ABSTRACT

Selected characteristics of the Spanish origin population (Mexican American, Puerto Bican, Cutan, Central cr Scuth American, and other Sparish) and labor force in the United States are presented in this chartbook, compiled from the Earch 1976 Current Population Survey. Divided into four sections, the charticck locks at the size and composition of the labor force and labor force participation rates; characteristics of the unemploy€d and their unemployment rates; 1975 work experience (weeks worked and incidence of unemployment) and earnings received; and family income and powerty. Three appendices contain technical notes, definitions of terms, and a statistical table for each chart. Buch of the data in the four sections and one appendix are cross-classified by sex, family relationship, school years completed, and other demographic and social characteristics. Data indicate that rerecns of Spanish origin make up 5% of the total population, 4% of the civilian labor force, 6% of the unemployed, 2% of the later force with four or more years of college, 12% of the labor force with eight or less years of school, 2% of workers in professional or technical occupations, and 7% of those in semiskilled jobs. Twelve percent of all families in powerty are headed by Spanish-origin persons. (RS)

Workers of Spanish Origin: A Chartbook

Family Head Data

While the family data in this report were assembled by the traditional procedures for identifying a "head" for every family—with the male in husband-wife families being automatically classified as the head—the Bureau of Labor Statistics has recently changed this practice. In light of current social trends, the Bureau no longer designates any person as the "head" in husband-wife families and publishes a large body of data on persons in the family. However, this chartbook was prepared and in production before the adoption of this change. Publication is being made in the traditional format in order to avoid a long delay in the release of material which has been in great demand.

Preface

This chartbook focuses on selected characteristics of the Spanish-American population and labor force. Many of the charts include data on two specific groups of Spanish origin. Mexican Americans and Puerto Ricans. Although most Americans of Spanish origin are white (about 96 percent), they may be of any race. Their numbers are included in the appropriate comparative data shown for whites and blacks. In this bulletin, the category "Spanish origin" refers to persons of Spanish origin or descent as defined in appendix B.

The chartbook is divided into four sections. Part I looks at the size and composition of the labor force and at labor force participation rates. Part II portrays characteristics of the unemployed and their unemployment rates. Part III covers work experience in 1975 (weeks worked, whether usually full- or part-time employment and incidence of unemployment) and the earnings received during the year. Part IV presents data on family income and on poverty. Three appendixes include technical notes, definitions of terms, and a statistical table for each chart. Many of the data presented in the four sections and in appendix C are cross-classified by sex, family relationship, years of school completed, and other demographic and social characteristics.

This bulletin was prepared by Earl F. Mellor of the Office of Current Employment Analysis, under the guidance of Janice N. Hedges. Bernardine Finstad contributed to the statistical work, and Daniel Glazer provided compilations of unpublished data from Current Population Survey files for March 1976.

Material in this publication is in the public domain and may be reproduced without permission of the Federal Government. Please credit the Bureau of Labor Statistics and cite the name and number of the publication.

Part I Labor Force

ERIC - 2 flank

Chart 1.
Population and Labor Force, by Spanish Origin, March 1976

Persons of Spanish origin are 5 percent of the total population and 4 percent of the civilian labor force. More than half of the population and labor force of Spanish origin is of Mexican origin or descent.

U.S. Population 211,140,000

Labor Force 93,063,000

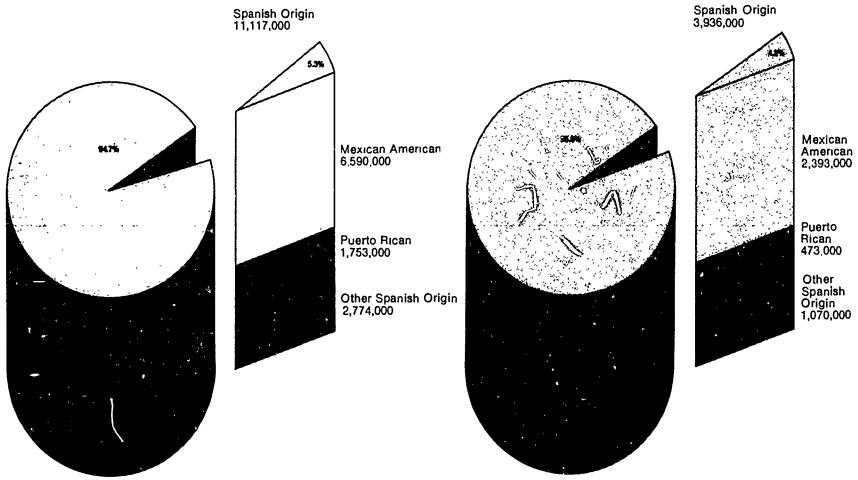

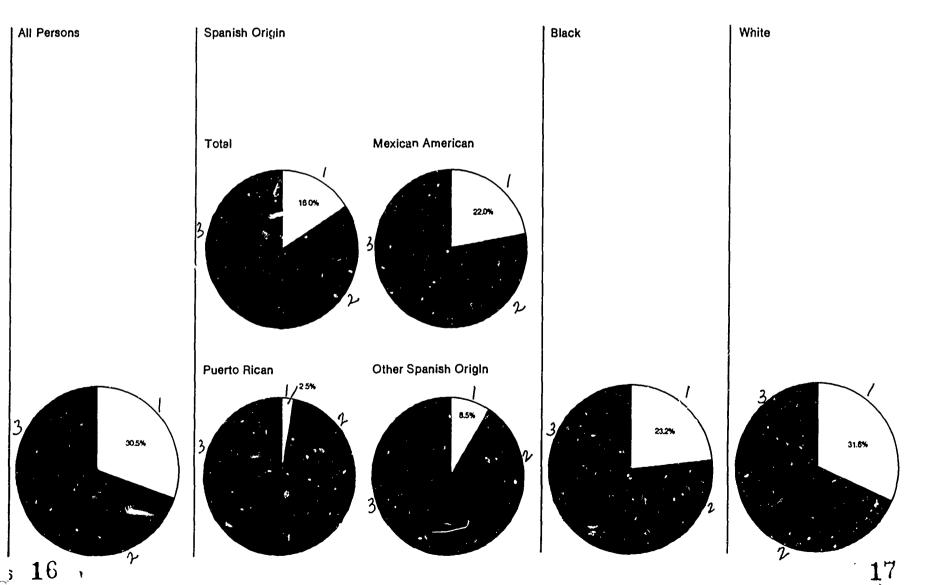

Chart 2.
Residence of the Labor Force, by Spanish Origin and Race, March 197'

Members of the labor force of Spanish origin are much more likely than the overall labor force to reside in the central cities of metropolitan areas. This is particularly true of Puerto Ricans.

Nonmetropolitan 1

Metropolitan:
Suburbs 2

Central Cities 3

ERIC

Chart 3.

Age of the Labor Force, by Spanish Origin and Race, March 1976

Workers of Spanish origin tend to be younger than other workers.

16 to 24 years 25 to 44 years 45 to 64 years 🔏 🕹 65 years and over

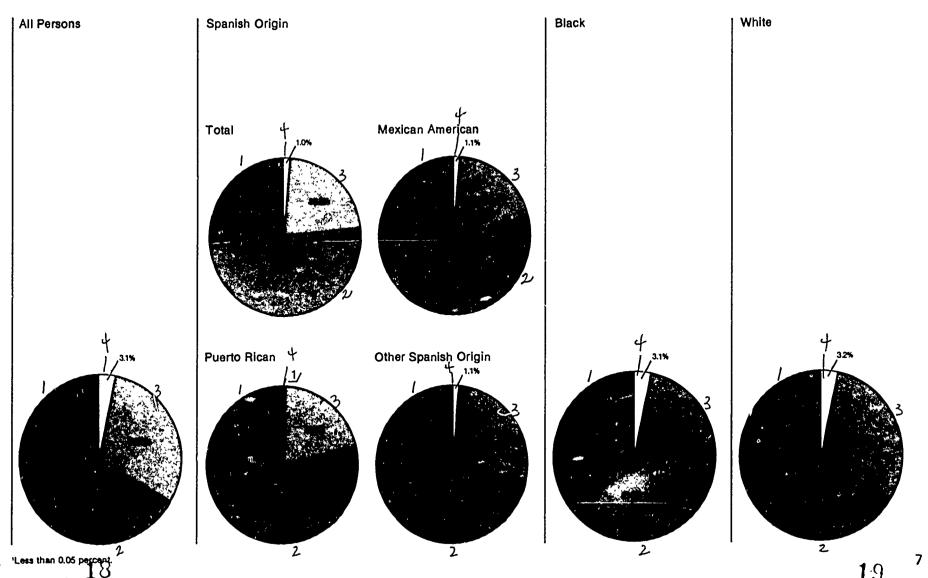

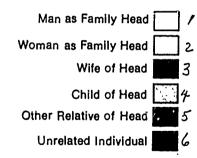

Chart 4.
Family Status of Labor Force Participants, by Spanish Origin and Race, March 1976

The distribution by family status of members of the labor force of Spanish origin is similar to that of the total labor force. About half are family heads.

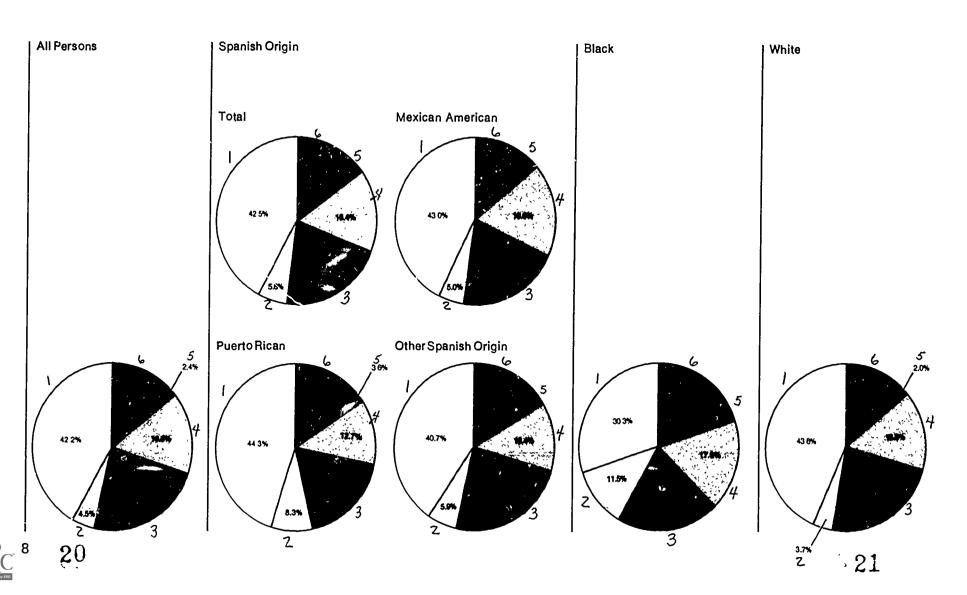

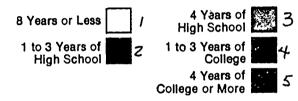

Chart 5. Years of School Completed by Labor Force Participants, by Spanish Origin and Race, March 1976

Workers of Spanish origin as a group have completed fewer years of school than other workers.

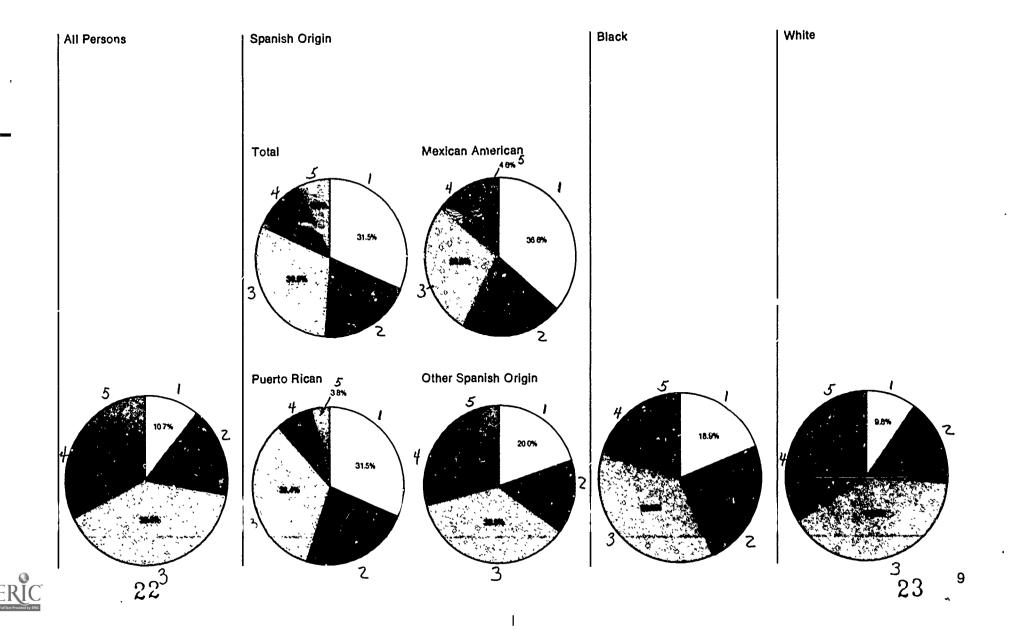

Chart 6. Labor Force Participation Rates, by Sex, and Spanish Origin and Race, March 1976

Men of Spanish origin are as likely as all men to be in the labor force. Among women, however, those of Spanish origin are less likely to be in the labor force.

Part II Unemployment

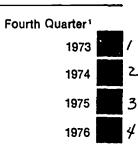

Chart 10. Unemployment Rates, by Spanish Origin and Race, Fourth Quarter 1973-78

The unemployment rate of persons of Spanish origin, as for all persons, fluctuates with the state of the economy. The rate for workers of Spanish origin,

however, is consistently higher than that of the overall population, although lower than that of blacks.

Chart 11. Unemployed Persons, by Age, and Spanish Origin and Race, March 1976

Youth 16 to 24 years old account for two-fifths of the unemployed persons of Spanish origin—about the same proportion as among all the unemployed.

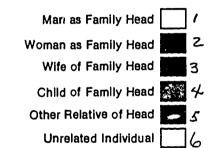

ERIC

Chart 12. Family Status of the Unemployed, by Spanish Origin and Race, March 1976

Of almost one-half million persons of Spanish origin who were unemployed in March 1976, about one-third were family heads. One-quarter were wives.

1 T

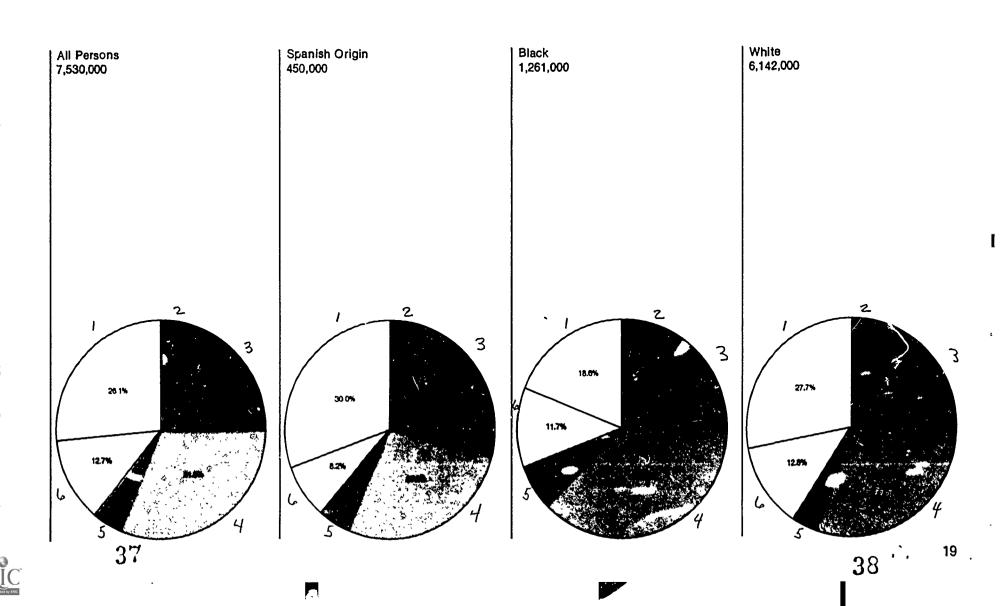

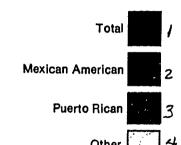

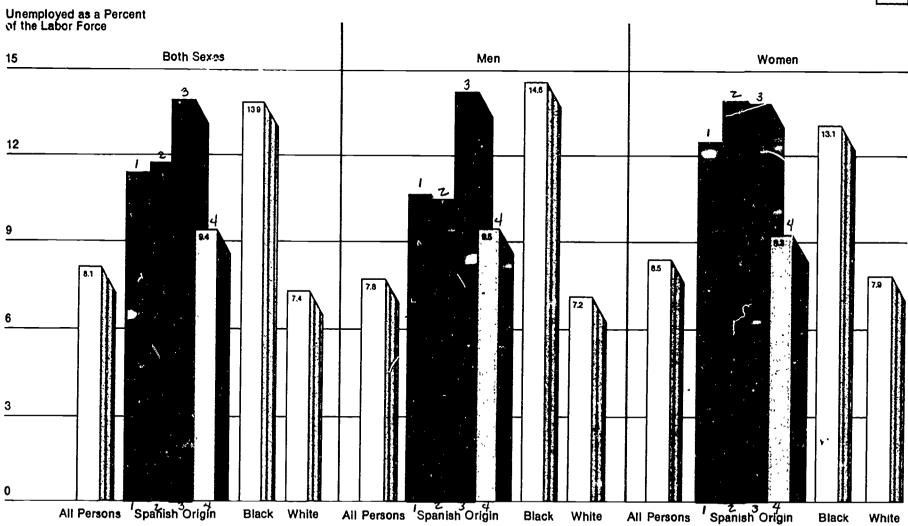

Chart 13. Unemployment Rates, by Sex, and Spanish Origin and Race, March 1976

Men and women of Spanish origin have lower unemployment rates on average than black men and women. Puerto Ricans, however, are about as likely as blacks to be jobless.

20

39:

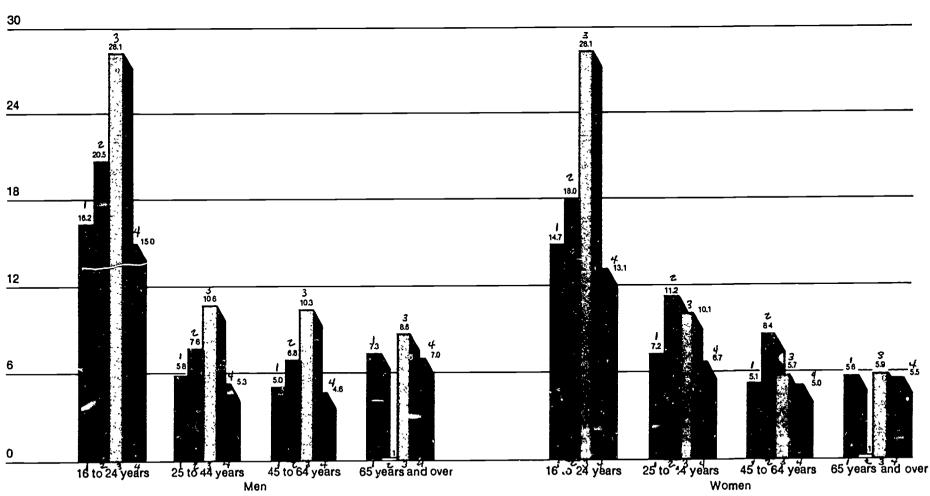

One in five youths of Spanish origin is jobless. As in other population groups, the unemployment rate for those 16 to 24 years of age is two to three times higher than for other age groups.

'Rate not shown because base (labor force) is less than 75 thousand.

42

Chart 15. Unemployment Rates of Family Heads, Wives, and Unrelated Individuals, by Sex, and Spanish Origin and Race, March 1976

Among family heads, the unemploy-ment rate for men of Spanish origin in March 1976 was 8.1 percent—higher than that for all men. The rate for women of Spanish origin was about the same as for all women.

Women

Unemployed as a Percent of Labor Force

16

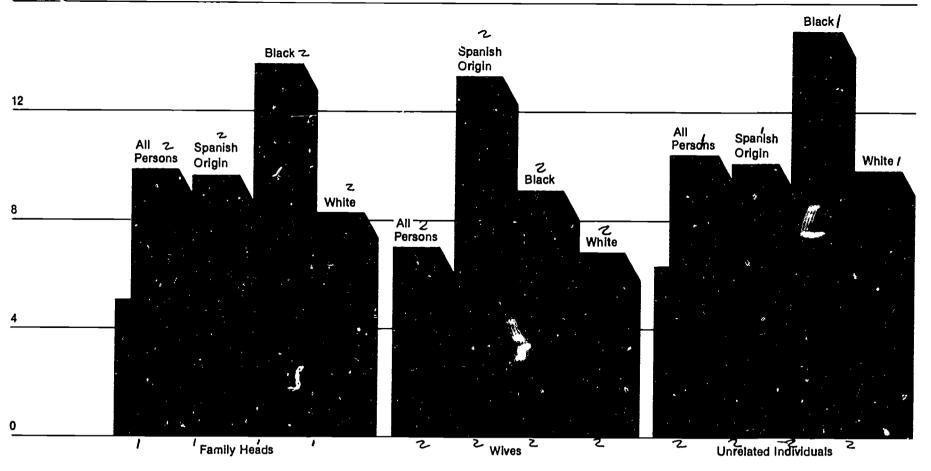

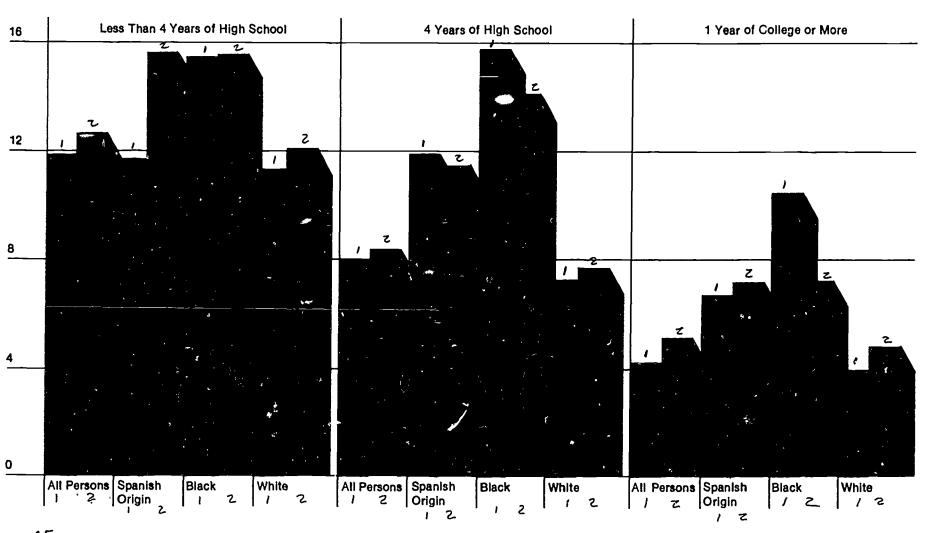

Chart 16. Unemployment Rates, by Years of School Completed, Sex, and Spanish Origin and Race, March 1976

Persons of Spanish origin, as well as all persons, who have completed 1 year of college or more have substantially lower unemployment rates than those who have not finished high school.

Unemployed as a Percent of the Labor Force

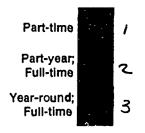

Part III Work Experience and Earnings

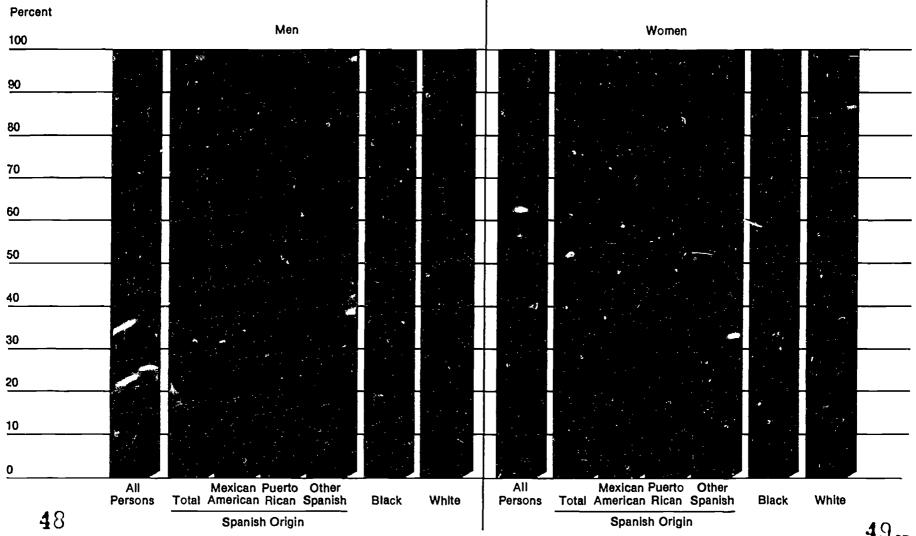

Chart 17. Work Experience in 1975 by Sex, and Spanish Origin and Race

Three-fifths of the men of Spanish origin who held jobs in 1975 worked year round, full time. For women of Spanish origin, the comparable proportion was about two-fifths.

Note: A year-round worker is one who worked 50 to 52 weeks in 1975; a part-year wc $^{-}$ x is one who worked 1 to 49 weeks. Dage 26 blank.

Chart 18. Year-round, Full-time Work Experience In 1975 of Family Heads, by Sex, and Spanish Origin and Race

Among family heads who worked in 1975, men of Spanish origin were tess likely than all men to have worked year round, full time. Women of Spanish

origin who worked in 1975 were as likely as all women to have worked year round, full time.

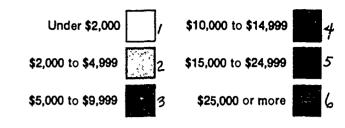

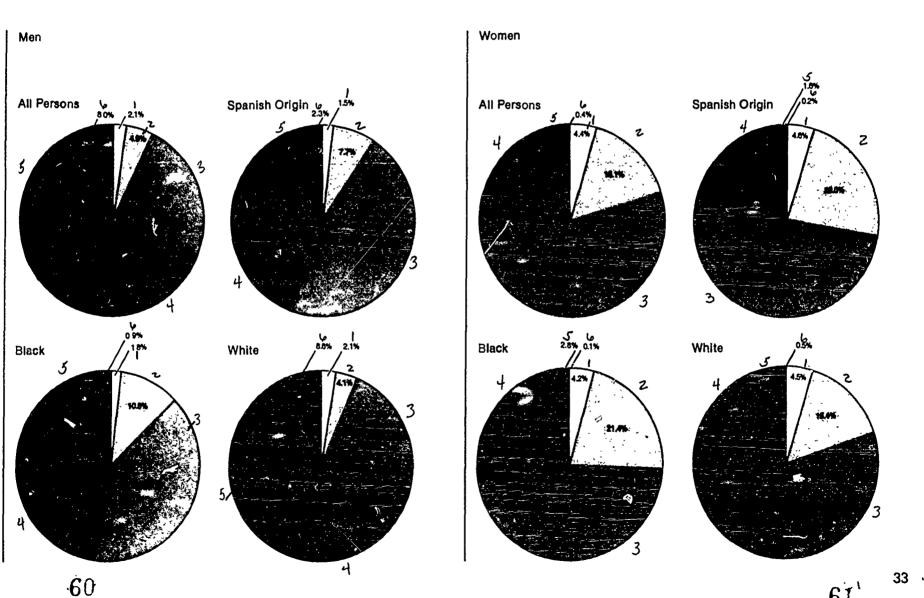

Chart 22B.
Distribution of Annual Earnings of Persons Who Worked Year round, Full time in 1975, by Sex, and Spanish Origin and Race

About 16 percent of the men of Spanish origin, but only 2 percent of the women, earned \$15,000 or more for year-round, full-time work in 1975. Among all year-

round, full-time workers, about 35 percent of the men and 5 percent of the women had 1975 earnings of \$15,000 or more.

ERIC

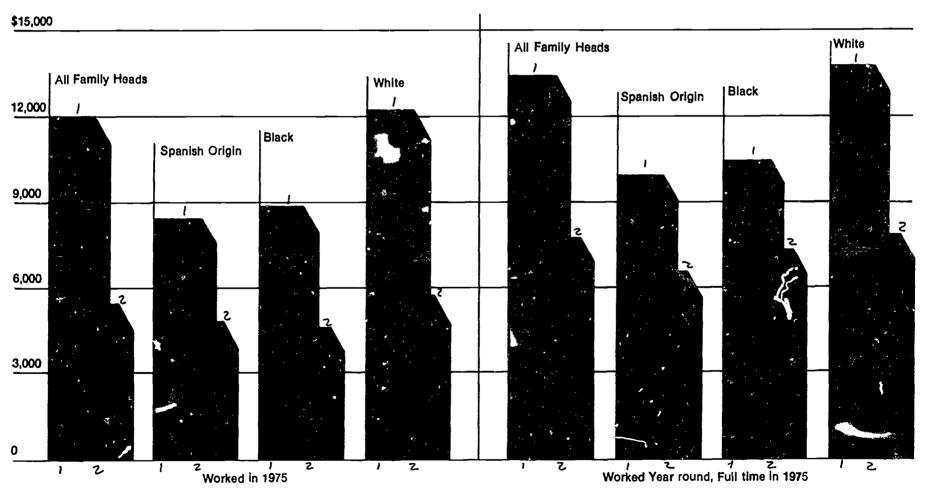

Chart 23. Median Annual Earnings of Family Heads, by Work Experience in 1975, Sex, and Spanish Origin and Race

Among family heads who worked in 1975, men of Spanish origin earned less than black men, while women of Spanish origin and black women had about the same earnings. Among family

heads who worked year round, full time in 1975, both men and women of Spanish origin had earnings below their black counterparts.

Median Earnings

62

Chart 24. Median Annual Earnings of Persons Who Worked Year round, Full time in 1975, by Years of School Completed, Sex, and Spanish Origin and Race

Among workers of Spanish origin, as among all workers, earnings for year round, full time work increased with more years of school completed. Earnings of both men and women of

Spanish origin with some college education were about three-fifths greater than the earnings of those who did not finish high school.

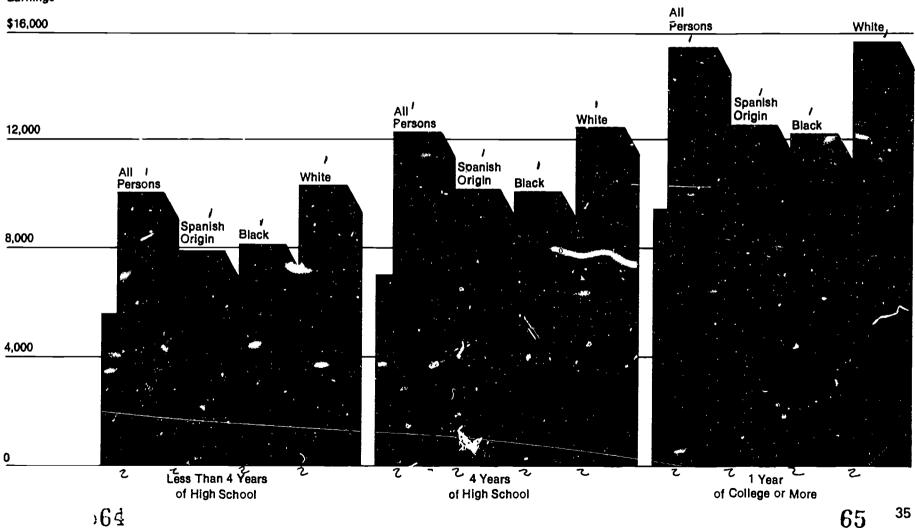

Chart 25.
Earnings of Family Heads and Wives as a Percent of 1975 Family Income, by Sex, and Spanish Origin and Race

The earnings of the family head accounted for about two-thirds of 1975 family income in families with a male head of Spanish origin and in all families with a male head. In

husband-wife families of Spanish origin, the earnings of wives accounted for about one-sixth of aggregate family income. All Persons

Chart 30. Persons with Income Below Poverty Level in 1975, by Work Experience, and Spanish Origin and Race

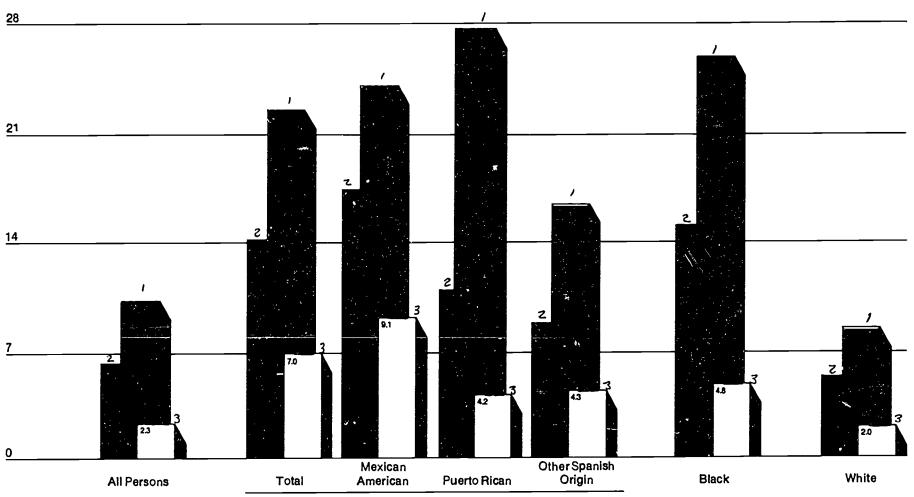

Persons of Spanish origin 16 years old and over were about twice as likely as all persons, and almost as likely as blacks, to be in poverty in 1975. Among

79

those who worked in 1975, the incidence of poverty among persons of Spanish origin was about the same as that among their black counterparts.

Percent Below Poverty Level

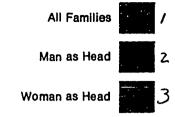

Spanish Origin

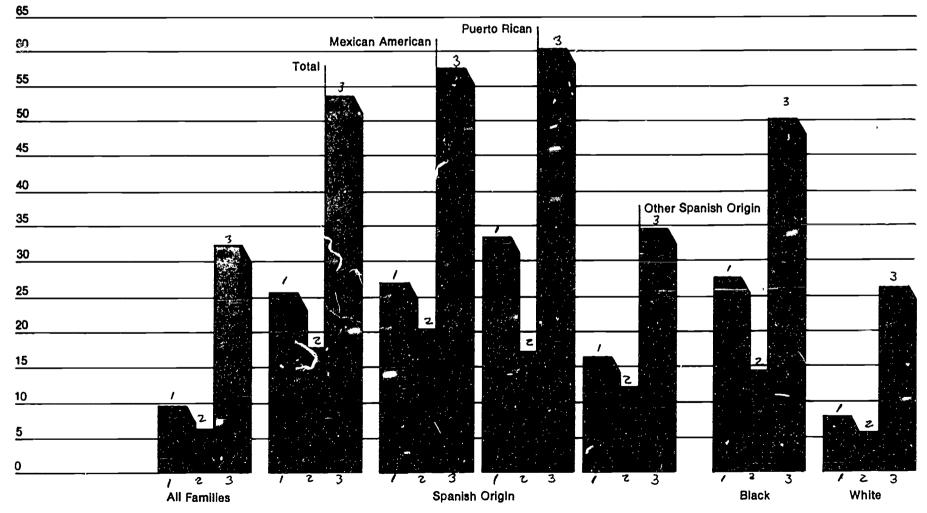

Chart 31. Percent of Families with 1975 Income Below the Poverty Level, by Sex, and Spenish Origin and Race of Family Head

Families with heads of Spanish origin were two-and-a-half times as likely as all families to be in poverty in 1975.

Families with heads of Puerto Rican origin had a higher poverty rate than black families.

Appendixes Technical Notes and Source Tables

F

Appendix A. Source, Coverage, and Limitations of the Data

Source and coverage

The tables in appendix C present all data contained in the preceding charts and, in many cases, additional information. Unless otherwise noted, data refer to the civilian noninstitutional population 16 years old and over, and are tabulated from the March 1976 Current Population Survey (CPS).

The CPS is conducted monthly for the Bureau of Labor Statistics by the Bureau of the Census. The households in the survey are located in 461 sample areas comprising 923 counties and independent cities, with coverage In every State and the District of Columbia. About 55,000 housing units or other living quarters are assigned for interview each month, and about 47,000 of them, containing about 100,000 persons 16 years old and over, are occupled by households eligible for interview. Of these units, about 3 to 5 percent are not interveiwed in a given month because the residents are not found at home after repeated calls, are temporarily absent, or are otherwise unavailable for interview. In all, about 45,000 households are interviewed each month.

The basic monthly survey provides statistics on the labor force, employment and unemployment, and on persons not in the labor force, and are published monthly by the Bureau of Labor Statistics in *Employment and Earnings*. In selected months, the basic survey is supplemented by additional inquiries designed to provide more detailed statistics of economic and other activity. Each March there are supplemental questions on work experience (number of weeks worked, whether part- or full-time, weeks of

unemployment, and other items pertaining to the previous year), marital and family characteristics; years of school completed, and income, including its components such as earnings. Many of the data derived from the March CPS are published by the Bureau of Labor Statistics in Special Labor Force Reports and by the Bureau of the Census in Current Population Reports.

Limitations of the data

All data are based on the sample survey (except as noted in table C-1), and thus may be different from those that would be obtained from a 100-percent enumeration. In addition, all data are subject to the errors in response, enumeration, and processing typical of any survey. The standard error measures the variations that occur by chance because the sample may not be completely representative of the universe. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error and about 99 out of 100 that it would be less than 2/2 times the standard error. All statements of comparison appearing in the charts and in the text are significant at the 90-percent level (1.6 standard errors or more). The tests of significance for statements in this builetin utilize tables and formulas provided by the Bureau of the Census, some of which are published in Current Population Reports, Employment and Earnings, and Special Labor Force Reports.

If other factors are held constant, the size of the standard error is inversely related to the number of households sampled for any one group, thus, standard errors for CPS data on the Puerto Rican population are relatively larger than those for all persons of Spanish origin, which in turn, tend to be larger than those for blacks, whites, or all persons. Because of this relationship, an apparent difference between persons of Spanish origin and all persons or whites may be statistically significant, yet a larger apparent difference between Puerto Ricans and all persons of Spanish origin, or another group, may not be statistically significant. Thus the user of this bulletin is cautioned against drawing conclusions from relatively small differences between numbers shown in the charts or tables. Because of the relatively large standard errors associated with small numbers, percentages or medians derived from a base of less than 75,000 are not shown.3

Calculating standard errors. Standard errors of estimated numbers (x) are derived from the following formula:

$$\sigma(x) = \sqrt{(a) x^2 + (b) x}$$

in which x is the size of the estimate and (a) and (b) are parameters associated with a particular characteristic.

Standard errors of estimated percentages (p), computed by using sample data for both numerator and denominator, are derived from the following formula.

$$\sigma(y, p) = \sqrt{\frac{(b) p (1-p)}{y}}$$

ERIC

Arull text Provided by ERIC

page 48 Glank.

in which y is the base of the percentage (the denominator), p is the percentage expressed as a decimal (e.g., 10.5 percent = .105), and (b) is the parameter associated with the particular characteristics of the numerator.

Table A-1 provides values of the (a) and (b) parameters that are associated with most of the characteristics and population groups covered in this bulletin. These parameters depend on the sample size, the sample design, and estimation procedures, and they are subject to change. In addition, the (a) parameter may vary among different age groups and by whether data are for both sexes together or for men and women separately. Since nearly all comparisons in this bulletin are based on percentages (which require only the (b) parameter in the calculation of the standard error), the detail

of table A-1 is limited. Additional information on the calculation of standard errors and examples of their calculation, including those of medians, are provided in the publications cited at the bottom of table A-1.

¹ The Bureau of Labor Statistics prepares Special Labor Force Reports and other publications using May CPS supplemental data (usual weekly earnings, multiple jobholders, and work schedules) and October CPS supplemental data (characteristics of students, graduates, and school dropouts). See BLS Report 456, Directory of Labor Force Studies Based on the Current Population Survey for a detailed insting of BLS publications utilizing data from the CPS. For additional information on the Current Populations

110

iation Survey and on definitions of terms, see BLS Report 463, Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey, a joint publication of BLS and the Bureau of the Census.

³ Because the sampling rate of the Spanish origin population in the March survey is about twice that of other months, standard errors for this population group from months other than March are about 30 percent higher than those from March data.

³Some of the percentages shown in the charts and tables, primarily labor force participation rates and unemployment rates, were calculated from unrounded numbers and may differ slightly from the rates which would be obtained by calculating them from the rounded numbers which appear in the tables.

values for x and y are not in thousands—the full number must be used.

A When comparing percentages, is a the parameters which pertain to the characteristic in the summerstors of the percentages. Example, if the compenson is between the percent of high school graduates with earnings of \$10,000 or more and the percent of high school graduates with aarnings of less than \$5,000, the parameter for earnings would be used rather than that for education, isowever, if the companson is between persons with four years of college as a percent of all persons with earnings of \$10,000 or more, and high school dropouts as a percent of all persons with earnings of \$10,000 or more, the parameter for education yould be used rather than that for earnings.

When comparing estimates (numbers) of different characteristics from cross-tabulations, use the parameters which have the largest (b). Example: if a comparison is between the number of employed high school graduates and the number of unemployed high school graduates, the parameters for education would be used rather than the parameters of amployment and unemployment.

51

ľ.,

³ Because the sampling rate of the Spanish origin population in March is about twice that of other months, the Spanish origin parameters in this table should be used only for March data. Standard errors for other months at about 30 percent larger.

^{*}The parameters for familias should be used for items which can typically appear only once in a given noveled or family, e.g., family income, earnings of family haad, earnings of wife, poverty status of unrelated individuals.

^{*}Values of all racus, white, and black, by age and sax ara not estimates from the Current Population Survey but are obtained from Independent sources. These values have no sampling error associated with them.

Appendix B. Definitions of Terms

Demographic and social characteristics

Age. The age classification is based upon a person's age at last birthday.

Family. The term "family" as used here refers to a group of two persons or more, related by blood. marriage, or adoption, and residing together; such persons are counted as members of one family. One person in each family is designated as the "head". usually the person who is regarded as the head by members of the family. Married women are not classified as heads if their husbands are living with them at the time of the survey. A lodger and his wife who are not related to the head of the family or a resident employee whose wife lives with him are considered a separate family. However, a married couple or parent-child group related to the head of the family and sharing his ming quarters (a subfamily) is treated not as a separate family but as part of the head's family. Persons not in families are classified as unrelated individuals.

Race. In the Current Population Survey, the population is divided into three groups on the basis of race: white, black, and "other". Data for races other than white or black are not shown in this bulletin. Race is determined by observation of the interviewer.

Spanish origin or descent. Identification of persons of Spanish origin or descent was obtained from responses to the CPS question shown in figure 1.

Persons who reported themselves as Mexican-American, Chicano, Mexican, or Mexicano (items 10-13) were consolidated into the one category Mexican-American. Persons who reported themselves as Puerto Rican (item 14) were classified separately. Those who chose Cuban, Central or South American, or "Other Spanish" (items 15-17) were consolidated into the category "Other Spanish". In the questionnaire "Other Spanish" (item 17) includes persons whose origin or descent is from Span and those of mixed Spanish origin or descent.

Cl	ORIGIN FLASHCARD RRENT POPULATION SURVEY

Years of school completed. Data on years of school completed were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), coileges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force and employment status

Employed in March 1976. Employed persons are all those who during the survey week, (a) did any work at all as paid employees in their own business or profession, on their own farm, or as unpaid workers working 15 hours or more in an enterprise operated by a member of the family; or (b) did not work but had jobs or businesses from which they were tem-

52

90.:

Nearly all male family heads are husbands in husband-wife families; most female family heads are mothers living with their children (and no husband present). The procedures for identifying family heads were devised many years ago and do not reflect current social trends. These procedures are in the process of being revised. For example, the Bureau of Labor Statistics no longer designates any person as the head in husband-wife families. However, this chartbook was prepared prior to the adoption of this change. For a comprehensive discussion of the definition and limitations of the family head concept and the efforts of the Bureau of Labor Statistics to present more relevant data, see Janet L. Norwood, "New Approaches to Statistics on the Family," Monthly Labor Review, July 1977, pp 31-34. Also see box on Inside front cover of this chartbook.

porarily absent because of illness, bad weather, vacation, labor-management dispute, or other personal reasons, whether or not they were paid by their employers for the time off, and whether or not they were seeking other jobs.

Unemployed in March 1976. Unemployed persons are all those who did not work during the survey week, made specific efforts to find a job within the preceding 4 weeks, and were available for work during the survey week or would have been available except for temporary illness. Also included as unemployed are those who did not work at all, were available for work, and (a) were waiting to be called back to a job from which they had been laid off, or (b) were waiting to report to a new wage or salary job within 30 days.

Labor force in March 1976. The labor force comprises all civilian persons classified as employed or unemployed according to the above definitions.

Not in labor force in March 1976. Persons not classified as employed or unemployed are defined as not in the labor force. Persons doing only incidental unpaid family work (less than 15 hours a week) are also classified as not in the labor force.

Work experience

Work experience. Persons with work experience in 1975 are those who worked as cilivians at any time during the year at full- or part-time jobs.

Part-time and full-time jobs. Respondents are asked how many hours they usually worked per week during 1975. They are classified as having worked at full-time jobs if they worked 35 hours or more per week in a majority of the weeks worked during the year; respondents are classified as having worked a part-time job if they worked 1 to 34 hours per week in a majority of the weeks worked during the year.

Incidence of unemployment in 1975. The proportion of the work force unemployed at some time during the year represents the incidence of unemployment.

Year-round full-time workers. Year-round full-time workers are persons who worked primarily at full-time jobs for 50 weeks or more in 1975.

Part-year workers. Part-year workers are persons who worked either full time or part time for 1 to 49 weeks in 1975.

Longest job. A person's longest job during the year is the one which was held for the greatest number of weeks. For most wage and salary workers, a job is defined as all the time worked for the same employer. The only exception is work for private families (domestic service, babysitting, odd jobs, and the like) which is counted as a single job regardless of number of employers. Self-employment and unpaid work in family-operated enterprises are also designated as jobs for purposes of this survey.

Occupation. The data on occupation refer to the job held for the longest period of time during the year. Persons who held two jobs or more are reported in the job at which they worked the greatest number of weeks.

Earnings, income, and poverty

Earnings. Earnings consist of income from the following sources: (1) Money wages or salary received for work performed as an employee during the income year. This category includes wages, salary, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc. (2) Net income from nonfarm self-employment—gross receipts minus expenses from one's own business, professional enterprise, or partnership. (3) Net income from tarm self-employment—gross receipts minus operating expenses from the operation of a farm by a

person on his or her own account, as an owner, renter, or sharecropper

Income. Data on income are limited to money income received before payments for personal income taxes and deductions for social security, union dues, Medicare, etc. Money income is the sum of the amounts received from earnings; social security and public assistance payments; dividends, interest, and rent, unemployment and workers' compensation; government and private employee pensions; and other periodic income. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that many families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing: that many farm families receive nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney income is also received by some nonfarm residents which often takes the form of the use of business transportation and facilities, full or partial payment by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. Underreporting tends to be more pronounced for income sources that are not derived from earnings, such as social security, public assistance, and net income from interest, dividends, rentals, etc. Overall, income earned from wages or salaries is much better reported than other sources of income and is nearly equal to independently derived administrative sources. By contrast, 1973 income data on social security and public assistance payments to beneficiaries equaled approximately 89 and 75 percent, respectively, of independently derived estimates.

Poverty. Families and unrelated individuals are classified as being above or below the poverty level using the poverty index adopted by a Federal Inter-

agency Committee in 1969 This index is based on the Department of Agriculture's 1961 Economy Food Plan and reflects the different consumption requirements of families based on their size and composition, sex and age of the family head, and farmnonfarm residence It was determined from the Department of Agriculture's 1955 survey of food consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the economy food plan For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher in order to

compensate for the relatively larger fixed expenses of these smaller households.

Weighted average thresholds at the poverty level. The poverty cutoffs used by the Bureau of the Census to determine the poverty status of families and unrelated individuals consist of a set of 124 thresholds arranged in a four-dimensional matrix consisting of family size (from one person, i.e., an unrelated individual, to a seven-or-more-person family) cross-classified by presence and number of family members under 18 years old (from no children present to six or more children present), sex of head, and farm-nonfarm residence. Unrelated in-

dividuals and two-person families are further differentiated by age of head (under 65 years and 65 years and over). The total family income of each family in the sample is tested against the appropriate dollar threshold to determine the poverty status of that family. If the family's total income is less than its corresponding cutoff, the family is classified as below the poverty level.

The poverty thresholds are updated every year to reflect changes in the Consumer Price Index (CPI)? Thus, the average poverty threshold for a nonfarm family of four was \$5,500 in 1975, about 9 percent higher than the comparable 1974 cutoff of \$5,038.

¹ Family heads in March 1976.

.123

³The earnings of each family head are compared to the poverty theshold for his or her family (see footnote 2, table C-30). The fact that a working family head has earnings below the poverty level does not necessarily indicate that the family's total income is below the poverty threshold as there may be other earners in the family and/or one or more family members may receive "unearned" income.

³ Percent not shown because of base of percentage is less than 75,000.
