ABSTRACT

This report summarizes the activities and impact of the Alabama Information and Development System (AIDS), an educational resource project funded from 1976 to 1981 by a federal Dissemination Capacity-Building Grant. Computerized literature searches, collection of information on local educational programs in an Alabama Resource File, coordination of a network of local linkers for dissemination of educational information, and other AIDS services to the State Department of Education, intermediate agencies, and local school systems are identified in the introduction. Seven additional report sections comprise: (1) a summary of components and activities of the AIDS program, organized in relation to 10 program objectives; (2) a collection of charts listing AIDS accomplishments; (3) a discussion of institutionalization of AIDS and its future state funding; (4) an examination of AIDS involvement in promoting educational equity; (5) a description of AIDS impact on Alabama's educational system; (6) a presentation of user responses to AIDS services, and general guidelines related to dissemination of information on educational resources; and (7) a collection of six-exhibits including forms, maps, questionnaires, and survey results from the AIDS program. Twenty tables and 27 maps and charts are provided in the body of the report. (ESR)

Introduction

The Alabama Information and Development System (AIDS) was established in July, 1976, with an NIE State Dissemination Capacity Building Grant for the purpose of improving the SEA's capacity and abilaty to provide information which would result in sustained improvement in the schools of Alabama. Continuation funding by NIE, SEA support considerably in excess of the original commitment, successful soligitation, coordination and maximum utilization of other resources, plus the effectiveness and diligence of an exceptionally competent, productive and highly committed staff have been major factors contributing to Project success. Continuous self-evaluation, careful analysis of all facets of the operation, systematic planning, efficient management and staff utilization, sincerely solicited feedback and input from clients and linkers have characterized the AIDS operation throughout its existence. The synergistic effect of this approach enabled AIDS to provide a wide array of services on a far greater scale than anyone envisioned when the original proposal was written. By maximizing resources and optimizing services, AIDS has been able to impact positively the quality of educational experiences for students in Alabama schools.

AIDS major goal, providing current, relevant information that will be used in problem solving and improvement efforts, is being achieved by focusing upon the following principal elements: (1) the resource center, (2) linkage and (3) leadership. Over the five-year period of its operation, AIDS has developed and continues to expand an information center which is a unique resource in the Alabama SDE. Its services and capabilities include:

- a. An average of 3,000 individual information requests per year from elementary and secondary educators, IHES, SDE personnel, State Board of Education members, legislators, Governor's office, and other State agencies. Most of the responses involve a computerized literature search by which AIDS is able to access the output of the 16 national ERIC clearinghouses as well as the more than 100 information banks in the DIALOG* information system (e.g., Legal Resources Index, American Business Information, National Newspaper Index, Child Abuse and Neglect, etc.).
- b. Develops linkages with other national sources of information through regular contact and utilization of materials and human resources from national educational labs and research centers. Examples of national and regional sources are: Education Commission of the States, Far West Laboratory for Educational Research and Development, Appalachia Educational Laboratory (AEL) and the National Center for Research in Vocational Education.
- c. Encourages the use of current, relevant information at the local level by establishing a system of "local linkers" within Alabama. There are currently 52 school systems in which one or more local educators have been trained to inform personnel from their systems regarding AIDS' services and to assist them in identifying information needs and transmitting requests to AIDS.
- d. Strives to translate research findings into educational practice through such functions as serving as the State Facilitator in Alabama for the National Diffusion Network (NDN) and working cooperatively with AEL and other agencies which seek more effective ways for disseminating r & d products.
- e. Provides awareness of alternative programs and solutions to needs identified by local educators by conducting awareness workshops at which relevant research findings and exemplary programs are presented. AIDS also assists LEAs in follow-up efforts to implement appropriate programs.
 - f. Shares the educational successes of individuals and agencies by identifying outstanding local programs and practices and incorporating them into the Alabama Resource File which, in turn, is referenced when responding to requests for current information from local educators.)
 - g. Responds to federal requests for proposals (RFPs)*related to improving the capacity of state and local agencies to
 - *DIALOG, operated by Lockheed Information Systems, Palo Alto, California, provides immediate access to more than 35,000,000 units of information.

utilize information. In the past five years, AIDS staff has developed 12 competitive proposals, all of which have been funded, for a total of \$957,389. AIDS also conducts or facilitates developmental projects. An example of a current effort is Project CAUSE, a collaborative venture of two large urban school systems (Birmingham and Mobile County) toward identifying common needs which can be addressed through sharing of locally developed programs and practices and the application of research and development products.

- h. Cooperates with other SDE programs in promoting local school improvements. AIDS has provided information and assistance to support Title I and IV-C programs, vocational education curriculum development, research-based module development for the leadership management program, career education projects, etc.
- i. Attempts to keep abreast of emerging trends by designing and conducting needs-sensing surveys and evaluation studies.

The AIDS office has the potential for providing expanded, more sophisticated and much needed services. Functions which the AIDS staff recognize as needing emphasis and which should be expanded if resources permit include the following:

a. Expansion of Resource Center

Services to educators would be improved if the physical resources of AIDS were expanded to include: (a) a limited professional library of selected periodicals which are referenced most frequently by users, (b) additions to the Alabama Resource File such as a human resource file, a complete cataloging of SDE publications, and a catalog of locally developed workshops designed for in-service programs, and (c) microfilming capability for cost-effective dissemination of certain products and materials.

b. Intra-departmental Linkages

AIDS user data show that SDE employees, with a few notable exceptions, utilize the AIDS resource center at an exceedingly modest rate. Every professional staff member in the SDE should be using the services available through AIDS to improve their job performance and to provide more effective support to local educators. Improved internal linkages may enable SDE staff to take advantage of the national perspective which the AIDS information services can provide for planning and decision making.

c. Proactive Dissemination

Specific target audiences should be identified and their opinions and information needs ascertained. Well-designed survey research methodology should be used to conduct needs-sensing surveys of these populations. Findings would enable the AIDS staff to assemble research findings and prepare information packets, training modules, etc., to assist planners in initiating programs which address emerging issues and concerns. Pilot programs could be conducted by AIDS staff and others to test new research findings as they are implemented in Alabama schools.

d. Transformation and Publication

Much needs to be done in transforming and synthesizing numerous and sometimes voluminous research reports into information useful to practitioners. A variety of publication formats and media should be utilized to impact specific categories of educators.

e. Local Linker Network

The developmental phase of AIDS required AIDS staff members to assume the role of making local educators aware of AIDS' services. During the next phase of AIDS' operation, much of the work at the local level would be performed through a more extensive network of better trained local linkers with increased responsibilities. Greater emphasis will be upon use of information for local planning, decision making and instructional improvement.

f. Research and Planning

AIDS personnel have the qualifications, experience and capability to design and conduct high quality action research to generate information for departmental planning. A close link between research and planning would be achieved through AIDS.

g. Evaluation and Feedback .

AIDS has continually evaluated its activities in accordance with the requirements of the NIE grant. More comprehensive evaluations need to be designed which examine, on a departmental basis, how various data are gathered and processed and how all information is disseminated and utilized within the department and throughout the state.

Recent funding reductions and subsequent reordering of priorities at both the Federal and State level are reason for concern regarding the continuation and expansion of services provided by AIDS. Although the

problems are real and serious, they are not insurmountable. In fact, despite the almost daily suffusion of "bad news," members of the AIDS staff are cautiously optimistic that the majority of AIDS services will be provided, if only on a year-to-year basis, without NIE funding. However, experience with this Project and the past history of failure of Federally funded programs to survive after Federal funds are no longer available. suggest that it was and is unrealistic to expect that many of the SCBP's will continue to function as originally envisioned without a reasonable amount of permanent Federal support. This discouraging conclusion, unfortunate but well-supported by overwhelming evidence, coupled with the positive impact of the SCBP's compels the AIDS staff to make one final appeal for long-term NIE financial support to the states which have developed an effective dissemination program and wish to continue this valuable service.

A. Major Project Components and Activities

During its five years of existence, AIDS filled a previously existing void within both the SEA itself and the State's educational community-at-large by creating and operating a unified statewide dissemination/diffusion system which has effected improved capacity for change in the State's public schools (K-14).

AÎDS' five-year developmental plan was based on three propositions concerning knowledge utilization and change in educational organizations:

- 1. The success of problem solving and improvement efforts in LEAs is rectly related to the extent to which decisions in these agencies are based on current knowledge.
- Local problem solving and improvement efforts, to be successful, must be collaborative in that basic decision making remains the prerogative of local personnel, but appropriate outside resources must be involved.
- 3. Local problem solving and improvement efforts, to be successful, must take the total organization and its environment into consideration.

AIDS' objectives and correlate activities were developed by reference to these three propositions and other theory-based considerations. AIDS' staff, however, have not been content to rely solely on a rationale developed at a fixed point in time based on the theories, findings and recommendations of those working in other contexts and environments. To create a viable and impactful program for Alabama educators, AIDS' staff have: (1) been ever-sensitive to the unique contextual considerations of the Alabama educational arena, (2) planned and conducted periodic needs sensing as well as feedback/evaluation activities, (3) designed and pursued a number of major intelligence-gathering projects, and (4) attempted to maintain their currency with regard to national issues, trends, and principles in the areas of information dissemination/diffusion, knowledge utilization, and change processes. These specific activities

11

will be reported beneath the objectives to which they are most closely related.

AIDS has made substantial progress toward achievement of each of the ten program objectives contained in the original (1976) project proposal. The project outcomes, in fact, exceed the projected outcomes contained in the original and continuation proposals. While many factors have contributed to the project's success, staff believe the major factor to be the extent to which program services and activities have met the needs of the client groups served. Specific project outcomes, categorized according to program objectives, are presented below. Cumulative effects of the project as well as year-by-year outcomes are presented where appropriate.

Objective 1: Legitimize AIDS within the SDE and establish a permanent dissemination/diffusion unit in the Department.

Legitimization of AIDS within the SDE is evidenced by an everincreasing understanding and acceptance by SDE leadership and staff and

LEA personnel of the role and functions of a dissemination/diffusion unit

Increased requests for services indicate support from LEA leadership.

Cooperative efforts with the SDE's Title IV office have resulted in an
increased number of LEAs submitting project proposals for Title IV
funding that are based on Research and Development findings and/or are
adaptations of nationally-validated programs. Direct State budgetary
support, State contributions in equipment, State-supported computer
services through Auburn University, microfiche reproduction services,
the use of State university and APLS library facilities, the willingness
of both SDE staff and LEA personnel to function in linker roles, AIDS'
placement in the Division of Research and Information Services—all

3

augur well for the long-range existence of AIDS.

Coordination of AIDS' Activities with Ongoing Local School Improvement
Efforts Conducted by Other SDE Units. During Year One, AIDS' training
focus was upon SDE staff; follow-up training sessions for this target
group have been conducted in subsequent project years. Early training
sessions were designed to develop "user capacity" of SDE staff members
themselves as well as to provide a knowledge and competency base that
would enable staff to function as linkers/facilitators between their
clients and AIDS. Continued efforts have been made to reinforce and
update these learnings.

During Years Four and Five, AIDS undertook a number of new initiatives and overtures to other SDE staff. These new initiatives stressed collaborative rather than more cooperative action. That is to say, AIDS has attempted to encourage joint planning, conduct and ownership of a number of activities, rather than just mutual assistance. To date, achievements have been only modest, in part perhaps because this type approach does not characterize bureaucratic action. Examples of collaborative activities pursued are:

(1), working with Division of Instruction education specialists in collaborative preparation, publication and dissemination of information in areas of statewide need as well as in provision of T.A. to clients on request; (2) working with various units. (e.g., Title I, Title IV, career education, community education, staff development, vocational education, leadership and management, special education) in program, improvement efforts via jointly planned/conducted workshops, etc.

AIDS continues its attempts to establish cooperative dissemination/.

diffusion patterns among various units within the SDE. Activities undertaken have promoted understanding, acceptance and support of AIDS' role and functions among the SDE's middle management and field staff as well

as among LEA clients groups served.

AIDS' Assumption of Other Dissemination/Diffusion Activities. Since its inception in 1976, AIDS has been assigned or has assumed major dissemination/diffusion projects in addition to those set forth in the original project proposal. Primary among these was the Alabama Facilitator Project funded by USCE to the Alabama SDE in 1977. The placement of this project in the AIDS office has greatly enhanced the capability of the SDE's dissemination/diffusion efforts as well as AIDS' leadership role in coordinating the overall effort.

Widespread Awareness of AIDS' Existence, Role and Functions. Early intensive awareness efforts among both SDE, LEA, and other client groups have promoted AIDS' legitimization and institutionalization within the SDE. AIDS receives many referrals from the following sources: SDE leadership and staff, university professors and librarians, Alabama Public Library Service and public librarians, professional associations, etc.

This is but one indication of the widespread awareness and acceptance of AIDS' existence and role.

Support from LEA Leadership. AIDS' staff believe the most important indication of AIDS' long-term legitimacy and survival to be the response of primary client groups to services offered by AIDS. This response is reflected in the requests for services (reported in other sections of this document) by individual educators across the State as well as by the active involvement of 65 LEA linkers in the AIDS' local linkage program.

Prospects for the long-range existence of AIDS appear bright despite overall budgetary cuts at both the Federal and State level. Budgetary support, organizational positioning and personnel permanence all lend credence to these prospects.

Budgetary Support. The direct State contributions to AIDS that were projected in the original proposal were exceeded during the second through fourth years of the project as indicated in the table below.

Table 1

STA	TÉ FUNDING,	1976-1980	-	· <u> </u>
	1976-77	1977 - 78	6 78-79	1979-80
State Dollars Projected for AIDS	s16,250	s 17, 280	s55,040	s31,550
State Dollars Allocated to AIDS	16,250	37,150	66,063	95,966
Per Cent Increase in State Support	· •	115%	; 20% ~	/ 18%

This level of State support has been essential to AIDS' delivery of services and also reflects the SDE leadership's commitment to AIDS' continuation.

State funding for the 1981-82 year is even more encouraging and impressive in view of the fact that during the past three years the SDE's total funding from State sources has been reduced by approximately 46 percent. The SDE's 1981-82 budget includes \$225,000 for support of AIDS during the upcoming year.

The above figures do not include the following significant State contributions to AIDS' operation.

(1) Equipment. During the past five years, AIDS has received the great bulk of its equipment needs through inter- or intra-departmental transfer. Included among equipment added since the State's original contribution in 1976 are a Texas Instrument Silent 700 computer terminal, secretarial desks, executive desks, chairs, storage cabinets, desk lamps, filing cabinets, microfiche filing cabinets, an electric calculator, a typewriter, shelving, book cases, etc. All of this has been at no cost to the project.

- AIDS' computerized searching of ERIC files via AU's Quandary system is heavily subsidized. AIDS is charged only \$250/hour CPU time as compared to approximately \$960/hour that would be charged through State government's centralized data processing division. AIDS also receives preferential rate in off-line print charges. In addition, AIDS is not charged at all for continuous on-line access to files, whereas AIDS would currently be subject to a considerable charge were the State government computer system used. This support is particularly impressive in view of the fact that from 60 to 70 percent of the computerized searches conducted by AIDS are run via Quandary.
- with the Retirement Systems of Alabama, AIDS is able to obtain microfiche reproduction at the rate of 40/fiche (cost of materials only). Other agencies have calculated actual cost at a minimum of 180/fiche (including staff time and amortization of equipment). AIDS has had in excess of 10,000 microfiche duplicated by RSA for delivery to clients. This represents a considerable savings to the project.
- Library Facilities. Because the SDE does not maintain a professional library, AIDS was in an initial bind relative to microfiche and journal, retrieval services (both of which were and are viewed as essential to the success and credibility of the program). AIDS has been afforded complete and open access to all library resources at Auburn University (AU), Auburn University at Montgomery (AUM) and the University of Alabama (UA). Because of staff proximity to these three institutions, these have served as literal extensions of AIDS' Resource Center with considerable benefit to the project. These resource connections did not just appear; rather,

AIDS has systematically developed relationships with these and other information centers throughout the State. APLS has made substantial resource contributions to AIDS by helping on both document retrieval as well as in tracking down answers to reference questions. 7

Staff Time of SDE and LEA Personnel. AIDS' success has rested upon the willingness of both SDE staff and LEA personnel to function in linker roles. (See discussion beneath Objective 2 below.) Untold hours have been devoted by several hundred individuals from these agencies to receipt of training and delivery of services. AIDS has not requested that linkers document actual time devoted to AIDS, for AIDS has attempted to capitalize on the premise that AIDS' linkage activities are logical functions for these designated linkers to assume as a part of their ongoing responsibilities, that linkage functions are both complementary and complimentary to their role performance. Because no portion of these individuals' salaries is paid by AIDS, requested or require record-keeping might be expected to inhibit their rnvolvement.

It should be clear that the State of Alabama has contributed significantly to project resources through the above and other in-kind matching sources. No attempts have been made to place dollar figures on these contributions, for AIDS' staff do not believe the Institute to be interested in this type of mathematical game playing. The bottom-line key to AIDS' continuation is the hard dollar budgetary support committed by the SEA to this program. To date, this support has exceeded original projections, and in-kind contributions have enabled AIDS to provide services at the level demanded by client groups. AIDS will continue to seek and use the most cost-efficient techniques for service offerings so as to stretch limited dollar resources and to provide the kinds of services that will merit continued State support.

8

Organizational Positioning. Another important indicator of AIDS' legitimacy and permanency was the creation in 1978 of a new division within the SEA designated the Division of Research and Information Services. AIDS was one of the first three sections placed in this newly created division and is today a vital part of this organizational unit. Prior to its creation, there was no division in the SDE charged with delivery of information and dissemination/diffusion services. For this reason, AIDS was initially (in 1976) placed directly under the CSSO. This was a temporary, stopgap mearine and was done with the understanding that, following anticipated reorganization, AIDS would be placed in an appropriate division. AIDS' Director now reports to a Division Director who reports to the CSSO. Although this may on the surface appear to be a move. "down" in the organization for AIDS, in fact, the move was a positive step toward true institutionalization of AIDS and its functions. No longer is AIDS just an "add-on" unit; it is an integral part of an SDE whose leadership have committed themselves to its continuation.

Personnel Permanence. All of AIDS' staff members are now appointed through the State's merit system and are, as a result, permanent employees with associated rights and privileges, whereas, the majority of AIDS' initial staff were employed through contracts with the University of Alabama renewable on a yearly basis. Of AIDS' six professional staff members, one has been with the program since its inception (five years), two have four years of service, two joined the staff three years ago and the most recent addition has been with the Program for one year. The only University consultant to the project, Dr. James N. Wilmoth, Associate Professor, AU, has been with the project since its inception. AIDS now has a well-trained, competent, hardworking staff, all of whom exhibit a high level of commitment to the program goals and functions.

This resource is a very important factor in insuring the legitimacy and permanency of AIDS.

Objective 2: Develop a unified linkage system which will provide for two-way communication among AIDS, SDE staff and LEAs.

AIDS has devoted considerable project resources to the identification, training and support of both SDE and LEA linking agents. To date AIDS has approximately 150 trained linkers in place in these agencies including approximately 75 SDE field staff and 65 LEA staff members from 52 LEAs and the State's two Catholic dioceses (Figure I on following base shows location of local linkers). A number of other interested educators function as linkers in an informal manner. Highlights of the major accomplishments associated with developing and maintaining these linkages are provided below.

SDE Task Force. Organized during the first month of AIDS' existence, this internal advisory and support group contributed to both planning and implementation efforts during the early years. The Task Force included a representative from each SDE division based in Montgomery and met on an as needed (usually quarterly) basis. Task Force members received training in linkage and served as internal linkers within the SDE.

SDE Field Staff Members. AIDS provided formal training in linkage skills to a majority of the SDE's instructional field staff. These training sessions, conducted during Years One and Two of the project, ranged from 16-40 hours in length and were geared to the needs of individual participants. Emphasis during Years Three to Five was upon updating skills, maintaining informal communications with these individuals and adding other SDE staff members to the linkage system.

School Systems with Local Linkers (1980-81)

LMA Linkers. Since its inception, AIDS has been committed to the principle and practice of internal linkage. Hence, the systematic development of an LEA Linker Program has been a vitally important part of AIDS' five-year developmental plan. The program was installed during, the second half of Year Two with the appointment and initial orientation of the first group of LEA linkers who were appointed by local school superintendents of 42 school systems which had demonstrated high interest in AIDS' services. Most superintendents appointed one linker only; several, however, appointed two. In addition, the State's two Catholic Departments of Education and two of the State's junior colleges appointed linkers. During Year Four of the project, heavy emphasis and considerable time and other resources were devoted to the development of local linkages in these pilot systems. Major accomplishments related to the development of the LEA Linker Program include the following.

- (1) Two one-day orientation sessions were conducted in April, 1978, for newly appointed linkers. These utilized the consultative services of Dr. Joe M. Bohlen, Iowa State University rural sociologist; Richard Brickley, Director of RISE; Dr. David Crandall, Executive Director of The Network, Dr. Joseph T. Pascarelli, Education Improvement Center of Northwest New Jersey and Dr. Ron Havelock, NIE Fellow.
- (2) AIDS' staff conducted two two-day training/planning sessions for a total of 32 linkers from 29 LEAs. The first of these was held in June, 1978, at Guntersville State Park; the second, in August, 1978, in Montgomery.
- (3) Staff have prepared and distributed awareness aids to linkers including AIDS' posters, brochures, one-page descriptions of AIDS, questions and answers about AIDS, duplicates of slide-tape awareness presentation, etc.

- (4) Staff developed and implemented system for monthly reporting to LEA linkers on all service requests received from personnel in their system.
- (5) AIDS designed and conducted one-day workshop for LEA linkers held in November, 1978. Twenty-five linkers attended this session (at LEA expense) and received orientation to A Guide for AIDS' Users. In addition, linkers assisted in planning twelve area meetings that were hosted by LEA linkers for purpose of disseminating these "Users' Guides" to personnel in other LEAs.
- (6) Staff has involved LEA linkers in planning/attending and participation in a variety of conferences, workshops, awareness sessions and training events.
- (7) AIDS designed and conducted a three-day linker workshop held at Guntersville State Lodge and Convention Center, December 4=6, 1979.

 Thirty-nine (39) local linkers participated in this workshop, the theme of which was "Designing Dissemination/Diffusion Activities for Local School Improvement." AIDS' staff and other facilitators (SEA and outside consultants) assisted each local linker in developing a customized plan for his/her LEA. Four small work group sessions on days two and three were dedicated to designing these individual system plans. On the final day of the workshop, the linkers were divided into four "ALSO" groups-"ALSO" being the acronym for AIDS' Linker Support Operation-headed by one of the AIDS' staff members (i.e., Guy, Walsh, Cassidy, and Smith).

 The purpose of the "ALSO" network is to provide linkers with more personalized service and more regular communications from the AIDS Resource Center. More detail concerning this workshop is provided beneath Objective 7.

Two-way regular communications between LEA linkers and the AIDS'

13 .

resource center and staff have characterized the Local Linker Program.

A variety of other formal and informal activities were planned and conducted to promote and support this genre of linkage. Many associated accomplishments are reported in other sections of this report, one of which was of vital importance; the planning and conduct of a comprehensive intelligence gathering effort focusing upon local linkers, the environments in which they work, and the clients whom they serve.

Objective 3: Build a centralized system within the SDE for retrieval of resource information needed in problem-solving and improvement efforts.

The hub of all AIDS' activity is a centralized, comprehensive resource center operation capable of delivering information and supportive assistance to clients--when (two week turnaround) and how (in requested format) needed. Establishment and orderly expansion of this resource center were key components of AIDS' developmental plan. Closely associated with the acquisition of resources and the training of staff in appropriate retrieval techniques was the development of a delivery system to satisfy client requirements. From the beginning, AIDS has simultaneously developed both generalized and comprehensive capability. While simultaneous pursuit of these capabilities has proven to be an ambitious and challenging undertaking, results have justified the effort. Alabama educators at 'all levels--from classroom teachers to central office administrators-lacked both knowledge of and access to varied information bases before AIDS' establishment. Response to AIDS! service offerings has been. overwhelming as documented elsewhere in this report. Major accomplishments related to the attainment of this objective are capsulized below.

(1) Acquisition of In-House On-Line Computerized Retrieval Capability.

In the first quarter of AIDS' life, this capability was developed through

training of two professional staff members in Dialog search techniques, acquisition of a computer terminal, and execution of a contract with Lockheed Information Services. Over the life of the project, new staff have received training so that all professionals have these retrieval skills. AIDS has taken advantage of numerous Lockheed and ERIC Clearinghouse training opportunities to update and improve staff competencies in this area. AIDS continues to train and utilize all staff the computerized retrieval techniques; however, two staff members have major responsibility for day-to-day strategy development and retrieval.

(2) Investigation of Alternative Retrieval System. Although AIDS relied heavily upon Dialog searching early on in project life, staff members have looked at other national retrieval systems as well as ${
m in}$ –state possibilities in an effort to utilize the most cost-effective system(s) possible. Of particular benefit to the project has been the contractual arrangement with Auburn University's College of Education which has existed since the inception of AIDS. Through this contract and the resulting technical and consultative assistance of Dr. James N. Wilmoth (Associate Professor, Foundations of Education), AIDS has been able to capitalize on computerized searching of AU's ERIC files, first through use of Query system, but more recently through use of an on-line, interactive system developed by AU Computer Center employee, Don Hudson, which is known as "Quandary." This retrieval system has been refined considerably during the past three years largely in response to AIDS' needs and demands and now has sophistication that enables its use to satisfy the large majority (approximately 90%) of AIDS' requests for ERIC searches. A data collection and analysis activity was undertaken in Year Three to compare /the overall effectiveness and efficiency of

Quandary to Dialog retrieval from ERIC files. Based on improvements in Quandary and findings resulting from aforementioned intelligence gathering, AIDS' staff have made ever-increasing usage of Quandary. Because Quandary searching is infinitely more economical than Dialog, AIDS, through increased usage of Quandary, has been able to meet increased user demands in spite of severe resource limitations.

a disadvantage in document retrieval due to the absence of a professional library in the SDE. Limited resources have prevented AIDS from acquiring an extensive collection. An early decision was made to purchase portions of ERIC microfiche collection as resources permitted while maintaining an ongoing, current subscription to the ERIC collection. This tactic has resulted in AIDS now having ERIC collection, 1974-present. AIDS also has RIE and CIJE indexes for this time period.

Other in-house documents have been donations from other units and individuals within SDE. While AIDS plans to acquire selectively a number of frequently used references, present plans call for continued reliance upon linkages and agreements with other agencies to render document retrieval services to clients.

(4) Coordination of Resources with Other Agencies. AIDS' staff
have made concerned and systematic efforts to establish mutually beneficial
relationships with other agencies and institutions. As a result, AIDS
has been able to avoid duplicative efforts and to maximize its operating
efficiency. For example, AIDS' staff members have served on numerous
APLS committees (including State Conference on Libraries and Information
Centers preparatory to White House Conference). In turn, APLS has offered
all reference and other resources to AIDS in its document retrieval effort.
University libraries have also allowed AIDS complete and free access to

their collections. These relationships have enabled AIDS to provide document retrieval services to clients at minimum cost to the project.

- (5) State Facilitator Project. By virtue of having the NDN

 Facilitator Project housed in AIDS, AIDS has immediate access to all

 JDRP--validated projects as well as to the T.A. network and associated

 services and resources of the NDN. This has proven to be an extremely

 waluable asset to the resource center operation. In an attempt to

 capitalize on this liaison, AIDS' staff have indexed and abstracted all

 D/D projects in an ERIC-compatible fashion for easemin retrieval and

 dissemination. All response packages to client requests include citations
 to these exemplary projects when applicable.
- (6) Alabama, Resource File (ARF). Now comprised of citations to more than 200 publications and 136 LEA promising programs/practices, this File (begun in Year One) has increased in size (number of entries) as well as in quality of citations (indexing and abstracting). Currently, ARF is searched manually in connection with the preparation of response packages to individual search requests. Planned automation has been delayed due to resource limitations, but as soon as resources permit, this File, completely ERIC-compatible, will be mounted in the AU Computer Center and searched using the Quandary retrieval system. AIDS received invaluable assistance in this effort from the NIE-ERIC technical assistance team which made a site visit to the Alabama SDE in August, 1978. Team members Chuck Hoover, Ted Brandhorst, Mima Spencer, and Pat Brown critiqued work done to that point and assisted in mapping a plan for conversion to automation.

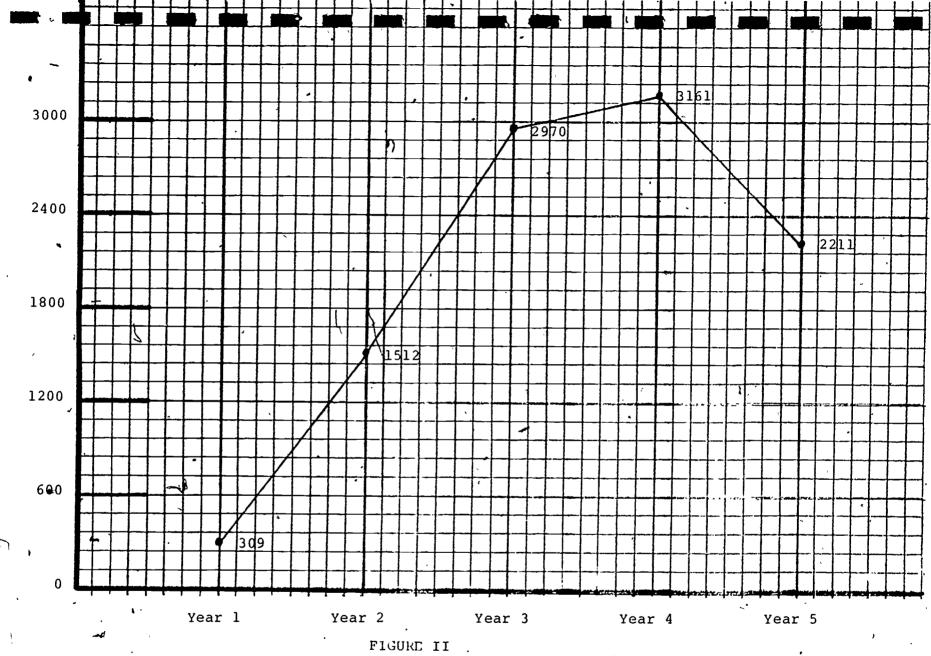

The procedures used in identifying and securing promising programs/
practices for inclusion in this File will be discussed beneath

Objective 4 ("Building an intrastate resource base..."). SDE publications

are submitted by SDE units.

- (7) A Guide for AIDS Users. In an attempt to disseminate usable and comprehensive information concerning the kinds of information available through AIDS' resource center, staff produced a users' guide in the Fall of 1978 that contains both a compendium of resources available through AIDS as well as practical suggestions concerning access to and use of these informational resources. Over 300 of these Users' Guides were disseminated to LEA linkers, SDE linkers and interested LEA administrators. Dissemination occurred during one-hour prientation sessions conducted by the AIDS Director and Assistant Director. Twelve area meetings were held across the State in November-December, 1978, and were attended by approximately 180 individuals representing 60 LEAs. An SDE in-service session conducted if nuary, 1979, was the occasion for the dissemination of these manuals to field staff linkers. This manual is serving to increase both the quantity and quality of usage of the resource center. The manual was updated in the fall of 1979 and additions/deletions were sent to all original receipients of the manual.
- (8) Responding to Service Requests. The heart of the resource center operation is receiving, processing, and responding to requests for informational services. Procedures for providing these services have been streamlined and refined throughout the life of the Project.

 While Figure II shows the monthly activity by project year, Table 2 and Figures III-VI provide more graphic information regarding fluctuations in requests.

AIDS' staff have been hard pressed to deliver requested services while concurrently attaining objectives in other areas of project development. If original projections of <u>demands</u> for services were underestimated, soo too were original projections of resource requirements: AIDS' continued need for adequate; permanent funding should be apparent in view of heavy demand for service delivery during the project's developmental period.

Objective 4: Building an intrastate resource base by identifying and validating promising programs and practices in educational agencies in Alabama.

Since the beginning of the project, AIDS has solicited promising programs and practices from local school systems to be included in the Alabama Resource File. In Year One, work began on a validation plan, and 13 programs/practices were submitted in a field test of the nomination and selection procedures. From feedback received, it was determined that staff resources would not permit a formal validation process, that an application form needed to be designed, and that all school systems completing the form would be included in the Resource File.

In Year Two, a 29-page "Application for Inclusion in the Alabama Resource File" was designed. As a result of a statewide solicitation, 59 activities from 21 school systems (13 city, 8 county) were added to the Alabama Resource File. Each has been indexed and abstracted in ERIC-compatible form for manual retrieval. There are now 136 projects in the Alabama Resource File representing 54 Alabama school systems (See Exhibit F). Information about all of these projects is disseminated as appropriate in AIDS' information packages.

In Year Three, the application form (see Exhibit A) used to solicit promising programs and practices was revised. All local

school systems in the State are invited to submit projects for inclusion, annually, and nominations are requested also from AIDS' linkers and SDE staff. In addition, persons named as responsible for projects currently in the Resource File are asked to update information about their projects on an annual basis.

Objective 5: Develop awareness among prospective users of AIDS'

availability, of its purposes, of outcomes which

can be expected through its use, and of procedures

for initiating its use.

Since the project's inception, AIDS' staff have made a total of 383 face-to-face awareness presentations to more than 13,000 Alabama educators. Table 3 presents summary statistics documenting AIDS' awareness activities.

In Year One, awareness efforts focused on SDE staff to encourage them to become AIDS' users and linkers. Staff also attempted to reach the leadership in LEAS. In Year Two, as in Year One, AIDS was very proactive in awareness activities. The focus was on both instructional and administrative Staff in LEAS to encourage greater use of AIDS' services at this level. Invitations from IHES were welcomed so as to reach students in preservice education courses. Presentations—to professional—organizations also expanded the number of possible AIDS' users. In Year Three, many awareness activities were coordinated through LEA and SDE linkers. In Year Four and Five, AIDS responded to invitations for "live" awareness presentations of one—two hours duration, rather than actively soliciting presentation opportunities. A shorter AIDS' general awareness is usually made as a part of all NDN awareness/training.

In a typical awareness session, staff give an overview of AIDS' services (using A-Vs as appropriate), distribute sample searches targeted

for the particular audience; provide response to user requests (e.g., summaries/syntheses of r & d, additional information sources, etc.); explain the process of requesting information, negotiating requests, receiving information, ordering additional materials, document retrieval, answer questions; provide brochures and information request forms; stress importance of using information for educational improvement.

A number of useful awareness aids have been developed for use by AIDS' staff and linkers including:

Brochures summarizing AIDS' services and capabilities. Staff has revised the brochure annually.

Staff developed a two-part slide/tape presentation, "Information for Educational Improvement" during Year Two. The program was duplicated during Year Three and linkers are encouraged to borrow it for use in their school system.

Staff developed an AIDS poster (three colors, $17" \times 11"$) for use by AIDS' linkers in promoting awareness within their systems.

As discussed in Objective 3, staff developed and disseminated a <u>Guide for AIDS' Users</u> to over 300 SDE staff and LEA leaders during Year Three.

AIDS has a regular monthly block in Alabama Education, the official publication of the SDE, circulation approximately 55,000. AIDS lists particularly interesting searches, prepares multiple copies, and invites educators to request them. From time to time, r & d outcomes and other sources of pertinent information are referenced.

Numerous articles about AIDS! activities have appeared in Alabama Education during the year.

Objective 6: Promote the improvement of equality of educational opportunity in the schools of Alabama

AIDS' Equal Educational Opportunity Plan has evolved over the life of the project. In Year One, a general plan was developed and implemented to the extent possible at the time. In Year Two, eight Alabama school systems were identified as potential target systems for AIDS' Equal Educational Opportunities activities. Superintendents of the systems were contacted by phone and on-site visits were made by an AIDS' consultant. The agenda for these visits included: clarification of the services provided by AIDS; a request that someone within the school system serve as an AIDS' linker; information about the availability of assistance through AIDS; information about AIDS' involvement in the Facilitator Project; and request for information from the school system for the Alabama Resource File. Linkers were obtained from all eight school systems and five of the systems submitted one or more projects for the Alabama Resource File.

In Years Three through Five, AIDS worked with the eight selected school systems in specially designed activities which are explained in detail in a subsequent part of this report.

Objective 7: Provide training in AIDS operation and utilization
to AIDS' staff, SDE and LEA linkers, and clients at
the State and local level.

AIDS' original proposal included heavy emphasis on training.

Proposed target groups included AIDS' staff, SDE field staff, and LEA personnel including LEA linkers and LEA users. Appropriate training plans and designs were formulated to meet the special needs of the target groups involved. In Year One, the emphasis was on training SDE staff as both linkers and users. In Year Two, the emphasis was on

training other SDE staff and updating the skills of those already trained. Training was expanded to LEA users. Most user training was on site in schools, but there was some training in higher education classrooms. This is still an area in which there is need for future development.

In Year Three, the focus was on linker training. The training sessions were conducted with SDE personnel: one with program coordinators and other leadership of the Division of Instructional Services; the second with SDE field staff. In addition, there have been individual conferences between AIDS' staff and interested SDE consultants. Also, two sessions for AIDS' linkers were conducted during Year Three. The agenda included in-depth training in use of AIDS' services, the negotiation process, the ERIC database, as well as linkage skills.

During Year Four, AIDS' staff designed two major training events: one for AIDS local linkers; the second, for LEA client groups.

The major linker training event was the linker workshop held

December 4-6, 1979, at Guntersville State Lodge and Convention Center.

The workshop design, influenced by results of AIDS' survey of local

linkers and clients, afforded the 39 local linkers (representing 26

LEAs) with opportunities to: (1) develop/update their knowledge,

skills, competencies related to performance of linkage roles;

(2) develop individualized dissemination/diffusion plans for their

respective LEAs; (3) share workable strategies with their colleagues

and develop new strategies for activating their plans; and (4) develop

rapport and communications channels with other linkers, AIDS' staff

and individuals representing national and regional information centers

and sources (i.e., ERIC, NDN, AEL, etc.).

. A large number of individuals contributed to the workshop's success as both content and process facilitators. Included among 24 individuals serving as workshop facilitators were five SEA staff members (representing all five SDE divisions engaged in direct service delivery to LEAs); Ms. Sandra Orletsky, Assistant Director, Educational Services, AEL (regional lab); Ms. Mima Spencer, Deputy Director, ERIC Clearinghouse on Early Childhood and Elementary Education: Mr. Ralph Parish, former Kansas State Facilitator, representing NDN; and Dr. James N. Wilmoth, Auburn University (IHE). While formal workshop evaluations and informal assessments and observations attested to the overwhelming success of this event, workshop planners were perhaps most pleased with their success in attracting these 24 individuals from all levels and types of dissemination agencies as workshop facilitators. This, we hoped, demonstrated to AfDS' linkers AIDS' commitment to the fact and practice of coordinated dissemination. Involvement of these multiple parties also provided opportunities for planning collaboratively educational improvement efforts in the LEAs participating in this workshop.

The second major training design developed during Year Four was for a "Workshop on Workshops." Developed at the request of the Assistant Superintendent for Staff Development in Mobile (who is also the AIDS linker for his system), this workshop was planned for 40 staff development and instructional specialists, who are responsible for planning and conducting staff development and in-service experiences for teachers and other staff. Given that workshops are major vehicles for information dissemination in local schools, this particular effort seemed to be a most appropriate training and technical assistance activity for AIDS to design and deliver.

In addition to the aforementioned events, AIDS continued, as in years past, to arrange and facilitate training experiences for local school personnel in connection with installation of new programs and practices as well as to conduct one-day training events related to other aspects of information utilization. Table 4 summarizes training events conducted by AIDS since its inception.

Objective 8: Provide technical assistance to LEAs in identifying and utilizing resource information for problem solving and improving educational programs.

AIDS provides technical assistance to LEAs in two manners:

(1) Resource center staff members deliver a wide range of technical assistance services to clients. The most frequent and the simplest type assistance rendered is help with problem identification and/or clarification. Many clients with a vague notion of an information need will phone or visit the resource center to seek assistance in clarifying both their problem and the type of information that might be secured to address same. Through the process of problem negotiation, AIDS' staff are able to assist clients in thinking through their problems. This type assistance is rendered many times weekly.

A second type of technical assistance frequently delivered by AIDS' staff occurs in the context of an LEA in-service session. This type assistance could be categorized as developing user capacity and involves working with potential clients to improve their knowledge utilization skills (and to increase their general proclivity to seek and use knowledge). During Years Four and Five, AIDS, in cooperation with AEL and other regional labs, sponsored and/or conducted several workshops designed to help local educators bring about improvement through the use of r & d outcomes. From these activities evolved development of a research-based staff development module for administrators which will be disseminated through the SDE's leadership and management program. The title "The Research Connection: Instructional Leadership and Teaching Effectiveness" indicates the module's focus. Resources have not been available to pursue this particular activity in as systematic and sophisticated a manner as desired; however, AIDS is-seeking resources

to do so in the future.

Another example of a technical assistance activity delivered directly by AIDS' staff is help to LEAs in seeking funding for exemplary programs that will lead to educational improvement. AIDS' staff have worked with personnel in several LEAs in proposal development and writing. A number of the systems receiving this type assistance were EEO systems.

Finally, AIDS has designed, administered, and responded to results of the "Needs Identification Survey" referenced earlier.

(2) AIDS' staff have brokered numerous technical assistance activities, the most numerous and successful activities occurring through NDN project activities. Because AIDS also serves as State Facilitator, this has been a particularly accessible and fruitful approach. In addition, AIDS has called upon SDE consultants to work with clients in choice and implementation activities. Finally, AIDS has attempted to take advantage of technical assistance activities offered by AEL and other regional and national agencies.

Objective 9: Providing evaluative feedback and for continuous assessment and long-range improvement of AIDS.

AIDS has placed strong emphasis upon pursuit of this project objective since Year One. Reference to the numerous ongoing evaluation activities has been made in discussions of accomplishments related to other project objectives. Major evaluation activities are described in section F of this document.

Objective 10: Develop mechanism and resources within the SDE to insure the continuity of AIDS

The numerous activities and strategies which were and are being employed to achieve this objective were thoroughly discussed under Objective 1.

B. Description of Program Status

Prior to the NIE grant award, the Alabama SDE had neither a dissemination/diffusion office internal to its structure nor a coordinated agency-wide approach to dissemination/diffusion nor direct links to research and development organizations and their products nor the capacity to deliver information product's and services to local schools and school systems nor any other evidence of the existence of functions associated with a viable dissemination program. In kind, the vast majority of state and local educators in Alabama had neither knowledge of the variety of education-specific or -related databases available nor access to such databases nor the proclivity to seek and use r & d-based . information in local school improvement efforts nor availability to the variety of other services and benefits that can be derived from a mature, well-functioning dissemination program. Hence, as has been previously stressed, Alabama's Capacity Building Project was planned (1) to develop the SDE's internal capacity to respond to user-initiated requests for information and to spread r & d based information while concurrently (2) developing a clientele for these services via design and conduct of activities intended to build user capacity. The Alabama plan was developmental in nature which is to say that it was time-phased with one year's accomplishments forming the basis for the next year's activities. Likewise, plans for development of the major program components, e.g., information resources, information services, linkage and leadership were interrelated so that activities of the different components were interrelated and mutually supportive.

Figures VII, VIII, XI and XII on the following pages depict accomplishments at year's end for each-of five years of capacity building for major

resource-building and other project activities. While these listings of project accomplishments are not exhaustive, they do provide a rather dramatic view of the impact of NIE funding upon dissemination in Alabama.

Information Resources. Figure VII clearly illustrates the importance of NIE funds in the building of an Information Resource Center in the SDE.

Not only did the Department lack the most basic information resources (e.g., ERIC collection and indices, important standard references) and the technical capability to access these (e.g., neither manual nor computerized retrieval systems), there was no office in the SDE charged with providing information support to SEA officials and staff or LEA personnel. Hence, there was no centralized clearinghouse for SDE publications and products. Nor was there an SDE unit with a motive for tapping state, regional and national dissemination/diffusion pools, e.g., the Research and Development Exchange, the National Diffusion Network, Education Commission of the States. Over the five-year period of capacity building, AIDS acquired and/or developed all of these resources within and for an agency previously lacking all.

Information Services. Because the Alabama SDE lacked vital information resources and a centralized resource center, the SEA did not offer any comprehensive set of information services prior to 1976, the first year of the NIE grant award. Concurrent with the acquisition of resources discussed above, AIDS began specifying the kinds of information that would be made available to various client groups, designing delivery systems for provision of these services, formulating policies and procedures for service delivery, developing relationships with rd & d and other resource agencies (e.g., APLS, state universities) whose resources could supplement those acquired or developed by AIDS, providing for formative evaluation by user groups of services offered, and attending to a myriad of other

tasks associated with establishing and operating a service-oriented information center. Major services delivered by AIDS to clients over five years of capacity building are itemized in Figure VIII. Again, the comparison of the pre-NIE status of dissemination activities with Year Five activities demonstrates convincingly the impact which NIE funds had upon Alabama's dissemination program.

Linkage. The concept of linkage was introduced to the SDE and the state through SCBP. Prior to AIDS there was no recognition of the importance or utility of such a function. Through capacity building, AIDS was able to develop expertise in identification, recruitment, training, updating and support of linkage systems. Figure XI portrays the systematic development and expansion of linkage over five years. AIDS derived much knowledge of the linkage phenomenon from analysis of results of the "Local Linker" and "User" surveys administered in Year Three. These surveys, discussed beneath Section F, advanced the state-of-the-art for AIDS and others in the national dissemination community. Figure XI should convey to the reader the increased utilization of collaborative principles in the latter years of the project. To achieve a true two-way linkage, collaboration is essential.

Leadership. AIDS created a dissemination unit where there was none and concurrently created a consciousness among educators in Alabama of the existence and importance of accessing and utilizing r & d-based resources in decision making and problem solving. Figure XII displays some of the specific areas and projects in which AIDS exercised leadership over the five-year project period. Prior to NIE funding, no advocate of or spokesman for dissemination/diffusion was present in the SDE. AIDS has been increasingly active in this role over the project period.

NIE funding had a dramatic impact upon the state-of-the-art and practice of dissemination in the Alabama SEA and, through it, the State at large. NIE resources were utilized to acquire basic resources where there had previously been a void. More importantly, the program goals and philosophy expressed by NIE in the State Capacity Building Program significantly influenced allocation of State dollars to build a dissemination program. NIE's leadership was the critical variable in the creation of a dissemination program in Alabama.

C. Institutionalization

AIDS' front-line approach to institutionalization is a straightforward and simple one: provide needed services in an effective and efficient manner, and recipients of those services will justify, if not demand, continuation and eventual institutionalization of the serviceproviding entity. Following this line, AIDS committed to the delivery of tangible products, including computerized literature searches, summary/ synthesis papers, and microfiche and journal article retrieval and reproduction, in the early months of Year One of the project. More sophisticated services were offered as developmental time permitted. Other strategies associated with this approach were: (1) strong emphasis upon awareness activities in Years One and Two and upon user capacity building activities in Years Three through Five; and (2) attention to acquisition of resources and provision of services unique within the SEA and broader educational community and concurrent attention to building of > collaborative relations with other resource-providing agencies. In this manner, AIDS sought to build client dependence through offering vital services not easily obtainable from other sources. Results of "AIDS User Questionnaire" suggest that at least the programmatic aspects of this strategy have been successful: \$5% of the respondents assessed AIDS' services to be of higher than average value, while only 5% saw these services as being of lower than average value. Equally as significant, 48% of the respondents indicated that they would have had no sources for the services had AIDS not offered these. How clients' views will affect state decision makers' determinations regarding longrange continuation is, of course, unknown at this point/in time.

Past and future funding of AIDS is, however, a known factor.

Using this particular gauge, AIDS' prospects for institutionalization are bright. As Table 7 illustrates, State funding of AIDS has increased steadily throughout five years of capacity building, and \$225,000 has been pledged for FY 1981-82. State funding has, in fact, exceeded what was pledged in the original proposal to NIE. This is particularly significant in view of the fact that State support has always been in the form of hard dollar support, not in-kind figures. AIDS' fiscal condition has been additionally enhanced by the fact that AIDS has for four years administered the NDN State Facilitator Project and, more recently, two other federally-supported projects. The coordination of these other dissemination/diffusion projects has been advantageous from both a programmatic as well as a staffing perspective. The pooling of these material and staff resources has had a synergistic effect, particularly with regard to program outcomes.

Another related strategy was recruitment and training of competent and dedicated staff. This resulted in a high degree of staff permanence: the Project Director was with AIDS for four of the five project years; the Project Manager, for all five of the project years; the resource center coordinator, for four years, two other professional staff, for three years; and the remaining staff members for one year. The competence, experience and tenure of the staff should enhance prospects for long-term institutionalization.

In spite of the project's success in (1) developing demand for dissemination services, (2) securing financial resources and (3) recruiting and retaining competent staff, no absolute assurance exists that complete institutionalization has been achieved.

To the contrary, a number of problems and concerns have been associated with institutionalization efforts. Included among these are:

Table 7 .

AIDS Funding By Year and Source (1976-1982) ,

YEAR	NIE	SDE	NDN	CAUSE (NIE)	NCES	TOTAL
1976-77	\$117,356	\$ -15,850			•	\$ 133,206
1977-78	94,002	17,280	\$ 74,999			186,281
1978-79	94,598	55,040	75,500		·	225,138
1979-80	60,553	81,550	98,000			240,103
1980-81	58,500	103,648	85,837	\$56,384	\$61,767	366,136
1981-82		225,000	, 80,000	?		305,000
TOTALS (\$425,009	\$498,368	\$ 4 14,336	\$56,384 _.	\$61,767	\$1,455,864

- Lack of understanding of role, functions and value of a comprehensive, integrated dissemination program on the part of SEA leadership. While leadership has given lip service to AIDS, this has been accompanied by evidences of some misunderstanding of the true nature of dissemination. (For example, attempts have been made to "tag" AIDS as a research and development unit (note: there is no such unit in the SDE), and continual references are made to AIDS' "research" functions. This practice persists in spite of AIDS' ongoing attempts to clarify the concept of dissemination.
- 2. Conservative structure and philosophy of the Alabama SEA.
- 3. Frequent reorganization of the SDE during AIDS' existence.
- 4. Mistaken assumption by AIDS' staff that performance and effective, efficient delivery of services would lead to a rational decision to continue and expand the program. (The staff chose to devote time and other scare resources to providing needed services, not to playing the political game or lobbying internally).
- 5. Unarticulated mission/role of SEA.
- 6. No Department-wide evaluation or research unit.
- 7. Lack of systematic planning and coordination on a Department-wide basis.
- 8. Political climate not conducive to attainment of AIDS' objectives (SBE and Governor extremely influential in setting priorities and determining policies with the Governor exercising considerable power over funding decisions and actively supporting his belief that the SEA should be primarily a regulatory and monitoring agency).
- 9. The "times" are not favorable for support of programs viewed by decision makers as nonessential.

 9_J

D. Equity

Since its inception, AIDS has assumed an "affirmative" approach with regard to equity issues. This posture was dictated, in part, by the Institute's requirement that AIDS develop an "Equal Educational Opportunity PTan" during the first quarter of funding as a condition of the NIE grant award. A special six-member panel, comprised of educators representing all levels (K-16) and geographic areas, was convened to formulate such a plan. This plan, submitted to and approved by NIE in November, 1976, provided the basic blueprint for actively promoting equity, and was predicated on the belief that "equality of opportunity means more than equal access to opportunity." The plan affirmed AIDS' responsibility "to help change schools so that processes which maintain discrimination will be eliminated." Strategies for implementing this plan were developed in Year One, and full scale implementation began in Year Two.

The approach to equity subsequently implemented rested upon three cornerstones:

- Targeting of at least six LEAs (of the State's total 127) that most nearly met a profile of a "traditionally underserved population, i.e., (a) more than 5,070 black;
 (b) below poverty level; (c) predominantly urban or rural and (d) low per pupil, expenditure.
- Preparation of information packages focused upon issues related to enhancing educational opportunities for minorities, women, the handicapped, the poor and others traditionally underserved.
- Collaboration with individuals, groups and agencies dedicated to promoting educational improvements for traditionally underserved groups.

All three of these strategies were successfully developed and implemented over the five years of the project.

Numerous special information packages featuring various equity

issues were developed and disseminated to large numbers of LEA personnel during all five project years. While these products were simply "spread" to target populations, follow-up requests from clients receiving initial packages provide evidence of increased awareness of these issues.

Following are some representative titles of these sample packages:

Vision and Hearing Screening Using Microcomputers with Preschool Handicapped Children Funding Sources for Bilingúal Education Identification of Gifted Children in Preschool Programs Teaching Vowels to Black Primary School Children Barriers Faced by the Handicapped Sex Education for Exceptional Children Self Concept Scales for Black Children Mainstreaming the Visually Impaired Student Curriculum Guides and Special Programs for Gifted Students Black English , Dyslexia and Elementary School Students Effect of the Feingold Diet on Elementary Learning Disabled Teaching the Multihandicapped Women in Education Leadership Roles Morale of Staff Working with Mentally Retarded

The equity strategy to which AIDS assigned the highest priority and greatest resource commitment was the targeting of LEAs serving large numbers of students historically deprived of equal access to educational opportunities. Although the EEO Plan committed AIDS to targeting six such systems, eight systems were eventually identified as meeting criteria stipulated in the predetermined profile, and the decision was made to target all eight in order to assure statewide geographic distribution. Table provides a profile of the eight LEAs selected for targeting using procedures perviously discussed.

AIDS conducted a number of initiatives in Years Two and Three of the SCBP designed to establish direct linkages with these eight LEAs and their respective leadership. Included among the strategies developed and implemented within each of these eight LEAs during these two years were:

	,	١		Year 2	Year 3
1.	Initial face-to-face contact and conference with the superintendent		,	· x	
2.	Recruitment of local AIDS linker	-		x ,	
3.	Solicitation of successful programs for inclusion in AIDS' Alabama Resource File			x	x
4.	Conduct of systemwide "Needs Survey"	•		х	` X

		Year 2	Year 3
5.	On-site conference with local superintendent for purpose of need/problem clarification and identification of priority needs	X	x
6.	Preparation and delivery of special information packages addressing priority needs	, x	X .
7.	Training of local AIDS linkers in general AIDS awareness, usage, etc., as well as linkage functions	х х	х

Following initial contacts with each of these systems, AIDS designed and or implemented various strategies intended to make these LEAs beneficiaries of the dissemination/diffusion programs and services offered by AIDS. Table 9 lists activities planned and conducted for these LEAs during Years Three through Five of the project and depicts participation by personnel with each of these LEAs in each:

Table 9
Summary of Participation by EEO School Systems in Planned Activities

Activity	A	В	С	D	Е	F	G	н

	<i>,</i> ,	1	1	1					
7	Activity	A	В	С	D	E	F	G	- H
5.	Sponsored attendance of individuals linkers at state and regional r & d workshop			х	X	. x	,	X	
6 .	Brokered assistance from national resource agencies			,	. x	х			
7.	Assistance in design and/or conduct of staff development programs focusing upon r & d outcomes			X	x .	. x		•	
8,	T.A. in local program development				x	6			
9.	Preparation of special information packages upon user request		x	х	X	x	х	х	х

The above table clearly illustrates that two of the eight systems i.e., "D" and "E") have been extensively involved in activities designed to support local improvement efforts; two (i.e., "C" and "G") have been moderately involved and four (i.e., "A," "B," "F" and "H") have been somewhat involved.

The uneven involvement across these eight systems may be attributed to a number of factors including (1) commitment of superintendent to school improvement; (2) interest and commitment of local linker to school improvement; (3) continuity of leadership within the LEAs; and (4) quality of "match" between r & d resource and priority system needs. For example, in the highly active systems "D" and "E" the local superintendents were personally involved in dissemination activities, and the local linkers were strong advocates for AIDS in particular and school improvement in general. Further, these assertive linkers have

positions within their respective LEAs that are very congruent with the linkage function as defined and practiced by AIDS, and each has remained in his/her position over the five-year period. Finally, each of these systems has utilized numerous resources made available through AIDS to solve locally identified needs. On the other hand, system "A" has had three superintendents during the past five years, three different linkers, and has experienced a number of internal political/public relations problems. Of the eight systems, four have had at least two superintendents and three at least two named linkers during the five-year time period.

Although impact of AIDS activities has varied across the eight systems, AIDS' staff assessment of the cluster of strategies associated with the "targeting" of needy systems is very positive. Among the quantitative results of this effort are five program adoptions in sixteen schools (K-12) serving in excess of 5,737 students and involving 147 trained staff members. In addition, one of these LEAs has embarked upon an intensive, comprehensive, systemwide effort to improve school—community and home-school relations as a direct result of AIDS' intervention. Each administrator and teacher in this LEA has been actively involved in this program. Two of these LEAs have provided in-service training to all faculty and staff designed to disseminate findings of significant research in teacher effectiveness. In addition, individual user-driven requests have emerged from all eight of these LEAs.

The above is by no means an exhaustive summary of all the planned, not to mention the unplanned, results of AIDS' targeting of the eight LEAS. It does present representative outcomes of the affirmative activities described herein.

ATDS' third major initiative in the promotion of equity was to

entities established to serve the needs of the historically underserved populations. In this regard, AIDS has worked closely with Title I staff within the SEA and has assisted in statewide Title I conference planning for three of the past five years. Likewise, AIDS has initiated collaborative arrangements with the SEA's ESAA Unit, the General Assistance Centers serving this region and the Governor's Basic Skills Teams, established to target the State's needlest system: AIDS has also provided numerous assistance activities to the Alabama Institute for the Deaf and Blind, Talladega, Alabama. In addition, as reported elsewhere in this document, AIDS promoted the establishment of a formalized urban collaborative comprised of the Mobile County and Birmingham City school systems, the Alabama SEA and the Appalachia Educational Laboratory. This collaborative, CAUSE, is funded by NIE and is intended to meet the needs of the urban-disadvantaged and minority students.

AIDS' approach to equity issues over the five years of capacity building has been multifaceted by design and labor-intensive in implementation. On the other hand, the approach was highly congruent with AIDS' overall developmental plan. The achievements outlined in this section should provide evidence of the success of the program.

E. Impact on Improvement of Practice

The services and products resulting from AIDS program activities have been delivered to decision makers at all levels of the educational establishment in Alabama--from the individual classroom teacher to the State Board of Education and from the kindergarten to the college classroom. Actions taken by individual recipients of these products/services subsequent to their delivery attest to the level of impact which the AIDS program has had upon improvement of practice.

The dissemination community perennially grapples with the concept of impact as it relates to outcomes of dissemination activities, just as it previously wrestled to define or attach meaning to the concept of dissemination itself. By formulating and fine tuning AIDS' developmental plan, staff have attempted to operationalize DAG's definition of dissemination, i.e., spread, exchange, choice, and implementation. That is to say, in designing dissemination strategies, AIDS has sought to deliver services and products in such a manner as to touch potential clients via all four levels of dissemination. Thus it is appropriate to describe AIDS impact upon clients' improvement of practice by employing a companion multidimensional scale. Hence, for purposes of depicting AIDS' impact upon various levels of education practitioners, the following four-level scale was devised.

Level

1 - Awareness

Nature of Effect

Practitioner has or experiences a new realization, perception or knowledge as a result of the . contact.

Level

Nature of Effect

2 - Consideration

Practitioner discusses, debates, or thinks about the manners in which the "new knowledge, insight, etc.," might alter his/her present. behavior or how it might affect a future decision.

3 - Commitment/Decision

Practitioner determines to do something differently or to take a certain course as a result of the contact.

4 - Implementation

Practitioner uses "new/knowledge, insight, etc.," in making a decision, change of behavior, etc.

Using the above scale, AIDS' impact upon clients (decision makers) at various decision levels can be portrayed. Further, this impact can be related to alternate services and products delivered by AIDS. Such a description is offered in Figure XIII which provides a portrait of the type of impact AIDS' program activities have had upon various client groups.

Figure XIII portrays the source and level of program impact upon various levels of decision makers. It does not suggest the numerical proportions of such impact; in fact, it would be foolish to speculate upon either the total number of improvements stimulated by AIDS program activities or, for that matter, the permanency of the changes that can be today documented. However, some statistical data can be offered to illustrate the extensiveness of "improvement of practice" across the State. Again, the reader is reminded that these data are incomplete, that many clients receiving programs and services have not been surveyed with regard to how they have used these in improving practice.

Figure XIV presents a user profile based upon 2,773 information requests received during the 1980 calendar year, while Figure XV depicts the statewide distribution of the 2,703 requests

received between January and August, 1981. Note that individuals from 112 of the total 127 LEAs (88%) had requested and received information from AIDS during this time period. Of this group, 47% were classroom teachers, 17% were individuals with building-wide responsibilities (e.g., principals), 9% were central office administrators within LEAS, 8% were SEA management or staff, and 10% were from two-year colleges or State universities. The "AIDS' User Questionnaire," administered to a sample of resource center users over a three-year time period (1978-81), yielded some information related to impact. The random sample of the 6,400 individuals using this service during this time period were asked to note the major effect of the information received (i.e., computerized search and relevant resource center materials). Twenty-nine percent (29%) responded "contributed to impate classroom teaching and management benefits"; and 13% stated "continuative butted to improved administrative procedures." Only 6% of this random sample suggested "little or no benefit." Ten percent (10%) of the sample acknowledged that information received in this search package caused them to "initiate steps leading" to a new program." Other results of this questionnaire are discussed beneath "F."

As discussed elsewhere in this report, the award of the NDN State—
Facilitator Project to the SDE and the placement of this project in the
ALDS office during Year Two of the SCBP greatly enhanced the development
of a coordinated dissemination/diffusion program. Information about
NDN exemplary projects matching user-identified needs has been disseminated
through ALDS resource center and via other ongoing dissemination
strategies. This coordinated approach to local school improvement has
accounted for an impressive number of program implementations at the
classroom, school building and school system level. Figure XVI illustrates

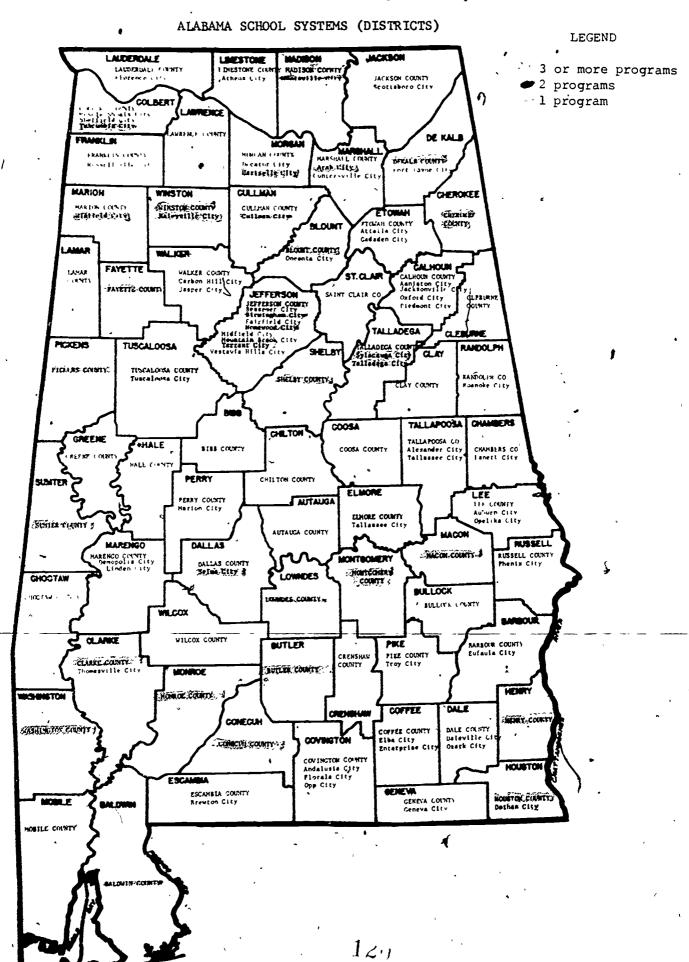

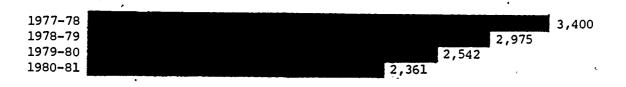

Figure XVII

Total number of different NDN programs implemented - 35

the distribution of these across the State, while Figure XVII provides other statistical data germane to the impact which this service has had upon locals. Note that the data in Figure XVII d. reflects changes at the classroom level. The value of operating a coordinated dissemination/diffusion program is confirmed by figures in Figure XVII e. for each year, an impressive majority of these program implementations occurred within one of the 52 LEAs in which a trained AIDS linker was operating.

In addition to NDN program adoptions, AIDS activities have resulted in implementations of other r & d-based programs. Some of these have been outgrowths of information received from a search of the ERIC database; others have resulted from AIDS' participation in the R & D Exchange through cooperation with AEL. Table 10 shows the numbers of individuals targeted through various dissemination strategies conducted in 1980 and 1981 to disseminate the following research projects and products:

- 1. "Classroom Organization and Effective Teaching," University of Texas R & D Center on Teacher Education, Austin, Texas.
- 2. "Proficiency Verification System" (PVS), developed by the Southwest Regional Educational Laboratory.
- The "Staff Development Model" developed by Dr. Jane Stallings, Stallings Institute for Teaching and Learning.

As a result of these activities, thousands of teachers have become aware of research findings that have enabled improvement in practice at the classroom level, hundreds of principals have received knowledge and insights to promote school-wide improvements, and dozens of SDE consultants have been updated as have dozens of teacher educators. Two school systems are currently piloting the PVS, and another LEA is considering this innovation. Two LEAs have brought Dr. Stallings on site to train all of their central office staff and local school

principals. These two LEAs are currently considering adopting the Stallings Model to their local needs. Dozens of LEAs have incorporated findings and products of the COET project into system-wide in-service programs. These are only isolated examples of the results of AIDS' efforts to promote r & d-based solutions to problems and needs across all levels of education in the State.

Hard data concerning the impact of synthesis products are not readily obtainable. For example, AIDS has selectively disseminated, both directly and indirectly, hundreds of copies of the RDIS products, Research Within Reach (Reading and Math). In addition, AIDS has designed and facilitated numerous workshops to orient teachers and administrators to this publication. At present, however, no extensive survey of the extent to which these publications may have effected practice has been conducted. Isolated individuals have reported their value. The same can be stated concerning the impact of other such products that have been disseminated over the project life as well as about the impact of brokered consultative assistance and AIDS' awareness workshops. Services and products that are generalized, as opposed to problem-specific, are more difficult to relate to discrete improvement efforts. In many instances, these more generalized services may "trigger" other actions that are more directly related to improvement of practice.

In summary, AIDS' services and products have been viewed as means toward the end of school improvement. While the total impact cannot be described or documented, the above examples should provide the reader with a flavor of the type and levels of improvements that AIDS has facilitated and/or supported.

Dissemination of Project

In addition to practicing proactive dissemination on a statewide basis, AIDS staff members have shared experiences, knowledge, successful strategies, important learnings, significant accomplishments, etc., at the regional and national level. This has been accomplished through a variety of informal, general activities (e.g., telephone conversations, correspondence, attendance and active participation in regional and national conferences, forums, seminars, workshops, planning sessions, etc.) as well as formal presentations and involvement in programs of a more specific nature such as:

- Presentation to NIE staff, Washington, January, 1979
- Presentation at RDU Conference, Orlando, February, 1979
- Hosting on-site visits from other SCBP as follows:
 - Louisiana, two days, 1980
 - Louisiana, one-day follow up, 1981
 - Louisiana, one-day training in use of Quandary retrieval/system, 1981
 - · Mississippi, two days, 1980
 - Tennessee, two days, 1979
 - 1 Tennessee, three days (linker workshop), 1979
 - Tennessee, two days follow up, 1980
- Presentation at NDLP Conference, Minneapolis, 1980
- Group facilitator at NDN Conference, Denver, 1981
- Presentation and panel member, AEL Forum, 1981 (involved AIDS staff member and five local linkers)

F. Other Pertinent Issues

1. Client Responsiveness to and Satisfaction With Services

From the beginning of the SCBP, AIDS staff has been aware of the importance of documenting, evaluating and assessing all aspects of the AIDS operation as well as ascertaining responsiveness to and satisfaction with services. A variety of strategies, both formal and informal, have been employed. The activities reported below are but a sampling of the numerous efforts designed to secure information which could be used for planning and continuous improvements.

AIDS User Questionnaire

As a part of the evaluation of AIDS services, the AIDS staff designed a questionnaire (see Exhibit B) to be completed by persons who had requested information from the AIDS office during the three-year period from September 1, 1978, through August 31, 1981. The survey instrument was designed to collect evidence regarding: (a) means by which users learned of AIDS services, (b) types of services requested and frequency, (c) major effect or benefit of services, (d) types of services requested and frequency, and (3) place of employment of users.

Approximately 9,000 requests for information had been received by.

the AIDS office during the three-year period being studied. About 6,400

of the requests required a computerized literature search. The response

package prepared for these clients consisted of several parts including:

(a) a computer printout listing annotations and complete bibliographic

references of literature related to the clients' interests, (b) other

pertinent materials including abstracts of State and national programs and projects, and (c) suggestions for using the response package and directions for obtaining additional information.

The population to be sampled for the survey was defined as the 6,400 clients who received the "standard" response package during the 1978-79, 1979-80, or 1980-81 school years. A random sample of 400 was drawn. Complete addresses were obtained for 301 of those sampled, and survey instruments were mailed September 25, 1981. Completed questionnaires were received from 174 clients, a return rate of 59.4 percent. A summary of return rates by year is presented in Table 11.

Table 11
Summary of AIDS User Questionnaires Mailed and Returned

Year	Number -Mailed	Not Delivered	Assumed Delivered	Returned	Return Rate		
1980-81	101	1	100	63	63.0		
1979-80	. 163	6	157 .	89	56.7		
1978-79	37	1	36	22	61.1		
TOTALS	301	8	293	174	59.4		

For the purpose of presenting data and interpreting the findings, all respondents were grouped into "user groups" based on their position or job title. This grouping permitted easy comparisons of persons in various professional positions regarding how they learned of AIDS, utilized the services, perceived the benefits, etc. The user groups and the number of respondents in each are listed below.

· · ·	
Description of User Groups	Number of Respondents
Teachers (elementary and secondary teachers, librarians, and counselors)	76
Pricipals (elementary and secondary building principals or assistants)	`20
Central Office (superintendents or assistants, supervisors and other LEA central office personnel)	. 35
Postsecondary (all persons in two-year or four-year postsecondary institutions)	18
State Employees (employees of the State Department of Education as well as other State agencies or departments)	16
Other (includes three respondents who did not identify their position)	, <u>9</u> .
Total Respondents	174

The findings of this questionnaire are presented in Tables 12 - 20. Comments and conclusions are presented beneath each table for the convenience of the reader.

Source of Initial Awareness of the AIDS Office and Its Services (Continued)

Comments:

- The majority of educators (72 percent) learned of AIDS' services from three sources: (a) presentations by the AIDS staff,
 (b) in connection with a college course, or (c) by word-of-mouth from a colleague.
- 2. College courses and colleagues were the most important sources for teachers, whereas formal presentations by the AIDS staff were most often cited by central office personnel. This may indicate that central office personnel (i.e., administrators, supervisors, coordinators, etc.) either have more opportunity or are more apt to attend meetings, workshops, etc., where formal presentations are made.
- Printed material alone (brochures, posters, newspaper articles) appeared to be relatively ineffective as a means for creating initial awareness of services such as AIDS.
- 4. In spite of a large number of awareness presentations arranged specifically for State employees, less than one-third indicated the presentations as the source of their information about AIDS.

Table 13

Total Number of Different Occasions AIDS Services Were Requested Since Its Founding

	Item		Eve	ryone	Tea	chers	Prin	cipals		ntral (* Eice		ost- ondary		tate loyees	o	ther

- 1. Over 70 percent of AIDS' clients were multiple users, that is, made information requests more than once.
- 2. Central office personnel were the most consistent "heavy" users of services. Almost 29 percent indicated they had made information requests more than ten (10) different times.

- 1. The majority of users take a "second step" to acquire more information after reviewing the printout of annotated citations. Only 46.5 percent indicated they took no further action. The majority obtained microfiche or complete journal articles from the AIDS office or other sources.
- 2. Microfiche and complete journal articles were obtained more often from sources other than the AIDS office, suggesting that AIDS services promote better utilization of existing resources such as university and public libraries, national information services, etc.

NOTE: One-page abstracts of NDN exemplary programs are included in some response packages as a low-cost means of promoting awareness of these programs when they are related to the client's area of interest.

- 1. The inclusion of one-page abstracts has led to 17 new programs being adopted or seriously considered during the three-year period of the survey.
- 2. Central office personnel (i.e., local decision makers) were most apt to take action leading to the installation of a new program or practice.

Major Effect or Benefit of Services Received From AIDS (Continued)

Comments:

,

- 1. An AIDS literature search is most frequently used to provide an overview of existing information and as a lead to other sources of information. All categories of users indicated this was the most important benefit of AIDS' services.
- 2. Assistance in completing a graduate course was the second most important benefit. Teachers, in particular, cited this assistance as a major benefit.
- Twenty-nine percent of all users indicated AIDS services had made a major contribution to improved classroom teaching and management;
 percent indicated a contribution to curriculum improvement, and
 percent indicated an improvement in administrative procedures.
- 4. Central office personnel were the local user group which perceived AIDS' services as having greatest impact on teaching, curriculum, and administration.

Table 18

If AIDS' Services Were Not Available, How Would Client Obtain Comparable Information

Comments: (No comments--table presented for information only.)

155

Feedback on Information Packages (Searches)

Since its inception AIDS has included user evaluation forms (see Exhibit C) in each information package delivered. Return rate has averaged about 25% over the life of the project.

Returns are reviewed individually for immediate follow-up action in needed. In addition, quarterly totals and user comments are reviewed and analyzed for trends that might indicate a need for revision in operating procedures, processes, etc. (Table 6 in Section B provides a summary of these user evaluations.)

Survey of All LEA Linkers and Users in Selected School Systems with Linkers.

An ambitious intelligence gathering effort was undertaken in the spring of 1979 in the form of a survey of AIDS' linkers and users in selected systems (See Exhibit D). Reports of individual LEA results were presented to linkers from participating LEAs during a Linker workshop. A copy of the "Executive Summary" of results was delivered to the linker and superintendent from each participating LEA. Results of the survey were used in selecting "new" linkers, in designing a three-day workshop for all linkers, as well as in revising certain procedures, forms, etc., associated with service delivery. (See Exhibit E for a copy of the "Executive Summary" of results.)

2. Significant Learnings

Five years of direct, intensive involvement in the design, implementation and evaluation of a coordinated, comprehensive dissemination/diffusion program have provided AIDS with a knowledge base grounded in both theory and practice. As the program has evolved, AIDS staff have taken full advantage of craft knowledge, have looked at the literature and have relied upon recognized experts in the field of dissemination and change theory for guidance in planning and implementing activities associated with each phase of project development from awareness through evaluation. Staff have attempted to internalize those precepts and principles most applicable to the state-of-the-art and practice in Alabama and most relevant to the identified needs and priorities of Alabama educators. The developmental approach adopted by Project planners has enabled short-term piloting and evaluation of both techniques and strategies adapted from others as well as those conceptualized by AIDS' staff.

Practically everything that the AIDS staff knows about dissemination has been learned during the life of the SCBP. AIDS has never had anyone join the staff who, by virtue of education or experience, was a "dissemination specialist." The present level of staff proficiency and effectiveness has been attained by a small group of highly committed individuals who believe in what they are doing and who have been willing to work untiringly over a long period of time to develop competencies which enable AIDS to provide services to Alabama educators. These efforts have been driven by one overarching purpose—the improvement of educational experiences for students. Obviously, it is neither possible nor desirable to report the myriad learnings which have evolved

during the past five years. Furthermore, while some of the learnings may be unique to AIDS, many tend to substantiate what others have theorized or corroborate experiential learnings of disseminators engaged in similar activities. Nevertheless, the learnings/observations/impressions reported below have been helpful to the AIDS staff and seem to offer some basic insights worth sharing.

multidimensional process. Multidimensional because each critical-variable associated with its implementation is pluralistic not monolithic in nature. The (a) needs and interests of client groups are varied hence the (b) types of resources they require are different as are the (c) delivery systems which ultimately reach and can potentially impact them. Thus a wide range and variety of customized dissemination strategies are essential if maximum benefits are to be derived. Furthermore, dissemination efforts must go beyond mere provision of information and focus upon "educating" people first to recognize a need for information and then to use knowledge in the improvement of practice.

Do be both affordable and workable, educational dissemination must be collaborative in nature. Many agencies and organizations are in possession of the resources -- human and material -- required for educational improvement. For one agency to replicate the resources or services of another is neither understandable nor justifiable from a management perspective; it is neither understandable nor acceptable from the client perspective. Linkages between and among resource agencies must be conceptualized and activated. From its inception, AIDS has practiced cooperation, coordination, and collaboration in lieu of duplication, replication, and autonomous action. As a result, networks with colleagues engaged in similar missions are in place and functioning. AIDS.will

continue to capitalize upon these established networks, refine these, and develop new ones as necessary in perfecting its unified and comprehensive dissemination/diffusion system.

To be legitimate over time, educational dissemination must be continuously evaluated. The environment in which dissemination occurs is not static, rather it is fluid, ever-changing. Target groups of clients, their needs and interests, resources and resource configurations, delivery systems—all are in constant flux. What worked today may not work tomorrow and vice versa. Formative evaluation activities are essential to the success of any educational improvement effort.

The above learnings strongly suggest that multiple strategies must be designed to assure maximum involvement of users in all phases of the dissemination/diffusion process—from initial awareness to implementation. Provisions for both formal and informal input and feedback are essential in order that users have a significant influence on the services being provided. Sensitivity and responsiveness to user needs coupled with the staff's commitment to strive constantly for improvement are important factors in building a successful dissemination program.

In its capacity as State Facilitator (SF) in the National Diffusion
Network (NDN), AIDS has designed variable strategies discriminated and
tailored to its multiple client groups for each of the following subsystems
of the project: (1) Awareness; (2) Needs Identification and Matching;
(3) Pre-Adoption Information Acquisition; (4) Training; (5) Monitoring and Technical Assistance.

The design of dissemination strategies for each subsystem proceeded from a pool of resource variables developed as a part of project planning. For each subsystem, variables for strategy selection were offered in three critical areas: target client group (to whom),

deliverable (products) and delivery system (how)..

The most and least effective strategies for each subsystem, based upon both formal and informal assessments of the SF, are delineated below.

AWARENESS SUBSYSTEM

Most Effective Practices and Strategies:

- Training and support of project collaborators (i.e., Title I, Title IV-C and instructional staff members, Basic Skills Team members, IHE faculty and professional associations) to enable their direct promotions of "level one" awareness.
- 2. Involvement of project collaborators in planning and facilitation of statewide awareness sessions (e.g., programming of NDN exemplary program awareness presentations at State or regional conferences sponsored by Title I, special education, career education, attendance supervisors, Alabama Reading Association, etc.)
- Training and support of AIDS' local school system linkers to enable their direct promotion of "level one" awareness.
- 4. Involvement of local school system linkers in planning and facilitation of local system awareness sessions.
- dissemination/diffusion unit (AIDS) which enables (1) inclusion of descriptions of relevant Developer/Deminstrater (D/D) projects in all AIDS' response packages to client requests for information concerning program improvement needs, (2) discussion of NDN options in one-to-one conferencing with resource center clients, and (3) inclusion of NDN and SF awareness in all AIDS' awareness presentations.
- 6. Use of in-state project adopters as presenters at awareness sessions.
- 7. Education of all professional staff of AIDS to as many different D/D projects as possible (through attendance at in-state awareness and training sessions, review of D/D awareness materials, etc.).

This promotes optimal effectiveness of functions referenced in #5.

- 8. Small-scale, personalized approaches to promotion of awareness at all levels.
 - 9. "On-adopter-site" visit by interested clients, either in state or nearby out-of-state sites. (On-developer site visit can be very effective, but also very costly.)
- 10. Promotion and facilitation of Alabamians' attendance at Title I NDN Regional Awareness Conference.

Least Effective Practices and Strategies:

- 1. <u>Large</u> (in excess of 300 participants and/or eight D/D presenters) statewide awareness conferences.
- Mass, indiscriminate mailing of NDN, SF, and/or D/D awareness materials.
- 3. Regional awareness conferences, except Title I (D/Ds frequently are not targeted to Alabama needs, conferences are too large and travel expenses are often prohibitive).

NEEDS IDENTIFICATION AND MATCHING SUBSYSTEM

Most Effective Practices and Strategies:

- Personal, one-to-one interactions with clients regarding nature,
 scope and intensity of need areas as well as system or environmental
 characteristics are essential. Due to resource and staff limitations,
 - involvement of project collaborators and local linkers has been essential to the operation of this personalized, one-to-one approach.
- 2. Maximum involvement of those who will ultimately implement project (e.g., teachers and building principals) in this phase of the adoption process.
- 3. Provision of information concerning alternative D/Ds (as opposed to one selected D/D) in response to individual client needs.
- 4. Use of existing local needs assessment data in counseling/conferencing with clients.

 Use of existing local needs assessment data in counseling/ conferencing with clients.

Least Effective Practices and Strategies:

- 1. Mass mailings of paper-and-pencil needs identification instruments (e.g., SF Needs Identification Survey).
- 2. Recommending single solution to given problem/need.
- 3. Expending scarce SF and D/D resource by allowing reasonable amount of "window shopping."

PRE-ADOPTION INFORMATION ACQUISITION SUBSYSTEM

Most Effective Practices and Strategies:

- 1. Arranging for prospective adopters to talk directly with D/D (either face-to-face when possible or via telephone conference). It is particularly important that such a conversation occur prior to any decision to visit a D/D site so that a determination of the necessity of such a visit can be made.
- 2. Arranging for prospective adopter to visit and talk directly with an in-state project adopter (if one exists) or with an out-of-state adopter in a school/system with characteristics similar to prospective adopter site.
- 3. SF conferencing with client to generate key questions client wishes to pose to D/D and other project adopters prior to any site visit.

Leave Effective Practices and Strategies:

- 1. Reliance upon print-based media, e.g., project materials and correspondence.
- 2. Dependence upon SF (or other "third party") to convey essential information concerning project: (Often too much is lost in the translation.)

TRAINING SUBSYSTEM

Most Effective Practices and Strategies:

- Insistence that those involved in administering project (e.g., school building principal) and those involved in evaluating project (e.g., central office administrators) be trained together with those who will actually operate project (e.g., teachers).
- 2. Training on an Alabama implementation site.
- 3. Training of project collaborators in projects of relevance/
 interest to them (e.g., training of State Title I staff in
 Title I adoptions, Title IV-C staff in Title IV-C-sponsored
 adoptions, Basic Skills Team members in adoptions in their
 geographical areas of responsibility, IHE faculty in their areas
 of specialization, etc.). This promotes collaborators' ability
 to participate in monitoring and provision of follow-up T.A. to
 adopter site and enables them to support efforts of those responsible
 for implementation.
- 4. SF's assumption of responsibility for making travel and other arrangements for D/D trainer and SF's participation in at least a portion of each training session. This insures that SF will have time with D/D to provide additional background information on adopter, to plan for monitoring and follow up and to procure needed first-hand information on project operation.
- 5. Scheduling of back-to-back D/D activities when D/D comes for project training (e.g., training in one system with awareness or follow up or training in another system as appropriate).

Least Effective Practices and Strategies:

1. Training away from the adopter's home site (whether on another adopter site or, in most cases, on the D/D's home site). The threats of a "new," "not-invented-here" project are greatly reduced when those to be involved in the implementation are on their "home turf." Training on-site also (1) promotes participation of administrators and others who would not be directly involved

in project operation and (2) gives D/D "first-hand" information concerning adopting system.

- 2. Training conducted by someone not completely knowledgeable about all aspects of the project.
- Ill-timed training, either too early or too late, for smooth and proper planning for implementation.

Note: All of these "least effective" training strategies have been used at one time or another in the name of cost-efficiency. The Alabama SF's experience has been that these practices should be exceptions, used only when absolutely essential.

MONITORING AND TECHNICAL ASSISTANCE SUBSYSTEM

Most Effective Practices and Strategies:

- 1. Involvement of project collaborators in monitoring and T.A. activities.
- 2. Securing recommendations from D/Ds concerning scheduling and purpose of SF monitoring.
- 3. Scheduling of D/D monitoring and follow up as early as possible after training.
- 4. Monthly telephone checks with adopters and periodic SF site visits.

Least Effective Practices and Strategies:

- 1. Reliance upon written reports for monitoring activities.
- 2. Reliance upon correspondence and other print media for provision of T:A.

Project CAUSE (Collaborative for Alabama Urban School Educators), funded by NIE and administered and coordinated by AIDS, has complemented and supplemented AIDS' dissemination capabilities. This small one-year planning grant provided the impetus which led to the development of a collaborative comprised of the Birmingham City School System, the Mobile County School System, the Alabama Department of Education and the Appalachia Educational Laboratory. The purposes of project CAUSE were: (1) To increase the capacity of urban educators in eligible school systems in this region to use resources available through rd&d agencies and, as a by-product, to strengthen their own internal rd&d capability; (2) To develop linkages between the eligible urban systems and build upon linkages currently existing between the offeror and other parties to CAUSE; (3) To constitute a collaborative that is viable and effective in serving the needs of its members and that can serve as a model for locales and agencies with similar characteristics and needs; and (4) To direct the above purposes as means toward the end of improving educational policies and practices and increasing equity within collaborating agencies.

Several significant learnings have accrued as a result of heavy, frequent staff involvement in project CAUSE (Collaborative for Alabama Urban School Educators) activities. The following propositions which influenced project CAUSE proposal development and were reflected in the project goals and objectives have even greater meaning and validity after a year's experience in establishing an urban collaborative than when they were written.

- All parties should be actively involved in planning from the earliest stages.
- 2. A successful collaborative must be formed for the "right" reasons at the right time with active involvement of the "right" people.

- 3. Participation must be voluntary, participants must have potential for meaningful commitment and follow through and the time to participate.
- 4. Effective collaboration requires a common interest in a significant goal.
- 5. Adequate time and attention must be devoted to cooperative planning, organizing, developing and nurturing the Collaborative.
- 6. Adequate provisions must be made for shared decision making and equal participation.
- 7. A standard set of operating procedures ("ground rules") must be established and a governing structure (policy body) which provides egalitarian control and promotes a democratic spirit must be formed in order to assure shared responsibility and authority for policy making.
- 8. The initiating organization must build trust, establish credibility and remove any threat it poses to other collaborators.
- Provisions must be made for a clear understanding of and agreement on intent, conditions, roles, responsibilities, constraints, expectations, division of labor and resources and rewards.
- 10. All parties must understand and accept the fact that the tasks involved in mutually productive, effective collaboration are highly demanding, time consuming and complex, and that parties often must "give" more than they receive before the principle of reciprocity or mutual exchange begins operating.
- 11. Project goals should be realistic and reasonable, objectives should be clear and precise, and provisions for early, visible accomplishment should be assured.
- 12. An effective, two-way communication system must be carefully developed, organized and maintained not only to make possible easy, frequent and productive dialog between and among all

parties, but to encourage and force it.

- 13. There must be a feeling that the Collaborative is benefitting individuals and their organizations, as well as the group as a whole.
- 14. A sense of local ownership (both psychological and financial) and recognition that local needs are being met are essential to sustaining an innovation or new capacity.
- 15. The Collaborative must be so structured that active participation from the organizations is both desirable and essential, and success is greatly dependent upon the interdependence of its members.
- 16. Local educators are more receptive to practical (practitioner-based, field-based, experience-based, craft knowledge) or action research approaches to problem solving than to theoretical solutions or esoteric discussions.
- 17. The human element (people-to-people interaction) is a critical factor in efforts to link research and resources to practice.
- 18. In a school system, significant change usually occurs at the building level which means that the quality, attitude and leadership of the principal and the involvement and perception of a need to change on the part of teachers are essential conditions for lasting educational improvement.
- 19. Flexibility must be built in to allow LEAs to identify system-specific needs/problems, explore resource availability and possible solutions and pursue an intra-agency approach for sharing success.

A number of specific learnings gleaned from Project CAUSE tend to reinforce many of these propositions and have served to shape continuation plans and future activities. Those deserving mention here are:

- Decision.making by consensus is sometimes difficult, time consuming and exasperating, but the benefits/ advantages are well worth the effort. The following advantages associated with consensus decision making were derived from three CAUSE Policy Council (governing body) meetings and several other group activities which encouraged participatory decision, making.

- Maximizes inclusion, input and responsibility of all members in decision-making process; therefore, groups becomes more efficient in satisfying members' personal goals.
- Leadership functions diffused among all members; therefore group becomes more effective because different leaders emerge depending upon the issue at hand and upon the recognized competencies of the participants.
- Full and free communications take place between members without regard to ascribed rank.
- 4. Participatory strategies are particularly effective in groups where the task goals are unstructured and where the goal of the group is innovative or creative problem solving.
- 5. Members are more committed to decisions made by the group and to the implementation of the products which emerge as a result of the group's efforts because they have had input into the solution.
- 6. Builds group cohension.
- 7. Minimizes risk of one or two persons actively sabotaging the decision.
- 8. Avoids quick compromise techniques, such as majority rule, trading, or average of rankings, thus breaking a "strain toward convergence."
- "Assembly effect bonus" potential of a group to outperform its own "best" resource.
- 10. Satisfaction with group decision.
- 11. More commitment to decisions reached.
- Parents, teachers, students, community members, principals, central office staff in urban schools are not apathetic—they are not unconcerned and disinterested. They do care. They want to be involved in improving schools and schooling. Contrary to popular opinion (fanned by the prophets of gloom and doom) non-educators (e.g., parents, students, business/labor representatives) are extremely interested in and committed to planning local school improvement efforts and are very willing to give of their time and energy to planning activities.
- Educators in urban settings are not afraid to identify problems and will make the necessary effort to locate and implement promising solutions that meet their needs.

Furthermore, they are willing to share ideas, insights, materials, programs, practices and other resources resulting in the discovery and use of previously underused or generally unknown sources of cost-effective assistance. Members are beginning to realize that much more can be accomplished collaboratively than separately.

- Most individuals who "buy into" a collaborative do so because they have a personal/professional respect for and trust in the <u>individuals</u> who are leading or promoting it. During the formative period in a collaborative's development, most individuals' commitment is conditional and tentative and is greatly dependent upon their rapport with and/or loyalty to the leaders.
- The higher the level of interaction between and among individuals from different agencies in the Collaborative, the more important and constructive the event in building the incentives for collaboration.
- The success of a collaborative depends to a great extent upon the overall attitude of the individual collaborators, particularly with regard to their willingness to be involved in the activities of the collaborative. It is not how much an individual collaborator has to contribute, but how much it is willing to give of what it has and how much it is willing to draw from the common resource pool established for the collaborative that make a collaborative effort successful. While collaboratives should provide for equity in decision making, they should not be established on the premise that all members/parties can contribute equally to the resource pool. What is important is that each member to the collaborative have an equal opportunity to contribute its strengths/successes and to draw from collaborative's resources a possible solution to a recognized need.

These learnings strongly suggest that urban schools are not doomed to failure or mediocrity. Improvement of urban schools and schooling is neither a hopeless nor unrealistic expectation. Committed people operating in a collaborative mode with strong, positive leadership and support can effect change.

Extensive involvement by AIDS in efforts to get local educators to make greater use of r & d has resulted in learnings which merit reporting. Sponsoring attendance of selected individuals from LEAs at workshops has been one strategy that has proven to be especially effective in achieving this goal when the following criteria have been used.

In deciding whom to involve (from LEAs) in sponsored workshop

activities, the following conditions seem to justify the cost and make a noticeable difference in the likelihood of benefits being derived from attendance.

Involve LEAs that have:

- (1) <u>Leadership</u> who have evidenced interest in or commitment to research-based solutions to identified problems.
- (2) Demonstrated commitment or will commit to improving curriculum and instruction.
 - (3) Strong emphasis upon professional development and comprehensive personnel improvement program.
 - (4) Understanding of the importance of sending teams of individuals from the LEA who:
 - (a) Are headed by an individual in a leadership position
 - (b) Are comprised of a broad range of individuals (e.g., classroom teachers, principal(s), central office support staff).
 - (c) Recognize the value of r & d-based solutions and relevance of these to local problems/needs.
 - (d) Are committed to "taking r & d home" for further consideration, sharing and follow up as appropriate.

Although the following comments are mainly in the form of observations or impressions and don't qualify as "learnings" in the strictest sense, they seem important enough to include in this section.

- Practice dissemination from the practitioners' perspective in a proactive manner.
- Never promise more than can be delivered.
- Build interpersonal relationships (internally, with LEAs and with outside agencies, organizations which can provide information and services) and establish confidence in staff's ability to respond to client needs.
- Develop staff skills and competencies that enable efficient delivery of user-determined services.
- Establish credibility and a positive image among clients (users must be convinced that staff wants to help, will help and is capable of providing needed assistance).

- Telling people how great the program is isn't enough. The staff must work continuously to <u>demonstrate</u> (by performance) that the services provided by the dissemination office are worthwhile, practical and personalized. Staff must convince users that they are sincere, capable and interested in providing services (must "sell" themselves as well as program).
- A great deal of interaction (as much face-to-face as possible) between staff and clients on a fairly regular basis is important. (Personal contact over a long period of time.)
- Always keep in mind that there should be some WIIFM (Whats In It For Me?) for everyone.
- We in education can solve more of our problems than we realize if we will stop depending upon someone else to solve all of the problems for us. There are tremendous, untapped potential solutions (in state) to many of our problems. For example, much progress can be made through inter- and intra-system sharing of ideas, programs, practices or by pooling of resources (especially human resources). This would require previously unexplored, imaginative approaches involving mutually beneficial cooperation and collaboration. An interpersonal network (both within and between schools and systems) should be established, promoted and supported.

Another promising possibility is for local schools and systems to make greater use of the many cost-effective, successful programs and r & d products currently available for adaptation. Obviously, strong leadership, commitment and concern on the part of administrators would be critical to the success of such endeavors.

- Most change in schools occurs at the building or classroom level.
- Strong, positive leadership on the part of the building principal is critical in improvement efforts.
- A core or nucleus of educators (often a team comprised of a few committed teachers, the principal and one or more highly supportive, interested members of the central office staff) can effect change.
- Strong support, active involvement and encouragement by the superintendent and central office staff are important factors in change or improvement efforts.
- Assuring a good "match" between client problems/needs and information/programs is an essential step in the adoption/ adaptation process.

- Providing the right information to the right person(s) at the right time in usable form is a definition of dissemination to which local educators can relate.
- Arrange for and insist upon maximum involvement of users throughout all aspects of dissemination, especially when implementation or adaptation of promising programs/ practices is being considered.

SUMMARY OF PROGRAM/PRACTICE

DIRECTIONS. In the space below provide a summery of the program/practice. When applicable, indicate the twos of program (i.e., subject or problem area), its intended audience (s), its purposes or goals, important characteristics and/or distinguishing features, and major cutcomes or results. Limit the summary to 200 words. This summary will be included as part of the document resume which will be disseminated to educators throughout the State.

INDEXING OF PROGRAM/PRACTICE

DIRECTIONS In order that AIDS may accurately index this program/practice to the Alabama Resource File, we need your cooperation in completing this section. Following are key terms of descriptors which have been categorized into eight topical areas representing significant indexing points. Place many terms as you deem appropriate in each category, you are encouraged to be selective and discriminating in the choices you make. (If possible/applicable, check at least one descriptor beneath each of the eight category.)

AIDS USER QUESTIONNAIRE

1.	How did you first learn about the AIDS office and its services?
	l. article in the Alabama Education newspaper
	2. awareness presentation by AIDS staff member
2	3. AIDS brochure or other printed material
	4. through a local inservice program
	5. informally (word-of-mouth) from a colleague
	6. college course (undergraduate or graduate)
	7. SDE employee other than AIDS staff
	8. Otherspecify
	· /
2.	Approximately how many different times have you requested services from the AIDS office since it was established?
	1. Once
*	2. 2 - 5
	3. 6 - 10
	4. more than 10
3.	Most requests to AIDS require a computer literature search which results in a printout of titles and abstracts. How did or how have you generally used the printout(s)? (Check all that apply.)
	l. reviewed the citations but usually did not order complete documents
	2. ordered one or more microfiche from AIDS office
•	3. obtained microfiche from a library or other microfiche collection
•	4. ordered one or more complete journal articles from AIDS office
	5. located journal articles in a library or other source
	a. Have you ordered microfiche or paper copy from ERIC Document Reproduction Service (Arlington, Virginia)?
	1. Yes2. No
	If yes, approximately how many times?
	b. Have you ordered one or more complete journal articles from University Microfilms International (Ann Arbox, Michigan)?
•	1. Yes 3. No
	If yes, approximately how many times?

4. In addition to the computer printout, the response package sent from the AIDS office frequently includes one or more one-page abstracts which describe exemplar projects in the National Diffusion Network (NDN), new or innovative programs from the Alabama Resource File, or documents from the State Department of Education. How did or how have you used these additional abstracts? (Check all that apply.)	n
l. I do not recall receiving additional abstracts	
2. reviewed them but usually took no further action	
3. discussed one or more of the abstracts with a colleague	
4. contacted the AIDS office or the person identified as the principal investigator for more information. Approximately how many times# have you requested more information?	
5. initiated steps which led or are leading to installation of a new program or practice described in an abstract	
5. After reviewing the complete response package, what did or what do you usually do with it?	,
l. discard it	
2. file it for future reference	
3. pass it to a colleague to share ideas. Shared with: (Check all that app	ly.)
1. students	
2. teachers	
3. counselors, librarians	
4. administrators, supervisors, coordinators	
5. otherspecify	
6. What has been the major effect or benefit of the services you received from AIDS? (Check all that apply.)	ı
1. provided assistance in completing a graduate course	ŧ
2. provided direction or references to other sources	į
3. provided input for a workshop or other presentationexplain	,
4. contributed to improve classroom teaching and management techniques explain	•
5. contributed to improve curriculum design or materialsexplain	•
6. contributed to improve administrative proceduresexplain	
7. otherexplain	
8. provided little or no effect or benefit

Instructions: Each of the eight sections comprising the remainder of the Survey is headed by a question designed to collect data concerning your need for and use of the best available current information in your job. Please begin each section by reading carefully the question and associated alternate responses. Then respond to each item by circling the number beneath the alternate response that best reflects your behavior or feeling concerning each. Please be sure that you mark a response for each item. Note: We suggest that you mark the first response that comes to mind. Please do not spend a lot of time attempting to analyze these items. There are no correct or even preferred responses. We are only interested in your perception concerning each item. Thank you for your cooperation.

I. We are interested in situations/occasions/assignments which prompt you and other Alabama educators to think about the need for obtaining the best available current information. We are also interested in knowing for which of these situations/occasions/assignments you are successful in securing such current information. Please share with us your recent experiences with regard to information needs and information use for each of the situations/occasions/assignments listed in the center column by indicating how you perceive a need for information related to each specified item (left response column) and how frequently you actually secure and use information for each identified purpose (right response column).

THANK YOU FOR YOUR COOPERATION

Survey of AIDS Local School System Linkers in Selected Alabama School Systems

Instructions: This survey, is comprised of seven sections each of which is headed by a question designed to collect information converning your perceptions of certain important elements related to linking local schools with a centralized information center such as AIDS. Please begin each section by reading carefully the question and associated alternate responses. Then respond to each item that follows by circling the number beneath the alternate response that best reflects your perception relative to the issue in question. We suggest that you mark the first response that comes to mind. Please do not spend a lot time attempting to analyze these items. There are no correct of even preferred responses. We are only interested in your perception concerning each item. Please be sure that you mark a response for each item. Thank you for your cooperation.

I. For AIDS to better serve you, it would help us to know what you do on your job Would you please tell us how frequently your regular job enables or causes you to become involved in the activities listed below? (Circle the number beneath the response that corresponds most closely to your actual involvement in each indicated activity.)

MAJOR FINDINGS OF AIDS' SURVEYS OF LINKERS AND USERS IN SELECTED ALABAMA SCHOOL SYSTEMS

SPRING, 1979

EXECUTIVE SUMMARY

Introduction

In the spring of 1979, the Alabama Information and Development System (AIDS) staff designed and conducted two complementary surveys in an effort to obtain information that could be used to plan for improvements in AIDS' overall program of services for Alabama educators. More specifically, the findings and conclusions from these surveys were intended to assist in reviewing and improving the following components of AIDS' operation:

- (1) Orientation and in-service training experiences for present and figure AIDS' linkers;
- (2) Expansion of linkage activities within systems currently participating in this program and to local systems that do not presently have AIDS' linkers;
- (3) Refinement of communications networks between local linkers and the ADDS' office:
- (4) Design of various types of avareness and in-service training sessions for potential users of AIDS' services.
- (5) Delivery of information services to local educators throughout Alabara.

These survey efforts were ambitious ones, and thanks to the cooperation of the hundreds of respondents the purposes of the surveys were or are being realized. The AIDS' staff gratefully acknowledges the participation of all respondents and the cooperation of the local school superintendents in participating systems.

The summary which follows highlights major components of the surveys together with related findings. Complete summaries of survey results are available in the ATDS' office. Summaries of responses from individual participating systems are being provided for the system superintendent and linker(s).

Information Needs Prompting Survey Efforts:

To better serve the information and program needs of Alabama educators, AlDS' staff indentified a need for standardized information concerning:

- 1. Characteristics and needs of the individuals serving as local linkers;
- 2. Characteristics and needs of potential clients (local school personnel to be served by these linkers); and
- 3. Major other factors related to information seeking and knowledge utilization in these Alabama school systems.

These information needs guided the design of the two surveys discussed below.

Design and Administration of Surveys:

The AIDS' staff designed two separate survey instruments to collect needed information. The first, entitled <u>Survey of AIDS local School System Linkers in Selected Alabama School Systems</u>, ("Linker Survey") consisted of 200 items dealing with six major areas of concern. This Survey was administered to 48 local school sustem staff members who were serving as AIDS' local linkers during the 1973-79 school year. Thirty-three (33) completed (and usable) surveys were returned to AIDS, representing a 69% return rate. These 33 surveys represented a total of 33 of the 45 school systems (73% to which surveys were delivered.

The second survey, entitled <u>Information Needs and Uses of Alabama Educators:</u>

A Survey of Teachers and Administrators in <u>Selected Local School Systems</u>, ("User Survey") consisted of 136 distinct items which constituted the eight major sections of this Survey. The User Survey was distributed to a total of 926 potential users in 21 selected school systems. Criteria used to select these 21 systems for participation related to the extent of their linkers' involvement in AIDS' linkage activities. The 926 potential respondents represented a random sampling of all staff numbers in these 21 systems. A total of 534 completed (and usable) survey instruments were returned, representing a 33°, return rate. Major biographic characteristics of respondents are presented in Table 1.

The two surveys contained four common sections. Linker and user responses to the 31 items comprising these common sections were thus amenable to comparison tiring antagreedcment and analysis.

Activity, Knowledge and Proficiency Profiles of AIDS' Linkers Responding to Survey:

- 1. Activity Profile. To determine if the 31 individual linker respondents had similar job responsibilities in their respective local systems, the following question was posed (as Section I of the Linker Survey instrument): "Would you please tell us now frequently your regular job enables or causes you to become involved in the activities listed below?" Thirty-three activities were included for response on a scale from "usually daily" to "not at all." Linker responses to this section were used to develop the "Activity Profile of AIDS' Linkers" which is included as Table 2. Berhaps the most significant finding emerging from an analysis of responses to this section was that the individual respondents, all of whom had been initially designated by their local superintendents to serve in the linker capacity, did not respond randomly to items in this section; rather, the responses suggest a significant degree of commonality among tasks performed by these local educators.
- 2. Knowledge Level Profile. To determine the extensiveness of knowledge possessed by linker respondents concerning services and resources available through AIDS, linkers were asked to rate their personal knowledge relative to twelve (12) knowledge areas on a scale from "none" to "extensive." The results of this self-assessment presented in Table 3 suggested areas of need for future AIDS' training endeavors.
- 3. Proficiency Level Profile. Linker respondents were asked to rate their "proficiency level" for fifteen (15) competencies/skills that are related to the performance of the linker role using a scale from "no opportunity to assess" to "extensive." The "Proficiency Level Profile" emerging from these responses is presented as Table 4. Like the "Knowledge Level Profile," this suggested areas of need for additional AIDS' training.

Findings Relative to Personal Characteristics of Linkers.

Respondents were presented with 27 adjectives depicting personal traits, qualities and characteristics and were asked to indicate how well each described them (on a scale from "extremely" to "not at all"). Of these 27 traits, "approachable" was the one which the greatest number of respondents felt "extremely" or "very" characteristic of themselves. A distant second, "self-directed" was viewed by 35% of the respondents to be "extremely" or "very" characteristic of their own behavior. Following these two in the top ranking were "responsive" (79%), "resourceful" (76%), "flexible" (75%), "impartial" (75%), and "task-oriented" (76%). The characteristics which the greatest number of linkers indicated to be "not at all" characteristic of themselves were "complacent" (49%), "non-directive" (18%), "authoritarian" (12%) and "political" (12%).

These same 27 traits were presented to the user respondents who were asked to rate each in terms of the relative importance (from "extremely" to "not at all") of each for an individual who is responsible for assisting educators in obtaining and using information. Six characteristics were rated by 90% or more of the user respondents as "extremely" or "very" important for such an individual. These were "resourceful" (96%), "helpful" (95%), "responsive" (93%), "approachable" (92%), "enthusiastic" (90%), and "productive" (90%). The characteristics which the greatest number of users rated "not at all" important were "impatient" (78%), "complacent" (50%) and "political" (45%).

Table 5 summarizes and compares linkers' and users' ratings of these 27 traits, A close examination of this table reveals a high degree of correspondence between linkers', and users' preferences regarding traits of a model linker. Only two of the ten characteristics receiving the highest ratings from users failed to be included among the traits receiving the nighest ratings from linkers. These two, "innovative" and "insightful," were replaced by "self-directed" and "task-oriented" among the linkers "top ten."

Findings Related to Factors Affecting Information Usage:

Both user and linker respondents were asked to indicate the extent to which the existence of 23 identified factors would affect their own (in the case of users) or "other educators" (in the case of linkers) tendency to seek and use information (Section IV of Linkers' Survey and Section VII of User Survey). Linker and user responses to these 23 items are summarized and compared in Table 6.

Findings Concerning Users' and Linkers' Perceptions of School System Characteristics:

To determine the extent to which certain factors which may relate to "educators' tendency to seek and use the best available current knowledge" exist in the local systems surveyed, both linker and user respondents were asked: "To what extent are the conditions listed below present in your school system?" Responses to each of the 23 items are presented in Table 7.

Sources of Information:

Respondents to "User Survey" were asked to indicate the extent to which they personally relied upon ten potential information sources (Section II of "User Survey"). Alternate responses ranged from "extensive" to "not at all." Averaging of all user responses yielded the following rank ordering of sources (from those used "most" to "least" extensively): (1) Discussions with teachers in your school/school system; (2) Reading professional journals/publications: (3) Participating in school system professional development (inservice) experiences; (4) Discussions with administrators/supervisors in your school/school system, (5) Attending meetings sponsored by

professional organizations/associations, (6) Enrolling in college/university courses and/or special workshops, (7) Attending meetings/conferences/workshops sponsored by State (and/or Federal) education agencies, (8) Discussions with educators in other school systems, (9) Informal contacts with university/college faculty, (10) Contacts with State Department of Education consultants.

Factors Inhibiting Information Use:

Wiser respondents were asked the extent to which eight factors interfered with their ability to "secure and use the best available current information in the performance of their professional responsibilities" (Section III of Survey). Alternate responses presented were "greatly interferes," "interferes somewhat," and "does not interfere." Responses were averaged and the following rank ordering emerged (from "greatly interferes" to "does not interfere"): (1) Lack of knowledge concerning what current information is available, (2) Don't have access to information when I need it, (3) Not enough time to read and use information even if I were able to obtain it, (4) Too time-consuming to make request for needed information, (5) Don't know where to go or whom to ask for help in securing needed information, (6) Limited access to professional journals and other literature, (7) Personal inability to recognize occasions when I can benefit from use of available current information, (8) Lack of personal conviction that information emerging from research and development efforts or other educators' experiences can help me.

Roles/Positions of Individuals whom Potential Users would Approach for Help in Obtaining and Using Information:

User respondents were asked the likelihood of their seeking assistance from ten given individual sources (Section IV-3). Alternace responses ranged from "extremely" to "not at all" likely. Again, responses of all users were averaged to obtain the following rank ordering (from "extremely" to less likely): (1) Teacher in your school; (2) Teacher in your school system, (3) Building principal, (4) School librarian, (5) School system instructional consultant, (6) Colleague in another school system; (7) Superintendent; (3) Cantral office administrator (other than superintendent); (3) University consultant, faculty member, and (10) State Department of Education consultant.

School Systems Submitting Local Programs and Practices to the Alabama Resource File (1978-81)
