### ABSTRACT

This is the first of two reports on existing measurement techniques for assessing characteristics of the home and educational environments and personal characteristics of children from birth to 9 years of age. In order to facilitate the use of currently available measures, tests have been categorized in terms of 10 broad areas and subcategorized in terms of the constructs they measure. The 10 areas of classification used are: (1) test batteries measuring many constructs: (2) measures of aptitude and/or intelligence: (3) measures of the ability to cope with cognitive demands: (4) measures of the ability to cope with personal-social demands: (5) family measures: (6) measures of language development: (7) measures of sensory-motor or physical skills or status: (8) measures of subject-matter achievement: (9) measures of teacher and cr program: and (10) miscellaneous measures. As indicated above, each measure was further assigned to one or more construct areas depending upon test content. For example, the broad area "ability to cope with cognitive demands" includes tests measuring the following and other constructs: attention: attitude toward school: curiosity: memory: and reasoning. In separate sections of the report the methodology and general conclusions of the review are indicated. Titles of tests are listed by construct in Appendix A. Appendix B provides a guide to the different test listings. (Author/RH)

TESTS AND MEASURES IN EARLY CHILDHOOD

Report I

### TESTS AND MEASURES IN EARLY CHILDHOOD

Report I on Task 1

under

OCD Grant Number H-2993 A/H/O

September 1972

This is the first of two reports on the status of existing measurement techniques for assessing characteristics of children between the ages of 0 and 9 and of their home and educational environments. The following people contributed to it: Scarvia Anderson, Thomas Barrows, Ruth Ekstrom, Ann Jungeblut, Elsa Rosenthal, Gray Sidwell, Irving Cantor, Marcy Gekoski, Ann McLaughlin, and Louise Ritenour.

### 1. The task and the background for it

In spite of the earlier work by Freud, Montessori, Pestalozzi, Froebel, and even Piaget, the young child was not discovered in a massive way by psychologists, educators, and government agencies until the early 1960s. Hunt, Bloom, and Bruner were the major conveyers of the message that the first eight years of life are the most important for human development, and there was concomitant interest in the critical effect of the environment and learning situations on both personality and cognition. Among the most compelling evidence for the significance of the early years was research demonstrating the wide range of learned responses which the human infant was capable of; it was not necessary to wait upon maturation for the benefits of educational intervention.

Membership in APA Division 7 (Developmental Psychology) burgeoned; special centers for the study of young children (including the handicapped and retarded) were established; Head Start became an instant success followed by Follow Through, Parent and Child Centers, and other national programs administered by a new special Office of Child Development in HEW; ESEA Title I funds were used to establish kindergartens in places that had never had kindergartens before; alternative magic curricula for the very young were put forth by university professors and by publishers with a good eye for the market; industries began to experiment with day care centers as an employee benefit (or necessity in some areas of short labor supply); Oscar of TV's Sesame Street became a word in households of all economic conditions that contained children from three to six; another television effort, The Electric Company, followed with its attempts to teach more children to read than the schools had been successful in doing; efforts were begun to establish a new profession of "child development associate"; and social scientists who had formerly based most of their theories on the behavior of college freshmen found themselves deeply involved in research and evaluation efforts with subjects who could not fill out machine-scorable answer sheets. None of these phenomena shows signs of abating.

Measurement came to serve the operational and research efforts committed to young children in both positive and negative ways. Positively, it was recognized that good measures were necessary to the elucidation of the processes, sequences, and interactions of development, and that they could aid in both the scientist's search for understanding and the practitioner's decisions about appropriate treatment of individuals and groups. The chief misus of measurement in this area has occurred when a test or measure was co used with a broader behavioral construct; e.g., when scores on a picture vocabulary test were interpreted as "intelligence" or when responses to smiling and frowning photographs were generalized to conclusions about "self-concept." Sometimes these problems could be traced to policy pressures to produce a report quickly, when time was inadequate either for sound instrument development and selection or for the necessary accompanying rational processes. In other cases, the difficulty arose because untrained personnel assumed or were forced into evaluation roles. In all instances of using measurement with young children, however, the enormous

difficulties attending any act of psychological and educational measurement are exacerbated by the child's relatively undifferentiated response system and the rapid developmental changes characteristic of his first few years. It is even the case that developmental changes or meaningful learning can sometimes occur during the very process of measurement.

Doubtless the extraordinary number of new measures that have been developed for young children during the last decade is a partial reflection of these difficulties—and the multiple dissatisfactions with the ways previous researchers or evaluators have dealt with them. But the same difficulties have led researchers also to much reaching for instruments placed on the shelf somewhere by someone else. Neither response is necessarily bad. Still, it is certainly inefficient and contrary to the desire for scientific comparability of results to develop a new measure when an adequate one already exists. It is lamentable, moreover, to use an inappropriate measure primarily because it exists and the investigator happens to be aware of it.

Recently a number of scholars have attempted to get information about published and unpublished measures for young children to researchers and program directors so that ignorance will not prompt either situation.

The most comprehensive attempt is probably that of Johnson and Bommarito (1971), which appeared in preliminary mimeographed form in 1968. It lists 322 unpublished but available measures for children from birth to age 12, classified in terms of different aspects of cognition; personality and emotional characteristics; feelings toward the environment; characteristics of the child's environment; motor skills, brain injury, and sensory perception and discrimination; physical attributes; attitudes and interests not included in earlier categories; social behavior; and "other." For each measure, information on the following is provided: title, author, age range, variable, type of measure, source, description, reliability and validity, and at least one selected reference. There are indexes by author, measure, and subject matter, and the publication should be quite useful to researchers and those conducting evaluation studies. However, because of the nature of the instruments listed, practitioners without specialized training in assessment should probably not be encouraged to use it, and indeed the authors do not address that group. Even though the volume does not provide any overall evaluation of the field of tests and measurements in child development, it is a useful resource for an assessment of the state of the art.

Another major effort in this area—one that encompasses mostly published tests—is that of Annie Butler and her colleagues (1971). They review 80 tests considered usable for diagnosis, screening, evaluation, or research at the preschool level and in addition provide long lists of other test titles with the sources from which they may be obtained. The usefulness of the information provided on many of the tests is enhanced by classifications in terms of preschool educational objectives.

Some other general references that focus on or include descriptions of measures for young children include:

- Berger, B. An Annotated Bibliography of Measurements-for Young Children.

  New York: Center for Urban Education, 1969.

  A selective listing of assessment instruments appropriate for preschool and kindergarten children. Included are research and commercially available measures of cognitive status, cognitive abilities, perceptual skills, reading readiness, characteristics of cognitive style, and personal-social development.
- Buros, O. K. (Ed.) The Seventh Mental Measurements Yearbook. Highland Park New Jersey: The Gryphon Press, 1971.

  The Yearbooks, published periodically since 1932, are a comprehensive source of factual and evaluative information about tests which generally are available for open sale. The Seventh Yearbook is the most recent in the series. The two volumes contain information on 1,157 tests. In addition to descriptive information and test reviews, there are bibliographic references to studies and articles pertaining to specific instruments, reviews of publications related to measurement and evaluation, and a current directory of 243 test publishers. Not included in the Yearbooks are tests not generally available, research instruments, or measures which have not been published as separates (i.e., tests included in the appendix of a book, in a research report or journal article).
- Hoepfner, R. (Ed.) CSE Elementary School Test Evaluations. Los Angeles:
  Center for the Study of Evaluation, UCLA Graduate School of Education, 1970.

  A compendium of tests, keyed to educational objectives of elementary school education, and evaluated by measurement experts and educators. Evaluations are assigned for meaningfulness, examiner appropriateness, administrative usability, and quality of standardization. Commercial assessment, diagnostic, and prognostic measures appropriate for use in grades one through six are included.
- Hoepfner, R., Stern, C., & Nummedal, S. G. (Eds.) <u>CSE-ERIC Pre-Schcol/Kindergarten Test Evaluations</u>. Los Angeles: UCLA Graduate School of Education, School Evaluation Project, Center for the Study of Evaluation, and Early Childhood Research Center, 1971.

  A compendium of published assessment, diagnostic and prognostic instruments, keyed to educational objectives for preschool and kindergarten education. Each measure is evaluated in terms of its meaningfulness, examinee appropriateness, administrative usability, and quality of standardization.
- Kaya, E. Review of Preschool Tests, 1965-69. New York: Hofstra University, 1969.

  Contains an evaluation of preschool test development; a listing of tests constructed during 1965-69, classified under 18 constructs; and a list of tests still under development in 1969. The listing of published tests includes only those for the age range 5 years and below. The following broad areas are covered: achievement, intelligence, language, Piagettype cognitive structure, social and personality, and techniques for assessing developmental status. Six types of information are given for unpublished tests: variable tested, operationalization and scoring procedures, age range, basic reference, statistical information, type of test.

Bonjean, C. M., Hill, R. J., & McLemore, S. D. <u>Sociological Measurement:</u>
<u>Inventory of Scales and Indices</u>. San Francisco: Chandler Publishing Co., 1967.

Bibliographies of measuring instruments representative of main research currents in American sociology during a 12-year period (1954-65). Extensive listings in 78 conceptual classifications are relevant to young children, their families, and their schools.

In addition, there are a number of special purpose reviews or listings of measures, all or some of which are relevant to children under the age of 9. They include Allen and Allen (1967), assessment procedures for use with mentally retarded children; Beatty (1969), measures of affective behavior; Buros (1968) and Farr and Anastasiow (1969), reading readiness and achievement; Coller (1971), Coller and Guthrie (1971), and Wylie (1961), self-concept; Guthrie (1971a), infant development; Guthrie (1971b), social skills; Guthrie (1971c), school readiness; Rosen (1971a), language development; Rosen (1971b), tests for Spanish-speaking children; Simon and Boyer (1967-70), classroom observation instruments; Straus (1969), family measurement techniques; and Buros (1970) and Cattell and Warburton (1967), tests of personality and motivation. The number of test bibliographies and reviews may be rapidly approaching the number of instruments!

What seem to be needed at this stage are (a) an integration of the listings across these various measurement volumes and such other sources as ERIC
and the ETS Test Collection, so that potential users can turn to a single retrieval mechanism, (b) a system for periodic updating of the information, and
(c), for purposes of development planning, an overall evaluation of the
adequacy and coverage of instrumentation with respect to constructs, age
levels, assessment methods, and technical characteristics.

Under a grant from the Office of Child Development, Educational Testing Service has begun this task. This report is based upon information obtained on over 1300 measures designed for application either to children under the age of nine or to aspects of their home or educational environments. These measures encompass published and unpublished instruments and include measures designed for use by practioners as well as researchers. The initial evaluation of the field (section 3 of this report) is limited to an appraisal of coverage in terms of construct and age level, with some summary data about the availability of reliability, validity, and normative information for the instruments. Subsequent analyses will focus on the quality of technical data about the measures, variations in assessment techniques, and construct coverage as it relates to assessment method and technical characteristics of the measures. The machinery that will allow these more detailed analyses will also enable periodic updating of information on the measures presently listed and the addition of information about new measures.

### 2. Methodology

The first task ETS set itself was to provide for potential test users an integration of all already available listings in the area of early child-hood development.

Accordingly, a large number of disparate sources were consulted. These include the references cited in section 1, the APA Data Retrieval System, the ETS Test Collection, the ERIC System, the Head Start Test Collection, and the Smithsonian Institution Science Information Exchange Service. A systematic search was made through the test collections and references for copies of each measure. The information in this report is based only on measures actually inspected. Tests or journals that were not available were placed on order whenever the reference was adequate to permit our doing so. It was, however, impossible to obtain copies of all instruments. A supplementary listing is thus being prepared on instruments not initially available for inspection.

The measurement materials included in this review encompass all those suitable for use with young children from birth through age 8 (or third grade). Only instruments in the English language or suitable for non-English-speaking American children are included.

The inspection of each measure included gathering the following items of information: name of test; construct(s) measured; parts or subtests; forms; author; source; age or grade range for which test is appropriate; suitability of test for any special group(s) of subjects, such as the handicapped; data collection method; administrator qualifications; administration time; scoring method—hand or machine; types of scores available—subscores, total; equipment needed; norms; validity information; reliability information; manual available; references included in test material; and additional information about the test. Not all of this information is available for every test, however. Many tests have no manuals and even for those tests that do, the manuals may not include much of this information. For example, the proportion of tests with any kind of normative information (some based on a total sample of less than 10 children) ranged from a high of 68 percent in the area of aptitude and intelligence measures to a low of 2 percent for measures of teacher and program.

A list of constructs was developed to encompass those found in the tests under consideration. These constructs were derived from ones used by the ETS and Head Start Test Collections and from lists of objectives in early education. It seemed wiser to use a construct system that had shown itself to be appropriate for similar tasks than to spend time reanalyzing the constructs underlying each of the tests and attempting to develop a different system of conceptualization. In short, there seemed to be no need to reinvent the wheel.

After the list of constructs was developed, each instrument was placed in one of ten broad areas: (1) test batteries measuring many constructs, (2) measures of aptitude and/or intelligence, (3) measures of the ability

to cope with cognitive demands, (4) measures of the ability to cope with personal-social demands, (5) family measures, (6) measures of language development, (7) measures of sensory-motor or physical skills or status, (8) measures of subject-matter achievement, (9) measures of teacher and/or program, and (10) miscellaneous measures.

Each measure was assigned to one or more construct areas depending upon test content. For each test to which multiple constructs were assigned, one construct was selected as primary and the others were considered as secondary. The terms "references" and "cross references" in this report relate to the secondary constructs.

Of course, any system of assigning measures to constructs is imperfect since it becomes necessary to choose between having an immense miscellaneous category or doing some "forcing" of tests into constructs which they are only partly related to. The latter course was chosen for these tabulations; consequently, the rich variety of available tests may not be immediately apparent from a cursory examination of the tables. The discussion of content areas will attempt, therefore, to highlight the variations that are not immediately obvious from the tabular data.

As indicated in section 1, attempts will next be made to "store" all information about individual tests in an easily retrievable form, to provide for a method for future updating of the system, and to carry out further analyses with respect to the body of existing instruments.

### 3. General conclusions

### Results

The results of the test search are presented in Tables 1 through 4 and Appendix A. Table 2 shows the number of tests by category and construct, the number of tests cross-referenced to each construct, and the total number of measures bearing on each construct, both primary and secondary.

Table 3 shows the number of instruments by category and construct, and by age or grade level of reported appropriateness. Table 4 provides information on the availability of reliability, validity, and normative data; and Appendix A provides instrument titles by category and construct. This final table provides access from category and construct to the separate test annotations. Table 1 aggregates the data across measures in a somewhat different way that is useful for the following discussion.

### Discussion

The ten categories of measures are ordered in Table 1. Some readers may be surprised by the rankings by number of measures. For example, measures of "Ability to Cope with Personal-Social Demands" are the most numerous in spite of the frequent suggestion that they are largely unavailable. However, the number of direct measures and/or ancillary (referenced) measures should not be considered as an entirely adequate index of the availability of satisfactory measurement within a category, or for a construct. There are several reasons for this:

First, the categories used obviously differ in the extent of their multidimensionality. Using the same example, we note that there are more constructs pertaining to the "Personal-Social" category than to any other. The reader is cautioned to consider specific constructs with the same realization. "Attitudes, Social" and "Personality Adjustment" clearly include numbers of dimensions for which the researcher or educator may want specific indices. "Vocabulary," on the other hand, is accepted as relatively unidimensional.

Second, different categories and/or constructs seem to involve different problems in establishing validity and reliability. For example, behaviors indicative of maximal performance are more easily sampled and observed than those indicative of typical performance. In addition, the contextual constraints on maximal performance seem more straightforward and are better known than are those of typical performance.

With regard to reliability, one consideration which differs from construct to construct is that of stability over time. Stability is an integral part of the conceptualizations of certain traits. Variability is similarly integral to the conceptualizations of others. For example, moods are conceived of as variable over time, while intelligence is generally conceived of as relatively stable. Therefore, temporal stability would be a desired characteristic of the former but not of the latter.

Table 4 shows us that, indeed, the variation in availability of reliability and validity data reflects some of the problems mentioned above. For example, validity information is available for 53 percent of the "Aptitude, Intelligence" measures, whereas only 26 percent of the "Personal-Social" measures provide any information of this type.

In spite of these problems, one thing appears relatively clear: measures of the characteristics of the individual learner are more readily available than those of the learning environment or context. This presents an especially acute problem for educational research if that endeavor is perceived as an attempt to understand the system in which both learner and environment (context) interact. Attempts to control or manipulate the dimensions of educational environments have proved largely ineffective because these environments are too numerous and because laboratory manipulations and controls rarely generalize to real situations within the complex system of the educational world. This inability to control the variation of dimensions of environment makes it critical that we measure naturally occurring variation. The need for additional measures of environment appears, therefore, to be acute. In addition, Table 4 reveals a distressing lack of technical information about those measures that do exist; thus the dilemma is compounded. However, note should be taken of Recommendation 1, p. 9.

The second column in Table 1 orders the categories of measures by numbers of ancillary or referenced measures. This ordering largely corresponds with the ordering by numbers of direct measures and therefore supports the generality of the interpretations of both. The most obvious differences in rank are those for "Ability to Cope with Cognitive Demands" and "Family Measures." Ancillary measurement in these two categories is more prevalent than it is in the other categories.

The third through fifth columns of Table 1 present ranks by extent of availability of normative, reliability, and validity information. The ranks appear consistent within these three columns indicating a general tendency to provide technical information or not to. A marked inconsistency between these three columns and the first two columns is noted however, and so the sixth column was developed—the sum of the five rankings, intended as a gross index of the relative adequacy of measurement or of the relative level of attention received by measurement within the ten categories. The grossness of the index must be stressed, and readers may feel that equal weighting of each index (Number of Measures, Number of References, etc.) is somewhat reader is encouraged to try weighting is easily accomplished, and the appeal.

We, on the other hand, find that the simple sum of ranks confirms many of our expectancies. For example, "Aptitude, Intelligence," a venerable category with a long and generally distinguished history,\* appears to have received the most attention or to be the most adequately covered, if you prefer that interpretation. Once again we note that the three categories of environmental measures are distinctly low—the size of the difference between

<sup>\*</sup>Although one also subject to a great amount of controversy and varying interpretation.

"Family Measures" (35) and the next lowest category (29.5) representing an apparent discontinuity in the series of sums. They seem therefore to constitute a neglected group—one which requires immediate and massive attension for the reasons noted above. We should add at this point that their neglect is not seen as an indictment of the efforts of psychometrists to date. Rather the preponderance of person measures reflects the practical sorting and diagnostic functions required by education, in addition to the requirements and historic traditions of educational research.

The indications of available measures summarized by age levels (Table 3) hold very few surprises. For the most part, there are very few instruments appropriate for use with children three years of age and younger. The major exceptions to this are to be found, as would be expected, in the Infant Development (I,D) construct and the main category of Sensory-Motor, Physical (VII). The obvious difficulties in assessment of young children are undoubtedly related to the paucity in numbers of instruments. For example, in light of the limited verbal skills of very young children, it is understandable that no entries appear for two-year-olds-and-under for the construct Self Concept (IV, V).

More specific conclusions will be drawn on the basis of further consideration of Tables 1 through 4 and of the Appendix, and the descriptions of the measures themselves. Report II will embody these conclusions.

### Recommendations

- 1. Other sources of measurement information should be explored for possible additions to this collection. Serious consideration must be given to at least the areas of sociology, anthropology, and economics if the ability to tap variation in the salient dimensions of persons, treatments, and contexts is required. We note, for example, that socioeconomic status is barely represented in the present collection, while the literatures of both sociology and economics contain numerous such measures.
- 2. Measures should be categorized according to a scheme which has additional dimensions and finer categories. Current suggestions should be expanded through further consideration, but we may now propose the following:
  - a. Types of reliability information, as opposed to simple presence or absence
  - b. Types of validity information
  - c. Types of diagnostic information, including considerations of treatment relevance

With respect to reliability, obviously both test-retest stability and internal consistency indices are important factors in considering adequacy of measurement. Undoubtedly, much of the diversity of information concerning internal consistency reflects the fact that choice of a particular method for estimating reliability depends on the kinds of general statements the researcher or test publisher chooses to make.

Pursuit of judgments concerning adequacy of validity information should go beyond the traditional views of concurrent and predictive validity. Population validity, or the generalizability of results across age groups, sex groups, and so forth, must be explored. Ecological validity, or the generalizability of results from one enironment or situation to others, is another important consideration. Task validity, or the generalizability across tasks to a construct, provides one more input for establishing priorities for the generation of a master plan of instrument improvement and development.

Access to instruments by type of diagnostic information appears especially critical at this time. The misuse of labelling is probably widespread and potentially harmful. On the other hand, the creation of sensible diagnostic categories related to differential treatment efficiency is of immense constructive potential.

- 3. We feel that a full construct-by-construct matrix of ancillary measures (cross references) would provide additional insights, and that it should be calculated in the future. This information bears on both the construct validity of the measures in the categories and the viability of the constructs themselves. It is hoped that relationships in the measurement domain will help clarify the conceptual interrelationships implied in our existing system of psychological concepts.
- 4. Computerization of the file will allow access or cross-sorting by any one or combination of existing or future categorizing dimensions. It should also provide an efficient means of updating and expanding the data file.

Auditory Motor Test
SEE Hearing & Auditory Perception

Burk's Behavior Rating Scale for Organic Brain Dysfunction SEE Behavior Rating Scales

Elizur Test of Psycho-Organicity: Children & Adults SEE Disabilities, Learning

Environmental Sounds--Labelling Test SEE Hearing & Auditory Perception

Environmental Sounds-Picture Identification SEE Hearing & Auditory Perception

Familiar Words Test - Repetition
SEE Hearing and Auditory Perception

Five-Task Test SEE Motor Skills

Phoneme Test SEE Phonics

Slosson Damage Coordination - SDCT for Children and Adults SEE Sensory Motor

Tack Forms Test SEE Motor Skills

Texture Test
SEE Tactile Discrimination

Word Picture Identification Test SEE Hearing and Auditory Perception

# Disabilities, Learning

Ahr's Individual Development Survey SEE School Readiness Battery

Chicago Non Verbal Examination SEE Aptitude, Nonverbal

Functional Readiness Questionnaire for School & College Students SEE Reading, Diagnostic

Johns Hopkins Perceptual Test
SEE Intelligence, Individually Administered

MKM Monocular & Binocular Reading Test SEE Vision & Visual Perception

Left-Right Discrimination Test SEE Sensory-Motor Skills, Combined

Object-Sort Task
SEE Concept Formation

Observation of Symptons that May Indicate a Hearing Problem SEE Hearing & Auditory Perception

Observation of Symptoms that May Indicate a Visual Problem SEE Vision & Visual Perception

Purdue Perceptual-Motor Survey
SEE Sensory-Motor Skills, Combined

Screening Tests for Identifying Children with Specific Language Disability SEE Language Function

Van Riper Test of Laterality SEE Laterality

#### Handwriting

Durrell Analysis of Reading Difficulty: New Edition SEE Reading, Diagnostic

## Hearing & Auditory Perception

Pre-tests of Vision, Hearing & Motor Coordination, Pre-Primary, Primary, SEE Learning Disabilities

Robbins Speech Sound Discrimination & Verbal Imagery Type Test SEE Sinsory-Motor Skills, Combined

Screening Test for the Assignment of Remedial Treatments (START) SEE School Readiness Battery

Slingerland Screening Tests for Identifying Children with Specified Language Disability
SEE Sensory-Motor Skills, Combined

Speech Battery
SEE Articulation

Test of Listening Accuracy in Children SEE Listening Skills

#### Laterality

Ayres Space Test
SEE Disabilities, Learning

Concepts of Left & Right SEE Piagetian Measures

Purdue Perceptual-Motor Survey
SEE Sensory-Motor Skills, Combined

Southern California Kinesthesia & Tactile Perception Test SEE Sensory-Motor Skills, Combined

A Standardized Road-Map Test of Direction Sense SEE Disabilities, Learning

#### Motor Skills

AAHPER-Kennedy Foundation Special Fitness Test for the Mentally Retarded SEE Physical Fitness

CAHPER Fitness-Performance Test SEE Physical Fitness

Communicative Evaluation Chart from Infancy to 5 yrs. SEE Language Function

Draw-A-Scene Test
SEE Personality Adjustment, Projective Measures

Oseretsky Tests of Motor Proficiency SEE Sensory-Motor Skills, Combined

## Motor Skills (cont.)

Physical Fitness Tests
SEE Health Record and Report Forms

Primary Progress Assessment Chart of Social Development SEE Personality Adjustment, Projective Measures

Progress Assessment Chart of Social Development SEE Social Competency

Seguin-Goddard Formboard
SEE Aptitude, Nonverbal

Southern California Motor Accuracy Test SEE Sensory-Motor Skills, Combined

## Physical Fitness

Physical Fitness Tests
SEE Health Record & Report Forms

Skill Tests for Pedal Pushers SEE Motor Skills

Wetzel Grid Charts: Grid for Evaluating Physical Fitness SEE Health Record

#### Sensory-Motor Skills, Combined

Albert Einstein Scales of Sensori-Motor Development SEE Infant Development Battery

Auditory Motor Test
SEE Hearing & Auditory Perception

Ayres Space Test
SEE Disability, Learning

Communicative Evaluation Chart from Infancy to 5 Yrs.
SEE Language Function

Gesell Developmental Schedules SEE Social Competency

Harris Tests of Lateral Dominance SEE Laterality

Initial Learning Assessment SEE Achievement Battery

Inventory of Réadiness Skills SEE School Readiness Battery

# Sensory-Motor Skills, Combined (cont.)

Lincoln-Oseretsky Motor Development Scale SEE Motor Skills

Preschool & Kindergarten Performance Profile SEE Aptitude, Achievement Battery

Pre-tests of Vision, Hearing, & Motor Coordination, Pre-Primary, Primary SEE Disabilities, Learning

Right-Lift Discimination
SEE Spatial & Perceptual Relations

Van Riper Test of Laterality SEE Laterality

Vane Kindergarten Test (VKT) SEE School Readiness Battery

# Spatial & Perceptual Relations

Albert Einstein Scales of Sensori-Motor Development SEE Infant Development Battery

Ayres Space Test
SEE Disabilities, Learning

Construction of a Projective Straight Line SEE Piagetian Measures

Coordination of Perspectives SEE Piagetian Measures

Dennis Visual Perception Scale SEE Vision & Visual Perception

Localization of Topographical Positions SEE Piagetian Measures

Sequin-Goddard Formboard SEE Aptitude, Nonverbal

# Tactile Discrimination

Roughness Discrimination Test SEE Braille

# Vision & Visual Perception

Audi or Perception Test Auditory Word Discrimination Test; Visual Discrimination SEE Hearing & Auditory Perception

Ayres Space Test SEE Disabilities, Learning

Bimodal Reaction Time Test SEE Hearing & Auditory Perception

Continuous Performance Test - Visual SEE Brain Damaged

Fixation Time SEE Attention

Johns Hopkins Perceptual Test SEE Intelligence, Individually Administered

Modality Preference Test
SEE Hearing & Auditory Perception

Moore Eye-Hand Coordination & Color-Matching Test SEE Sensory-Motor Skills, Combined

Progressive Matrices SEE Cognitive Styles

Screening Test for the Assignment of Remedial Treatment (START) SEE School Readiness Battery

Serial Learning Tasks: Auditory & Visual SEE Hearing and Auditory Perception

Slingerland Screening Tests for Identifying Children with Specified Language Disability
SEE Sensory-Motor Skills, Combined

Synthesis of Visually Perceived Forms SEE Brain Damage

Visual Discrimination Test - Object Test SEE Reading Readiness

## Construct

### A. Arithmetic

A.C.E.R. Lower Grades

American School Arithmetic Readiness Test

Arithmetic Progress Test

Arithmetic Tests for New York State Elementary Schools: Beginning G:

B.C. Arithmetic Computation III- IV

Bobbs-Merrill Arithmetic Achievement Tests

Buckingham Scale for Problems in Arithmetic

Contemporary Mathematics Test: Lower Elementary Level

Dominion Survey Test of Arithmetic Fundamentals

Emporia Elementary Arithmetic Test

Emporia Primary Arithmetic Test

Essential Mechanical Arithmetic Tests

4 C Numbers Tests

Graded Arithmetic - Mathematics Test

Head Start Arithmetic Test

Instructional Objectives Exchange - Objective

Leicester Number Test

MacLatchy Test of the Preschool Child's Familiarity with Measurement

Mathematics Attainment Test A and B

Mechanical Arithmetic Test, 2A & 2B

Modern Mathematics Supplement to the Iowa Tests & Basic Skills

National Achievement Tests: Arithmetic Fundamentals

National Achievement Tests: Arithmetic Reasoning

National Achievement Tests: Arithmetic Test (Fundamentals & Reasoning

Number Facility Scale

Numeral Name Inventory

Pacific Number Test (PNT)

Test of Basic Arithmetic Skills - Primary Level

Quantity Matching Inventory - 1/Mathematics, Set A: Experimental Version 1971

Quantity Matching Inventory - 1/Mathematics

Relational Concepts Inventory/Pre-Math

Revised Southend Attainment Test in Mechanical Arithmetic

SRA Greater Cleveland Mathematics Tests: Developmental Edition (GCMT)

Seeing Through Arithmetic Tests, Grades 1, 2

Seeing Through Arithmetic Tests, Grade 3-6

Sequentially Scaled Achievement Test

Set Matching Inventory - Math

Shea Arithmetic Essentials Test

Southend Attainment Test in Mechanical Arithmetic

Speed & Diagnostic Tests of Arithmetic - Set A

Staffordshire Arithmetic Test

Supplementary Computation Exercises

Surrey Infant Number Test (SY I)

A Test of Arithmetic Principles - Elementary Form

A Test of Understanding of Selected Properties of a Number System: Primary Form

Tests in the Fundamentals of Arithmetic

Tests of Number Facts

The Wilson Inventory of Diagnostic Tests in Arithmetic

Wisconsin Contemporary Test of Elementary Mathematics

# B. Arithmetic - Diagnostic

Buswell-John Diagnostic Test for Fundamental Processes in Arithmetic

Diagnostic Fractions Test 3

Diagnostic Number Tests

Diagnostic Tests & Self Helps in Arithmetic

Dominion Diagnostic Tests in Arithmetic Fundamentals

Key Math Diagnostic Arithmetic

Modern Math Diagnostic Test Sheets

Ohio Diagnostic Arithmetic Test, Level 1

Schonell Diagnostic Arithmetic Tests

Stanford Diagnostic Arithmetic Test Level 1

## C. Art

Tests in Fundamental Abilities of Visual Art

## D. Economics

Primary Economics Test

Experience With Money Test

Financial Knowledge Test

#### E. English

Cotswold Junior English Ability Test

English Progress Test A

English Progress Test A2

English Progress Test B2

Hoyum-Sanders Elementary English Test, Test I(1st sem.) II (2nd sem.)

National Achievement Tests: English Test Gr. 3-6 (Short Form)

National Achievement Tests: English Test for Gr. 3-8

# F. General Knowledge

The TAMA General Knowledge

Probst Range of Information Test

## G. <u>Heal</u>th Knowledge

A2 Health Test

Bicycle Safety Information Test

Dental Health Practices Inventory

Five-Point Rating Scale for the Young Trainable Child

Health and Safety Education Test

Health Behavior Inventory: Elementary Level

Health Test

Instructional Objectives Exchange: Objective Collection in Health

Kindergarten Health Check for Parents

National Achievement Tests, Health and Safety Education

School Safety Education Checklist

#### H. Music

Drake Musical Aptitude Tests: Second Edition

Instructional Objectives Exchange: Objective Collection in Music

Knuth Achievement Tests in Music

Measures of Musical Abilities

Music Achievement Tests: Test I

What Instrument Should I Play Quiz

Wing Standardised Tests of Musical Intelligence

## I. Religion

Bible Knowledge Test

Concordia PBK Inventory: An Inventory of Responses in Religion Analyzing Consistency Between Practice, Belief & Knowledge

# I. Science

Hunter Science Aptitude Test

Relational Concepts Inventory/Pre-Science

# J. Social Sciences

Interview Schedule

Primary Social Studies Test

National Achievement Tests: History and Civics Test

National Achievement Tests: Geography (Grades 3-6)

Instructional Objectives Exchange - 6 Objective Collection in Social Sciences (Geography)

#### Cross References

The following instruments bear to some degree upon the preceeding constructs, but their major emphases lie elsewhere, as indicated.

Mischel Delayed Reward Questions

#### Appendix B

# Guide to the Separate Test Listings

The information on the individual measures is compiled in separate looseleaf notebooks, with a completed form like that shown on the opposite page for each measure. Most of the numbered headings for information are self-explanatory but note should be taken of the meanings of the following:

SECONDARY CONSTRUCTS—other constructs under which the measure is cross—referenced

- Source--publisher or private source from which the measure can be obtained
- 6. Range--age or grade range for which measure is designed
- 7. Special groups—any special characteristics of population for whom measure is designed (e.g., Spanish-speaking, cerebral palsied)
- Instrument type--refers to such types as group test, interview, questionnaire and such variations as multiple choice, free response
- Admin. Qual. -- the kinds of training and/or qualifications those who administer the measure should have
- 18. Manual--indication of availability

The tests are classified by primary construct in the notebooks. However, they are also accompanied by an alphabetical index of instrument

PRIMARY CONSTRUCT	SECONDARY CONSTRUCTS
