ABSTRACT

A study examined adult participation in lifelong learning activities in California. During the project, 354 telephone interviews were conducted with adults in nine cities in California. About 42 percent of those interviewed had participated in at least one course, class, or other organized learning activity during the previous year. As compared to nonparticipants, the average participant in adult learning activities was more likely to be under 55 years of age, live in a suburban city, have higher levels of education and income, and be employed full-time in a professional job. With respect to learning activities in the previous year, the average number of courses taken was three; about a fifth of these were business courses, and over three-fourths of them were taken on a part-time bsis. While over half of the courses were taken for credit and for job improvement or self-development, employers only paid for about 20 percent of them. Over half of those interviewed planned to participate in some learning activities in the coming year. Mentioned as the major barriers to lack of participation were lack of time and cost. The most desired supportive services were job placement, counseling, and financial aid. (MN)

ACKNOWLEDGEMENTS

We would like to thank the following telephone interviewers: Ms. Leslie Gardner; Planning Management Research Associates; and Mr. Armando Ruiz, El Camino Community College. We would also like to thank Dr. Roger Bolus for his assistance with the data analyses, and Ms. Linda Rose and Mr. Barry Witkow for their assistance in coding the questionnaire responses. Ms. Janis Cox Coffey, Lifelong Learning Project Director, California Postsecondary Education Commission, provided on-going support and enthusiasm as project monitor, and her contribution to the study is gratefully acknowledged.

EXECUTIVE SUMMARY

A total of 354 telephone interviews were conducted with adults in nine cities to assess the degree of participation in lifelong learning activities in California. The main findings were:

- 1. About 42 percent of the sample of California adults had participated in at least one course, class, or other organized learning activity during the previous year.
- 2. As compared to non-participants, the average participant in adult learning activities:
 - .- is more likely to live in a suburban*city;
 - is equally likely to be male or female;
 - is more likely to be under 55 years old;
 - has a higher level of education and income;
 - is more likely to be employed full-time; and;
 - is more likely to be employed in a professional level job.
- 3. With respect to learning activities taken in the previous year:
 - the average number of courses taken was three;
 - over a third of the participants took only one class;
 - about a fifth of the courses were in business;
 - over three-fourths of the classes were taken on a part-time basis;
 - over half of the courses were taken for credit and for job improvement or self-development:
 - were on weekdays on a college campus;
 - about a third of the classes were one semester long, and were in the evening;
 - the average cost of participation was \$112.65 per class; and
 - participants paid the major share of the cost, with employers paying for about 20 percent.
- 4. Regarding future plans for participation in learning activities:
 - over half of the interviewees were planning to participate in some learning activity in the coming year; (
 - the most preferred classes were lecture courses on a campus, offered on weekdays, in the evening;
 - the major barriers to participation were lack of time and cost;
 - health and age considerations were mentioned as barriers to participation more often by non-participants;
 - the most desired support services were job placement and counseling services, and financial aid:
 - more non-participants indicated a desire for special services for elder students; and
 - the most effective means of providing information about educational activities was through brochures or bulletins in the mail.

INTRODUCTION

In 1973, the Carnegie Commission on Higher Education published a report focusing on alternative channels to higher education (1). Among the major themes of that report were:

"...the current system of postsecondary education in the United States ... puts too much emphasis on continuation of education right after high school and then never again, rather than on learning through out life. It thus discourages deferred attendance and the participation of older persons.

The system can be improved by...creating more opportunities for returnees to higher education and for all adults to participate in postsecondary education (p. 4)."

The report made an important distinction between "higher" education and "further" education: "Higher" education was defined as oriented toward academic degrees or broad occupational certificates. It occurs on college or university campuses, or through campus-substitute institutions, such as extension programs. "Further" education was defined as oriented toward more specific occupational or life skills, rather than academic degrees. It occurs primarily in non-campus environments such as industry, and the military.

This distinction is important because the report projected radically different futures for higher and further education. Specifically, in the eighties, higher education was expected to become a smaller, component of the expanding postsecondary education, and further education was expected to become a larger segment of the total. Higher education was also expected to grow less in numbers of traditional students and more in numbers of nontraditional students.

The issue of the role of adult learners in the future of postsecondary education is of great concern to educators within California. According to "Issues in Planning for the Eighties", a report of the California Postsecondary Education Commission (CPFC), the projected changes in the age mix of California's population indicate dramatic increases in the numbers of persons ages 30-49, with no changes in the number of persons aged 20-29 (2). If postsecondary education in California is to grow, or even to maintain itself during the next decade, there must be an increase in the numbers of older students.

There is very little information available, however, on the degree of adult participation in learning activities, either nationally or statewide. On the national level, the Commission on Non-Traditional Learning sponsored a study in 1972 that was conducted by the Response Analysis Corporation, in collaboration with the Western Office of the Educational Testing Service (3). Based on a nationwide sample of persons aged 18 to 60, they estimated that 30.9 percent of the adult population had participated in some form of instruction during the previous year.

A major source of information about California was the 1970 Census data. According to the Census, in 1970, 10 percent of the population in

California between the ages of 25 and 34 were enrolled in school. This figure compared quite favorably with the nationwide percentage of 6.1 for persons in that age range. In fact, California had the second highest rate of participation for this age group, surpassed only by the 12.6 participation rate in Utah.

The various segments of public postsecondary education have at times collected information on student enrollments by age groups. For example, the Spring, 1980 report of the Statewide Longitudinal Study (4), sponsored by the Chancellor's Office of the California Community Colleges, indicated that over 45 percent of the enrollments in their sample were persons over age 25. Data published by CPEC in the 1978 Information Digest indicated that adults over age 25 constituted 29.2 percent of the opening Fall enrollment in the California State University and Colleges in 1977; in the University of California, adults over age 25 were only 11.1 percent of the opening Fall 1977 enrollments.

None of the available data, however, have provided information on the participation of California adults in the wide variety of learning activities outside of the public sector. There is a general sense that much of the instruction provided adults occurs in proprietary schools, in the work place, in community organizations, or other "non-traditional" locations.

The goal of the present study is to examine adult participation in various types of learning activities within California. Specifically, the objectives of the Adult Learning Survey were to:

- A. Determine the degree of adult participation in lifelong learning activities in California.
- B. Identify the different types of learning and training activities in which adults participate within both traditional education agencies and non-traditional organizations;
- C. Determine which learning and training activities charge for participation, the costs of participation, and, for those activities that do charge, who pays;
- D. Determine which learning or training activities offer academic credit, and whether academic credit is perceived as being important by the participants;
- E. Describe the relationship(s), if any, between various demographic variables and types of learning or training activity participated in, by California adults;
- F. Describe the relationship(s), if any, between those learning or training activities an adult has participated in during the past, is currently engaged in, and anticipates or would like to participate in during the coming year.

The methodology used in this study is described below in three sections: 1) the selection of the survey sample; 2) the questionnaire and procedure used in interviewing; and, 3) the method of analysis of the results.

Survey Sample

The first step in selecting a representative sample of adults from within Galifornia was to select a sample of cities or areas. This was accomplished by categorizing cities according to two variables: 1) Geographical location in the state; Southern, Central or Northern; and, 2) Character: Urban, Suburban, or Rural.

The geographic locations were defined by county boundaries. The Southern area included San Luis Obispo, Kern, and San Bernardino counties and all counties south. The Northern area was defined as San Mateo, Alameda, Contra Costa; Sacramento, Amador, and El Dorado counties and all counties north. The Central area consisted of all counties in between the Northern and Southern areas.

The definitions of urban, suburban or rural character were derived from the Standard Metropolitan Statistical Areas (SMSAs) of the Bureau of Labor Statistics. An SMSA includes a city of specified population and the county in which it is located (central county). Contiguous counties may be included in an SMSA when they meet the criteria of metropolitan character and integration with the central county. Twenty-five of California's 52 counties are included in SMSAs.

All cities that were specified as the main city in a central county of an SMSA were categorized as Urban. Those cities with a population over 50,000 that were located in a county designated as an SMSA were categorized as Suburban. Cities with a population over 10,000 that were located in counties not designated as part of an SMSA were categorized as Rural.

All cities within California were categorized in this 3 (Location) by 3 (Character) matrix, shown in Appendix A. One city was then selected from each cell of the matrix, for a total of nine cities. The sample thus included three cities in each geographic location, and three cities of each character. The cities selected were: Sacramento, Berkeley, Redding, San Jose, Sunnyvale, Visalia, Los Angeles, Santa Monica, Calexico.

Procedure

The first step in conducting the survey was to revise the draft of the Adult Learner Survey that accompanied the Request for Proposals. The draft was reviewed by both ETI staff and the project monitor, and was then field-tested with a sample of 10 adults in the Southern California area. The final version of the Adult Learner Survey used in this study is presented in Appendix B.

ETI staff conducting the telephone interviewes were provided with an extensive instruction manual, which is presented in Appendix C. The instructions were as follows.

The interviewers were either provided with or asked to obtain the telephone book(s) of the city(s) in which they were to conduct interviews. In each telephone book, the interviewers were to first determine whether the individual name listings for their city were in a separate section, e.g. the Visalia section of the Kings & Tulare County telephone book, or whether the numbers were indicated by an abbreviation after the names, e.g. the abbreviation Calx for Calexico in the Imperial County telephone book.

To select the pages, the following procedure was used:

- 1. The interviewers determined the total number of white pages in the target city's section, or the total number of white pages in the book, if the cities were not separated.
- 2. The total number of white pages was divided by the number of interviews to be made in that city, and the result was rounded off to the nearest whole number.
- 3. The result indicated the page number of the first page to be sampled. The second page to be sampled was the first page number + the result, the third page sampled was the second page number + the result, and so on.

The following example illustrates the above procedure for a city that did not have a separate telephone book. Suppose there were 110 white pages in the book in which the city was listed. Dividing 110 by 35 equals 3.43, which was then rounded off to 3. Thus the first page sampled was page #3, the second page was page #6, the third, page #9, the fourth, page #12, and so on.

On each selected page, the interviewers were to randomly select one name from the target city. From each selected page; the interviewers were instructed to make as many calls as necessary to obtain one person who agreed to be interviewed. If a child answered the phone, the interviewers asked to speak with his or her father or mother.

In conducting the telephone interviews, interviewers were instructed to follow as closely as possible the script on the survey forms provided. They were, however, permitted to use their own words if it was more comfortable. The responses of each interviewee were recorded on a separate survey form. If the interviewee had taken more than one class or course in the previous year, the interviewers were to record the responses about each class on a separate survey form.

All interviews were conducted on Monday, Tuesday, Wednesday, and Thursday evenings, between 7 p.m. and 10 p.m.; on Saturday, between 10 a.m. and 5 p.m.; and on Sunday, between 12 p.m. and 10 p.m.

1.

Analyses

The survey responses were coded using the codes pre-printed on the questionnaires. Some questions were open-ended, and thus required pre-coding into categories. The categories used are identified in the Coding Booklet presented in Appendix D. Responses to the following questions were pre-coded into categories: #4 (Subject or Topic Area of Class), #5 (Reason for Taking Class), #7 (Where Instruction was Received), #21 (Reasons for Taking Future Classes), #24 (Where Prefer to Take Classes), and #39 (Type of Work).

A complete list of the responses to each of the following questions is presented in Appendix F: #4 (Subject or Topic Area of Class), #6 (Name of School or Organization Providing the Instruction), #20 (Learning Activities Plan to Take in Future), #22 (Activities to Encourage Taking Classes), #24 (Where Prefer to Take Classes), #39 (Type of Work), and #41 (Subject or Topic of Classes Taken by Other Members of Household).

Additional tables of the characteristics of participants and non-participants in learning activities are presented in Appendix F.

RESULTS

A total of 354 telephone interviews were conducted with adults in the nine sample cities across California. Of the adults interviewed, 42.4 percent had participated in at least one course, class or other organized learning activity in the previous year. This rate of participation is significantly higher than rates found in previous studies.

Before presenting the results, note should be made of the generalizability of the survey sample. Statistically, a sample of 350 persons randomly selected from the entire population of California would yield an estimated error rate of 5 percent. However, given the time and cost constraints of this study, the samples were randomly selected from nine representative cities across the state. On this basis, we feel that the statewide sample is representative of California's adult population.

The results are discussed below in three sections: characteristics of the entire sample, responses of those adults who participated in educational activities, and responses of all interviewees with regard to their future learning plans. It should be noted that as in any survey, not all interviewees responded to all questions, therefore the totals and percentages may not match from one table to another.

Characteristics of the Adult Learning Survey Sample

Ethnic Rackground. The overall random sample of adults contained about two-thirds white and one-third minority members. The percentage of participants and non-participants within each ethnic group is shown in Table 1. The sample totals in the table do not include the one American Indian, the three 'Other's", and the eight non-respondents.

The rate of participation in learning activities was around 45 percent for the white and black groups of adults, with a slight increase for Orientals. As might be expected, however, the Hispanic group had the lowest percentage of members participating in educational programs. It is tempting to speculate about the cultural differences in attitudes toward education that might yield the above findings, but a simpler explanation might be simply more Hispanic members of California's population who do not speak English well do not participate in learning activities provided in English.

To check for this possibility, 34 interviews were conducted with Hispanic persons who spoke only Spanish. Of these interviewees, only 11.8 percent were participants in educational programs. The participation rate of Hispanic interviewees who spoke English was 45.6 percent, which is the same as the white and black sample adults. Clearly, then, the lower participation rate of the total sample of Hispanic's was due to the lower participation by non-English speaking interviewees.

Geographical Distribution. There were more participants in learning activities in suburban cities than in rural or urban cities. The higher participation rate for suburban dwellers is reasonable, given that persons living in suburbs tend to be from higher socioeconomic strata, and to have

more education. Surprisingly, the percentage of participants in urban cities was the same as in rural cities.

The nine sample cities, shown in Table 2, were also selected to be representative of different areas in California. The percentage of participants in the Southern California cities (Los Angeles, Santa Monica, and Calexico) was slightly less than in either the Northern cities (Sacramento, Berkeley, and Redding) or the Central cities (San Jose, Sunnyvale and Visalia): 32.9 percent as compared to 47.6 percent and 50.0 percent, respectively. This finding, however, may be due to the fact that a deliberate attempt was made to conduct more interviews with Hispanic persons in Southern California, and the lower rate of participation for this ethnic group may have lowered the overall participation rate of Southern Californians as a whole.

The distribution of the ethnic background of the total sample in each city is shown in Table F1 of Appendix F. As was explained above, the percentage of Hispánics was highest in the three Southern California cities. The higest percentages of blacks were from Los Angeles, 26.2 percent, and Berkeley, 17.6 percent. The highest percentages of white interviewees were from Redding, 93.8 percent, and Sunnyvale, 91.4 percent.

Sex of Interviewees. Of the total sample of interviewees, about 48 percent were female and 52 percent were male. There was no difference in participation in learning activities due to sex: approximately 42 percent of the males and 43 percent of the females had participated in some form of learning activity.

The distribution of participants and non-participants of each sex within the three largest ethnic groups is shown in Table F2 of Appendix F. The rate of participation was relatively constant across ethnic groups for females, but the participation rate for males ranged from a high of 52.5 percent for white males, to 31.5 percent for black males, to only 18.4 percent for Hispanic males.

Age of Participants. As can be seen from Table 3, the ages of participants tended to concentrate between 25 and 55, while the age range of non-participants was much wider. There was a clear tendency for persons aged 55 or older to be less likely to participate in learning activities. This is supported by the participation rates within age groups, shown in Table 4: About 76 percent of persons aged 55 or over were non-participants, compared to almost 51 percent of persons under 55. The lower participation by seniors may be due to health or financial reasons, but there is also some indication in their responses to later questions that older adults do not perceive postsecondary institutions as trying to meet their needs.

Marital Status of Participants. Over half of the interviewees, participants and non-participants alike, were married. This is slightly less than the percentage of married persons in California at large. There was a slight tendency for more participants to be single, as might be expected in light of social folk-lore that says that classes are a "good way to meet people." However, the overall differences between the two groups were not significant. The distribution of marital status is

depicted in Table 5, and the percentage of participants within each status category is shown in Table 6.

Presence of Children. Surprisingly, the presence of children in a home did not affect participation in adult learning activities: 62 percent of participants and 69 percent of non-participants indicated they had children. The ages of the children also did not affect participation; chi-square tests on the distribution of children's ages were all non-significant.

Level of Education. As was expected, participants in adult learning activities had higher levels of education than non-participants. As can be seen from Table 7, over 80 percent of participants had gone on to some form of postsecondary education, as compared to about 40 percent of the non-participants. Over 35 percent of the participants compared to 21 percent of non-participants reported some college or technical school training; 14 percent of participants compared to 10.5 percent of non-participants had graduated college. Even more striking, eight percent of the participants reported some graduate work; of the non-participating group, less than one percent reported having had graduate work.

The distribution of highest educational level for male and female participants and non-participants is shown in Table F3 of Appendix F. Of the participants, slightly more females had Master's degrees, 10.7 percent as compared to 4.4 percent of the males, but all of the Ph.D.'s in the sample were males. Of the non-participants, the percentage of males with more than a high school education was higher than the females.

The percentage of participants and non-participants within each educational level is shown in Table F4, of Appendix F. As might be expected, the percentage of participants increases as the educational level increases.

Family Income. Over half of the interviewees, 64 percent, responded to the question asking the level of their family income. As has been found in previous studies, participants in adult learning activities tended to have higher family incomes than non-participants. Over 65 percent of the participants reported incomes over \$15,000, compared to only 42 percent of non-participants. At the other end of the scale, twice as many participants as non-participants reported incomes over \$50,000. The distribution of incomes for participants and non-participants is shown in Table 8, and the percentage of participants and non-participants within each income level is shown in Table 9.

A fourth of the interviewees, 24 percent, declined to indicate their income. Of the remaining interviewees, 50 percent of the participants and 55.2 percent of the non-participants indicated their family income was above \$15,000 per year.

Employment Status. As can be seen from Table 10, more participants were employed both full and part-time, and considerably more non-participants were retired. The percentgae of participants and non-participants within each employment status is shown in Table 11. Slightly over half of the employed members of the sample had participated

in learning activities, while over 60 percent of the unemployed interviewees had not.

The distribution of employment status for participant and non-participant members of different ethnic groups is shown in Table F5 of Appendix F. More white participants were employed full-time, 61.9 percent, than black or Hispanic participants, 37.5 percent and 43.8 percent, respectively. The distribution of employment status for male and female participants and non-participants is shown in Table F6 of Appendix F. More male than female participants were employed full-time, 76.8 percent as compared to 44 percent.

Type of Work. The type of work conducted by employed participants and non-participants was classifed according to categories shown in Table 12. As might be expected, more participants than non-participants were working at the professional levels, 37.8 percent compared to 20.8 percent. The complete list of responses to this question, presented in Table E6 of Appendix E, is quite revealing. Among the interviewees are a rancher, a hard rock miner, three M.D.'s, a disc jockey, and a man who makes grave markers! Clearly, the sample represents a wide range of Californians.

The percentage of participants and non-participants within each type of work classification is presented in Table F7 of Appendix F. The two classifications with the highest percentage of participants were professional II (professor, lawyer, etc.), 77.8 percent, and housewife, 66.7 percent.

The distribution of the type of work conducted by members of different ethnic groups is shown in Table F8 of Appendix F. More whites were professionals, 29.7 percent, than in either the black or Hispanic distributions. On the other hand, over 50 percent of the Hispanic interviewees, and about 44 percent of the black interviewees, were semi-skilled or general workers, as compared to about 20 percent of the white interviewees.

Participation by Other Members of Household. Having one person in a household participating in educational activities made it more likely that others in that household would also participate. Thirty-three percent of the participants indicated that there were other members of their household who had participated in educational activities during the previous year, compared to only 9.2 percent of the non-participants. It should be noted that the participation rate for the entire sample, 42.4 percent, was determined from the interviewees, and does not include other members of the household who may have participated in learning activities.

Course Information from Participants

The average number of courses taken by interviewees in the previous year was three, with 38.6 percent taking only one class. Most participants, 79.6 percent, took the classes on a part-time basis.

The most frequently mentioned courses were in management (8), history (7), exercise (7), and real estate (5). The courses ranged from Advanced Microbiology to Principles of Marketing to Astrology. A complete listing

of all courses taken by interviewees is presented in Table El of Appendix E.

The subject area of the classes or programs ategorized as shown in Table 13. About a lifth of the courses we business, with the remainder spread out over the entire categorization. The "Other" courses included bible studies, creative writing, est, navigation, speed reading, and GRE preparation.

Over half of the participants took classes for job improvement of for self-development, as can be seen from Table 14. Those participants taking courses for degree requirements were working towards a B.A. (61.5 percent), an M.A. degree (19.2 percent), or an A.A. degree (15.4 percent).

Of those participants who had taken courses for job improvement, 64.5 percent had taken 2 or more classes in the previous year, compared to 50 percent of participants taking courses either for self-development, or for recreation. Participants taking courses for recreation tended to take physical education (34.8 percent) or arts and crafts (30.4 percent). Those taking courses for job improvement tended to take business (20.8 percent), professional courses (18.8 percent) or technical-vocational (18.8 percent). Persons taking courses for self-development took courses from the entire range of subject areas.

Course Specifications. Over half of all participants took classes on a college campus, and on the weekdays. About a third of the classes were one semester in length, and a third were in the evening. The specifications of programs taken during the previous wear is shown in Table 15.

Using all participants, the average distance travelled to and from class each meeting was 26.4 miles. This figure, however, includes seven persons who travelled over 100 miles, and two persons who travelled over 500 miles roundtrip. Excluding these well-travelled individuals, the average distance travelled to and from class was only 11.3 miles. Clearly, there was a strong preference for learning activities offered nearby.

The average number of hours per class was 3.8, excluding six participants who indicated over 12 hours of class time per session. Over a fourth of the participants, 28.6 percent, indicated their classes lasted two hours per session.

Organizations and Institutions Providing Instruction. About half of the participants, 50.3 percent, were enrolled in courses offered through public or private postsecondary institutions such as the University of California, the State Universities and Colleges, and community colleges. The other half participated in learning activities offered through associations, specialty schools, community organizations, and employers, as can be seen in Table 16. A complete list of the schools and organizations providing instruction to the interviewees is presented in Table C2 of Appendix C.

Credit for Participation in Learning Activities. More classes were taken for credit than not, 61.2 percent compared to 38.8 percent. This

percentage is much higher than was expected in light of previous studies.

The credit was toward a certificate, diploma or degree for 50 percent of the classes, and 5.6 percent of those reporting credit were taking courses for continuing education units for licensing, 39.4 percent was for general continuing education units, and 4.9 percent was for other credit. Of those earning credit towards a certificate or degree, 47.2 percent were working toward a B.A. degree, 20.8 an M.A. degree, 15.1 percent an Associate degree, a high school diploma or a community college certificate (5.6 percent each), and 3.8 percent was towards a General Education Diploma (GED).

Costs of Participation in Learning Activities. The total average cost of participating in adult education programs was \$112.65, per class or course. Within this total cost, the average cost of tuition was \$62.00. This figure excludes the 11.4 percent who did not pay any tuition, and three persons who reported extremely large tuitions over \$500. The tuitions used in calculating the average ranged from \$1.00 to \$480, with 25.6 percent reporting a \$9.00 tuition. The average cost of books was \$28.73, with 34.4 percent not paying anything. Average cost of transportation to and from classes was \$21.92 (for the entire duration of the course).

Employers paid a portion of the total costs for about 23 percent of the participants; employers paid 100 percent of the costs for 19 percent. Approximately 72 percent of the interviewees paid 100 percent of their educational costs. Only five interviewees indicated that any portion of their fees had been paid by scholarships or grants, and only two of these received 100 percent of their costs.

Future Learning Plans of Participants and Non-Participants

Over half of all interviewees, 52 percent, were planning to participate in some learning activity in the coming year. An interviewee was more likely to plan on future participation in learning activities if he or she had previously participated; of those interviewees planning future participation, 63.3 percent had participated in some form of educational activities the previous year.

Previous participants in adult learning had a wider variety of reasons for future participation than non-participants, as can be seen from Table .17. Continuing the trend of why people take courses, the most frequent reason given for future participation was self-development, followed by job improvement.

Barriers to Participation. To assess the reasons why some interviewees were not planning to participate in learning activities in the future, questions were asked regarding perceived barriers to participants and non-participants perceived no real barriers to participation. A smaller number of both groups mentioned a lack of time and cost considerations as barriers. Interestingly, non-participants mentioned health and age-related considerations as barriers to participation more frequently than participants.

A second interesting finding in the list of barriers, shown in Table 18, is the relatively infrequent mention of lack of child care as a barrier. While concern over family responsibilities was mentioned by large numbers of both participants and non-participants, it cannot be assumed that this concern was directly related to the presence of children in the home. This ties in with the earlier finding that presence of children had no effect on rate of participation in adult learning activities.

Course Preferences. Both previous participants and non-participants indicated a strong preference for classes offered on a campus, on weekdays and in the evening. Lectures and workshops were the preferred method of instruction for about half of both participants and non-participants. On the job training was preferred by slightly more non-participants. The only difference in preferences between the two groups was that twice as many participants preferred workshops than non-participants. The course preferences are shown in Table 18.

Desired Support Services. The most frequently mentioned services respondents would like to have available in order for them to take advantage of educational activities were job placement and job counseling services, and financial aid. Of special interest was the finding that more non-participants indicated a desire for special programs for elder citizens. Thus one means of increasing the enrollment of older students may be to emphasize such support programs.

The list of preferred services is shown in Table 20.

Information About Educational Activities. The most effective means of providing information about educational activities to prospective participants was through brochures or bulletins mailed directly to their home. This was true for both the participant and non-participant groups. A distant second was newspaper articles or advertisements. There were two differences between participants and non-participants: more non-participants received information about courses through TV announcements, and more participants received information through announcements at work.

The distribution of responses to the question of how information was received is shown in Table 21.

Barriers Perceived by Participants:

No perceived barriers (66)
Lack of time (29)
Cost considerations (12)

*The percentages do not sum to 100, since each interviewee could indicate more than one information method.

The Adult Learning Survey yielded a number of interesting findings that have major implications for postsecondary education institutions in California. The findings are discussed below, first in terms of the profile of the average participant in learning activities, and then in terms of potential strategies for increasing adult participation.

Profile of the Average Participant. Of special interest is the fact that there were similar rates of participation in learning activities within the white, black, oriental, and English-speaking Hispanic sample groups. The only group that had a significantly lower rate of participation was that of persons of Hispanic background who spoke only Spanish. This is quite understandable, since the majority of learning activities in California are provided in English. Still, the participation rate of 11 percent in that group is remarkable. It would be interesting to know if the programs taken by that 11 percent were in English or in Spanish, but unfortunately the wording of the survey form did not allow us to make that analysis.

The rate of participation was higher in suburban than rural or urban cities. This is not too surprising, given that compared to non-participants, participants in learning activities tended to have higher income levels, and therefore might be more inclined to live in suburan communities. The higher participation rate in suburban areas might also be due to the relative proximity of educational activities. Given that the average distance to and, from classes was only about 11 miles, there appears to be a clear preference for activities that were offered close to home or work.

Participants tended to be employed full-time, and were more likely to be employed in a professional level job. The implications of this are evident in the finding that participants tended to take classes on a part-time basis, and many of these classes were business related. At least one group of adult participants in California, then, are looking for programs that provide additional or upgrade training for their job.

Contrary to previous studies, over half of the participants were receiving some form of credit for their learning activities. The majority of the credit was for either degree requirements or general continuing education units. There appears, then, to be a large segment of California adults who pursue postsecondary education through traditional institutions for relatively traditional reasons. Additional evidence for this perception is in the finding that over half of the courses in which adults participated were offered in a traditional academic setting in a university, college, or community college. It should be noted, however, that in at least two of the cities in the sample, Los Angeles and Sacramento, the community colleges do not offer any non-credit programs.

The other half of the participants were enrolled in wide variety of non-traditional postsecondary activities. The programs offered by non-traditional sources ranged from those offered by employers for employees within a company, to continuing education programs offered by

professional associations, to programs offered by community organizations. Somewhat surprising was the number of programs offered by shops and stores, which appear in Table 16 under the category "specialty school." These include music stores offering guitar lessons and fabric shops offering sewing classes. While these stores are not proprietary schools in the usual sense, they do appear to provide specific learning experiences for a number of California adults.

In addition to the wide range of sources of learning activities, there was an equally diverse set of course topics. While most of the courses were business related, participants also took courses in areas such as higher mathematics, tax law, karate, psychology, and stained glass. One interesting finding was the large numbers of adults enrolled in history classes. Indeed, the topics of interest to the older adult appear to be more in line with what has been traditionally a "liberal education." It is reasonable to speculate that the declining enrollments of traditional undergraduate students in these courses may be offset by active programs to encourage adult enrollment.

As might be expected, cost was a major factor in determining whether to enroll in a particular course or program. Somewhat surprising, though, was the relatively large percentage of participants whose employers paid a portion of their costs. In fact, employers paid all the costs for almost a fifth of the participants. This level of support clearly indicates that employers perceive benefits from providing education and training for their employees.

The most prominant source of information utilized by both participants and non-participants in planning learning activities was brochures or bulletins received in the mail. While this may be one of the more expensive means of advertising for institutions, the results of this survey indicate that it reaches far more potential participants than all other methods combined. The finding that more non-participants received information about courses through television announcements indicates that while such ads are remembered, they do not necessarily facilitate the action of enrolling to the same extent as does a brochure with an easy enroll-by-mail form.

There appeared to be clear relationship between previous, present, and future participation in adult learning activities. Those who had previously or were currently participating in some learning activity were much more likely to indicate plans for future participation. This is an indication of support and confidence in the providers of postsecondary education in California, in the sense that participants must have received enough benefit in participating to make them want more. The key to increasing adult participation in lifelong learning, then, may simply be to get them to the first course, and let the natural enthusiasm and pleasure of participation take over.

Implications for Postsecondary Education. Examination of the findings of the Adult Learner Survey leads to the conclusion that it is a misnomer to refer to all adults over age 25 as. "adult learners." There are at least two distinct populations within that group: working adults, aged 25-55; and retired, older adults over age 55. The educational needs of the working adult are related to job improvement, or continuing education credit. The educational needs of the older adult are more diffuse, and are related to self-development, and recreation.

Participation in learning activities by older adults also appears to be affected by their perception of the institution's understanding of their educational needs. The finding that more older, non-participant adults indicated a desire for special support services for elder citizens provides some evidence that many older adults did not perceive the institutions or organizations providing instruction as being sensitive to their needs.

Since the major contact any learner has with an institution is with the individual faculty members, one important implication is that postsecondary institutions might consider providing training for faculty to enable them to understand and be able to respond to the needs of older students. This could take the form of faculty development programs, or statewide in-service training workshops.

Another implication for postsecondary education is that one key to increasing the participation of the working adult is close communication and cooperation with business and industry. The findings of this survey indicate that employers are interested in the education of their employees. Many employers are offering their own in-house training programs, while others are willing to pay for the costs of education from other institutions. Postsecondary institutions might consider more actively assessing employer's needs in order to provide appropriate courses, and thus enhance their enrollments of working adults.

The low rate of participation in lifelong learning activities among Spanish-speaking members of the Hispanic population in southern California points to a second set of implications for postsecondary education. Obviously, one method of increasing the participation of Spanish-speaking members of the population is provide opportunities for learning and training in Spanish. It is equally likely, however, that participation could be encouraged simply by providing information about available programs taught in English through brochures and bulletins printed in Spanish. As with any group with special education needs, a demonstration that the institution is sensitive to the needs of Spanish-speaking students may be the first step in increasing their participation in educational activities.

The information obtained in this survey of adult learners has implications for, and can potentially be very useful to administrators and faculty in postsecondary education institutions across the state. CPEC might consider supporting a series of in-service workshops for representatives of California's postsecondary education institutions to disseminate the survey findings, and to help them develop strategies to increase the participation of both/working and older adults in lifelong learning activities in California.

APPENDIX C

CALIFORNIA POSTSECONDARY FDUCATION COMMISSION ADULT LEARNING SURVEY

INSTRUCTIONS FOR INTERVIEW STAFF

The main goal of the Adult Learning Survey is to gather information to determine the degree of participation of California adults in lifelong learning activities. In order to gather this information, the Evaluation and Training Institute has been contracted by the California Postsecondary Education Commission to conduct telephone interviews with a sample of 315 persons in 9 cities across the state. In each city, 35 telephone interviews will be conducted with a representative sample of persons selected from that city's telephone book. The mine cities are: Sacramento, Berkeley, Redding, San Jose, Sunnyvale, Visalia, Los Angeles, Santa Monica, and Calexico.

SAMPLING PAGES FROM TELEPHONE BOOKS.

You will either be provided with or should obtain the telephone book(s) of the city(s) in which you are to conduct interviews. In each telephone book, you should first determine whether the individual name listings for your city are in a separate section, e.g. the Visalia section of the Kings & Tulare County telephone book, or whether the numbers are indicated by an abbreviation after the names, e.g. the abbreviation Calx for Calexico in the Imperial County telephone book. All city abbreviations are listed on the first page of the A white page listings.

To select the pages from which you are to sample names, use the following procedure:

- 1. Determine the total number of white pages in your city's section, or the total number of white pages in the book, if the cities are not separated.
- 2. Divide the total number of white pages by 35, the number of interviews you are to make in that city. Round the result off to the nearest whole number.
- 3. The result is the page number of the first page you are to sample. The second page will be the first page number + the result, the third page will be the second page number + the result, and so on.

EXAMPLE: Suppose your city does not have a separate telephone book. In the book in which your city is listed, suppose there are 110 white pages. Dividing 110 by 35 equals 3.43, which should be rounded off to 3. So the first page you would look at would be page #3, the second page would be page #6, the third, page #9, the fourth, page #12, and so on.

SAMPLING NAMES FROM PAGES.

From each selected white page, you are to make as many calls as necessary to obtain one person from your city who agrees to be interviewed. Note that all they have to do is agree to the interview, they don't necessarily have to have taken any classes. However, if your entire sample of 35 has not taken any classes, complete a survey form for them and then use the same procedure to select an additional sample of 15 persons from that city and telephone them for interviews.

On each selected page, randomly select a name from your city. Quite often you will reach a number that is no longer in service, or where there is no one at home. Do not call back to a particular number, just select another from your city.

We are interested in obtaining interviews we adults, so if a child answers the phone, ask to speak with his or her father or mother.

WHEN TO MAKE CALLS.

You should make all telephone calls on the days, and between the times listed below:

Monday, Tuesday, Wednesday, and Thursday evenings, between 7 pm and 10 pm

Saturday day, between 10 am and 5 pm

Sunday day, between 12 pm and 10 pm

Be sure to spread the calls out over different days of the week.

PROCEDURE FOR MAKING CALLS.

Please read the entire survey form through at least once before you begin making calls. Follow as closely as possible the script on the survey forms provided. You may, however, use your own words if it feels more comfortable.

Record the responses of each interviewee on a separate survey form. For questions with response options printed on the form, circle both the option and the corresponding number. For questions with printed blanks, print the interviewees response as legibly as possible. If the interviewees give you a response that is not one of the options, write it out, using their words, next to the question.

If the interviewee has taken more than one class or course or whatever in the previous year, record his/her responses about one class on the survey form, and record his/her responses about the remaining classes on the extra course sheets provided to you. Be sure to staple these extra sheets inside that interviewee's completed survey form, so we will know which interviewee they belong to.

Be sure to thank the person at the end of the interview!!

COMMENTS ABOUT SURVEY ITEMS.

- 1. Comments on the survey form that are IN ALL CAPITAL LETTERS are instructions for you, the interviewer, and are <u>not</u> to be read to the interviewees.
- 2. On questions with lists of response options, such as Q. 14, 25, 28, 29, and 35, you should not read the entire list to the interviewees. You may read a few as examples, if it would make the item clearer to the interviewee.

WHAT YOU RETURN TO ETI.

After you have conducted all of your telephone interviews, you should return to us the completed survey forms, and a count of the number of persons who declined to be interviewed. Keep a separate count for each city.

If you have any questions, please call Cheryl Graesser at (213) \ 820-8521.

APPENDIX D

California Post-Secondary Education Commission Adult Learning Survey Codebook

Card 1	
1-3 ID - Identification No. 4 Language - Language 1=English, 2=Spar 5 Locate - Location 6 Sex - Sex of Respondent 2 = Female, 1 = Male 2 = Female, 1 = Male 7-8 Mon - Month of Call 9-10 Day - Day of Call 11-12 Time - Time of Call [LEAVE HLANK] 13 Q1 1 Taken classes 1=yes 2=no 14-15 Q2 2 Number of classes taken 16 Q3 3 Class-status 1=Fulltime	

Note: Space has been saved for 4 courses. If a person only has one course, then only columns 18-53 will be coded. If a person has 2 courses, then columns 18-78 on Card 1 and columns 10-18 on Card 2 should be coded, etc. Column 17 should contain the number of course sheets that have been filled out be an individual.

APPENDIX F

Table F1. Distribution of Ethnic Sample Within Each Location. (Read across the rows)

	White	Black	Hispanic	Oriental	American Indian
Berkeley	70.6	17.6	2.9	5.9	2.9
Calexico	34.7	8.2	57.1	0	. 0
Los Angeles	31.0	26.2	35.7	4.8	Ó
Redding	93.8	0	6.3	0	0
Sacramento	78.1	9.4	3.1	6.3	0
San Jose	60.0	8.6	14.3	14.3	0
Santa Monica	62.5	8.3	27.1	2.1	0
Sunnyvale	91.4	0	2.9	5.7	0
Visalia	79.4	8.8	2.9	8.8	0
	·	÷			

Table F2. Distribution of Participants and Non-Participants, Within White, Black and Hispanic Ethnic Groups for Male and Female Interviewees (Oriental and American Indian Groups are not Listed due to their Small Sample Size).

(Read down the columns for each sex)

,	White	Black	Hi'spanic_	
Male	• *		v.	
Participants	52.5	31.5	18.4	•
Non-Participants	47.5	69.5	81.6	
Female	•	·		
Participants '	43.2	53.3	45.0	
Non-Participants	56.8	46.7	55.0	

Table F3. Distribution of Highest Educational Level for Male and Female Participants and Non-Participants. (Read down the columns)

1		cipants		Non-Participan	
	<u>Male</u>	Female		Male	Female
Elementary	1.5	1.3		13.5	10.4
Junior High School	0	5.3	•	15.7	15.6
High School or GED	7.4	18.7		24.7	38.5
Same College	35.3	34.7		25.8	16.7
Technical or Business School	4.4	6.7		4.5	3.1
Associate Degree (A.A.)	5.9	4.0		1.1	3.1
3.A. Degree	14.7	14.7	,	11.2	9.4
Some Graduate Work	14.7	2.7	•	. 0	1.2
1.A. Degree	4.4	10.7		3.4	2.1
A.A. Degree Plus Additional Work	0	1.3		0	0
Ph.D. Degree	11.8	0		0	9

Table F4. Percentage of Participants and Non-Participants Within Each Educational Level. (Read across the rows)

	Participants	Non-Participants
-Elementary	8.3	91.7
Junior High	13.5	86.5
High School Diploma or GED	24.4	7 5.6
Same College or Technical School	56.5	43.5
Technical or Business School	56.3	43.8
Two-year Degree (Associate)	63.6	~36.4
Bachelor's Degree (7 3)	51.2	48.8
Some Graduate Work	92.3	7.7
Master's Degree	68.8	31.3
Master's Degree plus Graduate Work	100	0
Doctorate	100	0

Table F5. Distribution of Employment Status for White, Black and Hispanic Participants and Non-Participants.

(Read across the rows)

e .	Employed	Employed		2 5	
	Full-Time	Part-Time	Unemployed	Retired	Other
White				** .	•
Participants.	61.9	114	21.9	3.8	1.0
