership organization (DECA, FFA, FHA-HERO, OEA, TAHOSA, VICA, VOCT, and/or others, YHA, 4H, etc.). (Modification to Task I 153)

Duty Area J: Professional Development

Serve on advisory committee for state and national Board of Directors of youth leadership organizations.

<u>Duty Area K: Administrative Duty Assignemnts</u>

Perform duties as assigned at school (e.g. sports/social events, graduation duties, etc.). (Modification to Task K 206)

Provide in-service instructions to other faculty members.

Perform duties for school administration (e.g. landscaping grounds, run school store, occasional nursing duties, assist food services, janitorial services, build cabinents, occasional secretarial duties, evaluation team, etc.).

Participate in special activities (e.g. Career Day, V.E. Day, Free Enterprise Day, College Orientation Day, etc.).

Serve as substitute teacher, school counselor, school nurses, janitor, principal/assistant principal, vocational director and department head.

secretary, assisting in food service, and providing in-service instruction to the regular faculty members.

In Duty Area I, Youth Leadership Activities, it was discovered that coordinators were assisting the state staff in conducting area, state, and, occasionally, national contests for the youth leadership meetings. It was also pointed out that the chaperoning of youth leadership meetings at the various levels was a part of attending the meetings. From the responses, six additional tasks statements were written and six existing task statements were modified.

No more than one additional task was identified for any other duty areas and no tasks were added to Duty Area H, Clerical and Record Keeping, or Duty Area E, Testing and Evaluating Students, by respondents.

Research Question 2: What relative percent of the time do coordinators spend doing the tasks they do?

The relative time vocational cooperative coordinators spent on tasks they performed is reported in the Table in Appendix A on the row labeled "Average percent time spent by all members." This relative percent time was determined by the JOBDEC program of CODAP. One copy of the JOBDEC printent has been delivered to the Research Coordinating Unit at the Texas Education Agency as part of Project No. 78230027, and one copy is on file at Texas A&M University in the College of Education.

Appendix A presents each task in descending order of percent time spent by all members, listed by duty area with the relative percent time spent from the greatest time spent, Duty Area H, Clerical and Program Management Tasks (15%), then Duty Area I, Youth Leadership Activities (14%), then Duty Area G, Out-of-class Coordination Activities (14%), then Duty Area D, Teaching Lessons (9%), then Duty Area A, Selecting and Placing Students (9%), then Duty Area E, Testing and Evaluating Students (8%), then Duty Area C, Planning and Developing Lessons (8%), then Duty Area B, Guidance and Counseling (7%), then Duty Area F, Program Publicity (6%), then Duty Area K, Administrative Duty Assignments (5%), to the least time spent Duty Area J, Professional

Development (5%) and by descending order of time for each task within each duty area.

The relative percent time spent by all members performing each task in each program area was examined to discover which tasks were performed a relatively high percent of the time and which tasks were performed a relatively low percent of the time. It was found that coordinators in some program areas performed a task a greater or lesser percent of time than the composite of all other coordinators. the time spent performing each task as reported by coordinators in a program area deviated .10 (more or less) from the time spent for all coordinators, it was deemed significant. For example, in Task No. 131, "Maintain progress chart," (Appendix A) p.164 it may be seen that the CVAE coordinators spent .44% of their time performing the task, while the composite of all coordinators spent .34% of their time performing this task. The deviation of .10 higher indicates that CVAE coordinators may spend more time performing this task than others. Other researchers may wish to examine the data using different criteria.

Using the criterion, of plus or minus .10 it was observed that Ag coordinators spent less time on 16 of the 29 clerical and program managements tasks, Duty Area H, than coordinators in other program areas. Home Ec coordinators spent a greater amount of time on 6 tasks. (Appendix A) pp. 138-166.

In Duty Area I, 34 tasks pertaining to youth leadership activities, the Ag coordinators spent a greater amount of relative time performing 22 tasks than the composite of all coordinators. The CVAE coordinators spent a lesser amount of relative time performing 25 tasks, and the Home Ec coordinators spent a lesser amount of time performing 15 tasks than a composite of all coordinators. (Appendix A) pp. 167-200.

It should be noted that the CVAE youth leadership club, The Vocational Opportunities Clubs of Texas, is the newest of the youth leadership club organizations and has not, as yet, developed activities at the district and state levels to the degree that other youth leadership clubs have. Then, too, the Home Ec youth leadership program does not have contests at the local, area, or state level, possibly accounting for a lower percent of relative time spent performing those tasks

relating to contest activities.

In Duty Area G, consisting of 29 tasks pertaining to out-of-class coordination activities, CVAE coordinators spent a greater amount of relative time performing 12 tasks than the composite of all coordinators. There was no program area in which coordinators spent a lesser amount of relative time than the composite of all coordinators. (Appendix A) pp. 201-229.

No single program area emerges as especially different in Duty Area D, 17 tasks pertaining to teaching lessons. The Ag, CVAE, DE, Health, Home Ec, and VOE coordinators spent a greater amount of relative time performing one to four tasks than the composite of all coordinators. Ag, Home Ec, ICT, and VOE coordinators spent a lesser amount of time performing one to five tasks than the composite of all coordinators. (Appendix A) pp. 230-246.

In Duty Area A, consisting of 16 tasks pertaining to selecting and placing students, CVAE coordinators spent a greater amount of relative time performing three tasks and Ag coordinators spent a lesser amount of relative time performing five tasks than the composite of all coordinators. (Appendix A) pp. 247-262.

In Duty Area E, consisting of 13 tasks pertaining to testing and evaluating students CVAE, Health, Home Ec, and VOE coordinators spent a greater amount of time on two tasks while Ag and CVAE were low on three tasks, Home Ec and ICT low on 2 tasks, and Health and DE were 100 one task each. (Appendix A) pp. 263-275.

In Duty Area C, consisting of 15 tasks pertaining to planning and developing lessons, Home Ec coordinators spent a greater amount of relative time performing five tasks. Ag coordinators spent a lesser amount of relative time performing four tasks than the composite of all coordinators. (Appendix A) pp. 276-290.

In Duty Area B, consisting of 16 tasks pertaining to guidance and counseling, CVAE coordinators spent a greater amount of relative time performing eleven tasks. There was no program area which emerged as especially low in relative time spent performing these tasks than the composite of all coordinators. (Appendix A) pp. 291-306.

In Duty Area F, consisting of 17 tasks pertaining to program publicity, no program area emerged as especially high in amount of relative

time spent performing those tasks in comparison to a composite of all coordinators. CVAE coordinators spent a lesser amount of relative time performing seven tasks than a composite of all coordinators, however. (Appendix A) pp. 307-323.

In Duty Area K, consisting of 15 tasks pertaining to administrative duty assignments, Ag coordinators spent a greater amount of relative time performing three tasks, and Health coordinators spent a lesser amount of relative time performing five tasks than did a composite of all coordinators. (Appendix A) pp. 324-338.

An analysis of Duty Area J, consisting of 10 tasks pertaining to professional development, revealed few differences among program areas in relative time spent performing those tasks. (Appendix A) pp. 339-348.

Research Question 3 and 4: What do coordinators perceive is the most appropriate setting in which to first learn a task? Are there differences among programs in coordinators' perceptions of which setting is ideally suited for learning to perform particular tasks?

Although there are differences among program areas in coordinators' perceptions of which setting is ideally suited for learning to perform particular tasks, generally coordinators believed that teaching tasks should be learned before being hired and that most other tasks should be learned before being hired or in a certification course.

Coordinator-respondents reported when and where (in what setting) they first learned to do each task they did and ideally when and where (in what setting) they believed the task's first should have been learned. The settings listed were before being hired, defined as a preservice competency; in a certification course, defined as the courses taken to obtain coordinator certification just after being hired; in inservice programs as presented at the local, area, or state level; and on-the-job, defined as learned during employment.

Those responses appear in the table in Appendix A. That table presents each task in descending order of percent time spent by all members. The reader is cautioned to remember in examining the table that the tasks listed are not ranked according to either the setting in which the tasks were first learned or according to the coordinators'

perceptions of the ideal setting for learning those tasks.

The result of each response was converted to a percent of respondents selecting each category for "when learned" and "ideally when learned" for a composite of all coordinators and for each program area. (Appendix A) p. 138. It was assumed that if coordinator-respondents had randomly selected a setting that each cell containing the percent of coordinators selecting a particular setting would contain 25% for each of the four settings. It was decided that any time a cell exceeded 35% it would be considered above average and would reflect a higher than average choice for that particular setting among coordinators in that particular program area. Other researchers may wish to examine the data using different criteria.

The setting of tasks reported as high, categorized by duty area, under each program area, revealed information relative to coordinators' perceptions of "whén" and "ideally when" competencies should have been learned. For example, in Appendix A, Task No. A001, p. 262 56 percent of the Health coordinators reported that they first learned to perform this task on-the-job, whereas 78 percent of these same coordinators felt that this task ideally should have been learned in a certification course. In Duty Area H, Clerical and Program Management tasks, a majority of the tasks were learned by coordinators on-the-job. Most coordinator-respondents reported that the ideal setting in which to learn these tasks was in a certification-course, except for, VOE coordinators, who felt clerical tasks should have been learned before being hired. DE coordinators reported the highest number of clerical and program management tasks being learned on-the-job.

In Duty Area I, Youth Leadership Activities, Ag and Home Ec coordinators learned the tasks they did before being hired, and generally agreed that this is the ideal setting in which to learn youth leadership activities tasks. CVAE and ICT coordinators learned to perform most of these tasks in either a certification course or on-the-job, but coordinators in both program areas believed that most of these tasks should have been learned in a certification course. DE, Health, and VOE coordinators learned to perform most of these tasks on-the-job. Health coordinators believed that the ideal setting in which to learn these tasks was in a certification course. VOE coordinators preferred,

ideally, an inservice setting and DE coordinators evidenced no special preference for any of the settings.

In Duty Area G, Out-of-Class Coordination Activities, only VOE coordinators selected an in-service setting as being ideal for learning coordination tasks even though most VOE coordinators reported that the tasks they performed were learned on-the-job. CVAE, Health, and ICT coordinators have learned to do most of their tasks in a certification course or on-the-job and believed that a certification counse was the ideal setting in which to learn to do these tasks. A high percentage of Ag coordinators reported that they first learned to perform out-of-class coordination tasks in three settings, before-hire, certification course and on-the-job, but their ideal choice favored either the certification course or the before, hire setting. A highercentage of Home Ec coordinators learned the tasks they performed before they were hired or in their inservice setting and felt that these were the ideal settings in which to learn coordination tasks. DE coordinators reported a high percentage of tasks learned on-the-job and suggested that part of these tasks be learned in a certification course and part be learned on-the-job.

Most of the tasks which drew a response of 35% or more in the Duty Area D, Teaching Lessons, suggested that these competencies were learned and ideally should be developed before being hired.

In Duty Area E, Testing and Evaluating Students, a high percentage of coordinators reported having learned these tasks on-the-job. There was a strong preference indicated among the coordinators to favor, ideally, either the before-hire setting or certification course. VOE coordinators suggested only one task in testing and evaluating ideally to be learned in an in-service setting and that was "analyze progress reports from employers."

In Duty Area C, Planning and Developing Lessons, Ag, CVAE, Home Ec, and VOE coordinators tended to favor these tasks as a preservice competency, whereas Health and ICT coordinators selected a certification course as the ideal setting. However, a high percentage of ICT coordinators reported learning eleven tasks before being hired. DE coordinators reported having learned to plan and develop lessons on-the-job and preferred, ideally, to have learned these tasks in a certification course.

In Duty Area B, Guidance and Counseling, Ag, CVAE, DE, Health, and VOE coordinators reported having learned an average of fifteen tasks on-the-job. However, all program areas reported ideally favoring this as a before-thire (preservice) competency.

In Duty Area F, Program Publicity, Ag, DE, Health, and VOE coordinators reported having learned many tasks on-the-job. Ag coordinators did ideally prefer the before-hire setting; Health coordinators preferred a certification course setting and VOE coordinators an in-service setting. DE coordinators, on the other hand, showed no preference in either "when" or "ideally when", while a high percentage of Home Ec coordinators selected "before-hire" as when they first learned publicity tasks and ideally when they should have learned them. ICT coordinators ideally favored the in-service course setting.

Tasks in Duty Area K, Administrative Duty Assignments, were favored by a high percentage of coordinators of Ag, CVAE, Home Ec, ICT, and VOE as tasks to be learned before being hired. DE and Health coordinators tended to learn these tasks on-the-job and felt that this was an ideal setting in which to learn these tasks.

Likewise, in Duty Area J, Professional Development, Ag, CVAE, Home Ec, ICT, and VOE coordinators suggested these tasks be learned before being hired. DE and Health coordinators tended to learn these tasks on-the-job and felt that this was an ideal setting in which to learn these tasks.

Likewise, in Duty Area J, Professional Development, Ag, CVAE, Health, Home Ec, ICT, and VOE coordinators learned to perform many tasks in the before-hire setting and felt that this was the deal setting in which to learn these tasks.

Tasks in Duty Area K, Administrative Duty Assignments, were favored by a high percentage of coordinators of Ag, CVAE, Home Ec, ICT, and VOE as tasks to be learned before being hired. DE and Health coordinators tended to learn these tasks on-the-job and felt that this was an ideal setting in which to learn these tasks. Likewise, in Duty Area J, Professional Development, Ag, CVAE, Health, Home Ec, ICT, and VOE coordinators learned to perform many tasks in the before-hire setting and felt that this was the ideal setting in which to learn these tasks.

On the other hand, a high percentage of DE coordinators felt that the on-the-job setting was ideal for learning these tasks.

In summary, coordinators' perceptions of ideally when tasks should first be learned tended to favor the preservice settings of before-hire or certification courses. It was noted that, overall, coordinators believed that coordinators should first learn most teaching skills before being hired. Concerning differences among programs, coordinators tended to favor settings in which they first learned to perform each task except for the on-the-job setting which generally had the highest percentage in the "when learned" column, and in-service which had the lowest percentage in the "ideally when learned" column.

The differences may result from the variations in settings in which tasks are learned in the different program areas. For example, only Ag and Home Ec coordinators must graduate from a Bachelor's degree program in their respective fields approved by the Texas Education Agency; DE, VOE, ICT, and Multi-Occupational certification requires only a Bachelor's degree and Health does not specify a Bachelor's degree at all. Examining Table 1.33-1 of the Texas State Plan for Vocational Education reveals additional variations in requirements for certification. (Texas State Board for Vocational Education, 1976)

Research Question 5: How important do coordinators believe are the tasks they perform and are their perceptions consistent across program areas?

Coordinators had been asked to rate each task they performed on a scale of 4=very important, 3=important, 2=somewhat important, and 1=not important. A mean was calculated for responses of all coordinators and a separate mean was calculated for each task for coordinators from each program area. The means were tested for significant differences among program areas, and a Scheffé's test was performed to determine among which programs differences existed. The means for each task by programs are shown in Appendix A. Where an over-all significant difference was found among forgram areas, the row designation "average importance" is followed by an asterisk.

Twenty-five tasks were rated as having a mean equal to or less

than 2.50 and thus of below average importance. Seven of the "less than important" tasks were in Duty Area I, Youth Leadership Activities, and these seven tasks were so rated by CVAE coordinators. Health coordinators rated 12 tasks as less than important. Seven of these were in Duty Area K, Administrative Duty Assignments." They were: "Monitor students', conduct on school premises other than classroom," 2.24; "Perform duties as assigned at sport/social events," 2.50; "Attend school committee meetings," 2.43; "Sponsor school clubs," 2.24; "Supervise study hall/advisory class/home room," 2.00; "Attend P.T.A. meetings," 2.29; "Collect money for school pictures, annuals, charities, lunchroom, etc," 2.19.

Coordinators from the program areas of Health, Home Ec, and MOE believed that "Assist students in building floats for parades," was unimportant, and Ag, DE, ICT, and VOE coordinators felt it was unimportant to "Drive school bus on special occasions." The three program areas of Ag, Health and Home Ec rated the task "to supervise study hall/advisory class/home room"\*as unimportant, while "attend P.T.A. meetings" was rated unimportant by Ag, Health, and VOE coordinators. Ag, DE, and ICT coordinators rated "teach trade extension course," as less than important.

Significantly different perceptions at the .05 level among program areas were found to exist for 97 of the 211 tasks upon using analysis of variance techniques. These 97 tasks have been further analyzed using Scheffe's test for significant differences among the various program areas. Where differences were found they have been identified in the table in Appendix A, on the row labeled Scheffe's difference, by printing the column number of all programs from which the particular program in that column differed.

In Duty Area I, Youth Leadership Activities, 85% of the tasks revealed a significant variance at the .05 level in their rating of task importance among program areas. In Duty Area C, Planning Lessons, 75% of the tasks revealed a significant difference in the rating assigned by coordinators among program areas. In Duty Area A, Selecting and Placing Students, 56% of the tasks were rated by coordinators as significantly different. In the remaining duty areas, it was found that

a significant difference among program areas existed for approximately one-third of the tasks in each duty area, ranging from a 45% difference in Duty Area G, Out-of-Class Coordination Activities, to the 12% difference found in Duty Area F, Program Publicity.

A linear regression test was run on the relationship of percent time spent on each task by members performing to the perceived importance of each task. This test yielded an r of .66. A test of the significance of the r produced a p = .001, which indicated a highly significant correlation between the percent time spent by members performing a task and their perceptions of the importance of that task. (Hewlitt-Packard, 1974)

Research Question 6: What percent of coordinator-réspondents would have a teacher aide perform each task?

One-half of the coordinators were asked if they would have a teacher aide perform each task that they had checked as doing themselves. Coordinators' responses were converted to percentages and the percent of coordinators who would use a teacher aide to perform each task was calculated. The percent of affirmative responses to this question was adjusted upward by the exact ratio of gold to blue questionnaires. Tasks were then ranked from the task which the greatest percent of coordinators would have a teacher aide perform to the task which the least percent of coordinators would have a teacher aide perform.

An analysis of this ranking revealed that more than 20% of the coordinators would use a teacher aide to assist them in performing at
least one task in each duty area. The predominant category of tasks
which coordinator-respondents would have a teacher aide perform would
be in the area of clerical and program management. Even where a large
number of coordinator-respondents indicated it would be appropriate to
use a teacher aide to perform tasks in duty areas other than clerical
and program management, the nature of the tasks tended to be clerical.
For example, in Duty Area E, Testing and Evaluating Students, the task,
"Grade workbook, (study guide) assignments," or in the Duty Area I,
Youth Leadership Activities, the task, "Make travel and housing

arrangements for out-of-town youth leadership activities," seemed to be clerical.

Research Question 7: What percent of time did coordinators report they would use a teacher aide?

The average percent of time the 826 full-time coordinator-respondents included in the study believed they could use a teacher aide was 39%.

Coordinators were asked to indicate to what extent they could use a teacher aide, if one were available, on a five-point scale offering choices of: full-time, half-time, quarter-time, less than quarter-time, or not at all; weights of 1.0, .5, .25, .125, and 0 were assigned to each choice respectively. An average percent of time the 826 full-time coordinator-respondents identified in this study indicated they would use a teacher aide was calculated for each program area and for all program areas combined (Table 2)

It was noted that coordinators' responses ranged from those who indicated they could use a teacher aide full-time to those who would not use a teacher aide at all. CVAE coordinators indicated that they would only use a teacher aide 27% of the time while Home Ec coordinators believed they could use a teacher aide 44% of the time.

Research Question 8: What percent of full-time coordinator respondents would use a teacher aide if one were available?

When only full-time coordinators were considered, an analysis of the responses to the question, "To what extent could you use a teacher aide if one were available," revealed that 94% of the full-time Ag and Home Ec teachers would-use a teacher aide some of the time; 88% of the DE coordinators, 85% of both the Health coordinators and ICT coordinators, 84% of the VOE coordinators, and 75% of the CVAE coordinators indicated they would use a teacher aide some of the time. (Table 3)

When the percentages of coordinators who could use a teacher aide half-time or more were summed it was found that 58% of the Home Ec coordinators.

TABLE 2

# AVERAGE PERCENT OF TIME FULL-TIME COORDINATOR-RESPONDENTS INDICATED THEY COULD USE A TEACHER AIDE IF, ONE WERE AVAILABLE

tors, 53% of the VOE coordinators, 48% of the DE coordinators, 44% of the Ag coordinators, 39% of the ICT coordinators, and 28% of the CVAE coordinators believed that they could use a teacher aide half-time or more.

Research Question 9: To what degree do full-time coordinator-respondents perceive that the use of a teacher aide would result in an increase in enrollment?

An overall increase of 4.7 students indicated a 16% increase in the number of students which could be accommodated with a teacher aide.

The data were examined to determine the extent to which a teacher aide would affect enrollment. For this question, only the responses of full-time coordinator-respondents were included. The analysis was done by considering the relationship among three variables, (1) the number of students the coordinator-respondents reported enrolled in the spring of 1977, (2) the optimum number of students the same respondents reported they believed their program could accommodate at the present time, and (3) the optimum number of students the coordinator-respondents believed could be accommodated with a teacher aide. (Table 4) A mean was calculated for each variable for each program area. The mean of the difference reported by each respondent showed no significant difference between the number of students enrolled now and the number of students they could optimally accommodate now.

A mean of the difference reported by each full-time respondent between the optimum number of students they believed their program could accommodate now and the optimum number of students they believed could be accommodated with a teacher aide was calculated. This difference showed an overall increase of 4.7 students. (Table 4) Differences in the increase in number of students coordinators believed they could accommodate if a teacher aide were available ranged from 3.3 in CVAE to 6.7 in Home Ec.

**5**8

TABLE 4

AVERAGED NUMBER OF STUDENTS FULL-TIME COORDINATORS REPORTED ENROLLED IN THEIR CLASSES NOW, COMPARED WITH NUMBER OF STUDENTS ESTIMATED AS BEING OPTIMUM, AND ESTIMATED OPTIMUM NUMBER OF STUDENTS WHO COULD BE ACCOMMODATED, IF A TEACHER AIDE WERE AVAILABLE, BY PROGRAM AREAS AND BY ALL PROGRAMS

		Number of Stude	nts	7. H. S. A. S.
			Estimated Optimum Who Could Be	Increase In Number
Program Area	Reported Enrolled Now	Estimated As Optimum Now	Accommodated If A Teacher Aide Were Available	of Students If A Teacher Aide Were Available

A0E.	28.2	29.2	33.9	4.7
Average All	31,1 -	30.5	35.2	4.7

Research Question 10: Do differences exist among program areas with respect to the percent of coordinators who would use a teacher aide to perform each task?

The percent of coordinators who would use a teacher aide to perform a task among the various program areas was tested for significant differences among program areas using a "Differences Among Proportions Program." (Hewlitt-Packard, 1974) Where a significant difference among program areas was found, an asterisk has been placed after the row titled "Percent would use Teacher Aide." (Appendix A) p. 142. Seventy-two tasks were found to be significantly different with respect to the percent of coordinators in each program area who would use a teacher aide. Sixty-nine percent of the clerical and program management tasks showed a significant difference at the .05 level among proportions of coordinators who would use a teacher aide in each program area. No differences were noted among programs in Duty Area J, Professional Development, where few coordinators would use a teacher aide to assist them.

Further analysis revealed that among all programs there was no significant difference in the average percent of time coordinators would use a teacher aide to assist them between full-time coordinators and a composite of all coordinators. However, when comparing the 14 full-time Ag coordinators responding to this question with all 146 Ag respondents the full-time Ag coordinators would use a teacher aide 7%/less.

Research Question 11: What tasks are in common and where do differences lie with respect to various program areas as related to teacher preparation?

Statistically, coordinators in all program areas perform similar tasks. The duty areas as ranked by average percent of time spent by all members as reported in the JOBDEC for all coordinator-respondents were co-located with each similar ranking from each program area on the same table. (Table 5) The commonality of rankings of duty areas was

TABLE 5

tested using Kendall's Coefficient of Concordance. (Hewlitt-Packard, 1974) A test of the null hypothesis of no community or preference was performed. The null hypothesis was rejected with a X<sup>2</sup> of 65.09.

Kendall's W indicated an overlap among duty areas of 93%.

Similarly, the commonality of the ranking of tasks among programs (Table 6) was tested using Kendall's Coefficient of Concordance. (Hewlitt-Packard, 1974) The null hypothesis was rejected by a X<sup>2</sup> of 1252.3. Kendall's W indicated an overlap among tasks of 85% among all program areas.

The CODAP programs Overlap and Group (OVLGRP), compared every task performed by every coordinator with every task performed by every other coordinator to determine which two coordinators were most alike. When the first two coordinators were grouped the program continued to combine like coordinators into alike groups until all coordinators had been grouped hierarchically. No clustering of coordinators emerged which could be identiifed as representing a particular program area.

From the JOBDEC it was possible to determine which tasks were performed in the upper 50% of the coordinators' time by program area. The criterion of the upper 50% of time spent was selected for this study; other researchers may wish to examine the data using criteria of a greater or lesser level than 50%. Information to perform that analysis is contained in the JOBDEC on file in the Department of Occupational Education and Technology, Texas Education Agency. Table 7 was developed to determine which tasks appeared in the upper 50% of a coordinator's time in each program area and that task was marked with an "X" on the table. An analysis of those tasks revealed the following information.

Thirty-five tasks were found to be in common across all program areas in the upper 50% of the time spent by coordinators. Fourteen tasks were found to be in common across six program areas, eleven tasks were in common across five programs, eight tasks across four programs, and thirteen tasks were performed in the upper 50% of the coordinator's time in only one program area. A total of 107 tasks appeared in the upper 50% of the coordinator's total time in at least one program area.

coordinators performed the greatest number of tasks in the upper 50% of their time spent with eight tasks each. Health and Ag coordinators performed only five of the sixteen total tasks in Duty Area A in the upper 50% of their time.

In Duty Area B, Guidance and Counseling, CVAE and Ag coordinators performed six of the sixteen total tasks in the upper 50% of their time. Home Ec coordinators performed five tasks, while the rest of the program area coordinators performed four Duty Area B tasks in the upper 50% of their time spent.

The number of tasks performed in the upper 50% of the time spent by Health Coordinators in Duty Area C, Planning and Developing Lessons, was eleven. Home Ec and CVAE coordinators each performed nine tasks; ICT and VOE performed eight tasks; and DE and Ag coordinators performed only six of the fifteen tasks in the upper 50% of their time.

Tasks found in the upper 50% of time spent by coordinator-respondents in Duty Area D, Teaching Lessons, which included seventeen tasks, ranged from eight tasks performed by DE coordinators to four tasks performed by VOE coordinators. Seven tasks were performed by Health and CVAE coordinators.

In Duty Area E, Testing and Evaluating Students, thirteen tasks showed ten of them being performed by VOE coordinators in the upper 50% of their time. Nine tasks were performed in the upper 50% of the time by Home Ec and CVAE coordinators, while eight tasks were performed in the upper 50% of the time by Health and ICT coordinators. Seven tasks were performed by DE and Ag coordinators.

Of the seven tasks in Duty Area F, Program Publicity, only three were in the upper 50% of the time spent. Task Number Eighty, "Conduct an employer-employee appreciation function," was listed by Health, Home Ec, ICT, DE, and VOE coordinators. Overall, CVAE coordinators listed no tasks from this duty area in the upper 50% of their time spent; Health, Home Ec, and DE coordinators each listed two; and ICT, Ag, and VOE coordinators listed one.

In the time spent in the upper 50% of Duty Area G, Out-of-Class Coordination Activities, twenty-nine tasks, CVAE coordinators performed twelve, ICT, DE, and VOE coordinators performed nine, Home Ec

and Ag coordinators performed eight; and Health coordinators reported seven tasks consumed time in the upper 50% of their relative time spent.

Of the twenty-nine tasks in Duty Area H, Clerical and Program Management, VOE coordinators performed thirteen in the upper 50% of their time, and ICT coordinators performed twelve. Health, Home Ec and CVAE coordinators each performed eleven, DE coordinators nine, and Ag coordinators performed only five of the clerical and program management tasks in the upper 50% of their time.

The greatest difference among programs, when comparing tasks performed in the upper 50% of their time, is in the area of the thirty-four youth leadership activities tasks. The range is from CVAE which performed two tasks to Ag which performed 17. In between, DE coordinators performed fifteen, Health thirteen, ICT eleven, VOE nine and Home Ec six.

In the ten tasks involving Duty Area J. Professional Development, ICT coordinators reported that they performed six tasks in the upper 50% of their time spent. Ag coordinators performed five tasks; CVAE and DE four; and Health, Home Ec, and VOE three each.

Only four of the fifteen tasks listed in Duty Area K: Administrative Duty Assignments, appeared in the upper 50% of the time spent by coordinators in any program area. Coordinators in all program areas attended faculty meetings. Home Ec, ICT, CVAE, DE, Ag, and VOE coordinators reported the "Maintain clean/orderly classroom" task in the upper 50% of their average time spent. ICT and Ag coordinators reported, "Monitor students' conduct on school premises other than classroom (e.g. parking lot, halls, cafeteria, detention hall, etc.)," as a task in the upper 50% of their time, while only Ag reported, "Participate in school-wide open house activities," in the upper 50% of their time spent.

Research Question 12: Are tasks performed significantly different when set in large schools or small schools, large communities or small communities, or performed by coordinators with differing amounts of experience?

Large Schools vs. Small Schools. It was observed that 98 of the 211 tasks were performed by a significantly differently percent of coordinator-respondents who had come from large schools as compared with coordinators from small schools.

An analysis of the data was made to calculate the percent of members performing each task in schools where student enrollment was reported by coordinators to be greater than 1492. (1492 was the mean number of students calculated from coordinators responses to the background question, "Approximately how many students attend the high school(s) for which you serve as a vocational cooperative coordinator?") A similar calculation was made for respondents from schools with less than 1492 students. After subtracting the difference in percent performing between the large school groups and the small school groups the tasks were anked from the greatest plus difference to the greatest minus difference. Because of the different numbers of coordinators performing each take, a difference between proportions and frequency test (Guilford and Frichter, 1973) was performed to determine which tasks were in fact statistically significantly different. These tasks are listed in Appendia B, from the task with the greatest Z to the task with the least significant  $\overline{Z}$ .

It was further observed that the general nature of tasks which were different were those involving communication. In large schools a more formal communication system appeared to be employed by coordinators to inform students, other teachers, administrators, and employers about the cooperative program. Also in larger schools, a greater percentage of coordinators perform more record-keeping tasks. On the other hand, in small schools two differences emerged, (1) a much less formal means of communication, and (2) a much greater involvement in administrative duty assignments not directly related to the cooperative coordinator's specific duties.

Large Communities vs. Small Communities. It was observed that eighty tasks were performed significantly differently between coordination-respondents from small communities and those from large communities.

A background question asked, "What is the approximate population. (number of people) of the areas from which you draw your students?" An analysis of the data was made to calculate the percent of members performing each task in areas where population was reported by coordinators to be greater than 50,000 persons. A similar calculation was made for respondents who reported they were from areas with less than 50,000 persons. After subtracting the differences in percent performing between the coordinators from large communities and the coordinators from small communities, the tasks were ranked from the greatest plus difference to the greatest minus difference. Because of the different number of coordinators performing each task, a difference between proportion and frequency (Guilford and Fruchter, 1973) was performed to determine which tasks were in fact performed by a statistically significantly different percent of each group. These tasks are listed in (They are ranked a cording to the magnitude of the  $\overline{Z}$ .) Appendix C. Again, as in the findings reported for differences between coordinators working in larger schools Pand coordinators working in smaller schools, the main difference appeared to be in tasks involving more formal methods of communication and record keeping in the large communities. In small communities a greater percentage of coordinators performed tasks relating to youth leadership clubs and administrative duty assignments.

More Experience vs. Less Experience. It was observed that thirty tasks were performed differently between coordinators who had more experience as compared with coordinators with less experience.

From the background question which asked, "How many years have you been a vocational cooperative coordinator?", coordinators were categorized into two classifications and an analysis of the data was made to calculate the percent of members performing each task by coordinator-respondents with one to three years experience and by coordinator-respondents with four or more years experience. After subtracting the

differences in percent performing between more experienced coordinators and the less experienced coordinators, the tasks were ranked from the greatest plus difference to the greatest minus difference. Again, because of the differences in the number of coordinators performing each task, a difference between proportions and frequency test (Guilford and Fruchter, 1973) was performed to determine which tasks were significantly different. These tasks are listed in Appendix D.

It was observed from Appendix D that more experienced coordinators seemed to have a greater involvement with people outside of the program in the form of utilizing their former students, visiting business and industry, visiting advisory committees, conducting their follow-up by personal visits, and talking to groups both within and outside of the school. A greater percentage of more experienced coordinators assisted their chapter members in preparing for local, district, state, and national youth leadership contests and youth leadership officers' activities. Whereas, less experienced coordinators seemed to spend more time in activities relating to the individual students and their classroom situation.

Research Question 13: What differences exist between the tasks performed by full-time coordinators as compared with coordinators of combination units?

Full-Time Coordinators vs. Part-Time Coordinators. An analysis of the data was made to examine the question of whether or not there was a significant difference in the percent of full-time coordinators who performed each task as compared with coordinators of combination units. A total of seventy tasks were performed by a significantly greater percentage of full-time coordinators.

Only twelve of the 211 tasks, 6% were performed by a significantly greater percentage of combination unit coordinators. These were one task in Duty Area K, Administrative Assignments; five tasks in Duty Area I, Youth Leadership Activities; five tasks in Duty Area G, Out-of-Class Coordination Activities; and one task in Duty Area A, Selecting and Placing Students. (Appendix E) Also, when examining tasks that

96

combination coordinators performed more often than full-time coordinators, the youth leadership activities and the administrative duty assignment tasks had a significantly greater percentage of combination unit coordinators performing those tasks.

A statistically significant greater percentage of full-time coordinators performed 50% of the tasks in Duty Area D, Teaching Lessons; 48% of the tasks in Duty Area H, Clerical and Program Management; 47% of the tasks in Duty Area C, Planning and Developing Lessons; and 45% of the tasks in Duty Area G, Out-of-Class Coordination Activities. Forty-four percent of the tasks in Duty Area A, Selecting and Placing Students; 31% of the tasks in Duty Area B, Guidance and Counseling; 29% of the tasks in Duty Area F, Program Publicity; 10% of the tasks in Duty Area I, Youth Leadership Activities, were performed more by full-time coordinators than by part-time coordinators.

Again, as in the analysis of Large Schools vs. Small Schools and Large Communities vs. Small Communities, when full-time coordinators are compared with other coordinators on the percent who performed tasks, a significantly greater percentage of full-time coordinators performed tasks involving record keeping and visiting people in groups outside of the school and classroom, such as advisory committee members and people in business and industry. It was observed that full-time coordinators also seemed to use more audiotapes, role playing, and resource people such as former students and people from the community in teaching lessons.

## Additional Findings

From selected background questions which were included at the end of the questionnaire, additional information on five topics was elicited and analyzed. (1) Coordinator-respondents reported the number of hours per week they spent performing those tasks listed in the question-naire and (2) how well they felt they could perform as a vocational cooperative teacher coordinator in each program area. (3) Using a paired comparison technique, the coordinator-respondents reported which groups they spent more time teaching, that is, individuals, the entire class,

or small groups. (4) They were also asked how well they felt their certification training helped them in their job as a vocational cooperative teacher coordinator and (5) how well did in-service training at the state, area or district, and local level help to improve their job performance.

Hours per Week Coordinators Spent Performing Tasks

An analysis of coordinators' responses to the number of hours per week they spent performing tasks related to their job showed that a composite of all coordinators worked an average of forty-five hours, twenty-one minutes. A confidence interval was computed at the .05 level and found to extend from forty-two hours and fifty-four minutes, to forty-seven hours and fifty-four minutes. However, coordinators, responses ranged from a low of fifteen hours per week to ninety-nine hours per week. Health coordinators reported that they averaged the greatest average number of hours, forty-eight hours, forty-five minutes. However, some Health coordinators did report working as few as thirty-two hours per week and some as many as seventy hours per week. (Table 8)

Coordinators Perception of Job Performance

Coordinators reported on how well they felt they could perform as a cooperative teacher coordinator in the following program areas: Ag, CVAE, DE, Health, Home Ec, ICT, Multi-Occupational, and VOE. An analysis of variance revealed that there was no significant difference at the .05 level among program areas in their estimate of how well they performed in their own program area. However, it was observed that coordinators in most program areas felt that they would do poorly or would not try to coordinate in what might be called the more "technical" areas of Health, VOE, Home Ec, and Ag. Coordinators from a majority of program areas felt that they could perform "acceptably" or better in CVAE, DE, ICT, and Multi-Occupational areas where more diverse skills are represented.

TABLE 8

NUMBER OF HOURS PER WEEK SPENT PERFORMING TASKS BY FULLTIME COORDINATOR-RESPONDENTS IN VARIOUS PROGRAM AREAS

		Áverage		Rang		
Program Area	N	Number of Hours	Standard Deviation	Minimum Value	Maximum Value	Coefficient of Variability
Ag	16	40.90	15.59	15	60	38.13
CVAE	81	46.20	7.36	• 30	70	15.91
DE	275	42.80	9.96	12	80	23.28
Health	f 41 /	48.76	8.16	32	708	16.73
Home Ec	134	47.33	10.29	22	99	21.74
ICT ·	121 .	44.96	9.25	20	65	20.58
VOE	<b>'97</b>	46.57	9.02	20	<b>180</b> -	19.37

In addition, it was noted that CVAE coordinators believed they could coordinate "acceptably", "well", or "very well" in all program areas and well to very well in four program areas, CVAE, DE, ICT, and Multi-Occupational. Ag coordinators felt that they could perform tasks acceptably or better in Ag, CVAE, DE, and ICT. DE coordinators indicated that they could perform acceptably or better in CVAE, DE, ICT, and Multi-Occupational areas. Also Health coordinators reported that they could perform tasks acceptably or better in CVAE, Health, Home Ec, and Multi-Occupational areas. Home Ec coordinators believed that they could coordinate acceptably or better in three areas, CVAE, DE, or Home Ec, while VOE coordinators indicated that they could perform acceptably or better in DE, ICT, or VOE. Only CVAE and ICT coordinators indicated they could coordinate in the Ag area; and then only barely at the "Acceptable" level. (Table 9)

Although no significant variance was found at the .05 level among the means of how well coordinators believed they could perform in their own program area and no significant rank order relationship was discovered between coordinators' perception of performance in their own areas and their perception of potential performance in the program area of Multi-Occupational (Table 10), Spearman's Rank, Order Correlation Coefficient (Hewlett-Packard, 1974) rejected the null hypothesis of independence in the rankings with a z of 2.36. The  $r_s$  computed by the program was .96. A comparison was made between full-time coordinatorrespondents and all coordinator-respondents on how well they believed they could coordinate in their own and other program areas. By inspection no differences existed between the perceptions of full-time coordinators vs. all coordinators, except Ag, where only eighteen full-time coordinators were being compared with 145 coordinators. All VOE coordinators felt that they could perform as an ICT coordinator better than full-time VOE coordinators felt they could perform as an ICT coordinator. All Home Ec coordinators felt they could not perform as a multioccupation coordinator as well as the full-time Home Ec coordinators eved that they could. In all cases full-time coordinators felt could perform in their own area better than all coordinators.

Distribution of Teaching Time Among Individuals, Small Groups, and the Entire Class

Coordinators were asked to indicate, by responding to three paired comparison questions, how they divided their class time among teaching individuals, small groups, or the entire class. No attempt was made to define what was meant by teaching individuals, small groups, and the entire class; therefore, various interpretations among the respondents, the investigator and the readers are possible.

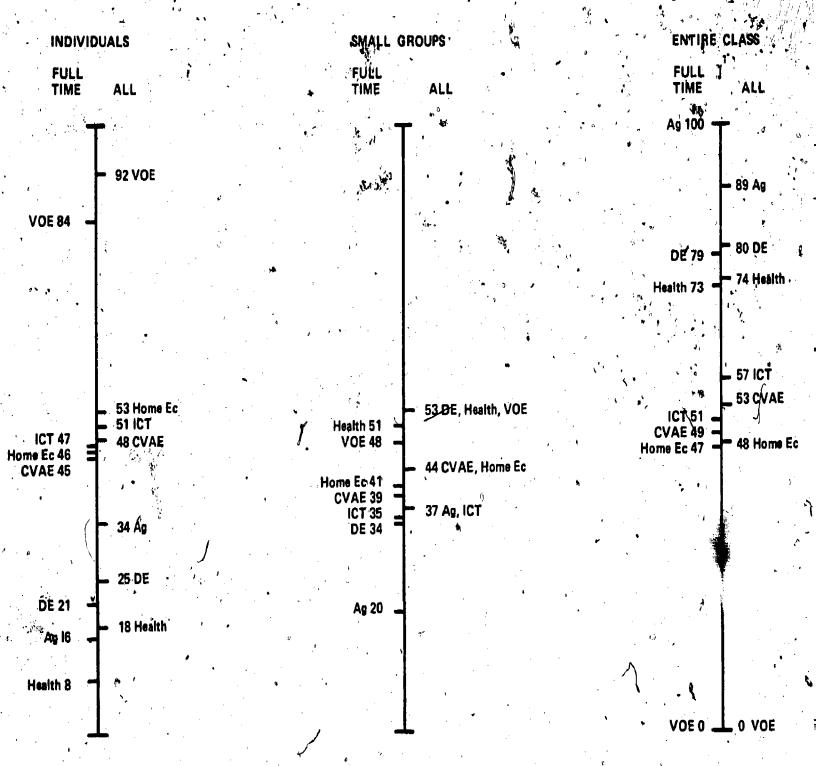

Responses were proportioned by program areas and scaled from 0 to 100 (Figure 1). It was observed that VOE coordinators reported that they spent relatively little time teaching the entire class and relatively more time teaching individuals. Ag coordinators reported that they spent relatively more time teaching the entire class and relatively less time with individuals. However, it should be noted that only eighteen Ag coordinators were identified as full time. By observation, Figure 1 revealed that relatively less time was spent by coordinators teaching individuals in smally groups as compared with Ag. Health, and DE coordinators who emphasized spending a greater amount of time teaching the entire class.

Fording Rerception of the Certification and Inservice

Coordinators responded to the question concerning how well the certification training in vocational education helped them in their job performance by affirming that on the average coordinators from all program areas but Health believed that their certification training helped them perform their job, as measured on a 5-point scale, either "very well" or "perfectly". Health coordinators responded by giving certification training a rating of "some", "very well" or "perfectly" in their perception of how well their certification training helped them in performing their job. Both the rating of the certification

# FIGURE 1

RELATIVE PROPORTIONS OF TIME REPORTED SPENT TEACHING INDIVIDUALS OR ENTIRE CLASS OR SMALL GROUPS BY FULL-TIME COOPERATIVE COORDINATORS COMPARED WITH ALL COORDINATORS, RESPONDING BY PROGRAM AREAS, CONVERTED TO A SCALE OF 100

training and the average number of years of employment were ranked and compared using Spearman's Rank Correlation Coefficient. (Table 11). The ranks were negatively correlated by an  $r_s$  equal to -.86, significant at .05 level.

Coordinators' responses to the question concerning how well their in-service training has helped them at the local, area or district, and state level revealed that in-service programs had been helpful in improving their job performance at the area and state levels. The responses were averaged and ranked, (Table 12)' Although Kendall's coefficient of concordance found no significant correlation among the rankings of all of the levels of in-service at the .05 level, a Spearman's Rank Correlation Coefficient found a significant correlation at the .05 level between rankings of coordinator's average ratings given to area or district and state in-service programs. The r<sub>s</sub> was computed and found to be .82. It was observed that in-service training programs conducted by the state were rated by coordinators as improving their job performance "very well" or better by Ag, CVAE, Home Ec, and VOE coordinators. Some improvement in job performance with the local programs and local coordinators.

In-service training programs at the local level received the lowest ratings among the three levels. VOE coordinators rated local in-service as improving job performance very little, while Ag, CVAE, DE, Health, Home Ec, and ICT coordinators indicated that local in-service provided only some help. A comparison between full-time coordinators and all coordinators concerning the question of in-service training showed no observable differences between these two groups in their perceptions of how helpful local, district or area, or state in-service training was in improving their job performance.

#### CHAPTER V

SUMMARY, CONCLUSIONS, IMPLICATIONS, AND RECOMMENDATIONS

Contained in this chapter is a summary of the purpose, objectives, methodology, and major findings of the study. Additionally, conclusions are drawn pertaining to each research question examined and to additional findings; wherever appropriate, implications are discussed and recommendations made.

### Purpose of this Study

The purpose of this study was to develop a validated list of tasks performed by vocational cooperative coordinators in the various program areas in Texas and of these tasks to determine the relative time coordinators spent on the tasks, when they learned to do each task, ideally when they believed each task should have been learned, how important they believed each task should be, and whether or not they would use a teacher aide to assist them in performing each task. Also, did the tasks which coordinators perform differ among program areas, between large or small schools, large or small communities, according to the amount of experience coordinators had and according to whether the coordinators worked as a full-time coordinator or taught in a combination unit.

#### **Objectives**

From the problems identified, a review of the literature, and a theoretical base, the following objectives were formulated and examined:
(1) Identify and validate the tasks performed by coordinators of cooperative vocational education programs in the secondary public schools of the State of Texas; (2) Determine a relative percentage of the time spent by cooperative vocational coordinators on these tasks; (3)

Identify tasks which coordinators feel should be among preemployment competencies, included in certification courses, or taught in in-service workshops; (4) Determine the perceived importance of the tasks performed; (5) Determine the extent to which coordinators perceived that tasks normally performed by the coordinator may be assigned to a teacher aide; (6) Determine the potential percent of increase in student enrollment if teacher aides were employed according to coordinators' present perceptions; (7) Determine if comparable performance areas exist among the seven program areas which could be taught to coordinators in any of the in-service workshops and/or certification courses; (8) Determine whether the percent of coordinators performing tasks varied according to the size of the school, the size of the community or the experience of the coordinator; (9) Determine what tasks were performed significantly differently by full-time coordinators as compared with coordinators of combination units; (10) Provide a base line of data which can subsequently be used in developing instruments to evaluate cooperative programs.

## Methodology

From this investigator's experience, a review of the literature, interviews with experienced coordinators and supervisors, a jury evaluation, and a pilot testing program, a task list was developed of the tasks which vocational cooperative coordinators were expected to perform on-the-job. These tasks were put into a questionnaire format which asked whether the coordinator performed the tasks, what relative time the coordinator spent performing the task, when the coordinator learned to do the task, ideally when the coordinator believed the task should have been learned, how important the coordinator believed the task was and whether or not the coordinator would use a teacher aide to assist in performing that task.

Background questions were also developed and included in the questionnaire to determine the demographic data concerning the coordinators who responded. However, no questions were asked which could be used to identify which respondent completed any particular questionnaire.

Through the cooperation of the seven state level program directors of the various vocational secondary programs, the questionnaire was administered during the inservice meetings held in the summer of 4977 by the Texas Education Agency. Of the 1510 questionnaires completed, 1412 were usable and provided the data for this study. Following a careful editing of each questionnaire, the data were keypunched on a magnetic tape by personnel of the Texas Department of Corrections, Wynne Unit, Huntsville, Texas.

The data were subjected to the following analyses. The question concerning the relative time spent was evaluated using the comprehensive data analysis program (CODAP) developed by Raymond Christal, Wayne Archer, and the staff at the Human Resources Laboratory, Lackland Air Force Base, San Antonio, Texas. The output of this program ranked each duty area and each task in each program area. This computer output is referred to as the job description (JOBDEC). Additional programs, (known as Overlap and Group (OVLGRP)) were run to identify commonalities in tasks performed by all coordinators.

A computer program was written to analyze the variance between when tasks were learned and ideally when tasks should be learned.

The coordinators' perceptions of the importance of the various tasks were subjected to analysis of variance to determine if there were differences among programs. A Scheffe's test determined whether or not differences existed among program areas in this regard.

A percentage of coordinators who would use a teacher aide to assist them in performing each task was calculated. The difference in the proportions of coordinators among program areas who would use a teacher aide was tested using the Chi Square statistic for each task.

Using the Statistical Analysis Systems (SAS) packages available at Texas A&M University, group differences were determined and the significance of these differences were evaluated between coordinators who worked in large schools vs. those who worked in small schools; those who worked in large communities vs. those who worked in small communities; coordinators with more experience vs. those with less experience; and coordinators who worked full time compared with coordinators of combination programs. Those tasks which were performed by a signifi-

cantly different percent of coordinators were rank ordered and evaluated.

In addition, background questions were analyzed to discover differences among programs and means of coordinators' responses regarding a the hours they are employed; the number of students they presently can accommodate in their cooperative program; the extent to which they can use a teacher aide if one were available; how well they believed they could perform as a cooperative teacher coordinator in each of the different program areas; how they divided their time among the teaching of individuals, small groups, or the entire class; how they felt their job utilized their occupational experience; how their certification training had helped them in their job performance; and the degree to which the in-service training received at the local, area, or state level had helped to improve their job performance.

Major Findings, Conclusions, Implications, and Recommendations

A summary of the major findings pertaining to each research guestion analyzed in this study is presented below along with conclusions, related implications, and recommendations for program action or for further research to answer unsolved questions.

Research Question 1: Which tasks should be included on a validated task list?

Findings. All of the 211 tasks listed in the questionnaire were performed by some coordinator-respondents. Seventy of the 1412 coordinators suggested additional tasks. After eliminating the duplications, 16 were identified that apparently would be appropriate for inclusion in any future list of tasks describing the job-of a secondary level cooperative coordinator.

Conclusions. The task list did adequately describe the job of a vecational cooperative coordinator even though 16 additional tasks were

identified in this study.

Implications. An analysis of the complexity and diversity of the tasks contained in the list implies that the job of a vocational cooperative coordinator is complex and demanding. The coordinator must not only have skills of a personnel manager, but those of a guidance counselor, a master teacher, a public relations person, a manager, a youth club leader, and a professional enthusiast. The coordinator's consistment to the total school program requires a willingness to participate in administrative duty assignments, especially in smaller schools.

Recommendations. It is recommended that, because of the variety and complexity of tasks to be performed by vocational cooperative coordinators, this task list be used in drawing up preservice competencies and selecting content for certification training courses. Also,
this list may be used to develop in service training for coordinators
presently on the job.

It is further recommended that future researchers consider including the 16 additional tasks and/or modified tasks with the objective of validating a more complete task list.

Research Question 2: What relative percent of time do coordinators spend doing the tasks they do?

Findings. An analysis of the data concerning the relative time coordinators spend performing the tasks they do revealed that 43% of their time was spent on three duty areas namely, 15% on clerical and record keeping, 14% on youth leadership activities, and 14% on out-of-class coordination activities. Thirty-two percent of the time was spent as follows: 9% selecting and placing students, 7% in guidance and counseling activities, 6% in program publicity, 5% doing administrative duty assignments, and 5% in professional development. The remaining 25% was spent as follows: 8% in planning lessons, 9% teaching the lessons and 8% evaluating the students.

It was also found that coordinators in some program areas performed certain tasks within duty areas a greater or lesser percent of time than all other coordinators. Ag coordinators varied measurably in seven of the 11 duty areas, CVAE coordinators in six instances, Home. Ec coordinatos in five cases, VOE and Health coordinators in two duty areas, and ICT coordinators in one duty area.

Conclusion. An examination of the individual duty areas would lead one to conclude that either the coordinator be well trained in clerical and record keeping duties or that a formalized structure be established to provide assistance in performing these clerical and record keeping duties, possibly in the form of a teacher aide as evidenced by data that will be presented later.

Implications. Although the relative time spent performing a task does not necessarily predict the degree of difficulty in learning to perform that task there are two duty areas which seem to merit the attention of curriculum developers. One, the high relative time spent performing duties in youth leadership activities seems to be somewhat out of proportion to the amount of time spent in some certification programs preparing teacher coordinators to conduct a youth leadership program. Two, although many coordinators are taught courses in selecting and placing students, few courses are taught in the techniques of guidance and counseling, an area in which coordinators not only spend a great deal of time but also consider somewhat important.

Recommendations. It is recommended that this task list, ordered in the relative time spent, be printed and distributed to teacher education institutions as a guideline as to what tasks vocational cooperative coordinators perform. Such a list might be valuable in helping prospective coordinators visualize how they are likely to be spending their time on the job.

Research Questions 3 and 4: What do coordinators perceive is the most appropriate setting in which to first learn a task? Are there differences among programs in coordinators' perceptions of which setting is ideally suited for learning to perform particular tasks?

Findings. On a composite of all coordinators from seven program areas examined in this study, considered by each duty area, the following pattern emerges. In clerical and record keeping duties, a higher than expected frequency of coordinators learned to perform the tasks they do on-the-job, whereas, a higher percentage of them feel/the appropriate place to learn to perform these tasks is in a certification course. In youth leadership activities, a higher than expected percentage of coordinators learned to perform those tasks on-the-job; however, it was not clear from the data as to what setting a composite of all coordinators felt would be the ideal setting in which to learn to perform youth leadership activity tasks. In out-of-class coordination activities, again, a higher than expected percentage of coordinators learned to-perform these activities on-the-job and felt that the ideal setting in which to learn these tasks would be in a certification course. In the classroom related activities of planning lessons, teaching lessons, and testing and evaluating students, coordinators generally learned to perform these tasks before they were hired and felt that this was the ideal time to learn to perform these tasks. In selecting and placing students, however, coordinators learned to do this on-the-job but again felt that this function should be learned in a certification course. A higher than expected percentage of coordinators warned to perform guidance and counseling tasks on-the-job but felt that this was a competency which should be learned before being hired. Many coordinators learned about program publicity on-the-job but many felt that this should be a preemployment competency.

In the area of administrative duty assignments and professional development, coordinators indicated these are ideally preservice competencies and should be acquired before being hired.

Overall, coordinators' perceptions about ideally when tasks should first be learned tended to favor the preservice settings of before be-

ing hired or certification courses. Coordinators also believed that the coordinator should have first learned most teaching skills before being hired.

Concerning differences among programs, coordinators tended to favor settings in which they first learned to perform each task, except the on-the-job setting which generally had the highest percentage of responses in the "when learned" category, and the in-service setting which had the lowest percentage in the "ideally when learned" category.

Conclusion. It is concluded that many coordinators perceived that they learned far too many competencies on-the-job, with the exception of Ag and Home Ec coordinators. Consequently, although this was not true of every program area, the data revealed that there were some program areas in which curriculum adjustments probably could be made.

<u>Implication</u>. This implies that if the coordinators' perceptions are accurate that there may be some program areas in which the teacher preparation curriculum needs to be modified.

Recommendation. It is recommended that teacher preparation programs in the State of Texas adopt a competency based curriculum using the list of tasks identified in this study as a guideline to the needs of beginning cooperative vocational coordinators.

Research Question 5: How important do coordinators believe are the tasks they perform?

Findings. A statistical analysis of the relationship between the relative time spent and the perceived importance of tasks performed by vocational cooperative coordinators in this study indicated that a high correlation existed (r = .66). This finding is contrary to the argument of some critics of the CODAP system of occupational analysis that relative time spent is no indication of the importance of tasks. When tasks were ranked according to coordinators' perceptions of importance, those tasks which appeared first on the list were tasks which involved

communications with students, employers and school administration personnel. Only one task was found to be unimportant by coordinators in all program areas, "Collect money for school pictures, annual, charities, lunchroom, étc." (K201).

<u>Conclusions</u>. Most tasks which coordinators perform are perceived by them to be important. Furthermore, there is a high correlation between relative time spent and perceived importance by coordinators who participated in this study. Additionally, it was concluded that tasks which coordinators believe are most important seem to be those requiring a high degree of communications skill.

<u>Implication</u>. The implication of this conclusion is that if the independent school district wishes to employ coordinators who are capable of performing the tasks which most vocational cooperative coordinators consider important they will seek applicants with a high degree of communication skill who can relate effectively to students, employers, other teachers, the school administrative staff, and the general public.

Recommendation. It is recommended that the staff of the Department of Occupational Education and Technology, Texas Education Agency, prepare guidelines by which local education agencies who are responsible for hiring vocational cooperative coordinators be informed of the emphasis on those tasks that are considered important by coordinators and encouraged to employ coordinators who have the competency to perform the tasks which are considered important.

Research Question 6: What percent of coordinators would have a teacher aide perform each task?

<u>Findings</u>. It was found that vocational cooperative coordinators who responded to this study would use a teacher aide to assist them in performing most of the tasks on this list. It was not found, however, to what degree a teacher aide would be used in performing each task.

For example, the investigator discovered that some coordinators would have a teacher aide assist in some of the tasks in teaching a lesson. It was not discovered whether the teacher would have the teacher aide teach the entire lesson, or simply pass out hand-out material, operate audiovisual equipment, or perform other activities.

It was clear, however, that the cooperative coordinators would use a teacher aide to perform many clerical and record-keeping tasks. By ranking the tasks from those which most cooperative coordinator-respondents would have a teacher aide assist them in performing to the tasks which the fewest coordinators would have a teacher aide assist them in performing, it was found that the tasks which ranked highest were those which were clerical and record-keeping in nature.

Conclusion. It is concluded that considering the high number of clerical and program management tasks suggested by a high percentage of coordinators, any teacher aide who is employed to assist vocational cooperative coordinators should have clerical skills as a preemployment competency.

Implications. Given the high correlation between the high relative time spent by vocational cooperative coordinators on clerical and program management tasks and the high ranking of clerical and record keeping tasks in which cooperative coordinators would use a teacher aide, it seems that a teacher aide with secretarial skills would be effectively utilized by many cooperative coordinators to assist them in performing many of the tasks which have been validated in this study.

Research Question 7: What percent of time did coordinators report they would use a teacher aide?

Findings. When only full-time coordinators were considered, the average percent of time respondents indicated they would use a teacher aide if one were available was found to be 39%. This ranged from a low of 27% of the time for a CVAE coordinator to a high of 44% of the

time for Home Ec coordinators. Some coordinators indicated that they would not use a teacher aide to assist them in performing tasks at all, while others indicated that they could use a teacher aide 100% of the time.

Conclusions. A teacher aide trained to perform the tasks for which vocational cooperative coordinators have suggested they would use a teacher aide, as reported in this study, would seem to be an effective innovation in the classroom. However, coordinators seem to indicate that, on the average, they would use a teacher aide only part of the time. It is, therefore, concluded that a teacher aide would be most effectively utilized if shared between two or three vocational cooperative coordinators if the aide were to be a full-time employee.

Implication. An implication arising is that if full-time teacher aides were employed in vocational cooperative education programs that their training should be such that they would be prepared to work in multiple program areas.

Research Question 8: What percent of coordinators could use a teacher aide in each program area?

Findings. From an analysis of coordinators' responses to the question, "To what extent could you use a teacher aide if one were available," the data revealed that 95% of the full-time Ag coordinators and Home Ec coordinators would use a teacher aide some of the time if one were available. Eighty-eight percent of the DE coordinators, 85% of the Health coordinators, and 84% of the VOE coordinators indicated they would use a teacher aide some of the time if one were available. Eighty-five percent of the ICT coordinators and 75% of the CVAE coordinators reported that they could use a teacher aide some of the time.

When only responses of those coordinators who indicated they could use a teacher aide half-time or more were evaluated, it was observed that 59% of the Home Ec coordinators, 53% of the VOE coordinators, 39% of the ICT coordinators, 48% of the DE coordinators, 44% of

the Ag coordinators, 41% of the Health coordinators and 28% of the CVAE coordinators would use a teacher aide half-time or more.

Conclusion. More than 75% of the full-time coordinators indicated they could use a teacher aide if one were available. However, a "difference among proportions" test revealed that coordinators in various program areas differed in the proportions of those who would use a teacher aide.

Implication. Not all coordinators expressed a desire for a teacher aide if one were available. Therefore, teacher aides should preferably be placed with coordinators who request the assistance of a teacher aide.

Recommendations. Considering the findings and implications of research questions six, seven, and eight above it is recommended that the Texas Education Agency, in cooperation with local education agencies, initiate a demonstration project which would place teacher aides in selected multiple unit cooperative vocational education programs. This demonstration project should hire, prepare, monitor, and evaluate the effectiveness of the teacher aide as an assistant to the vocational cooperative coordinator.

Research Question 9: To what degree do full-time coordinators perceive that the use of a teacher aide would result in an increase in enroll- ment?

Findings. It was found that the addition of a teacher aide to the vocational cooperative coordinator program would increase student membership an average of five students or 16%. It was not found, however, whether or not some coordinators perceived possibly that they would use a teacher; aide solely to improve the quality of their program without increasing the number of students because of the additional assistance that could be provided.

Conclusions. It was concluded that a teacher aide would increase the number of students which coordinators believed could be enrolled in their program. It was further concluded that the number of students who might be enrolled into program which utilizes the services of a teacher aide to assist a vecational cooperative coordinator not be the only criterion for evaluating the effectiveness of the teacher aide in the classroom. It is possible that even though some coordinators would not increase the number of students who were enrolled in their program that they might have perceived an increase in the quality of service which they offered to the students who were enrolled in their courses.

Since the quality of the vocational education offerings to students in the State of Texas may well be enhanced by the addition of a teacher aide to assist the cooperative coordinator in the performance of the tasks listed in this study, and since this factor was not investigated, it was further concluded that additional research on this particular question needs to be conducted.

Recommendation. If a demonstration project is established to evaluate the effectiveness of the teacher aide in the vocational cooperative program it behooves evaluators to assess not only the possible increase in the number of students enrolled but to examine the effect the teacher aide might have on the quality of the program, a factor not considered in this study.

Research Question 10: Do differences exist among program areas with respect to the percent of coordinators who would use a teacher aide to perform each task?

<u>Findings</u>. A "difference among proportions" statistical analysis of responses indicated that there were 75 tasks in which coordinators from various program areas differed with respect to the use of a teacher aide if one were available. However, in only 35 of those 75 tasks did more than 20% of the coordinators express a desire to have a teacher aide assist them in performing those tasks.

Conclusion. With no existing model to guide coordinator-respondents as to what tasks a teacher aide might perform, it is understandable that there would be some difference, among coordinators as to what tasks a teacher aide might do: It is, therefore, concluded that there are, in fact, differences among program areas.

Recommendation. If in the future it is determined that differences among program areas with respect to what tasks a teacher aide might perform need to be eliminated, it is recommended that any training program which is developed to prepare teacher aides to work with vocational cooperative coordinators take into account those tasks which coordinators have expressed a desire to have teacher aides assist them in performing. Part of such a training program should involve those coordinators who will be working with a teacher aide.

Research Question 11: What tasks are in common and where do differences lie with respect to various program areas as related to teacher preparation?

Findings. Although differences were found in program areas, a statistically high degree of commonality existed among program areas in the duty areas and tasks which coordinators perform. Using Kendall's coefficient of concordance, no statistical difference could be discovered among programs either in the performance of duty areas or in the performance of individual tasks among program areas. Using a hierarchical grouping program of CODAP, (OVLGRP) which clustered coordinators according to the commonality of time spent performing tasks, no program area emerged as being unique in the tasks coordinators performed.

Conclusions. It is concluded that generally, "a coordinator is a coordinator, is a coordinator" with reference to the tasks performed as listed in this study. It is further concluded, that those differences which exist are related to the structure of the youth leadership clubs and the preservice and certification requirements as examined in

other research questions in this study and not to the relative time spent performing the tasks examined.

Implications. The implications arising from the question. findings, and conclusions are several. First, while it may seem that given the appropriate preservice competencies coordinators might be permitted to become certified in more than one program area by completing a certification course in any of the program areas, it should be remembered that beginning coordinators who enroll in certification courses seem to be more comfortable when the teacher educator uses examples, in class, related to the students' occupational experience. For example, in a class taught by a teacher educator with an agricultural background, examples in his lessons which dealt only with agricultural cooperative program problems might miss the point if Health and Home Ec coordinators were among the class members.

Research Question 12: Are tasks performed by teachers significantly different when set in large schools or small schools, large communities or small communities, or performed by coordinators with differing amounts of experience?

Findings. The findings for large schools vs. small schools and large communities vs. small communities have been grouped here because of the similarity of the findings, conclusions, implications and recommendations which follow. The findings pertaining to the differing amounts of experience possessed by coordinators and the tasks they perform follow on page 123.

It was observed from the data that coordinators who were working in large schools or large communities performed tasks which indicated the necessity for a more formalized record keeping and communication network. On the other hand, less formalized communication structures and record keeping seemed to be appropriate to coordinators in small schools and small communities. However, in the small schools and smaller communities it was discovered that administrators were utilizing coordinators to perform tasks which the investigator regarded as

administrative duty assignments and which were not directly related to the coordinators' primary job function.

Conclusion. Coordinators in large schools and large communities as opposed to coordinators in small schools and small communities do in fact place a different emphasis on the tasks they perform in the role they perform as a vocational cooperative coordinator due to the setting in which they work.

Implications. The implications of the findings regarding this research question are two-fold. First, evaluators of vocational cooperative programs need to be aware of the differences which exist between large schools and large communities or small schools and small communities concerning the type of tasks coordinators perform. Although this study did not concern itself directly with evaluation it is proposed that evaluators could use a list of tasks performed, the relative time spent on the tasks, and the perceived importance of the tasks as a basis of conducting evaluations of the cooperative programs. If, in doing so, evaluators were to follow rigid criteria without considering the differences which might exist between large schools and communities and small schools and communities, they possibly could improperly judge some programs to be either more or less effective than those programs might be in fact.

A second implication is addressed to administrators. There may be administrators of vocational programs who are not aware of the variety of tasks and the amount of time that it takes to perform properly the job of a vocational cooperative coordinators. This may especially be true in small schools and small communities as evidenced by the number of administrative duty assignments given to vocational cooperative coordinators. If further study demonstrates that administrators are not aware of the complexity and time spent performing tasks by vocational cooperative coordinators, it then behooves program planners to assist administrators in improving their awareness so that a coordinator's time can be more effectively used in serving needs of students who they teach instead of the schools for which they work.

Recommendations. Two recommendations are being made regarding the role of a vocational cooperative coordinator in large schools and large communities as opposed to small schools and small communities. The first is that when and if validated evaluative criteria are developed pertaining to the competency of vocational cooperative coordinators that consideration be given to differences between those working in large and those working in small schools and communities. Secondly, in so far as it is within the capabilities of the Department of Occupational Educational Technology of the Texas Education Agency to provide input into the training of administrators, every opportunity should be taken to help these administrators better understand the somewhat differing tasks performed by vocational cooperative coordinators in large and small school settings.

<u>Findings</u>. Coordinators with four or more years experience were discovered to be performing 30 tasks significantly different from coordinators with one, two, or three years experience.

Coordinators with more experience seemed to be performing tasks which involved greater personal contact with former students, advisory committee members, business and industry people. They seemed to conduct their follow-up by personal visits; they gave talks to community groups; and in general performed coordinator activities which involved persons outside of their classroom or the school. Whereas, when looking at the tasks which coordinators with less experience perform more frequently, we see that generally these tasks involve communication with students and activities within the classroom settings.

Conclusion. It could not be determined from the data gathered in this study why this shift in tasks performed between coordinators with four or more years experience and coordinators with one, two, or three years experience occurred.

Recommendation. It is recommended that further study be conducted

to discover whether or not this shift in the percent of coordinators performing tasks according to varying amounts of experience has implications for curriculum developers of teacher preparation courses or evaluators of vocational cooperative education programs:

Research Question 13: What differences exist between the tasks performed by full-time coordinators as compared with coordinators of combination units?

findings. Seventy tasks were found to be performed significantly differently between full-time coordinators and other coordinators of vocational cooperative programs in this study. An analysis of the different types of tasks reveals that a greater percentage of full-time coordinators perform tasks which relate to formalized record keeping and coordinator visits to persons other than students in their class-room. A greater percent of full-time coordinators also seem to use a greater variety of teaching techniques in the classroom. On the other hand, a greater percentage of other coordinators perform tasks which are generally observed to be in the area of administrative duty assignments and youth leadership activities. The full-time coordinators seem to perform tasks not unlike coordinators in large schools and large communities whereas combination coordinators seem to perform tasks like coordinators in small communities and small schools.

Conclusions. It is concluded by analyzing tasks which are performed to a significantly different degree between full-time coordinators and coordinators of combination units that the full-time coordinator is committed to a greater variety of activities and that this greater variety of activities occurs in a greater variety of settings both within and outside of the school. On the other hand, coordinators of combination units seem to be oriented to in-school and classroom type activities, possibly because of being more "tied down" to teaching other classes.

Implications. The implication of these findings and conclusions

is that if the appropriate role of the cooperative coordinator is an external role which extends beyond the classroom then the full-time co ordinators are performing more of these tasks than the combination coordinator and therefore are better fulfilling the expected role of the cooperative coordinator in a vocational program. If this can be accepted and if it can also be accepted that, in fact, the tasks performed by a vocational cooperative program coordinator are in common across all program areas and that "a coordinator, is a coordinator, is a coordinator," then if may be logical to expect that more effective programs could be developed in small schools and small communities by combining the cooperative portion of combination programs into multioccupational programs in which each multi-occupational coordinator would have enrollments sufficient to permit that person to be employed as a full-time coordinator. However, the question of whether or not coordinators would have credibility with students and employers if they came from an occupational background which varied from the occupations of the students whom they were teaching was not answered by this study.

Recommendations. It is recommended that the multi-occupational programs underway in the State of Texas be continued and expanded where such programs can be shown to meet the needs of the students seeking cooperative vocational education experience provided that preemployment laboratory and existing cooperative education programs are not jeopardized by the addition of such multi-occupational programs and provided that the coordinators involved have the occupational experience which enhances their credibility.

Additional Findings, Conclusions, Implications and Recommendations

Number of Hours Per Week Coordinators Spend Performing Tasks.

Findings. Coordinators reported that they spent an average of 45 hours and 21 minutes per week performing the tasks in their job. Although some coordinators reported spending as low as 15 hours per week'

others claimed to be spending 99 hours per week. A confidence interval computed about the mean was found to extend from 42 hours and 54 minutes to 47 hours and 54 minutes.

Implications. The above findings imply that the average coordinator is working a number of hours that would be considered evertime in many occupations. However, from the experience of this investigator it seems that there are some people who believe that coordinators do not work as much, or as long, or as hard as the regular classroom teacher. If this investigator's experience is typical, and if further study reveals that the typical coordinator does work as long as other classroom teachers, the implication is that it may become necessary for coordinators to be more communicative with others concerning the amount of time they spent performing tasks and the variety of tasks which are performed on their job in order to correct this misconception.

Recommendations. It is recommended that information concerning the average number of hours coordinators perceived to be spending working on vocational cooperative coordinator tasks be disseminated to both the general public and the school administration personnel through the Texas Education Agency, teacher education institutions, and professional organizations of cooperative coordinators.

Coordinators' Perception of Job Performance in Their Own and Other Areas

Findings. There was no significant variance in how well vocational cooperative coordinators perceived they could perform as a.co-operative coordinator in the program areas in which they were presently employed. However, when coordinators were asked how well they could coordinate in programs other than their own it was observed that co-ordinators felt they could perform "acceptably" or better on a 5-point scale of "very well", "well", "poorly" or "would not try in the less technical areas such as CVAE, ICT, or Multi-Occupations programs where more diversified skills are represented. But in the more technically specific areas of Health, VOE, Home Ec, and Ag the coordinators in

most program areas believed that they would perform "poorly" or would not try to coordinate at all in those areas. It was also observed that the coordinators from all program areas believed they could perform "acceptably" or better working as a multi-occupational coordinator.

\*Conclusions. It is concluded that coordinators believe they can coordinate in a multi-occupational setting with acceptable or better effectiveness but not in the areas characterized by a single field or specialized "discipline."

Since there are vocational cooperative coordinators working in Texas at this time who believe they could function acceptably as a multi≔occupational coordinator, an implication arises that an experimental program might be established in a variety of small in 🕰 dependent school districts throughout the state where coordinators who wish to do so would be permitted to enroll students from occupational areas other than the primary area in which the coordinator was certified to work. For example, some small communities have a combination Ag program as the only cooperative vocational education in the school. It could possibly accrue to the benefit of students in that community if the Ag coordinator were permitted to enroll in his cooperative program students whose employment was in an area other than an approved agricultural occupation. In this case Ag coordinators would be credited with the total number of cooperative students for whom they Also, to the extent that conflicts with student organizational constitutions and bylaws did not exist, students could be permitted full participation in leadership activities, in this case, in the F.F.A.

Distribution of Teaching Time Among Individuals, Small Groups, and Entire Class

Findings. With the exception of Vocational Office Education, vocational cooperative coordinators reported spending more time teaching the entire class and less time teaching small groups and/or individuals. Implications. If the coordinator is spending his time teaching the entire class primarily, it seems to this investigator that two things might be happening. Either the coordinator is teaching life coping skills which are common to all students or the coordinator is teaching fundamental skills within the occupational area which may not directly address the occupational needs of the students who are working in the variety of jobs represented in the classroom.

One of the underlying principles of cooperative education is that students will learn the technical skills related to their specific occupations through individual study of the technical material necessary to perform in that occupation. It seems to this investigator that if this is in fact being done in cooperative classrooms that it is not reflected to a high degree. Is it possible that teachers are finding that this instructional approach doesn't work; or can't they use this approach effectively? In any event, we don't know why this apparent emphasis on teaching the entire class occurs.

However, the investigator did not define what was meant by "in-dividual" study, or "small groups", or the "entire class". Therefore, it may be possible that varying perceptions in the meaning of these particular teaching styles could account for a variance in coordinator responses from what is in fact happening in the classroom. For example, one VOE coordinator who assigns typing exercises to the entire class may feel that this is in fact teaching the entire class whereas, another VOE coordinator who assigns typing exercises to the entire class may feel that this is teaching individuals due to the fact that each individual is working at their own pace.

Recommendation. If upon further investigation it is found that most vocational cooperative coordinators do in fact spend more time teaching the entire class than in working with small groups or individuals, and if it can be proven that this is not a sound practice, it is recommended that in preparing vocational cooperative coordinators to teach in the classroom that greater attention needs to be paid to the importance and techniques of teaching individuals the technical content relating to their particular occupation while group

instruction techniques needs to be reserved for what some have called "general job skills" or "life coping skills."

Perceptions of the Value of Certification Training

Findings. On the average coordinators from all programs areas but Health believed that their certification training helped them perform their job, as measured on a 5-point scale, either "very well" or "perfectly." Health coordinators responded by giving certification training a rating of "some," "very well," or "perfectly," in their perception of how well their certification training helped them in performing their job. The investigator noted, however, that there seemed to be an inverse relationship between the number of years of occupational experience possessed other than teaching, and the rating that certification training was given in preparing people to be a coordinator.

Conclusion. It is concluded that the newer the number of years of occupational experience that a coordinator has before receiving certification training the more that person may feel the necessity of the type of training that present certification courses provide.

Recommendation. It is recommended that further study be conducted to consider the question of whether or not the number of years of occupational experience possessed by coordinators requires that different types of certification training by provided for individuals preparing to become vocational cooperative coordinators.

Perceptions of the Value of In-Service Training

Findings. It was observed that in-service training programs conducted at the district, area, or state level for vocational coordinators were rated by them as improving their job performance "very well" or "perfectly" in Ag, CVAE, Home Ec, and VOE. Some improvement in job performance was indicated by coordinators in DE, Health, and ICT. Inservice training programs at the local level received the lowest

ratings among the different levels. VOE coordinators rated local inservice programs as improving job performance "very little" while Ag, CVAE, DE, Health, Home Ec, and ICT coordinators indicated that local in-service programs provided only "some" help.

<u>Conclusion</u>. Local in-service training activities are not meeting the needs of vocational cooperative coordinators in the State of Texas as they perceive it.

<u>Implication</u>. In view of the above conclusion, planners of vocational in-service programs at the local level should be made aware of the perceived needs of vocational cooperative coordinators.

## Concluding Statement

From the data gathered in this study it was found that vocational cooperative coordinates in several program areas spend an average of 45 hours a wear performing 211 widely varying tasks which are unique to this educational setting. Many of these tasks have been learned by coordinators while on the job. Coordinators feel that many of those tasks should be required either as preservice competencies or that competencies to perform those tasks should be developed in certification programs. This investigator believes that such certification programs should be competency based on the tasks which have been validated in this study. Furthermore, an evaluation process should be developed to insure that all coordinators completing a certification program be competent in performing each task that needs to be performed.

It is believed further, by this investigator, that the use of teacher aides in cooperative vocational programs is an innovation whose time has come. It is further believed that the core of an effective training program can be designed to prepare teacher aides using the data obtained in this study.

This investigator recognizes the validity of the claim that "a coordinator is a coordinator, is a coordinator" and performs similar professional tasks regardless of the program area in which that

coordinator is serving. However, it is <u>not</u> proposed that all vocational cooperative secondary education programs areas come under one umbrella but only that in small towns and/or small schools which have a limited number of students requesting enrollment in the separate program areas that these students be combined and be permitted to enroll in a multi-occupational program providing for them a full-time cooperative coordinator and a greater opportunity for diversification in the occupational preparation. Finally, the reader is cautioned to remember that this study dealt only with the professional tasks engaged in by the vocational cooperative coordinator and not with the technical subject matter of all occupations approved for cooperative education by the different program areas.
