#### ABSTRACT

Part of a series which offers educational resources and teaching techniques related to major social issues to high school social studies teachers, the booklet describes and reproduces a test measuring students' economic literacy. Part I'is the test manual, which explains the objectives, value, development, and two-form structure of the test it uses a content-cognitive schema which. covers seven content categories (basic economic problems, economic systems, microeconomics, macroeconomics, world economy, economic institutions, and evaluation concepts), and two cognitive-level categorizations: one measuring student learning levels in terms of knowledge, comprehension, application, analysis, and evaluation; the. other in terms of recognition-understanding, simple application, and complex application. The booklet presents five suggestions for use of the test; instructions for how to administer and score it, and details technical data such as standardization and norms, norm tables, item analysis, reliability, validity, correlation with general ability, and additional descriptive statistics. Part II consists of an explanation of the 72 questions in Form A and Form B. Each question and its four possible answers are reproduced, with the correct answer appearing in bold type. Other items include a rationale for each answer, and numbers recording the percentage of the norm with the correct answer (with and without economics backgroupdy and the discrimination coefficient. Appendices list the schools that participated in the test norming, handscoring keys, and an answer sheet. (CK)

Discussion Guide and Rationale

By John C. Soper

Joint Council on Economic Education

#### ABOUT THE AUTHOR

John C. Soper, at the time of completion of the TEL project, was senior economist and acting director of programs for the Joint Council on leave from Northern Illinois University, where he is an associate professor of economics. During 1977-78 he served as interim executive director of the Illinois Council on Economic Education, and from 1972-78 he was the director of the Center, for Economic Education at Northern Illinois University. He has also taught economics at the University of Missouri (Columbia), Central Michigan University, The University of Michigan, and the University of Massachusetts, Amherstathe has published widely in economics and economic education, and is a member of more than fifteen professional organizations. He received his Ph.D. in economics from the University of Massachusetts, Amherst, in 1970.

## THE DEVELOPMENT OF THE TEST

In 1961, the National Task Force on Economic Educati tion released its report, Economic Education in the Schools, a detailed and objective outline of basis economic concepts for use in the nation's schools.)

Epollowing the release of the Task Force report, a void was perceived in the library of economic education materials, namely, an appropriate instrument to measure the economic knowledge of high school students. As a result, the Test of Economic Understanding (TEU) was developed in 1964 through the efforts of the Joint Council on Economic Education.2 The primary purpose of the TEU was to help school systems assess gains in economic knowledge by the. use of a standardized, nationally normed instrument. The test served this function adequately for a number of years. In addition, the TEU became one of the first tools available to test economic knowledge in experimental settings. It thereby fostered the development of a substantial body of research in the field of economic education.

In 1977, the Joint Council on Economic Education released the first major update of the work of the National Task Force: the Master Curriculum Guide for the Nation's Schools, part I, A Framework for Teaching Economics: Basic Concepts.3 This document was designed to specify an optimum base of economic knowledge for the typical high school graduate. The Framework is not an attempt to provide detailed guidelines of how to teach economics in school systems; it is rather, designed to spell out the basic structure of the discipline of economics in a relatively. brigf compass. Part II of the Master Gurriculum Guide (MCG) project is a five-volume series of gradespecific strategies to carry out economic education in the schools.⁴

Correurent with the Master Curriculum Guide project, the Joint Council on Economic Education moved ahead with the development of a substantive revision of the outdated Test of Economic Understanding, which culminated in the present publication, the Test of Economic Literacy (TEL). This two-form test provides school systems with an updated evalua-Non instrument and researchers with an updated set of tests for use in experimental settings. -

The TEL project began in the spring of 1976 with the formation of a National Advisory Committee. 5 A working committee, composed of economic educators, economists, and high school teachers, was also

Strategies for Teaching Economics: Primary Level (Grades 1-3); Intermediate Level (Grades 4-6); Basic Business and Consumer Education; U.S. History, and World Studies. The first two have been published and the last three, for the secondary level, are forthcoming in 1979.

The National Advisory Committee consisted of the following

G. L. Bach, Stanford University William E. Becker Jr., University of Minnesota James D. Calderwood, University of Southern California George G. Dawson, Empire State College-State University of New York W. Lee Hansen, University of Wisconsin-Madison Robert V. Horton, Purdue University Darrell R. Lewis, University of Minnesota Clayton Millington, Oklahoma State University

Donald W. Paden, University of Illinois Phillip Saunders, Indiana University S. Stowell Symmes, Joint Council on Economic Education

Arthur L. Welsh, Joint Council on Economic Education

<sup>1.</sup> Economic Education in the Schools \ ; a Report of the National Task Force on Economic Education, September, 1961 (New York: Committee for Economic Development,

Test of Economic Understanding (Chicago: Science Research Associates, Inc., 1964).

<sup>3.</sup> New York: Joint Council on Economic Education, 1977.

formed. The working committee first analyzed the old Test of Economic Understanding to specify what it contained in terms of economic concepts as well as the cognitive levels of the test items. This analysis facilitated the subsequent development of a new matrix for the TEL in which each question was categorized by content level (according to the Master Curriculum Guide Framework) and a set of cognitive levels (corresponding to a modification of Bloom's taxonomy). This content-cognitive schema is discussed in Section 2, below. The analysis of the TEU also indicated that a large number of questions could be used in the new instruments with little or no change. In addition, the new matrix for the TEL also pointed up a number of areas in which questions would have to be either drawn from other testing instruments or constructed anew. ,

In the summer of 1976, the TEL Working Committee assembled to write new questions for the TEL, and to flesh out the particulars of the test matrix in line with a sét of guidelines provided by members of the National Advisory Committee for the TEL. The exact content weights-in terms of economic concepts-were determined after close consultation with W. Lee Hansen, chairman of the Framework Committee of the Master Curriculum Guide project. Trial administrations of the first version of the TEL were conducted in a series of teacher-training workshops at Northern Illinois University in the late summer of 1976. At roughly the same time, the first version of the TEL was administered to several classes then studying the principles of economics at NIU. Based on these first trials of the test, a number of revisions were introduced in order to remove what were statistically identified as poor questions by the outcome of an item analysis of the test results.

working committee in several large high school districts in Illinois. Again, based on the statistical analysis of this trial administration, a number of revisions were introduced to I clean up" poor items. Two more trial versions of the test were constructed during the fall semester of 1976, each one leading to marginal improvements in the discrimination power of individual test items and the overall reliability of the test instruments. By January 1977, the test was ready for final checking by the National Advisory Committee, and based on the reactions of this committee, a fifth and final two-form (46 questions each) version was prepared for norming purposes.

Norming activities were carried on in the spring of 1977, using a large cross section of the nation's high schools selected on the basis of a stratified random sample. A listing of the schools that participated in the national norming is contained in Appendix A. The results of that norming are contained in Section 6, below.

The primary value of the TEL should lie in its ability. to help assess student understanding of the basic economic concepts that it is essential for them to know to effectively fill their present and future roles as consumers, workers, and voters. If the test is administered before and after a course of economics instruction, the test should be a useful aid in the evaluation of curriculum content and teaching methods. For preand post-testing purposes, two equivalent forms of the TEL are available, A and B, having 46 items each. When the period of economics instruction is shorter than a quarter or semester, pre- and post-testing should be conducted using alternate forms to preclude distortions in results because students "remember" the pretest at the time of the second testing.

## 6. The TEL Working Committee consisted of the following individuals:

## 2. THE STRUCTURE OF THE TEST

The economic content of the Test of Economic Literacy is based upon the Master Curriculum Guide Framework. The test questions are broken down in seven distinct content categories:

- A. The basic economic problem
- B. Economic systems
- Microeconomics: resource allocation and income distribution
- D. Macroeconomics: economic stability and growth
- E. The world economy
- F. Economic institutions
- G. Concepts for evaluating economic actions and policies

William C. Braman, economics teacher, Lake Forest High School, District 115, Lake Forest, Illinois

William Carlson, economics teacher, Rockford Charter School District 205, Rockford, Illinois

Michael A. MacDowell, former executive director, Illinois Council on Economic Education, DeKalb, Illinois; now president of the JCEE.

John S. Morton, economics and political science teacher, Homewood-Flossmoor High School District 233, Flossmoor, Illinois

Peter R. Senn, professor of economics and social science, Chicago City College (Wright Campus), Chicago, Illinois

John C. Soper, associate professor of economics, Northern Illinois University, DeKalb, Illinois

In addition, the TEL working committee had the benefit of special assistance from W-Lee Hansen, Arthur L. Welsh, and Darrell R. Lewis 1 the preparation of draft test instruments.

Benjamin S. Bloom, ed., Taxonomy of Educational Objectives, The Classification of Educational Goals, Handbook 1: Cognitive Domain (New York: McKay, 1956).

' In addition, a number of questions on the 📆 🗟 involve one or more of the seven "statistical concepts" listed in the MCG Framework. However, these questions also test knowledge of the "content categories" listed above. In general, pach question involving a "statistical concept" has at least one corresponding question testing the same "content" category" without the "statistical concepts." Thus, the teacher should be able to determine if the student has trouble with the "math" or the "economics" by comparison scoring of the appropriate questions. Table 1 lists the detailed content categories for the TEL

The TEL is also broken down according to a five-level schema of cognitive taxonomy. This set of cognitive levels is a variant of Bloom's taxonomy. In Bloom's original work, six taxonomic levels or categories were identifiéd: knowledge; comprehension; application, analysis, synthesis, and evaluation. In the TEL cognitive taxonomy, Bloom's synthesis level has been omitted, on the presumption that little or no synthesis is called for in the typical high school coulse or unit on economics. The working committee felt that the remaining five levels provide an adequate breakdown of the learning levels that dould and should be broached in the typical high school economics course or unit. Table 2 displays this five-level cognitive taxonomy for the TEL.

The overall specifications of the TEL are contained in Table 3, a matrix that breaks down each item of each form of the test by content and cognitive categories. Table 4 contains a summary TEL matrix, categorizing the test according to both cognitive levels as determined by the TEL five-level categories and the three-level breakdown used to categorize questions on the Test of Understanding in College Economics (TUCE). The TUCE cognitive categories were identified as' (1) recognition-understanding, (2) simple application, and (3) complex application. Those familiar with the TUCE categories will note the lack of overlap between the two cognitive-level categoriza-

The classification of a particular test item according to a single economic content category or a clear-cut

cognitive level (either based upon the modified Bloom taxonomy or TUCE level) is often somewhat arbitrary. Thus, any individual surveying the test matrix might well disagree with the determination of the working committee for any given item. However, it was the judgment of the working committee that the content and cognitive levels finally adopted best reflected, the actual structure of the TEL. With regard to the economic content tested by the two forms of the TEN Table 4 indicates the working committee's interpretation of the National Advisory Committee's guidelines as to what ought to be tested. In other words, the optimal content weights for the TEL were determined

### TABLE 1: Content Categories for the TEL

#### The Basic Economic Problem

- .Economic wants
- 26 Productive resources
- Scarcity and choices,
- Apportunity costs and trade-offs
- Marginalism and equilibrium

#### **Economic Systems**

- Nature and hes of economic systems
- Economic incentives: ..
- Specialization, comparative advantage, and the division of labor
- Voluntary exchange
- 10 Interdependence
- Government intervention and regulation

#### Microeconomics: Resource Allocation and Income Distribution

- 12 Markets, supply and demand
- 13 The price mechanism
- Competition and market structure 14
- "Market failures": information costs, resource im-15 mobility, externalities, etc.
- Income distribution and government redistribution

## Macroeconomics: Economic Stability and Growth

- Aggregate supply and productive capacity 17
- 18 Aggregate demand: unemployment and inflation
- Real and money income, price level changes 19
- 20 Meney and monetary policy
- Fiscal policy: taxes, expenditures, and transfers 21
- 22 Economic growth
- Saving, Investment, and productivity 23

#### E. The World Economy

International economics

#### **Economic Institutions**

#### Concepts for Evaluating Economic Actions and Policies

Economic goals: freedom, economic efficiency, equalty security, price stability, full employment, and growth

Trade-offs among goals

Test of Understanding in College Economics (New York: The

Pscyhological Corporation, 1968)

"Recognition Inderstanding" (RU) questions are those that could, in principle, be answered by reference to a textbook. Such questions need not be answerable by rote memory, but can and should test understanding or comprehension rather than simple recall. A "simple application" (SA) question involves the application of a principle or concept when its use is specified or clearly implied. A "complex application." (CA) question requires that the student demonstrate ability to select and utilize a concept of principle when its use is not specified. A CA duestion may also be one in which two or more concepts or principles must be related in some manner not previously presented to the students.

TABLE 2: Five-Level Cognitive, Taxonomy for the Test of Economic Literacy

| Level                    | Objective  | Operative Verbs 1   | Emphasis  |
|--------------------------|--|---|---|
| Knowledge                | To show that the student knows   | list, recall, remember, tell, define, identify, label, locate, recognize  | recognition and recall—ability to<br>remember facts in a form close to<br>the way they were first presented                                   |
| (I)<br>Comprehension     | To show that the student understands   | explain, illustrate, describe,<br>summarize, interpret, expand,<br>convert, measure, understand,<br>franslate, extrapolate,                         | grasp the meaning and intent of information—ability to tell or translate in own words   |
| Application              | To show that the student can use what is learned   | demonstrate, apply, use, construct,<br>find solutions, collect information,<br>perform, solve, use abstractions, (<br>choose appropriate procedures | use of information—ability to apply learning to new situations and real-life circumstances  |
| IV<br>Analysis           | To show that the student perceives andican pick out the most important points in material            | analyze debate differentiate,<br>generalize, conclude, distinguish<br>organize, determine   | reasoning—ability to break down<br>information into component parts<br>and to detect relationships of one<br>part to another and to the whole |
| <b>V</b> *<br>Evaluation | To show that the student can judge and evaluate ideas, information, solutions, procedures, and goals | compare, decide, judge; evaluate, condlude, contrast, appraise, develop criteria  | criteria or standards for evaluation<br>and judgment—ability to make<br>judgments based on criteria or<br>standards                           |

Source: Adapted from Sally R. Campbell, Consumer Education in an Age of Adaptation (Chicago: Sears, Roebuck, 1971).

p. 10.

This is actually the sixth level of Bloom's original taxonomy. We decided to delete the fifth level ("Synthesis") from the original schema, as it does not appear to fit in with what is normally taught in the economics classroom. In Bloom's formulation, the emphasis in the "synthesis" category is on originality and creativity.

TABLE 3: Overall Specifications for the TEL

| #1                                       |                      |                        |                                       | Form A                  |       |            |       | 4                                     |                      |                             | Form B          |            |              |       |

on the basis of consultation with members of the National Advisory Committee (in particular with W. Lee Hansen). The extent to which the working committee was able to find of to write test items that adequately reflected this optimal test structure is a completely different question, and is, of course, open to critical comment by reviewers and users of the test instruments.

### 3. Use of the Test

### To Measure Student Knowledge

The Test of Economic Literacy was designed primarily to aid teachers in evaluating and improving the quality of high school economics teaching. There are several ways in which it can be used to achieve that objective.

#### In Pretests

The TEL can be administered as a pretest at the outset of a unit of instruction or at the beginning of a

semester to assess the students prior knowledge of economic concepts. This is becoming more and more important to high school teachers because many school systems have inserted instruction in economics—sometimes only on a limited basis well below the high school grades. If pre-high school economics instruction has been effective, many students will already have acquired some knowledge of economic ideas. Thus, the wise high school teacher will want to know the students areas of strength and weakness, so that the teacher can balance the course's content appropriately.

To determine areas of students' relative strength or weakness in economic knowledge, teachers can compare the scores of their students with the national scotes for each test item. The relevant national scores for comparison with prefests are those listed in the Discussion Guide in Part II for students "without economics." Small differences between scores reported for a given question in this manual and those obtained in the classroom should not be emphasized. However, certain kinds/of comparisons may prove useful. For instance, if the average score of tudents on the test as a whole is as good or better than the national scores, significantly lower scores on selected items may indicate areas of economics the teacher may wish to emphasize in subsequent teaching. The Discussion Guide provides a brief rationale for each guestion, and teachers might want to examine those before deciding whether the particular concept tested deserves greater attention in the classroom. If still in doubt, the teacher should refer to the relevant pages of the MCG Framework.

In addition to comparing pretest scores by item, teachers can group their students' responses by the content and/or cognitive categories discussed in Section 2, above. This will enable the teacher to compare scores in several different areas of economic content or levels of cognition. For example, the scores of students in a given class can be compared with national scores in content categories such as economic systems or macroeconomics or in cognitive categories such as application or analysis. Students' incorrect responses often tend to cluster about specific topics; the identification of such topics may lead teachers to give them greater emphasis and to develop strategies for teaching them more effectively. However, whether a comparison is made on the basis of individual items or content/cognitive groupings, the TEL can be used to identify areas in which students have strengths and weaknesses even before formal teaching begins so that the teacher can make appropriate adjustments in the time and emphasis given to various economic topics.

ERIC

#### In Post-tests

`The TEL can also be used at the end of a semester or unit of instruction in order to measure the extent to which understanding has improved. Post-test scores for a given group of students may be compared to their pretest scores and to the national-scores-for-students-"with-economics" in the Discussion Guide (Part II). A pretest/post-testuse of the TEL should help to provide evidence of the effect of a given curriculum and teaching strategy on students, economic literacy. This will be a particularly useful tool of comparison if the test is administered on both a pre- and post-test basis to classes in a school system in which varying degrees of emphasis are placed on economics and different teaching approaches employed. It is hoped that the TEL will be used that way to measure the impact of varying teaching treatments on student performance in economics. Rigorous evaluations of this kind should contribute significantly to the improvement of teaching effectiveness in high schools  $\mathbb{R}^{L_{tot}}$ 

When used as a post-test, the TEL should be administered early enough to allow one or two class periods to be used for discussion of test scores, individual test items; and topic areas. The teacher can take advantage of the students' natural interest in their relative standing in the class and in relation to the national norming sample of students who have had previous training in economics.

To help compare item responses of a given group of students with those of the norming sample, the Discussion Guide, below, lists, each question and the possible responses, with the correct response printed in bold face. Also included for each item, in columns to the right of the item rationales, are the percentage of the norming sample of students with economics and without economics whose answers were correct and an item discrimination coefficient. The coefficient indicates the ability of a given question to discriminate between those students who "know economics" and those who do not. It is more an evaluation of the individual item than it is of the individual student. The higher the coefficient (i.e., the closer it

is to +1.0), the better the item. The lower the coefficient (i.e., the closer it is to ~ 1.0), the worse the item. An item discrimination coefficient of zero would indicate a question that completely fails to discriminate between "strong" and "weak" students. In general, an item discrimination coefficient below 0.20 is a "poor discriminator." Questions with a negative coefficient are reverse discriminators (indicating that more "weak" students get the guestion fight than do "strong" students)... Teachers should also be aware that the item discrimination coefficient does not adjust for the reading level or general ability of individual students in the norming sample. Thus, relatively "bright" students may do well on a given question regardless of whether or not they have had economics instruction.

There are other reasons for using the item discrimination information with care. Item difficulty (percentage of correct responses) depends upon many things besides the complexity of the fact, concept, or principle being tested. Such matters as classroom emphasis on the specific point in question, the closeness or plausibility of incorrect alternatives or "distractors," and the relation of the item content to students' outside activities, experiences, and reading and TV-viewing habits may also affect item difficulty. Therefore, it is worth stressing again that undue emphasis should not be placed on small differences between the percentage reported in this manual and those obtained in the classroom.

When students cannot answer a question or find it most difficult to select the correct answer, they are generally very interested in what the correct answer is and why it is correct. Students' incorrect responses often tend to be concentrated on specific topics. It is on those topics that review time can be spent most profitably, since the clustering of errors is an indication of confusion about the topic. Depending upon the class, the teachers may wish to read the rationale for each correct answer. directly from the Discussion Guide or simply use it as a basis for their own remarks. Discussion can then continue between students and teacher, using the class's textbook as well, as supplementary materials for background information. In this way, the TEL can become a powerful teaching tool.

#### During a Course.

A third use of the TEL is to administer one of its forms midway during a course or unit of instruction and to use the results for formative evaluation purposes. Data on student performance near the halfway point can then be used to alter instructional strategies for the balance of the course or unit, thereby more closely reaching the instructional goal: greater student economic literacy.

$$r_{\bar{s}g} = [(\bar{x}_g - \bar{x})/S_s] \sqrt{(P_g/Q_g)}$$

As a further reference, see Harold Gulliks# The Theory of Mental Tests (New York: Wiley, 1950), p. +26.

This is the point-biserial correlation between an individual test item, g, and the total test score, x. The formula for this correlation is

where  $\bar{x}_q$  = mean score of those answering item g correctly

 $<sup>\</sup>vec{x}$  = mean score of the total test

 $S_x = \text{standard deviation on the total test}$ 

 $P_g = \text{proportion answering item } g \text{ correctly}$ 

 $Q_g = (1 - P_g)$ 

When used on a pretest, midterm, and post-test basis, it is likely that some student "learning" will result because students will then take one form of the test twice. In other words, students may "remember" items from one test administration to the next. This effect can be reduced substantially, if not completely, by alternating forms of the test. However, if an entire quarter or semester intervenes between administrations, the same form of the TEL may be given without concern for major "incidental learning" effects through the testing process itself.

## Learning Economics through Group Testing

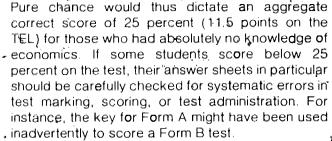

Standard testing practices tend to be competitive situations for students, pitting one student against another, the entire class, or the national norms. Some students may find this situation threatening or intimidating. As an alternative, teachers may wish to employ the group-testing method developed by Peter R. Senn of the Chicago City Colleges, Wright Campus.

In Senn's method, students are encouraged to form small groups of five to eight students each and to work cooperatively on individual test items. Each student has an individual answer sheet on which to record his or her individual response, but the group as a whole must come up with a "group answer" to each question (from which individual student answers may differ). Members of each group are encouraged to discuss each question and its selection of answers and to develop reasons for the choice of "correct" responses. When all groups have completed the test, a class discussion of every question follows. For each question, a different group is called upon to give the "correct" answer and the group's rationale for its choice Class discussion can then follow, particularly if a group's response is incorrect

Senn's group-testing method places emphasis on cooperation rather than competition and engenders a nonthreatening, nonintimidating class spirit. It also leads to group learning, which may be far more effective than more traditional approaches. However, the group-testing method obviously reduces the accuracy of measurement of individual student achievement or performance as customarily measured.

#### **Chance Results**

Each question on the TEL has four possible choices, one correct answer and three distractors.

It should also be noted that the norming data yielded several questions with "below chance" scores for the norming sample. These results indicate particularly difficult items which may be faulty in some technical way. In evaluating answers to such items, allowance should be made for the "quality" of the question. Subsequent work on the TEL may lead to modification of individual test items or "improvement" in item statistics through the elimination or reduction of measurement, error. In any event, pretest results for an entire class should equal or exceed the chance score of 11.5.

#### Use in Various Courses-

It should also be stressed that the Test of Economic Literacy was not designed for exclusive use in high school economics courses. Teachers of social studies, business education, consumer education, history, home economics, and other subjects may find the TEL useful, particularly if the courses include significant amounts of economics. Moreover, community college economics instructors may find the TEL useful in evaluating student achievement in basic economics courses. Finally, preservice and in-service feacher trainers may find the test worthwhile for college-level instruction of teachers in courses and workshops. In fact, any course, workshop, or unit of instruction based on the MCG Framework and intended for the high school level and above can be evaluated effectively by means of the TEL. If the MCG Framework is not the focus of instruction in a particular teaching situation, the TEL may or may not be an appropriate evaluation instrument; the teacher must decide on an ingividual basis

## Use in Research

The Test of Economic Understanding, which was published in the 1960s and was the predecessor of the TEL, led to a surge of evaluative studies and research on the teaching and learning of economic concepts in schools. It is hoped that the TEL will continue that trend Researchers employing the TEL in experimental settings may wish to pay particular

attention to the technical data reported in Section 6, below. In addition, a JCEE report now being prepared will contain a number of useful observations for researchers and evaluators. 11

### 4. Administering the Test

#### **General Instructions**

The Test of Economic Literacy has been designed to be used primarily by teachers. Those who administer the test should be familiar with the procedures described below. Unless standard procedures are followed when the TEL is given, results obtained at different times may not be strictly comparable. The TEL is easy to administer and may be scored by hand or machine.

The norm data provided in this manual are the result of testing many student groups throughout the United States. To ensure meaningful comparisons with the national sample, it is essential that the instructions that follow are adhered to by examiners during administration of the TEL. Specific directions for the student are provided in the test booklet. Although these instructions will be adequate for most situations, it is suggested that the examiner carefully look over the test and the answer sheet before the testing session begins in order to anticipate any problems.

#### **Materials**

The TEL is printed in a reusable test booklet. If students follow instructions, there will be no writing in the TEL test booklets, which can perefore be used a number of times. After each testing session the booklets should be inspected for pencil marks. Any marks should be completely erased before the booklet is reused or else marked up test booklets should be discarded.

The test questions may be answered on a facsimile of the answer sheet printed in Appendix B or on any machine-readable answer sheet having at least 46 answer positions, each with at least four options. If answers are to be machine scored, the teacher must use answer sheets that are compatible with the scoring equipment to be used, and the

students must mark the answer sheets with the appropriate pencils (usually No. 2 lead). In any event, caution students not to use a ballpoint pencils of a pen will make it difficult to change responses and most machines will not score ballpoint markers. For machine scoring, it is well to have additional pencils of the appropriate type on hand.

The room in which the test is to be administered should be well-lighted, well-ventilated, and reasonably quiet. The students should have sufficient working space to handle both the test booklet and answer sheet. Students should be seated so as to minimize opportunities to see each other's answers (unless the group-testing method is used).

All test materials should be counted and assembled prior to the testing session. Some time may be saved by placing an answer sheet under the front cover of every test booklet so that both answer sheet and test booklet can be distributed in a single operation. Make certain that each student receives only one booklet.

## Timing the Test

The TEL requires about 40 minutes of testing time. If testing is done in a class period that is shorter than 40 minutes, and the time cannot be extended, allowance should be made for this factor when test scores are evaluated and compared to the national norms. Since the TEL was designed as a power test rather than as a speed test, it is probable that most students will complete it before 40 minutes are up. Since many class periods are set at 45 to 50 minutes, the testing should begin as soon as possible after the start of class. To insure that students do not arrive late, it may be helpful to remind them in the class prior to the test to try hard to be on time and to bring No. 2 pencils.

#### Directions for the Examiner

First pass out the answer sheets (and No. 2 pencils if necessary) and instruct those taking the test to fill in the appropriate information on the answer sheet. Make sure the students mark which form of the test, A or B, they are taking. If the test booklets and answer sheets are not passed out together distribute the booklets while the students are filling out the preliminary information on the answer sheet. Test booklets should remain face up and closed until the examiner gives the signal to begin.

When everyone has received all the necessary materials, say:

ε

William E. Becker Jr. and John C. Soper, eds., "A Comprehensive Fvaluation Design for the Program and Structure of the Joint Council on Economic Education and Its Affiliates."

"Read the directions to yourselves as I read them aloud:

- "1. Please fill out the information requested on the answer sheet before beginning your test.
- "2. When marking your answer sheet, use only a regular No. 2 pencil. DO NOT USE A BALLPOINT PEN. Do not make any stray marks on the answer sheet. If you make a mistake, erase completely the answer you wish to change.
- This test is designed to measure your understanding of economics. Not all students will have taken a formal course in economics, but most have learned something about the subject in their regular courses, through reading, listening to the radio, or watching television. These questions will measure how well you understand the principles of economics and the way our economy operates. It is probable that you will not know the answers to some questions. However, you should answer every question by marking what you think is the best choice, using the information you do have to select your answer. Work at a comfortable speed, but do not spend too much time on any one item. The test consists of forty-six questions or incomplete statements, for each of which you are to choose the one best answer. Even though in some instances more than one answer may appear to be correct, your task is to choose the best answer "

After reading the directions say

"Sample questions, 1 and 2 on the front cover of the test booklet give examples of a properly marked answer. Notice that response C on question 1 and response A on question 2 have been filled in clearly. When you begin the test, read the question carefully and choose your answer. Then use your pencil to blacken the lettered space on the answer sheet that corresponds to the letter of the answer you have chosen."

If the answer sheets will be scored by machine, say:

"The papers will be scored by machine, so be sure that you use only a No 2 pencil to mark your answers on your answer sheet. Fill in the space under the letter that corresponds to the letter of the answer you have chosen. Be certain to make each mark heavy and black. If you change an answer, be sure to erase your first mark completely before making another mark. Erase all stray marks on your answer sheet."

Whether the sheets are to be scored by hand or by machine, say:

"When you finish the test go back and check your answers. If you have any questions, raise your hand now. No questions concerning any aspect of the test will be answered after the test has begun But if your pencil breaks or if you diffect a faulty booklet or answer sheet, raise your hand."

When you have answered all questions, say: 😚

"You will have 40 minutes for the test. Remember, make no marks on the test booklet itself. All right—begin."

During the first few minutes of the test, check to make sure that everyone is marking his or her answer sheet properly. When testing is completed, collect all materials. Verify that all materials have been collected before students leave the room.

If both forms are to be administered during the same testing session, 80 minutes should be set aside for actual test taking by the students. If a small group is tested, the teacher may find it donvenient to distribute the second test booklet and answer sheet as students complete the first test. With larger groups, it may be more convenient to distribute both test booklets and the two answer sheets at the beginning of the testing session. In either case, students must be especially careful to indicate the form of the test (A or B) on each answer sheet

### 5. SCORING THE TEST

The score for the *Test of Economic Literacy* is the number of correct responses. The maximum possible score on each form is 46. A single answer sheet is used and the sheet may be scored by hand or by machine

To score the test by hand, use the key and facsimiles of the answer sheet in Appendix B. Scan each answer sheet to make certain only one answer has been marked for each question; if more than one answer space has been marked, the response to that question is considered wrong. To use the scoring key, punch out the blackened circles for Form A or B and place the key over the answer sheet. Double check to be sure that the scoring key is for the same form (A or B) as the test. The raw score is the total number of answer marks showing through the holes minus any multiple-marked items.

After the tests have been graded and returned to the students, the teacher should read each test item aloud (as the students read silently from their test booklets and take note of their responses), asking those who answered correctly to raise their hands. The number of correct responses divided by the number of students taking the test and multiplied by 100 is the class percentage correct for that item. This percentage may be compared with the appropriate norming data in Part II.

Many schools and virtually all colleges are now equipped to score tests like the TEL by machine. In

most such cases, a special answer sheet is required that is compatible with the scoring machine available. Usually, No. 2 pencils *must* be used to mark answers. If machine scoring will be used, check with the scoring service in advance about required answer sheets and pencils.

Machine scoring of tests often also produces a printout of the student roster with raw scores and percentiles for the scores based on the group tested. In addition, the group mean, standard deviation, and a frequency distribution are often provided. Such data can be very useful in the interpretation of group results.

#### 6. TECHNICAL DATA

#### Standardization and Norms

The TEL was normed in May-June 1977. <sup>12</sup> using a nationwide sample. The purpose of the norm data collection was to make test scores as meaningful as possible. The testing provided national norms against which test users may compare the scores of their students. In addition, statistical data obtained from the norm data were used to judge the technical adequacy of the TEL.

The norm data were collected from classes in the 92 high schools listed in Appendix A. The approach taken in selecting schools was to obtain a diverse group that would include (1) students from different geographical regions (Northeast, North Central, South, and West), (2) different areas (urban. suburban, "mixed," and rural), and (3) different sizes of schools. However, no claim is made that the group tested is exactly representative of the student population enrolled in high schools throughout the nation. There is, however, a high probability that the norming sample contains a random distribution of students by general ability (IQ), socioeconomic status, and ethnic-racial mix, although no explicit categorical data are available to differentiate students by such subpopulations

The data should not be considered as indicating standards of achievement in high school economics. Rather, they are intended to aid teachers in comparing their students with others. The comparisons will be meaningful to the extent that composition of the student body in any class is like that in the data sample.

TABLE 5: Aggregate Statistics for the TEL, Norming Sample, Spring 1977

|                               | Form A | Form B |
|-------------------------------|--------|--------|
| b                             | 21.59  | 22.89  |
| Mean                          |        |        |
| Standard deviation            | 8.52 - | 8.43   |
| N                             | 4,192  | 4,468  |
| Standard,error of measurement |        |        |
| (S.E.M.) *                    | 3.02   | 3.01   |
| Cronbach Alpha                | 0.875  | 0.872  |
| Per cent with economics       | 55     | 58     |

For the norm sample as a whole (8,660 students). Table 5 reports the aggregate statistics obtained for each form of the test. These statistics indicate that Form A of the TEL is slightly more difficult than Form B (mean difference = 1.3 points), but that the standard deviations, standard errors of measurement, and Cronbach Alphas do not differ significantly between forms (the standard error of measurement and Cronbach Alpha are measures of test reliability, discussed below).

#### Norm Tables

Tables 6 and 7 present the norms obtained for eleventh and twelfth graders—with and without economics training, by form of the test, in percentiles. These tables permit the conversion of raw scores' to percentile, ranks for the appropriate grade level and also according to whether students have had prior instruction in economics or not. Percentile ranks are obtained by calculating the total percentage of students in a given grade who scored at or below a certain raw score.

Percentile norms allow comparisons to be made among students in different groups. For example, an eleventh grader with economics who obtains a raw score of 29 on Form A of the TEL is performing as well as, or better than, 91 per cent of all twelfth graders taking Form A without economics who participated in the norming of the TEL.

To use the norms in tables 6 and 7, simply read across from the raw score column to the column of percentile rankings for the appropriate grade level.

#### Item Analysis,

Test administrators may want to know how their students performed on certain parts of the TEL. This would be particularly important in cases where the teacher covered only some of the concepts included in the test. Tables 8 and 9 show the average percentage of correct responses for each item for students with and without economics and,

<sup>12.</sup> If the TEL is administered to a student group at a different time of the academic year, performance levels for that group relative to the national norm group may not be strictly comparable.

TABLE 7:

Percentile Norms for the TEL, Form B

also, the overall item discrimination coefficient (see Section 3, above). These data are also reported in the Discussion Guide, below.

Tables 10 and 11 show the percentage of all students responding to each of the four options foreach of the 46 items and the percentage of omitted responses, by form of the TEŁ. An item analysis of the kind presented in tables 8 through 11 can be very useful. For example, if a substantial percentage of students answered A when the correct answer is C, the teacher would do well to study distractor A in an attempt to determine the reason. Perhaps the students were misled by the teacher's

or textbook's presentation of the material or by some item of supplementary material.

#### Reliability

The reliability of a test is the degree to which that test measures student performance consistently. For example, two students taking the same test are likely to obtain different scores, but each student taking the test again (without intervening instruction in the subject being tested) should obtain about the same score as the first time. However, many

factors (including practice in taking the test) cause changes in student performance from day to day. As a result, we can never measure a student's performance perfectly, i.e., obtain his or her, "true" score.

Fortunately, it is possible to estimate the amount of variation in test scores that is due to measurement error, and therefore to specify a range within which one can be relatively certain the "true" score

will fall. By taking account of such measurement error, the reliability of the test as a whole can be estimated.

The standard error of measurement (S.E.M.), reported in Table 5 for both forms of the TEL. is an estimate of the amount of variation which can be expected in a test score. A raw score of 23 on a test with an S.E.M. of 3.0 indicates that we can be about 67 per cent certain that a person's "true"

\*Gorrect response \*

score lies in a range from 20 to 26 (23 ± 3.0), or that we can be 95 per cent certain that the "true" score lies in a range from 17 to 29 [23 ± (2 × 3.0)]. The smaller the S.E.M., the more accurate a test is as a measuring instrument Individual test scores are best thought of as lying within a range, rather than as single scores, because of our mability to measure perfectly, i.e., we never obtain a standard error of measurement of zero.

Another measure of overall test reliability is Cronbach's Alpha, a statistic yielding a coefficient with a value ranging from zero to 1.00; the higher the coefficient, the greater the statistical reliability. A Cronbach Alpha of 1.00 would indicate a perfectly reliable test, while a coefficient of zero would indicate a totally unreliable one. In spite of low discrimination indexes, a number of TEL questions (e.g., 42° on Form B) were retained in the final version of the

<sup>\*</sup>Correct response

TEL because of considerations of content validity. If questions with higher discrimination set exes had been used instead, the test would probably have had a higher overall reliability coefficient

\* Finally, it should be stressed that the reliability of the *Test of Economic Literacy* is substantially higher than that of most teacher-made tests. Therefore, the major question to be determined by each user of the TEL is whether the test as a whole—and the individual questions on it—are appropriate for the testing of his or her students'

#### **Validity**

A most important question for an educational achievement test such as the Test of Economic Literacy is whether or not it measures what ought to be measured. This is not a question that can be answered by reference to statistics. The content! validity of the TEL, as mentioned in sections 1 and 2, was established by the working committee's examination of a large number of test items. Those items selected by the working committee were then subjected to review by members of the National Advisory Committee, and the two panels exercised their best judgment as to the appropriate content and structure of the instruments. Thus the TEL can be said to possess "face validity." It was felt that the composition of the National Advisory Committee and of the working committee would best ensure the overall validity of the test instruments for their intended use. A check on the validity of any individual test item may be made by inspecting the relative scores of students in the norming sample who had or who had not had prior economics instruction (see Part II, below). In appraising the validity of these instruments for any particular classroom, research, or evaluation application, the user should refer to the MCG Framework at the same time.

The validity of a test, as defined above, cannot be determined quantitatively. Content validity is determined by comparing, the test questions with the content judged to be important, not by comparing scores on the TEL with some other measure. On such a definition, there is clearly no one "validity" for a test. Whether the TEL is a valid test depends on the purpose for which it is used. Some teachers may disagree with the content or with the objectives emphasized by the TEL Working Committee and the National Advisory Committee. For those teachers, the TEL will not be valid.

We have also obtained limited evidence of the TEL's concurrent validity, the test's correlation with other measures of achievement in economics. Data were obtained from a highly rated midwestern school, showing student performance on the test before and after economics instruction. Table 12 presents the relevant data for this sample of 163 students. The figures show that the observed mean differences are significant beyond the 0.01 level of donfidence.

## Additional Descriptive Statistics

Tables 13 and 14 present some additional descriptive statistics derived from the TEL norming sample by form. These supplementary data are broken down by sex of student, class year (junior and senior), type of area (rural, suburban, urban, "mixed"), geographical region (Northeast, Northcentral, South, West), prior economics instruction, and whether or not the student was enrolled in a DEEP Cooperating School System of the Joint

Council on Economic Education: 13 For each subgroup, the mean TEL score, standard deviation, and subgroup Ware given.

### Correlation with General Ability

We have no large-sample data on student general ability (IC) or reading scores (a reasonable proxy for IC) due to federal privacy act constraints. However, the limited sample of 163 students referred to above did provide a subsample of 93 students with matched TEL and lowa Test of Educational Development (ITED) reading scores as well as data on grade level, TEL pretest scores, student sex, and type of class the student had

attended (experimental or control). A simple correlation coefficient of 0.642 exists between post-test scores on the TEL and the ITED reading scores for these 93 students. This suggests a highly significant relationship between reading ability (which may be integered as a surrogate for intelligence) and performance on the TEL. This positive correlation is consistent with the expectations of most test and measurement specialists, based upon experience with numerous other correlations of achievement tests and general ability. 14

14 For this subsample of 93 students, a multiple linear regression equation was used to explain individual student performance on the TEL post test. That equation yields:

where POST\_TEL is the TEL post-test score, SENIOR equals 1 for twelfth-grade students and zero otherwise, PRE-TEL is the TEL pretest score, SEX equals 1 for males and zero for females, ITED is the lowarTest of Educational Development composite reading score, and CONEX equals 1 for students enrolled in a Title IV-C experimental course and zero for students in control courses. The figures in parentheses below the regression coefficients are fistatistics; those for PRE-TEL, ITED, and CONEX are significant at the 0.01 level. The equation as a whole is highly significant with an adjusted  $R^2 = 0.639$  and an F statistic of 33.59 with 5 and 87 degrees of freedom Each point on the intudent's ITED reading score (mean = 13.92 and standard deviation = 4.33) "explains" 0.636 points on the TEL post-score (mean = 23.01 and standard deviation = 7.06), holding the other variables constant  $R^2$ .

<sup>13.</sup> The Developmental Economic Education Program (DEEP) is the major school-based program of the JCEE. A DEEP Cooperating School System is one which has entered into a contractual affliation with the JCEE, an affliated state council, and a regional center for economic education to develop its curriculum in economic education, train its teachers in economics; produce, adapt, or adopt new economic education materials; and evaluate its progress. At this writing, over 450 school systems in the United States, enrolling more than 10 million students, participate in DEEP.

|   | \$3001-4000 |    | 30         |   | \$90     | 00 \$1200  |

- 18. The tax in the table above is a
  - A. proportional income tax.
  - B. progressive income tax.
  - C. regressive income tax.
  - D. fixed income tax.

Since the rate of taxation increases as income increases, the tax in the table is progressive. A proportional income tax is one whose rate remains constant as income changes, and a regressive tax is one whose rate falls as income increases. A fixed income tax (if one existed) would presumably have a constant amount of tax, independent of income. Such a tax would be regressive.

50.6 35.9 .36

- 19. Using the information in the table above, we know that as income increases the rate of taxation
  - A. increases and the amount of tax increases.
  - B. increases and the amount of tax decreases.
  - C. decreases and the amount of tax increases.
  - D. decreases and the amount of tax decreases.

As income increases, both the *rate* of taxation and the *amount* of the tax increase, and these are the hallmarks of a progressive tax.

Questions 23 and 24 are based on the following information:

Smog in the Central City area is largely caused by automobile exhaust fumes. The smog problem could be virtually eliminated if approximately 100 air-purification plants were built in the area. These plants would simply draw in smog-filled air, remove the smog, and pump the clean air back into the Central City atmosphere. It is estimated that the cost of operating each plant would be \$10,000 per. year.

- 23. It is highly unlikely that private business firms would build and operate the plants and sell their services directly to individual residents of the Central City area because
  - A, the cost of operating the plants would be too great.
  - B. people ee unlikely to be willing to pay for smog-free
  - C. It would be less costly for the government to build and operate the plants than for private business firms to do so.
  - D. it would probably be impossible to provide smogfree air to those who are willing to pay for it while withholding it from those who refuse to pay.

24. Suppose that the government

of Central City were to build

and operate the air-purification

plants. From the standpoint of

achieving efficiency in the allocation of economic resources,

which of the following taxes

should be increased to provide the additional tax revenues needed to finance the operation of the air-purification Since the only possible way to get all the resi- 49.9 41.0 dents of an area to pay for removing smog from the air is through taxation, only a government authority with taxing power is likely to erect air-purification plants. "Cleaned up air" in this case is a public good, that is, one whose benefits cannot be restricted to those who pay the costs of providing it. Such goods and services are therefore usually paid for by some form of general taxation, for example, clean air, paved streets, police protection.

A tax on motor fuel—a "user fee" for polluting the air-would have two desirable effects from the standpoint of allocative efficiency: it would make those who are causing the pollution pay the costs of cleaning it up, and it would reduce the amount of smog somewhat since the tax would raise gasoline prices, thus tending to reduce the quantity of gasoline consumed.

| el<br>Lud   | Parkland had an increase in output with a relatively low inflation rate during which period?  A. Years 1-2. B. Years 2-3. C. Years 3-4: D. Years 4-5.  What is the economic situation and the most appropriate monetary and fiscal policies during years 1-2?  A: Unemployment is falling; a budget deficit and/or easy money policy is needed.  B. The economy is in a recession; a budget deficit and/or easy money policy is needed.  C. Inflation continues and accelerates; a budget surplus and/or tight money policy is needed.  D. Unemployment is rising while inflation accelerates; a budget surplus and/or easy money policy is needed. | In years 1-2, output (real gross national product) declined while prices remained steady. In years 2-3, output rose sharply, but the price, level also increased considerably. In years 4-5, output increased but prices again rose markedly. Only in years 3-4 did output increase without a substantial increase in the price level.  In the period covering years 1 and 2, unemployment increased sharply (from 4 to 7 percent) while the CPI remained roughly constant (at a level of 100) and real output fell by roughly \$10 billion (from \$150 billion to \$140 billion). The combination of rising unemployment and falling real GNP is a typical sign of an economy in a recession. Many economists consider that a recession is in progress when real output falls for at least two consecutive quarters. The so-called neo-Keynesian policy stance under such conditions would call for a budgetary deficit and/or an "easy" monetary policy. Answer A is incorrect because unemployment is rising, not falling; answers C and D are incorrect because inflation is constant, not accelerating. Moreover, under D, the policy mix of a budget surplus and easy money would be self-canceling. | 53.6 |                       | 43                |
| <i>30</i> . | Which of the following groups is typically hurt the most by unexpected inflation?  A. Farmers. B. Debtors. C. Lenders. D. Manufacturers.  | Of the groups listed, lenders are typically hurt most by unexpected inflation since they are later repaid a fixed sum of money that has less buying power than it had when the loan was made. Moreover, lenders may well have made the loan at lower interest rates than those they would have charged after an unexpected inflation had taken place.  | 32.8 | 20.5                  | 36                |
| 31:         | The commercial banking system creates money when banks  A. sell bonds to the public.  B. extend loans to the public.  C. increase loans to the Federal Reserve System.  D. purchase bonds from the Federal Reserve System.  | When banks in the commercial banking system loan money to the public, they typically do so by crediting the checking accounts of the borrowers. Money is diterally "created" in this process.  | 53.2 | 40.2                  | -30               |

| nitially th | he price system in a | Product shortages cannot be ended instantly | 512 4     | 16.6          | 29                 |

- Initially, the price system in a market economy reacts to a shortage of a product by
  - A. raising the price and producer profits.
  - B. lowering the price and producer profits.
  - C. raising the price, but lowering producer profits.
  - D. lowering the price, but increasing producer profits.

Product shortages cannot be ended instantly under any type of economic system. In a market geconomy, the immediate effect of a shortage is to raise the price of the product in short supply, thereby increasing producer profits and making an increase in production attractive. In the should both decline as added production raises the supply through the pressure of competition.

longer run, product prices and producer prices.

- 13. Using the chart above, the poorest 20% of the U.S. population received about what percentage of the nation's income?
  - A: 40%
  - <sup>©</sup>B. 20€5.
  - C. 15%
  - D. 5%

The height of the smallest bar represents the share of total income received by the poorest 20% of the population. That bar indicates that the poorest fifth of the population receives about 5% of income.

| 14. You read the following head- line: "ORANGE GROWERS FORM MONOPOLY." How will the new orange monopoly most likely differ from a highly competitive orange growing industry?  A. Profits in the orange indus- try will now be certain. B. The orange growers will              | A monopolized industry differs from a competitive one because a monopoly (or cartel) generally places production or marketing limits on each member and also imposes a minimum price on the product. There is thus little or no market incentive for the members of a monopoly (or cartel) arrangement to be efficient. Answers B and C are inappropriate because of the restrictions on output. Answer A is inappropriate because profits in the orange industry depend upon many factors and the formation of | 33.7         | 23.1  | .43                         |
| increase their use of capital goods.  C. The orange monopoly will hire more workers and increase output.  D. There will be less incentive for the orange monopoly to be efficient.  | a monopoly or cartel will not guarantee high profits.   |              |       |                             |
| 15. A rise in the price of which product would be likely to increase the demand for butter?  A. Margarine. B. Butter. C. Cheese. D. Bread.  | Many people use margarine instead of butter. If margarine becomes more expensive, some users will shift to butter. Thus, the demand for butter will go up. A rise in the price of butter or of bread will tend to reduce the buying of those items. The demand for butter is unlikely to be influenced much by changes in the price of cheese.  | 80.9         | 76.0  | .50                         |
| <ul> <li>16. If U.S. farm output remains the same how will several years of bad weather in Europe and the Soviet Union affect American food prices?</li> <li>A. Raise them.</li> <li>B. Decrease them.</li> <li>C. Make no change.</li> <li>D. Cannot be determined.</li> </ul> | Bad weather in Europe and the Soviet Union for several years would have an adverse impact on crop production in those regions. To make up for shortfalls in their domestic production, Europe and the Soviet Union would be likely to import considerably more food or grains than usual, thus causing market prices in the world (and U.S.) grain markets to rise. Therefore, food prices in the United States will go up as well.   | <b>59</b> .2 | 53.7  | .324                        |

D. when total government spending exceeds revenues.   | A government budget deficit is defined as an excess of government expenditures over tax receipts for the period concerned—usually either a single quarter or a year. A budget surplus is just the opposite; an excess of tax receipts over government expenditures.   | 53.5          | 44.3  | .57                         |
| 33   | The maximum gross national product a nation can produce in any one year is set by  A. its natural resources.  B. its productive resources.  C. the amount of money people have to spend.  D. demand for goods and services by families.   | A nation's maximum GNP in any given year is set by its total productive resources. The amount of money people have to spend does not necessarily set a maximum on the nation's GNP because the quantity of money can be readily increased, or its velocity (turnover) can rise, or prices can go down.  | 34.6          | 33.6  | .28                         |

| 41. | Rapidly growing economies always have  A. a slow rate of inflation.  B. a high rate of investment.  C. a low rate of population growth.  D. a rapid rate of population growth.   | A high rate of investment (defined as the accumulation of more machinery, industrial plants, equipment, and the like) characterizes all rapidly growing economies. The conditions indicated by the other answers have frequently been true of both fast- and slow-growing economies.   | 52.3      | 46.0 | .39                         |
| 42. | Which of the following statements about tariffs is true?  A. Tariffs decrease employment in domestic industries whose products they protect.  B. Tariffs benefit some groups at the expense of the national level of living.  C. Tariffs increase the market for our exports by reducing our imports.  D. Tariffs encourage the growth of our most efficient industries. | Tariffs protect domestic industries that might otherwise be eliminated or reduced in size by foreign competition. The workers and owners engaged in such protected industries benefit from the tariff, but the national level of living suffers because all consumers must pay higher prices for the goods produced by the protected industry. Tariffs may increase employment in domestic industries whose products they protect. Tariffs may decrease the market for exports by reducing imports because other nations gain less foreign exchange with which to buy exports. The most efficient domestic industries will tend to grow with or without tariff protection.   | 28.6      | 26.8 | .17                         |
| 43  | The right to join a union and elect representatives to negotiate with the employer is referred to as  A. a closed shop. B. the seniority system. C. collective bargaining. D. right to work legislation.   | Collective bargaining means that workers have the right to join a union and elect representatives to negotiate with their employer about wages, fringe benefits, and the conditions of work for themselves as well as for nonunion workers in similar jobs. A "closed shop" means that all workers of a given employer or industry are required to join the union. The "seniority system" means that worker rights to, e.g., promotion or vacation, are directly tied to length of employment or duration of union membership, and that if employees are laid off, those with the most seniority are laid off last and are rehired first. "Right to work" legislation consists of state laws that mandate the opposite of a closed shop: workers are not required to join the union of a given industry or employer. |           | 50.3 | .40                         |

| · ·         | Common stocks, limited liability, and unlimited life are characteristic of A. proprietorships.  B. corporations. C. partnerships. D. cartels.  | Proprietorships, partnerships, and cartels cannot issue common stock. Proprietorships and partnerships do not have limited liability, and cartels only have limited liability in the sense that the corporations of which the cartels may consist have limited liability. Proprietorships and partnerships have limited lives in practice. Only corporations possess the three characteristics mentioned in the question.  | 64.0      | 53.2 | 43                         |
| <i>45</i> . | Those who believe that people should be taxed according to their ability to pay would be most likely to favor  A. an excise tax. B. a general sales tax. C. a progressive income tax. D. a residential property tax.   | In general, a progressive income tax levies higher tax rates, the higher a taxpayer's income. Such a form of taxation is closest to levying a tax according to ability to pay, particularly compared to the alternative answers.   | 60.6      | 51,1 | .50                        |
| 46.         | A national program of free housing for the aged poor is established. The program is paid for by an increase in the income tax. These actions promote one economic goal, but work against another. Specifically, these actions are likely to  A. reduce freedom but promote equity.  B. reduce equity but promote | This question involves a trade-off between freedom and equity, two economic goals of the United States. Economic freedom is reduced by the increase in the income tax. Since all taxpayers are taxed more in order to help the aged poor, the taxpayers' economic freedom is curtailed because they no longer have the taxed dollars to spend or save as they wish. On the other hand, equity (a more equal distribution of income and/or welfare) is promoted because the aged poor are given access to | 26.5      | 24.0 | .25                        |
|             | efficiency. C. reduce stability but promote growth. D. reduce security but promote efficiency.   | housing that they could not otherwise obtain in the quantities they desire. Whether or not such a system is "desirable" is <i>not</i> in question here. What is sought is the ability to identify which economic goals are in conflict in a given situation.   | μ         |      | φ.                         |
