## ABSTRACT

In July, 1982, letters were sent to the social studies coordinators in all 50 states requesting a list of high school geography texts approved for use in those states and information on the selection process used. The response rate was 100%. Information acquired from the 20 states that have statewide adoption policies constitute the basis of this paper. The most striking study result was the spatial pattern of states that have state adoption policies. They are almost all in the South or Mountain West. With the exception of Indiana, no state in the Midwest, plains, or Northeast has a statewide adoption policy. Reasons for having statewide adoption might include lack of confidence in local leadership or social and political conservatism. It was also found that large textbook adopting states, especially Texas, have little influence on the current adoption policies of geography texts in other states. The textbooks chosen by the adoption states consistently followed what can be considered the traditional world regional geography format. These texts are listed, along with the name of the publishing company, their publication date, and the number and the names of the states which have adopted them. (RM)

## Northern Kentucky University

One aspect of geographic education at the secondary level that has received relatively little attention relates to the geography textbook, that is, what textbooks are used and what spatial pattern of textbook adoption exists. Information on textbook use is sketchy on a nationwide basis; it is readily available, however, on books selected for use in states that adopt textbooks on a state-wide basis. Data acquired from the 20 "state adoption" jurisdictions constitute the basis of this paper:

order to collect data that was as accurate as possible, we sent 1982 to the social studies coordinators (or persons July. with that responsibility) for all fifty states requesting a list of all school geography texts approved for use in those states as well as on the selection process used. Ultimately, all fifty states information fashion. Contact with responded some provided little relevant information, and organizations communications with textbook publishers were particularly unproductive. data base and literature searches produced noted below. as a consequence, direct information from the little and, states constitutes the chief basis of this report. See Figures 1 and 2.

In order to understand the issues of state-wide adoption as they relate to geography texts, a brief overview of the history of textbook

adoption in the United States might be appropriate. The history of the American textbook is an interesting and elusive one. Textbooks were originally used for reference or review; now they are often the sole source of information for a subject area. Having their beginnings in the early Webster spellers and McGuffey readers, textbooks began to come into their own with the spread of compulsory mass public education at the end of the last century and the stall of this one. By the early part of the 20th century, there were more although the inschool (and hence a market) and the tradional American one room school was being replaced by larger buildings consisting of isolated classrooms. To meet the new need for subject content related to a specific grade, individual textbooks began to be produced.

During this evolution, the textbook also ceased to be authored in the traditional sense; that is, to be associated with a single authority in the field. More typically, they were team authored, edited, or "developed"— the textbook publisher controlling the market instead of an author searching for a publisher for his book. Publishers began to consult state curriculum mandates to see what should be published.

Many well-known textbook publishers of the past have been acquired by large conglomerates such as IBM, Xerox and RCA, whose textbook sales figures are almost impossible to obtain. Thus, the American textbook market appears increasingly to be a lucrative, secretive one, often more related to marketing issues than to educational ones, and highly structured and controlled. One mechanism related to that control is the state adoption of these textbooks, a practice currently followed by 20 states.

Within these states, adoption procedures regarding geography texts

n states, information from two states vary widely. Out o owing is based on the remaining 18. In was unavailable, 8 n of geography texts, 4 select eve / 6 regard to freque 4 years; 1 every 2 years (Texas); and 4 years: 6 every 5 most jurisdictions the textbook selection not indicate people from various levels of the committees people. Utah and Mississippi Have field education each curriculum area. By contrast, for COMO Mexico do not provide the social studies specialists New voting power in geography textbook adoption. Most states indicate that texts are sent to the selection committee and six states indicate that public hearings on these texts are part of the selection process: No listed specific guidelines for geography text selection. Out of states, the connection between politims and this educational appears ubvious because the governor or governor-appointed process official selects the committee.

This, then, is the general background of textbok adoption in the United States today. Among the questions relating to geography that we should like to raise are: What pattern exists for jurisdictions that have state-wide adoption policies? What influence, if any, do larger, states, such as Texas, have on the adoption policies of other states? What books are in fact selected, and where are they selected?

The first, and perhaps most striking result to come from this study was the spatial pattern of states that have state-wide adoption policies. As can be seen from Figure 3, almost all such states are in the South or Mountain West; with the exception of Indiana, no state in the Midwest, Plains, or Northeast has a state-wide adoption policy. The reasons for this pattern are not immediately

Clyde Tidwell, writing in the 1920's, speculates that southern states might not have had confidence in local leadership. There is also to suggest that parents lobbied for state-wide adoption evidence avoid the expense of new textbooks after each family move, to this motivation would not seem to have been unique to the -South or Mountain West. One could also speculate that these two regions be socially and politically more conservative than the rest the country and felt a greater need to regulate the textbooks that jurisdictions. Indiana, used in the schools in their being generally considered among the most conservative of Midwestern states would fit, into this pattern; only Oregon and Hawaii appear to depart from the general correlation between state-wide adoption policies and areas that are considered to be politically and socially conservative.

A common assertion regarding textbooks is that the large textbook adopting states -- especially Texas -- exercise a disproportionate effect on the textbook selection in other jurisdictions, or at the very least, cause publishers to slant their offerings so as to capture the lucrative Texas market. In order to test the assertion that Texas does fact have coinsiderable influence outside its borders, Texas's list geography textbooks was compared with lists in the other adopting of the five books on Texas' list did not appear on the lists any of the other states. Moreover, the textbooks chosen in Texas any jurisdiction examined: all clearly the oldest αf published between 1969 and 1972. Texas thus appears reluctant to adopt newer books that might be attacked on political or social grounds, a reluctance in large part attributable to the activity of Mel and Norma organization, Educational Research Analysts. is, therefore, that Texas has relatively little influence on the current adoption policies of geography texts in other states.

more rigorous approach to the question of Texas' influence was through the use of a cluster analysis program which producted groupings or clusters. See Figure 4. This clustering should identify which states had similar adoption lists for Thus, the first cluster would identify those two geography texts. lists most resembled each other's. whose textbook additional clustering would group each state with other states with it had the greatest similarity. By the fifteenth cluster, all but and Hawaii- had been grouped states- Texas, Oregon, Louisiana, four states had textbook. In other words, these with other states. adoption patterns that differed most markedly from the other state-wide adoption jurisdictions.

cluster routine also revealed several other interesting relationships. For example, by the tenth cluster three major state groupings had emerged: a "Deep South" cluster of Alabama, Georgia, Mississippi, and Arkahsas; a Border South/Mountain West cluster of Florida, Oklahoma, New Mexico, and Nevada; and a Middle South area that also included two non-southern states (North Carolina, South Carolina, Although there and - Idaho). Virginia, Indiana, work effect at a neighborhood suggestion . of clustered are probably most significant. Thus, at this stage of the program, Kentucky, Utah, Lodisiana, Hawaii, Oregon, and Texas remained apart from any other group. Although we were unaware of the reasoning behind the textbook selection process in these states, they all, with the possible exception of Kentucky, have distinctive social or political characteristics that set them apart from the other textbook course, it is impossible to establish

causal connection between the apparent social and political characteristics of states and their textbook selection policies; nevertheless, one might speculate that the states less likely to follow an educational trend in any field would be those states that were distinctive in their basic societal qualities.

attempt was made to analyze in depth each of the Although no generalizations certain · books individually, thirty-five: made regarding the content of texts chosen by the be nevertheless state-adoption jurisdictions. The textbooks consistently followed what be considered the traditional world regional geography format:a few chapters oriented chiefly toward physical geography and maps followed by a region by region description of the world. Moreover, the leading texts all had the same general appearance: all were roughly size, and all were profusely illustrated with maps, diagrams Encouragingly, many attempted to move beyond simple photographs. and description towards some explanation of current cultural, economic, and is noteworthy, however, that the High School political patterns. Ιt <u>Geography: in an Urban Age</u> was selected by only Geography Utah.

textbooks policy of statewide adoption of The Conclusion produces a clear regional pattern that at this point is only partially As noted above, one might speculate that understood. wished to maintain control at the state level of books jurisdictions used at the local level--especially in an era of rigid would segregation when most of the state adoption laws were passed. school struck by, the frequency of selection of relatively few a large number of possible texts--clearly, states tend to traditional books with tradional approach

shortage of educators trained in geography may well be a factor here. Finally, the large states, especially Texas, do not appear to have the impact on textbook selection that has been claimed—at least insofar as geography textbooks are concerned.
