ABSTRACT 9

In 1982, a survey of California community colleges was conducted to determine the formal and informal devices used to identify and assess learning disabled average (LDA) students; the characteristics, skills, and behaviors measured; the personnel who administered the assessment instruments; and the intake process and identification and assessment instruments recommended for LDA students. Study findings, based on responses from all 106 colleges surveyed, revealed that 80 of the schools had formal programs for identified LDA students, 13 operated some other type of service, and that approximately 7,962 LDA students were receiving formal or informal services. With respect to the 80 colleges with formal programs, the study found: (1) 94% conducted intake interviews; (2) 80% accepted assessment results from other agencies and 81% conducted standardized assessments to obtain further data; (3) informal assessments were used by 64 respondents to complement formal testing practices; (4) the Wide Range Achievement Test, the Peabody Individual Achievement Test, and the Peabody Picture Vocabulary Test (Revised) were used by more than 70% of the respondents; (5) reading, auditory perception, achievement, and arithmetic were the areas most frequently tested using formal assessment tools; and (6) a learning disability specialist was most often responsible for administering tests. The 20-item questionnaire used to collect data on the LDA programs is included in the Appendices. (HB)

ABSTRACT

This is the second report based upon a survey sent to the California community colleges regarding programming for Learning Disabled (LDA) students. This report looked at the identification and assessment of LDA students in detail. One-hundred percent (106 total) of the colleges responded to the survey questions. Over 75 percent of the community colleges operated formal programs while an additional twelve percent provided informal services for their LDA student Formal programs were scrutinized regarding their current practices with LDA students. This report is supplemental to an initial study entitled, A Report of the California Community College Learning Disabled Programs, submitted in July, 1982 to the Chancellor's Office, California Community Colleges. This report analyses in greater detail the assessment instruments/tests in use in these college LDA programs to identify and assess LDA students.º

INTRODUCTION

This report contains specific information drawn from statewide research project conducted by Dr. Bruce A. Ostertag and Dr. Ronald E. Baker during Spring, 1982. research team was also assisted by Ms. Laurel Best and Mr. Robert F. Howard in the development, dissemination and description of the project. The study sought answers regarding California's community colleges and services available to those students considered to have a learning disability. This report focuses on the following aspects 1) the formal and/or informal devices of that study: given to identify and assess learning disabled students; the assessment areas which were measured; 3) who administered and/or evaluated those assessment tools; 4) the intake process recommended by the respondents for identifying learning disabled students; and 5) the measurement tools recommended by the respondents for identifying, and assessing learning disabled students.

Following an initial review of literature pertaining to post-secondary education for the learning disabled, it was discovered that no specific study had been completed and published addressing the proposed research items. The Chancellor's Office of the California Community Colleges, as well as other organizations and authors, have published recommended assessment instruments or recommended methods. However, no study has identified which assessment instruments or methods are actually being utilized. This study identifies and reports, using descriptive statistics, charts, instruments presently being used and recommended by personnel working with learning disabled students in California Community Colleges.

Background

Identified adults with specific learning disabilities are a relatively new phenomenon in post-secondary education. Their participation in college is requiring a reevaluation of the types of programs and services offered in all segments of post-secondary education. Dr. Barbara Cordoni (1982) noted there is a minimum of such programming and services nationwide. However, this is not altogether true in California where the Community Colleges have been providing extensive services for the last five-to-seven years for students identified as having specific learning disabilities. The California State Universities and Universities

of California have also provided services, though on a smaller scale, for the past several years. The purpose of this study was to describe research conducted in the California Community Colleges on existing programs and services for adults with learning disabilities. Under the label of Learning Disabled Average (LDA), these students are attending and receiving services in the majority of the community colleges.

The definition for Learning Disabled has undergone substantial refinement during the last half-decade in the California Community Colleges. The colleges no longer adhere to the identification and assessment models operating in the K-12 special education system, though post-secondary education does deal with many adults who have attended that system. The community college definition of LDA is still in a state of transition. Various colleges are now operating LDA programs under the definition guidelines developed by the California Association of Post-Secondary Educators of the Disabled (CAPED), Learning Disabilities Division. As of this writing, the Community College Chancellor's Office has adopted the following CAPED draft:

"A specific learning disability refers to disorders in which an individual exhibits a significant/severe discrepancy between the current level of developed intellectual abilities and academic performances despite regular instruction and educational opportunity, as currently measured by professionally recognized diagnostic procedures. Academic performance refers to achievement in the following listening comprehension, oral expression, areas: written expression, basic reading skills, reading comprehension, mathematical calculation and reasoning. Specific Learning Disabilities are often due to constitutional, genetic and/ or neurological factors and are not primarily due to: visual or auditory sensory deficits, motor handicaps, severe emotional distrubance, environmental or economic disadvantage, cultural/language difference, or mental retardation (1982)."

Need for the Study

A study describing the "state of the art" in California, Community College programs for LDA students was necessary for reasons of accountability and program improvement. Inconsistencies in programming throughout the state have led to confusion and, in some few cases, charges of non-compliance.

with state and chancellor office mandates. It was also feasible that programs could be in compliance with the law and yet not be providing appropriate education for their learning disabled students. A comprehensive description of present LDA programs would provide information which could be beneficial for the post-secondary LDA students. This study could lend itself as a resource for the Chancellor's Office, administrators of LDA programs, specialists working with L.D.A. students, and college instructors of special education: Additionally, the accumulated data could serve as a possible reference point for future studies.

THE PROBLEM

The problem of this research was to identify and describe the means by which California Community Colleges assessed. ... LDA students. College programs were explored according to the areas of: assessment tools, involved personnel, and processes.

Statement of the Problem

More specifically, the problem examined programming for LDA students by determining answers to the following questions:

- 1. What assessment tools and approaches were used for identification and diagnostic purposes?
- 2. What assessment areas were measured?
- 3. Who administered and/or evaluated the assessment tools?
- 4. What identification processes are recommended by personnel involved with LDA students?
- 5. What measurement tools are recommended by personnel involved with LDA students?

Assumptions of the Study

· Several basic assumptions formed the basis for the questions of this study. First, there was no official coordinated programming between community college districts in the areas of assessment strategies, content and priorities, and identification procedures for LDA programs. Second, the expertise of specialists working with LDA students was, generally, quite professional, but not all community colleges had specialists available in their Many LDA students were being served by staff unfamiliar with and/or not certified in the area of learning disabilities. Third, though community college LDA programming was not coordinated statewide, there was a commonality of teaching techniques, tools, and administration. This assumption was based upon the belief that specialisttraining through graduate-college coursework stressed somewhat similar instruction in this field. Most specialists of the LDA have been instructed with convergent methods, texts, and assessment tools.

Limitations

The following limitations should be taken into account in this study. In all cases, the usual error factors that occur in any research existed, such as inadvertent inaccuracies and misinterpretation of question content by respondents.

- 1. Personal interviews based upon a written questionnaire were used to collect a representation of the data
- 2. A mailed questionnaire was used to collect the bulk of the data.
- 3. Other records, documents, and statistics were used to formulate this investigation.
- 4. The processing of the obtained data.
- 5. Learning disability theories are relatively new and unproven. The lack of longitudinal studies to support these theories will limit the utility of this research.

Methodology

A questionnaire was developed and field tested through personal interviews. This selected group of college personnel examining the questionnaire indicated an understanding of the questions; therefore no significant item modifications were made.

With the clarity of the questionnaire confirmed, the questionnaire was mailed to all the public California Community Colleges. In total, 106 community colleges were contacted. The study was conducted during April and May, 1982.

RESULTS

One-hundred-and-six colleges our of the total 106 participated in this study for a return of 100 percent. The Community College Chancellor's Office and California Association for Post-Secondary Educators of the Disabled (CAPED) assisted in obtaining the high return by requesting every college to respond.

Respondent Characteristics. Forty-one percent of the respondents identified themselves as Coordinator/Enabler of Handicapped Services. Twenty-seven percent identified themselves as an instructor in an LDA program and a like percentage indicated they were either psychologists, counselors, or other faculty.

Table 1 indicates the type and Program Characteristics. size of programs at California's Community Colleges for LDA Programs were designated as formal or informal. Formal programs were considered to have all those services offered to LDA students in an informal program plus: LDA specialist; 2) a standard, routine assessment procedure for each student; and 3) the option of conducting special With these guidelines, eighty of the responding colleges indicated that they had a formal program for identified LDA students. An additional thirteen colleges stated that they operated some type of service other than a formal Only thirteen of the respondent colleges did not serve LDA students in any capacity. Some 7,962 LDA students were receiving services in formal or informal programs through 88 percent of California's Community Colleges.

TABLE 1: Programs at Community Colleges for Learning Disabled Average (LDA) Students During 1980-81.

Type of	Number of	Percent of	Number LDA	of	Percent	of
	Number of Colleges	Colleges			Students 95.8	Served
Informal	13	12.3	331		4.2	
Mone Total	<u>13</u> 106	100.0	7,962		100.0	

The Ostertag and Baker's (1982) Chancellor's Office study reported further, pertinent program characteristics. Appendices C, D, and E lists the college sites by formal, informal or null programs for L.D.A. students.

Identification Instruments. Several questionnaire items addressed the issue of identification. The following data focuses in on information provided by the 80 respondents from colleges with formal programming for LDA students.

Intake interviews were given by ninety four percent of the respondents who operate a formal LDA program. An extra four percent occasionally held intake interviews with potential LDA students (see Aypendix A, Table 26).

Following the above interviews, eighty-eight percent of the existing formal LDA programs accepted assessment results from other agencies for placement purposes. Standardized assessments were given by eighty-one percent of these programs to obtain further pertinent data. Additionally, fifteen percent said they sometimes gave these tests (see Appendix A, Tables 27 and 28). Informal assessments were given by sixty-four respondents to complement the above testing practices. The most used informal test was a test of written language (see Table 2).

TABLE 2: Areas in which informal tests were used to identify students for Learning Disabled Average (LDA) programs.

Amaga	Total Community		Formal LDA	Programs
Areas	Frequencya	Percent	Frequencya	Percent
Written Language	5'9	55.7%	55	68.8%
Reading	36	34.5	32	40.0
Arithmetic	34	32.1	30	37 -5

Spelling	27	25.5	25	31.3
Overall Achievement	25	23.6	24	30.0
Spoken Language	24	22.6	24	30.0
Intellectual Performance/ Adaptive Behavior	18	17.0	17	21.3

aMore than one response permitted.

bBased upon 176 responses. Seventy responses were valid with 36 responses missing.

^cBased upon 80 responses. Sixty-four responses were valid with 16 responses missing.

ASSESSMENT TOOLS

Three formal assessment tools were in use by more than seventy percent of those respondents who used testing instruments in a formal program. In rank-order, these three tests were: 1) Wide Range Achievement Test (W.R.A.T.); 2) Peabody Individual Achievement Test (P.I.A.T.); and 3) Peabody Picture Vocabulary Test-Revised (P.P.V.T.-R). Five additional tests were in use by at least half of the respondents: 4) Detroit Test of Learning Aptitude (D.T.L.A.); 5) Woodcock-Johnson Psychoeducational Test Battery; 6) Wepman Auditory Discrimination Test; 7) Wechsler Adult Intelligence Scale-Revised (W.A.I.S.-R); and 8) KeyMath. One test in use by forty percent or more respondents was the: 9) Woodcock Reading Mastery Test. Table 3 lists these tests plus several others in use by twenty-five percent or more of the responding colleges.

Purposes of Measurement. Tables 3 through 14 indicate the purpose of administration of the various assessment instruments used by twenty-five percent or more of the formal programs for LDA students. The survey instrument listed the following options for the purposes of measuring:

- 1. Achievement
- 2. Intelligence Quoitent/Adaptive Behavior Skills
- 3. Perceptual-Motor Skills
- 4. Visual-Perception Skills
- 5. Auditory-Perception Skills
- 6. Classroom Behavior
- 7. Arithmetic Skills
- 8. Reading Skills
- 9. Spoken Language
- 10. Written Language. Skills, and
- 11. Vocational Skills.

Each of the above measurement areas are reported based on the responses from the eighty (80) formal programs for LDA students.

TABLE 3: Tests used in twenty-five percent or more formal programs for the Learning Disabled Average (LDA) for identification or assessment purposes.

20.	Goldman-Fristoe-Woodcock Auditory Skills Test Battery	21	26.3

a More than one response possible. bBased upon 80 respondents.

Measuring Achievement. Table 4 indicated the tests in use for the purpose of measuring achievement. The fifteen tests in use by the formal programs indicate the wide variety of assessment instruments available to college personnel in evaluating student achievement. However, several of the instruments were in use in fewer than 10 colleges statewide.

TABLE 4: Tests administered in formal Learning Disabled Average (LDA) programs for the purpose of measuring Avhievement.

	Tests Used to Measure Achievement	Frequency	Percentb
1.	Wide Range Avhievement Test (WRAT)	54	67.5

Measuring Perceptual-Motor Skills. Table 6 indicates the tests used by formal programs for the purpose of measuring perceptual motor skills. In general very few colleges reported that they administer tests in this area. Only 32.5 percent of the respondents indicated that they use Detroit Test of Learning Aptitude (DTLA) and/or the Bender Visual-Motor Gestalt Test for the purpose of measuring perceptual motor skills.

Measuring Visual-Perception Skills. Table 7 indicated the test in use by formal programs for the LDA for the purpose of measuring Visual-Perception skills. In rank order, the most popular three tests in use were the Detroit Test of Learning Aptitude (DTLA), the Woodcock-Johnson Psychoeducational Test Battery, and the Keystone Visual Screening Test. Several of the other reported tests were in use at less than ten colleges.

Measuring Classroom Behavior. Table 9 indicates the tests used for the purpose of measuring classroom behavior. College personnel are not administering formal assessments to measure classroom behavior. Only four tests were identified and fewer than 4% of the respondents used any one of these assessments.

RESPONDENT RECOMMENDATIONS

Respondents were asked to make recommendations regarding an identification procedure and ideal measurement tools. Over 95 percent of the respondents indicated the need to conduct an intake interview (see Table 22). Additionally, more than 60 percent considered a review of previous school records necessary. An administered assessment tool was also considered important for identification purposes by one—third of the respondents. Last, 22 percent of the respondents believed a review of previous medical records relevant when attempting to identify LDA students. Table 23 illustrates tests recommended by those respondents. The most highly recommended test was the Woodcock-Johnson Psychoeducational Battery.

TABLE 22: Identification procedures recommended by twenty percent or more respondents associated with formal programs for the Learning Disabled Average (LDA).

DISCUSSION/RECOMMENDATIONS

There was no one procedure or methodology employed throughout California's community colleges forthe deentification and assessment of LDA students. This diversity of practice would appear to derive from the basic philosophy of local autonomy to meet local needs that exists in the system. Yet, despite this diversity, a consistency exist's . among those colleges which run formal programs for their LDA students. Most colleges provided similar means for the identification and diagnosis of potential LDA students: intake interviewing, referring procedures and agencies, involved personnel, and a basic agreement as to assessment tool usage. Even the recommendations forwarded by the respondents were consistent in nature. Again, respondents seem to agree on basic procedures and assessment tools. Further, though the rank-order of recommended tests differed from those tests currently used to assess LDA students, every test on the recommended list also appeared on the in-use list. The same findings arise when comparing the recommended identification procedure to the in-use identification practices.

Based upon the survey results and the findings from the Ostertag and Baker's (1982) report on LDA Programs in California Community Colleges, the following recommendations are suggested for community college which serve students in an LDA program:

- Implementation of a specifically defined identification and assessment approach, I.E.P. development and delivery system for all LDA students;
- collection of assessment data on all students which measures and identified a student's discrepancy;
- adoption of appropriate, validated and reliable assessment tools;
- 4. implementation of IEP's which clearly indicate the assessment data, discrepancy, needs, goals and programming methods for working with said students;
- 5. adoption of a multidisciplinary team approach delivery systems for all LDA students;

- 6. collection of consistent data reporting methods securely maintained on the above material;
- 7. maintenance of confidentiality on the above material;
- 8. implementation of active in-service programming for faculty, advisory board and community;
- 9. an on-going review of current services and practices to maintain quality programming for LDA students; and
- 10. participation of staff in professional organizations concerned with the LDA individual. It should be noted that many of California's community colleges currently adhere to the above recommendations.

Further research is necessary concerning our community college LDA students and their programming needs. An extension and updating of current program models, such as the Learning Disabilities Handbook (1980), to specify procedures, discuss appropriate assessment instruments, identify new technology and findings will greatly benefit all concerned. Research is also needed to carlify the questions concerning the discrepancy definition model: how do you measure discrepancy; what tools do you use; etc.? Lastly, the purpose and goal of LDA college programs must be defined. Until these above needs and questions have concrete answers for the adult LDA student will have difficulties reaching their potential.
