ABSTRACT .

Designed as an overview of the 1979 and 1980 Illinois Inventory of Educational Progress (IIEP) in fourth, eighth, and eleventh grade reading, this report presents the results for each grade level along with performance comparisons between years and topic areas (using sources of information and reading in the social sciences, literature, and the sciences). Section one of the report discusses the purpose and rationale of the assessment and briefly summarizes the findings. Section two, the bulk of the report, contains an analysis of each of the test items in the assessment at all three grade levels, followed by a summary of the overall observations of the reading panel interpreting the assessment. Section three offers general observations and future considerations gleaned from the results of the assessment. Appendixes contain six tables displaying teacher opinions related to the test items (degree of exposure in class, importance of mastery, and degree of difficulty) and a sample of the teacher survey form. Reading Report Results of the 1979 and 1980

Results of the 1979 and 1980
ILLINOIS INVENTORY OF EDUCATIONAL PROGRESS

This report is designed to provide an overview of the 1979 and 1980 Illinois Inventory of Educational Progress (IIEP) in fourth, eight and eleventh grade reading. The results for each grade level are presented along with performance comparisons between years and topic areas. It is hoped that this information will help in curricular development and instruction in Illinois schools.

While many state staff members contributed to the preparation of this report, I would like to acknowledge the efforts of Carmen Woods Chapman as the main writer. Questions concerning this report may be addressed to her or to Thomas Kerins, Manager of the Program Evaluation and Assessment Section of the Department of Planning, Research and Evaluation.

Purpose

The Illinois Inventory of Educational Progress (IIEP) is a systematic effort by the Illinois State Board of Education to collect information on the educational achievement of Illinois students in certain areas and to make that information available to educational decision makers.

.The three goals of the IIEP are:

- 1) to make available relevant, reliable, and valid data on the educational attainments of Illinois students;
- 2) to identify any trends (growth, stability, or decline) in educational attainments which occur over time; and
- 3) to publish results of the research conducted in connection with the IIEP:

Student Selection

A random sample with two sampling stages is used to select those students attending Illinois public schools who will participate.

First, schools, throughout the state are chosen randomly. A sample of fourth, eighth, and eleventh graders is then randomly selected from lists of eligible students submitted by schools for participation. These grade levels are selected to correspond roughly with the end of the primary; elementary, and secondary levels of education.

Since the lIEP is geared toward determining how groups of Illinois students perform on given tasks, no individual student, teacher, school, or district is identified in any reports of the results.

Type of Test

The IIEP is designed as a domain referenced test in which the items are selected to measure one area of subject matter. In the reading test, the items are used assess the level of comprehension and reading competence in topical areas for Illinois students as a group.

The IIEP can also be used as a norm referenced test. A school district can administer the test to their students and compare their overall performance to the state wide results.

In addition, individual IIEP items can be used to construct a criterian referenced test. The items can be matched to local curriculum objectives and standards and included with additional questions to form a test.

The IIEP is not designed nor should it be used to diagnose or evaluate the strengths and weaknesses of individual students. Aggregate results are the only reliable and valid data which can be used.

Subject Areas

The IIEP has been in existence since 1976. A number of subject areas have been assessed, for example, reading, mathematics, science, citizenship, energy and nutrition, as well as student attitudes about themselves and education in general.

Baseline data is collected during the first year that any subject area is assessed. For each succeeding year that a subject area is reassessed, comparisons can be made concerning student performance on specific objectives, and any growth or decline in achievement can be noted.

6

Section I

Introduction to the 1979-80 IIEP Reading Report

Fourth, eighth, and eleventh grade students were tested by the Illinois Inventory of Educational Progress (IIEP) in the spring of 1979 and 1980 in the area of reading. This report includes analyses of student performance by grade level in general reading topic areas and various levels of comprehension for both 1979 and 1980.

Reading educators representing elementary, secondary, and college-level areas formed a panel which served in an advisory and consulting role to State Board staff in establishing the framework for, both the 1979 and 1980 reading tests. Upon completion of the assessments and the compilation of the statistical data, the committee was asked to comment and analyze the results which form the basis for both curricular and item-level discussions which follow.

In addition to the consultants' suggestions, a teacher survey, administered along with the test, sought to validate the test, supply additional perspective on the results, and provide a possible standard of performance that could be used to compare results of future tests..

A teacher from each participating school was asked to determine four things for each test item: (1) whether students had been exposed to the subject material; (2) how important the item was in a mastery concept; (3) whether the item was of an appropriate level of difficulty; and (4) the percentage of students that could be expected to answer each item correctly.

The conceptual foundation of the reading assessment is the following set of reading topics.

I. USING SOURCES OF INFORMATION

By definition, sources of information may include schedules; reference materials, such as the dictionary, table of contents, an atlas, and the encyclopedia; advertisements; labels; signs; forms; and applications.

II. SOCIAL SCIENCE

The several major areas in social science are identified as economics, environmental, anthropology/sociology, history, and government. These content areas are representative of the curricular areas commonly emphasized in the public schools of Illingist. Consumer economics, Illinois and U.S. government, and history are state-mandated programs.

III. LITERATURE

Literature is a general category which goes beyond the traditional meaning of the term "literature." The basic criterion for the category is whether the prose material is narrative, "poetic," or story materials (but not expository or content writing). The single statement cloze procedure is generally classified as literature-prose. Straight vecabulary items (which are not asked in context of a passage) are also included in this category.

IV. SCIENCE

Reading in the science area includes physical science, earth science, biology, and health topics.

Reading Abilities

- 1. Literal comprehension the ability to recognize or recall ideas, information, and happenings that are explicitly stated. It requires selection of a correct response on the basis of word analysis, word meaning, syntactic relationship, or any combination of these. Literal comprehension involves only one step; the reader sees the word and recognizes its meaning. Recognition of the meaning of difficult vocabulary is literal comprehension.
- 2. Inferential comprehension the ability to synthesize the literal content of a selection, personal knowledge, intuition, and imagination as a basis for conjecture or hypotheses. It involves the mediation of an extra step to identify the appropriate implications. At least two steps are necessary. The reader must understand the literal meaning of the words; the reader must also perceive that there are connotations, nuances, or implications beyond a literal interpretation. In reading passages, clues are provided to help the reader construct the necessary mediating symbol for arrival at the appropriate conclusion.
- 3. Critical comprehension the ability to apply personal, defensible criteria in interpreting and evaluating a passage. This necessitates the creation of one's own criteria and multiple comparisons of these to the passage. It demands at least three steps in addition to the development of one's own standards. The reader must have a set of concepts and values regarding the content of the passage. From this perspective, the reader must judge the author's purpose, truthfulness, fair-mindedness, and bias. The reader must also judge the validity of the passage and be able to describe his her judgment criteria. Finally, the reader's understanding of the passage, criteria for evaluation, and process of application must be reasonable. Although, by definition, critical comprehension cannot be assessed through an objective test, a discussion of this ability level is included to illustrate the total spectrum of reading comprehension as defined by the reading committee.

For purposes of analysis, the assessment results are concentrated in topic areas, ability levels, and teacher opinions on appropriateness, coverage, importance of mastery, and expectations for student performance.

Committee Rationale

In examining the results of two years of reading assessments, it is important to recognize that although similar in design, the two tests are not necessarily equal. It is possible to look and comment on the same items given in both years within each grade level as they relate to a general topic or comprehension area.

In addition to comments from the reading committee, items are also analyzed in terms of teacher evaluation (importance, difficulty, exposure, and estimate of student performance). These analyses will use the following quidelines in describing both discrepancies between teacher estimates and student scores as well as student performance on the same item across years.

- approximating for discrepancies of ten or less percentage points

- higher than/lower than for discrepancies of 11 to 20 points

considerably higher than/lower than for discrepancies of more than 20 points.

These discrepancies guidelines were established because consultants suggested the use of consistent standards. Ten percentage points was used since standard deviations for previously calculated data was usually near .10.

The committee agreed upon the following definition to be used within the framework of their comments and critique of the test results. Reading is the meaningful interpretation of printed or written language symbols. It involves the use of a variety of material types (i.e., novels, poems, short stories, textbooks, directions, notes and letters, application forms, encyclopedias, dictionaries, maps, graphs, etc.) for the accomplishment of an equally diverse set of purposes (i.e., to find out or to learn, to enjoy, to research, to remember, to apply, etc.). Differences in prior knowledge, perspective, cultural background, and experience certainly influence the reading process. However, they do not completely control it because there is probably unambiguous meaning tucked away in most messages.

The committee is of the opinion that there is no exact hierarchy of reading skills which should be introduced for learning. In addition, reading skills are so interrelated that measurement of single items is most difficult. Reading is not recognizing short vowel sounds or consonant digraphs. Reading is comprehending and applying the content, bringing to print one's previous knowledge and experiences, and anticipating events to be presented.

Reading involves (1) perception (recognition); (2) literal comprehension of word, sentence and paragraph meaning; (3) understanding of the implied or interpretive meaning; (4) the appreciation of the reaction to, and the use of the meaning; (5) and finally, the exercise of critical judgment toward the meaning.

Summary of the Findings

Following each grade level analysis, there is a section of "overall comments" which include the following observations.

Fourth grade students perform more accurately (10-11% higher) on literal questions than on inferential ones for both 1979 and 1980. In the topical area of social studies, there is an overall increase in performance from 57% in 1979 to 69% in 1980.

/-7- S

Eighth grade students also show a significant increase (See reading panel guidlines.) in performance in the social studies area from 56% in 1979 to 70% in 1980. In addition, there is a 10% increase on inferential reading items from 1979 (56%) to 1980 (66%).

Eleventh grade students had a mean score of 81% (1979) and 82% (1980) on literal items and 63% (1979) and 72% (1980) on inferential questions. This results in an 18% difference between these types of litems for 1979 and 10% difference in 1980.

It appears that for all grade levels there is a significant difference in performance on literal and inferential questions. There is also an upward trend in almost all subject areas from 1979 to 1980, although, in some cases the increase is more substantial than others. The report contains individual topic discussions by grade level for each group of items designated for the particular area. On the whole, the social studies topic area has the most noticeable increase between 1979 and 1980.

Section II

Item, Subject, Grade Level, and Teacher Survey Results

This section contains an item analysis of each subject area at all three grade levels followed by a summary of the overall observations of the reading panel.

There are six tables which display the teacher survey data which is being described in this section, as well as a sample copy of the survey instrument for both years at the conclusion of the report.

The panel of reading educators was asked to analyze and interpret test results using the test data and teacher survey data. This section gives the data and the panel's comments. Correct answers are underlined. Teacher estimates are abbreviated as Tchr.Est.; student's scores are abbreviated as Stu.Score. Each grade level will be analyzed separately and, where appropriate, the items compared across years.

 D) Saturday 5:00 p.m. 7:30 p.m. Movie, Tarzan

PANEL COMMENTS

These literal items all contain fairly easy vocabulary for 4th grade students, but in slightly different forms (e.g., reading labels, signs, schedules.) The items which were given in both 1979 and 1980 have no discrepancy in student scores but on both the street signs and the schedules, the teacher estimate is considerably different than student performance. Item #108 (1980) concerning the personal schedule is considered to be important to teachers, but 61% said that students had been only minimally exposed to this type of subject matter. In addition, 90% of the teachers thought it was a difficult question. The other items are rated as important to master, and either appropriate or easy for fourth graders. Teachers indicate that students had been or were presently being exposed to the subject matter contained in the items.

Sources of Information - Inferential Items

JOHNSON, MAKING GOOD MONEY IN NEW JOB

Officials at the Plattersville Government Mint awarded a special citation to E. J. Johnson, an ex-prisoner. One official was quoted as saying that the Plattersville Mint now produces the best quality currency of any mint in the nation.

Item # 113(1980)

1980

Stu. Score "

Tchr. Est.

. 46%

According to the article, the headline means that:

- Johnson has a new job for which he receives a good salary.
- Johnson makes high quality counterfeit money in his new job.
- Johnson makes high quality legitimate currency in his new job.
- Johnson is a good worker, so he gets a special citation.

Item # 86(1979)

CITY COUNCIL DISCUSSES PROBLEM WITH MAYOR

Last night in a closed-door session, council members met with mayor Frisbee to discuss the problems of traffic tie-ups in downtown Circusville. The meeting, which lasted till 2:00 a.m., resulted in a set of recommendations for changing downtown traffic patterns.

Item #112(1980)

1980

Stu. Score . 34%

Tchr. Est. 52%

According to the article, the HEADLINE means that:

- A) The city council had a problem with the mayor, and they met without the mayor to discuss it.
- B) The city council met with the mayor to discuss a problem of mutual interest.
- The city council held a meeting which lasted until 2:00 a.m. C)
- D) Traffic will soon be speeding along in Circusville.

Although the teacher estimates are not particularly high, the student scores on two of the three items are 18-21% lower than the predictions. Over 86% of the teachers surveyed believe that items 112 and 113 (1980) were difficult and over 37% of them do not feel that fourth grade students have been exposed to this type of material. Panel members suggest that students may have attempted to apply the literal meaning of the words in the headline without referring to the text of the selection.

In reviewing the whole topic of sources of information, only three and five items were asked in 1979 and 1980 respectively. The mean student response for all items is 75% for both years and mean percentage of teacher estimates is 74% for 1979 and 72% for 1980. The discrepancies between student scores and teacher estimates appear on the items which were rated as most difficult and least covered. The committee suggests that the whole area of using reference materials may be one which could be assessed in future years.

Social Science - Literal Items

Would you like to know about the Feast of Flags? It honors the boys of Japan. This feast is held on the fifth day of the fifth month. On that day, the air seems full of fish. Big colored fish fly like flags from tall bamboo poles. The paper fish are many sizes and are usually in the shape of carp.

Item # 98(1979)	»	-		Stu: Score Tchr. Est.	1979 57% 77%	٠

PANEL COMMENTS

On the questions which are asked in 1979, all of the teacher estimates are higher than actual student performance ranging from 11% to 22% difference. Teachers as a group do not think that these questions are particularly difficult, but rather appropriate to measure the skills involved. On the last three items (113, 114, 115), 15% of the teachers indicated that the material has not been covered and the same percentage listed them as difficult.

The panel agreed with the teacher survey in that the questions were not particularly difficult, and students have been exposed to the material.

The comparison across years on the "Feast of Flags" (items 98,99-1979) and "forests," (items 104, 107-1979) items shows that students in 1980 performed from 15% to 20% higher, which the panel feels is a positive trend. The teacher estimates on those 1980 items are much closer to actual student performance.

Social Science - Inferential Items

Life in the big cities can be one-sided. Often there is less chance for people to enjoy nature in the big city. There are not as many green trees, flowers or grassy areas where people can relax.

D) dressing

PANEL COMMENTS

Most of the social science inferential items have 10% higher feacher estimates than student performance scores. The student scores for 1980 are much closer to the teacher estimates. On three of the items (102, 103, 105, 1979), there is more than a 10% increase in student performance from 1979 to 1980.

The committee notes that the scores on the literal questions from the same passage are higher than these inferential ones. Students appear to be able to respond to "main idea" literal questions more accurately. Teacher survey data indicate that while teachers did expect students to do better than they actually did, teachers considered these inferential questions to be more difficult.

In the whole topical area of social science, there are 15 questions in 1979 and 9 in 1980. The mean correct response for students increased from 57% in 1979 to 69% in 1980 which the committee feels is a significant improvement in social studies reading. The mean teacher expectancy, was 71% in 1979 and 67% in 1980 which means that not only did students improve, but they scored much closer to teacher estimates in 1980 than in 1979.

Literature - Literal Items

Once there was a fish named Big Eyes who was tired of swimming. It wanted to get out of the water and walk like other animals do. So, one day without —telling anyone it just jumped out of the water, put on shoes, and took a long walk around the park.

PANEL COMMENTS

The committee feels that it is very difficult to assess the literature topic because of the inclusion of all prose materials which are not specifically assigned to the other topic areas. Some of the "literature/literal" items include simple one blank type sentences (88,89,90) which require vocabulary or simple syntactical knowledge. Students appear to have had problems on #88 and 90(1979) with correct spelling. Teacher estimates range from 14% higher on one to 23% higher on the other with little or no change across years.

Other items which require reading of a short paragraph are simple factual or sequential types of questions. Questions 81, 82, and 83(1979) show a consistent 10% increase from 1979 to 1980 and also exceed teacher expectations. Fourth grade students appear to have improved in answering these types of questions.

Similar improvement across years is also evident in the short American Haiku poem. Student mean percentages were up almost 10% and above teacher expectations on two of the three questions.

In the one more lengthy paragraph about the lie detector, student scores range from 7% to 22% below teacher expectations. The panel feels that although the selection is slightly longer than some of the others in this topic area, the questions are straightforward and easily found within the text. The teacher survey indicates that 85% - 96% of the teachers feel these questions are either easy or appropriate for fourth graders.

<u> Literature - Inferential</u>

A tree had fallen across the road. An army officer was ordering his servant to get the tree out of the way. A stranger came and asked the officer why he did not help his servant. The officer answered, "Why Sir, I am an officer in George Washington's army." The stranger smiled, leaned down and helped the servant, who was tugging at the tree.

The officer was surprised and asked why he lowered himself to help a servant. The stranger answered that all men were created free and equal, and no one has the right to order another about in such a manner. The officer asked the stranger who he was. The stranger answered, "George Washington." The officer said nothing and looked to the ground. The servant gave Washington a friendly smile.

PANEL COMMENTS

On the one passage about George Washington (Items #77, 78, 79, 80-1979), student mean percentage scores are almost exactly the same from 1979 to 1980, but consistently below teacher expectations. Eighty-seven percent of the teachers in the 1980 survey did indicate that the questions were difficult and 34-39% said that students had not been exposed to the material. Interestingly enough, only 3-8% of the teachers in 1979 said that students had not been exposed to the material. This may be some information which needs to be investigated in future surveys.

Overall Literature Topic Area Comments: .

There are a comparable number of literature questions in 1979 (22) and 1980(20). The mean percentage of student responses is 63% for 1979 and 69% for 1980. Teacher expectancy percentages are 71% for 1979 and 67% for 1980. Using the percentage discrepancies listed at the beginning of this selection, it can be concluded that there does not appear to be any differences between years in either teacher estimates or student scores.

Reading Committee members feel that the IIEP needs to assess the students' ability to read literature (prose). Concern is expressed about the lack of questions requiring the student to identify the four elements of fiction: setting, plot, character, and theme, which may be a direction for future assessments.

Science - <u>Literal Items</u>

The five fingers do not all have the same strength. After the thumb, the middle finger is usually the strongest. Next comes the index finger. Scarlet fever begins with fever, chills, headache, and sore throat. A doctor diagnoses the illness as scarlet fever when a characteristic rash erupts on the skin. This rash appears on the neck and chest in three to five days after the onset of the illness and spreads rapidly over the body. Sometimes the skin on the palms of the hands and soles of the feet shreds and flakes. Scarlet fever is usually treated with penicillin and, in severe cases, a convalescent serum. The disease may be accompanied by infections of the ear and throat, inflammation of the kidneys, pneumonia, and inflammation of the heart.

Tchr. Est. 57%

The passage begins by telling us

A) how to take care of scarlet fever.

B) how to keep from getting scarlet fever.

C) that other diseases may accompany scarlet fever.

D) how you look and feel when you get scarlet fever.

PANEL COMMENTS

It is difficult to form general conclusions about a topic area with only three items which are all on the 1980 assessment. On two of the questions, teacher expectancies are 10-13% higher than student scores. Nineteen to 34% of the teachers indicate that this material has not been covered, while 55-76% say that the questions are difficult for fourth graders. About 85% of teachers surveyed believe that these questions measure skills which are "very important" to master.

The committee feels that more questions need to be developed in the general area of science in order to draw conclusions about student performance. On the three questions which were asked, the mean student score is 54% and the teacher expectancy is 61%. Given the the general guidelines of the committee, there is no discrepancy between these mean percentages.

4th Grade Overall Comments

The panel suggests several summary conclusions on the fourth grade assessment. It appears that on the same questions, students did score higher in 1980 than 1979 particularly, in the social studies subject area. Although there is no statistically significant difference between the topic areas and teacher expectations and student performance, it can still be concluded that conceptually there are discrepancies (as defined by the panel) between student performance across years and also between teacher expectations and student performance.

In addition, if a comparison is made by dividing the test into literal and inferential questions, the student mean score for literal items is 65% (25 items) in 1979 and 73% (20 items) in 1980. The teacher expectancies are 73% for 1979 and 71% in 1980 for literal items.

On the 16 inferential questions in 1979, the student score is 56% and 63% for the fourteen items in 1980. The teacher expentancy means are 65% for 1979 and 62% for 1980.

While there is some increase in student performance across years, it is below the guidelines for discrepancy established by the panel. The interesting comparison is between the performance level of students on the literal questions and on the inferential ones. In both years, students score higher on the literal level questions (10-11%). Students appear to perform more accurately on questions where only one step is involved. The teacher expectation means do not have a similar discrepancy.

The purpose of this advertisement is to get you to

A) enjoy camping.

B) enjoy the wildlife.

C) protect the forests.

PANEL COMMENTS

Most of these "literal-source of information" items are fairly straight-forward with short sentences and elementary vocabulary. There are few discrepancies in student mean scores across years. Students scored within or above teacher estimates with the exception of the "TV Guide" items where there is a discrepancy in the 1979 teacher and student scores. Students scored 12-13% higher in 1980 on the two literal items on the TV Guide which could suggest an upward trend.

One comment that the panel members have about the item itself concerns the fact that the programs listed do not seem to be the type watched by 8th graders, though the process of reading the guide is the same regardless of content. Approximately two-thirds of the eighth graders answered the items of the panel suggests that this selection could be updated because most television guides are no longer written this way.

Several observations are made about the "Door County Advertisement" (items 103, 104, 105-1979). Success requires the reading of the total passage before responding to the items. The style of writing is different from preceding passages which are direct statements. The sentences in this passage often begin with dependent clauses or long introductory phrases which make them more difficult to read. The vocabulary of the foils is at times very difficult for this age group:

No greater sea voyage has ever been made than that inspired and 116 Ferdinand Magellan. Even now it is not as thoroughly appreciated as it should be. A whole great ocean with its isles and island groups added to western people's knowledge about the ____117 of the world. Magellan sailed around the world. These were 118 of staggering immensity. But recognition was slow. The 119 of Magellan was of little immediate use to Europe. Even today Magellan's memory is not greatly honored in either Spain or Portugal. His own direct line died out long ago, and the family home at Sabrosa has long since 120. His voyage required tremendous vision, competence, and courage. Thus the name Magellan shall be remembered with honor as long as vision, faith, and unquenchable repolution are 121 on this earth. No one knows where Magellan's bones may lie, but the of his tremendous voyage are still with us.

After a century or so the rocky, rolling hills of south central Pennsylvania again are green with grass and crops. The trees stand on the ridges again and the creek flows clear once more. Only the stone markers and monuments stand as reminders of Gettysburg, the most costly battle ever fought on North American soil.

Gettysburg became more than the name of a Pennsylvania farm town. Gettysburg became the place where the northern flow of the Confederate tide crested at its "high water mark."

Gettysburg became the 123 which resulted in over 51,000 dead, wounded and missing. More than 7,000 young Yanks and Johnny Rebs would never know that they had become 124 statistics in a battle which would be the beginning of the end for the Confederate States of America—the Battle of Gettysburg. At the Gettysburg National Cemetery, only six weeks after the battle, the hastily buried dead of both sides began to be reinterred with 125 befitting their sacrifices. By mid November of the same year, the task had been completed. As was customary, a distinguished speaker was invited to the 126. Edward Everett, the outstanding orator of the time, spoke to the assembled 127 and townspeople for two hours in the finest 128 tradition. But it was ten sentences delivered by the next speaker in about two minutes that have 129 as one of the noblest statements of purpose and dedication ever made. It is now known simply as Lincoln's Gettysburg Address.

The clippers were the fastest sailing ships that ever put to sea. They were built to bring tea from China to England. Tea lost its flavor when stored in a ship for a long time, so the English paid high prices for the fast ships.

When clippers were first built, steamships were slow and clumsy. But by 1850, steamers crossed from New York to England in 11 days, which was three days faster than the clipper record. Clippers carried less cargo than steamers because they were built narrow for speed. Clippers also needed large crews to man all the sails. By the 1870's, steam ruled the waves.

Which of the following appears to be the <u>best purpose</u> for reading the selection?

A) To learn about some of the history of the clipper ships

B) To discover that clipper ships were the fastest sailing ships

C) To discover the beauty of the clippers

D) To be entertained with a story about sailing

Stu. Score 45% Tchr. Est. 65%

According to the selection, in what ways were clippers and steamers alike?

A) They were quite fast.

B) They needed large, crews.

C) They carried large cargos.

D) all of the above

Item #115(1980) Inferential

1980 Stu. Score 60% Tchr. Est. 65%

According to the selection, why didn't steamers take over the sea trade as soon as they were invented?

- A) They had such small crews.
- B) They were not fast enough.

"C) They could not carry tea.

D) They could not travel as far as the clippers.

PANEL COMMENTS

Since there were so few social science inferential questions, the decision was made to put them in with the literal one (items 124-1979, #128-1979, #115-1980). A comparison between these types of items is difficult given the unequal number of questions in the inferential category.

The sentence on fuel economy (items 98-102-1979) does not seem to offer many problems to the students. The vocabulary is fairly simple and almost all student scores are above teacher estimates in both years.

The Magellan item appears to be more difficult given the lower student scores. On items 118, 119, and 120 (1979), teacher estimates are at least 10% higher than student performance. Teachers do indicate that these items are somewhat more difficult. On item 118, 33% of the teachers say it is too difficult, while 26% say the same on item 119 and 13% on item 120. An almost similar percentage of teachers also indicate that eighth grade students have not covered the subject matter called for in the item.

The Gettysburg passage also appears to be somewhat difficult for eighth grade students. In both years, student scores are at least 10% lower than teacher estimates on four of the seven items. Only 11-26% of the teachers in 1979 thought that these items were too difficult for eighth grade students while 70-87% indicated a difficulty level in 1980. In both years, 7-26% said that students have not been exposed to the material.

44

In the social science topic area, there are 19 questions in 1979 and 14 in 1980. The mean student score value is 57% for 1979 and 69% in 1980. This 13 point difference is not statistically significant but it indicates an increase in the performance level within the panel guidelines.

Another observation can be made between the teacher estimates in 1979 and 1980 and the respective student performance levels. The teacher estimate is 71% in 1979 which is 14% higher than the mean student scores. The 1980 teacher estimate is 67% which is only 2% lower than the student performance mean for the same year.

The panel suggests that there does appear to be positive movement within this reading topical area, and it is certainly more compatible with teacher estimates for 1980.

Literature - Literal Items

THE DOOR COUNTY FISH BOIL

108 has it that the Door County fish boil goes back more than a hundred years ago to the Scandanavians who brought the 109 to the early settlements. Then the lumberjacks of the 110 discovering white fish and lake trout plentiful, found it easy to prepare a meal by boiling the fish and potatoes together in a large pot out-of-doors.

Today, the Door County fish boil has become not only a tradition, but a 111 delight. Claims for this fish steak dinner and the ceremony of its preparation are reaching 112 status in some parts of the Great Lakes area. It is so much a part of 113 and culture that tourists from neighboring states make annual pilgrimages to Door County once they've participated in the 114 ceremony. It is claimed that nothing can compare with the pleasures of fish boil, the warmth of 115 and a cool summer evening on the shores of Lake Michigan or Green Bay.

After two weeks of high speed travel we reached Xeno, a small planet whose population, though never before visited by Earthlings, was listed as "friendly" in the Interstellar Gazette. On stepping from our spacecraft, we saw that "friendly" was an understatement. We were immediately surrounded by Frangibles of various colors, mostly pinkish or orange, who held out their "hands" to us. Imagine our surprise when their "hands" actually merged with ours as we tried to shake them!

Then, before we could stop them (How could we have stopped them?) two particularly pink Frangibles simply stepped right into two scientists among our party, who immediately lit up with same pink glow. While occupied in this way, the scientists reported afterwards, they suddenly discovered they "knew" a great deal about Frangibles and life on Xeno.

Apparently Frangibles could take themselves apart atomically and enter right into any other substance. They communicated by thought waves, occasionally merging "heads" for greater clarity. Two Frangibles who were in love with each other would spend most of their time merged into one: they were a bluish-green color unless they were having a lover's quarrel, when they turned gray.

PANEL COMMENTS

As in the case of the 4th grade, this topic area contains a variety of items. Most of them are asking the students to respond to vocabulary questions whether they are in the form of a passage (Door County) or shorter items (88, 89, 90, 91-1979). Students have problems with the word "cult" (item 113-1979) and "mythical" (112-1979) and also choosing the word which has more than one meaning (item 116 and 117-1980). Students scored well below teacher estimates on all of these questions.

The "Fishing" poem also involved vocabularly questions. Students in both years scored in the 90th percentile, which is 8-17% higher than the teacher estimates.

Literature - Inferential Items-

Read the following story and answer the questions on the next page.

After two weeks of high speed travel we reached Xeno, a small planet whose population, though never before visited by Earthlings, was listed as "friendly" in the Interstellar Gazette. On stepping from our spacecraft, we saw that "friendly" was an understatement. We were immediately surrounded by Frangibles of various colors, mostly pinkish or orange, who held out their "hands" to us. Imagine our surprise when their "hands" actually merged with ours as we tried to shake them!

Then, before we could stop them (How could we have stopped them?) two particularly pink Frangibles simply stepped right into two scientists among our:party, who immediately lit up with same pink glow. While occupied in this way, the scientists reported afterwards, they sudianly discovered they "knew" a great deal about Frangibles and life on Xeno.

Apparently Frangibles could take themselves apart atomically and enter right into any other substance. They communicated by thought waves, occasionally merging "heads" for greater clarity. Two Frangibles who were in love with each other would spend most of their time merged into one; they were a bluish-green color unless they were having a lover's quarrel, when they turned gray.

E) to tell you they were asked by the ghosts

Almost seven hundred years ago, King Edward of England bought 450 Easter eggs painted gold and other bright colors. He paid about 18 cents for all of them. Prices have gone way up since then. Easter eggs have been made not only from real eggs. Some of the most beautiful were fancy oval-shaped objects of silver and enamel, colorful stones or glass. Many had ribbons, beads, or feathers on them. Some of the tastiest looking eggs could not be fried or boiled. They were made of chocolate or of sugar-filled cand During the 19th century, candy eggs with a window at one end and tiny scenes inside were given as gifts. In England messages and dates were written on the eggs, and in Scotland children were given hard-boiled eggs as toy's on Easter Sunday.

A) The word will go forth.

B) A new generation is declaring war.

C) The generation coming to power will uphold the American belief in human dignity.

D) Young people of the new generation, now that they have the torch, no longer feel the way their parents did.

PANEL COMMENTS

The inferential literature type of questions generally require slightly longer paragraphs and passages than those with literal questions. There is only one comparison to make between years (The "Xeno-Frangible" passage) For which the student performance level increase is 11% on one item and 14% on the other. The panel sees this as a significant gain.

The teacher estimates are much more compatible with the 1980 scores. In 1979, teacher estimates are 15 percentage points higher than the mean student score on item 135 and 17 percentage points higher on item 133.

The remaining items all had one question following a paragraph. Teacher estimates are higher (by panel guadelines) on two of the five items. The biggest discrepancy is 16% on the Easter Egg item (#118). Sixty-eight percent of the teachers on the 1980 survey indicated that it is a difficult question. The Persian Gulf question has a 15% discrepancy and 67% of the teachers listed it as "difficult."

In the total literature area, there are 17 items on the 1979 test and 20 items on the 1980 one. The mean student score for 1979 is 65% and 72% for 1980. The teacher estimates are 72% for 1979 and 69% in 1980. There does not appear to be any discrepancy between years, even though the student mean score actually increased 7%. Overall, teacher estimates are well within the range of student scores for both years.

8TH GRADE GENERAL COMMENTS

Several tentative conclusions may be made concerning the performance of eighth grade students in relation to teacher expectations, as well as across years. In the literal area, the student mean percentage response for 1979 is 68% and 73% for 1980 and the mean teacher response is 70% for both years. None of these scores suggest any discrepancies until the inferential

questions are compared. In 1979, students scored 56% on the inferential questions, while teachers predicted a 66% level. For 1980, the average student score is 66% and the teacher expectation is 63%. From 1979 to 1980 there is a 10% increase in student scores. There is also a 13% difference in student scores on literal questions and inferential questions in 1979. The 10% discrepancy between teacher expectations (66%) and student scores (56%) also falls within the significance guidelines established by the compittee.

The panel sees the increase across years on the inferential questions as being very positive. At the same time, there is an increase in the total number of inferential questions from 11 to 16. Teachers are certainly more accurate in 1980 than in 1979 in estimating correct student response rate.

Eighth grade subject area performance levels resemble the 4th 'grade distributions. Correct responses to items in the "sources of information" area are higher than the others. Some of this can be attributed to the fact that most of the items in that category are literal questions. Suggestions for futher analyses in future assessments include the addition of more inferential items in order to make more accurate comparisons across subject areas. From the data, the reading panel suggests that the differences in performance levels appears to be the result of more student accuracy with literal questions with little or no differences in the designated subject areas. There is an upward trend in student performance between 1979 and 1980, and teacher expectations are more accurate.

11th GRADE.

For the 11th grade analysis, the literal and inferential items are combined under the general topic areas. The "inferential" questions will be so designated and a discussion encompassing both types of items follows each topical area.

PANEL COMMENTS

For purposes of discussion, the three inferential items in this topic area are also included (#s 75, 76, 93-1980). It appears that eleventh grade students had little difficulty with the literal items. Most of the scores are above 80% with teacher estimates being somewhat lower. Panel members feel that the vocabulary is quite elementary for eleventh graders as is the short sentence structure of the questions. Teachers appear to agree with this conclusion on the survey. There are virtually no differences across years in student performance. There is an 85% mean student response in 1979 and 84% in 1980. Only one item (#102-1979) is below teacher expectations and that is true for both years (77% in 1979 and 75% in 1980).

The last two questions require reading and interpreting the descriptive language in three short newspaper articles. The vocabulary seems appropriate for eleventh graders. It is the task of interpreting and identifying the author's purpose which makes these items more difficult. In item 76, students are required to select the most objective report of the incident, or one not showing bias towards any of the characters described. This appears to have been a more difficult task as shown by the 53% mean.

Amerigo Vespucci was an Italian businessman, scientist and explorer whose name was given to the 128 of the New World early in the sixteenth century. Amerigo Vespucci lived as a contemporary of Christopher Columbus, but unlike Columbus, he believed that the land now known as South America was a newly discovered continent, not the coast of India.

Vespucci's $\underline{129}$ was used to name the New World. Columbus died believing that the New World he helped to discover was really $\underline{130}$.

Until about thirty years ago, the village of Nayon seems to have been a self-sufficient agricultural community with a mixture of native and sixteenth century Spanish customs. Lands were abandoned when too badly eroded. The balance between population and resources allowed a minimum subsistence. A few traders exchanged goods between Quito and the villages in the tropical barrancos, all within a radius of ten miles. Houses had dirt floors, thatched roofs, and pole walls that were sometimes plastered with mud. Guinea pigs ran freely about each house and were the main meat source. Most of the population spoke no Spanish. Men wore long hair and concerned, themselves chiefly with farming.

D) Europe.

C) being an accessory to a crime can result in severe criminal charges.

D) the courts tend to treat accessories with extreme disinterest.

Education plays an important role in both types of economic systems. In a traditional economy, all instruction of the young is done by the parents in the home. In modern societies, teaching is a cooperative effort between the home and the school because there is so much which children must learn. When he or she finishes school, every young adult in a modern society is expected to be able to take a specialized job which may require many complex skills.

D) improved farming methods.

WHAT IS GOVERNMENT?

In general, government is a complicated system organized to administer the laws of a society. Every society has some form of government. Governments are needed to protect people's rights and property. Protection is accomplished by law enforcement. Law is the basis of all forms of government. The differences among types of government are attributable mainly to variation in who has the authority to make laws.

Throughout the world, many different kinds of government can be found. Under a republican form of government, the 138 of the people have the power to make laws. In a monarchy, a king or queen has the power to make laws unless the nation retains a monarch out of tradition and, in actuality, has a democratic form of government, perhaps with a parliament and a prime minister as the chief officer of government. Under a tribal form of government, the chief and a few advisors have the power to make laws governing native residents of a reservation. Leaders of totalitarian governments use 139 to maintain control over the people who have relatively little say in what laws are passed.

In today's world, tribal and true monarchial governments are disappearing. These forms of government are being replaced by either totalitarian dictatorships or by some form of democratic government.

In many cases, 140 tyrants seize power in a time of change promising citizens many luxuries and privileges which cannot be delivered without bloodshed and destruction of society.

ECONOMIC SYSTEMS KEEP US "ALIVE

In observing human life on planet earth, it becomes apparent that life is a continual struggle to exist. One of an individual's chief aids to survival is intelligence, which enables him or her to remember and learn. Gradually people have learned 143 methods for fulfilling their basic needs because it has proven 144 for them to live on earth without making plans for survival. People spend most of their waking hours fulfilling basic needs for food, clothing, shelter, and personal 145. People provide for safety through a system of law enforcement. But they also require an economic system for fulfilling safety needs. People must know; for example, that sufficient food is 146 that they will be able to survive the winter, and that shelter is near.

Looking at human societies we find two major kinds of economic systems. These two major divisions are the primitive economy and the modern economy.

In primitive societies people fulfill their needs mainly by hunting, gathering, and sometimes farming. Primitive people change 147 over the centuries. They do most things the same way their 148 did them a thousand years before. The life 149 of primitive people is relatively short. Their daily life is simple yet very demanding. The wife in a primitive economy often must make all household and personal articles, pots, clothing, and jewelry. The family shelter is made of animal skins or grass. Although some 150 occurs in primitive societies, most people in the tribe still make almost everything they need if it is not readily 151 directly from the environment.

Striking contrasts of primitive economic life appear in modern societies.

One of the most remarkable aspects of modern societies is the existence of 152 change. For example, the America of today is 153 the America of 1900. Today America is much more industrialized. People are healthier because of advances in medicine, and governments are more powerful because of our vast military organizations and atomic weapons.

Many of the comforts enjoyed today have been made possible by job specialization. Modern people fulfill their basic needs by performing a special job 154 money. People then use the earned money to 155 what they need.

The bearded man gave the impression of being old. His tattered clothing, long beard, and sagging shoulders gave an impression of age or despair. He was one of many who had become completely engulfed in gold mining, and although only a novice, gold commanded all of his concentration. By contrast the experienced prospector knew where to look for gold and usually got there first. The novice might spend weeks or months searching in vain. With these people, despair was often disguised as age.

Item #125(1980) Inferential

According to the author of the passage, what happens to a person once he begins searching for gold?

- A) He neglects his health and appearance and ages quickly.
- B) He searches for gold for many years and doesn't find any.
 - C) He resorts to almost any means to keep someone else from getting to the gold first.
 - D) He becomes totally absorbed in his search and cannot give it up.

PANEL COMMENTS

The "Animal Superstition" passage has similar student scores for both years and are above teacher estimates. Student scores for the most part are 10-20% higher in 1979 for the "criminal law" passage (items 131, 132, 133-1979) and "Economic Systems Keep Us Alive."

The "What Is Government?" passage (items 138-142-1979) has three of the five student scores below teacher estimates which the committee suggests may be due to somewhat more difficult vocabulary and the requirement of previous knowledge of the subject. According to the survey, teachers indicate that the material has been covered and that the questions are not particulary difficult.

In the passage on "Human Societies" (items 147-155-1979), there are four questions which are also asked in 1980 and there is over a 10% improvement from 1979. According to the panelists, it is difficult to account for this increase, but students in the 1980 test appear to be able to make better use of the context clues in this passage.

The "Indian artistry" selection (items #117-120 - 1979, 109-112 - 1980) is another example of students scoring well above teacher estimates. Student, mean percentages are 7-9%, 21-23%, 20-24%, and 22-25% higher than what teachers estimated they would do. Approximately two-thirds of the teachers indicated that these questions are difficult, but also that the material in them has been covered.

Items 125 - 126 (1980) require the reader to interpret the central meaning of the passage and choose from several true responses. Eighty percent of the teachers think that these items are difficult, but also very important to master. Less than 4% indicated that this type of material has not been covered.

The mean correct percentage for the 34 social studies items is 64% in 1979 and 78% for the 19 items in 1980. The teacher estimates are 66% and 69% respectively for the two year periods. The increase in the correct response rate, while not statistically significant is 14% and well within the committee's definition of discrepancy. The 1979 response rate of 64% is also more than 10% below the response rate for the other subject areas, but it is in line with teacher estimates (66%) for the year.

PANEL COMMENTS

The area of "literature" contains 14 questions on the 1979 test with a mean student response rate of 79% and 13 questions with a 76% mean in 1980. The teacher expectancy scores are 73% and 71%, respectively.

The fairly simple vocabulary (items 88-90, 1979) does not appear to cause problems for students and the scores are within teacher expectations. In 1980, more difficult vocabulary is introduced (items 122-124, 1980) and the student scores are 53%, 41% and 25%; the last two falling well below teacher expectations. Eighty-six to 94% of the teachers indicated that the vocabulary items are difficult for eleventh grade students but only 13% responded "no coverage" on the material.

The "You Have To Get There" question results are almost the same for students in 1979 and 1980. The scores range from 10%-24% above teacher expectancy scores on five of the six items, and yet there is no indication that teachers felt these were difficult questions.

Panel members suggest that eleventh grade students may need to be challenged with longer passages which may reflect more traditional "literary" content.

Science Items

The creek was already high from melted snow and all the rain that had recently fallen. If there is another $\underline{96}$, the swinging bridge could wash away.

Ambergris is a smelly, waxy substance produced by the sperm whale and used in making perfumes. The complete story of ambergris is not known. However, most scientists believe that the sperm whale produces ambergris within its digestive tract when it is 134, and that this illness is in some way connected with the whale's diet of squids. Ambergris is sometimes taken from inside whales after they have been 135 by whalers. Less often, it is found floating in the ocean or lying on the seashore. Usually, only small lumps of ambergris are found, but 136 lumps weighing several hundred pounds are obtained. These large masses are worth thousands of dollars.

PANEL COMMENTS

The are only a few items in this area (11 in 1979 and 5 in 1980) to an e. Some caution needs to be exercised in relation to comparing the 73% mean score in 1979 to the 87% in 1980 because there is only one passage in 1980. On that particular the ("Center for Disease Control"), student scores are almost exactly the same and four out of five were higher than teacher expectations. The vocabulary in the passage is not particularly technical and three of the questions are literal.

The other passage, "Ambergris" was only used in 1979 and students scored above teacher estimates except for the last question, which is somewhat confusing in the choice of foils.

The reading panel suggests that if schence is to be one of the topic areas tested, more items need to be developed which may reflect high school reading requirements.

OVERALL 11TH GRADE COMMENTS

The eleventh grade IIEP for both 1979 and 1980 is perhaps the most comprehensive of all the three levels, covering in considerably greater depth life reading skills, social science reading, and science reading. There are 42 literal comprehension questions in the 1979 test with a mean student score of 81% and 37 literal items in 1980 with a mean score of 82%. The teacher expectancies are much farther apart with 87% in 1979 and 73% in 1980. The reading panel does not see an apparent reason for the lower teacher score estimates in 1980 in terms of material covered or the difficulty of the questions.

Eleventh grade students scored higher on the literal items than the inferential ones (18% higher in 1979 and 10% higher in 1980), but also appear to have improved from 1979 to 1980. On the 29 inferential questions, students scored about 63% in 1979 and 72% on the 17 items in 1980 with teacher expectancies being approximately the same.

Although the content and number of items are not the same from year to year or category to category, the panel agrees that literal questions have an over-all higher correct response rate than inferential ones and that the eleventh grade students in 1980 did somewhat better on inferential items. They also did considerably better on the social science reading questions (both literal and inferential).

. Section III General Observations and Future Considerations

Panelists feel that since reading is not generally taught in high schools, with the exception of remedial courses, reading skills which are developmental for high school students may need to be emphasized through all the subject areas. Vocabulary development, such as word recognition through phonetic analysis, structural analysis, use of context, development of sight recognition, and use of the dictionary as an aid to word recognition, could be planned systematically in all basic courses. Word meanings may need to be emphasized on a mastery learning basis prior to assigning the reading from which the vocabulary has been derived. Frequent and thorough review of vocabulary is essential. The consultants feel that one of the contributing factors to declining verbal scores is neglect of vocabulary instruction.

The committee suggests that students need to be taught how to use textbooks effectively. Specific suggestions for instruction include: how authors indicate the important ideas; how the parts of a textbook facilitate its use as a reference tool; how and when to use the glossary, index, table of contents, etc.; how to read charts, maps, diagrams, schedules, etc.; how to use the summaries and reviews in the textbook; how to take notes on reading materials; how to study for different kinds of examinations.

Consultants feel that questions on factual materials need to be designed to cause the student to organize, using several concepts developed in a chapter or unit. Apparently, many students find it difficult to answer any question that goes beyond the level of short-term memory which requires only a single piece of information. Instruction in higher levels of comprehension (inferential, evaluative, and critical reading) may be needed.

Reading consultants suggest that school authorities may be well-advised NOT to fall into the practice of adopting textbooks which are written several years below grade level for use with average and above-average readers. It is a difficult challenge to handle adequately, but secondary school personnel could move in the direction of differentiated assignments using a multi-textbook approach.

Secondary teachers may benefit from thorough, planned inservice in developmental reading for high school students. Many teachers have come to view reading as a remedial subject for disabled students. This perception may need to be changed. The reading panel feels that one of the greatest unmet challenges instructional leaders face is that of helping teachers effectively teach heterogeneously grouped classes with wide ranges of reading ability.

By limiting the subject areas, expanding the length of passages, checking readability of items, and asking more inferential and interpretive types of reading comprehension questions, evaluators will be able to continue to improve upon the foundation which has been built with the state assessment.
