IDENTIFIER'S

ABSTRACT

Designed for students in grades 7 and 8, this electricity/electronics curriculum guide contains instructional modules for ten units of instruction (nine-week class): (1) crientation: (2) understanding electricity: (3) safety: (4) methods to generate electricity: (5) wiring tools and wire: (6) soldering: (7) magnetism and electromagnetism: (8) circuits, symbols, and Recomponent identification: (9) resistors and identification systems: and (10) available sources of the Earth's energy. Each instructional module is divded into two sections. The first section of each module is an instructor's guide providing a lesson plan overview of the unit. This overview includes the title of the unit, time allocation, unit goal, unit objectives, evaluation, instructor references, unit overview, suggested presentation hints/methodology, supplemental activities and demonstrations, and instructional module contents listing, Section 2 of the module contains the packet of materials to be utilized in the classroom. Each packet includes the following parts: unit outline/transparency master, pre-post test, vocabulary enrichment activities, student informational handouts, related gaest activities, and answer keys. (LRA)

. Reproductions supplied by EDPS are the best that can be made from the original document.

A special thanks is extended to the public schools, industries, and publishers whose input contributed greatly to the completion of this curriculum project. Thanks is also extended to James Herman, Chief (retired), Bureau of Industrial Education, California State Department of Education, and James Allison, acting Chief, Bureau of Industrial Education, California State Department of Education.

Other Contributors

An additional acknowledgement of gratitude must be extended to the California Council of Electronics Instructors, whose 400 Statewide membership actively provided valuable input towards the creation of the Instructional Modules.

PREFACE

Industrial Education, in the public schools of California, is a generic term which applies to all levels of education and training which relate directly to industrial occupations. Industrial Education includes the major subject matter fields of industrial arts, trade and industry, and technical and health careers and services. A comprehensive and reflective Industrial Education curriculum will assist and support students in selecting, preparing, and advancing in occupations or careers which currently exist or which are emerging.

Industrial Education programs are also those educational programs which pertain to the body of related subject matter organized for the development of understanding about the technical, consumer, occupational, recreational, organizational, managerial, social, historical, and cultural aspects of industry and technology.

In essence, Industrial, Education curriculum is concerned with aiding the individual to respond and react sensitively to technological developments and to cope efficiently and effectively with the consequences in one's personal life.

In order to provide skills for students to meet their employment needs in the future, the educational system must meet its curriculum challenges today. One means of solving this problem was the dévelopment of the State Electricity/Electronics Curriculum Guide Phase I, that centered on a competency-based cluster approach to derive curriculum. Phase II provides the necessary Instructional Learning Modules including classroom materials for a realistic curriculum foundation which will assist in developing student competencies for entry level occupations and/or technical spetialization. Statewide application of these materials will allow for student mobility because of standardization and it avoids duplication of high cost instruction.

It is sincerely hoped that the educational materials contained in this curriculum project will serve as the foundation for improving instruction in the area of Electricity/Electronics within the school systems of California.

INTRODUCTION

Philosophical Background

One of the primary purposes of the public schools in our society is to acquaint the young with the nature of the culture within which they live and operate. The American culture is distinctly technological; therefore, it is the responsibility of our educational system to acquaint our youth with the nature of this technological culture. The tremendous acceleration of industrial technology has had and will continue to have an overwhelming impact on society.

One fundamental concept behind Industrial Education in our educational system is that technical experiences, curriculum, instruction, and guidance assist the student in preparation for economic independence and an appreciation for the dignity of work. Another main thrust is to prepare students for a successful life of work by increasing their options for occupational choice, by eliminating barriers to attaining job skills, and by enhancing learning achievement in all subject areas.

Irrespective of what the future may hold, individuals fiving in our present day environment will be handicapped unless they are reasonable well informed concerning the vast Electrical/ Electronic technological applications in our daily living. Our present civilization is scarcely conceivable without the applications of Electricity/Electronics which have become identified with the industrial growth of our country and our thousands of everyday conveniences. The Electricity/Electronics subject field is an integral part of the Industrial Education curriculum, and this field provides employment for millions of individuals annually.

The total impact of Electricity/Electronics on human life is of such magnitude that it necessitates a comprehensive technical program in our schools to produce informed individuals capable of effective and meaningful functioning in our society.

Project Purpose Phase I

During the Industrial Revolution, Industrial Education focused on primary or single skill development, and this approach was viable in an era that required the mastery of one skill for initial employment. However, present technological developments in the labor market have necessitated that individuals within the labor force have a multiplicity of skills to meet the needs of the nation's trade and technological communities.

ERIC

8

In order to facilitate methods for students to meet their employment needs in the future, the educational system must meet its curriculum challenges today. One means of solving this problem is the development of an Electricity/Electronics instructional program that centers on a competency-based cluster approach to derive curriculum. Utilizing this approach, the student will have a realistic curriculum foundation which will provide access to the necessary competencies for entry level occupations and/or technical specialization.

The basic intent of the State Electricity/Electronics Curriculum Guide was to provide educators within Industrial Education a competency-based guide that can be adapted or adopted to any existing or new program without major cost expenditures. Hopefully, the guide will act as a catalyst for educators who desire a revision or restructuring of their Electricity/Electronics curriculum, yet the guide format provides the flexibility for teacher-based modifications related to methodology, instructional resources, textbooks, equipment, laboratory systems, etc. For the educator, the heart of this guide was the curriculum outlines that were an outgrowth of the occupational tasks and/or competencies identified through various occupational needs assessments and tasks analysis inventories.

The following is a brief synopsis of each outline in terms of level of instruction and duration.

- 1. Curriculum Outline Level I Grades 7-8
 - a. 9 week unit outline
 - b. 18 week unit outline
- 2. Curriculum Outline Level II Grade 9
 - a. 36 week unit outline
- 3. Curriculum Outline Level III Grade 10
 - a. 36 week unit outline
 - 4. Curriculum Outline Level IV (Specialization Level) Grades 11-14
 - a. 36 week unit outline at each grade level

The contents of the curriculum outlines were generated to increase the efficiency of the Electricity/Electronics programs in the schools of this State, and the competency based structure was established for the students so that their complex and confusing world begins to take on order and their learning tasks are more relevant and readily attained.

Project Purpose Phase II

The State Electricity/Electronics Curriculum Guide was proposed as a comprehensive educational guide designed to eliminate the dichotomy between formal school and the world of work. Basically Phase II allowed the development of Learning Modules for the Guide, in an effort to improve the preparation of California's youth for their future in the world beyond the classroom.

Phase II also addressed itself to the development and use of Instructional Modules within the classroom as a vehicle to implement the Curriculum Outlines presented in Phasé I.

Instructional Modules were based on each major unit topic within Levels I, II and III of the State Curriculum Guide for Electricity/ Electronics. Approximately sixty Instructional Modules or packets were created for teacher/student use. Each module contains basically the following:

- 1. Goals and Objectives (unit)
- 2. Outline
- 3. Pre-Post Test (keyed)
- 4. Instructor References
- 5. Suggested Methodology
- 6. Demonstrations and Quest Activities
- 7. Student Handouts -- Informational
- 8. Vocabulary Enrichment List
- 9. Student Worksheets
- 10. Related Instructional Activities and Graphical Illustrations

ORIENTATION

Rationale

The Instructional Modules in this level were specifically designed to assist the electronics instructor in the planning, organization, and presentation of course materials. Care and emphasis throughout the modules has been given to the needs of technical instructors who must motivate and guide California's youth through the educational system. At the same time the authors of the Instructional Modules were fully cognizant of the need to present fundamental competencies, yet, not in the traditional dry fashion but with an eye towards:

Marketing the Subject Matter
Innovative Assignments
Eye Appeal
Constant Reinforcement
Educational Games
Doing Activities
Immediate Unit Evaluation
"State of the Art" Subject Matter
Diversity in Teaching Methodology

Scope

The Instructional Modules are generally divaded into two sections, as follows:

Section I (Instructor's Guide)

This section is presented first in the module to enable the instructor to have a lesson plan overview to the unit. This overview includes;

- 1. Title of Unit
- 2. Time Allocation
- 3. Unit Goal
- 4. Unit Objectives
- 5. Evaluation
- 6. Instructor References
- 7. Overview (unit)
- 8. Suggested Presentation Hints/Methodology
- 9. Supplemental Activities and Demonstrations
- 10. Instructional Module Contents Listing

All of the suggestions in this section were designed to enhance the unit presentation and provide the most effective learning environment for utilization of all instructional materials. The contents of each module have been carefully prepared and scrutinized in order to establish a solid technical foundation for the student.

Section II (Instructional Module Materials)

This section contains the packet of materials to be utilized in the classoom. When appropriate each module includes:

- 1. Unit Outline/Transparency Master
- 2. Pre-Post Test (keyed)
- 3. Vocabulary Enrichment Activities
- 4. Student Informational Handouts
- 5. Related Quest Activities
- 6. Answer Keys

The Instructional Modules have been constructed and packaged so that the deletion of certain materials or the addition of pertinent information can be inserted or removed with minimal difficulty. Individual courses and instructors are not identical hence provision for flexibility is necessary in order to achieve a curriculum that is compatible with the instructor.

In the event a training program requires a radical change in the content of material presented within a module, the instructor may easily cut, insert, and paste masters to achieve the desired results which are tailored to the instructors specific needs.

Support Systems

No amount of planning or preparation can guarantee success in the classroom, because learning is such an intangible quality, yet, the lack of these ingredients in any program immediately guarantees dismal educational results. The most indispensable support system within the educational process is the teacher, who must have the expertise and enthusiasm that can propel students into the world of learning.

The instructor must also possess the drive and ambition to continuously improve and update the program, especially in this area, due to dramatic technological innovations.

The classroom should contain the necessary furniture to allow the course to be taught in a satisfactory manner. Good lighting is absolutely essential in terms of the activities that occur. Power outlets are of paramount concern for obvious reasons, and their location should allow for room flexibility. Tables, benches, and/or desks should contain locks to insure inventory control, and storage facilities for projects, equipment, parts, etc., must be readily available. Chalkboards and bulletin boards should be mounted for easy access within the classroom.

The field of Electricity/Electronics seems to be a natural interest area to many students and the laboratory portion can be used as the vehicle to generate a vast amount of enthusiasm along with necessary technical concepts. Whether an instructor utilizes individual experiments, project construction, training systems, of a combination approach in their laboratory is not critical; what is vital is that their selection reflects the goals, and objectives that they want to attain within the course.

An individual school may have the best physical facility, equipment, instructional materials, and administration, but in the final analysis it is the teacher who must promote, coordinate and maintain the program.

Title of Unit: Orientation

Time Allocation: Several Days

Unit Goal:

To communicate these competencies which will allow an awareness of course goals, objectives, and basic requirements.

Unit Objectives:

The student will be able to:

- 1. describe examples of the technical nature of our modern society and the need for technical instruction in the area of Electricity/Electronics.
- 2. explain basic course requirements and the system of student evaluation.
- 3. demonstrate an awareness of the general course objectives and verify the significance of each within this educational program.

Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria, which may utilize a combination of oral, or written testing procedures.

Instructor References: 1

Industrial Education Electricity/Electronics Curriculum Guide Grade Levels 7-14. Published by the State of California, 1977.

Innovative Programs In Industrial Education. Leslie H. Cochran, McKnight and McKnight Co., 1970. Chapters 5, 6, and 7.

Planning and Organizing Instruction. Ralph C. Bohn and Harold Silvius, McKnight and McKnight Co., 1976.

Overview:

This unit should be introduced by examining the course goals and objectives, not merely an instructor/student exercise in reading, but a brief discussion in reference to each item while also highlighting their overall significance.

Basic school or classroom rules and regulations, or operating procedures require attention early and this may be a good opportunity to present those to the class.

The next topic should emphasize specific course requirements and the method for student evaluation. Time should be allocated in such a manner that it will allow extensive descriptions as needed.

This unit will not conclude with an examination as will other modules, because of the length and nature of the subject matter presented.

Suggested Presentation Hints/Methodology:

Follow the instructional module unit outline as a basic skeleton for curriculum presentation, however, note the following:

1. This unit can afford the instructor an unusual opportunity to learn about important qualities the student possesses. The Student Questionnaire for example can act as a means to discover a wealth of information, so read through it carefully upon completion, then file all student forms by periods in one notebook for a handy reference.

The handout labeled "Student Performance Record" can serve several functions as desired. First, it can be placed at the front of the students' notebook as a title page, or it can be graded periodically to indicate unit performance as evaluated by instructor. Finally, this handout could be a quick Table of Contents for students in terms of specific course content and/or subject matter chronology.

3. When introducing the Informational Handout - Electricity/
Electronics, (area description) have each student read out
loud a small portion. This will immediately draw your attention to those students who might need special attention

tion to those students who might need special attention.

4. Remember detailed Rules for Conduct and Procedure are located in the safety unit and will be taught at a later time. This unit is only concerned with basic classroom conduct and procedures.

Supplemental Activities and Demonstrations:

Initial room impressions are important so if possible have the bulletin boards adequately displayed, materials stored properly, safety signs posted, etc. These kinds of things such as shop appearance develop student attitudes that will affect their own craftmanship or performance.

2. During the first week of school many students can be disenchanted with the "paper shuffling" so try to demonstrate a technical device that can catch their imagination. If a strobe light, color organ, or even a microcomputer is available use it to generate enthusiasm about the program.

Instructional Module Contents:

- 1. Unit Outline (overhead)
- 2. Informational Handout (Course Goals and Objectives)
- 3. Informational Handout (Electricity/Electronics Area Description)
- 4. Informational Handout (Student Questionnaire)
- 5. Informational Handout (Student Performance Record)
- 6. Informational Handout (Student Evaluation System)
- 7. Exam Answer Sheet (Master)

COURSE GOALS AND OBJECTIVES

This Electricity/Electronics program is a technical school program designed to make sure that all individuals are prepared with "entry" level skills to enter either the world of work or to continue their education.

Listed below are some general objectives that will be accomplished with the successful conclusion of this course!

An appreciation of the influence the Electricity/Electronics area has on our life.

The ability to select, care for, and utilize electronic products equipment and tools.

An awareness of safe habits and attitudes regarding materials, tools, and equipment.

Opportunities to explore leisure-time activities within this subject field.

An appreciation of design, construction techniques, and craftmanship.

An understanding of the occupational families in the Electricitý/ Electronics area.

The ability to problem-solve by utilizing sound judgements based on knowledge and experience.

An awareness in regards to energy conservation and its significance.

An understanding of consumer products and their technical operation and application.

Demonstrations of basic technical skills that apply to a range of jobs in Electricity/Electronics.

The recognition of specific training essential for employment in a job area and the basic formation of occupational goals.

	Manie .

INFORMATIONAL HANDOUT	Period:			4
ELECTRICITY/ELECTRONICS			•	

Our grandparents would never recognize the world in which we live or many of the gadgets which are so common to us. Hundreds of electronic wonders which we readily accept in jour society were unknown sixty years, ago, and have become familiar objects only through the development of a new industry that is called electronics. This industry is now one of the largest in the United States, and a major portion of its research and production plants are located in California.

This school has recognized that present technology and consumer demands offer a special opportunity for students who want occupations which are interesting and challenging and where the chance for advancement and salary are unlimited. The electronics field is one in which continuous research is always adding new products to be made, tested, marketed, and operated. There will be a steady increase in the number of persons employed in this industry according to statistics developed by the State of California.

The student in Electricity/Electronics studies basic electrical theory, laboratory techniques, use of test instruments, care and use of hand tools, shop safety, circuits, and construction or project building. The skills which one can develop may be applied to the areas of communication, transportation computers, research and development, etc.. If the student is deeply interested in his/her work, has abilities, and is willing to study and learn, s/he can progress to an entry level occupation or to continue further technical training.

Basically, electronics is a field that is a combination of the study of mathematics and physical science, and its principles can be understood by

ERIChe individual who is willing to........WORK

STATE ELECTRICITY/ELECTRONICS CURRICULUM GUIDE INSTRUCTOR'S GUIDE TO ACCOMPANY LEVEL I UNIT 1

Title of Unit: Understanding Electricity

Time Allocation (Several Days (Units 0 and 1 = 1 week)

Unit Goal:

To communicate and develop those competencies which will permit. students to evaluate the basic characteristics of electricity and to Comprehend the dramatic role that electricity plays in our technical society.

Unit Objectives:

The student will be able to:

- describe in general terms, what is electricity and identify several major applications.
- 2. define the terms static and/or dynamic electricity, and indicate an appropriate example of each type.
- explain and/or justify the need for mastering fundamental theories related to the Electricity/Electronics field, and verify the importance of this field to modern society.

Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria, which utilizes a combination of oral, or written testing procedures.

Instructor References:

Basic Electricity. Marcus and Marcus, Prentice-Hall, Inc., 1974.
Chapters: I and 2.

Basic Electricity Training Manual. Ted Pipe, Howard W. Sams Inc., 1976. Chapter: 1.

Loper and Ahr, Delmar 1973. Introduction to Electricity and Electronics. Chapter: 1.

Overview:

The primary purpose of this unit is to provide an introduction or initial exposure into the Electricity/Electronics area of instruction. central theme, however, is to provoke student awareness of the nature, characteristics, magnitude, and application of electricity.

The unit lesson should concentrate on first describing that electricity is still in many ways a mystery, although, society has put it to a variety of uses.

Next, a technical presentation explaining the specific principles of both static and dynamic electricity.

Unit 1 should conclude with a review of the importance of electricity and the reasons for its expanding influence and vast market of job opportunities.

This unit will not contain a formal examination as will other modules,

because of the length and nature of the subject matter presented.

Suggested Presentation Hints/Nethodology:

Follow the instructional module unit outline as a basic skeleton for curriculum presentation, however, note the following:

1. An important aspect of this lesson would be to stress that static electricity is largely a nuisance, a disturber, and a potentially dangerous for in some instances. A frank discussion about lightning, its cause, and how one can avoid harm should be helpful to the student in terms of personal safety.

Some students are hesitant to admit that they are confused or that a concept is not clear to them. The student should be aware that in this class there is no penalty for admitting that they are technically bewildered and in need of further

explanation.

When explaining the basic difference between static and dynamic electricity try to equate static to electrical charges "at rest" while describing dynamic electricity in relationship to electrical charges in motion to accomplish a specific purpose.

4. It is highly important as they begin their studies in this field that they realize that technical reading requires a slower pace due to the illustrations, schematics, and other graphics that must be digested. Recommend to students that when they read, they concentrate on comprehension rather than reading speed.

Supplemental Activities and Demonstrations:

- 1. This is a sure fire attention grabber if materials are available. Obtain a static machine or Tesla coil and operate it in a manner to dramatically show the affects of static electricity. Check with the science area at your school for possible support materials.
- 2. Suspend a charged balloon from a stand, then bring a rubber rod that has been rubbed with cat's fur or flannel near the balloon. Observe the reaction and discuss with your class. Repeat this demonstration utilizing a glass rod rubbed with silk!
- 3. With the class, itemize all the uses of electricity that they can think of and then list them on the chalkboard. From this list discuss the significance of this subject field to their daily life and the world around them.

Instructional Module Contents:

- 1. Unit Outline (overhead)
- 2. Technical Glossary
- 3. Worksheet (vocabulary) Word Search
- 4. Quest Activities
- 5. Unit Module Answer Keys

- I. Understanding Electricity
 - A. Why Study Electricity
 - 1. Importance
 - 2. Applications
 - 3. Job opportunities
 - B. What is Electricity
 - 1. Kinds
 - a. Static
 - b. Dynamic
 - 1. Electron flow
 - 2. Direct current
 - 3. Alternating current

Mame.	 	
Date:	 · ·	
Period:		

TECHNICAL GLOSSARY

ALTERNATING CURRENT: A flow of electrons moving first in one direction through a circuit, stopping, then flowing in the opposite direction. Alternating current can be thought of as a back and forth movement of electrons. Abbrev. AC

DIRECT CURRENT:

A flow of electrons moving in one direction through a circuit - from negative to positive. Abbrev. DC

DYNAMIC ELECTRICITY: A usable, flow or movement of electrical charges.

Dynamic electricity provides a continuous flow of electrons which can be used to do work.

ELECTRIC CHARGE:

A collection of positive or negative particles on an object. A material having many negative particles collected on it is said to have a negative charge. While many positive particles provide a positive charge.

ELECTRICITY:

A form of energy, (generated by friction, induction, or chemical reaction) which is based upon the movement of free electrons.

ELECTRON FLOW:

The orderly movement of electrons through a wire, electrical device or circuit.

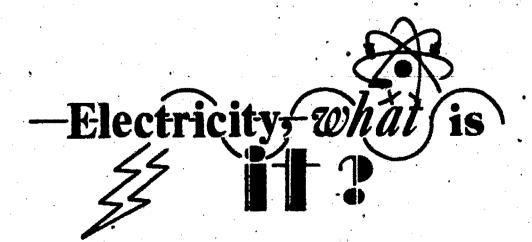

ELECTRONICS:

The study of electrical action, and especially the study and development of devices and circuits that use and control electricity.

ELEKTRON:

The Greek word for amber (a brownish-yellow fossil resin) which later evolved into the words "electrics" and "electricity".

STATIC ELECTRICITY: A collection of electrical charges at rest. Static charges are basically an unusable source of electricity, yet can be very dangerous in the form of lightning.

STATE OF CALIFORNIA DEPARTMENT OF EDUCATION

DATE STARTED______
DATE COMPLETED_____

R. E. LILLO N. S. SOFFIOTTO

STATE ELECTRICITY/ELECTRONICS CURRICULUM GUIDE INSTRUCTOR'S GUIDE TO ACCOMPANY LEVEL I UNIT #2

Title of Unit: Safety

Time Allocation: 1 week

Unit Goal:

To inform and instil student competence in safe guarding themselves and to apply this safety attitude to their daily life, whether in the classroom, on the job, or at home.

Unit Objectives:

The student will be able to:

- 1. identify the three classes or categories of fires, and indicate the proper method of extinguishing each.
- distinguish between common safe-laboratory practices and, hazardous conditions, and pass a safety test with 100% accuracy, based on the information discussed.
- 3. explain and apply the proper safety and first aid procedures when dealing with an electrical hazard or a serious shock.

Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria which utilizes a combination of written or oral testing procedures.

Instructor References:

Basic Electricity: Theory and Practice. Milton Kaufman and J.A. Wilson, McGraw-Hill Book Co., 1973. Appendix A.

Industrial Education Safety Guide. Published by the State of California 1978.

Making Safety Work. National Safety Council, McCraw-Hill Book Co., 1976.

Overview:

The unit should be introduced as a necessary, yet meaningful resource for all activities. In order to place "safety" in its proper perspective within the students' mind, stress that safety instruction should begin early in childhood and extend continuously throughout life! The idea that accidents or electrical shock are unaboldable in this kind of class must be discouraged.

The central safety theme of this unit is promoted by the discussion of rules which have been established to assist students in remembering the fundamentals of preventing accidents.

The next topic of emphasis deals with the nature of electrical shock

and the first sid procedures to employ if necessary.

This unit concludes with a brief description of fire prevention and fire classifications. The student will also learn about proper extinguishing techniques to be used, dictated by the type of fire encountered.

Suggested Presentation Hints/Nethodology:

Follow the instructional module unit outline as a basic skeleton for curriculum presentation, however, note the following.

- This unit is often used as the most opportune time to introduce both school fire drills or civil defense drills. impress students, during these kinds of activities, with the idea that disaster preparation is the only thing that really saves lives.
- In the objectives of this unit it is stated that a safety examination must be passed with 100% accuracy, however, with some students this may be virtually impossible. Allow these few the opportunity to retake the test after a study session, but do not advertise this make up test at the beginning of the safety lesson. Sometimes certain disadvantaged students have a very difficult time to comprehend the vast amount of written material handed out, hence they score lower than other students on the test. A buddy study system will assist them greatly in achieving a successful score.
- When describing dangerous current levels and their affect on the human body, remember that electrical terms and units of measurement may not be familiar to some students at this time. thus much of the impact will be lost if this is not considered and modified.

Supplemental Activities and Demonstrations:

- Obtain and show a good safety film from regular film sources. 1. local industries. National Safety Council, or any other company and/or institution which offers such a service.
- When explaining the classification of fires, demonstrate the actual procedures necessary to activate the fire extinguisher. A blast from a chemical extinguisher while explaining operating techniques can stimulate a class instantaneously.
- Invite a medical guest speaker to deliver a simple first aid presentation to the class. Prior to the class lesson explain to the guest specific areas of concentration that will help the overall safety program.

Instructional Module Contents:

- Unit Outline (overhead)

- B. Safe Use of Power Tools
- C. First Aid
- D. Fire Safety
- E. Safety Test

UNIT EXAM

ELECTRICAL SAFETY

IMPORTANT-

Indicate your responses on the answer sheet only. Fill in the box corresponding to the correct answer to each question - there is only one correct answer for each question.

- "Horseplay", running, and throwing of objects are dangerous practices in the shop and are forbidden:

 (A) when the teacher is looking, (B) only when students are working, (C) at all times, (D) occasionally.
- 2. When using machines or hand tools:
 (A) give the job all your attention, (B) stand up straight, (C) watch your classmates, (D) watch the clock.
- The floor, aisles, and passageways should be kept clear of stock, tools, and materials. Objects on the floor:

 (A) may be left there if the operator of the machine is in a hurry,

 (B) may cause someone to slip or trip into a moving machine, (C) may be ignored, (D) are unsightly.
- 4. Students must not talk to or distract a person operating a machine because:

 (A) the operator is likely to be injured, (B) conversation slows down the flow of work, (C) the operator is likely to make a mistake, (D) conversation is annoying to the operator.
- Report to the teacher any:

 (A) damaged tools and equipment, (B) missing guards, (C) equipment not working properly, (D) all of the above.
- Never operate shop equipment when the teacher is:

 (A) out of the shop, (B) in the shop, (C) both A and B, (D) none of the above.
- 7. Most tools are designed for a specific use or purpose. If they are used incorrectly, the result may be:
 (A) damage to the student's project, (B) breakage of tools, (C) injury to the students, (D) damage to the bench tops.

- 8. Long hair is dangerous around shop equipment. If it is long enough to get caught in the machine, it must be:

 (A) tied up and back, (B) burned off, (C) pulled out, (D) none of the above.
- Loose clothing must be securely fastened or removed and long loose, sleeves rolled up above the elbows:
 (A) before operating any machine,
 (B) after operating any machine,
 (C) during the operation of a machine,
 (C) only when you are assisting the teacher.
- 10. All accidents and injuries, no matter how slight must be:
 (A) ignored, (B) reported to the principal's secretary immediately,
 (C) reported to your teacher immediately, (D) reported to the shop foreman immediately.
- 11. Caution other students if you see a violation of shop:
 (A) traffic rules, (B) good manners, (C) safety rules, (D) none of the above.
- Only the operator and _____ are permitted within the working area around a machine.

 (A) one other student, (B) the teacher, (C) a helper, (D) all of the above.
- Gasoline, paints, kerosene, and other materials that will burn or produce fumes should be used:

 (A) with another student, (B) in a well ventilated area, (C) at a workbench, (D) in an enclosed area.
- 14. Students are to operate only those machines or pieces of equipment for which they have received:

 (A) instructions to operate, (B) permission to operate, (C) both A and B, (D) none of the above.
- When touching electrical switches, plugs, or receptacles be sure your hands are dry because:

 (A) a switch will not operate properly if your hands are wet, (B) a plug will easily slip from your fingers if your hands are wet, (C) if your hands are wet, you may receive a severe shock and serious burns, (D) none of the above.

- Acid or chemicals on the hands or face should be immediately washed away with plenty of:

 (A) water. (B) glycerine. (C) olive oil. (D) vaseline.
- 17. If you notice any breakage or damage to tools, instruments, or machinery, you should:

 (A) repair the damage yourself; (B) be careful when using such equipment, (C) say nothing because you might get the blame, (D) none of the above.
- 18. Screws, nuts, and other nondigestible materials are never to be placed in your:
 (A) hand, (B) pocket, (C) mouth, (D) all of the above.
- 19. If you are in doubt about the use of any tool or machine, or about any shop procedures:

 (A) ask an advanced student for help, (B) proceed cautiously, (C) always ask your teacher, (D) none of the above.
- 20. Always sweep scraps from your workbench of table with a brush or whisk broom rather than your hand because:

 (A) sharp or jagged particles may injure your hand, (B) less dust is-stirred up, (C) this is the easiest way to clean up, (D) it will cause less work for the janitor.
- 21. Eye protection is used to:

 (A) improve your vision, (B) prevent eyestrain, (C) prevent flying particles or corrosive substances from entering your eyes, (D) none of the above.
- 22. When tools are carried in the hands, keep the cutting edge or sharp points:

 (A) directed toward the floor, (B) directed away from the body,

 (C) directed over the head, (D) directed toward the body to protect others.
- NEVER direct compressed air:

 (A) toward the floor, (B) toward the teacher, (C) toward another student, (D) all of the above.
- 24. Extension and power cords should always be checked and kept in good repair because:

 (A) breaks and tears in the cord are unsightly, (B) breaks and tears in the cord can cause serious shocks or burns, (C) sparks may cause wood to burn, (D) a short may cause the machines to burn up.

LI-U2-6

25: Carbon dioxide (CO^2) fire extinguishers may be used to put out what types of fires?

(A) electrical fires only, (B) wood fires only; (C) oil fires only,

(D) any kind of fire.

26. Water should never be used to put out what kind of fires?

(A) wood fires, (b) electrical and oil fires, (C) paper fires,

(D) none of the above.

- The proper procedure to fight a fire with a fire extinguisher is to:

 (A) point the nozzle at the top of the flame, (B) point the nozzle at the middle of the flame, (C) cover the area around the fire and keep it from spreading, (D) point the nozzle at the source of the fire because that is where the fire is located.
- 28. In case of fire in the shop you should first:

 (A) run out of the shop, (B) throw water on it, (C) sound the alarm,

 (D) none of the above.
- Lifting any object that is too heavy for you:

 (Λ) is all right if you do it slowly, (β) can be done if you know the right way to lift, (C) should never be done, because it may cause strain or rupture, (D) is a good way to show off your strength.
- 30. Before the power is turned on, the teacher must check:
 (A) the hand tools, (B) the classroom, (C) all special setups,
 (D) none of the above.
- 31. The teacher MUST approve:

 (A) all "horseplay", (B) all projects, (C) all fighting in the shop,

 (D) none of the above.
- Deliberately shorting an electric circuit:

 (A) is permissible if the voltage is low, (B) may damage the wires,

 (C) is an easy method to test whether the circuit is closed or open,

 (D) may cause an explosion or do hodily harm.
- Cutting two or more "hot" wires with pliers:

 (A) is safe practice if the handles of the pliers are insulated,

 (B) is permissible if the wires are 18 gage, (C) may be done safely if you are standing on a wooden floor, (D) none of the above.

- 34. Shop clean up is the responsibility of:
 (A) the custodian, (B) all the students, (C) the teacher, (D) the principal.
- 35. When a machine makes an unusual sound, it should be:
 (A) oiled immediately, (B) ignored, (C) reported to the teacher immediately, (D) adjusted.
- Check a soldering iron for heat with:

 (A) your face, (B) your hand, (C) a piece of solder, (D) your feet.
- To remove excess solder from a soldering iron tip:

 (A) wipe with a cloth, (B) flip it off, (C) wash it off, (D) use cleaning fluid.
- 38. When changing components in an electrical circuit:

 (A) leave the plug in, (B) pull the plug out, (C) turn the circuit on its side, (D) turn off the power switch.
- Make sure that the hand tools you are going to use are:

 (A) sharp; (B) the proper tool for the job, (C) in good condition,

 (D) all of the above.
- 40. If a tool becomes defective while you are using it you should:

 (A) hide it so that no one will know, (b) report the condition of the tool to the instructor, (C) place it back on the tool panel and not say anything (D) regain the tool yourself.
- 41. Be sure your hands are as free as possible of ______ before using hand tools.

 (A) dirt, (B) grease, (C) oil, (D) all of the above.
- Repairs are to be made on shop equipment only with:

 (A) the power on, (B) the machine running, (C) the teacher's permission, (D) none of the above.
- 43. Spilled oil or grease is dangerous. Always:

 (A) clean it up, (B) leave it, (C) pour water on it, (D) none of the above.

2

- The motion involved in striking or cutting must be done in a direction:

 (A) towards you, (B) away from you, (C) towards other students,

 (D) all of the above.
- A project is still dangerous even after its power switch is turned off because:

 (A) it may still be plugged in, (B) some of the components may be hot, (C) the capacitors can store a charge which can shock you, (D) all of the above.
- 46. Never use a file: (A) without a handle, (B) as a pry bar, (C) as a hammer, (D) all of the above.
- Pass tools to classmates:

 (A) with handles first, (B) with the points first, (C) by throwing them, (D) none of the above:
- 48. Before starting a machine, you must:
 (A) check all adjustments, (B) make sure all guards work, (C) remove all tools/rags, (D) all of the above.
- Before leaving a machine, you must make sure:

 (A) the guards are off, (B) the power is off, (C) the machine has come to a complete stop, (D) both B and C.
- 50. I did well on this test.
 (A) True, (B) False, (C) OK, (D) I blew it.

SAFETY

Name:	1 1 1	
Date:		,
Period:		-

TECHNICAL GLOSSARY

ACCIDENT:

An unplained or unexpected occurance usually resulting in injury. Most common shop accidents can be prevented by observing safety rules, working carefully, and using common sense.

ARTIFICIAL RESPIRATION:

A life saving procedure used to revive a person who has stopped breathing. Artificial respiration may be required as a result of electrical shock, drowning, strangling, etc.

CARDIAC ARREST:

A loss of heartbeat caused by electrical shock, or high blood pressure. Closed cardiac massage is the recommended first aid procedure.

ELECTRIC SHOCK:

The flow of an electric current through the body. Shock can cause such physical effects as muscle twitching or paralysis, burns, interruption of breathing, unconsciousness, ventricular fibrillation, cardiac arrest, or death.

FIRE:

A combustion process characterized by heat, flame, and light. There are three general classes of fire: Class A fires involve wood, paper, rubbish, and fabrics; Class B fires involve oil, grease, gasoline, paints, and solvents; Class C fires involve insulation and other combustible materials in electrical and electronic equipment.

FIRE EXTINGUISHER: A portable, selfcontained device holding a liquid, or chemical which can be sprayed on a fire to extinguish it.

FIRST AID:

Emergency treatment for injury, accidents, or sudden illness generally administered before regular medical care is available.

FLAMMABLE:

A designation for types of materials which are easily ignited or set on fire. Other designations may be used to identify these materials, such as; combustible or inflammable.

GROUNDING:

A safety precaution which calls for placing the metal housing or case of a device at ground potential to prevent possible operator shock. Most commonly, a third wire is added to the power cord. This wire is connected between the case and earth ground allowing an alternate path for current flow. Thus, if the metal housing of a device becomes electrically "hot", current will flow through the grounding wire to the earth, instead of through the operators body to earth.

'A H we :						•	
		-		٠.			•
Date:		- t				· 	
•	1		•	, ,'			•
eriod:		· .		_	_		

HAND TOOLS:

This term refers to a wide variety of tools which require physical manipulation or primarily the use of your arms and hand muscles for their operation and use. Examples of typical hand tools would be; screwdrivers, wrenches, soldering irons, pliers, etc..

HAZARD:

The presence of a dangerous or potentially dangerous situation.

HORSEPLAY:

The undesired, potentially hazardous, activity of clowning or playing in the shop or laboratory.

INJURY:

Physical harm or damage to ones body.

LIVE CIRCUIT:

An electrical circuit which is energized, (power applied switch on) and capable of producing current flow.

MACHINE TOOLS:

Generally, power assisted tools utilized for "heavy" jobs which require work beyond that supplied by hand tools. Examples of machine tools; drill press, grinders, sheet metal shears, box and pan break, etc..

SAFETY CLASSES:

Protective eye glasses with shatter proof lenses and side shields. Safety glasses should be worn at all times when necessary while working in the shop. They provide invaluable protection by preventing foreign materials (pieces of wire, chips, broken glass, chemicals etc.) from entering or coming in contact with the eyes. Goggles and face shields can be utilized to provide additional eye protection while working in extremely hazardous areas.

SAFETY PRECAUTION:

An action taken, followed or observed, to avoid a possible hazard or dangerous situation.

SAFETY RULES:

A specific list of rules designed to identify common accident causing situations and hazards. By observing the safety rules many accidents will be avoided or prevented.

VENTRICULAR PIBRILLATION:

A type of heart failure, caused by electric shock, in which the heart muscle no longer beats in a regular fashion but rather quivers erratically. If this condition is not corrected rapidly, death will result.

INFORMATIONAL HANDOUT

SHOP CONDUCT AND PROCEDURE RULES

- 1. Students must be on time daily and each student must be in his/her assigned seat before the tardy bell rings.
- 2. You are required to have a notebook specifically for this subject at your desk each day. It will be collected and graded during the year.
- 3. You must also supply yourself with the necessary materials for class-room notes paper and a writing tool.
- 4. All handouts and notes will be kept neatly in your notebook, not scattered in your locker.
- 5. Seats (and lab. station) will be assigned. Do not change your seat without consulting your teacher.
- 6. Absolutely no horseplay in the shop. Many painful accidents occur by the careless and thoughtless antics of the so-called "clown." Walk in the shop at all times. Loud talk and unnecessary noise will not be tolerated.
- 7. No eating, drinking, or class-room.
- 8. Keep your desk (lab. station) and adjacent floor area clean.
- 9. Pencils should be sharpened before class. All trash (scratch paper etc., shall be kept at your desk and thrown away after class only.
- 10. Throwing anything in the classroom is absolutely forbidden.
- 11. Turn in all assignments on time. Late assignments will be down graded.
- 12. If you finish your work before others, use the extra time constructively. Do not disturb your fellow students.
- 13. Poor attendance will hurt your grade, because it is difficult to make up missed work.
- 14. It is the students responsibility to make up any tests or missed work.
- 15. Feel free to ask questions anytime on subject matter which you do not understand.
- 16. If you must leave the room during class, clear it through the instructor first.

	Name:	 ,			
		 		. 1	_
	Date:	 			_
			,	,,	:
Pe	riod:	 		 	_

- 17. Work safely and encourage other students to do the same by setting a good example each day.
- 18. Use only the machines and tools for which you have satisfactorily passed safety tests.
- 19. Report any injuries or damage to yourself or equipment to the teacher.
- 20. Malicious damage to equipment and parts will not be tolerated. You will be required to pay for any damage caused in this manner.
- 21. Do not remove any project, or material, from the shop without the instructors approval.
- 22. When the time for clean-up comes, cooperate with the foreman and do your fair share to keep the shop clean and attractive.
- 23. Students must return to their seats prior to class dismissal at the end of the period. Class will be dismissed only after the shop is clean, all tools are accounted for, and all students are quiet and in their assigned seats.

SHOP CONDUCT AND PROCEDURE RULES

The shop conduct and procedure rules have been read and explained to me. I agree to abide by these rules, and if I have any questions I will ask the instructor.

CLASSIFICATION OF FIRES AND EXTINGUISHING TECHNIQUES

There are three classification categories for fire. Each type of fire requires special extinguishing techniques. Use the chart below to distinguish the extinguishing techniques.

Class "A"

Fires involving combustible material such as wood, paper or cloth: to extinguish, cool and quench with pump type extinguishers containing water, or soda-acid. CO2 (carbon dioxide) extinguishers may also be used.

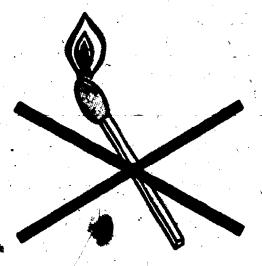

Clas's "B"

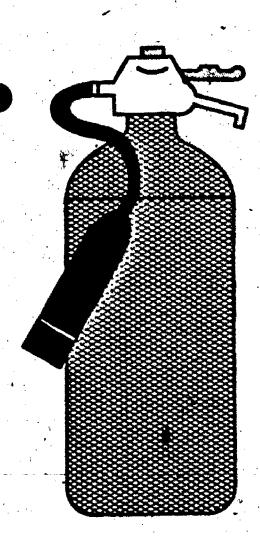

Fires involving flammable liquids such as gasoline, kerosene, greases, thinners, and finishes: smother the burning fuel. Foam and CO2 type extinguishers may he used.

Class "C"

Fires involving electrical equipment; use a nonconducting type extinguisher such as CO2 or dry powder, and if possible disconnect the source of electrical energy.

NOTE: Always point the fire extinguisher nozzle at the source of the fire and not at the top of the flame.

LABORATORY SAFETY PROCEDURES

INTRODUCTION:

People working in industry know the importance of safe working habits. Safety training programs are sponsored by unions, management, public agencies, and insurance companies. Despite these good efforts, accidents annually cause lost job time, painful injuries, and needless deaths.

Good safety habits are learned daily. As you begin your laboratory work in electricity, resolve now to learn and practice safe working habits in the laboratory. The choice of your future safety and future laboratory work habits is up to you. Form safe habits now.

Name:	-
Date:	.)
Period:	

GENERAL SAFETY PROCEDURES:

Safe Attitudes. Laboratories are working areas for adults. Tricks, games, and horseplay should be left in the school yard.

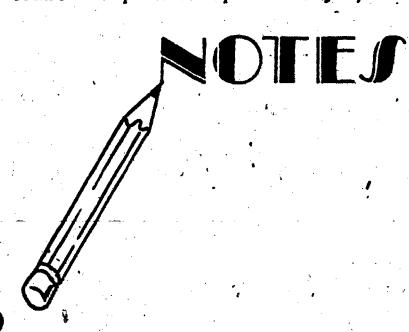

Safe Environment. Work areas must have proper power, ventilation, and light. Aisles should be open and clear. Storage areas are to be kept clean and secured. The use of temporary extension cords, fans, heaters, gas or water connections is discouraged. Maintain a neat and orderly work area.

First Aid Procedures. Even with good safety practices someone may be injured. Your instructor and/or the school nurse are trained in first aid procedures, but there are several general rules which you should follow.

Don't panic! Determine if there is any immediate danger to the injured person. Never move an unconscious person without cause. Lay such a person flat. Keep the person warm to prevent shock. Never try to force liquids on an unconscious person. If the victim is breathing normally, keep the person still and comfortable until medical aid arrives.

Severe electrical shock or other types of accidents may interrupt breathing. A procedure such as artificial respiration can be used to stimulate the breathing process. Check for a swallowed tongue before application of artificial respiration. This procedure should be administered by a trained person if possible, and continued until medical help arrives. The two common methods of artificial respiration are mouth-to-mouth and the Schaeffer method.

All injuries should be reported to the instructor. Even minor cuts can become infected, and the best first aid supplies, nurses, and doctors cannot help an unreported injury.

Date:	 • •	
	F.,	
Period:	 •	

GENERAL SAFETY RULES:

Shop Behavior and Safety Practices

- 1. Clowning, scuffling, pushing, running, and throwing objects are dangerous practices in any shop and are forbidden at all times.
- 2. Obey all warning signs -- they are posted for your protection.
- 3. Caution any student you see violating a safety rule.
- 4. When using machines or hand tools, give the job at hand all of your attention.
- 5. Work at a speed consistent with safety. "Foolish hurry," such as rushing to complete a procedure, is dangerous.
- 6. Cooperate with your classmates in the shop cleanup program.
- 7. Machines must not be operated while instructor is out of the room.
- 8. If equipment is not working properly, shut it off and tell the instructor at once.
- 9. Report to the teacher all breakage or damage to tools, machinery, or equipment.
- 10. A student who sees a dangerous situation must report it at once to the teacher.

Eye Protection

- 11. Eye protection must be worn when working in an area where hazardous conditions exist.
- 12. Face shields or goggles shall be utilized where extra protection is required, such as while grinding or working with caustic substances.
- 13. Eye glasses must not be used in place of goggles or face shields.
- 14. When compressed air is used for cleaning, wear eye protection. Take care to direct chips, shavings, and dust away from other students.

 NEVER ALLOW THE STREAM OF AIR TO COME IN CONTACT WITH YOUR BODY.

	Name:		
•			
	Date:	1	
Pe	eried:		

- 15. Wear safe clothing when working in a shop. Fasten or remove loose clothing before you operate any machine. Roll long sleeves above the elbows. Apron fastening should be such that they will break if the apron becomes entangled in a machine.
- 16. Long, loose locks of hair can easily be caught in revolving machinery and ripped out causing serious scalp laceration. Have your hair cut short, tied back, or tightly covered.
- 17. Wearing gloves is forbidden when you are working with power driven machinery in the lab.
- 18. Remove jewelry--bracelets, rings, chains, and other accessories that are hazardous in shop work.
 - 19. Sharp, pointed tools or materials are not to be carried in clothing.

 Hold sharp pointed edges down.
 - 20. Always wear protective clothing when working with chemicals. Rubber gloves should be worn when handling chemicals or immersing wour hands in chemical solutions.
 - 21. Always wash hands with soap and water after working with materials that might be harmful to the skin.

Housekeeping

- 22. Keep your work area clean and orderly. Good housekeeping is part of
- 23. Keep floors, aisles, and passageways clear of materials and equipment.
- 24. Keep tools in a safe place. Never leave them where they may cause injury. Put them in tool boxes, trays, cases, or on wall panels.
- 25. Store material neatly and securely and in a place where persons passing will not be injured.
- 26. If water, grease or oil is spilled on the floor, clean it up immediately.
- 27. Extension cords shall always lie flat on the floor in such a way that students will not trip over them.
- 28. Always use a brush to clean off benches and machines. There may be sharp or jagged particles among the scraps, which could cause serious injury to the hands.

•	Name	:		 1		
	•		•		 	
	Date	13			•	
		7		 	 , 	.
9	eriod	: 1		 		

29. Always keep bench, cabinet drawers, and locker doors closed.

30. Keep tools and materials from projecting over the edge of benches or tables whenever possible.

Approval

- 31. Students are warned not to use machines until they have been given the proper safety instruction, and received permission from the teacher. The student must ask for further instructions if in doubt concerning any operation.
- 32. When in doubt, ask the instructor. Do not depend upon the advice of another student.
- 33. The shop safety test must be passed by students in order to operate any power driven machine.
- 34. Do not operate switches of machines and instruments unless given permission to use them by the instructor.
- 35. Ask your instructor to approve all projects you plan to do.
- 36. Repairs are to be made on shop equipment only when permission has been given. Do not tamper with shop equipment.
- 37. All special set-ups in the lab, must be approved before the power is turned on.

Injury

- 38. Report all accidents, however slight, to the instructor at once. Infection may result from uncared for cuts and scratches.
- 39. When lifting heavy objects, keep your arms and back as straight as possible, bend your knees, then lift with the powerful muscles in your legs.
- 40. Do not attempt to lift heavy items alone. If there is any doubt in your mind about your ability to safely lift an object, ask for help.
- 41. Screws, nuts, and other nondigestible materials are never to be placed in one's mouth.

Manie

Period:		•	* ** ** ** ** ** ** ** ** ** ** ** ** *
		والمراجع	

Fire

- 42. The location of fire extinguishers, fire exits, and fire drill procedures shall be known by all students.
- 43. Nothing shall be hung on fire extinguishers. The area around them must be kept clear so that they may be reached without delay if a fire were to occur.
- 44. When pouring flammable liquids, be careful not to spill them.
- 45. Oily or paint-filled rags must be placed in a covered metal container.
- 46. Toxic chemicals, kerosene, paints, thinners, and other finishes or cleaning materials are to be used in a well ventilated room. They are never to be used near an open flame.
- 47. Never use water to put out an electrical or oil fire, it will cause the fire to spread.
- 48. In case of fire in the shop: Sound the alarm; FIRE!!, turn off all gas and electricity, put the fire out.

iland Tools

- 49. Be sure your hands are as free as possible of dirt, grease, and oil when using tools.
- 50. Select the right tool for the job to be done. Use the proper type and size hand tool for the job.
- 51. Make sure when using a sharp-edged tool to point the edge away from yourself and classmates.
- 52. When carrying tools in the hands, keep the cutting edge or point directed toward the floor.
- 53. Clamp small work on a bench or in a vise when using a hacksaw, a screw-driver, or when performing delicate operations.
- 54. Never use a chisel, punch, or hammer with a "mushroomed" head. Chips may fly off and injure someone.
- 55. Never use a file without a handle. Be sure that the handle is properly secured to the file.
- 56. Pass tools to classmates with the handles first.

name:				1		
						_
Date:		•	1			
•		•				
Period:	·				• .	

- 72. Keep rags away from machines that are in operation.
- Make sure everyone is clear of the machine before starting it.
- 74. Have the instructor check all special set-ups and new operations before turning on the machine.
- 75. Think about your job while operating a machine. It is dangerous to talk when you are using power equipment.
- Have machine at a dead stop, power off, before cleaning, oiling or repairing. Always turn the power off before leaving a machine.
- Use only electric power tools that are grounded, or that have UL approved housings.

- 78. Only the operator and teacher are permitted within the defined working area around any machine.
- 79. Do not lean on machines - stand clear.
- Disturbing another student while he is working is a dangerous practice.

Electrical

- 81. Consider every electric circuit live until proved otherwise.
- 82. Make certain your hands are completely dry before touching electrical switches, plugs, or receptacles.
- 83. Remember even 110 volts can be fatal. Approach all jobs with caution, and analyze each job before you start.
- 84. The location of emergency power switches shall be known by all students.
- 85. Never allow anyone to turn power on and off for you while you are working with instruments.
- Cutting two or more wires at the same time with pliers or other tools 86. is extremely dangerous and may result in damage to the circuit and tools and severe injury to the person if the power is not turned off.
- Electricity has no respect for ignorance. Do not apply voltage or 87. turn on any device until it has been properly checked by the instructor.

Name:				
	` `	•		
	5			
Date:	· ·	<u> </u>	<u>. </u>	
•			:	
Period:			• •	

- 57. Plastic handled screwdrivers should not be used near an open flame or near hot soldering irons.
- 58. Netal rules should be kept clear of electrical circuits. When in doubt use a plastic or wood rule.
- 59. All portable electric tools and equipment must be disconnected when not in use.
- When disconnecting an electric tool or appliance from a circuit, remove.
 the attachment plug from the receptacle by pulling on the plug handle
 instead of on the cord.
- 61. There is a right and a safe method to use all tools. Don't try to cut corners by using incorrect methods.

- 62. Never test the heat of a soldering iron by feeling it with your hands. Check the heat of the iron with a piece of solder.
- 63. Always return the iron to its proper holder.
 - 64. Always wipe off excessive molten solder. Never flip it off. Molten solder inflicts painful burns when it comes in contact with the skin.
- 65. When passing a soldering firon to another student, place it on the soldering iron rest. The other student can then pick up the iron by the handle.
- 66. Care must be taken not to let the soldering iron burn any electrical cord, or circuit wire.

Machine Tools

- 67. Only the operator may start and stop a machine, and after the machine is turned off, s/he should stand by until it has stopped running.
- 68. All adjustments must be securely fastened before the power is turned on.
- 69. All wrenches and other tools must be removed from the machine before the power is turned on.
- 70. Keep machine and safety guards in proper position at all times.
- Overloading or forcing in any manner any hand operated or power driven machine is dangerous. Use only the material or stock furnished or approved by your teacher.

Mame:		 	
		-	
Date:			
_			_
Period:	<u> </u>		

- 88. Always stand a safe distance from any project when it is turned on for the first time. Sparks and smoke can be dangerous.
- 89. Deliberately shorting any electric circuit or generating device may damage the equipment, cause an explosion, or do bodily harm.
- 90. Certain components such as resistors and vacuum tubes get hot while operating. Wait for them to cool before attempting to remove them.
- 91. Do not work around electrical equipment if floors are damp or wet...
- 92. Do not work on an electrical circuit with the power turned on.
- 93. Be sure equipment is in proper working order before using. Frayed cords and plugs are a major source of accidents.
- 94. Ask for instructions before using any piece of electronic test equipment. One wrong connection can destroy an instrument and thus deprive you and others of its use until repaired. The repairs can be expensive.
- 95. Use proper instruments for testing circuits.
- 96. Before replacing a fuse in any electrical equipment, disconnect the power source.
- 97. When making temporary or permanent connections, carefully avoid leaving open splices or pieces of wire sticking out. Secure all wires properly. Tape or cover the connections.

LABORATORY SAFETY PROCEDURES

The laboratory safety procedures have been read and explained to me. I agree to abide by these rules, and if I have any questions I will ask the instructor.

INFORMATIONAL HANDOUT

ELECTRICAL SHOCK

One of the major hazards in the electronics field is protection against electrical shock. Shock is caused by the passing of electric current through the body. Current flow is related to the voltage applied and therefore the higher the voltage the more serious the shock. Don't however get the idea that low voltages do not shock for they certainly do if the circumstances are right.

Let's see what can happen when an electric current passes through your body. A number of effects may occur depending upon the circumstances and magnitude of the shock.

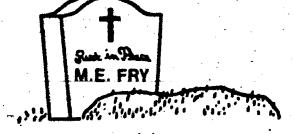

Effect

Produces a shock than can be felt. (Mild "tingling" sensation).

Produces a severe shock, which is painfull, and can cause loss of muscular control. (Can't let go phenomenon).

.. i ampere

Produces a potentially fatal shock which can cause death if current lasts for a second or more.

Name:			1	_
Date:				
Period:	•	•	_	

As you can see, the body is sensitive to relatively small current flows. As a comparison, a common 100 watt light bulb draws a current flow of .85 amperes, far higher than the .1 ampere of current which can cause death.

OTHER EFFECTS OF ELECTRIC SHOCK:

Muscular Paralysis-

Burns-

Cessation of breathing-

Unconsciousness-

Ventricular fibrillation-

Cardiac arrest-

All of these effects do not occur with every shock. As stated before, conditions vary. What happens to you depends upon several factors:

- (1) The intensity of the current.
- (2) The frequency of the current.
- (3) The path the current follows through the body.
- (4) How long the current passed through the body?
- (5) Did you expect to be shocked?

Keep in mind, that the current flow through your body, not the amount of voltage applied is the determining factor in the severity of a shock you might receive. The higher the current, the more dangerous the shock.

CAUTION: Electric shock can be harzardous to your health.

ELECTRICITY / ELECTRONICS

CURRICULUM GUIDE INSTRUCTIONAL MODULE

STATE OF CALIFORNIA DEPARTMENT OF EDUCATION

DATE STARTED______
DATE COMPLETED_____

R. E. LILLO N. S. SOFFIOTTO

STATE ELECTRICITY/ELECTRONICS CURRICULUM GUIDE INSTRUCTOR'S GUIDE TO ACCOMPANY LEVEL I UNIT #3

Title of Unit: Methods to Generate Electricity

Time Allocation: 1 week

Unit Goal:

To disclose those competencies which will introduce the student to a variety of sources and/or methods of producing electricity.

Unit Objectives:

The student will be able to:

- 1. identify six methods of producing electricity.
- 2. illustrate by example how each of the sources discussed produces electricity.
- 3. explain in detail the two kinds of cells that are classified under chemical action.

Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria, which may utilize a combination of written, oral, and laboratory testing procedure.

Instructor References:

Basic Electronics Systems Technology Unit 1. Dugger, Patrick, Suess, and Ziegler, Bruce, 1973. Lessons: 2-6.

Electricity and Electronics. Walter B. Ford and William B. Steinberg, American Technical Society, 1974. Units: 6-9.

Electricity One-Seven. Harry Mileaf, Hayden Book Company, Inc., 1976.
Chapter: Electricity 1.

Overview:

Unit 3 focuses on the fact that electricity has become an essential part of our life, therefore it is important to be aware of the sources for creating electrical energy.

The instructor should first examine the sources that are available, then identify those which are small-scale sources and those that are classified as large-scale sources in terms of power produced.

This unit introduces the six basic sources of electricity along with some of the details of application. The actual concept of "how" these sources generate electricity will be considered at a higher level of instruction.

A variety of appropriate exercises and laboratory experiments and/org project should be coordinated with all unit topics when feasible.

Suggested Presentation Hints/Methodology:

Follow the instructional module unit outline as a basic skeleton for curriculum presentation, however, note the following:

1. Try not to leave the impression that the sources presented in this unit are the only sources; they are just the most common ones. Explain further that many other sources have potential, yet are still in the experimental stage in terms of development.

2. Most of the methods of producing electricity can be explored in greater depth during laboratory activities in which the student physically examines and/or performs a variety of experimentation.

3. When discussing heat, light, or pressure methods of producing electricity, under small-scale production, it is important to emphasize that these methods are primarily utilized in control or sensing types of circuits.

4. Discuss with the class in detail the topic of cells and batteries.

Present the primary type cells as being basically non-rechargeable, while the secondary type is rechargeable. Stress that
the output pressure (voltage) is greater in the secondary cell.
Introduce new career choices to your class which may exist in.

Introduce new career choices to your class which may exist in the future in special energy areas like solar, geothermal, wind power, and nuclear fusion, however, note that Unit 10 of this level will deal with this subject in greater detail.

Supplemental Activities and Demonstrations:

1. Producing electricity through heat action can be demonstrated by using a pair of wires (iron and nichrome) and a <u>large</u> galvanometer. Twist the loose ends of the wires together and heat the junction with a match.

2. Producing electricity through pressure action can be demonstrated with a record player pickup. Apply pressure to the needle and

then measure the voltage across the cartridge...

3. Producing electricity through light action can be demonstrated with a measurement of the output of a solar cell. The output will increase as the light striking its face increases.

4. Many vendors sell an inexpensive dry cell kit which is both fun and a real learning activity - try it.

Instructional Module Contents:

- 1. Unit Outline (overhead)
- 2. Pre-Post Test (keyed)
- 3. Technical Glossary

ERIC

UNIT EXAM

METHODS TO GENERATE ELECTRICITY

IMPORTANT-

Indicate your responses on the answer sheet only. Fill in the box corresponding to the correct answer to each question - there is only one correct answer for each question.

- 1. Static electricity is produced by heat. (T-F)
- 2. A charged rod will attract a neutral material. (T-F)
- 3. Two types of static charges are positive and negative. (T-F)
- 4. Most primary cells are rechargeable. (T-F)
- 5. The common "D" size dry cell uses carbon and tin for its metal plates or electrodes. (T-F)
- 6. A battery can change chemical reactions into electrical energy. (T-F)
- 7. Light shining on a crystal will produce a small amount of electricity (T-F)
- 8. Moving a coil of wire through a magnetic field will produce electricity. (T-F)
- 9. A thermocouple is an example of a piezoelectric device. (T-F)
- 10. A DC generator contains a coil of wire (armature), magnetic field (field winding), and a commutator. (T-F)
- 11. A charged rubber rod will attract:

 (A) a charged glass rod, (B) a positively charged material, (C) B
 neutral material, (D) all of the above.

- 12. The liquid in a wet cell is called the:
 (A) acid juice, (B) electrolyte, (C) chemical composition, (D) electrode.
- 13. Piezoelectricity is electricity produced by:
 (A) heat, (B) chemical reactions, (C) pressure, (D) magnetism.
- 14. A generator requires a coil of wire, motion, and ______ in order to produce electricity.

 (A) light, (B) heat, (C) friction, (D) magnetism.
- 15. Which of the following is an example of a photoelectric device?

 (A) solar cell, (B) thermocouple, (C) battery, (D) Rockelle salt crystal.

TECHNICAL GLOSSARY

ACI Da

A strong chemical substance with corrosive properties. Vinegar, is an example of a weak acid, other common acids are citric acid and sulfuric acid.

BATTERY:

Two or more cells connected together. A battery is an important source of DC electrical energy because it is self-contained, and portable.

CELL:

A single voltaic unit, which is made by combining two dissimilar metals and an acid solution or electrolyte.

CHEMICAL ELECTRICITY: A source of DC electricity, which is produced by chemical reactions. A cell and a battery are examples of chemical electrical devices.

COIL:

A number of turns of insulated wire, usually wrapped in circular form. A coil of wire is a necessary part of a generator.

GENERATOR:

A device used to produce electricity, by moving a coil of wire through a magnetic field; or by keeping the coil stationary, and moving the magnetic field.

PHOTOELECTRICITY:

A source of DC electricity, which is produced by <u>light</u> energy. Photoelectrical devices are of three types - photovoltaic, photoconductive, and photoemissive. Photovoltaic devices produce electricity directly from light.

PIE ZOELE CTRI CITY:

A source of electricity which is produced when pressure is applied to a certain crystal material such as quartz, Rochell salts, or barium titanate.

PRIMARY CELL:

A type of voltaic cell, which will produce electricity as soon as the chemicals are combined, and generally cannot be recharged.

SECONDARY CELL:

A cell which requires charging before it will produce electricity, and can be recharged many times.

STATIC ELECTRICITY:

A collection of electrical charges (both positive, and negative) at rest on the surface of an object. Static charges are produced by, friction.

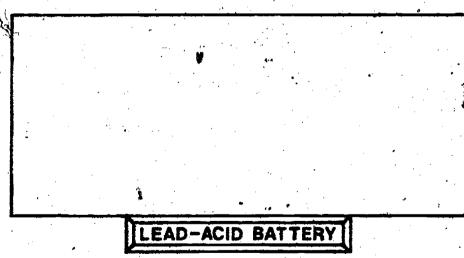

THE RMOCOUPLE:

A device consisting of two different metals joined at a junction. When the junction is heated, a small amount of DC electricity is produced.

ELECTRICITY / ELECTRONICS

CURRICULUM GUIDE INSTRUCTIONAL "MODULE

STATE OF CALIFORNIA DEPARTMENT OF EDUCATION

NAME.		·	
DATE	STARTED		·
DATE	COMPLETED		

BY R. E. LILLO N. S. SOFFIOTTO

STATE ELECTRICITY/ELECTRONICS CURRICULUM GUIDE INSTRUCTOR'S GUIDE TO ACCOMPANY LEVEL I UNIT #4

Title of Unit: Wiring Tools and Wiring

Time Allocation: 1 week

Unit Goal:

To establish basic technical assembly and electrical skills by conveying those competencies relevant to successful usage of tools and wiring techniques.

Unit Objectives:

The student will be able to:

- describe the function, list safety precautions, and illustrate the correct use of each essential wiring tool presented in this unit.
- 2. demonstrate the proper method of preparing wire for electrical translation and explain several standard methods to terminate wire.
- 3. explain the purpose of wire and insulation, and indicate the reasons for the different types of wires.

 Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria, which utilizes a combination of written, oral, and laboratory testing procedures.

Instructor References:

Electronics Assembly and Fabrication Methods. S.R. Duarte and R.L. Duarte, McGraw-Hill Book Co., 1973. Chapters: 1, 5, 6, 7, 8, 9, and 10.

Electronic Techniques. R.S.-Villanucci, A.W. Avtgis, and W.F. Megow, Prentice-Hall, Inc., 1974. Chapters: 3-16.

Technical Electricity and Electronics. Peter Buban and Marshall L. Schmitt, McGraw-Hill Book Co., 1977. Units: 27-31.

Overview:

Unit 4 will allow the student to develop competencies that will act as a foundation for future mechanical and electrical assembly tasks.

The unit should also be introduced as a valuable resource in project construction. The idea of constructing a project should be stressed as a necessary "hands on" experience in order to facilitate working with devices and processes.

The central theme is to describe a variety of tools and basic electrical skills for the students to become familiar with and develop, however, craftmanship is also a quality that must be emphasized by the instructor as an on going process that should permeate all levels of activities.

Most major topics in this unit can be presented through laboratory demonstrations, and projects. A student project can really assist in evaluating student understanding and it will further motivate the students in their studies.

ERIC Full Text Provided by ERIC

Suggested Presentation Hints/Methodology:

Follow the instructional module unit outline as a basic skeleton for curriculum presentation, however, note the following:

1. When illustrating basic hand tools and describing their function, an overhead projection can be easily adapted as a means to show tool outline or shape. In addition, physically tracing tools with color pencils can assist disadvantaged students in learning the basic differences in size, shape, etc.

Hopefully, in this unit a variety of simple exercises on wire identification, techniques of wire stripping, methods of wire termination or wire size determination can really help introduce

students to many basic assembly techniques.

Whatever unit project or lab activities are utilized, it is vital at this age to have activity organization, adequate materials, and good supervision of the class.

. At this educational level it is also wise when instructing students in tools and wiring techniques to utilize higher ability students to assist in demonstrating a procedure or helping

a slower student.

Supplemental Activities and Demonstrations:

1. The vocabulary list presented in this unit is long. Spend a good deal of time describing each term and if possible demonstrate each tool listed and emphasize safety precautions when appropriate.

2. Wire stripping stranded wire is taken for granted by many instructors, however, the correct technique is sometimes difficult for students to acquire. When demonstrating this skill make an effort to explain what happens electrically and mechanically when strands are broken during the stripping process.

Remember that safety must be stressed especially in this unit. Try to emphasize to students for example, that when changing an AC plug extreme care must be observed to secure wires in their proper location to avoid a hazardous situation

Instructional Module Contents:

- 1. Unit Outline (overhead)
- Pre-Post Test (keyed)
- 3'. Technical Glossary
- 4. Worksheet (vocabulary) Tool and Material Identification
- 5. Quest Activities
 - 6. Informational Handout (Tools and Equipment I May Need)
 - 7. Informational Handout (Wire: Purpose and Use)
- 8. Informational Handout (Wire Termination Methods)
- 9. Unit Module Answer Keys

IV. Wiring Tools and Wire

- A. Essential Wiring Tools and Usage 1. Long nose pliers
 - 2. Diagonal cutting pliers
 - 3. Wire strippers
 - 4. Other varieties
- B. Wires and Cables
 - 1. Wire as a conductor
 - 2. Insulation -- purpose and types
 - 3. Kinds of wire
 - 4. Cables and cords
 - 5. Wire size
 - 6. Wire termination methods
 - 7. Wiring plugs LI-U4-3

UNIT EXAM

IMPORTANT-

Indicate your responses on the answer sheet only. Fill in the box corresponding to the correct answer to each question - there is only one correct answer for each question.

- 1. Wire strippers are used to remove the insulation from wires. (T-F)
- 2. A stranded wire is less flexible than a solid wire of the same gauge. (T-F)
- 3. Soldering irons are available in many shapes, sizes, and wattage ratings. For general project work, a 25-35 watt iron is appropriate.

 (T-F)
 - 4. A conductor provides a path through which electricity can easily flow. (T-F)
 - 5. Plastic is a common conductor used on wires. (T-F)
 - 6. A 24 gauge wire has a larger diameter than a No. 12 American Wire Gauge wire. (T-F)
 - 7. When fastening a wire to a screw terminal, the wire should be wound around the screw in a clockwise direction. (T-F)
 - 8. An insulator offers a difficult path for the flow of electricity. (T-F)
- 9. Connectors are generally used for a one-time, permanent contact

 between wires and cables. (T-F)
- . 10. Diagonal-cutting pliers are designed for stripping wires. (T-F)

- 11. A chassis punch is commonly used to punch round holes in sheetmetal.
 (T-F)
- 12. Long-nose pliers are designed primarily for holding and bending small-gauge wires. (T-F)
- 13. A Phillips head screw can be driven by either a standard blade screwdriver, or a Phillips screwdriver. (T-F)
- The proper strain relief knot to use when connecting a plug to an electrical cord is the knot.

 (A) Square, (B) Undertakers, (C) Granny, (D) Underwriters.
- 15. The best conductor for most electrical work:
 (A) copper, (B) aluminum, (C) silver, (D) tin.

TECHNICAL GLOSSARY

ADJUSTABLE WRENCH:

An open-end style wrench with adjustable jaw size. This type of wrench is made with one stationary jaw, and an adjustable jaw, operated by a thumb screw. This allows one wrench to be used on many different nuts or bolt sizes.

CABLE:

A group of insulated wires held together by an outer covering.

CENTER PUNCH:

A metal punch with a sharp point. The center punch is used to mark the location of a hole that is to be drilled, preventing drill "wandering."

CHASSIS PUNCH:

A sheetmetal punch designed for punching round holes in a range of sizes from 1/2" to 3". The punch halves are drawn together with a machine screw.

CONDUCTOR:

A material through which electricaty will easily flow. Wire is a conductor or conducting material.

CONNECTOR:

A device at the end of a wire or cable used to connect the wires to or disconnect the wires from the equipment.

DIAGONAL-CUTTING PLIERS:

Pliers used for cutting soft metal wire. Two popular terms used for identifying these pliers are diagonals and dykes.

FILE:

A tool used mainly to smooth the edges of sheetmetal, and to do small amounts of cutting, shaping, and sitting of metal parts.

GAUGE:

A standard method for sizing wires. Gauge sizes are given as numbers, such as 24 gauge or 24g. The lower the number, the larger the diameter of the wire.

HEAT SINK:

A small tool used to draw heat away from an electrical part or connection during the soldering process.

HEX WRENCH:

A six sided wrench used for removing Allen head set screws or bolts.

INSULATION:

A material which does not allow electricity to flow through it. Insulation is placed around a wire, connection, or joint to prevent a short circuit or an accidental shock.

JACK :

A plug-in device or recepticle which accepts a matching plug to complete a connection.

·,/	wame:					
-	Date:		•	•	•	
Pe	riod:)				
			 			-

LONG-NOSE PLIERS:

Pliers used primarily for handling small objects and for bending and shaping wires. Most long nose pliers also have a cutting jaw for cutting small gauge wires.

LUG:

A terminal or device which is designed for easily attaching wires or electrical parts. Most lugs require that the wire be wrapped on and soldered.

NUT DRIVER:

A tool designed to rapidly install or remove nuts. The tool resembles a socket wrench attached to a screwdriver handle.

PLUG:

The male half of a connector which is plugged into a matching jack or socket.

PORTABLE :

A hand-held power tool used for drilling holes in various materials. The tool uses a chuck to hold the drill bit and generally has a trigger style switch as a control.

REAMER:

A tapered tool used to slightly enlarged holes drilled in sheetmetal.

SCALE:

A tool marked off in divisions and used for measuring length or distance. A one foot ruler is a type of scale.

SCREWDRI VER:

A tool which allows you to produce a twisting motion to tighten or loosen screws. The two common tip types are slotted or standard and Phillips-head.

SCREW TERMINAL:

A type of connector which uses a screw to hold or connect a wire in place. Screw terminals are often found on the back of speakers, on AC plugs, etc.

SHEETMETAL NIBBLER:

A special cutting tool used to nibble away small bits of sheetmetal. A nibbler can be used to cut irregular shaped holes in sheetmetal.

SLIP JOINT PLIERS:

A common type of plier designed for holding or gripping work. The slip joint permits the jaws to be opened wider.

SOLDER:

A mixture of tin and lead, which is melted into an electrical connection to form a bond.

SOLDER AID:

A tool used to bend wires for easy connection to terminals or lugs. Solder aids may also contain a brush or pointed probe for clearing terminals of solder.

SOLDERING IRON:

A tool used to provide the heat required when making a solder connection.

Name:			
Date:			
Period:	•		

SOLDERLESS TERMINAL: Also called a solderless connector or crimp connector, these devices do not require soldering, rather, the wire is inserted into a lug, and the lug is squeezed with a special tool, to make the electrical connection.

SOLDER REMOVER:

A device used to remove molten solder from a wire or connection. Most desoldering tools draw the molten solder from the connection with a vacuum or suction force.

SOLID WIRE:

A type of wire that consists of only one solid conductor, usually covered by Insulation.

SPLICE:

A method for connecting two or more wires together. Example: Tap splice, Rat-tail splice, or Western Union splice.

STRANDED WIRE;

A type of wire which consists of many strands of fine wire twisted together. The twisted conductors are then covered with an insulating material. Stranded wire is more flexible than solid wire of the same gauge.

STRIPPING:

The process of removing the insulating material (plastic, cloth, enamel) from a wire or conductor.

TERMINATION:

The ending of a wire or wire connection.

TIN SNIPS:

A scissors like tool used for cutting sheetmetal.

UNDERWRITERS KNOT:

A special strain relief knot used on electrical cords.

If the cord is accidentally pulled, the knot will absorb
the force, rather than the electrical connection.

VISE:

A tool used to securely hold work pieces while drilling, cutting, soldering, etc.. The most common style vise is called a bench vise, although many specialty vises are available for electronics work.

WIRE NUT:

A type of insulated solderless connector used for making Rat-tail joints. To use a wire nut, thread it onto a pair of bare conductors which are held parallel to each other. The conductor will twist and be held together firmly.

WIRE STRIPPERS:

A common tool used to remove the insulation from a conductor or wire.

INFORMATIONAL HANDOUT

TOOLS AND EQUIPMENT I MAY NEED

The following tools, and materials are considered as "basic equipment" for building or repairing of electrical projects.

Name:			 	 	
Date:				 	
Period:	•	,		1	 •

The following items may be needed and should be available in your school laboratory:

- A. Portable Electric Drill and Bits
- G. Scale or Ruler

B. Chassis Punch Set

H- Vise

C. Slip Joint Pliers

I. Center Punch

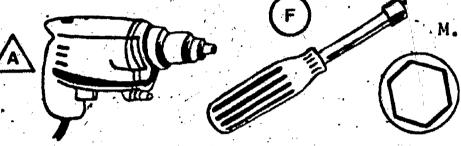

D. Hex Wrenches

- J. Tin Snips
- E. Assorted Miniature Files
- K. Reamer

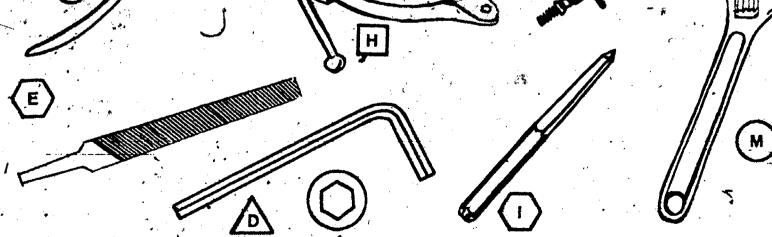

F. Nut Driver Set

L. Sheetmetal Nibbler

Adjustable Wrench

Remember, selecting the proper tools--using them wisely, often makes the difference between a rough, rancid, rookie job and a slick, super, professional one. Each tool works in its own special way so always select tools to fit the construction task.

INFORMATIONAL HANDOUT

WIRE: PURPOSE AND USE

PURPOSE

insulation wire 0

Wire is an important part of all electrical circuits and you should review some of the main factors to be considered when selecting or using wire.

A conductor (wire) provides the path or highway for the movement of electrons, and many times wire is covered with insulation to keep the electricity safely within the wire.

CONDUCTOR + INSULATOR = WIRE CONDUCTOR - INSULATOR = BARE WIRE

Types of Wire -

Solid wire is usually made from one thick copper thread. It is easy to handle and to solder, yet, when a lot of movement is necessary this kind of wire should not be used. You can buy this wire in a variety of outside colors and sizes. Components like resistors, capacitors, inductors, and transformers have solid wires (leads) extending from the body of the device so that the component may be connected securely to the circuit.

USAGE EXAMPLE: Solid wire is used to complete electrical circuits in the walls of homes, schools and industries.

Stranded wire is made from a bunch or group of copper threads that have been twisted together to appear like one wire. When flexibility or movement is important this is the type of wire to use. Remember that you must really be careful when stripping this kind of wire or some of the strands will be broken. Stranded wire is generally tinned with solder before being connected to a circuit point.

USAGE EXAMPLE: Stranded wire is used in cables, appliances, and extension cords.

WIRE INSULATION

PROTECTION

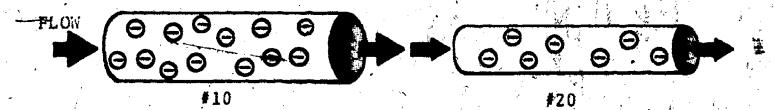

Most wires are covered by some kind of insulating material to prevent short circuits and dangerous accidents! Look at the various types of coverings used with each kind of wire on the following page.

		Name	•
		Date Period	
ename l varnish			
insulations plastic rubber			SOLID WIRE
rubber	_ 		
insulations plastic cloth			STRANDED WIRE
fiber glass	نا 		

The American Wire Gauge (AWG) number is a system of describing by number, the size or electrical capacity of the wire. The larger the wire number, the smaller the diameter of the wire. Of course, it is important to select the proper size of wire for the job at hand.

NOTE: A wire gauge is a device that can be used to determine the size of wire.

SIZE EXAMPLE: A #20 wire can carry less electricity than a #10 wire because the #20 is physically smaller in size, hence less current can travel through this wire.

WIRE IN GENERAL

Most wire is now made from copper because it is such a good conductor of electricity and can be purchased at a fair price. Silver is rated as a better conductor, however, it is far more expensive which means increased cost, thus, it is seldom used by manufacturers.

INFORMATIONAL HANDOUT

WIRE TERMINATION METHODS

WIRE TERMINATION METHODS:

After routing a wire to a location in a project, how do you finally end or secure the wire connection? There are several approved methods, some of which are pictured below.

1 Attach the wire directly to a pin or terminal LUG

2) Use a SPLICE to connect one wire to another. Splices are generally soldered and then insulated with black electrical tape.

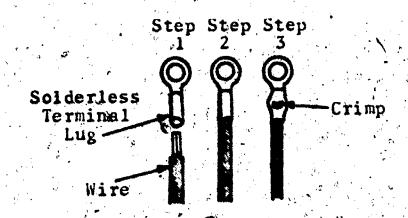

3 A WIRE NUT can be used to mechanically hold wires together. Soldering is not required.

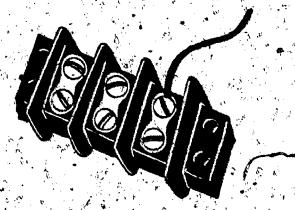

Name:	•		~				
				ای		_	
Date:			•	·	-	•	
		1	1			- .	
Period:		· . ·	, •				

Various types of CRIMP OR SOLDERLESS TERMINALS are available for connecting wires together, or attaching a cap or lug to the wire end.

SCREW TERMINALS provide another method for securing a wire. Usually the wire is tinned, formed into a loop or hook, and placed under the head of the screw. The screw is tightened down completing the connection.

Many times, wires are attached to a PLUG OR JACK CONNECTOR.
These devices allow the wire connection to be plugged together (joined) or pulled apart (disconnected).

STATE ELECTRICITY/ELECTRONICS CURRICULUM GUIDE INSTRUCTOR'S GUIDE TO ACCOMPANY LEVEL I UNIT \$5

Title of Unit: Soldering

Time Allocation: 1 week

Unit Goal:

To instil student confidence and competence in operating soldering devices, including knowledge related to the soldering process, wire preparation, solder, and soldering materials.

Unit Objectives:

The student will be able to:

- 1. describe the function, list safety precautions, and illustrate the correct use of each soldering device presented in this unit.
- 2. identify and demonstrate proper soldering techniques and methods of preparing wires for soldering.
- 3. explain the purpose of the following processes: soldering, tinning, mechanical connections and desoldering.

Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria, which may utilize a combination of written, oral, and laboratory testing procedures.

Instructor References:

Electronics Assembly and Fabrication Methods. S.R. Duarte and R.C. Duarte, McGraw-Hill Book Co., 1973. Chapters: 1, and 5-10.

Electronic Techniques. R.S. Villanucci, A.W. Avtgis, and W.F. Megow, Prentice-Hall, Inc., 1974. Chapters: 3-16.

Understanding Electricity and Electronics. Peter Buban and Marshall E. Schmitt, McGraw-Hill Book Co., 1975. Units: 24-28.

Overview:

Like Unit 4 this unit will also allow the student to physically develop skills and/or competencies that will form a foundation for future mechanical and electrical assembly tasks.

Unit 5 is a fun kind of activity unit because it focuses on an aspect

of training that is stimulating and fascinating to students.

Technical justification for the soldering process in electrical work along with the fundamental soldering definitions and basic techniques should be the initial topics for the presentation.

Next, safety must be again emphasized as an on going process when

working with tools and material.

The other major topics in this unit can be presented through laboratory demonstrations and activities. Remember, student expertise can be further enhanced by creating activities which are predicated on those competencies depicted in the unit outline.

Suggested Presentation Hints/Methodology:

Follow the instructional module unit outline as a basic skeleton for curriculum presentation, however, note the following:

- 1. It is recommended that from the outset the use of safety glasses be a mandatory procedure during the soldering process. A method for sanitizing and cleaning should be available in the shop and utilized when appropriate, or on a regular basis.
- 2. To save wear and tear on table tops or shop benches it is beneficial to invest in some small circular boards or the equivalent and use them when students are soldering or doing any construction work. This will protect the workbenches and leave the shop environment in a more positive condition. Accidents, burns, and scratches over the year can really destroy the furniture. It is also smart to make or purchase holders for the soldering irons to help reduce damage caused by a misplaced "hot" iron.
- 3. Check the cords on soldering irons frequently for burns and exposed conductors. It is common practice that students will inadvertently burn their own iron's cord and create a potentiall dangerous situation. When purchasing a new soldering iron check to see if the cord can be replaced without physically having to splice the replacement line cord to the old cord.

. One way to control solder is to hand it out in 6 inch pre-cut lengths. This should help reduce the overall consumption of this very expensive material.

Supplemental Activities and Demonstrations:

- 1. Many soldering demonstration charts are available free, so check around and pick several up. Mount these charts strategically around the classroom for student use.
- 2. When instructing or demonstrating desoldering techniques it is usually easy to procure old printed circuit boards which are loaded with components. Have students remove parts in an effort to develop their proficiency.
- 3. If available, demonstrate the use of other kinds of soldering devices. Do not overlook aids, solder suckers, heat sinks, and other support materials.
- 4. If student soldering exercises are the activity of the day be sure to walk around and examine student work and the general order in which it is being accomplished.

Instructional Module Contents:

- 1. Unit Outline (overhead)
- 2. Pre-Post Test (keyed)
- 3. Technical Glossary
- 4. Worksheet (vocabulary) Word Decoding

TECHNICAL GLOSSARY

CONDUCTOR JOINT:

A method for connecting or attaching two or more wires together. A satisfactory conductor joint must be 1) mechanically secure - wires tightly twisted together; 2) electrically secure - the connection must freely pass electricity, and 3) covered with an approved insulation.

DESOLDERING TOOL:

A device used to remove molten solder from a wire or connection. Most desoldering tools draw the molten solder from the connection with a vacuum or suction force.

ELECTRICAL TAPE: A black vinyl insulating tape used to cover exposed conductor joints.

FLUX:

A chemical used when preparing wires to be soldered. Flux helps remove dirt and oxides which sids in making a good solder joint. For electrical work use only rosin flux, which is available as a paste, or as a core in the solder itself.

ME CHANI CAL CONNECTION:

The process of attaching wires to terminals, or another wire, by twisting or bending them so that the connection remains snug even though it is not soldered.

SOLDER:

A mixture of tin and lead which is melted into an electrical connection to increase electrical contact, improve mechanical strength and to protect against oxidation. Solder used for electrical work is known as 60/40 rosin core. That is: 60% tin and 40% lead with a core of rosin.

SOLDER JOINT:

The process of cleaning, heating, and properly applying solder to a connection, splice, or joint.

SOLDERING IRON:

A tool, with a heated tip, used to heat a connection for soldering. The style of iron used for general electronic work is called a "pencil" iron and has a rating between 25 and 40 watts.

SPLICE:

A method for connecting two or more wires together. Example. Tap splice, Rat-tail splice, or Western Union splice.

TINNING:

The process of cleaning and coating with solder. Tinning is usually thought of as the job of preparing the heated tip of a soldering iron, but wires, terminals, and part leads are often tinned before making an electrical connection.

2 TAP-SPLICE

1. Obtain safety glasses.

2. Plug in iron and tin tip as directed.

3. Obtain two pieces of solid wire about 5" long

4. Remove about 3" of insulated covering from the end of the tap wire.

S. Remove about 1" of insulation from the middle of the main wire where the branch splice is to be attached.

6. Wrap the tap wire around the main as directed by instructor

7. Make two long turns and four short turns with tap wire.

8. Cut off the extra wire, and solder. Seek instructor's approval and attach to this lab.

TAP-SPLICE

WESTERN UNION SPLICE

1. Obtain safety glasses.

2. Plug in iron and tin tip as directed.

3. Obtain 2 pieces of solid wire about 5" long.

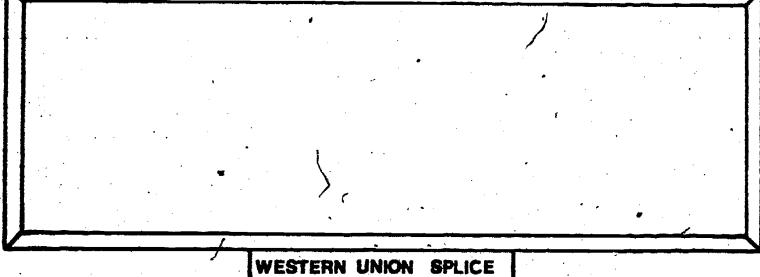

4. Remove 2" of insulation on each wire.

5. Cross the wires at their middle then twist the ends in opposite directions 3 to 4 times.

 Twist each end sharply, at right angles to the run on the splice, and wind 3 full turns.

7. Cut off the excess ends and solder.

8. Seek instructor's approval and attach to this lab.

INFORMATIONAL HANDOUT

A 4 STEP GUIDE TO SOLDERING

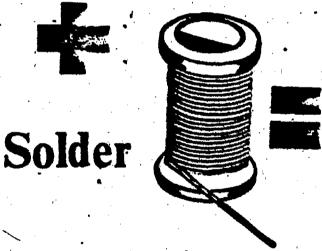

INTRODUCTION: What is soldering?

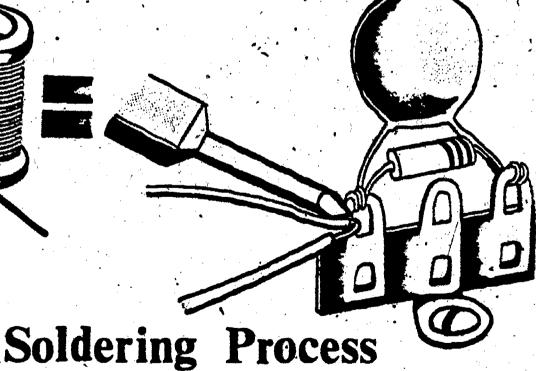

In all Electricity/Electronics work, high quality soldering connections are important. Soldering allows the joining together, both mechanically and electrically, of metal objects (wires, component leads, etc.) using a material called solder and a heating device called a soldering iron.

SKILL

Soldering Iron

Many times soldering is required to make sure that an electrical connection will last for a long time. Proper soldering will also

Prevent corrosion

• Add strength

	Naz	e:					•
•	Dat	e:					1
1	Perio	d:					
		(RE	ME P	Y)

Re	hest	and	Te	ROV	e s o	lder	•

(SOLDERING ERROR)

Not enough solder used

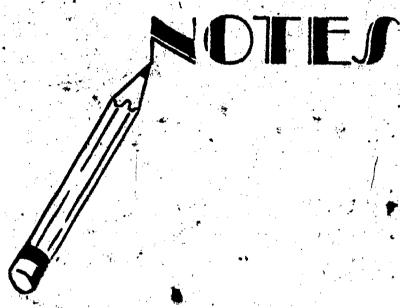

Too much solder used

● Improper heat application (cold solder joint)

Desoldering Process:

Sometime you will have to remove soldered wires or parts from a project or mounting lugs or terminals, to do this the components must first be desoldered. Desoldering is basically the reverse of the soldering process. Study the list below of the steps that you should follow each time you desolder.

Obtain tools and materials	
Plug iron in and clean tip	•
Tin the tip	
Keep tip damp with sponge	
Grasp wire or lead	
Apply heat	
Apply pressure use solder removing tool	
Remove part	
Visual check/clean-up	

When "resting" a soldering iron always use a soldering iron holder or stand.

Always hold a soldering iron by its handle and when reaching for it she alert and never accidently grab the "hot" tip.

Do not splash hot solder around by shaking the iron when soldering or desoldering.

, Name:	•	·	, i	•	·
Date:	:	1.	. ,		
DECC.			•		
Period:			0	,	•

Selecting Soldering Tools and Materials:

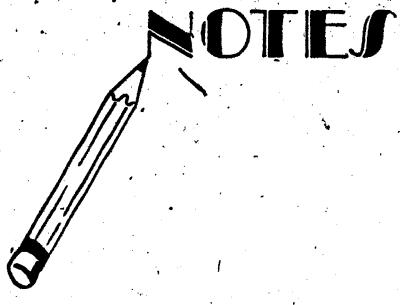

Always use the correct tools and materials to complete the task; and remember, proper use of tools and materials will increase your skill and the quality of your work. Check the following list when preparing to solder.

				•	100
Safety glasses	•,				
Proper wattage	(heat) s	oldering	iron	and	tip
Proper wattage Rosin core sol	der - 60/	40			
Solder aid					2
Solder remover	tool/bra	id 🛰			
Damp sponge			-		٠.
Misc. hand too.	ls 🤚	•	•		
Vise	•				. 0

2 Soldering Procedures:

Correct soldering requires the learning of a skill, and the best way to learn a skill is to practice. Study the list below of the steps that you should follow each time it is necessary to solder.

Obtain tools and materials
Plug iron in and clean tip
Tin the tip
Prepare parts to be soldered
Make mechanical connection
Protect heat sensitive parts
Apply solder
Don't move parts
Visual check/

Inspection:

Check your work immediately after the solder hardens to avoid making a poor soldering connection. Poor connections are generally caused by "three" specific problems. However, you can fix each of these problems by applying the remedies on the next page.

	WWE) i	· · ·		·	·

.....then solder and tape.

INFORMATIONAL HANDOUT

ELECTRICAL CONNECTIONS

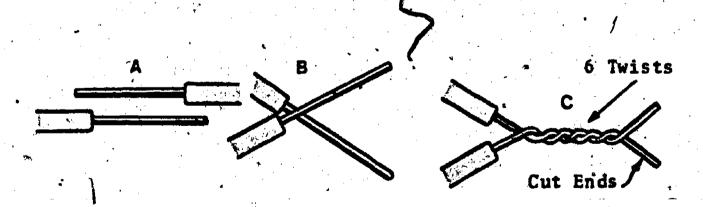

Electrical connections and electrical circuits must be reliable. Therefore, the individual who is wiring and soldering must be skillful. These sheets will help you master some basic wiring techniques, but remember it takes a great deal of practice to learn a skill, so lets get started!

Note, splices are hand-formed wire connections. The three most commonly used splices are the; Rat-Tail, Tap or Tee, and the Western Union.

Common Splices

Rat-Tail:

This splice is generally used where two or more wires are to be joined together. The Rat-Tail joint is commonly used in an electrical junction box, like the ones in your home. This splice should be soldered and taped, or a solderless connector (wire nut) used, before the box cover is replaced. Note, if wire sizes below AWG 14 are used the splice can no longer be formed by hand. Use pliers for twisting and be careful not to damage the wires. Follow the examples below when making this splice.

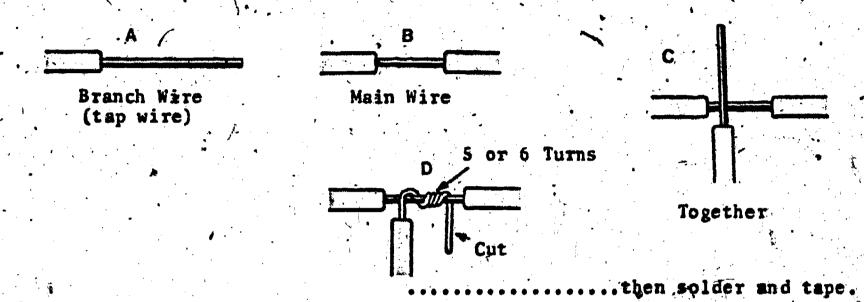

Tap or Tee:

This splice is also used in home electrical wiring circuits. The Tap splice is used when you want to connect a branch conductor to a main wire or conductor. The advantage of this splice is that the main wire is not

	Name:	 	 <u> </u>	4		
		 ··		•	-	
•	Date:	 				
Pe	riod:				:	 (

cut, just stripped where the branch wire is joined. This splice should be soldere'd and taped. Follow the examples given when making this splice.

Western Union:

This splice is the strongest of the three connections shown here, and the most interesting one to make. It is used for splicing a broken/cut wire in a long wire or to extend a wire a few more feet if it is short. This splice should be soldered and taped when completed. This splice has an interesting piece of history attached to its name. When the Western Union Telegraph Company had problems with breaks in telegraphic wires their workers would use this splice to repair the wire. Follow the examples given when making this splice.

ELECTRICITY / ELECTRONICS

CURRICULUM GUIDE INSTRUCTIONAL MODULE

STATE OF CALIFORNIA DEPARTMENT OF EDUCATION

DATE STARTED_____
DATE COMPLETED____

R. E. LILLO N. S. SOFFIOTTO

STATE ELECTRICITY/ELECTRONICS CURRICULUM GUIDE INSTRUCTOR'S GUIDE TO ACCOMPANY LEVEL I UNIT 16.

Title of Unit: Magnetism and Electromagnetism

Time Allocation: 1 week

Unit Goal:

To broaden and impart student competence in terms of comprehending the basic effects, application, and influence that both magnetism and electromagnetism have on their daily living and lifestyles.

Unit Objectives:

The student will be able to:

- 1. write or recite an explanation describing the characteristics of the phenomenon referred to as magnetism and/or electromagnetism
- 2. identify and list several common devices or appliances that use the principle of magnetism or electromagnetism in their operation.
- 3. explain the basic laws of magnetism related to the poles of a magnet, and describe the three fundamental categories for classifying magnets.

Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria, which may utilize a combination of written, oral, and laboratory testing procedures.

Instructor References:

Electricity and Electronics. Howard Gerrish and William Dugger, Goodheart-Willcox Co., 1978. Chapter: 4.

Industrial Arts Electricity. Clifford Lush and Glenn Engle, Chas. A Bennett Co., 1971. Chapter: 2 and 4.

Introduction to Electricity. Kurt Harding Schick, McGraw-Hill Ryerson Limited, 1975. Chapter: 2 and 9.

Overview:

Most students can identify some of hhe basic properties of magnets through their own personal experiences, hence the subject matter is not foreign and quite easy to introduce.

Stress that this topic has tremendous impact on the lives of each of us, and then trace the historical background of this topic prior to the technical presentation on types of magnets.

The next topic of emphasis should be the basic laws of magnetic attraction and repulsion, and while instructing in this area a discussion in reference to the Earth's magnetism would be appropriate.

Then Oersted's discovery is ideally suited as a point of origin for a

Unit 6 should conclude with an emphasis on the uses or applications of both magnetism and electromagnetism in consumer products and in the generation of electricity.

ERIC

Suggested Presentation Hints/Methodology:

Follow the instructional module unit outline as a basic skeleton for curriculum presentation, however, note the following:

1. When demonstrating magnetic lines or flux with a magnet and iron filings be careful not to use an excessively strong magnet. Too intense of a magnet will not perform adequately because it forces the filings into groups rather than a uniform pattern.

2. Try and create with the students an atmosphere of importance

Try and create with the students an atmosphere of importance about the concept of electromagnetism so that they realize that this topic is one of the most vital to the modern electrical era. Stress that Oersted's discovery has made possible countless

devices from electromagnets to motors.

3. Before a lecture presentation use this activity to generate some enthusiasm. Obtain a small, working, black and white TV and tune it for a local channel. Bring a strong electromagnet close to the front of the C.R.T. and let the class watch the picture distort. Discuss the implication of what has been observed.

4. If a school budget is available and financially sound, try and

order a simple assemble-disassemble type kit which will illustrate to students some of the fundamentals of magnetism/

electromagnetism.

Supplemental Activities and Demonstrations:

1. A natural for this unit would be to have students build a simple electric motor kit. This kind of motor is generally designed for beginning kit builders and sold complete with a manual that includes information regarding the How and Why of its operation.

2. When demonstrating magnetic principles place a magnet or magnets on the stage plate of an overhead projector and then cover with a clear plastic sheet. Using a shaker, sprinkle some iron filings on top of the sheet, and discuss the pattern created. This can also provide an opportune time to discuss magnetic

polarity and the basic law of magnetism.

TECHNICAL GLOSSARY

ATTRACT:

The action of drawing or pulling toward an object. For example; a magnet will attract a piece of soft iron.

BASIC LAW OF MAGNETISM:

A law that explains the interaction of magnetic fields. The law states: Like poles repel and unlike poles attract.

COMPASS:

A device which uses the earth's magnetic field, and a pivoted magnetic needle which will always point in a north direction.

ELECTROMAGNET:

A coil of insulated wire wrapped around a soft iron core which becomes magnetic when electricity is forced through it. The strength of the electromagnet depends upon the amount of electricity flowing through the coil, the number of turns of wire in the coil, and the type of core used. If the electricity flowing through the wire is turned off, the magnetic field stops.

FLUX LINES:

The lines of magnetic force which form around a magnet.

KEEPER:

A piece of soft iron placed across the poles of a magnet to "hold" the magnetic field within the magnet, and to prevent demagnetizing.

MAGNET:

A piece of iron, or a special material, which has an invisible force of attraction to materials such as iron, nickel, or cobalt.

MAGNETIC FIELD:

The space around a magnet which is controlled by the magnet.

MAGNETIC POLE:

The part of a magnet where the lines of force are the strongest. In every magnet there is one north-seeking pole (N-pole), and one south-seeking pole (S-pole).

MAGNETISM:

The invisible force, produced by a magnet, that allows it to attract magnetic materials, and to attract or repel other magnets or magnetic fields.

NATURAL MAGNET:

A material, such as "lodestone" or "magnetite," which in its natural state acts as a magnet.

PERMANENT MAGNET: A man-made magnet which when magnetized will keep its magnetism. Steel or alnico are examples of material which can be made into permanent magnets.

REPEL:

ERIC

The action of pushing away or forcing back of an object. A north pole of a magnet will repel the north pole of a second magnet.

TEMPORARY MAGNET:

A man-made magnet that loses its magnetism soon after the magnetizing force is removed. Magnetized soft iron is an example of a temporary magnet.

LI-U6-4 119

UNIT EXAM

MAGNETS AND ELECTROMAGNETISM

IMPORTANT-

Indicate your responses on the answer sheet only. Fill in the box corresponding to the correct answer to each question there is only one correct answer for each question.

- 1. A magnet will attract both iron and steel. [T-F]
- 2. A permanent magnet cannot be, destroyed or weakened. (T-F)
- 3. As two magnets are moved apart, their force of attraction increases.
 (T-F)
- 4. Lodestone is a type of natural magnet. (T-F)
- 5. An electromagnet must have electricity flowing through it to produce a strong magnetic field. (T-F)
- 6. Around each magnet is:
 (A) a negative charge, (B) current, (C) a voltage, (D) a magnetic field.
- 7. A magnet which keeps its magnetism for only a short time is:
 (A) a permanent magnet, (B) made of soft iron, (C) a temporary magnet, (D) both B and C.
- 8. The basic law of magnetism says:
 (A) unlike poles repel, (B) like poles repel, (C) two south poles attract, (D) like poles attract.
- 9. Which of the following operates by magnetism or magnetic force?

 (A) electric motor, (B) electric buzzer, (C) electric bell, (D) all of the above.
- 10. Which pole of a magnet has the most magnetic strength?

 (A) N-pole, (B) S-pole, (C) both poles have equal strength, (D) will vary from one magnet to the next.

INFORMATIONAL HANDOUT TO

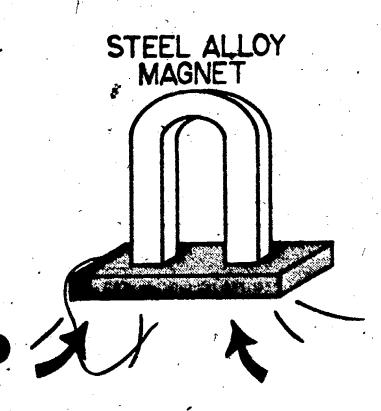

CLASSIFICATION OF MAGNETS

Any magnet can be classified as either natural, temporary, or permanent. Carefully study the descriptions below.

NATURAL

A natural magnet needs no special treatment by people to make it magnetic.
Lodestone (or magnetite) is a natural magnet found on the earth. Especially large quantities can be found in the United States, however, these magnets are very weak and really serve little purpose in the modern world.

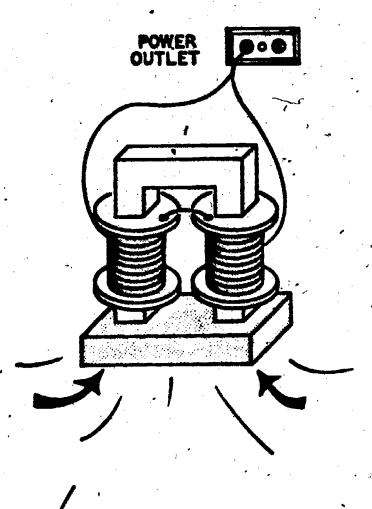

PERMANENT O

A permanent magnet or man made magnet, keeps its magnetism for a long time. This type of magnet is produced from magnetic materials and can be made in many different shapes and sizes. They are used frequently in electrical appliances, hardware items, and compasses.

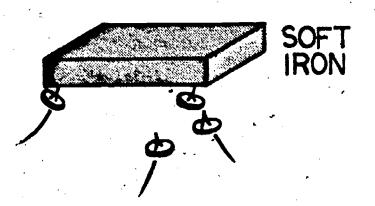

Name:	
Date:	,
Period:	

ELECTROMAGNET

TEMPORARY

Temporary magnets are generally of two types, those made of material that do not keep their magnetism long (soft iron), and those which operate with the help of electricity (electromagnets). Electromagnets operate only when electricity is applied, when the electricity is removed they do not keep their magnetism.

Date:		

Period:	•	

INFORMATIONAL HANDOUT

BASIC LAW OF MAGNETISM

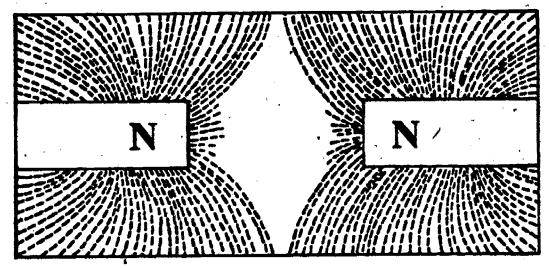

As you probably know from common experience, when two magnets are brought close to each other they will either pull together (attract), of push apart (repel). The action of the two magnets will depend upon the position of the magnetic poles. The basic law of magnetism explains the magnetic reaction in this way:

LIKE POLES REPEL

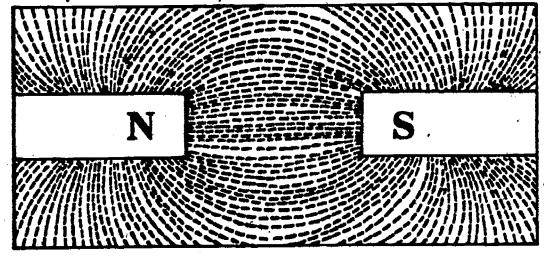

(N-POLE AND N-POLE REPEL AS WELL AS S-POLE AND S-POLE)

UNLIKE POLES ATTRACT

(N-POLE AND S-POLE ATTRACT)

Magnetic Repulsion

Magnetic Attraction

ELECTRICITY / ELECTRONICS

CURRICULUM GUIDE INSTRUCTIONAL MODULE

STATE OF CALIFORNIA DEPARTMENT OF EDUCATION

DATE STARTED_____

R. E. LILLO N. S. SOFFIOTTO

STATE ELECTRICITY/ELECTRONICS CURRICULUM GUIDE INSTRUCTOR'S GUIDE TO ACCOMPANY LEVEL I UNIT #7

Title of Unit: Circuits, Symbols, and Component Identification

Time Allocation: 2 weeks

Unit Goal:

To investigate and transmit those competencies related to identifying fundamental electrical components, quantities, and their units of measurement, and to attain student competence in understanding the basic requirements of an electrical circuit.

Unit Objectives:

The student will be able to:

- 1. identify and draw the schematic symbols of the following common components: resistor, inductor, capacitor, switch, speaker, xenon flashtube, neon lamp, transformer, diode, battery and indicator lamp.
- 2. differentiate and identify the basic circuit parts of an electrical circuit, and demonstrate the ability to connect components either in a series or parallel configuration.
- identify and explain the three common types of electrical quantities and their corresponding units of measurements.

Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria, which may utilize a combination of written, oral, and laboratory testing procedures.

Instructor References:

Electronics Assembly and Fabrication Methods. S.R. Duarte and R.L. Duarte, McGraw-Hill Book Co., 1973. Chapters: 2 and 4.

Introduction to Electricity. Kurt H. Schick, McGraw-Hill Ryerson Limited, 1975. Chapters: 3, 7, and 21.

Understanding Electricity and Electronics. Peter Buban and Marshall L. Schmitt, McGraw-Hill Book Co., 1975. Units: 2, 3, and 10.

Overview:

Several basic competencies are introduced in this unit, and these competencies can serve as a solid foundation for succeeding technical units throughout this level as well as future, levels if they are acquired.

The unit should be presented carefully in terms of content. First, stress that symbols are utilized in schematic drawings as a means to explain where parts are electrically located. Second, instruction on component identification, with specific emphasis on those common components encountered in typical beginning type projects or kits.

Next, it is necessary to identify basic electrical terms and to emphasize that these quantities operate as a team when performing within a circuit. Once the definitions and functions have been firmly established it is relatively easy to associate letter symbols or units of measurement with the proper quantity.

Finally the requirements for a complete circuit may be evaluated.

Suggested Presentation Hints/Methodology:

Follow the instructional module unit outline as a basic skeleton for-curriculum presentation, however, note the following:

> Be mindful when explaining circuit operation and terminology that very often first exposure to technical expressions can be misunderstood for example "current flow", "potential difference", and "voltage". Spend a significant amount of time with these kinds of terms in order to facilitate your students basic comprehension. I

Present basic DC circuits by showing students that electrical parts or components comprise a system only when they are wired together to perform a desired result or function. This system. can consist of a simple or complex circuit which has at its

foundation a supply, control, conductor and load.

Do not be afraid to use the art of repetition as a means to drill or impress students with specific units of measurement or letter symbols. Use the blackboard also as an effective vehicle by listing a variety of terms and/or units, then let the students match up the correct pairs.

Investigate with the class a variety of components that they might typically encounter when building a simple project. an overhead projector and place a component on top of the stage plate and examine its size and shape, then, discuss the general purpose, special properties, value determination/codes, and symbol.

Supplemental Activities and Demonstrations:

Class can physically examine a box containing basic parts such as switches, wires, lamps, cells, batteries, bells etc., and categorize their functions on the blackboard in terms of circuit use; supply, control, conductor, or load.

Instructor can assemble several simple circuits to dramatize circuit operation, and by utilizing duplicate load devices can easily manipulate configuration into a series, parallel, or combination circuit. Circuit failures can be introduced along with troubleshooting and repair techniques if desired.

Many short story booklets on Electricity/Electronics are available from major companies. A letter written on school letterhead indicating a need for a classroom set will usually bring results and thus supplement basic reading materials and technical knowledge.

IMPORTANT-

Indicate your responses on the answer sheet only. Fill in the box corresponding to the correct answer to each question - there is only one correct answer for each question.

- 1. The letter abbreviation for voltage is V. (T-F)
- 2. On a schematic diagram, the components are shown as schematic symbols. (T-F)
- 3. A supply provides the electricity for circuit operation. (T-F)
- 4. Electrons always flow from negative to positive in an electrical circuit.
- 5. Motors, lamps, bells, and heaters can be used as loads in electrical circuits. (T-F)
- 6. The orderly flow of electrons through a circuit is known as:
 (A) current, (B) electromotive force, (C) resistance, (D) power.
- A circuit which contains more than one path for current flow is known as a(n):

 (A) parallel circuit,
 (B) series circuit,
 (C) abnormal circuit,
 (D) normal circuit.
- 8. The letter abbreviation for voltage is the:
 (A) V. (B) VOL. (C) E. (D) B.
- 9. The letter abbreviation for current is: (A) C. (B) I. (C) A. (D) E.
- "A" is the electrical symbol for the:

 (A) volt, (B) ampere, (C) resistor, (D) ohm.

INFORMATIONAL HANDOUT

REQUIREMENTS FOR. AND TYPES OF ELECTRICAL CIRCUITS

In order to make a working or complete electrical circuit you must have four basic things present in your circuit.

1) The SUPPLY provides the electrical energy to the circuit.

A BATTERY

is an example of a supply.

2) The CONTROL is used to turn the circuit on or off.

is an example of a control.

3) The CONCUCTOr forms the pathway for the electricity to flow through.

Copper wil

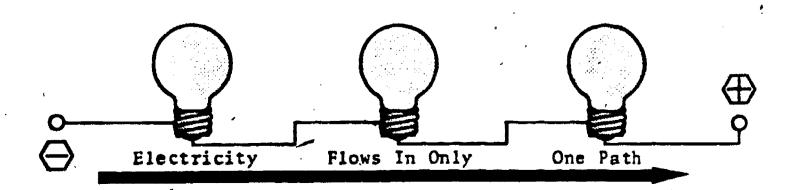

is the most common conductor used in • electronic projects.

4) The load is the device that the circuit will operate.

A motos is an example of a load.

Electric circuits can be built in three basic forms.

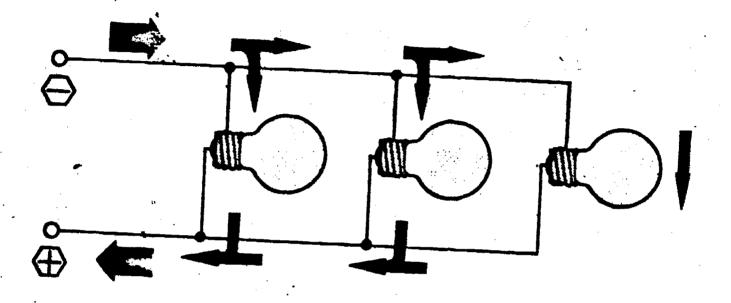

1) In a Series circuit, the parts are connected one after / the other. In this type of circuit electricity can move in only one path.

	Name:	
	Date:	
Pe	riod:	

2) A parallel circuit, or branch circuit allows the electricity to "split up" and take different paths through the circuit.

3) A Combination circuithas at least one series and one parallel circuit contained within it.

CURRICULUM GUIDE INSTRUCTIONAL MODULE

STATE OF CALIFORNIA DEPARTMENT OF EDUCATION

DATE STARTED_____

R. E. LILLO N. S. SOFFIOTTO

STATE ELECTRICITY/ELECTRONICS CURRICULUM GUIDE INSTRUCTOR'S GUIDE TO ACCOMPANY LEVEL I UNIT *8

Title of Unit: Resistors and Identification Systems

Time Allocation: 1 week

Unit Goal:

To develop those student competencies which will enable students to grasp the basic theory and application of resistance, and to familiarize students with the symbols and coding systems that are employed

Unit Objectives:

The student will be able to:

- define the term, symbol, and unit of measurement for resistance.
- name two common types of resistors and the two coding systems utilized for indicating ohmic values.
- identify the color coded value of a typical resistor, including the tolerance percentage and mathematically computing the usable tolerance range.

Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria, which may utilize a combination of written, oral,

Instructor References:

Electricity One-Seven. Harry Milesf, Hayden Book Company, Inc., 1976.

Electronic and Electrical Fundamentals Volume I. Published by C.T.I. Education Products, Inc., 1976. Chapter: 4.

Individual Learning Program In DC Electronics. Heathkit Continuing Education, Heath Company, 1976. Unit: 3. Overview:

Unit 8 has at its main purpose the expansion of the student's technical competencies so that they will include the means to identify color coded

First, resistance should be defined as the opposition to current flow, and the instructor should indicate also that all materials contain this quality. The thought that resistance might be a desired factor should be

explored as well as the traditionally negative aspect of circuit resistance. The next topic should express the idea that resistors were developed to provide high resistivity in a small package. Types of resistors along with coding systems, and the concepts of resistor value accuracy (tolerance) should be explored in a variety of exercises.

Note, that some related mathematical skills may have to be reviewed to support tolerance computations.

Suggested Presentation Hints/Methodology:

Follow the instructional module unit outline as a basic skeleton for curriculum presentation, however, note the following:

- 1. Students must be made aware of the fact that resistors are commercially available at electronics stores/dealers in certain sizes only. Indicate that other values are special order devices which will be very expensive to obtain.
- 2. In this unit the concept or phrase types of resistors will refer to the resistor's internal composition (carbon, wire wound, or film) while the phrase resistor variety is alluding to the physical style (fixed, adjustable, or variable). When presenting this topic display samples of the components that are available in the shop to help students become more familiar with their physical properties.

3. Prior to the class presentation on color code ask students to memorize the complete color code system. Select students individually to recide the colors and the number value.

4. The concept of resistor tolerance and the method of solving specific tolerance ranges are difficult for beginning students to comprehend. Walking the student through some simple problems will improve their understanding and confidence. A review of basic mathematical skills such as percentage determination and decimals can especially assist slower students and is recommended.

Supplemental Activities and Demonstrations:

1. Make a demonstration display that includes a sample of resistor of various types, color code markings, and physical styles. Cement the parts on a board and label.

2. An informative visual aid can be quickly made by using an old cardboard container that has a cylinder shape. Insert a long welding rod through the container and plug the ends. This will act as the body of the resistor with pigtails, now paint the body with one solid color and add various color bands with colored tape.

3. Using a flat piece of cardboard, in the shape of a carbon composition resistor, construct a resistor "mock up" with four see through pockets on one end. Insert different colored paper in each pocket to simulate a coded resistor, then hold the display up so that the class can view and discuss.

UNIT EXAM .

RESISTORS AND IDENTIFICATION SYSTEMS

IMPORTANT-

Indicate your responses on the answer sheet only. Fill in the box corresponding to the correct answer to each question - there is only one correct answer for each question.

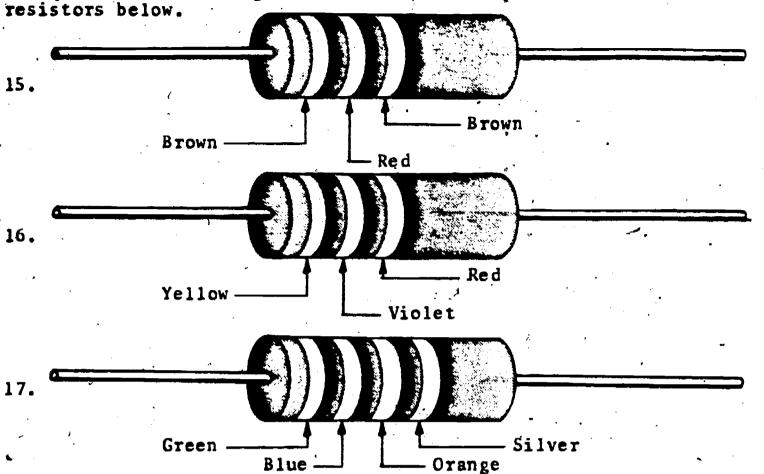

- 1. Carbon composition resistors have their resistance value clearly printed on the body of the device. For example: "1000x+10% (T-F)
- 2. The symbol for a fixed value resistor is: \((T-F) \)
- 3. Wirewound resistors are made by wrapping special resistance wire around a ceramic core. (T-F)
- 4. Orange represents the number "4" in the resistance color code. (T-F)
- 5. If a 100 ohm resistor has a tolerance of 10%, its actual value can be between 90 and 110 ohms. (T-F)

Complete the color code chart below for questions 6 through 14, by filling in the missing number or color.

14.	white	151 -?
13.	7,	. 8
12.	?	7
11.	blue	?
10.	green	?
9.	?.	. 4
8.	orange	7
7.,,	77	2 ,
6.	brown	?
· ·	black	0
),	COLOR	. VAL UE

For questions 15 through 17 find the ohmic values of the color coded resistors below.

For questions 18 through 20 color code the following resistor value:

- 18. First color band
- 19. Second color band
- 20. Third color band

Name:

Period:		

TECHNICAL GLOSSARY

CARBON COMPOSITION RESISTOR:

The most common type of resistor used in electronic devices. It contains carbon as the resistance material, and uses color bands to indicate its ohmic value.

COLOR CODE:

The resistor color code uses a system of three or four color bands, painted around the resistor, to give the "ohmic value" of the resistor. Each color in the code represents a number or percentage value.

FIXED VALUE RESISTOR:

A resistor which has only one resistance value. Fixed resistors can be either carbon composition, wirewound, or film type.

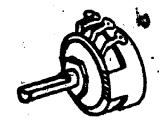

OHMIC VÂLUE:

The ohm rating or value of a resistor.

POTENTIOMETER:

A type of variable resistor consisting of resistance material and a movable arm. A terminal is attached to each end of the resistance material and to the movable arm. The resistance can be set by adjusting the movable arm.

-RESISTOR:

An electrical component used to oppose the flow of electricity through a circuit. Resistor values are measured in the basic unit ohms. Symbol: - Letter symbol: R.

TOLERANCE:

The amount by which the actual value of a resistor may vary from its marked value and still be considered good. Tolerances are usually expressed as a percentage. example, the value of a 1000 Aresistor with a 10% tolerance can wary between 900 n and 1100 n.

WATTAGE RATING: A measurement of the amount of power that a resistor can safely handle. Generally, the larger in size the resistor is the more power it can handle. Excessive power will cause a resistor to overheat and burn-up.

QUEST ACTIVITY

"UNIT 8"

In this activity you will be color coding resistors for an assigned value and computing their tolerance ranges. Cut out the puppers on the attached sheet and use them as the color bands for the blank resistors drawn below. Use colored pencils to shade in each puppet.

EXAMPLE:

A. Color code a 180 A + 10% resistor and determine its tolerance range.

Tolerance range: From 1981 to 1621

Show work:		
percentage	upper limit	lower limit
180 x .10	180 + 18	180 - 18
000 180	198	162
18.00	2	•

1. Color code a 100 n + 20% resistor and determine its tolerance range.

INFORMATIONAL HANDOUT

THE RESISTOR COLOR CODE

Carbon composition resistors use a system of three or four color bands painted on the body of the resistor to give its ohmic value. Each color represents a number or percentage value. Here's how the system works.

Color Code Chart:

	First Color #Band	Second Color Band	Third Color Band	Fourth Color Band
Color Code	First Digit	Second Digit	Number of Zeros to Add	Tolerance
O Black 1 Brown 2 Red 3 Grage 4 Yearow 5 Green 6 Blue 7 Violet 8 Gray 9 White	1 2 3 4 5 6 7 8 9	0 1 2 3 4 5 6 7 8 9	0 1 2 3 4 5 6 7	No color 20% Silver 10% Gold 5%
- Gold - Silver			+ 10 + 100	

Locating The Color Bands

Start from

First band
(lst digit)

Second band
(2nd digit)

Fourth band
(tolerance)

Third band
(multiplier)

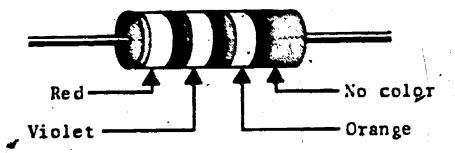

Name:	
Date:	
Period:	·

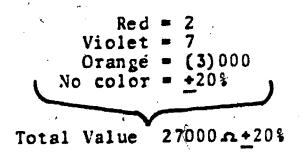

Using The Color Code:

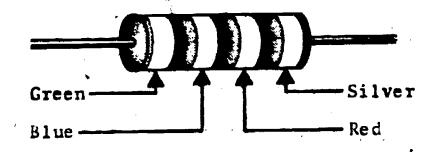

Even though it looks a little difficult, using the color code system is actually pretty easy once you have the hang of it. These are the points to remember!!!

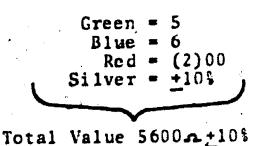

1. The first color band represents the first digit.
2. The second color band represents the second digit.
3. The third color band basically tells how many zeros are added to the first two digits.
4. The fourth color band indicates the + tolerance.

ELECTRICITY / ELECTRONICS

CURRICULUM GUIDE INSTRUCTIONAL MODULE

STATE OF CALIFORNIA DEPARTMENT OF EDUCATION

DATE STARTED______
DATE COMPLETED_____

R. E. LILLO N. S. SOFFIOTTO

STATE ELECTRICITY/ELECTRONICS CURRICULUM GUIDE INSTRUCTOR'S GUIDE TO ACCOMPANY LEVEL I UNIT #9

Title of Unit: Available Sources of the Earth's Energy

Time Allocation: I week

Unit Goal!

To impart basic knowledge and competencies related to the methods of producing or generating large amounts of electricity, and to assess which methods are presently more commercially feasible.

Unit Objectives:

The student will be able to:

- 1. identify the four major sources of the Earth's energy (geothermal, fossil fuels, nuclear, and water), and briefly describe their methods of producing power.
- 2. state several alternative methods for the generation of electricity which are currently being explored.
- 3. summarize and discuss the need for conservation in the use or consumption of electrical energy.

Evaluation:

The student will demonstrate his/her competence in terms of these measurable objectives based upon individual instructors acceptable performance criteria, which utilizes a combination of written, oral, and laboratory testing procedures.

Instructor References:

Electricity and Electronics Basic. William B. Steinberg and Walter B. Ford, American Technical Society, 1972. Unit: 16.

Energy Primer. Richard Merrill and Thomas Gage, Dell Publishing Co., 1978.

Industrial Electricity: Rex Miller, Chas. A. Bennett Co., 1978. Chapter:

Overview:

Unit 10 like part of Unit 3 focuses on the fact that electricity has become an essential part of our life, therefore it is important to be aware of the specific methods for producing electrical power in large quantities.

The instructor should first examine the four major or primary sources of the Earth's energy. The examination of these sources, of course, is of a very general nature, but should include the future availability of power plant fuels and the basic history of plant development.

Next, explain that present demand for power may soon be greater than the supply, and to help offset this condition alternative resources and power plants are being considered, along with general conservation of existing supplies.

Finally, awareness that the new sources will take time to be fully developed and implemented should be brought out through a class discussion.

Suggested Presentation Hints/Methodology:

Follow the instructional module unit outline as a basic skeleton for curriculum presentation, however, note the following:

1. Try not to leave the impression that the major methods of producing energy presented in this unit are the only methods; they are just the most common ones. Explain further that other methods have potential, yet, are still in the experimental stage in terms of development.

When discussing nuclear power plants present some information related to potential health hazards from radioactive by products. Indicate that strontium, cesium, plutonium and tritium can pose

some real problems to human beings.

3. Although energy demand growth has been slowed recently by higher prices and conservation, total energy consumption is still expected to increase about 50% by 1990 - discuss the implication of this one statistic.

4. Note: Fission - involves the splitting of the nucleas of atoms such as uranium. Fission - involves joining the nuclei of two light atoms such as deuterium and tritium. Remember to explain that in both cases the nuclear reaction produces energy!

. Introduce new career choices to your class which may exist in the future in such special energy areas as solar, geothermal,

wind, and nuclear power.

Supplemental Activities and Demonstrations:

1. Write or telephone your local gas and electric company for information related to the generation of power. Many companies produce free materials that can be distributed to students that will really enhance their knowledge about plant operation and purpose.

Mickey Mouse and Goofy Explore Energy is a book in comic form which does an outstanding job in relating current energy information to students. For information about this comic

book, write to:

Public Affairs Department Exxon, U.S.A. P.O. Box 2180 Houston, Texas 77001

UNIT EXAM

AVAILABLE SOURCES OF THE EARTH'S ENERGY

. IMPORTANT-

Indicate your responses on the answer sheet only. Fill in the box corresponding to the correct answer to each question - there is only one correct answer for each question.

- 1. Of the many sources of energy available, fossil fuel is the most widely used. (T-F)
- 2. Fortunately, the earth has a large supply of usable energy so we need not conserve. (T-F)
- Most power plants use steam from heated water to turn a turbinegenerator. (T-F)
- 4. Geothermal energy comes from the constant wave and tidal action of the ocean. (T-F)
- 5. Solar energy supplies both heat and light which can be put to work making electricity or heating liquids. (T-F)

MATCHING

Record the letter of the answer which best matches the numbered term.

- 6. Fossil fuel
- 7. Geothermal power
- 8. Hydro power
- 9. Tidal power
- 10. Solar power
- 11. Conservation
- 12. Nuclear power

- E. The force produced by the wave action of the ocean.
- F. The heat produced by atomic fission.
- G. Coal, petroleum, natural gas.
- H. Saving or limiting the use of a resource.
- I. Geysers or natural steam.
- J. Windmills or wind generators.
- / K. Energy provided by running or falling water.
 - L. Heat and light provided by the sun.

TECHNICAL GLOSSARY

BIO-GAS

An interesting source of energy which has become more popular as an inexpensive fuel. Bio-gas or methane is formed when garbage or natural wastes deteriorate and breakdown. This gas can be trapped and used as a substitute for natural gas.

COAL:

A hard black fossil fuel, made mostly of carbon, which can be burned to produce heat. Coal has the disadvantage that it gives off a sooty or black smoke when burned.

CONSERVATION:

The process of saving or limiting the use of a resource, such as fossil fuels, electrical energy, etc.

CRUDE OIL:

Often called petroleum, this material is a dark, thick and slippery liquid type fossil fuel. Crude oil is refined to produce more usable fuels such as heating oil, diesel fuel, gasoline, etc.

FOSSIL FUEL:

Fuels such as coal, crude oil, natural gas, and refined petroleum products (gasoline, diesel oil, and fuel oil) which are burned in order to produce heat.

GEOTHERMAL ENERGY: A source of energy produced when water seeps into the ground, is heated by the Earth's hot magma core, and then rises to the surface as steam. Geysers, steam vents, and fumaroles are examples of geothermal activity.

MUSCLE POWER:

The oldest form of power, in which human muscles or an animals muscles are wised to do work.

NATURAL GAS:

A type of fossil fuel which is in the form of a vapor or gas. Natural gas is usually found along with petroleum or crude oil. The gas cannot be seen, but it does have an odor. When burned, it makes a clean, hot fire.

NUCLEAR ENERGY:

A modern source of energy which uses the atomic principles of fission (the breaking of the atom) to produce tremendous amounts of heat. Nuclear energy is safe if handled properly. Just one pound of nuclear fuel (uranium) has as much energy as 3,000 tons of coal.

SOLAR ENERGY:

The clean, nonpolluting energy available from the sun or the sunbeam. Modern developments in solar energy have lead to more efficient solar collectors and heating units.

TIDAL POWER:

The energy available from the constant tide or wave action of the ocean.

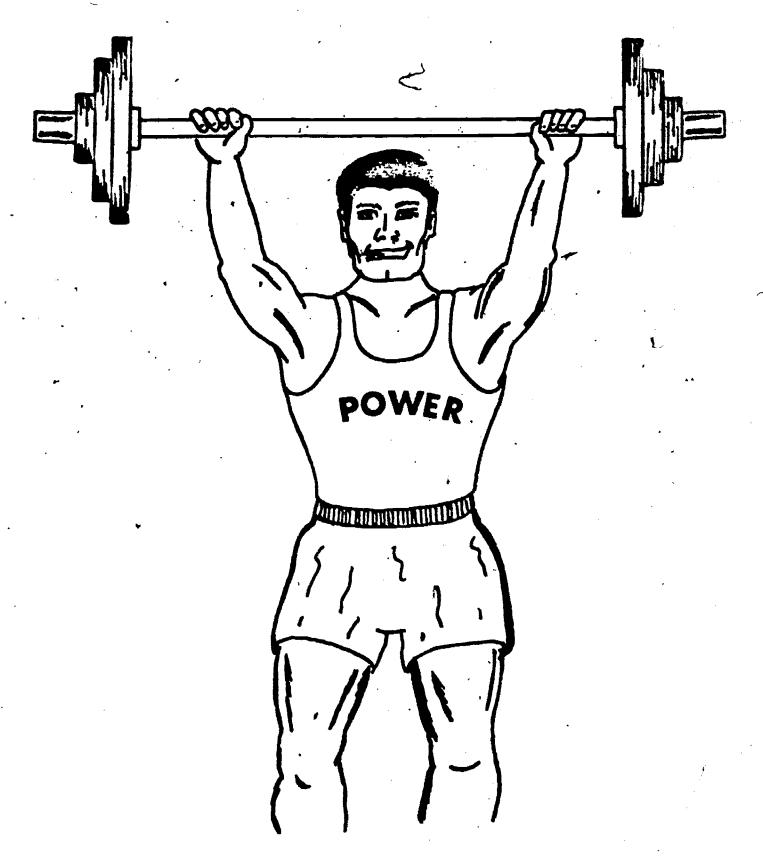

Name:			
Date:			
Period:	*	٦	

WATER POWER:

The energy provided by running or falling water. Water power is also referred to as hydro energy.

WIND POWER:

Using the force of the wind to supply power for such jobs as turning a windmill or turbine.

QUEST ACTIVITY

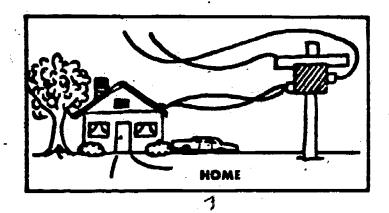

"UNIT 9"

To generate and distribute the electricity used in our homes and businesses, power companys must follow a process that has a number of steps. Below you will find a set of boxes arranged in order or sequence from start to end. Your task will be to arrange the puppets, found on page two, in proper order to show steps used in making electricity. You can use colored pencils to shade in the puppets and to make your work look sharp.

INFORMATIONAL HANDOUT SOURCES OF ENERGY

GEOTHERMAI

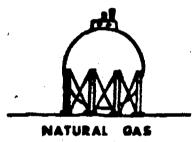

The energy available from geysers or natural steam vents can be harnessed to do work such as turning a turbine. California has the worlds largest geothermal generating plant, which uses 200 wells that bring up natural steam from as far as 10,000 feet below the earths surface to turn 12 turbine generators.

FOSSIL FUELS

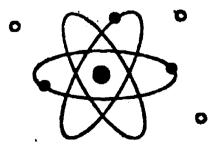

COAL

CRUDE OIL

The burning of fossil fuels to release energy is today the largest single source of natural energy. Fossil fuels are formed from decayed remains of ancient animals and plants. These remains have been squeezed and formed by the earth's pressures for many thousands of years to form coal, crude oil, and natural gas. These materials must be mined and carefully removed from the earth. Fossil fuels are then burned to release heat which is used to heat water and make steam. The steam is then used to turn a turbine - generator.

NUCLEAR

WATER - HYDRO

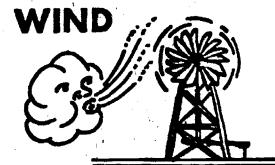

Atomic reactors, which can release the vast amounts of energy trapped within the small atom, can be used as a relatively safe form of energy. As atoms are split in a process called fission, high heats are generated. This heat is used to heat water and produce steam. The steam is then used to turn a turbine - generator.

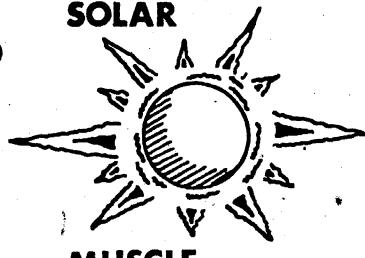

The force produced by falling or running water can be harnessed and used to turn a turbine. Water power or hydro energy is an old source of natural power; water wheels were commonly used to operate

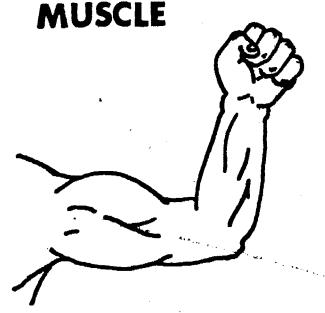

Name:		·
Date:		
Period:	:	

TIDAL

factories and machinery. Several states, especially California, count heavily on water power to generate electricity.

The constant wave and tide action of the ocean is being studied as a future source of energy. Special wave action generators have been designed to produce electricity using tidal power.

Wind energy may some day become an important and practical source of energy. Today wind energy can be used to turn blades such as on a windmill.

The light and heat produced by the sun can be used in several ways to provide energy. One system which is becoming very popular is solar heating, where sun rays are gathered and used to heat water for home and pool heating. The suns light energy can be focused on solar cells to produce electricity. By some forecasts, in the year 2020 solar energy will make an important contribution to our energy supply.

The oldest form of energy where human or animal muscles are used to do work. The ancient civilizations used muscle power exclusively to accomplish such fantastic things as the pyramids of Egypt, the Acropolis in Greece, and the Colosseum of Rome.

H	Special Interest Groups - Industrial Education

REVIEW OF ACTIVITIES CONDUCTED DURING THE PROJECT

The project was conducted under the direction of the East Side Union High School District, Frank Fiscalini, Superintendent, with aid and assistance of the Bureau of Industrial Education. District personnel directly responsible for completion of the project were:

- 1. Career Services Administrator Clarence Moomau
- 2. Industrial Education Keith Bush, Project Director
- 3. Robert Lillo, Project Coordinator
 - 4. Nick Soffiotto, Project Staff Leader.

All budgetary matters were conducted through the District's business office, using standard district and state procedures.

The Project Director made the necessary arrangements for running the project, which included:

1. Budgeting

- 2. Personnel hiring every attempt was made to maintain an ethnic and sex balance commensurate with the district
- 3. Contracts for consultants

4. Procurement of supplies and materials

5. The project office and resource library used in Phase I, of State Curriculum Guide for Electricity/Electronics was utilized.

Learning Module Development: (Activities for Objective 3.1)

1. The project staff reviewed task and/or competencies established in Phase I of the State Curriculum Guide for Electricity/Electronics

2. Reviewed technical literature

- 3. Analyzed school district questionnaires completed during Phase I. Related input which aided in the establishment of the criteria for learning module content and scope.
- 4. Developed individual worksheet models for each section of learning modules.

Learning Module Development: (Activities for Objectives 3.2, 3.3, 3.4)*

5. Consulted with specialists in the areas of reading, special education, sex equity, to aid in the development of the learning module and their format

*See timeline attached, page 3.

6. Determined learning module titles, and coordinated them with existing level outlines per State Curriculum Guide for Electricity/Electronics.

7. Developed content of each learning module that was based upon researched needs.

8. Upon completion of each learning module, drafts were reviewed by staff, designated specialists, and state personnel. After corrections and/or revisions were

made, modules were sent to reproduction.

9. Worked on the learning modules, working predetermined hours each day, outside of district contract hours, utilizing consultant, vacations, weekends and summer (1978) for concentrated efforts.

Personalized Instructor Inservice (Activities for Objectives 3.5*, 3.6)

1. The Project Staff developed instruction sheets showing the recommended procedural steps for use, adoption or adaptation of Phase I and II. The Staff also developed visual and support materials that illustrated how the guide and modules are intended to be used. Flyers for publicizing were also developed.

2. Copies of instruction sheets, fliers, modules, State
Curriculum Guide for Electricity/Electronics were
reproduced for dissemination during each of the regional

personalized instruction inservices.

(Activities for Objectives 3.7, 3.8, 3.9)*

3. The Project Director, with the assistance of the State Industrial Education personnel, designated locations and made necessary arrangements for personalized instruction inservice meetings in each of the 3 state regions. Fliers were mailed out with adequate lead time so as to inform all necessary personnel to be involved. Every attempt was made to locate each inservice in an accessible area at a time that was available to teachers. Inservices were held at California State University at Los Angeles, Mt. Pleasant High School, San Jose and Woodruff R.O.C., Stockton, California. Each personalized instruction inservice presentation included:

*See timeline, attached, page 3.

1. Introduction

2. Background (history)

3. Use of State Curriculum Guide for Electricity/Electronics

4. Use of Modules

- 5. Advantages of articulation, etc.
- 6. Procedures for procurement of (3 and 4)
- 7. Evaluation

4. (Activities for Objective 3.10)

After the completion of the three regional inservices, 100 copies of the State Curriculum Guide for Electricity/Electronics Phase II Instructional Learning Modules were shipped to the appropriate state office for dissemination.

5. (Activities for Objective 3.11)

Evaluations were completed by participants in the three regional inservices. Copies of each evaluation were sent to the Industrial and Health Program Manager with the Quarterly Report.

RESTATEMENT OF PROJECT - OBJECTIVES AND ANTICIPATED OUTCOMES

- By April 1, 1978, each learning module format will be developed upon needs, tasks and competencies identified in the State Curriculum Guide for Electricity/Electronics.
- By June 1, 1978, staff will develop, for statewide dissemination, twenty Instructional Modules for Level I (grades 7-8) of the State Curriculum Guide for Electricity/Electronics.
- By December 1, 1978, the project staff will develop, for statewide dissemination, twenty-four Instructional Modules for Level II (grade 9) of the State Curriculum Guide for Electricity/Electronics.
- By May 1, 1979, the project staff will develop, for statewide dissemination, sixteen Instructional Modules for Level III (grade 10) of the State Curriculum Guide for Electricity/Electronics.
- 3.5 By May 1, 1979, the project staff will have developed an organized plan for the implementation of the regional inservices.
- By June 1, 1979, the project staff will have supplied copies of the State Curriculum Guide for Electricity/Electronics for Instructional Modules for use and evaluation at each of the regional inservices.
- 3.7 By June 1, 1979, designated staff members will have conducted three regional inservices within the State of California, one each in coastal, central and southern regions.
- By June 1, 1979, the project staff will have conducted inservices on the use, application, and availability of the State Curriculum Guide for Electricity /Electronics and its Instructional Modules.
- By June 1, 1979, designated project staff members will have, during regional inservices, recommended the adoption or adaptation of the State Curriculum Guide for Electricity/ Electronics and its Instructional Modules as a means of equalizing educational opportunities for students in the Electricity/Electronics field.
- 3.10 By June 1, 1979, the project staff will provide 100 copies of each Instructional Module to the State Dissemination Center.

RESTATEMENT OF PROJECT - OBJECTIVES AND ANTICIPATED OUTCOMES (Cont'd.)

3.11 By June 30, 1979, the Learning Modules and inservice of these modules will be evaluated by inservice participants and follow-up by State staff, annually, regarding effective implementation.

DETAIL THE ACTUAL OUTCOMES AND THE MANNER BY WHICH THESE OUTCOMES WERE MEASURED

Objective 1.

Outcome: Learning module format was developed on schedule. Each learning module reflected the needs, tasks and competencies identified in the State Curriculum Guide for Electricity/Electronics. Evaluation/Measurement: Learning modules were developed prior to the stated completion date of April 1, 1978.

Objective 2.

Outcome: Twenty Instructional Modules for Level I (grades 7-8) were developed. Actually, two were developed - a Level I-A, nine-week model and a Level I-B, an eighteen-week model. One hundred copies of each were sent to the State for dissemination, per request from regional inservices.*

Evaluation/Measurement: 1. Learning Modules were developed and submitted to the Project Director for reproduction, prior to the completion of the project. 2. Recipients of learning modules are using developed materials.

Objective 3.

Outcome: Twenty-four Instructional Modules for Level II (grade 9) were developed. One hundred copies were sent to the State for dissemination per request from regional inservices. **

Evaluation/Measurement: 1. Learning Modules were developed and submitted to the Project Director for reproduction prior to the completion of project. 2. Recipients of the Learning Modules are using developed materials.

Objective 4.

Outcome: Sixteen Instructional Modules for Level III (grade 10) were developed, and submitted to the Project Director for reproduction prior to the completion of the project. Over 127 copies were disseminated during the three regional inservices. Additional copies, to-meet their requests are being run by the State Department of Education.***

Evaluation/Measurement: 1. Learning Modules were developed and submitted to the Project Director for reproduction prior to the completion of the project. 2. Recipients of Learning Modules are using developed materials. 3. Evaluation forms were filled out at each of the three regional inservices.****

* See Appendix A (Level I - A and B)

*** See Appendix C (Level III)

** See Appendix B (Level II)

-6-1 O

**** See Appendix D (Evaluations from Regional Inservices)

DETAIL THE ACTUAL OUTCOMES AND THE MANNER BY WHICH THESE OUTCOMES WERE MEASURED (Cont'd.)

Objective 5.

Outcome: Regional inservices were held at California State University at Los Angeles Woodruff R.O.C. Center in Stockton, California, and at Mt. Pleasant High School in San Jose, California. All were well attended and evaluations were very positive.*

Evaluation/Measurement: See attached evaluation of participants at each of the inservices. Project staff had to rely on hosts for inservice accommodations. Locations seemed to be good; attendance was high.

Objective 6.

Outcome: Level III Learning Modules were printed and used as sample for the three regional inservices. Phase I Curriculum Guides are being run and disseminated by the State. The Phase I Curriculum Guide and the Learning Modules were reviewed and explained during each of the inservices.

Evaluation/Measurement: See attached evaluations from participants at each of the inservices.

Objective 7.

Outcome: Inservices were held in Los Angeles, Stockton, and San Jose, CA. Attached are copies of the information brochure and agenda. Meetings were well attended. **

Evaluation/Measurement: See attached evaluation forms.

Objective 8.

Outcome: See Outcomes 5, 6, 7.

Evaluation Measurement: See attached evaluation forms.

Objective 9.

Outcome: The prime goal of this project is the adoption or adaptation of any or all of the developed materials.

Evaluation/Measurement: This goal was stressed during each inservice by the presentors and staff.

- * See Appendix D (Evaluations from Regional Inservices)
- ** See Appendix E (Information Brochure and Agenda)

DETAIL THE ACTUAL OUTCOMES AND THE MANNER BY WHICH THESE OUTCOMES WERE MEASURED (Cont'd.)

Objective 10.

Outcome: One hundred copies of Level I and Level II were sent to the State for dissemination. Level III was disseminated by the Project staff during the three regional inservices.

Evaluation/Measurement: One hundred copies of Level I and II were delivered to the State Department of Education for dissemination by the Project Director.

Objective 11.

Outcome: Participants filled out an evaluation form, which covered the items on the inservice agenda.

Evaluation/Measurement: See attached inservice evaluation forms.*

^{*} See Appendix D (Evaluations from Regional Inservices)

DESCRIBE THE DIFFERENCE BETWEEN ANTICIPATED OUTCOMES AND THOSE DESCRIBED IN THE PROJECT OBJECTIVES AND REASONS FOR ANY DIFFERENCES.

Objective 1.

Anticipated outcome met. No deviation from stated objective.

Objective 2.

Anticipated outcome met. Level I was printed in two forms, Level I-A (9-week program) and Level I-B (18-week program). Level I-B is Level I-A plus an additional nine weeks. The reasons for the A-B format was to save duplication during dissemination.

Objective 3.

Anticipated outcome met. No deviation from stated objective.

Objective 4.

Anticipated outcome met. No deviation from stated objective.

Objective 5.

Anticipated outcome met. No deviation from stated objective.

Objective 6.

Level III was used as a sample and a copy was given to each inservice participant. Level I, II, and Phase I curriculum material were made available to participants with an order form. These materials are now with the State Department of Education for dissemination. Level III was developed first, to save time in the development of Levels I and II.

Objective 7.

Anticpated outcome surpassed. Last inservice was on June 2, 1979. More participants attended than pre-registered at each of the inservices. The period of time happened to correspond with the gasoline shortage...

Objective 8.

Anticpated outcome met/surpassed, because of the increased number of participants. (see attached inservice agendas.)*

* See Appendix F (Inservice Agenda)

DESCRIBE THE DIFFERENCE BETWEEN ANTICIPATED OUTCOMES AND THOSE DESCRIBED IN THE PROJECT OBJECTIVES AND REASONS FOR ANY DIFFERENCES (Cont'd.)

Objective 9.

Anticipated outcome met. (See actual and anticipated outcomes 5, 6, 7.)

Objective 10.

Anticpated outcome met.

Objective 11.

Anticipated outcome met. (See participant evaluation attachments.)*

* See Appendix D (Evaluations from Regional Inservices)

FOR CURRICULUM DEVELOPMENT PROJECTS DESCRIBE HOW THE PROJECT HAS OR WILL RESULT IN IMPROVED TEACHING TECHNIQUES OR CURRICULUM MATERIALS

The Electricity/Electronics Curriculum Guide Phase II (Instructional Modules for Levels I,/II, III) has dealt with the development and use of instructional modules for use in the classroom as a vehicle to implement the articulated, competency-based curriculum outlines presented in the Electricity/Electronics Curriculum Guide (Phase I).

Educators, using these competency-based modules, can adapt or adopt these modules to any existing or new program without major cost expenditures. These modules, as presented during the three regional inservices, hopefully will act as a catalyst for educators who desire a revision or restructuring of their Electricity/Electronics curriuclum. The module development provides for teacher-based modification related to methodology, instructional resources, textbooks, equipment, laboratory systems, etc. Each instructional module contains the following:

- 1. Goals and Objectives (unit)
- 2. Outline
- 3. Pre-post Test (keyed)
- 4. Instruction references
- 5. Suggested Methodology
- 6. Demonstrations and Quest Activities
- 7. Student Handouts Informational
- 8. Vocabulary Enrichment List
- 9. Student Worksheets
- 10. Related Instructional Activities and Graphical Illustration.

It is hoped that the Curriculum Guide and its Modules will be a measure of equalizing educational opportunities for students in the Electricity/ Electronics programs throughout the State.

COMPLETED PARTICIPANT SUMMARY FORM

Attached are copies of the forms filled out by the participants of each of the three regional inservices. (See Request Forms from Regional Inservices)*

*See Appendix G (Request Forms from Regional Inservices)

DESCRIBE EXTENT OF DISSEMINATION OF PROJECT PRODUCTS AND/OR SERVICES

Each participant of each of the three regional inservices was given a copy of the Level III and an order form to request Level I, Level II and Phase I materials. These materials were forwarded to the State Department of Education for dissemination upon completion of reproduction. Other individuals were exposed to the project materials through California Industrial Education Association Section and State conferences. Some individuals were exposed through a State Department of Education project titled "Industrial Education Delivery System" which was contracted through Orange Unified School District. Information was also sent out, in publications of the California Council of Electronics Instructors Newsletters, and California Industrial Education News.

DESCRIBE ANY FOLLOW-UP ACTIVITIES AND GIVE DATE INFORMATION CAN BE EXPECTED

Project Objective 11 calls for the State Department of Education staff to follow-up, regarding effective implementation. Other activities that will check the effectiveness of material in the field will be through the (Demonstration) Site project.

DESCRIBE INTERNAL ACTIVITIES CARRIED OUT

In addition to the "Activities Conducted During the Project", we established a project office and resource center at the school of the project coordinator. A part-time secretary and technical illustrator were used to supplement the consultants who worked with the project coordinator in the development of the modules.

Maintenance of an active working advisory committee is very important. The East Side Union High School District Industrial Education Department maintains* Special Interest Groups which meet monthly. These groups were helpful in the overall production of the project. Many of these teachers worked as consultants on various parts of the project.

* See Appendix H (Industrial Education Special Interest Groups [S.I.G.], East Side Union High School District)

STATE ANY OBSERVATIONS THAT MIGHT BE HELPFUL TO OTHERS CONSIDERED FOR SUCH A PROJECT

- . Support services from State were very helpful. Constant communication is very important.
- Maintain an active advisory committee and make sure you have the key person at participating firm who can make decisions and/or supply help needed to complete the project. Do not prostitute the committee with requests for jobs, materials, etc. when they were asked to serve in an advisory capacity.
- Make sure the core working staff has adequate working conditions that support and/or facilitate their work. (i.e., files, reproductions of materials, etc.)
- Develop a contract for consultants and other workers so they are paid by the completion of units or tasks rather than by the hours. Set deadlines and follow them.

INDUSTRIAL EDUCATION SPECIAL INTEREST GROUPS (S.I.G.)

These are subject field committees composed of teachers spending the majority of their time in a specific area of the Industrial Education field (i.e., woodworking, metals, etc.) and is chaired by the Special Interest Group Leader. The Special Interest Groups meet monthly and are a subcommittee working under the Subject Coordination Committee (I.E.C.C.).

General Functions of the Special Interest Groups:

- 1. To study and review the curriculum in their respective areas, assure continuity and make recommended changes which are necessary.
- 2. Share educational and other expertise, experiences, techniques, and technical knowledge with other S.I.G. members.
 - 3. Cooperatively develop new materials for district curriculum book.
- 4. Study and share new trends related to the specific Special Interest Group.
- 5. Study and share new trends in career opportunities related to the specific interest group.
- 6. Review and recommend to I.E.C.C. new text and supplementary textbooks respective to each area.
 - 7. Coordinate and compile yearly district reproduction requests.
 - 8. Review and recommend policies and procedures that may be pertinent to the Special Interest Group.
 - 9. Coordinate purchasing procedures.
- 10. Cooperatively develop and recommend proposals which may merit support under federal, state, district or private programs and develop information necessary to make applications for financial support of said projects which have the approval of the Industrial Education Curriculum Committee.
- 11. Review and recommend summer curriculum development related to the Special Interest Group.
 - 12. Make recommendations on other appropriate matters.
- 13. Work on special tasks as assigned by Subject Area Coordinator, Special Interest Group Leader, or as directed by group.

SPECIAL INTEREST GROUP LEADER. (S.I.G. LEADER)

Special Interest Group Leader is appointed by and works with Subject Area Coordinator and strives to improve and maintain instruction for his/her Special Interest Group. The S.I.G. Leader is usually not a department chairperson, but does represent his/her group at the monthly Industrial Education Coordinating Committee meetings (I.E.C.C.)

Duties and Responsibilities:

- 1. Acts as an expert resource person for the Special Interest Group.
- 2. Represents their group at the Industrial Education Coordinating.

 Committee meetings.
- 3. Works with Subject Area Coordinator and Special Interest Group to plan and conduct monthly S.I.G. meetings.
 - 4. Develops agendas and minutes for each meeting.
 - 5. Assists teachers when feasible.
 - 6. Acts as resource person for teachers in group.
- 7. Helps coordinate and compile district yearly reproduction requests for their area.
 - 8. Coordinates annual purchasing procedure.
- 9. As area specialist, the S.I.G. Leader may upon request work with Subject Area Coordinator to: give reports, review purchasing and any other items that may arise.

INDUSTRIAL EDUCATION

ELECTRICITY / ELECTRONICS

CURRICULUM
GUIDE
PHASE II

INSTRUCTIONAL MODULES

STATE OF CALIFORNIA

AGENDA - INSERVICE WORKSHOP

REGIONAL WORKSHOPS:

May 5, Los Angeles - May 12, Stockton - June 2 San Jose

PRESENTERS:

Robert Lillo - Project Curriculum Coordinator Nick Soffiotto - Project Staff Leader

WORKSHOP FOCUS:

To review, evaluate, and disseminate the Level III Instructional Modules in order to facilitate immediate utilization by the classroom instructor. Modules correspond to the existing California State Curriculum Outlines Grade Levels 7-10, and each learning module contains all of the program materials in an innovative format.

PRESENTATION OUTLINE:

I. Introduction (general)

A. Presenter Background

B. Project Background (needs assessment)

II. Project Purpose Phase I

A. Competency-based curriculum

B. Easy to adapt or adopt to existing programs

C. Teacher flexibility is not ignored

D. Topics include "state of the art" technology

E. Development of the subject matter topics in outline form to act as a guide for instructor at grade levels 7-14.

F. Industry actively participated in the creation

of these outlines.

G. Format and development of Phase I guide

H. Additional resource data included - textbooks and support systems

III. Project Purpose Phase II

A. Development of 63 instructional modules based upon Level I, II, and III outlines

B. Discuss and demonstrate the basic content of each instructional module.

1. Goals and objectives (unit)

2. Outline (unit)

3. Pre-Post Test (keyed)

4. Instructor References

5. Suggested Methodology

6. Demonstrations and Quest Activities

7. Student Handouts-Informational

8. Vocabulary Enrichment List

9. Student Worksheets

10. Related Instructional Activities and Graphical Illustrations

C. Module listings Phase II - what is available

D. Dissemnation of Phase II, Level III instructional modules

E. Review of modules and sharing of ideas

IV. Closing Statements

A. Implementation

B. Availability/Contacts 100

C. Questions

Forms - Fill out and submit

State Electricity/Electronic Curriculum Project C/O Mt. Pleasant H.S. 1750.S. White Road San Jose CA 95127

Atten. Robert Lillo

If you have any additional comments or inquiries reguarding the Electricity/Electronics Curriculum Guides - Phase II. - please drop us a line at the above address. We are interested in your feedback in reference to the materials presented in the guide, any "problems" or errors that you might locate, and of course any constructive suggestions. We welcome your input, and invite you to contact us if you desire any assistance in program developement and implementation.

COMMENTS:

294

STATE OF CALIFORNIA: DEPARTMENT OF EDUCATION INDUSTRIAL EDUCATION DIVISION

INSERVICE WORKSHOP

Electricity/Electronics Curriculum Learning Modules

Industrial and For: Vocational Education teachers in Junior and Senior High School or Junior College programs who are interested in reviewing, evaluating and re-ceiving curriculum materials recently developed in the areas of Electricity and Electronics.

Sponsored By:

The State of California, Industrial Education Division and the State Electricity/ Electronics Curriculum Project.

WORKSHOP AGENDA

- Describe the State Curriculum Guide Phase I (course topic-outlines).
- Introduce Phase II (scope and content).
- Discuss and Demonstrate basic content of each Instructional Module.
- Review all modules (example: Safety Graphical Illustrations Fabrication - Vacuum Tubes and Solid State Electronics - etc.)
- Implementation into your program? What levels are available?
- Dissemenation of modules.

Sharing of ideas.

COST: NONE. All materials will be distributed free of cost, while supplies last.

63 modules 7-8 grade. Level grade -Level 10 grade being developed! Level III -11-14 grade Level IV

Types Of Materials To Be Distributed:

*Compléte course materials *Illustrated handouts and worksheets

*Pre-post unit test
*Vocabulary list and activities *Instructor topic guides

*Quest activities

*Answer keys

Workshop Coordinators

Chris Almeida, State Consultant Keith Bush, Project Director Robert Lilio, Project Coordinator Nick Soffictto, Project Leader

TAKE HOME A WEALTH OF NEW innovative materials Interested? Don't delay mail in the pre-registration card and indicate which regional workshop you will attend. Cards should be mailed prior to 4/27/79.
