ABSTRACT

Information on the current and projected supply of and demand for graduates of higher education in the food and agricultural sciences is presented, based on federal data bases. The supply data are aggregated by 11 educational clusters, and employment demand data are aggregated by eight occupational clusters. Analysis reveals imbalances in the supply of, and demand for, graduates of higher education in the food and agricultural sciences. When total supply is relaied to total demand for each of the eight occupational clusters, shortages of qualified graduates appear to exist through 1985 for five clusters: scientific and professional specialists, manufacturing and processing scientists and engineers, sales and service representatives and purchasing agents, administrators/managers/linancial advisors, and miscellaneous agricultural specialists. Supply approximates demand for agricultural production and management specialists, and exceeds demand for media specialists and educators. However, several supply deficiencies were identified for educators. Information is presented on supply/demand relationships by occupational cluster, degree type (agriculture and agriculture-related), and degree level (associate, baccalaureate, master's, doctoral, and Doctor of Veterinary Medicine). Suggestions for future research on this topic are presented, and additional information is included on international employment opportunities for food and agricultural graduates. Findings pertinent to data collection for the Foreign Agricultural Service and those stemming from the review of existing data are discussed. (SW)

ACKNOWLEDGMENTS

Graduates of Higher Education in the Food and Agricultural Sciences: An Analysis of Supply/Demand Relationships was prepared by the Office of Higher Education, Science and Education Administration (SEA), U.S. Department of Agriculture (USDA). Kyle Jane Coulter, Deputy Assistant Director, Office of Higher Education, was coordinator of the SEA Manpower Assessment Project which served as the basis for this report.

Several professional organizations provided initial recommendations for conducting the project. Foremost among these were the American Association of University Agricultural Administrators (AAUAA) of the American Association of State Colleges and Universities (AASCU), and the Resident Instruction Section of the Division of Agriculture, National Association of State Universities and Land-Grant Colleges (NASULGC). The AAUAA appointed Charles M. Smallwood as liaison to the project. The Resident Instruction Section appointed the following members to serve as a panel of consultants to the project coordinator: Stephen R. Chapman, J. Robert Cooke, Ed Glazener, Allan Goecker, Richard Merritt, and Winston E. Pullen.

The following organizations also expressed interest in the project and provided guidance and direction: the Council of Forestry School Executives, the Association of State College and University Forestry Research Organizations, the Society of American Foresters, the Association of American Veterinary Medical Colleges, the Federal Interagency Committee on Plant Sciences, the Federal Interdepartmental Committee on Employment Opportunities and Training Needs in Agriculture, and the National Plant Genetics Resources Board.

Within USDA, many individuals contributed to the project. Anson R. Bertrand, Director, Science and Education, and Homer C. Folks, Assistant Director, Higher Education, gave administrative support. Josefina Lago and Marge Stanton, Communications and Data Services Division, SEA, were responsible for analyzing the data pertaining to the supply of graduates of higher education in the food and agricultural sciences. Dennis Clark, also with the Communications and Data Services Division, provided guidance in processing the Cooperative Extension Services data. Jane Hart and Cheryl Cohen, Higher Education, provided clerical assistance. Deborah Gerald, National Center for Education Statistics, helped prepare projections for future graduates in food and agriculture.

Data used in the project were made available by the National Center for Education Statistics, the Bureau of Labor Statistics, SEA-Extension, the American Vocational Association, the Foreign Agricultural Service, and the Department of Defense. A USDA-SEA funded Clemson University project, directed by Stephen R. Chapman and Edward L. McLean, was responsible for collecting and analyzing the data for teaching and research faculty employment in higher education.

Program Resources, Inc. (PRI) developed the overall project design, identified and processed the employment demand data, analyzed supply/demand relationships, and helped prepare the final report. Representing PRI were David Lipstein, David Mixer, Jane Burgess, Trish Carrico, and Betty Johnson.

The panel of consultants from the Resident Instruction Section, Division of Agriculture, NASULGC, reviewed the report. In addition, the Joint Council on Food and Agricultural Sciences appointed the following group to review the report: T. H. Blosser, Robert Coltrane, Rudy M. Kallander, Fred B. Knight, and Charles M. Smallwood.

EXECUTIVE SUMMARY

This report--prepared by the Office of Higher Education, Science and Education Administration (SEA), U.S. Department of Agriculture (USDA)--provides information on the current and projected supply of and demand for graduates of higher education in the food and agricultural sciences.

Purpose

The purpose of this report is threefold: (1) to identify current and projected supplies of new graduates of higher education qualified for employment in food and agriculture_related positions; (2) to identify current and projected occupational employment demand for graduates of higher education in the food and agricultural sciences; and (3) to analyze and interpret supply/demand relationships, thereby providing insight into the extent to which higher education in the food and agricultural sciences is producing sufficient graduates to complement needs of the labor force.

Overview of the Methodology

The project responsible for this report primarily used data bases from agencies of the Federal Government. Information on the supply of higher education graduates was obtained principally from the Higher Education General Information Surveys administered by the National Center for Education Statistics; the only exception was for data pertaining to graduates certified as secondary vocational agriculture teachers, which were acquired from the American Vocational Association. Occupational employment demand information was obtained primarily through the Occupational Employment Statistics Program of the Bureau of Labor Statistics (BLS). In addition to BLS data, USDA data were used to assess employment demand in the Cooperative Extension Services, and a USDA-funded study by Clemson University provided data On college and university teaching and research faculty employment.

The supply data are aggregated and presented by 11 educational clusters: General Agriculture; Agricultural Business and Management; Agricultural Engineering; Agricultural-Related Sciences; Agricultural Social Sciences; Animal Sciences; Food Sciences; International Agriculture; Natural Resources; Plant Sciences; and Soil Sciences. The 8 occupational clusters used to aggregate and present the employment demand data are: Scientific and Professional Specialists; Manufacturing and Processing Scientists and Engineers; Sales and Service Representatives and Purchasing Agents; Administrators, Managers, and Financial Advisors; Educators; Media Specialists; Agricultural Production and Management Specialists; and Miscellaneous Agricultural Specialists. Supply/demand relationships focus on associations between the 11 educational clusters and the 8 occupational clusters.

Throughout the project, a panel of consultants representing the Resident Instruction Section of the Division of Agriculture, NASULGC, and a liaison representative of the American Association of University Agricultural Administrators, AASCU, provided suggestions and guidance. This panel afforded the necessary expertise to overcome the inherent limitations due to the paucity of existing data as well as the inconsistent and incompatible data classification systems of the different information bases. Without such expertise, the development of a single analytical model would not have been possible.

Summary Conclusions

The study shows imbalances in the supply of, and demand for, graduates of higher education in the food and agricultural sciences. Through the mid-1980's, estimated

xlii

supplies of associate and baccalaureate degree recipients appear to be adequate for most types of employment demand. Current and projected supplies of graduates with advanced degrees do not appear to satisfy employment demand.

To strengthen the food/agriculture labor force, the United States needs more master's graduates in Agricultural Business and Management, Agricultural Engineering, Animal Sciences, Food Sciences, Natural Resources, Plant Sciences, and Soil Sciences. At the doctoral level, we need more graduates in Agricultural Business and Management, Agricultural Engineering, Animal Sciences, Food Sciences, Forest Engineering, Forest Products Utilization, Plant Sciences, and Soil Sciences. In addition, this study projects shortages of graduates in selected specialties in Veterinary Medicine (for example, regulatory medicine, pathology).

Limitations

The project represents the first phase of a continuing effort to conduct a comprehensive supply/demand analysis of graduates of higher education in the food and agricultural sciences. For brevity, this report presents supply information pertaining only to degrees conferred by all institutions. Future reports will address sex, race, and ethnicity of graduates, as well as type of institution (for example, landgrant, nonland-grant).

A comprehensive data base does not exist for analyzing supply and demand components of the food and agricultural labor force sectors. Therefore, the project employed an innovative, experimental methodology to develop estimates for: percentages of graduates of the various degree specializations qualified for food/agriculture employment; percentages of workers in given occupations who possess higher education in food/agriculture; and percentage distributions of graduates of various degree specializations among the 8 occupational clusters established for the project. Future studies will refine and validate this research design.

Graduates of Higher Education in the Food and Agricultural Sciences:

An Analysis of Supply/Demand Relationships

Volume I—Agriculture, Natural Resources, and Veterinary Medicine

Edited by Kyle Jane Coulter and Marge Stanton *

CHAPTER I

Introduction

The Food and Agriculture Act of 1977 (PL 95-113), Title XIV, Subtitle B, Caccion 1405 states:

The Department of Agriculture is designated as the lead agency of the Federal Government for agriculture research,...extension, and teaching in the food and agricultural sciences, and the Secretary, in carrying out the Secretary's responsibilities shall...keep informed of developments in, and the Nation's need for research, extension, teaching, and manpower development in the food and agricultural sciences and represent such need in deliberations within the Department of Agriculture, elsewhere within the executive branch of the United States Government, and with the several States and their designated land-grant colleges and universities, agricultural and related industries, and other interested institutions and groups.

The Science and Education Administration (SEA) of the U.S. Department of Agriculture (USDA) is mandated to carry out the Secretary's responsibilities as cited.

Recognizing the foregoing, the Office of Higher Education, SEA, USDA, conducted a comprehensive analysis of the occupational structure of the food and agriculture sector of the Nation's economy and the extent to which higher education is producing the specific types of graduates required by the total spectrum of food and agricultural industries. The basic focus of the project was to identify current and projected employment opportunities for graduates of higher education programs in the food and agricultural sciences. In designing and carrying out the project, the following definitions were used:

Food and Agricultural Sciences—academic programs concerned with the production, processing, marketing, distribution, conservation, consumption, research and development of food and agriculturally related products and services, inclusive of programs in natural resources, forestry, veterinary medicine, and home economics.

Graduates of Higher Education Programs—current and projected recipients of an associate, baccalaureate, master's, doctorate, or first professional degree awarded

^{*}Kyle Jane Coulter is Deputy Assistant Director, Office of Higher Education, SEA, and Marge Stanton is statistician, Communications and Data Services Division, SEA, USDA, Washington, D.C. 20250.

by any accredited public or private institution of higher (postsecondary) education. A Doctor of Veterinary Medicine (D.V.M.) was considered a first professional degree.

<u>Employment Opportunities</u>—current and projected levels of employment, as well as projected average annual job openings in those occupations related to the broad spectrum of food and agriculture-related positions.

Labor Supply--new graduates of higher education programs who are qualified for and are seeking employment in food- and agriculture-related positions.

<u>Labor Demand</u>—employment opportunities (job openings) related to food and agriculture created by industry growth and employee separations from the labor force due to death, disability, retirement, or personal reasons.

Purpose of Report

If the United States is to continue as the lead Nation in confronting problems associated with increasing global population and decreasing agricultural and natural resources, it must possess the requisite "human capital"—individuals with higher education in the food and agricultural sciences.

As colleges and universities strive to produce sufficient expertise in the food and agricultural sciences, they must have access to sound information for educational planning. One such information base denotes current and projected numbers of graduates of the specializations comprising the food and agricultural sciences. A second information base depicts the occupations which require higher education in food and agriculture, as well as current and projected levels of employment by occupational field. A synthesis of such information can then serve as a frame of reference for-

- . Identifying those academic areas which appear to warrant increased attention/support on the basis of stable or expanding employment opportunities which exceed qualified graduates.
- 2. Identifying those academic areas which are producing an adequate number of graduates to complement stable or declining labor market requirements.

Methodology

Cverview

The methodology used for this study entailed a quantitative assessment of the supply of and demand for new graduates qualified for employment related to food and agriculture. The outline on page 3 summarizes the overall project design. The outline addresses the review of existing data bases, the selection of appropriate data bases, and the collection of new data. In addition, the outline denotes the manner in which expert opinion was used to synthesize the various data into a single analytic model.

Assumptions

Current as well as projected supply/demand estimates were developed. The projected estimates were predicated on the following basic assumptions:

Outline of the selection, evaluation, and interpretation of data relating supply of and demand for Food and Agriculture graduates

Data reviewed (Appendix 1)

American Vocational Association
Department of Commerce
Department of Defense
Department of Health, Education
and Welfare
National Academy of Sciences

Data selected

Annual Surveys by Professional Personnel Recruitment Committee, Agricultural Education Division. American Vocational Association (Table 30) Higher Education General Information Surveys, National Center for Education Statistics. DHEW (page 6) Manpower Data Center, DOD (Table 50) Master Personnel File, Cooperative Extension Services (Appendix 22) OES Census-Based Data, Bureau of Labor Statistics, DOL (page 11)

Data collected

Higher Education Faculty Employment in Food and Agriculture, Clemson University Stud, (Tables 28, 29)
International Agricultural Employment of U.S. Citizens, Foreign Agricultural Service, USDA (Table 46)

Data evaluation, integration and synthesis by panel of consultants

Selection of HEGIS degree specializations leading to expertise in food and agriculture (Appendix 3) Estimation of percentages of graduates by degree level & d field qualified for f. /agriculture employment (Appendix 3) Categorization of degree specializations by 11 educational clusters (Appendix 4)

Selection of OES Census-based occupations and industries representative of food and agriculture (Appendixes 13, 14)

Estimation of percentages of workers, in each selected occupation and industry, possessing higher education in the food and agricultural sciences (page 12)
Categorization of occupations by 8 clusters (page 15)

Estimation of percentages of graduates of each educational cluster employable within each occupational cluster (Appendix 15)

Results

Current and projected average annual graduates of sclicted food/ agriculture degree specializations by degree level categorized by educational cluster (App_ndix 5) Estimated number of food/ agriculture workers in selected occupations and industries (Tables 2, 7, 12, 17, 22, 32, 37, 42) Estimated average at...:1 job openings for food/ agriculture occupations through 1985-86 (Tables 2, 7, 12, 17, 22, 32, 37, 42) Supply/demand relationships hetween occupational and educational clusters by degree level (Charts 1, 2, 3) Additional information on employment demand for food and agriculture graduates--military (Table 50), international (Table 46, Appendix 23) Implications for higher education in the food and agricultural sciences

- 1. Assumptions for projecting the 1985-86 supply of graduates of higher education in the food and agricultural sciences as developed by the National Center for Education Statistics, U.S. Department of Education (formerly part of the U.S. Department of Health, Education, and Welfare).
 - a. Trends in graduation rates will not change drastically from the mid-1970's to the projected period in spite of a decline in the college age population and the propensity of older age groups to participate in the education process. Graduation rates may begin to decline toward the end of the decade.
 - b. Values placed on an education will not alter significantly during the projected period.
 - c. The proportion of graduates in a given degree specialization to the total number of graduates in the food and agricultural sciences may not remain constant through the projected period.
- 2. Assumptions for projecting the average annual demand through 1985 for graduates of higher education in the food and agricultural sciences as developed by the Bureau of Labor Statistics, Department of Labor.
 - a. The institutional framework of the U.S. economy will not change radically through the projected period.
 - b. Current sociological, technological, and scientific trends will continue through the projected period, including values placed on work, education, income, and leisure.
 - c. The economy should gradually recover from the higher unemployment levels of the mid-1970's and reach full employment (defined as an unemployment rate of 4 percent) by the mid-1980's.
 - d. No major event such as widespread or long-lasting energy shortages or war will significantly alter the industrial structure of the economy or alter the rate of economic growth by the mid-1980's.
 - e. Trends in the occupational structure of industries will not be altered radically by changes in relative wages, technology, or other factors.

Some of the stated basic assumptions underlining the study may appear to be questionable in light of current developments. Because the primary data bases utilized in the project reflect such assumptions, the findings of the study pertaining to projected labor supply/demand should be interpreted accordingly.

Sources of Data

To the maximum extent possible, the project utilized existing data bases available through agencies of the Federal Government. Information on the supply of higher education graduates was obtained principally from the Higher Education General Information Surveys (HEGIS), a series of annual and periodic data collection instruments administered by the National Center for Education Statistics. The particular data collection component of HEGIS used was the survey of "Earned Degrees and Other Formal Awards Conferred." This survey collects information on the number of degrees conferred by degree specialization from each institution of higher education and is

the most comprehensive source of data covering the output of higher education programs.

Occupational demand information pertaining to potential employment opportunities was obtained through the Occupational Employment Statistics (OES) Program of the Bureau of Labor Statistics (BLS). One of the components of OES is referred to as the Industry-Occupation (I-O) Census-Based Matrix. In addition to the decennial Census, the matrix data are based on many sources including BLS's Current Employment Statistics program and Current Population Survey program. The matrix provides employment data cross-classified by industry and occupation and is developed for a base year (current year) and for a projection year. Along with occupational rates for job separations because of death, retirements, and other factors, the employment matrices are used to estimate average annual job openings by occupation.

In addition to the HEGIS degrees conferred survey and the OES Industry-Occupation matrix, several other sources of information were utilized in the project. Although not necessarily consistent with either of the core sources of data in terms of academic degree specialty or occupational concept, these other sources provided valuable information for the project. Appendix 1 summarizes these supplementary data bases and the manner in which they were utilized. As shown in Appendix 1, two special surveys were conducted—one, by Clemson University, encompassing faculty employment in the food and agricultural sciences in higher education institutions, and the other, by the Foreign Agricultural Service, USDA, covering international agricultural employment opportunities for Americans. These special surveys were conducted to provide information in areas where critical gaps in the existing data were identified.

Panel of Experts

Synthesizing the data from the various sources of information into a single aralytic model was constrained because of (1) significant differences in the various occupational and educational taxonomies used to classify data from the individual sources, and (2) the limited set of data pertaining directly to the food- and agricultural-related labor market. To overcome these limitations, the use of expert opinion in assessing the relevance of information from a single source was a virtual necessity.

Throughout the project, a panel of consultants representing the Resident Instruction Section of the Division of Agriculture, National Association of State Universities and Land-Grant Colleges, provided suggestions and guidance for the study. Appendix 2 lists the members of the panel of consultants. Consensus from this panel of consultants was utilized in developing data for several aspects of the study, including:

1. Estimates of the percentage of graduates of the various academic degree fields qualified for employment in food- and agriculture-related occupations (Appendix 3). Estimates were developed based on available enrollment and degrees conferred statistics and knowledge of the curriculum associated with the various academic degree fields. Also, the estimates were based on the assumption that the percentages of graduates of the different degree

^{1.} American Vocational Association, Department of Commerce, Department of Defense, Department of Health, Education and Welfare, National Academy of Sciences, National Science Foundation, Office of Personnel Management, Resident Instruction Committee on Organization and Policy of the National Association of State Universities and Land-Grant Colleges, Institute of International Education, U.S. Department of Agriculture.

fields qualified for food/agriculture employment would remain constant through the projected period.

- 2. Estimates of the percentage of employed workers in specific occupational fields within various industrial sectors that possess higher education in the food and agricultural sciences. Percentage estimates were based on analysis of current occupational employment data and knowledge of the skills and tasks required in each occupational field. Further, the percentage estimates were based on the assumption that the relative relationship of food and agriculture worker employment in an occupation to total employment in that occupation will remain constant through the projected period.
- 3. Estimates of the percentages of graduates of disciplines comprising the food and agricultural sciences distributed among defined occupational clusters. Appendix 15 provides the estimates derived from a synthesis of the various sources of education placement information described in Appendix 1.

In essence, the panel of consultants provided the necessary expertise to develop a single analytic model using several sources of data.

Identification of Supply of Higher Education Graduates Qualified for Food and Agricultural Occupations

The current supply of workers for a given occupation at a given point in time consists of persons currently employed in that occupation plus unemployed persons defined as available and actively seeking work in that occupation. In reality, the supply of workers for a specific occupation is not a static concept; rather, it is a dynamic one in which workers are continually moving into and out of the labor supply for a specific occupation. The projected supply of workers for a given occupation for a given future time period is the current occupational supply plus new entrants minus separations because of death, retirement, occupational transfer, or geographic migration. Expected new entrants for a given occupation may come from one of several sources, including:

- Unemployed persons
- Educational institution graduates
- Occupational transfers (if wage and/or nonmonetary inducements are offered)
- Geographic in-migrants
- Labor force new entrants or re-entrants

These sources of new entrants to the labor supply for a specific occupation are not mutually exclusive. For example, a graduate of an educational institution may relocate to a different geographic area (and, hence, be a geographic in-migrant). The graduate also may be a new entrant to the labor force. These concepts of labor supply for an occupation constrain efforts to develop an analytical model of the supply of qualified workers for defined occupational fields.

For the purposes of this project, labor supply was deemed to be new associate, baccalaureate, master's, and doctoral graduates of higher education programs representative of the food and agricultural sciences who desire employment in food- and agriculture-related occupations. The following steps were used to assess the current and future supply of graduates:

6

^{2.} Nontransferable associate degrees.

1. <u>Urilization of The Higher Education General Information Survey (HEGIS)</u>

The Higher Education General Information Survey (HEGIS) was used to identify current (1976-77) and projected (1985-86) numbers of higher education graduates in the food and agricultural sciences. HEGIS is a series of annual and periodic surveys conducted by the National Center for Education Statistics (NCES), U.S. Department of Health, Education, and Welfare. HEGIS data are collected from all accredited public and private colleges and universities granting associate or higher degrees. The results of this data collection process provide comprehensive figures classifying students of higher education degree programs by level of degree, discipline division, and degree specialization. Furthermore, graduates of each degree specialization are aggregated by sex. As of 1975, HEGIS initiated collection of racial and ethnic characteristics of graduates on a biennial basis.

The classifications of discipline divisions and degree specializations are presented in A Taxonomy of Instructional Programs in Higher Education, published by the National Center for Education Statistics. The HEGIS taxonomy classifies the degrees into two sections. Within Section I, conventional academic subdivisions of knowledge and training are contained which relate to the bachelor's degree level and higher. Section II contains technological and occupational specialties which relate to curricula leading to associate degrees and other awards below the baccalaureate.

These two sections are divided into discipline divisions which are divided further into degree specializations. As an example of the structure of the taxonomy, Agriculture and Natural Resources represents a Section I discipline division, while Poultry Science represents a degree specialization within this division. Natural Science Technologies represents a Section II technological specialty, while Agricultural Technologies represents a degree specialization within the Natural Science Technologies.

HEGIS has been producing data since the 1960's. Hence, an historical set of data exists. NCES uses these historical data to project future graduates of higher education.

2. Selection of Degrees Representative of the Food and Agricultural Sciences

While HEGIS provides a comprehensive, standard set of academic degrees data, not all of the graduates receiving the degrees are qualified for, nor desirous of, employment requiring expertise in the food and agricultural sciences. To determine relevant academic degrees, the panel of consultants was asked to identify the degree specializations that result in expertise in the food and agricultural sciences. The panel selected 122 HEGIS degrees for which all or some of the graduates were deemed qualified for jobs requiring food and agricultural expertise. For each of the degree specializations, the panel estimated also the percentage of graduates at each degree level (associate, baccalaureate, master's, doctoral) qualified for employment related to food/agriculture. Appendix 3 presents the degree specializations selected and percentages estimated by the panel.

Using both the agriculture degrees and the degrees related to agriculture, ll educational clusters were defined for the purpose of aggregating

^{3.} Inclusive of junior colleges and community colleges.

the 122 degree specializations. The clusters group similar degree specializations according to educational emphases and are as follows:

- General Agriculture (cluster 1)
- Agricultural Business and Management (2)
- Agricultural Engineering (3)
- Agricultural Related Sciences (4)
- Agricultural Social Sciences (5)
- Animal Sciences (6)
- Food Sciences (7)
- International Agriculture (8)
- Natural Resources (9)
- Plant Sciences (10)
- Soil Sciences (11)

For each of the ll educational clusters, degree specializations were assigned to either an agriculture or an agriculture-related component of the cluster. Appendix 4 summarizes the assignment of HEGIS degrees to educational clusters. In certain instances, a HEGIS degree provides graduates for multiple educational clusters. Recipients of such degrees were prorated among the appropriate educational clusters. For example, 60 percent of Agronomy degrees were included in the Plant Sciences cluster, 40 percent of Agronomy degrees were included in the Soil Sciences cluster.

Subsequent to defining the educational clusters, data from 1976-77 HEGIS tabulations were aggregated accordingly. These data aggregations are presented in Appendix 5 by degree level, sex of student, and type of institution (for example, land-grant, nonland-grant). Appendix 5 is organized as follows:

- Associate Agriculture Degrees
- Associate Agriculture-Related Degrees
- Baccalaureate Agriculture Degrees
- Baccalaureate Agriculture-Related Degrees
- Master's Agriculture Degrees
- Master's Agriculture-Related Degrees
- Doctoral Agriculture Degrees
- Doctoral Agriculture-Related Degrees
- Doctor of Veterinary Medicine Degrees

Appendix 6 presents an overall summary of the supply of 1976-77 graduates by educational cluster deemed qualified for employment opportunities in food and agriculture.

3. Adjustment of HEGIS Data to Accommodate Allocation of General Degrees to Degree Specializations

Each of the major discipline divisions in the HEGIS taxonomy includes a degree specialization designated as general. The consensus of the panel of consultants was that students reported as recipients of a general degree frequently are qualified in a more specific discipline specialization. To adjust HEGIS data to more accurately reflect the actual specializations for which degrees were conferred, the panel of consultants estimated the percentage of such degrees which were in reality generalist degrees. The remainder of the general degrees were distributed across the specific degree specializations within the appropriate discipline divisions.

As an example of this procedure, reference is made to the Agriculture and Natural Resources academic discipline division of the HEGIS taxonomy. The panel of consultants determined that 5 percent of the baccalaureate degrees, 2 percent of the master's degrees, and none of the doctorates conferred as General Agriculture (0101) were legitimate generalist degrees. The remaining degrees conferred as General Agriculture were distributed proportionately among the other degree specializations within the Agriculture and National Resources discipline division, excluding Forestry, which is considered to be a specialized degree rarely recorded erroneously as a degree in General Agriculture. Appendix 7 summarizes the percentage factors determined by the panel of consultants for the number of general degrees to be retained as legitimate general degrees.

4. Projections of Higher Education Graduates

In developing the 1985-86 projections of higher education graduates in the food and agricultural sciences qualified for employment in food/agriculture occupations, several procedures were followed. The initial procedure was the acquisition of HEGIS degree projections from the National Center for Education Statistics. These projections are available by level, sex, and field of study through an ongoing program at NCES.

Projections of degrees produced by NCES are based on the <u>Earned Degrees</u> <u>Conferred</u> reports from accredited institutions of higher education listed in the <u>Education Directory</u>. Although these reports provide a large portion of the data, additional data and information are supplied by education and professional associations, experts in the fields, and other agencies in the Federal Government.

NCES uses a College Graduate Model (CGM) which produces projections of the supply of college graduates at the bachelor's, master's, and doctor's levels. For each sex, the College Graduate Model maintains a data bank of historical time series of earned degrees conferred by level and field of study. In addition, projections of other variables (social, demographic, and economic) are internal to the model.

The supply of college graduates comes from two submodels of CGM. Specifically, the projections of degrees by level and sex are produced by the Level and Sex Submodel (LSS) and projections of degrees by field of study are produced by the Degrees by Field Submodel (DFS).

Beginning with enrollment projections by type of student based on population and enrollment projections developed by the Bureau of the Census, the projections of total degrees by level and sex are developed using enrollment rates and age-specific graduation rates. Specifically, projections of bachelor's degrees are produced by projecting enrollment rates by attendance status of fourth-year college enrollment to undergraduate college enrollment. The projections of master's degrees are developed by projecting enrollment rates by attendance status of first-year graduate college enrollment to total graduate college enrollment. The age-specific projections of doctor's degrees are based jointly on the projections of enrollment rates of sixth-year college enrollment and enrollment beyond the sixth year.

Projections of these enrollment rates at the bachelor's, master's, and doctor's levels and the projections of graduation rates at the doctor's level are primarily based on the assumption that the prevailing past trends

will continue into the future. Exponential smoothing is the principal projection method used to project the enrollment and graduation rates.

The NCES projections of degrees by 20 major fields are developed analyzing historical time series of earned degrees by sex. When available, additional variables are incorporated into the final equations. Principal projection methods include exponential smoothing and regression analysis. Final degree projections by field are obtained by comparing the sum of the field projections by level to total degrees by level. The two sets of projections are adjusted iteratively until general consistency is obtained.

For the purposes of this project, the numbers of graduates projected by NCES were used as control totals. Basically, these projections were for broad discipline divisions. Therefore, since NCES did not provide projections of graduates by detailed degree specialization, these projections had to be developed for the project. For this development, historical data were acquired from NCES for each degree specialization by level and by sex. Since the projections of graduates were needed for the total of both sexes, the male and female historical data were summed by degree specialty. With the resulting series, extrapolative techniques were generally used to develop the projected values.

In addition, degree specializations which represented a relatively large share of a control group were directly tied to the group's growth rate. Degree projections from other sources, expected labor market conditions, and projected demographic characteristics were also considered in the development of the degree projections. The sums of the generated individual projections by degree specialization were compared to the NCES broad group totals. When differences occurred, the specializations were forced to the NCES control totals.

The projections of graduates for the general degrees were distributed across the relevant individual degree specializations according to the same procedures established for the analyses of historical HEGIS data. A comparison of current and projected estimates of graduates in the food and agricultural sciences is presented in Appendix 8. The estimates are aggregated according to the ll educational clusters utilized in the project.

5. Processing of Current and Historical HEGIS Data

The HEGIS public distribution tapes were acquired from NCES for each academic year, 1970-71 through 1977-78. For each academic year, tabulations of degrees conferred were generated and are on file in the Office of Higher Education, SEA, USDA by:

degree level

associate
baccalaureate
master's
doctorate
first professional degree

^{4.} It is not the practice of NCES to project the number of graduates by specific degree areas, because the reliability of the results cannot be substantiated.

sex of student

male female

type of institution

land-grant colleges of 1862 land-grant colleges of 1890 and Tuskegee Institute all land-grant institutions all nonland-grant institutions

For purposes of brevity, this report presents information pertaining only to degrees conferred in 1976-77 by all institutions.⁵ It is recommended that future reports address sex, race, and ethnicity of graduates, as well as institutional type (e.g., land-grant, nonland-grant).

Development of Data on the Demand for Food and Agriculture Graduates

A comprehensive data base does not exist specific to the full spectrum of employment in food and agricultural occupations. Therefore, this project employed an innovative, experimental methodology to develop estimates of the number of workers by occupation that require higher education in the food and agricultural sciences. The major source of employment data used was the Occupational Employment Statistics (OES) Program of the Bureau of Labor Statistics. The following discussion provides an overview of the process used to develop a major portion of the occupational demand data for this project.

1. Occupational Employment Statistics (OES) Program

The OES Program is a Federal/State cooperative statistical program of the U.S. Department of Labor and is comprised of three components, as follows:

- (a) Survey Component -- The OES survey collects employment figures by occupation from nonfarm establishments with the objective of providing current, reliable, and detailed occupational employment data. The survey is conducted by the State Employment Security Agencies over a 3-year cycle with different industries surveyed each of the 3 years. The survey instrument used is specific to each industry surveyed.
- (b) Industry-Occupation Matrix Component -- The national matrix system produces tabular presentations of current and projected employment statistics cross-classified by industry and occupation. These national tables or matrices are currently based on the 1970 Census of Population concepts and classification systems. In the future, matrices will be based on the OES survey classification system. With data from a base year matrix, a projected year matrix, and with job separation rates developed from decennial Census data and working life tables, the matrix system can generate future job openings for occupations. The

^{5.} The 1977-78 HEGIS tape became available January 1980. Time did not allow incorporating the data in this report.

^{6.} Future replications of the study should serve to accommodate refinement and validation of the research design.

national matrices have been used as tools for policy decisions as well as aids to develop State and area occupational employment projections.

(c) State and Area Projections Program Component -- This program produces current and projected employment statistics cross-classified by industry and occupation for all States, many metropolitan cities, and other labor market areas. The matrices may be based on the OES Survey or OES Census classification systems. The matrix data, adjusted for job separation rates due to death and retirement, yields estimated job openings by occupational field.

2. OES Survey-Based Matrix/OES Census-Based Matrix

Initially, the project consultants selected, as the primary source of employment estimates, the matrix that is being developed from OES survey occupations and industries, rather than the matrix based upon OES Census occupations and industries. This decision was made because the OES survey matrix provides for greater specificity. For example, a Census industry can be comprised of multiple survey industries. Likewise, a Census occupation can be an aggregate of numerous survey occupations. Specific examples are as follows:

This <u>OES Census Industry</u> aggregates these <u>OES Survey Industries</u>

metal mining

- iron ores
- copper ores
- lead and zinc ores
- bauxite and other aluminum ores
- miscellaneous metal ores

This OES Census Occupation aggregates these OES Survey Occupations

accountants

- accountants and auditors
- tax examiners, collectors, and/ or revenue agents
- tax preparers

After the project was initiated, it was learned that the OES survey-based matrix would not be available until late 1980. This required a conversion of project design to facilitate use of the OES Census-based matrix.

3. Computation of Demand Data

The following steps were taken in developing data on the demand for food and agriculture graduates:

a. Selection of OES Survey Occupations

The consultants reviewed a complete listing of OES survey occupations. From this list they selected those occupations perceived as likely to require formal training in food and agriculture. The list of selected OES occupations is presented in Appendix 9.

b. <u>Selection of OES Survey Industries</u>

The consultants also reviewed a complete listing of OES survey industries and selected those industries likely to employ persons with food or agricultural training. The list of selected OES survey industries is presented in Appendix 10.

c. Development of Industry-Occupation (I-O) Matrix

The industries and occupations selected by the consultants were arranged in a matrix format. All selected occupations were listed under each selected industry. An example of an I-O matrix is presented in Appendix 11.

d. Estimation of Percentage of Workers Likely To Possess Food or Agricultural Training

For each industry, the consultants examined the number of workers employed in each occupation and estimated the percentage deemed to possess food or agricultural training. For example, it was estimated that 10 percent of the agricultural and biological technicians in the dairy products industry possess food or agricultural training.

4. Conversion From OES Survey-Based to OES Census-Based Industry-Occupation Matrix

Subsequent to completion of an OES survey industry-occupation matrix, a decision was made to convert to an OES Census-based matrix. The conversion process was complex. Cross-coding systems, which relate survey data to Census data, were used to create the Census-based matrix. The percentage of workers deemed to possess food or agricultural training was adjusted to reflect the distribution of survey industries and occupations included within a Census-based matrix cell. A simplified example of the conversion process is presented in Appendix 12. Appendixes 13 and 14, respectively, present the final list of Census occupations and industries used in the project.

a. Multiplication of Percentage of Workers That Possess Food or Agricultural Training by Current and Projected Occupational Employment

Occupational employment for 1976 was used as the base year for the project. The percentages of workers estimated to possess food or agricultural training were multiplied by the 1976 and 1985 employment ievels.

b. <u>Calculation of Total Workers in an Occupation Who Possess Food or</u> Agricultural Training

The number of persons in an occupation perceived as possessing food or agricultural training was determined by summing employment for a given occupation across all selected industries. The following example depicts the process:

1976 estimated number of workers with food or agricultural training

	dis indi	of the state of th	\$ 1.7 0 /0 pts	St. C. Leil St. Reil		spiral sp
OES census occupation	10	5	0	2	31	48

1. The total number of persons in the occupation who possess food or agricultural training equals 48. This calculation represents the sum of all workers across industries A-E.

The process diagrammed was carried out for 1976 and 1985 employment levels. Therefore, for each occupation used in the project, data are available on the number of persons employed in 1976 and the number of persons expected to be employed in 1985 estimated as possessing food or agricultural training.

c. Calculation of Average Annual Employment Growth

The average annual employment growth was calculated by dividing the total growth by the number of years in the period. For example, 1976 employment for dietitians was 45,790 and 1985 projected employment is 51,997; therefore, the total growth is 51,997 minus 45,790 or 6,207. Since there are 9 years in the period, the average annual growth is 6,207 divided by 9, or 690.

d. Calculation of Average Annual Replacements

Employment opportunities are created when currently employed persons leave their jobs. The Bureau of Labor Statistics has devised a methodology to estimate the number of employee replacement opportunities that will be created as a result of employee deaths, retirements, disabilities, or temporary withdrawals from the labor force for personal reasons. The methodology uses decennial Census data on the age and sex distribution of workers in an occupation and working-life tables. These data are used to calculate separation rates. The manner in which separation rates are used is shown in the following diagram.

	E	stimated wo	rkers with food	/agricultural tra	aining
OES census occupation	1976	1985	Mid-year separation rate	Mid-year employment ¹	Average replacements ²
Dietitian	45,790	51,997	.0424	48,894	2,073

- 1. 1976 employment (45,790) plus 1985 employment (51,997) divided by 2 = 48,894.
- 2. Mid-year separation rate multiplied by mid-year employment.

e. Calculation of Average Annual Openings

The total average annual openings in an occupation for persons with food or agricultural training was calculated by adding average annual growth and average annual replacements. An example is presented below.

Census	Average annual estimates						
occupation	Growth	Replacements	Openings (Total)				
Dietitian	690	2,073	2,763				

5. Aggregation of Demand Data Into Occupational Clusters

For organizational purposes, the 83 occupations used were apportioned among 8 occupational clusters established by the panel of consultants. These occupational clusters are as follows:

- Scientific and Professional Specialists (cluster 1)
- Manufacturing and Processing Scientists and Engineers (2)
- Sales and Service Representatives and Purchasing Agents (3)
- Administrators, Managers, and Financial Advisors (4)
- Educators (5)
- Media Specialists (6)
- Agricultural Production and Management Specialists (7)
- Miscellaneous Agricultural Specialists (8)

Analysis of Supply/Demand Relationships

One of the most important components of this particular study was the specification of relationships between educational programs and occupations. The relationships between degree areas and occupational employment are complex for higher

education graduates. Furthermore, little empirical information exists relative to specific placement of higher education graduates in the food and agricultural sciences.

Placement studies which collect data on the employment of graduates provide an empirical basis for specifying relationships between degree areas and occupations. The project consultants examined data from a variety of placement studies. This review, synthesized with professional expertise, enabled the consultants to relate degrees to occupations via a matrix format. The consultants then estimated the percentage of graduates from each designated educational cluster qualified for employment in each occupational cluster designated for the project. Further, estimates were determined for the percentage of graduates in each educational cluster that would elect not to enter the labor force.

The percentage distributions of graduates of educational clusters to occupational clusters established for the project are presented in Appendix 15. The Appendix displays the percentage distributions for each degree level (associate, baccalaureate, master's, and doctorate). These percentage distributions were multiplied by the number of persons graduating in 1976-77 in each of the educational clusters, respectively, for agriculture degrees and for agriculture-related degrees.

Appendix 16 presents the actual computations for graduates with food and agriculture degrees that were estimated to be employed in food and agriculture occupations. Appendix 17 presents similar computations for graduates receiving degrees related to agriculture. The total supply of graduates with agriculture degrees and with agriculture-related degrees, as distributed by occupational cluster, is shown in Appendix 18. Appendixes 19-21 present similar computations for projected 1985-86 graduates of higher education in the food and agricultural sciences.

Summary

Financial and temporal constraints dictated that the study utilize existing data bases to the maximum extent possible. In order to assess the relevance of the available data bases and to develop a framework for synthesizing the data into a single analytical model, a panel of consultants was established. This panel provided guidance and direction throughout the entire project.

In addition to using existing data, the study entailed the collection and use of two new data bases. One such data base, developed by Clemson University with USDA-SEA support, identifies current and projected employment of faculty in higher education in the food and agricultural sciences. A second data base, developed explicitly for the study via cooperation with the USDA Foreign Agricultural Service, represents an initial attempt to gain insight into international employment opportunities for American graduates in the food and agricultural sciences.

As outlined on page 3, the following procedures were employed in conducting the study:

- 1. Procedures for identifying supply of higher education graduates in the food and agricultural sciences
 - a. Selection from the HEGIS taxonomy of agriculture and agriculturerelated degree specializations leading to expertise in food and agriculture.

- b. Identification of degrees for which 100 percent of the graduates are deemed qualified for employment in food and agriculture positions.
- c. Estimation of specific percentages, by degree level, of graduates of the remaining degrees deemed qualified for employment in food and agriculture positions.
- d. Computation of actual numbers of graduates with agriculture or agriculture-related degrees based on 1976-77 HEGIS earned degrees conferred data.
- e. Assignment of selected HEGIS agriculture and agriculture-related degrees to 11 educational clusters established for organizational purposes of the study: When HEGIS degree specializations appeared to produce graduates related to more than one educational cluster, graduates were prorated among the appropriate clusters.
- 2. Procedures for assessing employment demand for graduates of higher education in the food and agricultural sciences
 - a. Identification of OES-survey based industries and occupations representative of the full spectrum of employment related to food and agriculture.
 - b. Estimation of the percentage of workers, in each selected occupation for each selected industry, deemed to possess higher education in the food and agricultural sciences.
 - c. Conversion to OES Census-based data to facilitate completion of the project within the established time frame.
 - d. Computation of current occupational employment and projected average annual openings.
 - e. Assignment of selected occupations to eight occupational clusters established specifically for organizational purposes of the study.
- 3. Procedures for relating supply to demand
 - a. Estimation of the percentage of graduates representative of each educational cluster electing not to enter the food and agricultural labor force--return to native country, continue education, elect career in unrelated field, etc.
 - b. Estimation of the percentage of graduates of each educational cluster obtaining employment within each occupational cluster.
 - c. Computation of supply/demand figures.
 - d. Analysis of supply/demand relationships.

The project represents the first phase of a continuing effort to conduct a comprehensive supply/demand analysis of graduates of higher education in the food and agricultural sciences. Of necessity, innovative and experimental methodologies were employed. Future replications of the project should accommodate further refinement

and validation of these methodologies, thereby resulting in enhanced specificity and reliability of findings.

CHAPTER II

Introduction to Findings

Future growth of agricultural productivity and increases in production, distribution, and consumption efficiency require a continuing supply of qualified food and agricultural workers. Traditionally, institutions of higher education have been expected to supply the requisite number of graduates qualified to assume professional roles entailing high levels of expertise in food and agriculture.

In recent years, many developments have appeared to substantiate the contention that the Nation may well be facing a shortage of qualified expertise in the food and agricultural sciences. Representatives of industry, government, and higher education frequently cite significant difficulty in employing specific types of professionals in food and agriculture. College and university educators continually project decreasing enrollments and graduations in the food and agricultural sciences. Furthermore, technological advancements, diminishing natural resources, and an increasing global population are introducing changes throughout the structure of the food and agricultural labor force.

Concern for assessing the extent to which higher education is producing sufficient expertise to enable the U.S. to maintain its status as the lead Nation in confronting food and agricultural issues prompted this study. Essentially, the study was undertaken to achieve the following major objectives:

- 1. identification of the current and future supply of graduates of higher education in the food and agricultural sciences
- 2. identification of the current and future employment demand for graduates of higher education in the food and agricultural sciences
- 3. analysis and interpretation of supply/demand relationships.

Presentation of Findings

Estimates for national supply of and demand for higher education graduates in the food and agriculture sciences are organized and presented for eight occupational clusters. The following information is included for each cluster:

- Description of the occupational cluster
- Summary and detailed data on the supply of agriculture graduates and agriculture-related graduates qualified for employment in the occupations within the cluster
- Summary and detailed employment demand data for each occupation within the cluster
- Selected examples of specific food and agriculture jobs included in the occupations in the cluster
- Narrative interpretation of employment opportunities for food and agriculture graduates

The presentation of findings for the occupational cluster, Educators, differs in format. Data on employment opportunities in the education field were obtained from several sources in addition to BLS. These sources included SEA-Extension, the Agricultural Education Division of the American Vocational Association, and the Clemson University Survey of Students and Faculty in Higher Education in the Food and Agricultural Sciences.

Scientific and Professional Specialists (Occupational Cluster #1)

Included in this cluster are the professional occupations that involve high levels of technical agricultural and scientific competency. These occupations generally require the application of mathematics, biology, chemistry, statistics, or the social sciences to solving problems, expanding productivity, or increasing efficiency in the areas of food, agriculture, and renewable natural resources.

Examples of Sp.cific Jobs Representative of Selected OES Consus-Based Occupations Included in the Occupational Cluster for Scientific and Professional Specialists

The Census occupations used in the project to assess demand for graduates of higher education in the food and agricultural sciences frequently serve as aggregations of more specific job titles. The 1971 Classified Index of Industries and Occupations, published by the Bureau of the Census, U.S. Department of Commerce, provides an exhaustive listing of the specific job titles comprising each aggregate Census occupation.

The following listing is intended to illustrate some of the specific job (as aggregated by some of the Census occupations included in the cluster for scictific and professional specialists. Similar lists will be provided for the Census occupations included in six of the remaining seven occupational clusters. The occupational cluster for Educators is self-explanatory.

1970 Census- of-population code	Census occupation	Examples of specific jobs
042	Agricultural scientist	Agricultural consultant Agricultural scientist Agriculturist Agronomist Animal breeder Animal pathologist Arborist Dairy scientist Dairy technologist Floriculturist Forest pathologist Plant breeder Wool technologist
150	Agriculture and bio- logical technician (except health)	Artificial breeder Agricultural research laboratory assistant Botany laboratory assistant Breeding technician Dairy and food laboratory assistant Research technician Seed analyst Seed laboratory assistant Seed specialist Silviculturist Wildlife technician
002	Architect	Landscape architect
043	Atmospheric and space scientist	Atmospheric scientist Weather analyst

Interpretation of Employment Opportunities for Scientific and Professional Specialists

The summary supply and demand data for scientific and professional specialists as presented in Tables 1 and 2, respectively, suggest an inadequate average annual supply of qualified higher education graduates through 1985. There is a marked deficiency when only agriculture graduates are considered. However, the inclusion of graduates of agriculture-related fields fails also to satisfy the demand.

The average annual demand for 1,448 veterinarians, as shown in Table 2, refers only to private clinical practitioners. The average annual supply of 1,291 graduates satisfies 89 percent of this demand. While a report to the American Veterinary Medical Association by Arthur D. Little, Inc., projects an oversupply of veterinarians by the end of the decade, another study by the Health Resources Administration, DHEW, projects shortages in the mid-decade. This study further suggests supply/demand balance for veterinarians may occur by the end of the decade.

Analysis of the remaining supply/demand data, excluding veterinarians, indicates that approximately 12,488 graduates will be available to fill 13,538 positions annually. Thus, the total average annual demand exceeds supply by 8 percent. There are no national employment demand data documenting degree type and level requisite to occupational employment. Therefore, it is not feasible to statistically relate the supply of graduates by degree level, as shown in Table 1, to the specific occupational employment data presented in Table 2. However, analysis of the total supply/demand for scientific and professional specialists indicates that the average annual supply of doctoral graduates meets 4 percent of the demand; master's graduates equal 12 percent; baccalaureate graduates equal 76 percent.

Public consciousness and national priorities for the 1980's reflect a concern for greater productivity in agriculture, more energy-efficient food production and delivery systems, and environmental quality, as well as a more nutritious and safer food supply. Therefore, a sustained and expanding demand for scientific and professional specialists in food and agriculture is anticipated for several decades. It is important to note that many such specialists must possess the highest level of expertise in the food and agricultural sciences. An adequate supply of such human capital capable of responding to national priorities and public concern related to food, agriculture, and natural resources is critical to national and world progress, perhaps even human survival.

Higher education in food and agriculture must be encouraged to attract and graduate more students in such disciplines as the following:

- Agricultural Engineering
- Animal Sciences
- Food Sciences
- Natural Resources (master's and doc.oral levels)⁹
- Plant Sciences
- Soil Sciences
- 7. Veterinary Supply and Demand in the United States: A Report to the American Veterinary Medical Association. Arthur D. Little, Inc., 80559-07, 1978.
- 8. Report to the President and Congress on the Status of Health Professions Personnel in the United States. Health Resources Administration, Department of Health, Education, and Welfare. HEW SkA/78-93, 1978.
- 9. The supply of graduates with baccalaureate degrees appears adequate to meet the employment demand for Scientific and Professional Specialists.

Manufacturing and Processing Scientists and Engineers -(Occupational Cluster #2)

Included in this occupational cluster are the scientific and engineering occupations related to the design of facilities, processing, and quality control of products manufactured from raw agricultural and forest inputs.

Interpretation of Employment Opportunities for Manufacturing and Processing Scientists and Engineers

As shown in Tables 6 and 7, the total average annual supply of graduates qualified for employment as manufacturing and processing scientists and engineers meets approximately 82 percent of the demand. Graduates with agriculture degrees equal 74 percent of the demand; agriculture-related graduates satisfy an additional 8 percent of employment demand. When graduates at the different degree levels are related to total demand, the data indicate that doctoral and D.V.M. graduates satisfy 6 percent of employment demand; master's satisfy 14 percent; baccalaureate's equal 61 percent of average annual demand.

Emphases on energy efficiency, quality control, and improved alternative food sources as they relate to agricultural production, processing, and natural resources are expected to escalate. Consequently, the 1980's should afford substantial employment opportunities for manufacturing and processing agriculturists, food scientists, and forest engineers. Employment demand should be particularly strong for graduates with advanced degrees.

Specific educational backgrounds which appear to be especially needed include:

Agricultural Engineering

- Food Sciences (food development, processing, and quality control)
- Forest Engineering
- Veterinary Medicine (biological research and regulatory medicine)
- Forest Products Utilization (lumber, plywood, and wood-composition or particle board as related to the pulp and paper industries)—primarily master's and doctoral degree levels

Sales and Service Representatives and Purchasing Agents (Occupational Cluster #3)

Included in this cluster are the occupations related to retailing of agricultural and food products, as well as occupations involved in the sales of inputs (e.g., feed, see, fertilizer, pesticides, machinery) to producers and processors. Service occupations directly associated with buying, producing, and selling are also included (e.g., representatives who provide lawn and ornamental horticultural services).

Interpretation of Employment Opportunities for Sales and Service Representatives and Purchasing Agents

Essentially all phases of the food delivery system require the procurement of raw materials and the marketing of products. Therefore, an extensive number of representatives and agents are needed in the marketing process. The supply/demand data for sales and service representatives and purchasing agents suggest an annual shortage of almost 2,000 graduates, or 12 percent of unmet demand.

Sales occupations, buying positions, and technical services directly affecting farming and ranching are strongly correlated to the level of agricultural production. With anticipated increases in agricultural output in the 1980's, there should be an associated modest increase in the number of retailing positions. Graduates with a technical subject matter understanding as well as business and marketing training should be in the strongest position to compete for employment. Graduates from the plant sciences, animal sciences, agricultural mechanization and agricultural business curricula should continue to attract substantial interest from employers seeking sales representatives to serve farmers and ranchers.

It is anticipated that Americans will continue the trend of the 1970's and consume an increasing proportion of meals outside the home. Consequently, there should be a continuing high demand for food sales representatives, food buyers, and retail food service managers. Primary candidates for these rositions will be individuals with associate and baccalaureate degrees in food technology and food science.

Two factors might tend to restrict the market for sales representatives, buyers, and technical service representatives during the coming decade. Restricted foreign markets could result in decreased agricultural production. A general economic recession could result in reduced demand for agricultural products, especially those intended to enhance the quality of life (e.g., ornamental house plants).

Administrators, Managers, and Financial Advisors (Occupational Cluster #4)

Included in this cluster are the food and agricultural occupations which require managerial and administrative competencies. The occupations involve financial management, public administration, real estate appraisal, business analysis, and program direction.

Interpretation of Employment Opportunities for Administrators, Managers, and Financial Advisors

A review of the available supply and demand data indicates a strong employment market for graduates trained as administrators, managers, and advisors. Qualified doctoral graduates are available to fill only 1 percent of the estimated demand. Master's and baccalaureate graduates equal 17 and 52 percent, respectively, of the estimated average annual demand. In essence, the total average annual supply of new graduates satisfies only 70 percent of the estimated employment demand.

Increased emphasis on alternative land use and the related need for economic impact analyses require trained estimators and appraisers. Maintenance of a high quality environment further expands the demand for investigators and appraisers with expertise in soils, plants, and natural resource utilization.

Financial managers should continue to be in strong demand during the 1980's because of trends toward larger firms, restricted money supplies, smaller operating margins, more extensive use of credit, increased use of tax management strategies, and more complex organizational structures in conducting farming and agribusiness operations. Individuals with a master's degree in agricultural economics emphasizing financial analysis and management skills are particularly in short supply as compared to demand.

^{1.} nec = not elsewhere classified.

Managerial decisions in food, agriculture, and natural resources should increasingly require technical expertise in problem solving as well as in economic and social impacts of strategies adopted. Consequently, individuals with a degree in a technical field combined with a business emphasis should be in a strong position to advance to an advisory or managerial role in food or agricultural industries, as well as public administration.

Educators (Occupational Cluster #5)

Included in this cluster are secondary school vocational agriculture reachers, adult education teachers specializing in agriculture and food, and college faculty engaged in teaching and research directly related to agriculture and food. Cooperative Extension Service personnel are also included.

Table 28--Summary of number of faculty members in higher education teaching and research in Agriculture/Natural Resources, Forestry, and Veterinary Medicine, 1979, and estimated retirements and average annual openings, 1980-891

		Sample responses							
Teaching/ res2arch field	Fall Total employment ²		1980-89 estimated total retirements ²	1980-89 estimated average annual retirements ³	estimated average annual openings (population) ⁴				
Agriculture	7,822	266	1,334	133	450				
Natural Resources	446	18	32	3	20				
Forestry	1,267	86	108	11	115				
Veterinary Medicine	1,678	108	165	15	138				

1. Detailed data are presented in Table 29.

2. Data represent summations of figures provided by survey respondents--59 percent of all Colleges of Agriculture/Natural Resources, 47 percent of all Schools of Forestry, and 50 percent of all Colleges of Veterinary Medicine.

3. Estimated total retirements, 1980-89, divided by number of years in period (10).

4. Extrapolated to represent the population of colleges/universities with programs in Agriculture/Natural Resources, Forestry, and Veterinary Medicine: It was assumed that one-half of the reported 1979 unfilled positions represent openings due to an unadjusted chronic shortage of faculty and the remaining one-half represent openings due to turnover, migration, and mobility. Therefore, estimated annual average openings were computed by summing annual average retirements and that half of unfilled positions due to turnover, migration, and mobility. This sum was then extrapolated to represent the total population by dividing by the response rate (.591 for Agriculture and Natural Resources, .471 for Forestry, and .50 for Veterinary Medicine).

^{1.} Based on 1979-80 Clemson University Survey of Students and Faculty in Higher Education in Agriculture/Natural Resources, Forestry, Veterinary Medicine, and Home Economics funded by the U.S. Department of Agriculture. Project lirectors were Dr. Edward L. McLean and Dr. Stephen R. Chapman.

(Footnotes continued)

Table 29--Number of faculty members in higher education teaching and research in Agriculture/Natural Resource, Forestry, and Veterinary Medicine, 1979, and estimated retirements and average annual openings, 1980-891--Continued

Footnotes (Continued)

- 2. Includes racial and ethnic minorities employed by responding institutions; does not include Anglo females.
 - 3. Total retirements estimated by responding institutions, 1980-89.
- 4. Total retirements, 1980-89, estimated by responding institutions and divided by number of years in the period (10).
- 5. Extrapolated to represent population of colleges/universities with programs in agriculture, natural resources, forestry, and vet rinary medicine: It was assumed that one-half of the reported 1979 unfilled positions represent openings due to an unadjusted chronic shortage of faculty and the remaining one-half represent openings due to turnover, migration, and mobility. Therefore, estimated average annual openings were computed by summing average annual retirements and that half of unfilled positions due to turnover, migration, and mobility. This sum was then extrapolated to represent the total population by dividing by the response rate (.591 for Agriculture and Natural Resources, .471 for Forestry, and .50 for Veterinary Medicine) or, equivalently, multiplying by the reciprocal of the response rate.
 - 6. Includes only faculty in agriculture; faculty in home economics are reported in Volume II.
 - 7. Because of rounding, details may not add to total.
- 8. Most frequently listed specialty titles under "other" included Forest Recreation, Forest Wildlife, Fish and Wildlife, Forest/Wood Science, Wildlife Management, Range Management/Science, and Remote Sensing.
 - 9. Includes faculty in Colleges of Agriculture as well as Colleges of Veterinary Medicine.
- 10. Most frequently listed specially titles under "other" included Epidemiology and Public Health, Parasitology, Clinical Medicine, Clinical Pathology, and Virology.

Interpretation of Employment Opportunities for Educators

Several observations are pertinent when reviewing the supply/demand data for food and agricultural educators in the 1980's. Various sources suggest regional differences in higher education enrollment patterns with projected increases in some areas and projected declining enrollments in other areas. Despite NCES enrollment projections which are based largely on the growth of agricultural colleges in the early 1970's, many leading educators predict stable or declining student enrollments in the food, agricultural, and natural resources programs during the 1980's. Hopefully, the adjustments of the 1980's will not result in fewer courses taught and fewer professors needed, but rather will result in a return to more optimum class size and teaching load.

In response to an expanded need for teaching and research, many agricultural colleges increased their faculties during the post-World War II period of the late 1940's and early 1950's. It is expected that a greater-than-average number of Ph.D. graduates will be needed as replacements during the late 1980's because an above-average number of current faculty members will reach retirement age. Recent changes in the normal retirement age from 65 to 70 may have some impact.

Based on the data presented in this report, present chronic shortages of college/university faculty in several areas warrant attention. These areas include: agronomy, animal sciences (general), agricultural economics, horticulture (fruit and vegetable), agricultural engineering, wildlife biology/management, water resources, aquaculture, forest management, forest engineering, wood science technology and industry, and veterinary medicine (pathology, internal medicine, microbiology, and anatomy).

During the next 10-year period, the most critical needs for additional agricultural educators at the college level appear to be for doctoral graduates in agricultural engineering, agricultural business/management (particularly agricultural economics), animal sciences (particularly dairy and livestock production), aquaculture, fisheries, wildlife biology and management, forest engineering, forest management, wood science technology and industry, and plant sciences (agronomy, fruit and vegetable horticulture, and plant pathology). In veterinary medicine, additional educators are needed with specializations in anatomy, internal medicine, microbiology, pathology, preventive medicine, and surgery.

An expanding need for dissemination of new knowledge and technology related to agricultural production, natural resource utilization, and rural development substantiates a significant demand for Cooperative Extension Service personnel based in local areas and on university campuses.

A recent report conducted by the agricultural education staff of The Ohio State University and published by the American Vocational Association, indicates an annual deficiency of 600-750 secondary school vocational agriculture teachers.

In the aggregate, it appears that the supply of educators exceeds the demand. Yet, it is important to note the aforementioned shortages which are apparently the result of (I) competition for trained educators by business and industry, and (2) inadequate supplies of graduates of certain fields. Simply stated, in many instances educational institutions are apparently being outbid by business and industry for trained educators. In other instances, the supply is far short of the demand.

Media Specialists (Occupational Cluster #6)

Included in this cluster are the professional workers in all media; e.g. adio, television, newspapers, and other publishing firms which specialize in reporting for food and agriculture. In general, these specialists are journalists, librarians, public relations specialists, and archivists. The occupation of curator is included as many of its functions are analogous to that of the archivist.

Interpretation of Employment Opportunities for Media Specialists

The total annual average supply of new graduates with food/agriculture/natural resource degrees qualified for employment as media specialists approximates 87 percent of the estimated demand. When graduates with agriculture-related degrees are considered, the total supply exceeds annual demand by almost 200 graduates. Hence, there is no apparent shortage of food/agriculture media specialists.

An important occupational field for food and agricultural media specialists is that consisting of editors, reporters, and writers. Government agriculture/natural resource units employ such personnel to report research findings for use by producers and consumers. Agribusiness firms and commodity organizations employ them to edit and publish newsletters, magazines, and other publications for employees, members, and patrons. Additionally, these types of professionals are employed by publishing firms producing technical journals and books as well as popular magazines for both producers and consumers with food, agricultural, and natural resource concerns.

Other positions for food and agricultural media specialists exist with advertising and public relations firms. An increasing number of professionals are being employed by such agencies as account executives for agricultural clients. Also, some

complex conglomerates are expanding the number of agricultural media specialists within their operations to develop intra-company informational publications and newsletters.

The demand data reveal a limited need for librarians and archivists with specific expertise in food and agriculture. Similarly, there appears to be little demand for radio and television agricultural announcers as many stations are utilizing syndicated reports by a relatively few farm broadcasters.

In summary, agricultural communicators are employed primarily as editors, writers, reporters, and public relations specialists for government agencies, agribusiness firms, commodity organizations, and publishing houses. Graduates with multidisciplinary backgrounds in food, agriculture, or natural resources, and communications would appear to be best qualified for these types of occupations. Non-agricultural journalists and media specialists should continue to be a significant competitive factor in the market and should buffer the expansion of career opportunities for food and agricultural media specialists.

Agricultural Production and Management Specialists (Occupational Cluster #7)

Included in this cluster are all individuals directly involved in the production of raw agricultural products such as grains, fibers, and livestock, including dairy and poultry. Also included are the growers of ornamental horticulture crops.

Interpretation of Employment Opportunities for Agricultural Production and Management Specialists

Farming, ranching, and other related production industries (for example, nurseries and greenhouses) should afford significant employment opportunities for college graduates in agriculture and natural resources through the mid-1980's. However, it is anticipated that the trend will continue toward larger and more complex production units with adoption of labor-saving technology. If so, somewhat fewer farmers, ranchers, and production workers may be required in the 1980's as compared to the previous decade.

The intensification of animal production units, including more confined swine and cattle feeding operations, requires highly trained production managers. Also, the expanding size of production units, in general, and the introduction of more complex technology to farming and ranching increasingly require expertise gained through higher education in agriculture and natural resources.

Currently, between one-half and two-thirds of the students who enroll in agricultural colleges do not have a farm or ranch background or significant agricultural production experience. The strongest demand for agricultural production and management occupations in the 1980's should be for individuals with practical experience as well as academic credentials in the following fields:

- Agricultural Mechanization
- Agriculture Production
- Agronomy
- Animal Sciences
- Dairy Management
- Farm and Ranch Management
- Horticulture and Ornamental Plants
- Poultry ManagementRange Management

Miscellaneous Agricultural Specialists (Occupational Cluster #8)

Included in this cluster are a diverse group of professionals in food and agriculture with specific technical skills that are not accommodated by the preceding seven clusters. The kinds of technical expertise required of these workers vary widely

<u>Interpretation of Employment Opportunities for Miscellaneous</u> Agricultural Specialists

The nature of this occupational employment category limits the demand for workers primarily to recipients of associate and baccalaureate degrees. Also, it should be noted that relationships between supply and demand are frequently more specific than those for the preceding seven clusters. For example, graduates with associate degrees in Agricultural Technology (included in the educational cluster for Agricultural Engineering) are qualified for employment as farm implement mechanics, but not as animal caretakers or bakers. Because of this, interpretation of the findings focuses more on specific types of occupations included in this cluster than on the employment cluster as a whole.

The largest annual employment demand is for 2,675 animal caretakers. However, this is a highly diverse type of occupational employment, and associate degree graduates are frequently as qualified as baccalaureate graduates. Furthermore, it is believed that presently there may exist numerous individuals with Animal/Biological Sciences associate and baccalaureate degrees who may strongly compete with new graduates for employment as animal caretakers.

The strongest employment demand in relationship to supply is that for farm implement mechanics. The data indicate that annually some 353 associate degree graduates are available to fill an estimated 1,936 job openings (Table 42).

The estimated demand for meat cutters (including meat specialists, meat supervisors, and meat department managers) exceeds supply by a sizable margin, as does the estimated demand for food service workers. Increased demand for convenience foods and for meals which are consumed outside of the home should continue to augment the need for associate and baccalaureate degree recipients in the food technology programs during the early 1980's. Increased interest in maintaining a high quality and nutritious food supply should sustain the need for graders and inspectors as food produc move from producers to consumers.

While occupations associated with wildlife and recreation enterprises are not specifically identified in this employment aggregation, the present supply of qualified associate and baccalaureate graduates is believed to be ample. A depressed market for additional, new graduates may develop over the coming decade.

During the 1980's, the demand for Miscellaneous Agricultural Specialists should strongly correlate to levels of agricultural production. With some expansion of agricultural production anticipated, a continuing healthy demand for these workers also is expected.

CHAPTER III

Conclusions

Overview of Supply/Demand Relationships

Projected estimates through 1985 of supply/demand relationships for graduates of higher education in the food and agricultural sciences differ by occupational cluster. When total supply is related to total demand for each of the eight occupational clusters investigated in the study, shortages of qualified graduates appear to exist for five clusters: Scientific and Professional Specialists, Manufacturing and Processing Scientists and Engineers, Sales and Service Representatives and Purchasing Agents, Administrators/Managers/Financial Advisors, and Miscellaneous Agricultural Specialists. Supply approximates demand for one cluster, Agricultural Production and Management Specialists, and exceeds demand for two clusters, Media Specialists and Educators. However, with regard to Educators, it is important to note that, within the cluster, several supply deficiencies were identified

As depicted in Chart 1, average annual employment demand exceeds average annual supply by the largest percentage factors for occupational clusters representative of Miscellaneous Agricultural Specialists, Administrators/Managers/Financial Advisors, and Manufacturing and Processing Scientists and Engineers. For these particular occupational clusters, demand exceeds supply by 50 percent, 30 percent, and 18 percent, respectively. These shortages suggest impending problems as the Nation strives to maintain adequate reserves of expertise in the food and agricultural sciences to complement labor force needs.

Examination of actual average annual numbers of graduates as compared to average annual job openings reveals that the largest shortages of workers are for those in the occupational clusters for Miscellaneous Agricultural Specialists, Administrators/Managers/Financial Advisors, Sales and Service Representatives and Purchasing Agents, and Scientific and Professional Specialists. Cumulatively, these four clusters suggest average annual shortages of some 8,500 qualified graduates. Therefore, these occupational clusters would seem to offer significant employment opportunities for graduates in food, agriculture, and natural resources.

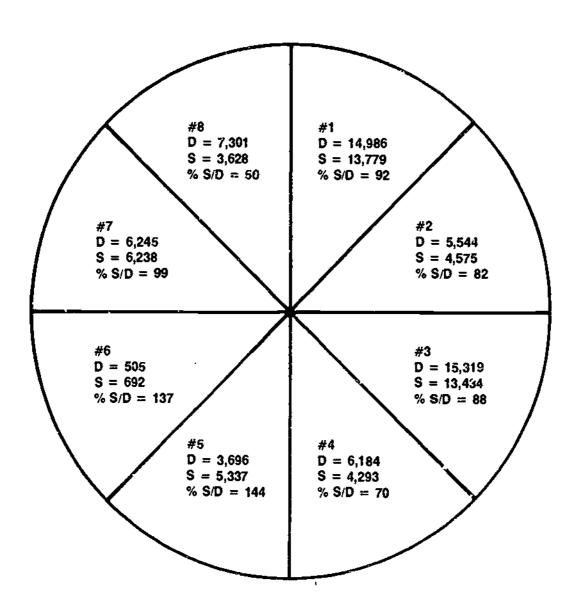

Supply/Demand Relationships by Degree Level and Type

Chart 2 summarizes supply/demand relationships by occupational cluster, degree type (agriculture and agriculture-related), and degree level (associate, baccalaureate, master's, doctoral, and D.V.M.). For example, within the Scientific and Professional Specialists (Occupational Cluster #1), the average annual number of agriculture degree recipients satisfies 75 percent of the demand; agriculture-related graduates satisfy approximately 15 percent of the demand. Of the agriculture degree recipients, baccalaureates satisfy 50 percent of the demand. Master's, doctoral, and D.V.M. recipients satisfy 25 percent of the demand.

Degree level and type requisite to occupational employment are empirical unknowns. Nevertheless, it seems important to assess the extent to which recipients of different types and levels of degrees are available to meet employment demand. To the extent that the methodological estimations underlying this study (for example, percentage distributions of graduates of the educational clusters among the occupational clusters) are accurate, these relationships are shown in Chart 2. As seen in the chart, associate degree graduates should be available through 1985 to fill approximately 10 percent, 20 percent, and 25 percent of employment demand for Sales and

Supply/Demand Relationships of Recipients of Agriculture and Agriculture-Related Degrees to Total Employment Demand, by Occupational Cluster, 1976-85.*

'Average annual supply expressed as percentage of average annual demand from 1976 through 1985. Because projections are unavailable for Associate degrees, 1976-77 supply data were used in lieu of average annual estimates for Associate-degree recipients

Occupational Clusters:

- Scientific and Professional Specialists.
- 2. Manufacturing and Processing Scientists and Engineers.
- Sales and Service Representatives and Purchasing Agents.
- Administrators, Managers, and Financial Advisers.
- 5. Educators.
- 6. Media Specialists.
- Agricultural Production and Management Specialists.
- 8. Miscellaneous Agricultural Specialists.

Service Representatives and Purchasing Âgents, Agricultural Production and Management Specialists, and Miscellaneous Agricultural Specialists.

The extent to which baccalaureate graduates should be available to fill employment demand ranges from 25 percent for Miscellaneous Agricultural Specialists (Occupational Cluster #8) to 85 percent for Educators (Occupational Cluster #5). With regard to employment demand for Educators, it is not practical to assume that baccalaureate graduates are qualified to fill 85 percent of all job openings (for example, college and university teaching positions). Furthermore, past history has shown that large numbers of these graduates are qualified for and elect career options other than education. As a result, many job openings in education remain unfilled on a continuing basis.

With the exception of employment demand relative to Miscellaneous Agricultural Specialists (Occupational Cluster #8) and Administrators, Managers, and Financial Advisors (Occupational Cluster #4), baccalaureate recipients should be available to fill at least 60 percent of average annual job openings in food and agriculture through 1985. In essence, substantial employment opportunities are projected for these graduates. Critical shortages of such graduates are not likely to become apparent through the mid-1980's, except for those specific degree specializations noted in the interpretations for some of the eight occupational clusters in Chapter II.

Advanced degree recipients should be available to satisfy from 6 percent to 58 percent of the demand for the various occupational clusters. This information is presented in greater detail in Chart 3. Considering the nature of the occupations within the eight occupational clusters, the adequacy of the supply of graduate degree recipients is questionable for several of the clusters.

Current and projected master's graduates would seem to be in short supply for employment demand related to Administrators, Managers, and Financial Advisors (S/D percent = 17), Manufacturing and Processing Scientists and Engineers (S/D percent = 14), Scientific and Professional Specialists (S/D percent = 10), and, perhaps, as related to Sales and Service Representatives and Purchasing Agents (S/D percent = 6). In order to strengthen the food/agriculture labor force, additional master's graduates appear to be needed in the following fields: Agricultural Business and Management, Agricultural Engineering, Animal Sciences, Food Sciences, Natural Resources, Plant Sciences, and Soil Sciences.

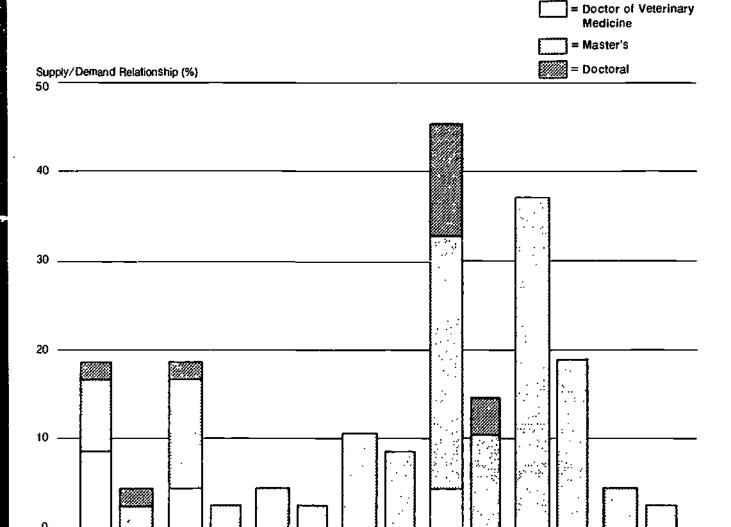

Annually through 1985, doctoral graduates are estimated to be in short supply for Administrators, Managers, and Financial Advisors (S/D percent = 1), Manufacturing and Processing Scientists and Engineers (S/D percent = 3), Scientific and Professional Specialists (S/D percent = 4), and Educators (S/D percent = 15).

Those educational backgrounds which appear to be especially needed at the doctoral level are as follows: Agricultural Business and Management, Agricultural Engineering, Animal Sciences, Food Sciences, Forest Engineering, Forest Products Utilization, Plant Sciences, and Soil Sciences.

Analysis of supply/demand relationships further suggests current/impending shortages of Doctor of Veterinary Medicine degree recipients relative to employment as Manufacturing and Processing Scientists and Engineers (biological research and regulatory medicine), and Educators (anatomy, internal medicine, microbiology, pathology, preventive medicine, and surgery).

Future Directions

This USDA study has entailed a comprehensive analysis of the supply of and demand for higher education graduates in the food and agricultural sciences. Because both educational and employment patterns are subject to change and because the methodology for this study relied heavily on expert opinion, future replications of labor supply/demand analyses need to be conducted on an ongoing basis. Such replications should serve to strengthen the methodology as well as to provide continually updated supply/demand statistics for purposes of educational planning.

Much has been accomplished in the conduct of this study toward establishing a model for future iterations. Yowever, there are many possibilities for strengthening the research model, for improving data bases used in the analysis, and for examining special segments of the supply/demand population in greater detail. Briefly, this section addresses possible future directions for improving the technical quality and specificity of the information.

- 1. This initial study was constrained because of certain limitations in existing data sources that could not be overcome in the time frame during which the study was conducted. Future efforts should focus on correcting some of these limitations. For example:
 - a. The Bureau of Labor Statistics Occupational Employment Statistics (OES)
 Program has not yet completed a national OES survey-based IndustryOccupation (I-O) Matrix. In lieu of a survey-based matrix, a Censusbased matrix was used for the USDA study. In the future, however, an
 OES survey-based I-O matrix will be available for use, thus providing
 substantially more occupational and industrial detail than was possible
 by using the Census-based matrix.
 - b. Currently, the OES survey program does not examine agriculture specific occupations and industries (e.g., farming and ranching). A study is currently being conducted for the National Occupational Information Coordinating Committee (NOICC) to determine alternative methods for including agriculture in the OES survey. Should the NOICC study result in feasible alternatives, cooperative efforts need to be initiated to encourage and enable BLS to expand the OES survey program to include coverage of specific agricultural occupations and industries.
 - c. No existing data base presently accommodates comprehensive analysis of the labor force mobility of higher education graduates in food, agriculture, and natural resources. Longitudinal employment mobility information on these graduates needs to be acquired.
- 2. The use of expert opinion could be minimized in future studies if sound data bases were available pertaining to career placement of food/agriculture graduates and to educational backgrounds of workers in specific occupations/industries.
 - a. The National Center for Education Statistics conducts a Survey of Recent College Graduates. These biennial surveys could be expanded to provide detailed information specific to the labor market experiences of higher education graduates in the food and agricultural sciences.
 - b. Industry surveys of the educational backgrounds of workers could establish a data base on the actual percentage of workers in the occupations

- within the various industries who possess academic backgrounds in food/agriculture.
- 3. This initial study did not attempt to investigate special segments of the supply/demand population. Future endeavors could focus on greater specificity by identifying sex, racial, and ethnic characteristics of:
 - a. food/agriculture graduates, and
 - b. employees in food/agriculture-related positions.

Implementation of the foregoing suggestions would serve to strengthen future supply/demand analyses. As a result, educational planning, administration, and evaluation would have access to more precise, reliable information on which to base policy and action.

CHAPTER IV

Additional Information on Employment Demand for Food and Agriculture Graduates

International Employment Opportunities for Food and Agricultural Graduates

The demand for food and agricultural scientists extends beyond the borders of the United States. Furthermore, graduates of the U.S. agricultural system are held in high regard worldwide. For these reasons, international agricultural employment opportunities were considered also from the onset of the project. A first step in this endeavor was to access and review pertinent existing data. However, little information existed on international employment relative to food and agriculture. This prompted SEA to elicit the cooperation of the Foreign Agricultural Service, USDA, to collect data from U.S. agricultural counselors, attachés, and officers stationed in some 60 countries. Findings pertinent to data collection by the Foreign Agricultural Service and those stemming from the review of existing data are discussed in the two following sections.

Data Collected From Agricultural Counselors, Attachés, and Officers

In cooperation with the Foreign Agricultural Service, USDA, data were collected on international agricultural employment of U.S. citizens. For purposes of data collection, citizens were defined as individuals with a valid U.S.A. passport, 21 years of age or older, residing in and gainfully employed in a foreign country in a position for at least 1 year. Employment included positions with business and industry regardless of national origin of firm, the U.S. Federal Government, foreign governments/agencies, non-U.S.-based educational institutions, and self-employment.

U.S. agricultural counselors, attachés, and officers in 60 countries were asked to complete a questionnaire. The questionnaire was kept simple and brief. It was recognized that a simplistic methodology would not provide highly accurate data. However, the intent was to obtain indications of the magnitude of current/projected international employment and to identify those areas for which there appears to be the greatest demand for American specialists in food and agriculture.

A summary of the data collected is presented in Table 46; detailed data are presented in Appendix 23. The data show an increased demand for additional workers in all areas, with the exception of Plant Sciences, through 1985. Currently, the largest number of workers are in areas related to Agricultural Business and Management, Plant Sciences, Agricultural Education, Animal Sciences, and Natural Resources. Furthermore, these same areas, plus Agricultural Engineering, were cited most frequently as presently needing additional workers in order to meet current needs of the respective nations.

Projected employment demand for 1985 is such that those areas with the highest levels of employment are estimated to be Agricultural Business and Management, Agricultural Education, Agricultural Engineering, Natural Resources, Animal Sciences, and Plant Sciences. The most significant increments in employment projected through 1985 are for the fields of Agricultural Engineering, Agricultural Education, Natural Resources, and Food Sciences.

^{1.} Detailed data are presented in Appendix 23.

Review of Department of State Data

The Department of State develops an annual comprehensive listing of the number of civilian agency personnel under jurisdiction of diplomatic mission chiefs. Table 47 provides a summary of the December 31, 1978 listing.

As shown in Table 47, these data are helpful in assessing the scope of U.S. civilians working abroad under jurisdiction of the Federal Government. The data are categorized by agency and by geographic region, with information available by country. However, the data fail to indicate types of occupational employment (e.g., Agricultural Engineering, Dietetics/Nutrition, Forestry, Veterinary Medicine), nor do the data include U.S. citizens working abroad as non-Federal employees. Other than identifying numbers and locations of persons assigned to the U.S. Department of Agriculture, the data are of limited value in assessing labor force supply/demand relative to food and agriculture.

Review of 1970 Census Data

The publication, Americans Living Abroad, 10 which is based on the 1970 Census, presents data on U.S. citizens living abroad. Specifically, the publication encompasses those civilians who returned an Overseas Census Report and the crews of vessels who are counted on the Report of Military and Maritime Personnel as U.S. citizens or previous U.S. residents. In addition, spouses and children are included regardless of citizenship or previous residence.

As shown in Table 48, the 1970 employment level of Americans overseas (137,361) was relatively small. Overseas employment represented 0.2 percent of the 1970 labor force. The 137,361 workers were distributed among various occupations, though a high concentration were in the professional, technical, and kindred worker categories. Specifically, many of these workers were electrical or electronic engineers and religious workers. Data on detailed occupations related to food and agriculture are presented in Table 49.

Although 137,000 persons represent the employment count from the most comprehensive available data source, the figures are subject to response error and incomplete coverage since the enumeration of "other citizens" was conducted on a voluntary basis. Also, the data represent a point in time approximately 10 years ago. Changes in types of workers as well as changes in numbers of workers can be expected to have occurred over the 10-year period. Such changes are related to the political atmosphere and to general national and world economic and technological conditions. Even with historical data, it is very difficult to present a good planning forecast of Americans working abroad since world political conditions change constantly.

Persons in Food- and Agriculture-Related Positions in the Military

A comprehensive labor force supply/demand analysis must take into consideration military personnel. Therefore, data were requested and obtained from the Manpower Data Center, Department of Defense (DOD). The specific data accessed were those pertaining to the DOD occupational groups identified by the project consultants as likely to require higher education in the food and agricultural sciences. Table 50 presents the data for the selected occupational groups. Part I displays enlisted and

^{10.} Americans Living Abroad: 1970 U.S. Census of Population Subject Reports.

Bureau of the Census, Social and Economic Statistics Administration, U.S. Department of Commerce.

military civilian personnel; Part II includes officers and military civilian personnel. As shown in the table, the military has substantial need for persons with food and agricultural expertise (for example, biological scientists, dietitians and nutrition officers, food inspectors, food service workers, foresters, landscape architects, soils engineers, and veterinarians).

APPEND IXES

Appendix 1. Supplementary data bases

1. Occupational employment information used to assess demand

Data base

Description/source

- a. Federal Civilian Employment
- Employment statistics for all Federal civilian employees are contained in the Central Personnel Data File (CPDF). Information from this source was used in the study to provide current employment statistics for Federal civilian occupations related to the food and agricultural sciences.
- b. Hired Farm Work Force

The Economics, Statistics, and Cooperatives Service (ESCS) of the U. S. Department of Agriculture collects information on the hired farm work force. Statistics indicate that approximately 10 percent of the hired farm work force have a 4-year college degree. These statistics were used as indicators of the percent of hired farm workers requiring a degree in the food and agricultural sciences.

c. Employment in Higher Education Institutions Clemson Unive...ity was awarded a USDA-SEA grant to survey higher education institutions to determine current employment levels in college and university teaching and research positions in the food and agricultural sciences. The survey also collected information on unfilled positions, temporary faculty, and expected replacements because of retirements. This information was incorporated as employment statistics in the higher education component of the education employment sector.

d. International Employment of Americans in the Food and Agricultural Sciences A survey of Agriculture Counselors, Attachés, and Officers in 60 counties was coordinated through the USDA Foreign Agricultural Service. Results of the survey provide some indication of international employment opportunities for Americans.

e. Defense Manpower

Information provided by the Defense Manpower Data Center was utilized to provide estimates of employment in military occupations related to the food and agricultural sciences.

f. Cooperative Extension Service

USDA information on the educational, demographic, and occupation background of cooperative extension personn was utilized to estimate the number of extension workers currently employed as agriculturists and to determine separation rates for estimating the replacement requirements for extension personnel.

Appendix 1. Supplementary data bases -- Continued

g. Employment in Vocational Education A 12-year summary prepared by the American Vocational Association provided data on the current supply of and demand for secondary teachers in the field of vocational agriculture. The summary indicates 1967-1978 employment levels, number of openings and the number of college graduates available to fill openings.

2. Higher education information used to assess supply

Data base

a. Higher Education Enrollments in the Land-Grant Colleges

Description/source

The Resident Instruction Committee on Organization and Policy (RICOP) of the National Association of State Universities and Land-Grant Colleges (NASULGC) conducts annual surveys of enrollments at member institutions in the following food and agriculture disciplines:

- (1) Animal Science
- (2) Plant/Soil Science
- (3) Social Science
- (4) Natural Resources
- (5) Related Sciences
- (6) General Agriculture
- (7) Other programs

Information from these RICOP surveys was used to substantiate HEGIS information and as a basis for estimating placements of students receiving degrees in the food and agricultural sciences.

b. Enrollments of International Students in Food and Agriculture Sciences Degree Programs The Institute of International Education conducts an annual survey of foreign students enrolled in American higher education institutions. Information from this survey will become available by late in 1980 and will subsequently be used to adjust the effective supply of higher education graduates qualified for jobs related to food and agriculture. This subsequent adjustment is important since less than 1 percent of these studies remain in the United States and participate in the American labor force.

3. Education placement information

Data base

a. Survey of Recent College Graduates

Description/source

Every 2 years the National Center for Education Statistics (NCES) conducts a placement survey of recent college graduates with baccalaureate and master's degrees. The results of the most recent placement survey were utilized in the analysis of the immediate labor force status of recent college graduates from food and agricultural-related disciplines. The use of these survey

Appendix 1. Supplementary data bases--Continued

Survey of Recent
 College Graduates - Continued

results was limited because (1) the sample of higher education institutions included in the survey is not adequately representative of colleges and universities with strong programs in food and agriculture, and (2) the degree areas of the graduates sampled do not provide adequate cc rerage of the food and agricultural sciences.

b. National Survey of Doctorate Recipients This annual survey of all doctorate recipients is conducted by the National Academy of Sciences. Information from this survey was utilized to corroborate placement analyses.

c. Doclorate Records Files A sample of doctoral recipients over a 42-year span is surveyed periodically by the National Academy of Sciences to determine current labor force status. Information from this survey was utilized to provide insight, of a longitudinal nature, regarding the occupational attachment of doctorates from the food and agricultural disciplines.

d: Recent Survey of Science and Engineering Graduates This survey conducted by the National Science Foundation provides information on the labor force atatus of recent science and engineering graduates. The information from this survey was valuable but of limited use because of incompatibility in classification methods used in this and other surveys.

Appendix 2. Panel of consultants representing the Resident Instruction Section of the Division of Agriculture, National Association of State Universities and Land-Grant Colleges

Panel member

Stephen Chapman, Ph.D.
Associate Dean and Director of
Instruction
College of Agricultural Sciences

J. Robert Cooke, Ph.D. Director of Resident Instruction College of Agriculture and Life Sciences

120

^{2.} Percentages reflect expert opinion of the panel of consultants and are assumed valid through 1985.

Appendix 4. Assignment of HEGIS degree specializations to educational clusters

Initially, HEGIS degrees which lead to expertise in the food and agriculture sciences were selected (Appendix 3). Subsequently, the following 11 educational clusters were established for the purpose of categorizing agriculture and agriculture-related degrees according to educational emphasis. In instances when a given degree leads to expertise in multiple clusters, selected percentages of the graduates were assigned to the appropriate clusters.

General Agriculture (Educational cluster #1)

Agricultural Degrees

Agriculture-Related Degrees

0101 General agriculture

(Not applicable)

Agricultural Business and Management (Educational cluster #2)

	Agricultural Degrees	<u> </u>	griculture-Related Degrees

Appendix 12. Overview of matrix conversion process

1. Development of original OES survey-based Industry-Occupation matrix

	OES survey industry										
OES survey occupation	#1	#2	#3	#4	#5						
#1	10%	2%	4%	15%	9%						
#2	5%	6%	0.	10%	6%						
#3	3%	5%	3%	8%	0%						
#4	7%	3%	1%	6%	4%						

Percentages represent proportion of total workers in a given occupation for a given industry.

2. Transformation from OES survey occupations and industries to OES Census occupations and industries

OES survey occupation 1 OES census OES survey occupation 2 OES census OES survey industry 1 OES survey industry 2 OES census OES survey industry 2 OES census OES survey industry 3 OES survey industry 4

3. Development of OES Census-based Industry-Occupation matrix

*Percentage represents proportion of total workers in a given occupation for a given industry; based on weighted averages.

Appendix 22. Methodology used to analyze current and projected employment in the Cooperative Extension Services

USDA, SEA-Extension maintains a continuous master-personnel file of the Cooperative Extension Services' professional employees. The data in this file were reviewed January 1980, for the purposes of--

- Categorizing Cooperative Extension personnel into two employment categories: agriculture and home economics
 - a. Individuals were categorized as agricultural personnel when--
 - (1) Their first and latest degrees represented a specialization in agriculture,
 - (2) Their latest degree represented a specialization in agriculture, or
 - (3) Their first degree represented a specialization in agriculture and their latest degree represented any specialization other than home economics.
 - b. Individuals were categorized as home economics personnel when--
 - (1) Their first and latest degrees represented a specialization in home economics,
 - (2) Their latest degree represented a specialization in home economics, or
 - (3) Their first degree represented a specialization in home economics and their latest degree represented any specialization other than agriculture.
 - c. Remaining personnel, without degrees and with first and latest degrees representing specializations other than agriculture or home economics, were allocated proportionately to agriculture and to home economics.
- 2. Assessing 1979 levels of employment for agriculture personnel and for home economics personnel by position and by area and responsibility
- 3. Assessing 1970-79 annual replacements due to death, retirement, voluntary separation, or involuntary separation

In addition to reviewing the master-personnel file, estimates were developed by SEA-Extension for employment demand in the Cooperative Extension Services due to growth through 1985. These percentage estimates and derived computations are shown on the following page.

Appendix 22. Methodology used to analyze current and projected employment in the Cooperative Extension Services--Continued
