ABSTRACT

This booklet presents data on years of schooling completed by individuals in the United States who are 14 years old and older. Data are based on the results of the Current Population Survey (CPS) conducted by the Bureau of the Census in March 1978 and 1979. Data are presented in tabular and narrative form. Characteristics considered in the survey included age, sex, race, Spanish origin, type of residence, region of residence, and occupation. Findings indicated that 68 percent of persons 25 years old and older were high school graduates in March 1979: the proportions of persons who completed at least one year of college and four or more years of college were greater for men than women in 1979; the proportion of persons who were high school graduates increased more for blacks than for whites--although white youths were still more likely than black youths to be high school graduates as of 1979; people residing in metropolitan areas were more likely to be either high school graduates or college graduates in 1979 than those living in nonmetropolitan areas; the West consistently has had the largest proportion of adults who were either high school or college graduates: the educational level of the American worker has increased substantially throughout the years: and the proportion of male laborers who were high school graduates increased dramatically since 1960. The document concludes with appendices which present information on definitions, explanations, sources of the data, and reliability of the estimates. (DB)

ACKNOWLEDGMENTS

This report was prepared by Denise I. Sanford and Peter J. Sepielli, with the assistance and supervision of Rosalind R. Bruno, of the Education and Social Stratification Branch, Population Division. Table preparation and statistical testing were performed by Andrea E. Adams and Brenda R. Jeffries. Sampling review was conducted by Ronald J. Statt and Donna L. Kostanich of Statistical Methods Division. Programming support was provided by Thelma N. Varbach and survey operations were coordinated by Kathleen P. Creighton of Demographic Surveys Division. Overall supervision was provided by Arthur J. Norton, Assistant Division Chief (Demographic and Social Statistics Programs), and Paul C. Glick, Senior Demographer, Population Division.

SUGGESTED CITATION

Educational Attainment in the United States: March 1979 and 1978

INTRODUCTION

This report contains data based on the results of the Current Population Survey (CPS) conducted by the Bureau of the Census in March 1979 and 1978. The detailed statistical tables present data on years of school completed by persons 14 years old and over by such characteristics as age, sex, race, Spanish origin, type of residence, region of residence, and occupation.

In March 1979, 68 percent of persons 25 years old and over were high school graduates, a significantly larger proportion than the 55 percent recorded in 1970. During the 1970's, the proportions of persons completing at least 1 year of college and graduating also rose. By 1979, 31 percent of adults had completed at least 1 year of college, and about 16 percent were college graduates, both proportions grew by nearly one-half during the decade. This increase was largely because of the higher attainment levels of the young adults

who had recently completed their education and the attrition of older persons who completed less years of school. In comparing persons 25 to 29 years old and persons 65 years old and over, large differences in attainment levels are apparent. Eighty-six percent of the younger group completed high school as compared with only 40 percent of the older group. Of persons 25 to 29, close to one-fourth completed 4 or more years of college—nearly three times the proportion of persons 65 and over who completed college.

Table A shows that the proportions of persons who completed at least 1 year of college and 4 or more years of college were greater for men than for women in 1979. This differential between men and women has not been narrowing, and in fact, among all persons 25 years old and over, the gap appears to have widened. In examining the level of educational achievement among young adults 25 to 29 years old, it appears that changes for men and women, although substantial at every level, were not very significant.

Female.....	75.4	57.9	17.5	32.2	18.8	13.4	11.7	8.0	3.7

The proportion of persons who were high school graduates increased more for Blacks than for Whites, although White youths were still more likely than Black youths to be high school graduates as of 1979. The dramatic increase in graduation rates among young Blacks caused the rate for all Black persons 25 years old and over to rise from about one-third in 1970 to about one-half in 1979. The difference between high school graduation rates of young Blacks and Whites decreased dramatically; among persons 25 to 29 years old, the gap narrowed from 22 to 12 percentage points during the 1970's. In 1979, about 87 percent of Whites 25 to 29 years old and 75 percent of Blacks of the same age were high school graduates; in 1970, the comparable figures were 78 percent and 56 percent, respectively. In addition, the difference between young and old Black adults shows the advances in educational attainment in the last 40 years. Less than one-fifth of Black persons 65 years old and over were high school graduates in 1979, compared with three-fourths of persons 25 to 29 years old.

College graduation continued to be more common for Whites than Blacks. In March 1979, 17 percent of White adults 25 years old and over had completed 4 or more years of college, compared with 8 percent of Black adults. Among young adults 25 to 29 years old, 24 percent of Whites and 12 percent of Blacks had completed college. There have been significant gains in the proportions who completed at least 1 year of college and 4 or more years of college for both young Blacks and Whites, but the percentage points changes for both groups were not very different.

RESIDENCE AND EDUCATIONAL ATTAINMENT

Survey results show that among persons 25 years old and over, those residing in metropolitan areas were more likely to be either high school graduates or college graduates in 1979 than those living in nonmetropolitan areas. Of the total population 25 years old and over living in metropolitan areas, 71 percent had completed at least 4 years of high school and 18 percent had completed 4 or more years of college, whereas in nonmetropolitan areas, 62 percent had at least completed high school and 13 percent had completed 4 or more years of college. Table B indicates that in March 1979, persons 25 years old and over residing in metropolitan areas outside central cities (e.g., in the suburbs) were more likely to be high school or college graduates than persons residing in any other area: roughly 74 percent of the persons 25 years old and over were high school graduates and 20 percent were college graduates. In contrast, the nonmetropolitan farm population had 61 percent high school graduates and only 9 percent college graduates. These large differences reflect in part the older age structure of the adult farm population (table 6).

Table B shows that from 1970 to 1979, the proportion of high school graduates and the proportion of college graduates 25 years old and over increased in both metropolitan and nonmetropolitan areas. The proportion of persons 25 years old and over who were high school graduates increased by about 15 percentage points in both metropolitan and

FIGURE 1.
Percent of Persons 25 Years Old and Over Who Were High School
Graduates and College Graduates, by Region: 1979, 1970, and 1960

High school
graduates
College graduates

nonmetropolitan areas, resulting in a national average in 1979 of about 68 percent. The increase that occurred from 1970 to 1979 in the proportion who were college graduates was also similar for each residential area—about 5 percent of those in nonmetropolitan areas and 6 percent of those in metropolitan areas.

Attainment levels also differ by region (figure 1). In March 1979, persons 25 years old and over living in the South were less likely to be high school graduates than persons in the Northeast, North Central, and West Regions. Even though the South had proportionally fewer high school graduates compared with the other regions, the South did experience a greater increase from 1970 to 1979 than the national average (table C). The South differed less from the other regions in the proportion of adults who were college graduates than the proportion of adults who were high school graduates. The proportion of adults in the South who completed college was not significantly different from the proportion in the North Central Region, but was substantially below that in the Northeast and West.

The West consistently has had the largest proportion of adults who were either high school or college graduates. In 1979, 76 percent of adults in the West were high school graduates; in 1960, the figure was 51 percent. In both Years,

the figure was at least 8 percentage points greater than that for the rest of the country. In 1979, about 20 percent of adults in the West had completed college, compared with 17 percent or less in the other regions.

OCCUPATION AND EDUCATIONAL ATTAINMENT

The educational level of the American worker has increased substantially throughout the Years. More than three-fourths of all workers were high school graduates in 1979, compared with less than one-half in 1960. This higher educational level indicates that the school achievement of the population may be increasing more rapidly than the qualifications once regarded as necessary for some jobs. Certainly, employers now have the option to hire "better educated" workers for jobs that have traditionally been filled by persons with a relatively small amount of education.

During the period from 1960 to 1979, the proportion of employed persons 25 to 64 years old who had completed 4 years of high school or more increased by 33 percentage points for men and 29 points for women (table D). These educational advances may indicate that entrance require-

ments for some jobs may be tightened by employers because: (1) a better trained labor force is available now that a much larger proportion of young adults are completing high school, and (2) there is increased technical complexity of those jobs. Young workers with high school diplomas were replacing retiring workers with fewer years of schooling. As table 5 indicates, a substantially larger proportion of workers 25 to 44 years old than of those 45 to 64 years old have completed at least 4 years of high school.

The educational level for persons in some occupational groups was greater than that for persons in others (figure 2).

percent) as older workers were replaced by younger workers with at least high school diplomas. Gains for persons employed as craft workers, operatives, and service workers were similar in both decades, as less well-educated workers continued to be replaced by young high school graduates. With more youths graduating from high school and a relative scarcity of white-collar jobs available, coupled with the fact that some blue-collar jobs pay more than white-collar jobs, an increased proportion of blue-collar workers were high school graduates. The proportion of male laborers who were high school graduates increased dramatically since 1960. In

FIGURE 2.
Percent of Employed Persons 25 to 64 Years Old Who Were High School Graduates, by Occupation: March 1979 and April 1960

1979 
1960 

The greatest increases in the proportion of men who were high school graduates occurred among those employed in the craft, operative, labor, service, and farm occupations. The large gains made by these groups reflect in part the fact that only a small proportion of these employees at the beginning of the period were high school graduates. Less than 40 percent of the men in these occupations in 1960 were high school graduates, compared with over 60 percent of clerical, sales, and management workers and 90 percent of professional workers. In some occupation groups, the changes in the proportion who were high school graduates were greater in the 1960's than in the 1970's; for other occupations, the reverse was true. Men and women employed in the professional, managerial, and clerical occupations achieved more advances during the 1960's than the 1970's. By 1970, nearly all employees in these white-collar occupation groups were high school graduates (approaching 100

1979, 53 percent of male laborers were high school graduates, compared with only 16 percent in 1960).

The percentage of employed persons 25 to 64 years old who completed 4 years of college or more also increased between 1960 and 1979 (table D). The most significant educational attainment increases since 1960 have been for persons in occupations in which a college background is seemingly most beneficial to their careers: the professional, managerial, and administrative fields for both sexes as well as the sales field for men. It is also noteworthy that some increase in the percentage of persons completing 4 years of college or more occurred in other occupational groups such as service workers (which includes police and firefighters), farmers, and craft workers.

In 1979, men who had not completed at least 1 year of college were most likely to be employed in the craft fields (table E). This was true for high school graduates as well as

for those who were not high school graduates. Men who completed at least 1 year but less than 4 years of college were most likely to be employed as managers, administrators, or craft workers. The majority of those who had completed 4 years of college were in professional, technical, managerial, or administrative positions. The data suggest that occupational status is more closely related to amount of education for women. Fully one-third of all working women were in clerical jobs. For those who were not high school graduates, the majority were operatives or service workers, nearly one-half of the women who completed high school but not college were clerical workers, and the majority of all female college graduates were professional or technical workers.

The major occupation groups of White and Black persons 25 to 64 years old by years of school completed and sex are

shown in table F. Among persons who were not college graduates, White men and women were more likely to be employed in white-collar occupations than were Black men and women with similar levels of education. Black men who did not graduate from high school were about as likely as White men of a similar educational level to be employed in blue-collar and farm occupations; among those who graduated from high school but did not complete 4 years of college, a greater percentage of Black men were employed in blue-collar occupations than their White counterparts. For both Black and White men and women, at least 4 out of 5 college graduates were employed in white-collar jobs. Overall, Black workers were at least twice as likely to be in service occupations as White; this is most evident among those who completed 4 years of high school or less.

Table F. Summary Occupation Group for Employed Persons 25 to 64 Years Old, by Years of School Completed, Sex, and Race: March 1979

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for each member of the household (or family). However, the trend toward recognition of equal status and roles for adult family members makes the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques for the enumeration and presentation of data which will eliminate the concept "head." Although the data in this report are based on this concept, methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Table 1. Years of School Completed by Persons 14 Years Old and Over, by Age, Sex, Race and Spanish Origin:
March 1979 and 1978

(NUMBERS IN THOUSANDS. NONINSTITUTIONAL POPULATION. Appendix A. Definitions and Explanations

Population coverage. The figures in this report for March 1979 and March 1978 are sample survey data and relate to the noninstitutional population of the 50 States and the District of Columbia. Members of the Armed Forces living off post are included, but all other members of the Armed Forces are excluded. The March 1979 survey included 874,000 members of the Armed Forces and the March 1978 survey includes 824,000 members of the Armed Forces in the United States living off post or with their families on post.

Population figures shown for States and SMSA's are based on weighted results of the Current Population Survey and have not been adjusted to Independent Census Bureau estimates.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In this report, "other races" are usually shown in combination with the Black population.

Spanish origin. Information on origin or descent was obtained by asking "What is (this person's) origin or descent?" Responses generally refer to a person's perceived national or ethnic lineage and do not necessarily indicate the country of birth of himself or his parents.

Persons of Spanish origin are persons who reported themselves as Mexican American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Spanish origin. However, all persons who reported themselves as Mexican American, Chicano, Mexican, or Mexicano were combined into one category: Mexican. Persons of Spanish origin may be of any race.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to two questions: (a) "What is the highest grade of school he has ever attended?" and (b) "Did he finish this grade?"

The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the population into two equal parts—one half having completed more schooling and one-half having completed less schooling than the median. This median was computed after the statistics on years of school completed had been converted to a continuous series of numbers (e.g., completion of the first year of high school was treated as completion of the 9th year and the completion of the first year of college as completion of the 13th year). The persons completing a given school year were assumed to be distributed evenly within the interval from .0 to .9 of the year (for example, persons completing the 12th year were assumed to be distributed evenly between 12.0 and 12.9). In fact, at the time of the March survey, most of the enrolled persons had completed about three-fourths of a school year beyond the highest grade completed, whereas a large majority of persons who were not enrolled had not attended any part of a grade beyond the highest one completed. The effect of the assumption is to place the median for younger persons slightly below, and for older persons' slightly above, the true median. Because of the inexact assumption as to the distribution within an interval, this median is more appropriately used for comparing groups and the same group at different dates than as an absolute measure of educational attainment.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central county. In New England, SMSA's consist of towns and cities rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

The population inside SMSA's is further classified as "in central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.
2. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:
 - a. The additional city or cities has at least 250,000 inhabitants.

- b. The additional city or cities has a population of one-third or more of that of the largest city and a minimum population of 25,000.

Comparability of metropolitan and nonmetropolitan data from the 1979 CPS with data for previous years. Changes in CPS design and procedures over the last several years have made the annual series of sample population data for metropolitan and nonmetropolitan areas inconsistent. Analytic comparisons of year-to-year changes in these figures should be avoided. Trends in metropolitan and nonmetropolitan population growth over the period from 1970 to 1979 and from 1978 to 1979 should not be appreciably affected by the procedural changes.

The major revisions to the CPS sample design and estimation methods have involved the expansion of the number of sample units from 55,000 housing units to 65,500 housing units. This incorporation of approximately 10,000 supplemental housing units into the March CPS sample in 1977 was accompanied by new procedures for inflating the sample results to reflect national estimates. It was determined subsequent to the introduction of the additional sample that the new inflating (weighting) procedures used for processing both the March 1977 and March 1978 CPS supplement data had resulted in an apparent overestimate of the nonmetropolitan population and corresponding underestimate of the metropolitan population for those years. For March 1979, another revision of the weighting process was introduced to correct the problem discovered in the earlier procedures. The result of this change was a large spurious increase in the metropolitan population and decrease in the nonmetropolitan population relative to March 1978 levels.

The March 1979 CPS metropolitan/nonmetropolitan population estimates also reflect other operational changes including the introduction of a coverage improvement sample designed to provide greater accuracy in survey estimation. The net effect of all changes in procedure was to increase the metropolitan area estimates. Research and detailed analysis of the impact of each procedural change on the population estimates is underway and the results will be issued in a forthcoming technical report.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the Current Population Surveys since March 1960 is the same as that used in the 1960 census but differs from that used in earlier censuses.

The nonfarm population, as the term is used here, comprises persons living in urban areas and all rural persons not on farms.

According to the current definition, the farm population consists of all persons living in rural territory on places of less than 10 acres yielding agricultural products which sold for \$250 or more in the previous year, or on places of 10 acres or more yielding agricultural products which sold for \$50 or more in the previous year. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming are not classified as farm population.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

The North as used in this report includes the combined Northeast and North Central regions.

Employed. Employed persons comprise those civilians who, during the survey week, were either (a) "at work"—those who did any work for pay or profit, or worked without pay for 15 hours or more on a family farm or business; or (2) "with a job but not at work"—those who did not work and were not looking for work but had a job or business from which they were temporarily absent because of vacation, illness, labor-management dispute, bad weather, or because they were taking the week off for various other reasons.

Occupation. Data on occupation are shown for the employed and relate to the job held during the survey week. Persons employed at two jobs or more were reported in the job at which they worked the greatest number of hours during the week. The major groups used here are generally the major groups used in the 1970 Census of Population. The composition of these groups is shown in 1970 Census of Population, Vol. I, *Characteristics of the Population, U.S. Summary*.

Four occupation divisions. The major groups are arranged in four divisions as follows:

White collar. Professional, technical, and kindred workers; managers and administrators, except farm; sales workers; and clerical and kindred workers.

Blue collar. Crafts and kindred workers; operatives, except transport; transport equipment operatives; and laborers, except farm.

Farm workers. Farmers and farm managers, farm laborers, and farm supervisors.

Service workers. Service workers including private household.

The sequence in which these four divisions appear is not intended to imply that any division has a higher social or skill level than another.

Symbols. A dash (—) represents zero or rounds to zero, and the symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals which are independently rounded. With few exceptions, percentages are based on the rounded absolute numbers.

Appendix B. Source and Reliability of the Estimates

SOURCE OF DATA

Most of the estimates in this report are based on data collected in March of 1970, 1975, 1978, and 1979 from the Current Population Survey (CPS) of the Bureau of the Census. Some estimates are based on data obtained in earlier years. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and over in every sample household. In addition, supplementary questions are asked each March about various population characteristics. In order to obtain more reliable data for the Spanish-origin population, the March CPS sample was enlarged to include all households from the previous November sample which contained at least one person of Spanish origin. This results in almost doubling the number of sample persons of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are included. Brief descriptions of the sources and the procedures by which the data were obtained are presented below.

The present CPS sample was initially selected from the 1970 census files and is continuously updated to reflect new construction where possible. (See section, "Nonsampling

Variability.") The monthly CPS sample is spread over 614 areas with coverage in each of the 50 States and the District of Columbia. The CPS sample areas are comprised of 1,113 counties, independent cities, and minor civil divisions in the nation.

The estimation procedure used for the monthly CPS data involves the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. The estimation procedure for the data in the report also involves a further adjustment so that husband and wife of a household receive the same weight.

RELIABILITY OF THE ESTIMATES

Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey—sampling and nonsampling. The standard

Description of the Current Population Survey for March Supplement

Time period	Number of sample area ¹	Households eligible		Housing units visited, not eligible ²
		Interviewed	Not interviewed	
March 1979.....	614	55,000	3,000	10,500
March 1978.....	614	54,500	3,000	10,500
March 1977 ³	614	55,500	2,500	10,700
March 1973 to March 1976.....	461	46,500	2,500	8,500
March 1972.....	449	45,000	2,000	8,000
March 1967 to March 1971.....	449	48,000	2,000	8,500
March 1964 to March 1966.....	357	33,500	1,500	6,000
March 1962 ⁴	333	33,500	1,500	6,000
March 1957 to March 1959.....	330	33,500	1,500	6,000
March 1947, March 1950, and March 1952.....	68	21,000	500-1,000	3,000-3,500

¹Beginning in May 1956, these areas were chosen to provide coverage in each State and the District of Columbia.

²These are housing units which were visited, but were found to be vacant or otherwise not eligible for interview.

³A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS to produce March 1977 data.

⁴Three sample areas were added in 1960 to represent Alaska and Hawaii after statehood.

errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

NONSAMPLING VARIABILITY. As in any survey work, the results are subject to errors of response and nonreporting in addition to sampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, inability to recall information, mistakes made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the biases due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population, with differentials by age, sex, and race similar to those observed in CPS.

A coverage improvement sample was included in computing the estimates beginning in October 1978 in order to provide coverage of mobile homes and new construction housing units that previously had no chance for selection in the CPS sample. This sample is composed of approximately 450 sample household units which represent 237,000 occupied mobile homes and 600,000 new construction units. These new construction units are composed of those units where building permits were issued prior to January 1970 and construction was not completed by the time of the 1970 Census (i.e., April 1970). The extent of other sources of undercoverage of housing units is unknown but believed to be small. The inclusion of this coverage improvement sample in the CPS does not have a significant effect on the estimates.

Use of metropolitan and nonmetropolitan data. In using metropolitan and nonmetropolitan data, particular care should be exercised in comparing estimates from 1977 and later years to each other and to those from earlier years.

Methodological and sample design changes have occurred in these recent years resulting in relatively large differences in the metropolitan and nonmetropolitan area estimates.

Decennial Census of Population. The 1940 census data shown in this report are based on a 100-percent sample and 1960 and 1970 census data are based on 5-percent samples from the census. Data obtained from the CPS and the census are not strictly comparable. This is due in a large part to differences in interviewer training and experience and in different survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

SAMPLING VARIABILITY. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the whole of the population was surveyed. The sample estimate and its estimated standard error enable one to construct interval estimates that include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these surveyed under identical conditions using the same sample design and an estimate and its estimated standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples;
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples;
3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average result of all possible samples may or may not be contained in any particular computed interval. However, for a particular sample one can say with specified confidence that the average result of all possible samples is included within the constructed interval.

All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Note when using small estimates. Summary measures (such as medians and percent distributions) are shown in the report only when the base is 75,000 or greater. Because of the large

standard errors involved there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown however, even though the relative standard errors of these numbers are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit those combinations of the categories which serve each user's needs.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard errors.

The figures presented in tables B-1 through B-4 provide approximations to standard errors of various estimates for total, White or Black persons in the total United States for education only. To obtain standard errors for other characteristics, factors from table B-5 must be applied to the standard errors given for education in order to adjust for the

combined effect of sample design and estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the tables may be approximated by interpolation.

Data based on the 1940, 1960 and 1970 censuses. Sampling errors of all sample data from the 1960, and Census of Population for 1940, 1960 and 1970 in this report are small enough to be disregarded. However, these standard errors may be found in the appropriate volumes.

Standard errors of estimated numbers. The approximate standard error, σ_x , of an estimated number shown in this report can be obtained by use of the formula

$$\sigma_x = f\sigma \quad (1)$$

In this formula f is the appropriate factor from table B-5 and σ is the standard error for total or White persons in table B-1 or the standard error for Black persons in table B-2.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed by using sample data for

- Represents zero.

Note: To estimate the standard errors for the 1956-66 period, multiply these standard errors by 1.23. For years prior to 1956, multiply by 1.5.

both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula:

$$\sigma_{(x,p)} = f\sigma \quad (2)$$

In this formula f is the appropriate factor from table B-5 and σ is the standard error for total or White persons in table B-3 or the standard error for Black and other races in table B-4. Illustration of the use of tables of standard errors. Table 1 of this report shows that in March 1979 there were 58,986,000 men 25 years old and over. At that time, an estimated 5,049,000 of them had completed elementary school and had not completed at least 1 year of high school. Table B-1 shows the standard error of an estimate of this size to be approximately 97,000. In this situation no factors have to be applied to the standard error, (i.e. f is equal to 1.0). The 68-percent confidence interval as shown by the data is from 4,952,000 to 5,146,000. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude with 95-percent confidence that the average estimate derived from all possible samples lies within the interval from 4,855,000 to 5,243,000, (i.e. $5,049,000 \pm (2 \times 97,000)$).

Table 8 shows that in March 1979, 75.3 percent of the 12,961,000 Californians 25 years old and over were high school graduates. Table B-3 indicates the standard error on this percentage to be 0.6 percent. Applying the appropriate factor from table B-5 and using formula (2), the approximate standard error is $1.0 \times 0.6 = 0.6$ percent. Consequently, the 68-percent confidence interval as shown by these data is from 74.7 percent to 75.9 percent and the 95-percent confidence interval is from 74.1 percent to 76.5 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \quad (3)$$

where σ_x and σ_y are the standard errors of the estimates x and y ; the estimate can be of numbers, percents, medians, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between two separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustrations of the computation of the standard error of a difference. Table 8 of this report also shows that in March 1979, 68.8 percent of the 10,436,000 persons in the State of New York 25 years old and over were high school graduates.

Table B-2. Generalized Standard Errors for Estimated Numbers of Persons—Black and Other Races

(68 chances out of 100. Numbers in thousands)

Estimated number of persons	Total Persons in age group						
	100	250	500	1,000	2,500	5,000	10,000

7,500.....	-	-	-	-	-	-	72.4
10,000.....	-	-	-	-	-	-	-

- Represents zero.

Note: To estimate the standard errors for the 1956-66 period, multiply these standard errors by 1.5. For years prior to 1956, multiply by 1.5.

Thus, the apparent difference between California and New York in the percentage of people 25 years old and over who were high school graduates is 6.5 percent. The standard error (σ_x) of 75.3 percent is 0.7, as shown above. Table B-3 and the factor from table B-5 show the standard error (σ_y) of 68.8 percent with a base of 10,436,000 to be approximately $0.6 = 0.6 \times 1.0$ percent. Therefore, using formula (3), the standard error of the difference of 6.5 percent is about

$$.8 \pm \sqrt{(0.6)^2 + (0.6)^2}$$

This means that the 68-percent confidence interval about the difference is from 5.7 percent to 7.3 percent, and the 95-percent confidence interval is from 4.9 percent to 8.1 percent. Since this interval does not contain zero, we can conclude with 95-percent confidence that there exists a difference between the percentage of high school graduates of California and New York who were 25 years old and over.

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as on the size of its base. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence that the median based on a complete census lies within the interval. The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

1. Determine, using table B-3 or B-4 and the appropriate factors, the standard error on a 50-percent characteristic;
2. add to and subtract from 50 percent the standard error determined in step (1);
3. using the distribution of the characteristic, calculate the 68-percent confidence interval by finding the values corresponding to the two points established in step (2).

A 95-percent confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step (1).

Illustration of the computation of a confidence interval for a median. Table 8 of this report shows that the median number of school years completed by Californians 25 years old and over is 12.8.

1. There was a total of 12,961,000 Californians 25 years old and over. Using formula (2) and tables B-3 and B-5 the standard error of a 50-percent characteristic is found to be approximately $0.7 = 1.0 \times 0.7$ percent.
2. To obtain a 95-percent confidence interval on an estimated median, add to and subtract from 50 percent twice the standard error found in step (1). This yields percent limits of 48.6 and 51.4.
3. From table 8 the percent of Californians 25 years old and over who completed 12 years of school is $33.0 = 75.3 - 42.3$ percent and 24.7 percent completed less than 12 years of school. By linear interpolation, the lower limit on the estimate is found to be about

$$12.0 + (13.0 - 12.0) \frac{48.6 - 24.7}{33.0} \approx 12.7 \text{ years}$$

Similarly, the upper limit may be found by linear interpolation to be about

$$12.0 + (13.0 - 12.0) \frac{51.4 - 24.7}{33.0} \approx 12.8 \text{ years}$$

Hence, the 95-percent confidence interval about the estimated median is from 12.7 to 12.8 years.¹

Standard error of a 3-year moving average. To calculate the standard error of 3-year moving average, first find the standard error for the estimate of the middle year using the appropriate table(s). Then divide this number by the square root of 3 (1.7) to obtain the approximate standard error of the average.

¹Note, the estimated median and the upper limit of the 95-percent confidence interval are identical. This result can be attributed to the rounding of the estimated median (from 12.76 to 12.8) and the upper limit (from 12.81 to 12.8).

Table B-3. Generalized Standard Errors of Estimated Percentages—Total or White Population

current housing reports

Data on housing vacancies
and housing characteristics

U.S. Department of Commerce
BUREAU OF THE CENSUS

CURRENT DATA ON HOUSING

HOUSING VACANCIES (SERIES H-111):

Current statistics on housing vacancies, based on a scientifically selected sample. This series of four quarterly reports and one annual report provide rental vacancy rates and homeowner vacancy rates for the United States, each of the four regions, and inside and outside standard metropolitan statistical areas. The statistics for the current quarter are compared with data for the same quarter in the preceding year. Percent distributions are presented for rental vacancies and homeowner vacancies by the following housing characteristics:

Number of rooms
Number of bedrooms
Number of housing units in the structure
Duration of vacancy
Plumbing facilities
Monthly rent and sale price asked
Year structure built

Also shown are percent distributions of all vacant housing units by year-round and seasonal status, figures on occupancy and vacancy rates based on the total housing inventory, and the home ownership rate. The annual report, in addition to the above, presents percent distributions of housing characteristics for both renter- and owner-occupied units.

HOUSING CHARACTERISTICS (H-121):

This series of reports is published on an irregular schedule. Individual reports present data for the United States, regions, or local areas on one or more selected housing characteristics. (Publications in this series include 15 reports on television ownership, 1 report on second homes and 1 report on housing units by plumbing facilities and condition, and a special study on housing characteristics classified by the 1959 income of occupants.) Stocks of these reports are exhausted. Photo copies only are available. For information write to: Housing Division, Bureau of the Census, Washington, D.C. 20233

HOW TO ORDER

Both series of current housing reports described in this announcement are available from the Superintendent of Documents in a combined subscription for \$5 per year (individual copies vary in price). Use the order form furnished below.

RELATED REPORTS

The Bureau of the Census also issues several series of monthly reports on the construction industry. Subjects covered include housing starts, construction activity, building permits, and housing sales. An announcement and order form covering these reports is available free of charge upon request to: Subscriber Services Section (Publications), Bureau of the Census, Washington, D.C. 20233
