ABSTRACT

This report describes the applications and work flow of a TRS-80 microcomputer at the Maine State Library, and provides sample computer-generated records and programs used with the TRS-80. The machine was chosen for its price, availability, and compatibility with machines already in Maine's schools. It is used for mailing list management (with pre-packaged SCRIPSIT and PENCIL/PAL software); serials check-in (with PROFILE); production of printed book catalogs and union lists of serials (with SCRIPSIT); compilation of statistics (with VISICALC); and typing invoices (with an in-house program). Customized software has been written in-house to enhance many of the pre-packaged programs. The report notes that word processing is the single most important library application for microcomputers. Sample records, forms, and lists generated on the TRS-80 are presented, including for the sake of comparison, serials records produced with both pre-packaged and customized software. Also shown are copies of customized programs which enable the Maine State Library to print serials records, search their large print catalog for new titles, list the holdings of a single library from a union list of serials, and produce invoices covering online searching on the part of member libraries of the Maine Online Consortium. TRS-80 at the Maine State Library

by Donald Wismer, Coordinator
Automated Data Services

October, 1982

I almost never write anything on a typewriter anymore. Microcomputer-based word processing is so much faster and more efficient.

But I began to write this on my primitive office key-flicker because the computer's not around! It's off in another Section gobbling up a film catalog!

We've had a TRS-80 Model III (Radio Shack) at the Maine State Library since last December, only ten months as I write this. Yet it already plays a significant role in library operations. It is the repository of many small mailing lists. It does serials check-in and gift subscription management. And it does word processing, including small list management and the production of various catalogs, flyers, handouts, and mass mailings.

Already one of the eight State Library Sections has ordered a machine of its own. Scheduling of the present machine is tight -- which is why I'm using a typewriter right now! And the future? Well, the future is bright and glorious and riddled with unknowns.

WHY A TRS-80?

Our decision to go after a microcomputer was not the result of cost studies or extensive work flow analyses. It proceeded instead from an almost intuitive sense by State Librarian J. Gary Nichols and a few others that such machines could dramatically raise individual productivity if used in a rational and carefully controlled manner.

We had heard that an essential ingredient of successful micro application was the presence on the staff of someone who had a personal interest in the technology. We had such a person --

me! I had had a Model III at home for over a year and was using it for writing and small business applications.

(Our library experience so far suggests that a micro is used most efficiently when there is an in-house hobbyist of some kind, but that even without such a person, significant work would be done using the prepackaged work processing program alone, if not several others.)

Why a TRS-80 as opposed to an Apple, Televideo, Sanyo, Atari, Commodore, Osborne, Xerox or some other? Two reasons. One was price: the Radio Shack machine with two disk drives, 48 kilobytes of memory, could be had for \$2000. The second reason: the local microcomputer climate. In Maine schools last year, for example, there were one hundred twenty TRS-80's, forty Apples, thirty-eight Commodores, four Ataris, and eighteen others.

Maine is a rural state. While there are many Radio Shack outlets, there were only two Apple and Commodore dealers when we bought our machine, none of them local, and the other brands were virtually unrepresented. Local service was important. So was the need for us, as the State Library, to reflect our constituency.

We did not need the superior graphics of the Apple and other machines for the purposes we had in mind. Software support for the TRS-80 was extensive and exploding. (Have you ever seen the phone-book sized magazine 80 MICRO? It's catching up with BYTE, and BYTE is hard to believe!) And we were not buying a machine whose presence would force all purchasing decisions in the future to fall into some narrow line. So we went ahead with the TRS-80 Model III, and have not regretted it.

Since then one of our regional consultants has purchased an Osborne, which is as portable as a briefcase. It suits his needs perfectly.

WHAT DO WE DO WITH IT?

Perhaps I should start with what we do NOT do with it:

1) CIRCULATION. It's too small for that at this library, and anyway the

relevant software is only now becoming available.

2) BILLING AND OVERDUES. But we're moving toward it, intending to use PROFILE III+, due to arrive any day.

3) STATISTICAL ANALYSIS. We have the software (STATPAK) and see it in the future.

4) BUSINESS OFFICE FUNCTIONS: accounts receivable, accounts payable, payroll, etc. That office would need its own, full time machine for such things.

5) ACQUISITIONS. But the Section that ordered its own machine, wants it for acquisitions!

6) CATALOG CARD PRODUCTION. No reason why not, except that we use OCLC for that.

7) PUBLIC ACCESS. Not our role at present.

8) DIAL-ACCESS TO DATA NETWORKS. We have on hand a Decwriter LA-36 that we've used for DIALOG, SDC, etc. for years, and while the micro could be used, there's no reason to yet. At some future date the direct storage of remote database output onto the micro's floppy disks may be indicated, though.

Here's what we DO do with it:

1) MAILING LIST MANAGEMENT. This was the first thing we did with the machine -- it's a natural, and we could have thrown out our Addressographs, if we had any. Using the word processing program SCRIPSIT from Radio Shack, and a privately-produced program called PENCIL/PAL, we became able to store mailing lists, print labels on our daisy wheel printer, and merge the mailing lists with text to produce custom form letters, i.e., letters that look individually typed, and go to many people with the same content. We now stock some sixteen lists, such as: state House and Senate members; Maine On-Line Consortium members; newspapers and radio stations in Maine; DOWNEAST LIBRARIES advertiser lists; a list of all state librarians; "Do You Like Libraries" lists (citizens who have responded to a Maine Library Association campaign to identify library supporters around the state). None of the lists have more than 600 names so far, a number reflecting the size of the lists

rather than the capacity of the machine, which is about 2500 name/addresses on the two disks. The State's central computer services don't want to touch lists that small, but my heavens, the work we save!

2) SERIALS CHECK-IN. For two hours every morning, a staff member uses PROFILE from Radio Shack to check in periodicals. About once a week the file is printed in triplicate and distributed to Circulation and Reference. The Kard-X has been abandoned.

3) CATALOG PRODUCTION. By this I mean printed catalogs, book catalogs if you will, not card catalogs. Both Film Services and Handicapped Services have entered catalog copy onto disks using SCRIPSIT. With the daisy wheel printer, high quality copy can be typed out in flexible format, and then sent out for photo-offset printing. Handicapped has already produced a catalog of large print books using not the daisy wheels, but a borrowed dot matrix printer with large type capacity. The beauty of both catalogs, of course, is that updating and reprinting next year will be childishly simple.

4) UNION LIST PRODUCTION. This is no more than a variation of 3) above, but worth mentioning separately to emphasize the possibilities. With Maine's Special Library Group (SLG) and Health Science Librarians Information Cooperative (HSLIC), we've put together a serials union list for thirteen special libraries so far, using SCRIPSIT. Again, it's a question of size. A large union list is not feasible on a small machine, but we're getting a handle on the holdings of libraries in Maine with unique collections. One person spent an hour a day for about three weeks for inputting, so that the staff time needed was not exorbitant. And next year, such easy updating!

5) STATISTICS. Not in-depth analysis, but compilation. Media Services uses VISICALC (Radio Shack) to keep track of videotape library usage, and Library Development uses it for compiling statewide public library statistics for later printing in the annual LIBRARIES OF MAINE.

6) INVOICE TYPING. Some time ago we

formed the Maine On-Line Consortium, which is nothing more than a local subscription contract with DIALOG to gain that database vendor's maximum discount rate. Instead of billing each library separately, DIALOG sends us a statement every month with each password's usage broken down. We in turn calculate the discount, and send a bill (invoice) to each library. I've designed a program in BASIC to make that invoicing process as near to a "no-work" proposition as I could get; the program does everything except stuff envelopes.

THE WORK FLOW

The computer is scheduled for four hour blocks of time each working day; the noon hour is set aside for staff self-training. The machine is housed on a metal table with wheels. When a Section is scheduled, a staff member comes to my office and wheels the machine to its temporary workplace.

A diskette box goes with the TRS-80 everywhere. In the box are the important utility programs: TRSDOS 1.3, SCRIPSIT and PENCIL/PAL, PROFILE, VISICALC, and two self-teaching packages from Radio Shack, BASIC INSTRUCTION and DISK INSTRUCTION. PROFILE III+ will soon replace PROFILE, and SUPERSCRIPSIT will replace both SCRIPSIT and PENCIL/PAL. Also on the table are manuals for the non-instruction programs.

The daisy wheel printer (a C. Itoh P-10/40) is placed on the table only when needed, otherwise staying in my office. When the machines reach their work station, the printer is taken off and placed near the computer, and the cable attached. Each Section was given one ribbon cartridge, and is responsible for its future ribbon and paper needs. A dozen daisy wheels are available in my office for changing the pica and elite typefaces, as desired.

Each Section was given five diskettes when we acquired the computer, and each is responsible for purchasing additional disks as needed. The Sections were trained in disk care and usage, and especially in the need for backing up all files in use on a daily basis (which means every four hours, at least, when the

shift from one Section to another occurs). Each Section handles back-up storage; I take my back-ups home nightly, while some Section Heads store the back-up disks in the same room, but widely apart from the masters. At least one Section rotates its masters and back-ups, using the master one day and backing it up, then using the back-up as the master the next day and backing it onto the previous day's master, etc. It's a good practice.

In these ten months, staff mistakes have accounted for about two hours of lost time. Humbly, I confess that an hour of this time was my own, once when I carelessly SAVEed a blank screen on top of an hour's work, and the other when I changed all the T's in a file to Y's and vice versa. (Don't ask!)

The other error occurred when one of the disk drives did not properly format a diskette for some reason, and the staff member did not know how to correct the problem (I was out of town that day).

The upshot is that so far, knock on wood, there have been no disastrous losses of data, due I think to the careful back-up practices of the Sections, and the skills of the individual staff users.

Staff training has not been a formal thing. When we first got the machine I held a staff meeting to show it off, and from then on, it was up to the Section Heads to determine need. In general, staff members using the machine are those who have shown interest and aptitude. Those few staff members who exhibit fear haven't been forced to take it on. But word of mouth is a funny thing, and some previously reluctant staffers have come around after observing the successes of the computer users.

And a few have delved deeply into it. One secretary has become highly skilled in VISICALC, for example, far surpassing anyone on the staff, including me, in knowledge of that invaluable program.

CUSTOM PROGRAMMING

As you can see from the above, we have generally stuck with prepackaged programs, mostly from Radio Shack itself.

But I am increasingly using my self-taught BASIC to work around the limitations of some of that software, and to do things for which we have no ready, in-house package.

One such home-built program is MOLCINV, the invoice typist for the Maine On-Line Consortium mentioned above. That's done in BASIC, and there's nothing particularly complicated about it. For each invoice, the computer asks no more than four questions, and the user responds.

More complex are several programs I have written to interact with disk files, the purpose being to get around the printing limitations of PROFILE or to select parts of a SCRIPSIT-produced file. For example, in designing the special libraries' union list, I wanted a way to search the serial file and pull out holdings for a particular library, giving that library a double-check mechanism before the union list is sent to the printer. SCRIPSIT has no ability to do that, and so I wrote a BASIC utility for it. It works fine as long as the union list files are SAVEed onto disk using ASCII format, the S,A rather than the S or SAVE command in SCRIPSIT.

For serials check-in, we wanted something beyond the restricted printing capabilities of PROFILE, which essentially demands that each record be printed across the page on a single line, with no more than 132 characters per record printed (when the record may hold 255 characters or so). The BASIC program which I wrote takes advantage of the fact that PROFILE stores records sequentially, with fields rigidly fixed in terms of length. The result is a readable printout.

In the case of the large print catalog for Handicapped Services, the Section Head wanted a way to search for and print all titles entered during the course of the year, between printings of the full catalog. This was accomplished with another BASIC utility, the key being that Handicapped entered a "tag" before every new title in the form of an asterisk.

Film Services had a slightly different problem. It wanted to insert

subject headings into the text of its catalog on-line, headings that would not print when the full catalog was printed, but that could be searched for the custom printing of subject-specific listings. SCRIPSIT has a print-suppression command that allows on-line text that will not be printed, and a BASIC utility is in the works that will accomplish the custom searching.

Writing these little utilities takes time, in particular for debugging. The advantages to the Sections are great, but I don't mean to suggest that each micro-using library has to have a programmer on the staff. No. The prepackaged programs are enough. Custom programming is no more than icing on the cake.

CONCLUSIONS

Libraries should get microcomputers for administrative and office functions. Now.

On-the-spot staff training is enough for most situations. It is optimum to have at least one staffer trained in-depth, and/or "into" micros as a hobby.

Prepackaged software is sufficiently available and useable for library applications.

Word processing (including list management) is the single most important library application for microcomputers -- so far.

THE LAST TWO WORDS
Get one!

(Note: About two pages in and after much liquid paper, I threw in the towel and brought in my own micro to finish the rest of this article. So you see, I'm addicted!)

Notes for Figure I

PROFILE permits no more than some 255 characters per record (the new PROFILE III+ permits over 800, I hear). Naturally this limits the amount of information in the check-in record. The Technical Processing Section decided to provide two fields per month for check-in, wherein a "1" meant that an issue of the particular periodical was in fact received, a "0" (zero) that it was not, and a blank that no action has occurred one way or the other. One additional field was provided for July and December, a device to allow for the fact that bi-weeklies have three issues a month twice a year.

The home-brew program PRTMONTH allows the printing of the entire file in readable form with all information intact and interpreted (PROFILE allows only one horizontal line per record in printing, and no more than 132 of the possible 255 characters).

Note that in the case of ACA JOURNAL, February shows no activity. PRTMONTH could easily provide a routine to flag such records for claims processing.

Notes for Figure II

Figures I and II are based on similar reasoning, as are the serials check-in-modules for gifts and newspapers, neither shown here. The only real difference is in the formatting of the output; if we had followed the same pattern as the one shown above for monthlies, too much space would have been consumed by the check-in fields.

The PRTWEEK program itself is shown below, to give some idea of the simplicity of the coding. I make no claims that it is the neatest programming in the world, just that it works.

Notes for Figure III

The large print records are kept in a SCRIPSIT file in ASCII format, i.e., using the S,A rather than the S or SAVE command. It is usually printed using a dot matrix printer capable of a large face typestyle.

The asterisk (*) in the fragment at left indicates a title that has been added since the last publication of the catalog. The purpose of CATGRAB, highlighted below, is to search for those new titles in order to produce a supplement to the main catalog, pending the next publication of the full catalog.

The type of book is also noted in the record; (M) means Mystery, for example. Another program will be written to search the catalog by type of book, and type out a separate list for each general type.

Notes for Figure IV

The Union List is listed alphabetically by title. When a new library is entered, its holdings are merely inserted at the appropriate alphabetical spot. SCRIPSIT does not sort, but it does search files for any string desired. Once a list gets rather long, it is quite convenient to insert new records, if a printout of the file is available for scanning in order to determine the place where the new entry should go. Deleting is very easy in SCRIPSIT, of course.

The home brew UNIPRINT (below) types out holdings for any single library in the list. The printout is then sent to the library for error-checking. It is vital that the file be saved in ASCII format (S,A command rather than S or SAVE) for UNIPRINT to work.

A separate SCRIPSIT file contains the name/addresses of the libraries in the list.

Notes on Figure V

The Maine On-Line Consortium is a group of fifteen Maine libraries taking advantage of the discount plan of DIALOG Information Services, Inc., a major vendor of nationally-available databases accessible by telephone hook-up to a terminal or microcomputer. The Consortium pays a set amount of money to DIALOG each year in anticipation of usage, thereby gaining a substantial discount.

DIALOG bills the Consortium, and the Consortium in turn bills each member library for its monthly usage.

The home-brew program MOLCINV was written to make this billing process as easy as possible, while taking into account the fact that some libraries have prepaid certain amounts, and others have not.

When MOLCINV is used, it asks only two or three questions,

depending on the particular library: what month is covered by the invoice, and what is the library's gross bill from DIALOG. (The third question in certain cases: what is the prepaid balance in the particular library's account.)

MOLCINV does all calculations, and also automatically types the library's name/address onto the invoice and envelope. It creates an invoice number out of the month covered and a library's code, and even pulls today's date out of the dialog that ensues when the computer is turned on each day.

A FINAL NOTE

All home-brew programs mentioned above are Copyright 1982 by Donald Wismer and the Maine State Library. They can be secured in machine-readable form by sending a blank disk and \$5 prepaid to: Donald Wismer, Coordinator, Automated Data Services, Maine State Library, State House Station 64, Augusta, ME 04333. They will be formatted using a TRS-80 Model III with 40-track disk drives using TRSDOS 1.3, which is the only format available at present. If you would like permission to key in the programs, or if you would like typed coding for the programs not listed, please write and inquire.
