ABSTRACT

Results of an assessment of 50 ecological and stress management competencies that were developed as part of a Kansas project to improve retention of special education personnel are presented in narrative and data sections. Ecological considerations include those that contribute to job success, such as job challenge and community atmosphere, while stress management factors include relaxation, nutrition, time management, and interpersonal communication. Twenty-three individuals who were knowledgeable in these areas rated the importance of competency and indicated what type of training would be appropriate for each competency. In addition to rating each of the 50 competencies individually, respondents rated the group as a whole. Eighty percent indicated that the competencies adequately covered stress management as it related to special educators. About one-third of the respondents provided examples of competencies or general topics they thought should also be addressed. A list is presented of the additional competency areas that were suggested. Statistical tables are provided that list the 50 competencies in ascending order according to their mean score for importance. The tables also include a rating of skill for each competency, along with the ratings of four options judged appropriate for each competency. These training options are: college coursework only, inservice training or workshops only, both college coursework and inservice training, or no training required. Appended materials include a questionnaire, and a bibliography of about 58 references on stress management and related topics. (SEW)

KANSAS REGENT INSTITUTIONS SPECIAL PROJECT

SUMMARY REPORT

STUDY OF COMPETENCIES RELATED TO STRESS MANAGEMENT AND ECOLOGICAL CONCERNS OF SPECIAL EDUCATION PERSONNEL

May, 1982

Patricia P. Kells, Project Director R. Denise Banman, Coordinator Colleen Daub, Administrative Asst.

This report was performed pursuant to a Grant from the Division of Personnel Preparation, Program of Special Education and Rehabilitative Services, U.S. Department of Education. However, opinion expressed herein do not necessarily reflect the position or policy of the U.S. Department of Education, and no official endorsement by the U.S. Department of Education should be inferred.

Study of Competencies Related to Stress Management and Ecological Concerns of Special Education Personnel

The Kansas Regent Institutions Special Project (KRISP) is a collaborative effort of the six universities governed by the Kansas Board of Regents to provide preservice intervention for improving the retention of special education personnel. The project is funded by the Division of Personnel Preparation, Program of Special Education, U.S. Department of Education.

The problem of attrition of special education teachers in Kansas is a serious factor as is demonstrated in the number of special education vacancies which exist each year. As of September 30, 1981, there were approximately 200 special education vacancies according to statistics provided by the Kansas State Department of Education. Almost one half of those are replacement vacancies caused by personnel leaving a position. We believe that by improving higher education curriculum in several key areas we can reduce the high attrition rate of special educators.

One method KRISP has used to approach this problem has been the project development of fifty competencies in the area of stress management and ecological considerations for special educators. Stress management refers to understanding the "stress response", factors which contribute to stress, and those techniques which help to control or eliminate stress such as relaxation, nutrition, time management and interpersonal communication. Ecological considerations include factors which contribute to the success of an individual in a particular position such as realistic job challenge and the community atmosphere.

Procedures

In order to validate the stress management and ecological consideration: competencies, a survey research approach was used. The survey instrument (Attachment 1) was mailed to 43 persons in Kansas who had been identified as persons who had previously demonstrated knowledge about the area of scress management and ecological considerations. The study group included university personnel in the areas of education and counseling and Kansas teachers who are qualified facilitators for a workshop developed by the National Education Association, Survival of Stressed Teachers. Twenty-three surveys were completed and analyzed for a return rate of 53.49 percent.

Respondents were asked to rate each competency to reflect how important they felt each competency is for special education teachers and their perception of the current strength of special education teachers' skill in the competency, by assigning a numerical rating on each factor for each competency from 1-4 (1-high importance or skill, 4-no importance or skill). The respondents were also asked to indicate where they felt special education teachers should receive training for each competency; college coursework only, inservice training or workshops only, both college coursework and inservice training, or no training.

Results

In order to analyze the data collected, means were calculated for importance and skill. Training scores were determined by the percentage of respondents who selected each training option. Table 1 lists all 50 competencies in ascending order according to their mean score for importance. The first competency listed has the lowest mean which reflects most highly important with the last competency having the highest mean which reflects the least importance. Where more than one competency has the same mean for importance, competencies are sequenced in descending order according to their mean score for skill. Mean scores for skill as well as the percent of responses in each category of where training should occur are also included in Table 1.

response.	ė .				•

In addition to rating each of the 50 competencies individually, respondents were requested to rate the group as a whole. Eighty percent of the respondents indicated that "the competencies adequately cover the area of stress management as it relates to special educators." Approximately one-third of the respondents gave examples of competencies or general topics which they thought should also be addressed. These suggestions are summarized in Table 2.

Suggested Additional Competency Topics Table 2

Public relations/communication barriers between the special educator and and parent, student, administrator, special educator director, etc.

Strategies to cope with mandates, state plans, and the paperwork (i.e., task analysis, on-task behavior, setting priorities of actions.)

Organization and prioritizing work load

Coping with stress which is beyond control

Salary

Low reinforcement from administrators

No control over placement of special education children and youth in classroom.

Ways to increase support of principals and supervisors through their increased observation, discussion, and suggesting solutions with special education teachers -- especially first year teachers

Realistic setting of goals for special children

.Techniques in dealing with parents of special children

Techniques in dealing with non-special teachers in the same school

Money management (because the pay is not good)

Determining the person(s) to whom they (e.g., the special educator) are responsible.

Paper work

Working with parents

Understanding and knowledge of school administrators

As seen in the responses summarized in Table 2, working with others (administrators, parents, other teachers) to increase their support is the most frequently suggested addition. "Paper work" and "low salary" were also indicated as stressors which should be more adequately addressed in the competencies.

Respondents were allowed an opportunity to provide additional comments. Five persons made comments which were recommendations for the manner in which college or inservice experiences related to stress management should be addressed. A summary of these suggestions follows:

The competencies of the trainer or workshop leader should be addressed.

College classes on stress should be ungraded and more of a seminar or workshop style.

The competencies should be introduced at colleges and followed up in local inservice.

Inservice should not be just a one-shot effort but include sustained follow-up.

Administrators also need the knowledge.

Full-time graduate students in special education should work with a special educator as part of their training.

Before entering the special education field, a teacher should have teaching experience in the classroom.

Included with each survey instrument was a bibliography of materials used in the development of the competencies (Attachment #2). The respondents were asked to identify additional references related to stress management which they thought would be useful resources. These suggested additions are listed in Attachment #3.

Summary

The data as a whole indicate that all competency statements were rated as important for special educators with means ranging from 1.13-2.0. Skill was rated consistently lower than importance with means ranging 2.19-3.05. Responses on the question of training for each competency indicate that few respondents believed that formal training was unnecessary for the skills described in the competency statements. The need for pre-service as well as inservice training in these competency areas is strongly indicated by these survey results.

KANSAS REGENT INSTITUTIONS SPECIAL PROJECT

SURVEY REGARDING STRESS MANAGEMENT AND ECOLOGICAL CONCERNS OF SPECIAL EDUCATION PERSONNEL

This survey lists competencies associated with stress management for special educators. We ask that you consider how important each competency would be to reducing "burnout" related attrition of special educators. We also ask that you rate the degree to which you feel special education professionals currently possess each competency.

DIRECTIONS:

1. In the columns labeled "DEFORTANCE" and "SKILL" please rate each of the following competency statements described by writing in the first column a numerical rating that reflects how important you feel the skill is for special education teachers. In the second column, labeled "SKILL", write a numerical rating which reflects the current strength of special education teachers' skill.

•			_			-

2 - Some importance	2 - Some skill
	4
3' - Limited importance	3 - Limited skill
•	o Dimited Skill
4 - No importance	4 - No skill
	, 4 - NO SKIII

- 2. In the columns labeled "TRAINING", check (vor x) any of the following which apply:
 - College Check this column if you believe special education teachers should receive college coursework directly related to developing the competency described.
 - Inservice Check this column if you believe special education teachers should receive training directly related to developing the competency described during conventions, seminars, or special state or school sponsored workshops.
 - None Check this category if you believe special education teachers should receive NO college coursework or inservice experience in the skill described in the competency statement.
