ABSTRACT

The National Science Foundation (NSF) Division of Science Resources Services designs and conducts surveys related to, and supports other data collection activities dealing with, science resources. The data from these surveys and data collection efforts are used by NSF and others to analyze various research and development (R&D) funding and scientific and technical labor market issues. This document, a guide to the recurring portions of these databases, provides information on survey scope, sample size, pertinent variables, and survey instrument (copy included where appropriate). Surveys described are presented in three sections. They are: (1) scientific and technical resources--experienced scientists and engineers, doctoral recipients, federally employed scientists and engineers, scientific and technical personnel employed at universities and colleges, recent science and engineering graduates, doctorate records file, survey of graduate science and engineering students and postdoctorates, and foreign scientists and engineers; (2) science and technology funding resources -- federal funds for R&D; industrial R&D; federal support to universities, colleges, and selected nonprofit institutions; and scientific and engineering expenditures at universities and colleges; and (3) science and technology inputs and outputs -- science indicators literature database and counts of patents applied for and granted in the United States. (NE)

A Guide to NSF

Science/Engineering Resources Data

introduction

Among the many missions assigned to the National Science Foundation (NSF) by the Congress is the authority and responsibility to "...appraise the impact of research upon industrial development and upon the general welfare;...maintain a current register of scientific and technical personnel, and in other ways to provide a central clearing-house for the collection, interpretation, and analysis of data on the availability of, and the current and projected need for, scientific and technological resources ... to initiate and maintain a program for the determination of the total amount of money for scientific research...." (PL81-507, Sec. 3. (a)).

In pursuit of these objectives, the Division of Science Resources Studies (SRS) designs and conducts surveys, and supports other data collection activities dealing with science resources. The data from these surveys and data collection efforts are used by NSF and others in analyses of various research and development (R&D) funding and scientific and technical labor market issues. This document is a guide to the recurring portions of these data bases including scope, size of sample, and pertinent variables.

The abstracts found in this guide provide a minimum introduction to these data resources. More complete descriptions can be found in the technical notes of publications cited for each data base. These notes provide technical detail and also contain copies of the current survey instruments employed.

Inquiries concerning the surveys should be addressed to:

Scientific and Technical Personnel:

scientific and technical human resources

xperienced scientists and engineers

irpose and background

The National Science Foundation (NSF) rsonnel Characteristics System is dened to measure the demographic, emigment, educational, and geographic tracteristics of the nation's science and sineering personnel. The survey, Extended Scientists and Engineers, is the jor component of this system, and proes a longitudinal profile of those sciists and engineers who were in the labor ce at the time of a decennial census; a new sple is drawn:)

The initial survey in the series was done 1972; and repeated in 1974; 1976; and 8. In 1978; completed questionnaires received from about 82 percent of se in the sample—approximately 41,000 pondents; representing an estimated pulation of about 970,000.

ollowing the 1980 decennial census, a

new sample was drawn and a survey was conducted in 1982, with subsequent surveys planned for 1984, 1986, and 1988. The 1982 survey was mailed to approximately 140,000 individuals, and had a response rate of over 70 percent.

In these surveys, an individual is classified as a scientist or engineer if two of the following three criteria are met: (1) employed in a science or engineering field; (2) holding a degree in a science or engineering field; or (3) self-identification as a scientist or engineer based on an individuals total education and experience. Criteria used by NSF to define scientists and engineers are developed in consultation with appropriate professional societies.

REFERENCE LIST A - MAJOR FIELDS OF STUDY

This list is to the used in answering question 3, about the field in which you have obtained study or training. It is divided into two sections. Section 1 is a list of fields of academic study generally leading to bacheloi's or higher degrees; Section II is a list of fields of study and training below those generally leading to a bacheloi's degree.

Please scan_the_entire list.__choose the appropriate answer for the question and then enter the code and description in the appropriate section of question 3.—4f none of the-categories listed below adequately describes what you were studying or being trained in, use the "Other" category (code 600 or 625) and enter a brief description of what you were studying in the space provided on the questionnaire.

FORM PMS-28F 18-28-771

doctorate recipients

purpose and background

The primary objective of this continuing biennial survey is to estimate at the national level the supply and utilization of doctoral scientists and engineers. One use of these data is to refine the estimates of doctoral scientists and engineers derived from the Experienced Scientists and Engineers Sample Survey.

This survey is unique in that the sample is drawn from the Doctorate Records File [q.v.], a complete enumeration of doctorateholders. During 1972 a roster was compiled of all known recipients of doctoral degrees for the years 1930-72, inclusive. The completed Comprehensive Roster of Doctoral Scientists and Engineers, encompassing this particular 42-year span, was used as the population for the initial survey conducted in 1973. Subsequent surveys were, and continue to be, conducted at 2-year intervals (e.g., 1979 and 1981). For each succeeding survey the 42-year population definition is maintained by adding the two most recent graduating classes and dropping the oldest two cohort-year groups. For example, the 1975 survey covered doctorate recipients in the period January 1; 1932 to June 30, 1974; while the 1977

survey spanned the 1934-76 population.

The first survey in 1973 was based on the Comprehensive Roster of approximately 272,000 doctorate-holders from which a stratified sample of approximately 59,000 was selected. Individuals included in the 1973 roster were stratified according to the following variables: (1) U.S. science and engineering (S/E) doctorateholders; foreign S/E doctorate-holders; non-S/E doctorate-holders subsequently employed in S/E positions; [2] sex; [3] size of graduating institution according to the annual number of doctorates awarded; (4) field of doctorate; and (5) year of doctorate. The survey yielded 42,456 responses, or 72 percent of those contacted.

The stratification plans for the subsequent surveys were the same as for the 1973 survey except that in 1975 "size of graduating institution" was replaced by a different variable—"racial/ethnic identification." Note that these racial/ethnic data are only available beginning with the 1973 cohort group. The 1981 survey, the most recent for which data are presently available, used a stratified sample of 44,400 scientists and engineers of whom 31,400, or 71 percent, responded.

federally employed scientists and engineers

purpose and background

Data are collected and maintained concerning scientists and engineers employed by the U.S. Government. These data, when combined with other information resources, provide estimates of the number of science and engineering (S/E) personnel employed as well as the method of their utilization in the Federal Government (excluding uniformed military personnel).

The source of data on federally employed scientists and engineers is the U.S. Office of Personnel Management. As each person is employed, released, or has his/her status changed by an agency of the Federal Government, the employing office must notify the U.S. Office of Personnel Management via a Standard Form 50. Data on the form include sociodemographic, educational, occupational, and minority-status variables that provide the basis for this National Science Foundation (NSF) file and, more recently, for a set of computer-readable tapes.

Currently, only data for 1977-78 accessions and separations are available on computer-readable tape. Selected data are also available in NSF reports for over 25 years: Numbers employed by sex, intermittent since 1954; salary since 1964; major functions reported biennially for

1969 through 1975; educational levels for 1974; minority-group participation in the Federal work force as of 1977. A statistical report on the Federal work force is available for 1976-78. A similar report for 1979-81 will be available in late 1984.

references

The most recent NSF report based on the above data is

Federal Scientific and Technical Personnel, 1976, 1977, and 1978 (Detailed Statistical Tables) (NSF 81-309), available from NSF and NTIS (PB 82-115395).

data access

The following tape files based on the Central Personnel Datafile (U.S. Civil Service Commission) are available.

A. Tape files of all in-house Federal civilian scientists and engineers employed full time in October 1977. Data on the tape files include: Agency, bureau; year of birth; State-city-county of employment; occupational specialty (series); pay plan; grade and step; salary; service computation date; sex; tenure (career, etc.); minority group designation; highest degree earned and year; field of highest degree; and functional class.

B. Tape files of all new hires (and rehires) of full-time Federal civilian scientists and engineers in calendar 1977 and 1978. Data include: Age interval; occupational series; grade; salary; sex; minority group designation; highest degree earned and year; and field of highest degree.

C. A tape file of all separations of fulltime Federal civilian scientists and engineers in calendar 1977 and 1978. Data include: Age interval; occupational series; grade; salary; sex; minority-group designation; highest degree earned and year; and field of highest degree.

D. A tape file of all white-collar workers, including scientists, engineers, and technicians, as of October 1981. Data include age, occupational series, grade, salary, sex, minority-group designation, highest degree earned and year, field of highest degree, functional classification, and management/supervisory status. The tape will be available for use by mid-1984:

These tapes are available subject to restrictions (e.g., Privacy Act of 1976) and reproduction cost from:

scientific and technical personnel in private industry

purpose and background

This series of surveys is supported as part of a National Science Foundation (NSF) effort to compile national estimates of employment by detailed industry and occupation from the Occupational Employment Statistics Survey of the Bureau of Labor Statistics (BLS), Department of Labor: Similar, but not strictly comparable. time-series data are available from NSF for the 1950-70 period and for 1975. Data for the 1950-70 series were collected by BLS from intermittent direct surveys of samples of establishments between 1950 and 1970 with interpolations for intervening years. The 1975 estimates were made by the Bureau of the Census from a sample of 24,000 establishments and included data on energy personnel.

Six surveys were conducted from 1977 through 1982. Manufacturing establishments were sampled in 1977 and 1980; the number of responding firms were 83,000 and 116,000, respectively. The surveys of nonmanufacturing establishments in mining, construction, financial, and service industries obtained responses

from 217,000 firms in 1978 and 240,000 firms in 1981. There were approximately 240,000 respondents to the 1979 and 1982 surveys of nonmanufacturing establishments in trade and regulated industries. Manufacturing firms are found in Standard Industrial Classification (SIC) codes 20-39; nonmanufacturing firms, in SIC codes 10-17; 00-07; 70; 72-73, 75-76, 78-81, 83-84; 80; 80; and trade and regulated firms, in SIC codes 41-42; 44-59;

20 . 19

scientific and engineering personnel employed at universities and colleges

purpose and background

The purpose of this survey is to provide quantitative information on professional science and engineering (S/E) personnel employed by universities and colleges.

The survey was conducted periodically between 1954 and 1973; since 1973 it has been conducted annually. All U.S. universities and colleges which employ scientists or engineers are surveyed, as are approximately 19 academically administered federally funded research and development centers [FFRDC's].

The data variables collected over the years have primarily consisted of head-counts by highest earned degree, of full-and part-time scientists and engineers by S/E field and sex, with some measure of the extent of research and development (R&D) involvement.

Prior to January 1979, data were collected for both full- and part-time personnel by the function (teaching, research, or other) in which they were primarily employed, for each specific field of science or engineering. Headcounts for both full- and part-time personnel were also collected by highest earned degree and function of primary employment. Additional questionnaire items requested headcounts of scientists and engineers with doctoral degrees by broad S/E area and employment status; headcounts for full-time personnel by detailed field and sex; and headcounts for technicians by broad area and primary function: Full-time-equivalent (FTE) counts were collected only for all-field totals prior to 1979 and were available by employment status and primary function.

Over time the scope of the survey has varied because of concern about response burden. Data on the distribution of personnel according to degree level and function of primary employment have not been collected since 1978. The items on primary function by field were converted to an FTE concept on a permanent basis on the

shortened questionnaire used in 1979. All items on distributions of personnel by degree level or by sex were omitted from the shortened 1979 form but were returned to the full-scale survey form in 1980. The items on function of primary employment and the item on technicians last appeared on the 1978 survey form.

In addition to the reduced number of data items on the 1979 questionnaire, the scope of the survey was further restricted in that only doctorate-granting institutions and FFRDC's were surveyed. Prospective data users must therefore exercise care and judgment in interpreting and utilizing the 1979 data; data aggregates, for example, should not be treated as national totals. Data elements for the 1980, 1981, 1982, and 1983 surveys are identical.

NATIONAL SCIENCE FOUNDATION

Washington, D.C. 20550

SURVEY OF SCIENTIFIC AND ENGINEERING PERSONNEL EMPLOYED AT UNIVERSITIES AND COLLEGES, JANUARY 1983

Organizations are requested to complete and return this form to:

NATIONAL SCIENCE FOUNDATION 1800 G Street, N.W., Room L-602 Washington, D.C. 20550—Attn: UNISG

This information is solicited under the authority of Section 3 (a) (6) of the National Science Foundation Act of 1950, as amended (42 U.S. Code 1862 (a) [6)]. Your response is entirely voluntary and your failure to provide some or all of the information will in no way adversely affect your institution.

Please correct if name or address has changed.

This survey requests scientific and engineering (S/E) employment data according to institutional recordkeeping conventions. The completed 1983 questionnaire should be returned by March 15, 1983. Your prompt cooperation will be appreciated. If you determine, however, that you cannot respond by March 15, please notify NSF and request an extension of time.

Please read the enclosed instructions before completing this form. If you have any questions, contact Ms. Judith Coakley or Ms. Esther Gist (202-634-4673). Please complete all columns; estimates by academic officials will be better than NSF estimates.

All entries should be in whole numbers; please do not enter decimals or fractions, except in item 3, columns 2 and 3, where two decimal places are optional.

SURVEY POPULATION

Include data for ALL ORGANIZATIONAL UNITS OF YOUR INSTITUTION THAT EMPLOY SCIENTISTS AND ENGINEERS, such as regional campuses, computer centers, medical schools, agricultural experiment stations, and associated research units. Also include any hospital or clinic owned, operated, or controlled by your university and integrated operationally with the clinical programs of your medical schools.

Federally Funded Research and Development Centers (FFRDC's)

Separate forms have been mailed directly to all FFRDC's administered by academic institutions. A list of these centers appears on page 3 of the Instructions and Definitions.

NATIONAL SCIENCE FOUNDATION

Washington, D.C. 20550

SURVEY OF SCIENTIFIC AND ENGINEERING PERSONNEL EMPLOYED AT UNIVERSITIES AND COLLEGES, JANUARY 1983 INSTRUCTIONS AND DEFINITIONS

Introduction

This information is solicited under the authority of the National Science Foundation Act of 1950. as amended in P.L. 507 [42 U.S.C. 1862] (Section 3(a) [6]], and Executive Order 10521 (March 17, 1954). All information you provide will be used for statistical purposes only. Your response is entirely voluntary and your failure to provide some or all of the information will in no way adversely affect your institution.

The National Science Foundation requests your cooperation in completing the attached questionnaire covering the characteristics of personnel in your institution as they relate to the sciences and engineering. This form requests employment data in 1982-83 according to institutional recordkeeping coventions. The questionnaire should be completed and returned to NSF by March 15, 1983. If you determine, however, that you will not be able to respond by that date, please notify NSF and request an extension of time.

Where data you report in the current survey differ significantly from those reported in the previous survey, please indicate the reasons for the difference, such as "opening of new medical school," etc., at the end of the questionnaire in the "Remarks" section, or on a separate sheet of paper.

The survey procedures are outlined in flow chart format. (See pp. 5-8.)

If you have any questions regarding information requested on this form, write or telephone Ms. Judith Coakley or Ms. Esther Gist at the Universities and Nonprofit Institutions Studies Group, Division of Science Resources Studies, National Science Foundation, 1800 G Street, N.W., Room L-602, Washington, D.C. 20550 (Telephone: [202] 634-4673.] Additional forms, as well as copies of previous responses, may be obtained by writing to the above address.

Survey Instructions

1. Survey Population

This survey, conducted annually, covers professional employment at all academic institutions with a science or engineering (S/E) program. The institutional response to this survey should reflect personnel activity in all branches and other units of the parent institution, including regional campuses, computer centers, medical schools, agricultural experiment stations, and associated research units. If any data for any of these campuses are not included in your response to NSF, please indicate this under "Remarks" when submitting your questionnaire.

Federally funded research and development centers (FFRDC's) are to report their data separately from the administering university; see the listing of FFRDC's administered by academic institutions (p. 3.)

2. Survey Time Period

The January date referenced in this questionnaire reflects the midpoint of the 1982-83 academic year rather than the actual reporting date of data to be compiled for NSF. Data reported on this survey are to reflect a "snapshot" of S/E personnel employed at a fixed time during the 1982-83 academic year. For institutions reporting on the basis of central record systems, data should reflect the date when your files are "frozen" for annual personnel reports. Many institutions, especially those with State affiliation, use their central records compiled in the preceding fall of each year to report to NSF. You may want to report as of the payroll period closest to October 1, 1982, which is the basis for the Equal Employment Opportunity Commission's survey of higher education staff (EEO-6, Form 221). Please indicate the reporting month used by your institution in the space provided in the "Remarks" section.

3. Professional Employment

The term "professional," for purposes of this survey, refers to all persons paid a salary or stipend by the responding institution who work at a level at which the knowledge acquired by academic training equal to a bachelor's degree in science or engineering is essential in the performance of duties. Many institutions with central reporting systems use headcounts of exempt employees, i.e., those employees who are in the exempt category of the Fair Labor Standards Act as amended. Exempt employees are not eligible for overtime payment. Others use EEO-6 concepts.

Include: S/E personnel with faculty status, postdoctorates, and other professional employees such as systems analysts in computer centers.

Exclude: (1) Personnel on sabbatical or other leave status even if these personnel continue to be paid by your institution; (2) personnel employed in branches of your institution located in foreign countries; (3) unpaid voluntary staff; (4) persons "unpaid" by the university but paid by the medical school; (5) student health service personnel; (6) those agricultural extension personnel primarily involved in home economics and 4-H youth programs; (7) administrative officers above the level of department chairpersons with titles such as president, academic dean, dean of faculty, provost, chancellor, etc., even though they may devote part of their time to teaching and/or research; (8) all graduate students.

27

^{&#}x27;Some institutions without comprehensive central records on the number of postdoctorates base their response to this survey on data gathered in the office of the graduate dean as part of NSF's Survey of Graduate Science and Engineering Students and Postdoctorates.

4. Assignment of Scientists and Engineers to NSF Disciplines

Determination of whether professional employees should be reported in the NSF personnel survey as "scientists and engineers" and their associated disciplines is done by most respondents on the basis of departmental structures. After particular departments are selected for inclusion in the NSF personnel survey, respondents issually classify headcounts of all professional employees into various S E disciplines according to their primary or home department of assignment. Where individual assignments are split into two departments on a 50-percent basis, classification into a single NSF discipline should be made according to institutional conventions.

See the classification of Disciplines of Employment in the Sciences and Engineering, for the broad and detailed S/E disciplines of employment corresponding to those shown on the questionnaire; with illustrative categories of each discipline (pages 3 and 4.) Also, for those that use the NCES instructional program categories; see the enclosed "Crosswalk" between NSF's S/E fields and the codes in the NCES Classifications of Instructional Programs (NCES 81-323]. Please note that education, law, humanities, music, the arts, physical education, and library science are not considered S/E disciplines for the purpose of this survey. This discipline-oriented taxonomy is used by institutions that compile their own departmental groupings for this NSF survey. While most respondents report S.E headcounts based on departmental structures, NSF recognizes that because of the multidisciplinary nature of many academic activities, degree specialties and departmental assignments may differ (e.g., a Ph.D. in mechanical engineering may he assigned to the department of orthopedics.) To promote ease of reporting and consistency of data among institutions, it is suggested that where these differences are not significant, all professionals in the department he assigned to a single discipline. In other instances, where sizable differences occur, institutional respondents may choose to report professionals employed in a single department into two or more disciplines. For example, an institution may have a single department of electrical engineering and computer science and report individuals into two separate disciplines on the NSF personnel survey according to their degree specialties.

It is important that respondents include in the survey scientists and engineers who are appointed to organizational units that are not part of any academic department. For example, scientists and engineers employed at a computer center that is not affiliated with a particular academic department should be included in the survey. In a similar manner an economist in a nonscience department should be reported. The most prevalent reporting practice for these nonacademic units is to assign groups of individuals to NSF disciplines according to their degree specialties, especially when multi-disciplinary activities are prominent.

5. Medical and Clinical Disciplines

For purposes of this survey, all M.D.'s, D.D.S.'s, etc., with foculty or ocodemic appointments are to be reported, including postdoctorates. NSF considers faculty status given to physicians, dentists, public health specialists, pharmacists, etc., to he an indicator of significant involvement in teaching, clinical investigation, or other R&D activities.

Exclude: (1) All medical practitioners, such as nurse anesthetists, occupational therapists, physical therapists, interns; (2) scientists or engineers whose primary employment is at independent hospitals even though they may perform some teaching or research functions for your institution through cooperative agreements; (3) unpaid voluntary staff at medical or dental schools; and (4) medical residents unless research training under the supervision of a senior mentor is the prime purpose of the appointment.

6. Questionnaire Item 1, Highest Earned Degree and Headcounts

a. Highest earned degree information is most commonly available in personnel, payroll, or budget files. Most academic institutions have a computerized system for updating highest earned degree data for professionals. If these files at your institution do not contain degree data, however, these data may be estimated using departmental records.

For purposes of this survey, earned degrees are classified in four categories:

- (1) Under "Doctorate Degree" include earned degrees carrying the title of Doctor, e.g., Ph.D., D. Eng., D.E.S., etc. include individuals holding both the Ph.D. degree and any other doctorate degree.
- (2) Under "First-Professional Degree" include individuals whose highest earned degrees, e.g., M.D., D.D.S., D.V.M., etc., are first-professional medical degrees that represent the completion of the academic requirements based on programs that require at least 2 academic years of previous college work for entrance and require a total of at least 6 academic years of college work for completion. Specifically include in line 2h first-professional degrees in Medicine (M.D.), Dentistry (D.D.S. or D.M.D.), Veterinary Medicine (D.V.M.), Podiatric Medicine (D.P.M.) and Osteopathic Medicine (D.O.). Individuals holding both the Ph.D. degree and a first-professional degree such as the M.D., should be included in line 2a as mentioned in [1] above.
- (3) Under "Master's Degree" include earned degrees carrying the title of Master that are above the bachelor's degree and are other-than-doctorate or first-professional degrees reported in lines 2a and 2b.
- (4) Under "Bachelor's degree or the equivalent" include all individuals who have successfully completed a baccalaureate program of studies; usually requiring at least 4 years (or equivalent) of full-time college level study. For the purpose of this survey, 5-year bachelor's degree holders may he included in this category, as well as those who are considered to have the equivalent in experience, even if they have not earned such as degree:

b. Headcounts

- (1) Full-time employees are those individuals available for full-time assignments at the date used for reporting in this survey, or those who are designated as "full time" in an official contract, appointment, or agreement. Determination of "full-time" designation should be based on institutional recordkeeping conventions and standards. Avoid double counting; if, for example, individuals are full-time employees but their assignments involve more than one department or campus, they should be counted as one full-time employee according to their primary or home department of assignment (or campus).
- (2) Part-time employees are those individuals who work for a length of time in a day, week, etc., defined by your institution as part-time employment.

7. Questionnaire Item 2, Sex of Full- and Part-time Scientists and Engineers

Item 2 collects data on the sex of full- and part-time scientists and engineers, characteristics which are usually available in central records. Computer programs used to respond to other requests for employment data on women may often be modified to provide specialized information on scientists and engineers.

8. Questionnaire Item 3, Full-Time-Equivalents (FTE's)

a. The FTE reporting concept should reflect the actual utilization of S/E professionals in various disciplines and their involvement in separately budgeted R&D activities. While headcounts are usually reported on the basis of primory department of assignment, FIE reporting in various NSF disciplines should reflect multiple appointments. For example, an individual with a 60-percent appointment in electrical engineering and a 40-percent appointment in computer science would be reported in FTE's in two NSF disciplines according to the 60-40 percent split in departmental assignments. Accordingly, the FTE concept converts the number of persons with part-time or split appointments among various disciplines or activities to an equivalent number of full-time persons, in accordance with institutionally agreed upon conventions. The number of FTE's reported in column 2 of item 3 should be equal to or greater than the number of full-time employees in any given field, using decimals (proportion of 1.00) for part-time employees. Therefore, the number of FTE's would be equal to or less than the total headcount in any field, and equal to or greater than the number of full-time employees.

The procedures used to compile FTE data vary from institution to institution, depending largely on the records available. Generally, there are two categories of records available to institutions—budgeting information describing the allocation of personnel resources and/or data reflecting actual rather than planned utilization of the resources.

In converting S/E headcounts into FTE's, the following method is suggested:

- Categorize headcounts of all exempt employees in S/E departments, medical schools, agricultural experiment stations, research institutes, and other institutional organizational units into one of the NSF disciplines according to primary assignment;
- (2) Within each discipline, differentiate employees as being either full time or part time (according to institutional practices);
- (3) Calculate the full-time equivalents of full-time S/E personnel. Use budgetary or resource utilization records to report S/E employees with split appointments between departments and/or institutional units, and distribute these data according to appropriate NSF disciplines.
- (4) Calculate the full-time equivalents of part-time S/E personnel and merge them into appropriate NSF disciplines.
- b. Full-Time-Equivalents in Research and Development (R&D)

For purposes of this survey, report only the full-time-equivalent involvement of persons engaged in separately budgeted research and development.

R&D activities are systematic, intensive studies directed toward fuller knowledge of the subject studied. R&D is the same as "organized research" as defined in OMB Circular A-21 revised; July 23, 1982. It includes all R&D activities of an institution that are seporately budgeted and accounted for. R&D includes both "sponsored research" activities (sponsored by Federal or non-Federal agencies and organizations) and "university research" (separately budgeted under an internal application of institutional funds).

Exclude: Time spent by professional employees on departmental research that is not separately budgeted, training grants, public service grants, demonstration projects, etc.

Estimating the division of time allocated or spent by individuals in separately budgeted R&D programs is difficult for many institutions. Again, procedures used to supply these data vary among institutions and the extent to which central reporting is feasible depends, by and large, on the degree to which budget/personnel/financial records are mechanized and linked. Among the procedures used by various institutions are the following:

- Using some generally held criteria at the institutional or departmental levels (i.e., three-fourths for instruction, one-fourth for research);
- (2) Estimating separately budgeted R&D involvement or assignment obtained from payroll records, personnel records, or from employee contracts (i.e., salaries paid from separately budgeted R&D funds may be compared with total academic salarie: of individuals);
- (3) Asking research administrators, department chairpersons, or heads of other organizational units to furnish estimates of separately budgeted R&D involvement.
- (4) Using faculty activity analyses in institutions where these are regularly conducted, and differentiating separately budgeted R&D activity from departmental research activity.

Federally Funded Research and Development Centers (FFRDC's)

For purposes of this survey, FFRDC's are defined as R&D organizations exclusively or substantially financed by the Federal Government and administered on a contractual basis by educational institutions or other organizations. The following is a current list of FFRDC's administered by universities and colleges:

Ames Laboratory Argonne National Laboratory Brookhaven National Laboratory Center for Naval Analyses Cerro Tololo Inter-American Observatory E. O. Lawrence Berkeley Laboratory E. O. Lawrence Livermore Laboratory Fermi National Accelerator Laboratory Jet Propulsion Laboratory Kitt Peak National Observatory Lincoln Laboratory Los Alamos Scientific Laboratory National Astronomy and Ionosphere Center National Center for Atmospheric Research National Radio Astronomy Observatory Oak Ridge Institute of Nuclear Studies Plasma Physics Laboratory Sacramento Peak Observatory Stanford Linear Accelerator Center

Classification of disciplines of Employment in the Sciences and Engineering. Illustrative subfields include:

ENGINEERING

Aeronautical & Astronomical: aerodynamics, aerospace, space technology.

Chemical: ceramic, petroleum, petroleum refining process.

Civil: architectural, hydraulic, hydrologic, marine, sanitary and environmental, structural, transportation.

Electrical: communication, electronic, power.

Mechanical: engineering mechanics.

Other Engineering: agricultural, industrial and management, metallurgical and materials, mining, nuclear, ocean engineering systems, textile, welding.

PHYSICAL SCIENCES

Astronomy: laboratory astrophysics, optical astronomy; radio astronomy; theoretical astrophysics, X-ray, gamma-ray, neutrino astronomy.

Chemistry: analytical, inorganic, organo-metallic, organic, pharmaceutical, physical, polymer science (exclude biochemistry).

Physics: acoustics, atomic and molecular: condensed matter; elementary particles; nuclear structure, optics, plasma.

Other Physical Sciences: used for multidisciplinary fields within physical sciences:

ENVIRONMENTAL SCIENCES (TERRESTRIAL AND EXTRATERRESTRIAL)

Atmospheric Sciences: aeronomy, solar, weather modification, extraterrestrial atmospheres, meteorology.

Earth Sciences: engineering geophysics, general geology, geodesy and gravity, geomagnetism, hydrology, inorganic geochemistry, isotopic geochemistry, organic geochemistry, lab geophysics, paleomagnetism, paleontology, physical geography and cartography, seismology.

Oceanography: biological oceanography, chemical oceanography, geological oceanography, physical oceanography, marine geophysics.

Other Environmental Sciences: used for multidisciplinary fields within environmental sciences.

MATHEMATICAL AND COMPUTER SCIENCES

Mathematics: algebra, analysis, applied mathematics, foundations and logic, geometry, numerical analysis, statistics, topology.

Computer Sciences: computer programming,² computer and information sciences (general), design, development, and application of computer capabilities to data storage and manipulation, information sciences and systems, systems analysis.

LIFE SCIENCES

Agricultural Sciences: agronomy, animal science, dairy science, food science and technology, forestry, horticulture, poultry science.

Biological Sciences: anatomy, bacteriology, biochemistry, biogeography, biophysics, ecology, embryology, entomology, evolutionary biology, genetics, immunology, microbiology, nutrition and metabolism, parasitology, pathology, pharmacology, physical anthropology, physiology, plant sciences, radiobiology, systematics, zoology, veterinary biology.

Medical Sciences: internal medicine, neurology, ophthalmology, preventive medicine and public health, psychiatry, radiology, surgery, veterinary medicine, dentistry, pharmacy, podiatry, anesthesiology, chemotherapy, dermatology, geriatrics, nuclear medicine, obstetrics, gynecology, oncology, pediatrics, physical medicine and rehabilitation.

Other Life Sciences: all other health-related disciplines.4

PSYCHOLOGY

Psychology: animal behavior, clinical psychology, comparative psychology, counseling, and guidance, development and personality, educational, personnel, vocational psychology and testing, experimental psychology, ethology, industrial and engineering psychology, social psychology.

SOCIAL SCIENCES

Economics: econometrics and economics statistics, history of economic thought, international economics, industrial, labor and agricultural economics, macroeconomics, microeconomics, public finance and fiscal policy, theory, economic systems and development:

Political Science: regional studies, comparative government, history of political ideas, international relations and law, national, political and legal systems, political theory, public administration.

Sociology: comparative and historical, complex organizations, culture and social structure, demography, group interactions, social problems and social welfare, sociology theory.

Other Social Sciences: cultural anthropology, criminology, history of science, linguistics, socioeconomic geography, urban studies.

*Exclude personnel primarily involved in direct patient care.

NOTE: See enclosed NSF Crosswalk between NSF field of S/E codes and the NCES Classification of Instructional Programs.

^{*}Personnel employed as computer programmers should not be reported as professionals.

Institutions with schools of veterinary medicine should distribute professionals among the appropriate disciplines (agricultural, biological, and medical) rather than report all personnel as medical scientists.

Flow Charts

Institutions that automate NSF survey data or plan to—or even engage in manual data processing—may be assisted by these charts.

STEP 1:

Retrieve; sort; and select information from central records of institution.

Central File: Contains centralized records for all paid em-Central ployees. (Note: Some affiliated entities such as medical schools File may have their own central files. See below.) Examples: Personnel, payroll, or general financial records. Exempt Nonexempt Select personnel exempt from Fair Labor Standards Act. (See Exclude or nonexempt section 3 in Instructions.) Exampt No Select scientists and engineers (include postdoctorates) by "home" department. Exception: if "home" department is not S/E scientist science or engineering, and person holds joint appointment engineer? in S/E department. Yes sabbatical/ Exclude See section 3 in Instructions. leave? Yes Employed in foreign Exclude See section 3 in Instructions. country No Rank Yes above dept. Exclude See section 3 in Instructions. chairperson? No Assign to categories of See section 6 in Instructions. educational attainment Assign to specific S/E Assign to appropriate disciplines. disciplines Assign by See section 7 in Instructions. At this point you have extracted file containing all profes-Professional sional scientists and engineers covered by central records S/E's, by discipline (but may be limited to those assigned to academic S/E de-

partments in the institution proper).

STEP 2:

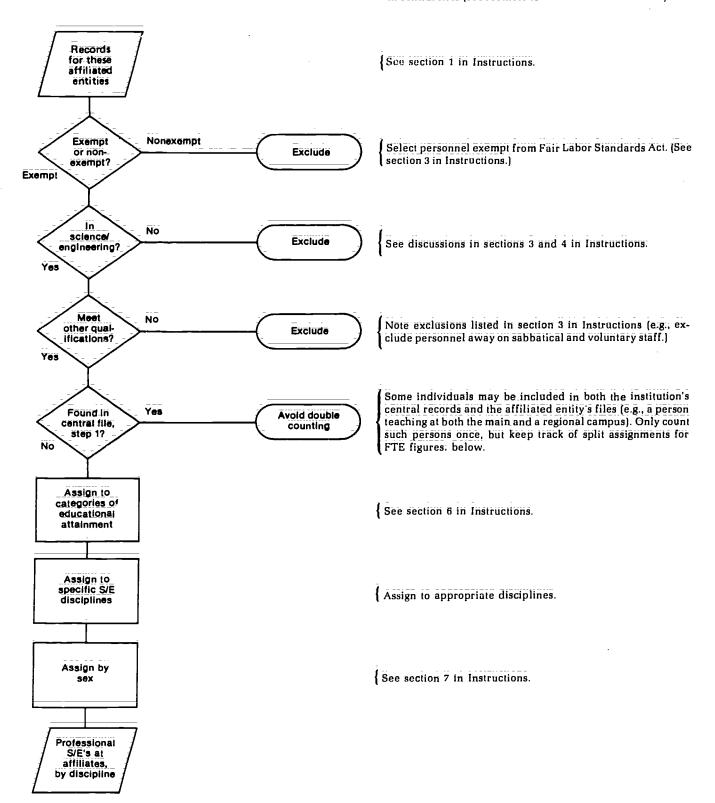

Collect information for medical school (if any) if not covered by central file of institution.

Refer to discussion of medical schools (section 5 in Instruc-Medical school tions): records Exempt Nonexempt Select personnel exempt from Fair Labor Standards Act. Exclude or non-(See section 3 in Instructions.) exempt? Exempt No Do not include medical school personnel unless they have Faculty No faculty or academic appointments. Exceptions: postdoctorates. or academic Postdoc? (See section 5 in Instructions.) app'tmnt? Exclude personnel "unpaid" by the university even if paid "Unpaid" by Exclude by the medical school. Exclude voluntary staff. university? Scientists whose primary employment is at independent hos-Mostly Yes employee of pitals are to be excluded even if they perform teaching/ indep. hosp? research for your institution through cooperative agreements. No Some individuals may be included in both the institution's Yes central records and the medical school records. Count such Found in Avoid double central file, persons only once, but keep track of split assignments for counting step 1? FTE figures, below. Assign to categories of See section 6 in Instructions. educational attainment Assign to specific S/E Assign to appropriate disciplines. disciplines Assign by See section 7 in Instructions. **Professional** S/E's at med school, by discipline

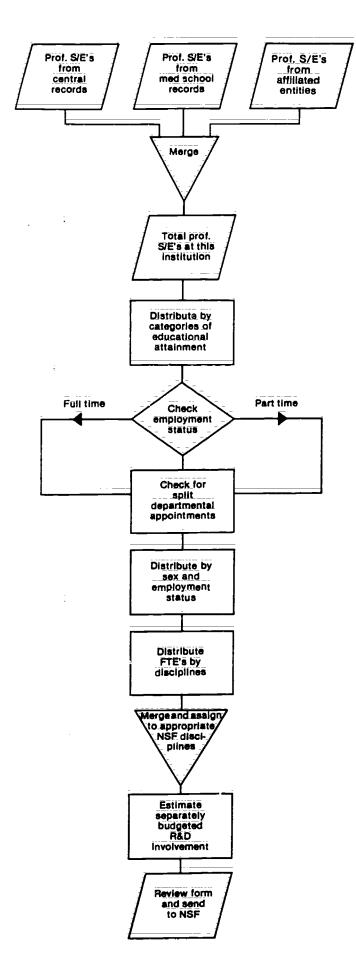

STEP 3:

Collect information on any remaining affiliated entities not covered by files already processed. Such entities might include a regional campus, a computer center, an agricultural experiment station or an associated research unit (except for FFRDC's), etc. Also check for postdoctorates not included in central files (see footnote to section 3 in Instructions.)

STEP 4:

Merge all extracted information, compute full-time-equivalents in each discipline for both full-time and part-time personnel, and determine extent of separately budgeted R&D involvement.

If duplicate entries have not already been eliminated, it may be convenient to do so at this stage:

Data required for item 1 have now been collected.

Use institutional definition for "part-time" employees. (See also discussion of "full time" in section 6 in Instructions.)

FULL TIME: Check for personnel assignments which are split across several disciplines. (See section 8 in Instructions.)

PART TIME: Use institutional conventions or practices to convert numbers of part-time personnel to the equivalent number of full-time individuals in each discipline. (See section 8 in Instructions.)

Data required for item 2 have now been collected.

For all personnel, determine the proportion of time spent in separately budgeted R&D programs. Use institution's conventions or data from faculty activity analyses, salaries paid from research funds, etc. (See section 8 in Instructions.)

Data required for item 3 have now been collected.

recent science and engineering graduates

purpose and background

The purpose of this periodic survey is to compile national statistics describing the employment and educational characteristics of baccalaureate- and master'sdegree level scientists and engineers graduating after the decennial censuses in 1970 and 1980: As indicated above, the Survey of Experienced Scientists and Engineers biennially collects data about the "stock" of people who were already at work in 1970 or 1980. These data; however, would become increasingly inaccurate with passing time unless the "new entrants" into the Nation's science and engineering (S/E) population were added to reflect the "birth" process in that stock. Thus, the Survey of Recent Science and Engineering Graduates is part of a continuing effort to trace the changing nature of "new entrants" to the S/E labor force as well as to provide the means by which current national estimates of this population can be made.

Recent doctorate recipients, who are excluded from this survey, are covered by other surveys. See the sections entitled (a) "Doctorate Records File" and (b) "Doc-

torate Recipients" for the sources of these data:

The initial effort in this series, the 1974 survey, used a sample of entering classes for 1967-69; the presumed source population for 1971-73 baccalaureates. Low response rates required a change in methodology. Subsequent surveys utilized samples drawn from lists of graduates furnished by participating institutions. Under this procedure a sample survey of recent bachelor's- and master's-degree recipients in science and engineering has been conducted periodically since 1976. The 1982 study surveyed the graduating classes of 1980 and 1981.

1982 survey sample

Approximately 27,000 persons who earned bachelor's or master's degrees between July 1979 and June 1981 were surveyed. Samples stratified by discipline were drawn from each of the two years consisting of 9,000 bachelor's-degree recipients and 4,500 master's-degree recipients, for a total of 27,000 individuals. Their names were drawn from lists received

from 295 universities and colleges. Among the data collected were: Age, citizenship, sex, ethnicity, education, employment, work activity—including relationship to Federal research and development (R&D) efforts, and salary.

INSTRUCTIONS FOR COMPLETING THIS QUESTIONNAIRE

In constructing this questionnaire we have tried to provide response categories for most answers. If the response categories are not adequate for you to answer a question correctly, please write your answer in the question box. If you are not certain of the correct response, please give us your best estimate or guess.

There are basically two types of questions: the closed-end questions, where response categories have been provided and you are asked to mark a box; and open-end questions, where you are asked to fill in the information sought. In addition, in some of the questions you are asked to fill in "code numbers" either from the list on page 2 or from a preceding question.

| ceding question. |
|--|
| An example of each type, with sample answers, is shown below. |
| 1. Do you subscribe to any periodical journals or magazines? |
| 1. X Yes (GO TO QUESTION 2) |
| 2. NO (SKIP TO QUESTION 4) |
| Which of the following journals or magazines do you receive? (MARK AS MANY AS APPLY) |
| 01. X Newsweek |
| 02. Time |
| 03. Life |
| 04. Science |
| 05. X Scientific American |
| 06. X Other, Specify: Smith Sonian |
| 3. Which of the journals marked in question 2 most relates to the kind of work you do? (ENTER THE APPROPRIATE CODE NUMBER FROM QUESTION 2) |
| 0 4 |
| 4. What professional society or association do you belong to? |
| National Association of Mechanical Lugineers |
| Engineep |
| |

Please answer all the questions that apply to you and follow directions which may ask you to skip certain questions. In the absence of instructions, always go to the next question. Even if you feel only part of the questionnaire applies to you, or there are some questions you cannot answer, please return the entire questionnaire.

We appreciate your participation and thank you for completing this questionnaire.

PART I. DEMOGRAPHIC CHARACTERISTICS

| In what month and year were you born? | 7.) As of May 9, 1982; did you have any children living with you? |
|--|---|
| (MONTH) (YEAR) | 1. Yes 2. Under 6 years of age |
| 2. Ārē you: | 3. 6-17 years of |
| 1. Male 2. Female | 4. No |
| 3. Are you: | 8. Are you physically handicapped? |
| 1. U.S. citizen (GO TO QUESTION 4) | 1. Yes (GO TO QUESTION 9) |
| 2. Non-U.S. citizen, immigrant (permanent resident) | 2. No (SKIP TO QUESTION 10) |
| 3. Non-U.S. citizen, nonimmigrant (temporary resident) | 9.) What is the nature of your handicap(s)? (MARK AS MANY AS APPLY) |
| (3a.) If non-U.S. citizen, of which country are you a citizen? | 1. Visual 2. Ambulatory |
| and job a catalogn | 4. Auditory 8. Other, specify: |
| (COUNTRY) | · . |
| 4. Are you: | Are you a student, currently attending a college or university? |
| 1. American Indian or Alaskan Native | 1. Yes -> 2. Student, full-time |
| 2. Asian or Pacific Islander | 3. Student, part-time |
| 3. Black 4. White | 4. 🔲 No |
| 5. Other, please specify: | In the next section (Question 11) beginning with the most recent and working back, list on the appropriate line each institution beyond the high school level from which you have obtained or are obtaining formal training leading to an academic degree. |
| descent? 1. Yes 2. Mexican-American 3. Puerto Rican 4. Other Hispanic | Designate degrees by abbreviations, for example, AA, BA, MA, MS, Ph.D., LLB, MD, etc. Use a separate line for each degree granted or worked for, or for any change in major field of specialized study. Refer to the list on page 2 for the code number and |
| 6. As of May 9, 1982, were you: 1. Married 2. Widowed | the description of major fields. Do NOT include correspondence courses, on-the-job training, apprenticeship, or training at an employer's training school. |
| 3. Separated 4. Divorced 5. Never married | If you need more space, attach a separate sheet of paper and give the same type of information for each additional school listed. |

PART II. EDUCATION AND TRAINING

PART III. EMPLOYMENT STATUS

| г | | | | |
|---|-------------|--|-----|--|
| | 12. | During the week of May 9, 1982, were you: I. Working full-time (35 hours or more at least in one position) (SKIP TO QUESTION 16) | 16. | During the week of May 9, 1982, were you working at (or on layoff or temporarily absent from) a position related to the natural sciences, social sciences, or engineering? |
| | | Working part-time (GO TO QUESTION 13) Not working, but seeking work | | 1. Yes (SKIF TO PART IV ON PAGE ?) 2. No (GO TO QUESTION 17) |
| | | (SKIP TO PART IV ON PAGE 7) 4. Not working and not seeking work (SKIP TO QUESTION 14) | 17) | What was the most important reason for taking that position? |
| | 13. | Were you seeking full-time work? 1. Yes | | (MARK ONLY ONE BOX) 1. Preferred nonscience or nonengineering position |
| L | | 2. No (SKIP TO QUESTION 16) | | 2. Promoted out of science or engineering position |
| | 14.) | Did you look for work at any time during the three weeks prior to the week of May 9, 1982; that is, between April 18 | | Pay was better in nonscience or nonengineering position Locational preference |
| | | and May 8, 1982? 1. Yes 2. No | | 5. Science or engineering position not available |
| | \bigcirc | What was the <u>main</u> reason you were not working or not seeking work during the week of May 9, 1982? | | 6. Other reason, please specify: |
| | | (MARK ONLY ONE BOX) | l | |
| | 10 | 1. On layoff from a job 2. On vacation or otherwise temporarily absent from a job for health or personal reasons 3. Retired 4. Student 5. Family responsibilities 6. Chronic illness or permanent disability 7. Could not find work or believed no jobs available in my particular field 8. Did not want to work 9. New job to begin within 30 days 10. Waiting for school to begin 11. Other, please specify: | | |
| | | | | |

PART IV. EMPLOYMENT PROFILE

| | If you have never been employed, nor self-employed, please mark this box and SKIP TO QUESTION 39. Otherwise, CONTINUE with the instructions below. |
|------|--|
| | In this part of the questionnaire, we are asking questions about the job you held during the week of May 9, 1982, or your most recent job before May 9. Please include any employment, including a military service job, not only a scientific or technical job. If you had more than one regular job during the week of May 9, record the one which you consider your principal employment. |
| 18. | For whom did you work? What is the name of the company, business or the government agency you worked for? |
| | Check here if self-employed |
| (19) | Where were you employed, that is, in what city, county and state? |
| | (CITY OR TOWN) (COUNTY) (STATE OR FOREIGN COUNTRY) |
| 20) | Which of the categories below best describes the type of organization of your principal employment or post-doctoral appointment? (MARK ONLY ONE BOX) Self-employed |
| 21) | If you had more than one job during the week of May 9, 1982, enter the category from the above list that is most appropriate for your second job. (ENTER THE APPROPRIATE CODE NUMBER, 01-14, FROM Q. 20 ABOVE) |
| | Did not have a second job the week of May 9, 1982 |

| 22. From the activities listed below, select your primary and secondary work activities for your principal job as reported in question 18, in terms of time devoted for a typical week. (ENTER THE APPROPRIATE CODE NUMBER 01-16 FOR EACH) Primary activity Secondary activity Ol Management or administration of research or development 22 Management or administration of other than research and development 33 Teaching and training - preparing and teaching courses, guiding and counseling students or traines 44 Knowledge of that is, study directed toward gaining scientific knowledge of the first is, study directed toward gaining scientific knowledge in a fefort to meet a recognized need 45 Development - product set, si, study directed toward production of useful materials, dege eliment from research toward production of useful materials, dege eliment from research toward production of useful materials, dege eliment from research toward production of useful materials, dege eliment from research toward production of useful materials, dege eliment from research toward production of useful materials, dege eliment from research toward production of useful materials, dege eliment from research toward production of useful materials, dege eliment from research toward production of useful materials, dege eliment from research toward production of useful materials, dege eliment from research toward production of poperations - production, maintenance, construction, installation 10 Quality control, testing, evaluation, or inspection 11 Distribution - sales, traffic, purchasing, customer and public relations 13 Statistical work - survey work, forecasting, statistical analysis 14 Consulting 15 Computer applications 16 Other activities (SPECIFY); (23) During a typical week in your principal job reported in question 18, which is precipally most in the principal employment from the princip | | |

doctorate records file

survey of earned doctorates awarded in the united states

purpose and background

The Doctorate Records File is a virtually complete listing of the 725,000 recipients of earned doctorates awarded by U.S. universities since 1920. The file includes research doctorates in all fields, but excludes professional (clinical) degrees such as M.D., D.D.S., or D.V.M.

The record for each doctorate recipient includes basic information of interest to policy analysts, planners, and others in the Federal Government, the general educational community, and employers. The major data categories are sociodemographic characteristics, education, and postgraduation plans. Sociodemographic characteristics include items such as date and place of birth; sex; marital status; citizenship; racial or ethnic group; cation of parents, and number of dependents. Educational information includes State and date of high school graduation, colleges attended with dates, fields of study and degrees, title of dissertation and field, and kind and sources of support during graduate study. Postgraduation plans include information on further education or employment. Many items of information, however, are available only since 1957 or, for racial or ethnic data, since 1973.

The Doctorate Records File is compiled from an annual survey (Survey of Earned Doctorates Awarded in the United States)

conducted by the National Academy of Sciences under Federal sponsorship of the National Science Foundation (NSF) and other Federal agencies. The questionnaire is distributed with the cooperation of deans of graduate schools. Each survey requests information from all new recipients of the Ph: D: or equivalent degree le.g.; Ed:D:1. The response rate to the questionnaire has been approximately 95 percent. Nonrespondents are individually represented in the Doctorate Records File by skeleton entries obtainable from commencement programs, graduation lists, and other similar public records. It is important to note that file entries for all early Ph. D.'s [1920-57 inclusive] were developed from commencement programs and similar sources rather than from questionnaire responses of individuals.

survey instrument

A copy of the 1983 survey instrument is reproduced on the following pages:

SURVEY OF EARNED DOCTORATES AWARDED IN THE UNITED STATES, 1982-83

Conducted by
The Commission on Human Resources of
the National Research Council
in Cooperation with
The American Council of Learned Societies,
The Social Science Research Council,
The Council of Graduate Schools in the United States,

Supported by
The National Science Foundation,
The Department of Education,
The National Endowment for the Humanities, and
The National Institutes of Health

To the Doctoral Candidate:

and Other Graduate Deans

This is a brief description of the Survey of Earned Doctorates indicating how the resulting data are used and how the individual confidentiality of data is protected. The basic purpose of this survey is to gather objective data about doctoral graduates, data that are important in improving graduate education both at your home institution and at a national level. Often, decisions by federal, state, and private agencies to develop new programs or support present ones are based in part on the data developed by this so. We ask your cooperation with the project.

The information requested on the accompanying questionnaire is largely self-explanatory. Please complete it, detach it along the perforated line, and return it to your Graduate Dean. On the back of this sheet is a Specialties List with code numbers and titles for classifying your fields of specialization. This will be useful in connection with several items on the questionnaire. If none of the detailed fields listed seems to be appropriate, note the "General" and "Other" categories.

What is the Survey of Earned Doctorates?

The survey form is distributed annually with the cooperation of the Graduate Deans and filled out by all graduates who have completed requirements for their doctoral degrees, Research doctorates in all fields are included, but professional degrees such as the MD, DDS, and DVM are not included because information about recipients of those degrees is compiled elsewhere. The cumulative file goes hack to 1920 and is called the Doctorate Records File.

The use of the doctoral data has been increasing, partly because of the implications for graduate education stemming from the change in the growth pattern of the number of persons receiving doctorates (562 in 1920; 3,278 in 1940; 9,735 in 1960; 29,497 in 1970; peaking at 33,727 in 1973; and now at 31,319 in 1981). This survey attempts to supply some of the information as of the time the doctorate is received:

What uses are made of the Survey data?

The data collected by this survey questionnaire become part of the Doctorate Records File maintained by the Commission on Human Resources of the National Research Council. In addition, all data collected will be provided to the National Science Foundation, the National Endowment for the Humanities, the National Institutes of Health, and the Department of Education. The Survey data are collected with the intention that they will be put to use, but only under carefully defined conditions. Such data as the number of degrees awarded in each field of specialization, the educational preparation of degree recipients, their sources of financial support, the length of time required to attain the degree, and postdoctoral employment plans of doctorate recipients are of great interest to graduate schools, employers, the scholarly community, and the nation generally. The Doctorate Records File is used for a limited number of carefully defined follow-up research studies. Each year a sample of doctorate recipients is selected for inclusion in a longitudinal research file maintained for the National Science Foundation, the National Institutes of Health, and the National Endowment for the Humanities. It is anticipated that in the future, as in the past, participation in the follow-up studies will be voluntary.

Statistical summaries from the Doctorate Records File are used by educational institutions, professional societies, and government agencies. Some specific examples are:

- An extensive statistical summary of the data is published and distributed to all graduate schools about every five years. These reports have been widely used by graduate schools and states to evaluate their progress in providing doctoral education. The data may also be useful to graduate students as an aid in selecting a graduate department.
- Annual reports containing statistical summaries based on the most recent year's Survey are distributed to graduate schools, government agencies, and any others on request.

The confidentiality of Survey data is carefully protected.

This information is solicited under the authority of the National Science Foundation Act of 1950, as amended in P.L. 507 (42 U.S.C. 186) Section 3(a)(6); and Executive Order 10521 (March 17, 1954). Within the extent provided by law all information you provide will be treated as confidential, will be safeguarded in accordance with the provisions of the Privacy Act of 1974; and will be used for statistical purposes only. Information will be released only in the form of statistical summaries or in a form which does not identify information about any particular person. There are only two exceptions to this policy: (1) information (name, year, and field of degree) is released to institutions from which you received degrees and to other organizations as part of the address search procedure for follow-up research studies; and (2) information from your form will be made available to the institution where you receive your doctorate degree and to the National Science Foundation, the National Endowment for the Humanities, the National Institutes of Health, and the Department of Education. Your response is entirely voluntary and your failure to provide some or all of the information will in no way affect you.

survey of graduate science and engineering students and postdoctorates (gssp)

purpose and background

The survey is designed to obtain data on the characteristics of graduate science and engineering (S/E) enrollment at the department level including: Enrollment status (full or part time); level of study (tirst year or beyond); types and sources of major support of full-time students; number of women studying full time and the primary sources of their support and level of study; number of women studying part time; the total number of foreign graduate students; and the support, citizenship; and sex of postdoctoral appointees.

Thus, the Survey of Graduate Science and Engineering Students and Postdoctorates (GSSP) compiles a factual base for assessing the relationship between financial support patterns and resulting shifts in graduate encollment and postdoctorates. It provides the only nationally representative data bank on major sources of support of full-time graduate 5/E students and their characteristics. Data for the doctorate- and master s-granting institutions are collected on NSF Form 812.

Since 1972 the National Science Foundation (NSF), in cooperation with the National Institutes of Health (NIH), has conducted the CSSP survey annually to collect data from institutions of higher education, including their medical school affiliates. Originally limited to institutions which grant a doctoral degree in at least one S/E field, the survey was expanded in 1970 to include master's-granting institutions as well.

Between 1905 and 1971; data on the support of graduate S/E students and postdoctorates were collected through institutional applications for NSF traineeships. The NSF-NIH survey, originally called the Survey of Graduate Science Student Support and Postdoctorals, was

designed in 1972 to continue the collection of similar data from an expanded universe of graduate departments in all S/E doctorate-granting institutions: Since 1972 the survey universe has been expanded: First, through the addition of all medical schools with graduate programs; second, with the inclusion of all 5/E departments in institutions that grant a master's as the highest degree in the sciences and engineering; and third, with the annual addition of newly formed institutions and departments within the scope of the survey. The expansion of coverage to master's-granting institutions was initiated as a parallel survey utilizing an abbreviated form in 1976. For comparison purposes, selected 1975 data variables were collected for these institutions at the same time. The expanded population of doctorate- and master'sgranting institutions has been surveyed in parallel since 1977:

For 1978, as part of an NSF experiment with biennial reductions in survey scope to reduce respondent burden, the population was restricted to doctorate-granting institutions and an abbreviated survey instrument was employed. The full population was restored for the succeeding surveys, with a revised full-scale survey form.

The data variables collected over the years have consisted primarily of head-counts of full-time graduate students, with information on sources and mechanisms of their major support (e.g., fellow-ships, traineeships, research assistantships, or teaching assistantships), sex, level of study (first year or beyond); and citizenship. For graduate students enrolled part time, summary data on sex and racial/ethnic background have been available since 1980. Counts of postdoctorates and nonfaculty research staff have also included source and mechanism of support, sex, and

citizenship information.

Beginning in 1982, four items on the characteristics of S/E faculty were added to the survey form on an optional basis. Number of full-time faculty by rank and tenure status; number that were appointed during the preceding year by tenure status; number that departed during the preceding year by reason for departure and tenure status; and number of non-faculty doctoral research staff by number of years since doctorate. Response to these items was light and the results were tabulated by using a separate data file rather than incorporating them in the multiyear tape.

For purposes of an overview, it is useful to think of the questionnaires used over the years as falling into four basic groupings:

- the doctorate-level GSSP prior to 1978;
- the master's-level survey for 1975-77;
- the abbreviated survey of doctorategranting institutions in 1978; and
- the combined (master's plus doctorate) survey conducted since 1979.
- the addition of faculty characteristics data beginning in 1982 on an optional basis and incorporated in the questionnaire in succeeding years.

Prospective data users must exercise particular care in generating and interpreting any aggregates over all institutions, since some data variables were not collected for all portions of the population in the time series.

data access

Data for the years 1975 through 1982 are currently available on a single multi-year tape. Data for 1972, 1973, and 1974 are available on separate tapes. The data records are sequenced in ascending order by school identification number, departmental identification number, year, and record type. The departmental populations for these years are as follows:

Fall 1972-4,593 Departments in Doctorate-Granting Institutions
Fall 1973-0,571 Departments in Doctorate-Granting Institutions
Fall 1974-7,498 Departments in Doctorate-Granting Institutions;
49 Departments in Master's-Granting Institutions
Fall 1975-7,059 Departments in Doctorate-Granting Institutions;

1,263 Departments in Master's-Granting Institutions Fall 1976-7,759 Departments in Doctorate-Granting Institutions; 1,299 Departments in Master's-Granting institutions Fall 1977-7,988 Departments in Doctorate-Granting Institutions; 1,469 Departments in Master's-Granting Institutions Fall 1978-8,202 Departments in Doctorate-Granting Institutions; 15 Departments in Master's-Granting Institutions Fall 1979-8,341 Departments in Doctorate-Granting Institutions: 1,442 Departments in Master's-Granting Institutions Fall 1980-8,529 Departments in Doctorate-Granting Institutions; 1,396 Departments in Master's-Granting Institutions Fall 1981-8,448 Departments in Doctorate-Granting Institutions; 1,421 Departments in Master's-Granting Institutions Fall 1982=8,346 Departments in Doctorate-Granting Institutions;

1,430 Departments in Mas-

ter's-Granting Institutions

For further information regarding data tape availability or contents, please contact:

Ms. Catherine Joseph Abt Associates NSF Surveys 55 Wheeler Street Cambridge, Massachusetts 02138 (617) 492-7100

The cost of the multiyear tape is \$325 for the period 1975-82; the 1982 single-year tape is \$200; and the 1972, 1973, and 1974 tapes are \$100 each. A Data User Guide has been developed for 1972-82 tape users that documents the compatible code structure utilized in NSF's Integrated Data Base—a 4-survey system of academic institutions' personnel and financial resources devoted to S/E activities, of which this survey is a part. A copy of this guide may be obtained at no charge from:

NOTE: This information is solicited under the authority of the National Science Foundation Act of 1950, as amended. All information you provide will be used for statistical purposes only. Your response is entirely voluntary and your failure to provide some or all of the information will in no way adversely affect your institution.

OPTIONAL

SURVEY OF GRADUATE SCIENCE AND ENGINEERING STUDENTS AND POSTDOCTORATES, FALL 1982

INSTRUCTIONS

Please complete items 9, 10, and 11 with regard to FULL-TIME SCIENCE/ENGINEERING [S/E] FACULTY only, include all full-time S/E faculty in your department regardless of whether they instruct graduate or undergraduate students. Please complete item 12 for FULL-TIME S/E NONFACULTY research doctorates only.

9) RANK AND TENURE STATUS OF FULL-TIME S/E FACULTY. What academic ranks are held by the full-time S/E faculty of this department? What is their tenure status?

Full-time S/E faculty. Persons with regular full-time appointments. Include all ranks from instructor to professor. Include full-time members of your department who are on sabbatical leave away from your institution. Persons with joint appointments who work part of their time in another department should be treated as follows: Those working more than one-half their time in this department should be included here; those working less than one-half time in this department should be included in the other department: if they work exactly half time in each, please consult with the chairperson of the other department as to which one will include the appointee. Please DO NOT include the following as full-time faculty: Visiting professors, post-doctorates, research associates, graduate assistants, or others who are not regular FULL-TIME S/E FACULTY in this department.

| Rank and tenure status of full-time S/E faculty, fall 1982 | Academic rank | Total | Tenured | Non- tenured | Of those in column (C) how many are in tenure track? |

| ☐ Check here if this | (5) Non-ranked | | | | |
| department has no full- time S/E faculty: | (6) Total full-time S/E faculty | | | | |

10) APPOINTMENTS. How many full-time S/E faculty did your department appoint for service to begin during the academic year 1981/82? How many of these new appointees held full-time faculty or staff appointments in another academic institution immediately prior to their joining your department? What tenure status were they given in your department at the time of their appointments? Note that line [2], columns [B] & (C) refer to the status of these individuals at your institution.

| D. Full-time S/E faculty | Are - loso coso | ************ | Total full-time S/E | Tenure status as of date of appointment | | | |
|--|-----------------|---|---------------------|---|--------------------|--|--|

12) NONFACULTY S/E DOCTORAL RESEARCH STAFF. How many full-time, nonfaculty S/E research doctorates are employed in this department? Please enter the number of people in each category shown. Only persons holding full-time appointments are to be included.

Full-time nonfaculty S/E research doctorate. Persons employed full time by the department in fall 1982 in a professional capacity specifically for research activities, who hold doctorates on the date this survey form is filled out, who do not have a faculty appointment, and who are not postdoctorates.

INSTRUCTIONS FOR SURVEY OF GRADUATE SCIENCE AND ENGINEERING STUDENTS AND POSTDOCTORATES, FALL 1982

General Definitions

A graduate science/engineering (S/E) student is defined as a student enrolled for credit in an advanceddegree program leading to either a master's or Ph.D. degree in fall 1982; M.D.; D.V.N., or D.D.S. candidates. interns, and residents should not be reported unless they are concurrently working for a master's or Ph.D. in a science or engineering field or are enrolled in a joint M.D./Ph.D. program. Individuals who already hold on M.D., D.V.M., or D.D.S., master's or Ph.D. degree but who are working on another master's or Ph.D. degree are to be counted as graduate students, either full or part time. Do not report such individuals as postdoctorates in item 8.

Graduate S/E students performing thesis or dissertation research away from the campus at Government and contractor-owned facilities in the United States are to be included as long as they are enrolled for credit in an advanced-degree program. Students enrolled at a branch or extension center in a foreign country are to be excluded.

A graduate S.E student, whether falls or partstime, should be reported in only one department. If any students are in interdisciplinary programs, please be sure that they are counted only once by their "home" department. If a graduate student is enrolled in an inter-institutional program, please report the student only if the degree will be granted by your institution, Please report in terms of headrounts, not in full-timeequivalent (FTE) terms. If data are may allable or unknown, write "unavailable" or "unknown" in the blank; "N/A" means "not applicable" on this form.

Item Instructions and Definitions

HIGHEST DEGREE OFFERED, item 4: Check the item which refers to the highest degree program offered by this science/engineering department in fall 1982; If your department does not offer a graduate degree, but is a department of clinical medicine with or without postdoctorates; check (3).

FULL-TIME GRADUATE STUDENTS; item 5: A fulltime graduate student is defined as a student enrolled for credit in an advanced-degree program (not a regular staff member or a postdoctorate) who is engaged full time in training activities in his/her field of science/ engineering: these activities may embrace any appropriate combination of study, teaching, and research, depending on your institution's own policy. If your department has no full-time graduate students, write "None" in item 5 and move to item 6.

MECHANISMS OF SUPPORT, item 5, lines [1]-[5]: Report each full-time graduate 3/E student only once according to the source of the largest amount of support received in the fall of 1982. Students receiving equal amounts of support from two or more sources should be reported only once, under one of the sources, Students who receive tellowships or traineeships should be reported on fine (1) or (2) respectively, if either of these mechanisms constitute the largest source of his her support. The Federal Interagency Committee on Education (FICE) differentiates between the two tellowship and traineeship stipends as follows: 11 A fellowship is an award made directly to or on behalf of a student selected in a national competition; to enable him to pursue post-baccalaureate training, and 2) a tranceship is an educational award to a student selected by his university. Except for the student selection process, the terms and conditions of the two types of awards are generally identical. A student receiving his her main support from an assistantship should be classified as a research assistant on line [3] or as a teaching assistant on line (4), depending on low he/she spends the majority of his/her time; e.g.; a graduate assistant devoting most of his/her time to teaching should be classified as a graduate teaching assistant. All other full-time graduate students should be reported on line (5).

STUDENTS RECEIVING FINANCIAL ASSISTANCE. item 5, columns (A) through [11]: Report the number of full-time graduate SZE students in the appropriate columii according to the source of the largest portion of their support. To determine the source, consider only tuition and other academic expenses. If a graduate student receives equal support from more than one source, report student under only one source.

FEDERAL SOURCES, columns (A) through (E): Report the number of full-time graduate S/E students in the appropriate column where they receive the largest portion of their support. Full-time graduate S/E students receiving the largest portion of their support from Federal Government loans should be reported as selfsupported; column (1):

Department of Defense (DOD), column [A]: Report full-time graduate S/E students receiving support from the Department of the Ariny, Navy, or Air Force. Students receiving their main support from the Veterans Administration under the G.I. Bill should be reported uniter column (E) "Other Federal Sources"; if this form of support does not constitute his/her main source. the student should be counted in the appropriate column representing that source;

Department of Realth and Human Services (HHS). columns (B) and (C): Report full-time graduate students receiving support from the institutes or divisions of the

National Institutes of Health (NIH) under column (B): support from all other components of IHS should be reported under column (C), as indicated below:

National Institutes of Health, report in column (B):

Division of Research Resources

National Cancer Institute National Eve Institute

National Heart, Lung, and Blood Institute

National Institute on Aging

National Institute of Allergy and Infectious Diseases

National Institute of Arthritis; Diabetes; and Digestive and Kidney Diseases

National Institute of Child Health and Human Development

National Institute of Dental Research

National Institute of Environmental Health Sciences National Institute of General Medical Sciences

National Institute of Neurological and Communi-

cative Disorders and Stroke National Library of Medicine

Other HHS, report in column (C):

Alcohol, Drug Abuse; and Mental Health Administration (including National Institute of Mental Health

Center for Disease Control Food and Drug Administration Health Resources Administration Health Services Administration Office of Human Development

69

60

Other Federal sources, column (E): Report the number of full-time graduate S/E students receiving support from all other Federal agencies, including the Department of Education.

NON-FEDERAL SOURCES, columns [F] through [11]: Institutional support, column [F]: Report full-time graduate S/E students receiving support from your own institution and State and local governments. Students supported by funds given to a university by the Federal Government, such as training grant funds, should be reported under the appropriate Federal agency and NOT reported as institutional support.

Foreign sources, column (G): Include support from any non-U.S. source,

Other U.S. sources, column [11]: Include support from tomprofit institutions; private industry, and all other U.S. sources.

SELF-SUPPORTED STUDENTS, column [1]: Include full-time graduate S/E students whose main source of support is derived from loans from any source and from personal or family financial contributions. Full-time graduate S/E students receiving the largest portion of their support from Federal loans or tuition waivers should be reported here. Note that these students should be included in the total, column [J] Foreign self-supported students are to be reported here, also.

Women, line (7): Report all women S/E students by their source of main support. Please note that in each column, data on line [7] should not exceed the total on line [6].

NOTE: Foreign students are now to be reported in item 7, column G.

First-year students, lines [8] and [9]; A first-year student is defined as one who will have completed less than a full year of graduate study as of the beginning of the fall term in 1982 in the S/E program in which he/she is enrolled for a degree. All other graduate S/E students should be considered beyond their first year.

PART-TIME GRADUATE S/E STUDENTS; item 6: A part-time graduate student is defined as a student who is enrolled in an advanced-degree program who is NOT pursuing graduate work full time as defined in item 5. Report the total number of part-time graduate students on line (1); if a department has no part-time graduate students, enter "None" and move to item 7.

RACIAL/ETHNIC BACKGROUND, item 7. Racial/ethnic designations as used in this survey do not denote scientific definitions of anthropological origins: a graduate student may thus be included in the group to which he/she appears to belong, identifies with, or is regarded in the community as belonging. No person should be counted in more than one racial/ethnic group, however, and only those with U.S. citizenship should be reported in columns [A] through [F].

On line 1, report the total number of full-time S/E graduate students under the appropriate racial/ethnic category. The total for each line should equal the sum of columns [A] through (G). The total for full-time enrollment shown in item 7 should match the total shown in item 5; similarly, the part-time total shown in item 7 should could the total in item 6.

The following racial/ethnic designations are those defined by the Office of Civil Rights:

U.S. CITIZENS: columns (A) through (E):

Black, non-Hispanic, calumn [A]: Report persons having origins in any of the black racial groups (except those of Hispanic origin).

American Indian or Alaskan Native, column (B): Report persons having origins in any of the original peoples of North America.

Asian or Pacific Islander, column (C): Report persons having origins in any of the original peoples of the Far East, Southeast Asia; or the Pocific Islands. These areas include China, Japan. Korea, the Philippine Islands, and Samoa.

Hispanic, column (D): Report persons of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.

White, non-Hispanic, column [E]: Report persons having origins in any of the original peoples of Europe, North Africa, the Middle East or the Indian subcontinent, except those of Hispanic origin.

OTHER AND UNKNOWN, column [F]: If department records are not complete as to racial/ethnic origin of some graduate students, please report in column [F] those students with U.S. citizenship whose origins are not listed in item 7, as well as those whose origins are unknown.

FOREIGN, column (G): Please report all foreign students, whether nonresident allien or holding a permanent visa; in column (G). A foreign graduate student is defined as an individual who has not attained U.S. citizenship. Do not include native residents of a U.S. possession, such as American Samoa. Applicants for U.S. citizenship are to be considered as foreign until the date their citizenship becomes effective.

POSTDOCTORATES AND NONFACULTY DOC-TORAL RESEARCH STAFF, item 8: Include as postdoctorates those individuals with science or engineering Ph.D.'s, M.D.'s, D.D.S.'s, or D.V.M.'s (including foreign degrees that are equivalent to U.S. doctorates) who devote their primary effort to research activities or study in the department under temporary appointments carrying no academic rank. Such appointments are generally for a specific time period. They may contribute to the academic program through seminars: lectures, or working with graduate students. Their postdoctoral activities provide additional training for them. Exclude clinical fellows and those with appointments in residency training programs in medical and health professions, unless research training under the supervision of a senior mentor is the primary purpose of the appointment.

On line (1), under columns (A) and (B), enter the number of fellows and trainees receiving support under Federal fellowships and/or training grants. Under column (C) enter the number of postdoctorates who are receiving federally supported research grants. Those remaining postdoctoral appointees receiving non-Federal support should be entered under column (D). Of the total in column (E), enter in column (F) the number of postdoctorates who are foreign:

Under other nonfaculty doctoral research staff, column (G), report all doctoral scientists and engineers who are principally involved in research activities but who are considered neither postdoctoral appointees nor members of the regular faculty. In column (H), report the total of columns (E) and (G).

On line 2, report the number of women in each category. On line 3 (optional) report those postdoctorates and nonfaculty doctoral research staff who hold first professional medical degrees JM.D., D.D.S., D.V.M., etc., Please note that in each column, data on lines 2 and 3 should not exceed the total on line 1.

foreign scientists and engineers

purpose and background

In addition to the new "entrains" to these fields from training programs discussed earlier; immigration provides a major source of science and engineering [S-U] population. For this reason, the National Science Foundation (NSF) obtains yearly data from the U.S. Immigration and Naturalization Service on foreign individuals entering the country.

Data are obtained from the U.S. Immigration and Naturalization Service of the Department of Justice on all nontourist/nonstudent, foreign-born scientists, engineers, and physicians entering the United States in each year according to their visa status, i.e., permanent or temporary residents. These data are in two files: (a) Immigrant Professional, Technical, and Kindred Workers with permanent resident visa status and (b) Nonimmigrant Scienists and Engineers, Physicians and Surteons with temporary resident visa status. Innual data are available for fiscal years Y s. 1905 through 1978:

Data for FY 1978 are available in nachine readable form: Data for FY 1966 brough 1973 are available in hard copy format. Cross tabulations of the above noted variables may be obtained for 1966-78 on the same basis as magnetic tapes.

references

The most recent NSF report based on the data cited above is

Scientists and Engineers From Abroad: 1970-78 (Detailed Statistical Tables) (NSF 80-324); available from NSF and NTIS (PB 81-188070).

data access

The following tape files based on data from the U.S. Immigration and Naturalization Service are available from NSF.

A. All Immigrant Scientists, Engineers, Physicians, and Surgeons, fiscal year (FY) 1978. The tape file includes: Occupational specialty: country of birth; country of last permanent residence; age; sex; change from the nonimmigrant status by year of entry and former nonimmigrant category; State of intended residence; status as pro-

lessor or instructor; and type of immigrant visa:

B. Selected Nonimmigrant Scientists, Engineers; Physicians, and Surgeons grouped by like characteristics, FY 1978. This tape file includes: Occupational specialty; country of birth; country of last permanent residence; status as professor or instructor; half-year of entry; and non-immigrant category. The nonimmigrant categories are H-1, temporary workers of distinguished merit and ability; FI-2; temporary workers performing services unavailable in the United States; H-3 industrial trainees; J-1 exchange visitors; and L-1, intracompany transfers.

These tapes are available, subject to reproduction cost and official regulations (e.g.; Privacy Act of 1976), from:

Mr. Joseph Gannon Division of Science Resources Studies National Science Foundation 1800 G Street; N.W.; Rm. L-011 Washington; D.C. 20550 (202) 034-4055

Data for FY 1979 through 1981 are not available. Tape data for FY 1982 are expected to be available by spring 1984.

science and technology funding resources

federal funds for research and development

purpose and background

The Federal Funds survey—an annual series that began with fiscal year (FY) 1952 and has continued without interruption since that time-provides comprehensive statistical information on the size and scope of Federal funding for research and development and the types of institutions and purposes to which such funds are directed. Data are collected from all Federal agencies that provide funds for research and development. Each agency provides data for three years: actual funding for the prior fiscal year and estimates for the current and next fiscal year. These estimates are based on funding levels contained in the Federal budget document. Most data are collected in obligations, although limited portions of the survey ask for funding in outlay terms. The research and development (R&D) data are classified by character of work, type of performer, field of science, geographic (State) distribution and R&D plant; research data are classified by field of science.

Historical tabulations are available for the period 1967-83. These tabulations are classified similarly to those that cover only the most recent 3-year period.

survey instrument

A copy of the FY 1983 survey covering the years 1982, 1983, and 1984 is reproduced on the following pages.

ANNUAL SURVEY OF Federal Funds for Research and Development Fiscal Years 1982, 1983, and 1984

INTRODUCTION

This annual survey is conducted to measure Federal support of, and participation in, national scientific activities in terms of obligations and outlays. The survey results will be published in the Federal Funds for Research and Development, Volume XXXII final report.

In this survey, data are to be provided for fiscal years 1982, 1983, and 1984 covering funding support in the areas of research, development, and R&D plant. The scope of the survey remains identical with the scope of last year's survey.

Reports from Federal agencies should originate from all organizational subdivisions supporting research, development, or R&D plant.

Please read the instructions carefully before filling in the tables.

SUBMISSION DUE DATE

Due date for submission of responses for the survey is March 1, 1983.

Two typed sets of completed tables and narrative statements (the original and one copy; each with the agency code number on each cable) from the survey should be sent to:

Division of Science Resources Studies National Science Foundation Washington, D.C. 20550

or

Government Stop 19
Attention: Government Studies Group

Members of the Foundation staff are ready to assist in clarifying the instructions and to discuss any problems that may arise in their application. Additional copies of the instructions and tables are available upon request. All inquiries should be made to:

Ms. Eleanor Stoddard, Study Director

ŏř

Mr. Gerard Glaser, Associate Study Director Government Studies Group Phone: (202) 634-4636

Comments and recommendations for formulating and refining future questionnaires are solicited.

Be sure to include the names of the individuals in your office with whom survey matters may be discussed.

GENERAL CONCEPTS AND DEFINITIONS

The following general concepts and definitions are applicable throughout the survey:

- 1. An agency is an organization of the Federal Government whose principal executive officer reports to the President. The Library of Congress, however, whose chief officer reports to the Congress, is also included in the survey. Subdivision refers to any organizational unit of a reporting agency, such as a bureau, division, office, or service.
- 2. Obligations and outlays reported should be consistent with figures shown for fiscal years 1982, 1983, and 1984 appearing in The Budget of the United States Government, Fiscal Year 1984.

Obligations and outlays cover all transactions that occurred in fiscal year 1982, and those estimated for 1983 and 1984. The data should include all Federal funds available to

an agency that the agency received or expects to receive, from direct appropriations, trust funds, and special account receipts, corporate income, or other sources, including funds appropriated to the President.

The amounts shown for each year should reflect obligations or outlays for that year regardless of when the funds were originally authorized or received, and regardless of whether or not they were appropriated, received, or identified in the agency's budget specifically for research, development, or R&D plant.

Each agency should include in the reporting of obligations or outlays the amounts transferred to other agencies for support of research and development. The receiving agencies are not to report funds transferred to them. Similarly, a subdivision of an agency that transfers funds to another subdivision within that agency reports such obligations or outlays as its own.

Obligations and outlays for work performed for an agency in foreign countries should include all funds available to the agency for this purpose, including funds separately appropriated for special foreign currency programs.

- 3. A performer is either an intramural group or organization carrying out an operational function or an extramural organization or person receiving support or providing services under a contract or grant.
- a. Intramural performers are the agencies of the Federal Government. Their work is carried on directly by agency personnel. Oblinations reported under this category are for activities performed or to be performed by the reporting agency itself, or they represent funds that the agency transfers to another Federal agency for performance of work as long as the ultimate performer is that agency or any Federal agency. If the ultimate performer is not a Federal agency, the funds so transferred are to be reported by the transferring agency under the appropriate extramural performer category (industrial firms, universities and colleges, or other non-profit institutions).

Note that intramural activities cover costs associated with the planning and administration of intramural and extramural programs by Federal personnel as well as actual intramural R&D performance. Intramural activities also include the costs of supplies and equipment, essentially of an "off-the-shelf" nature, that are procured for use in intramural research and development. For example, the purchase from an extramural source of an operational launch vehicle (i.e., one that has gone beyond the development or prototype stage) that is used for intramural performance of research and development should be reported as a part of the cost of intramural research and development.

b. Extramural performers are organizations outside the Federal sector that perform with Federal funds under contract or grant. Only those costs associated with actual R&D performance should be reported, but these would include costs of materials and supplies to carry out R&D activities. Note, however, that the costs of "off-the-shelf" supplies and equipment procured from extramural suppliers that are required to support intramural research and development should be considered as part of the costs of intramural performance and not as part of the costs of extramural performance.

Extramural performers are identified as follows:

- (1) Industrial firms: Those organizations that may legally distribute net earnings to individuals or to other organizations.
- (2) Universities and colleges: Institutions engaged primarily in providing resident and/or accredited instruction for at least a 2-year program above the secondary school level. Included are colleges of liberal arts; schools of arts and sciences; professional schools, as in engineering and medicine, including affiliated hospitals and associated research institutes; and agricultural experiment stations.
- (3) Other nonprofit institutions: Private organizations other than educational institutions no part of whose net earnings inure to the benefit of a private stockholder or individual, and other private organizations organized for the exclusive purpose of turning over their entire net earnings to such nonprofit organizations.
- (4) Federally funded research and development centers (FFRDC's): Research and development-performing organizations exclusively or substantially financed by the Federal Government either to meet a particular R&D objective or, in some instances, to provide major facilities at universities for research and associated training purposes. Each center is administered by an industrial firm, a university, or another nonprofit institution. (See p. 41 for list.)

In general, all of the following criteria are met by an organization before it is included in the federally funded research and development center category:

- (a) Its primary activities include one or more of the following: Basic research, applied research, development, or management of research and development (specifically excluded are organizations engaged primarily in routine quality control and testing, routine service activities, production, mapping and surveys, and information dissemination);
- (b) It is a separate operational unit within the parent organization or is organized as a separately incorporated organization;
- (c) It performs actual research and development or R&D management either upon direct request of the Federal Government or under a broad charter from the Federal Government, and in either case under the direct monitorship of the Federal Government;
- (70°) It receives its major financial support (70°) or more) from the Federal Government, usually from one agency;
- (e) It has, or is expected to have, a long-term relationship with its sponsoring agency (about 5 years or more), as evidenced by specific obligations assumed by it and the agency:
- (f) Most or all of its facilities are owned by or funded under contract with the Federal Government; and
- (g) It has an average annual budget (operating and capital equipment) of at least \$500,000:
- (5) State and local governments: State and local government agencies, excluding State or local universities and colleges, agricultural experiment stations, medical schools, and affiliated hospitals. (Federal R&D funds obligated directly to such State and local institutions should be included under the universities-and-colleges category in this report.) Research and development activities under the State-and-local category are performed either by the State or local agencies themselves or by other organizations under grants or contracts from such agencies. Regardless of the ultimate performer. Federal R&D funds directed to State and local governments are to be reported under this sector and no other.
- (6) Foreign performers: Foreign citizens, foreign organizations, or foreign governments, as well as international organizations, such as NATO, UNESCO, WHO, performing work abroad financed by the Federal Government. Excluded are U.S. agencies, organizations, or citizens performing research and development abroad for the Federal Government: it is survey does not seek information on "off-shore" payments. An exception is made in the case of U.S. citizens performing research or development abroad under special foreign currency funds; these activities are included under foreign performers. Foreign scientists performing in the United States are excluded, however.
- (7) Private individuals: In the case of an R&D grant or contract awarded directly to a private individual, place obligations incurred under "industrial firms."

Instructions for Reporting Obligations and Outlays for Research, Development and R&D Plant, Fiscal Years 1982, 1983, and 1984

There are no changes in this year's instructions. No new questions have been added. The scope of the survey remains identical with the scope of last year's survey, as follows:

- Obligations and outlays; in summary form, for research and development and R&D plant.
- Obligations for total research, basic research, and applied research, by field of science.
- Obligations for total research, basic research, and applied research performed at universities and colleges, by field of science.
- Obligations for total research, basic research, applied research; and development; by performer;
- Obligations for total research and development and basic research, by foreign country.
- Obligations for R&D plant by performer of the research and development supported.
- Obligations for research and development and R&D plant; by State and performer or performer supported;

DEFINITIONS

- 1. Research, development, and R&D plant include all direct; indirect, incidental, or related costs resulting from, or necessary to, performance of research and development, and costs of R&D policial defined below, regardless of whether the research and development are performed by a Federal agency (intramurally) or performed by private individuals and organizations under grant or contract (extramurally). Research and development exclude routine product testing, quality control, mapping and surveys; collection of general-purpose statistics, experimental production, and the training of scientific personnel.
- a. Research is systematic study directed toward fuller scientific knowledge or understanding of the subject studied. Research is classified as either basic or applied according to the objectives of the sponsoring agency.

In basic research the objective of the sponsoring agency is to gain fuller knowledge or understanding of the fundamental aspects of phenomena and of observable facts without specific applications toward processes or products in mind.

In applied research the objective of the sponsoring agency is to gain knowledge or understanding necessary for determining the means by which a recognized and specific need may be met.

- b. **Development** is systematic use of the knowledge or understanding gained from research, directed toward the production of useful materials, devices, systems, or methods, including design and development of prototypes and processes. It excludes quality control, routine product testing, and production.
- c. **Demonstration** activities that are part of research or development (i.e., that are intended to prove or to test whether a technology or method does; in fact, work) should be included. Demonstrations intended primarily to make information available about new technologies or methods should not be included.
- d. **R&D** plant (R&D facilities and fixed equipment, such as reactors, wind tunnels, and radio telescopes) includes acquisition of, construction of, major repairs to, or alterations in structures, works, equipment, facilities, or land for use in R&D activities at Federal or non-Federal installations. Excluded from the R&D plant category are expendable equipment and office furniture and equipment. Obligations for foreign R&D plant are limited to Federal funds for facilities located abroad and used in support of foreign research and development.
- 2. Fields of science in this survey are divided into eight broad field categories, each consisting of a number of detailed fields. The broad fields are life sciences, psychology, physical sciences, environmental sciences, mathematics and computer sciences, engineering, social sciences, and other sciences not elsewhere classified. The following listing presents the fields grouped under each of the broad fields together with illustrative disciplines. (Additional information concerning fields of science is provided on page 8 under Reporting Guidelines for tables III, IV, and V.)

a. Life sciences consist of five detailed fields: biological (excluding environmental). environmental biology, agricultural, medical, and life sciences not elsewhere classified. The illustrative disciplines provided below under each of these detailed fields are intended to be guidelines, not sharp definitions; they represent examples of disciplines generally classified under each detailed field. A discipline under one detailed field may be classified under another detailed field when the major emphasis is elsewhere. Research in biochemistry could be reported as biological, agricultural, or medical, depending on the orientation of the project. Human biochemistry would be classified under biological, but animal biochemistry or plant biochemistry would be under agricultural. In no case should the research be reported under more than one field. No double counting is intended or allowed.

Biological (excluding environmental):

anatomy; biochemistry; biology; biometry and biostatistics; biophysics; botany; cell biology; entomology and parasitology; genetics; microbiology; neuroscience (biological); nutrition; physiology; zoology; other biological, n.e.c.¹

Environmental biology:

ecosystem sciences; evolutionary biology; limnology; physiological ecology; population biology; population and biotic community ecology; systematics; other environmental biology, n.e.c.

Agricultural:

agronomy; animal sciences; food science and technology; fish and wildlife; forestry; horticulture; plant sciences; soils and soil science; phytopathology; phytoproduction; agriculture, general; other agriculture.

Medical:

internal medicine; neurology; obstetrics and gynecology; ophthalmology; otolaryngology; pediatrics; preventive medicine; pathology; pharmacology; psychiatry; radiology; surgery; dentistry; pharmacy; veterinary medicine; other medical, n.e.c.

Life sciences, n.e.c.1

b. Psychology deals with behavior, mental processes, and individual and group characteristics and abilities. Psychology is divided into three categories: biological aspects, social aspects, and psychological sciences not elsewhere classified. Examples of the disciplines under each of these fields are as follows:

Biologica, aspects:

experimental psychology; animal behavior; clinical psychology; comparative psychology; ethology

Social aspects:

social psychology; educational, personnel, vocational psychology, and testing; industrial and engineering psychology; development and personality

Psychological sciences, n.e.c.1

c. Physical sciences are concerned with understanding of the material universe and its phenomena. They comprise the fields of astronomy, chemistry, physics, and physical sciences not elsewhere classified. Examples of disciplines under each of these fields are as follows:

Asironomy:

laboratory astrophysics; optical astronomy; radio astronomy; theoretical astrophysics; X-ray, Gammaray, neutrino astronomy

Chemistry:

inorganic; organo-metallic; organic; physical

Physics:

acoustics; atomic and molecular; condensed i, ...ter; elementary particle; nuclear structure; optics; plasma

Physical sciences, n.e.c.1

Environmental sciences (terrestrial and extraterrestrial) are concerned with the gross nonbiological properties (with one exception) of the areas of the solar system that directly or indirectly affect man's survival and welfare; they comprise the fields of atmospheric sciences, geological sciences, oceanography, and environmental sciences not elsewhere classified. The one exception is that obligations for studies pertaining to life in the sea or other bodies of water are to be reported as support of oceanography and not biology. Examples of disciplines under each of these fields are as follows:

Atmospheric sciences:

aeronomy; solar; weather modification; extraterrestrial

atmospheres; meteorology

Geological sciences:

engineering geophysics; general geology; geodesy and gravity; geomagnetism; hydrology; inorganic geochemistry; isotopic geochemistry; organic geochemistry; laboratory geophysics; paleomagnetism; paleontology; physical geography and cartography; seismology;

soil sciences

Oceanography:

biological oceanography; chemical oceanography;

physical oceanography; marine geophysics

Environmental sciences, n.e.c.1

Mathematics and computer sciences employ logical reasoning with the aid of symbols and are concerned with the development of methods of operation employing such symbols, and in the case of computer sciences, with the application of such methods to automated information systems. Examples of disciplines under these fields are as follows:

Mathematics:

algebra; analysis; applied mathematics; foundations and logic; geometry; numerical analysis; statistics;

Computer sciences:

programming languages; computer and information sciences (general); design, development, and application of computer capabilities to data storage and manipulation; information sciences and systems; systems analysis

Mathematics and computer sciences, n.e.c.1

f. Engineering is concerned with studies directed toward developing engineering principles or toward making specific principles usable in engineering practice. Engineering is divided into eight fields: aeronautical, astronautical, chemical, civil, electrical, mechanical, metallurgy, and materials, and engineering not elsewhere classified. Examples of disciplines under each of these fields are as follows:

Aeronautical:

aerod; namics

Astronautical:

aerospace; space technology

Chemical:

petroleum; petroleum refining; process

Civil:

architectural; hydraulic; hydrologic; marine; sanitary

and environmental; structural; transportation

Electrical:

communication; electronic; power

Mechanical:

engineering mechanics

Metallurgy and materials:

ceramic; mining; textile; welding

Engineering, n.e.c.1

agricultural; industrial and management; nuclear;

ocean engineering; systems

g. Social sciences are directed toward an understanding of the behavior of social institutions and groups and of individuals as members of a group. Social sciences include anthropology, economics, political science, sociology, and social sciences not elsewhere classified. Examples of disciplines under the fields of social science are as follows:

Anthropology:

archaeology; cultural and personality: social and

ethnology; applied anthropology

Economics:

econometries and economic statistics; history of economic thought; international economics; industrial, labor and agricultural economics; macroeconomics; microeconomics; public finance and fiscal policy; theory; economic systems and development

Political science:

area or regional studies; comparative government; history of political ideas; international relations and law; national political and legal systems; political theory; public administration

Sociology:

comparative and historical; complex organizations; culture and social structure; demography; group intoractions; social problems and social welfare; sociological theory

Social sciences, n.e.e.1

linguistics; research in education; research in history; socioeconomic geography; research in law, e.g., attempts to assess impact on society of legal systems and practices

- h; Other sciences, n.e.e. To be used for multidisciplinary and interdisciplinary projects that cannot be classified within one of the broad fields of science above.
- 3. Performers are defined under General Concepts and Definitions (pp. ., 2, and 3).

REPORTING GUIDELINES

Shuttle data: Agencies are requested to complete the data for the shuttle columns (shaded areas on tables) if these data are not already inserted. Shuttle data are the estimates provided by agencies for fiscal years 1982 and 1983 in last year's survey (Federal Funds, XXXI). They are included in the present survey for purposes of comparison. If there are important differences (increases or decreases) between the current report and last year's report for fiscal years 1982 and 1983 explain the reasons on the sheet attached for this purpose (page 49).

Cost coverage: Obligations and outlays reported should reflect full costs. In addition to costs of specific scientific projects, applicable overhead costs should also be included. Thus, the amounts reported should include the costs of planning and administration of both intramural and extramural R&D programs, laboratory overhead, pay of military personnel, and departmental administration.

Character of work: Classifying research and development on the basis of the character of the work, i.e.; basic research, applied research, or development, may present problems. It may be necessary in some cases to employ a measure of judgment in distributing obligations among categories. In cases where an overlap exists, funds should be assigned to the category most appropriate to the principal type of work supported.

Intramural transfer of funds: A Federal agency that transfers funds to another Federal agency for the support of research and development should report such obligations or outlays as its own. The receiving agency is not to report, for purposes of this survey, on funds transferred to it from another agency. A subdivision of an agency that transfers funds to another subdivision within that agency should also report such obligations or outlays as its own.

To assure that no undue distortion of funds for intramural performance of research and development takes place; the agency transferring the funds should make a special effort, within practical limits, to determine whether the ultimate performer is intramural or extramural and report accordingly. The transfer of funds to another Federal agency should not be the sole basis for reporting that the R&D performance is intramural:

Tables

Table I is for reporting outlays only.

Table II is for reporting obligations only. Obligations shown in items 5 and 6 of table II should be identified by appropriation titles and program activities on pages 43 and 47 as part of the descriptive narrative.

Tables III, IV, and V are for the reporting of obligations for research by field of science.

Definitions and a guide relating to fields of science are provided on pages 5 through 7, although the examples provided for the disciplines are not intended as a complete enumeration.

[!]Not elsewhere classified: 25 is used for multidisciplinary projects within a broad field and for single-discipline projects for which a separate field has not been assigned.

Every effort should be made to allocate obligations to a specific discipline rather than to the "not elsewhere classified (a.e.c.)" category: If specific allocation is not feasible, however; obligations reported under the n.e.c. category should be identified in an explanatory note. In reporting obligations for activities concerned with interdisciplinary studies funds must not be double-counted:

Tables VI, VII, and VIII cover reporting of obligations by performer. Definitions of performers appear on pages 2 and 3. Item 2 is for identification of obligations for intramural personnel services and related allowances, as defined in OMB Circular A-34; Section 25.1A. Such obligations cover salaries for scientists and engineers and other intramural support personnel; including planning and administrative personnel.

Items 4. 6; and 8 are for identification of obligations to federally funded research and development centers (FFRDC's) appearing on Table IX and on the list of FFRDC's (pages 41 and 42). Each agency should report obligations to each FFRDC that it uses that appears on that list, even though the FFRDC may be sponsored by another agency. Obligations to FFRDC's administered by university consortia should be included in the amounts under item 6.

Agencies may not unilaterally delete organizations classified as FFRDC's from the list or add organizations thereto. Inquiries concerning additions or deletions to the list of FFRDC's should be directed to Dr. Charles E. Falk, Director, Division of Science Resources Studies, National Science Foundation. Additional information concerning FFRDC's is provided on pages 2 and 3, under General Concepts and Definitions, and in Reporting Guidelines for table IX.

Item 9 is for identification of obligations to State and local government agencies for R&D activities financed by the Federal Government.

Item 11 is for identification of obligations for R&D performance by foreign individuals or foreign organizations (including international organizations in oreign countries) that is financed by Federal agencies. Obligations made with funds separately appropriated for special foreign currency programs should be included in the totals for foreign obligations (item 11) and separately identified in item 12. These special foreign currencies are derived largely from funds provided under Public Law 480, 1954, as amended. Care should be taken to report foreign performance only once. For example, it a foreign performer is an educational institution, obligations to that institution should be reported only under foreign performance and not also under universities and colleges.

Table IX provides for reporting additional information on fiscal year 1982 R&D and R&D plant obligations to FFRDC's. This table requires the breakdown of obligations for research and development reported in items 4, 6, and 8 of table VI by each FFRDC listed. This table also requires the breakdown by individual FFRDC of obligations for R&D plant reported in items 3, 5, and 7 of table XI for FY 1982. Each agency should report obligations to each FFRDC it supports, even though the FFRDC is sponsored by another agency. Pages 41 and 42 provide a list of FFRDC's by sponsoring agency and administering organization.

Table X. Countries included in each geographic area are as follows:

Europe: All countries of continental Europe and the British Isles: Excluded are Greece and Turkey, which are classified under the Near East.

Near East: Greece, Iran, Iraq, Israel, Jordan, Lebanon, Saudi Arabia, Sudan, Turkey, and Egypt.

Asia: All countries of continental Asia and Japan, the Philippines, Sumatre, and Borneo, Excluded are Iran, Iraq Israel, Jordan, Lebanon; and Saudi Arabia, which are included under the Near East.

Africa: All countries of continental Africa except Egypt and the Sudan, which are under the Near East.

Latin America: All countries of continental South America, Central America, the Caribbean, and Mexico.

Note that for table X, data for fiscal years 1983 and 1984 are not required.

Table XI provides for reporting obligations for R&D plant by the performer of research and development that the R&D plant supports regardless of the plant's ownership or location.

Under item 1 report obligations for R&D plant that are provided to support research and development performed intramurally.

Under item 2 report obligations for R&D_plant that are provided to support research and development by industrial firms excluding FFRDC's.

Under item 3 report the amount obligated for R&D plant that is provided to support research and development performed by FFRDC's administered by industrial firms.

Under items 4 and 5 report obligations for R&D plant that are provided to support R&D performance by universities and colleges excluding FFRDC's and those that are provided to support university-administered FFRDC's.

Under items 6 and 7 report the same information for nonprofit performers.

Under item 8 report obligations for R&D plant that are provided to support research and development performed by State and local governments.

Under item 10 report obligations for R&D plant located abroad that are provided to support foreign research and development.

Note that the performer of research and development determines the classification of R&D plant obligations.

Tables A and B. Instructions for these tables are included as a separate attachment for the 10 agencies that are requested to provide data on geographic distribution, by State, of fiscal year 1982 obligations for research and development and R&D plant. These 10 agencies are the following: The Departments of Agriculture. Commerce. Defense, Energy, the Interior. Transportation, and Health and Human Services; the Environmental Protection Agency; the National Aeronautics and Space Administration; and the National Science Foundation.

Tables C, D, and E. Instructions for these tables are included as a separate attachment for the six agencies that are requested to report obligations for basic research, applied research, and total research performed at universities and colleges by field of science. These agencies are the Departments of Agriculture, Defense Energy, and Health and Human Services; the National Aeronautics and Space Administration; and the National Science Foundation.

Narrative Statements

Sheets are provided for reporting a description of the content and objectives of the research, development, and R&D plant programs being supported in fiscal years 1982, 1983, and 1984.

Respondents are requested to identify R&D and R&D plant obligations by appropriation title and by program activity or subactivity within each appropriation, as shown in *The Budget*, Fiscal Year 1984.

For each program activity or subactivity the R&D and R&D plant obligations should be given for fiscal years 1982, 1983, and 1984.

In addition, brief descriptions should be provided of the research and development or R&D plant construction supported under each program activity or subactivity, including reasons for increases or decreases during the 3-year period.

Respondents are encouraged to confer with the staff of the National Science Foundation in the development of descriptive material on programs.

RELATIONSHIP TO OFFICE OF MANAGEMENT AND BUDGET ANALYSIS

In response to Office of Management and Budget (OMB) Circular No. A-11 (Section 44, Exhibit 44, revised July 1982), agencies provide OMB with data on their obligations and outlays for research and development by character of work and R&D plant. They also provide data on R&D obligations and outlays to universities and colleges. OMB publishes some of these data in the budget document, Special Analysis, Budget of the United States Government. This document includes a report on the R&D portion of the budget, but in its coverage of R&D data it does not provide as much detail on character of work or performers as Federal Funds and provides no information on fields of science or geographic distribution. Both the Federal Funds report and the OMB report, however, use the same general definitions and guidelines. Therefore, the

overall amounts reported for total research or development for distribution by character of work, and for R&D plant, both Federal Funds and OMB should be the same.

If there are differences between the R&D data submitted for the Federal Funds report and for the OMB report, each reporting agency or subdivision should provide an explanation on the attached sheets (pages 51 and 53) for differences in total R&D obligations, basic research obligations, and R&D obligations to universities and colleges.

RELATIONSHIP TO (CASE) SURVEY ON FEDERAL OBLIGATIONS TO INDIVIDUAL UNIVERSITIES AND COLLEGES FOR FY 1982

Certain agencies² have been requested to provide specific obligational data for fiscal year 1982 to NSF in response to the reporting system established in 1965 by the Committee on Academic Science and Engineering (CASE) of the Federal Council for Science and Technology; this survey is referred to in these instructions as the Federal Support to Universities (CASE) survey. The requested data cover obligations for research and development and R&D plant to universities and colleges and to FFRDC's administered by universities as well as data on other activities. In general the concepts and definitions used in the Federal Support to Universities (CASE) survey conform with the general guidelines in the annual Federal Funds survey. Thus, for agencies participating in both surveys, overall totals for research and development and R&D plant to universities and colleges and also to FFRDC's administered by universities should be substantially the same. Where differences appear in data reported for the two surveys, each reporting agency or subdivision should provide an explanation for the differences on the attached sheets (pages 55 and 57):

Different totals can sometimes result from the fact that for the Federal Funds survey and the Federal Support to Universities (CASE) survey reporting is accomplished in different ways. For the Federal Funds survey each agency includes in its reporting the amounts transferred to other agencies for furtherance of its own purposes; the receiving agencies do not report funds transferred to them. In the Federal Support to Universities (CASE) survey, however, the data are reported by the agencies in terms of individual performing institutions, and because of this requirement, only the agency that makes the final distribution of the funds can readily determine where the transferred or reimbursable funds are obligated. For this reason agencies reporting for the Federal Support to Universities (CASE) survey include funds received from other agencies and exclude funds transferred to other agencies, the reverse of the procedure for the Federal Funds survey.

^{&#}x27;The Departments of Agriculture, Commerce, Defense, Education, Energy, Housing and Urgan Development, the Interior, Health and Human Services, Labor, State (AID), and Transportation; the Environmental Protection Agency; the National Aeronautics and Space Administration; the National Science Foundation; and the Nuclear Regulatory Commission.

FEDERALLY FUNDER RESEARCH AND DEVELOPMENT CENTERS

The following is a list of the water to be used in providing information for tables VI, VII, VIII, IX, and XI. The list is arranged by sponsoring agency and administering organization. Respondents will report under the FFkDC category funds obligated to centers identified on this list.

Department of Defense

Office of the Secretary of Defense

Administered by other nonprofit institutions:

Institute for Defense Analyses (IDA), Arlington, Va.

Department of the Navy

Administered by universities and colleges:

Center for Naval Analyses (University of Rochester), Arlington, Va.

Department of the Air Force

Administered by universities and colleges:

Lincoln Laboratory (Massachusetts Institute of Technology), Lexington, Mass.

Administered by other nonprofit institutions:

Aerospace Corporation, El Segundo, Calif.
C'I Division (MITRE Corporation, Bedford, Mass.
Project Air Force (RAND Corporation), Santa Monica, Calif.

Department of Health and Human Services

National Institutes of Health

Administered by industrial firms:

Frederick Cancer Research Facility (Litton Bionetics, Inc., Litton Industries)
Frederick, Md.

Department of Energy

Ad ninistered by industrial firms:

Bettis Atomic Power Laboratory (Westinghouse-Electric Corp.), Pittsburgh Pa Hanford Engineering Development Laboratory (Westinghouse-Hanford Corp.), Richland, Wash.

Icaho National Engineering Laboratory (EG&G Idaho, Inc.; Exxon Nuclear Idaho Co.; Argonne National Laboratory, West; Westinghouse Electric Corp.), Idaho Falls, Idaho

Knolls Atomic Power Laboratory (General Electric Company), Schenectady, N.Y. Energy Technology Engineering Center (Rockwell International Corporation), Canoga Park, Calif.

Oak Ridge National Laboratory (Union Carbide Corp.), Oak Ridge, Tenn.
Sandia National Laboratories (Western Electric Co., Inc. —Sandia Corp.).
Albuquerque, N.M.

Savannah River Laboratory (E.I. du F Nemours & Co., inc.): Aiken, S.C.

92

(A)

Department of Energy-con.

Administered by universities and colleges:

Ames Laboratory (Iowa State University of Science and Technology), Ames, Iowa Argonne National Laboratory (University of Chicago and Argonne Universities Assn.); Argonne, Ill.

Brookhaven National Laboratory (Associated Universities, Inc.), Upton, Long Island, N.Y.

r. O. Lawrence Berkeley Laboratory (University of California), Berkeley, Calif.

E. O. Lawrence Livermore National Laboratory (University of California), Livermore, Calif.

Fermilab (Universities Research Association, Inc.), Batavia, Ill.

Los Alamos National Laboratory (University of California), Los Alamos, N.M.

Oak Ridge Institute of Nuclear Studies (Oak Ridge Associated Universities), Oak Ridge, Tenn.

Plasma Physics Laboratory (Princeton University), Princeton, New Jersey Stanford Linear Accelerator Conter (Stanford University), Stanford, Calif.

Administered by other nonprofit institutions:

Pacific Northwest Laboratory (Rattelle Memorial Institute), Richland, Wash. Solar Energy Research Institute (Midwest Research Institute), Golden, Colo.

National Aeronautics and Space Administration

Administered by universities and colleges:

Jet Propulsion Laboratory (California Institute of Technology), Pasadena, Calif.

National Science Foundation

Administered by universities and colleges:

Cerro Tololo Inter-American Observatory (Association of Universities for Research in Astronomy, Inc.), La Serena, Chile

Kitt Peak National Observatory (Association of Universities for Research in Astronomy, Inc.), "Tucson, Ariz.

National Astronomy and Ionosphere Center (Cornell University), Arecibo, Puerto Rico

National Cente for Atmospheric Pesearch (University Corporation for Atmospheric Research), Boulder, Colo.

National Radio Astronomy Observatory (Associated Universities, Inc.), Green Bank, W.V.

Sacramento Peak Observatory (Association of Universities for Research in Astronomy, Inc.), Sunspot, N.M.

Only the C'I Division of the MITRE Corporation should be reported as FFRDC. All other agency support to MITRE should be reported under "other nonprofit institutions." uding FFP C's."
Only the Project Air Force portion of the RAND Corp.; ation small be reported as an FFRDC. All other agency support to RAND should be reported under "other nonprofit institutions excluding FFRDC's."

(See page 11).

industrial research and development

purpose and background

The National Science Foundation (NSF) has sponsored the Survey of Industrial Research and Development since 1953 to obtain data on the magnitude and underlying trends in the research and development (R&D) efforts of American firms. The Bureau of the Census conducts this annual survey and prepares the statistical tables for NSF. The survey is designed to collect data on dollar volume of research and development, sources of financing, employment of R&D scientists and engineers, and other economic characteristics of industrial R&D performance.

survey instrument

Since 1978, an abbreviated survey form has been mailed biennially to reduce the reporting burden on companies. The full questionnaire is sent to survey respondents in the intervening years. Copies of the 1981 and 1982 survey forms are reproduced on the following pages:

sample

The sample used for the Survey of Industrial Research and Development represents all manufacturing industries and those nonmanufacturing industries known—on the basis of earlier, more detailed samples—to conduct or to finance research and development. The sampling unit for the survey is the company defined as a business organization consisting of one or more establishments under common ownership or control. Approximately once every five years a new panel for the R&D survey is selected.

The 1982 industry survey is the 26th in the annual series sponsored by NSF and conducted by Census. NSF also sponsored two industry surveys covering the 1953-56 period, which were conducted by the Bureau of Labor Statistics (BLS). Data obtained from the BLS surveys are not directly comparable with the Census figures because of methodological and other differences in the surveys conducted by the two agencies.

references

The most recent NSF reports based on survey data are

Science Resources Studies Highlights, "Industrial R&D Spending Rises 17% During 1981" (NSF 83-313), available from NSF. Research and Development in Industry 1981. Funds, 1981; Scientists and Engineers, January 1982 (Detailed Statistica Tables) (NSF 82-325), available from NS and NTIS.

Trends to 1982 of Industrial Basic Research (NSF 83-302), available from NS and NTIS.

data access

Data on individual companies canno be released by Census because of proprietary considerations. However, additional tabulations of data collected on the enclosed survey form are available directly from the Census Bureau. The cost is dependent on the amount of detail involved. Information on the availability of data and costs may be obtained from:

federal support to universities, colleges, and selected nonprofit institutions

purpose and background

The purpose of this survey is to collect data on Federal obligations to individual U.S. universities and colleges. The interagency system for reporting Federal obligations to universities and colleges was originally established in 1965 under the auspices of the Committee on Academic Science and Engineering [CASE] of the Federal Council on Science and Technology. Since 1908 these data have been collected annually by the National Science Foundation (NSF) through the Survey of Federal Support to Universities, Colleges, and Selected Nonprofit Institutions. Data are currently supplied by 15 Federal agencies accounting for over 95 percent of all Federal obligations to the institutions included.

Data are provided by the agencies at the institution or campus level; however, all records on tapes are maintained at the institutional level; with separate totals for system offices where funds were obligated to a system of institutions and the funding agency was unable to determine the ultimate distribution of the money among the institutions within the system.

references

The most recent NSF reports based on the data cited above are

Federal Support to Universities, Colleges, and Selected Nonprofit Institutions, Fiscal Year 1981. A Report to the President and Congress (Final Report) (NSF 83-315), available from NSF, GPO, and NTIS (PB 84-134246).

Science Resources Studies Highlights, "Federal Science/Engineering (S/E) Support to Universities and Colleges Rose by 6% in FY 1981; Non-S/E Support Down 25%" (NSF 83-306), available from NSF.

data access

Data for 1975 through 1982 are currently available on a single multiyear tape. Data for 1971, 1972, 1973, 1974, and the 1976 Transition Quarter are available on separate tapes. The survey populations for these years are given below.

For further information regarding data tape availability or contents please contact:

Ms. Catherine Joseph Abt Associates NSF Surveys 55 Wheeler Street Cambridge, Massachusetts 02138 [617] 492-7100

The cost of the multiyear tape is \$325 for the period 1975-82; the 1982 single-year tape is \$250; and remaining single-year tapes are \$100 each. A Data User Guide has been developed for 1971-82 tape users that documents the compatible code structure utilized in NSF's Integrated Data Base—a 4-survey system of academic institutions' personnel and financial resources devoted to science and engineering (S/E) activities, of which this survey is a part. A copy of this guide may be obtained from:

Mr. J. G. Huckenpahler Division of Science Resources Studies National Science Foundation 1800 G Street, N.W., Rm. L-602 Washington, D.C. 20550 (202) 634-4673

survey instrument

More detailed information about the participating agencies and subagencies; the definitions of the categories of support and the fields of science and engineering, and the formats used by agencies when submitting data are found in the annual NSF publication, "Instructions and Specifications for Reporting Federal Support to Universities, Colleges, and Selected Nonprofit Institutions," copies of which are available at no charge from the Division of Science Resources Studies.

^{&#}x27; Federally funded research and development centers.

scientific and engineering expenditures at universities and colleges

purpose and background

The purpose of this survey is to collect information on three areas of academic spending for scientific and engineering (S/E) activities: Separately budgeted research and development (R&D) expenditures; current-fund expenditures for research equipment; and capital expenditures for S/E activities: Separately budgeted R&D expenditures are reported by source of funds and by S/E field.

The Survey of Scientific and Engineering Expenditures at Universities and Colleges originated in 1954 and has been conducted annually since 1972. The population surveyed in most years consists of the 500 to 600 universities and colleges which annually perform over \$50,000 in separately budgeted research and development; these institutions account for over 95 percent of the Nation's academic R&D expenditures. In addition, approximately 19 academically administered federally funded research and development centers (FFRDC's) are surveyed.

In most years the expenditures surveys have collected information on three areas of academic spending for S/E activities: Separately budgeted R&D expenditures; expenditures for instruction and departmental research (discontinued in 1978 survey); and capital expanditures for S/E activities. Two significant changes from other survey years were made for the FY 1978 survey as part of an NSF experiment with biennial reductions in the survey scope to lessen response burden. First, unlike the FY 1972-77 and 1979-81 surveys, the survey population for 1978 was restricted to doctorate-granting institutions and FFRDC's. Secondly, in contrast to the other years, the 1978 survey collected information via a shortened survey form which included a limited number of items as indicated below.

Although all surveys in the Integrated Data Base have collected data on separately budgeted R&D expenditures by source of funds (total and Federal) and by S/E field, the 1978 form omitted questions on character of work (e.g., basic research) and on capital expenditures for S/E activities. Expenditures for instruction and departmental research were collected annually during the period 1972-77 but were discontinued in 1978 and are not available on the current multiyear archival tapes. In FY 1980, an item on current-fund research equipment expenditures by S/E field was added as a regular part of the form.

Instructions for Items 1 and 2

Separately budgeted research and development (R&D) includes all funds expended for activities specifically organized to produce research outcomes and commissioned by an agency either external to the institution or separately budgeted by an organizational unit within the institution. *Include* research equipment purchased under research project awards from "current fund" accounts. Also, *include* research funds subcontracted to outside organizations. *Exclude* training grants, public service grants, demonstration projects, and departmental research expenditures that are not separately budgeted. Also, exclude any R&D expenditures in the fields of education, law, humanities, music, the arts, physical education, library science, and all other nonscience fields.

- a. Federal Government. Report grants and contracts for R&D (including direct and reimbursed indirect costs) by all agencies of the Federal Government.
- b. State and local governments. Include funds for R&D from State, county, municipal, or other local governments and their agencies. Include here State funds which support R&D at agricultural experiment stations.
- c. In:Justry. Include all grants and contracts for R&D from profitmaking organizations, whether engaged in production, distribution, research, service, or other activities. Do not include grants and contracts from nonprofit foundations financed by industry; these should be reported under All other sources (line 1175).
- d. Institutional funds. Report funds, including indirect costs, which your institution spent for R&D activities from the following sources: (1) General-purpose State or local government appropriations; (2) general-purpose grants from industry, foundations, or other outside sources; (3) tuition and fees; (4) endowment income. In addition, estimate your institution's contribution to unreimbursed indirect costs incurred in association with R&D projects financed by outside organizations, and mandatory cost sharing on Federal and other grants. To estimate unreimbursed indirect costs, many institutions use a university-wide negotiated indirect cost rate multiplied by the base (e.g., direct salaries and wages, etc.) minus actual indirect cost recoveries. If your institution now separately budgets what was previously classified as departmenta: research, these data should be included in line 1161.
- e. All other sources. Include grants for R&D from nonprofit foundations and voluntary health agencies as well as from all other sources not elsewhere classified. Funds from foundations which are affiliated with, or granted solely to your institution, should be included under line 1160, Institutional funds. Funds for R&D received from a health agency that is a unit of a State or local government should be reported under State and local governments (line 1125). Also include gifts from individuals that are restricted by the donor to research.

ITEM 1. CURRENT FUND EXPENDITURES FOR SEPARATELY BUDGETED RESEARCH AND DEVELOPMENT IN THE SCIENCES AND ENGINEERING, BY SOURCE OF FUNDS, FY 1982 (Include indirect costs)

| Source of funds | | (1) Total | (2) Basic research |

| f. TOTAL (sum of a through e) | 1100 | \$ | |

CONFIDENTIALITY

Information received from individual institutions in lines 1161 and 1162, or estimates for basic research expenditures, will not be published or released; only aggregate totals will appear in publications.

Total R&D expenditures reported in line 1100, column (1) and line 1400, column (1) should be the same.

Federally financed R&D expenditures reported in line 1110, column (1) and line 1400, column (2) should be the same.

^{*}Combined data cell (See Instructions for b and e).

ITEM 2: CURRENT FUND EXPENDITURES (TOTAL AND FEDERALLY FINANCED) FOR SEPARATELY BUDGETED RESEARCH AND DEVELOPMENT, BY FIELD OF SCIENCE/ENGINEERING: FY 1982 (Include indirect costs)

| | Dollars in thousands) | | | | |
|---|-----------------------|-----------|-------------|--|--|
| Field of science/engineering | <u> </u> | (1) Total | [2] Federal | | |
| a. ENGINEERING (TOTAL) | 1410 | \$ | \$ | | |

| TOTAL (sum of a through h) | 1800 | | | | | |

^{*}Current fund expenditures in each field for scientific research equipment should be a subset of the "Total" and "Federal" column reported in item 2.

1

Item 3 Instructions

Please report that portion of current fund expenditures reported in items 1 and 2 that went for the purchase of research equipment. This includes all research equipment purchased under sponsored research project awards from current fund accounts.

NOTE: These research equipment expenditures are not to be included under capital expenditures reported in item 4.

For column (1) report current fund expenditures for R&D from all sources: Federal Government, State, county, municipal, or other governments and their agencies (including State funds supporting R&D at agricultural experiment stations); industry; institutional funds; and private foundations and voluntary health agencies, individuals, and associations.

For column [2] include funds from grants and contracts for R&D sponsored by agencies of the Federal Government.

Item 4 Instructions

Please report expenditures for facilities that were in process or completed during FY 1982.

Capital expenditures for facilities and equipment **include** the following: [a] Fixed equipment such as built-in equipment and furnishings; (b) movable scientific equipment such as oscilloscopes and pulse-height analyzers; (c) movable furnishings such as desks; [d] architect's fees, site work, extension of utilities, and the building costs of service functions such as integral cafeterias and bookstores of a facility; (e) facilities constructed to house separate components such as medical schools and teaching hospitals; and (f) special separate facilities used to house scientific apparatus such as accelerators, oceanographic vessels, and computers.

Expenditures for administration buildings, steam plants, residence halls, and other such facilities should be **excluded** unless used principally for research, development, or instruction in the sciences and engineering. Land costs should be **excluded**. **Also exclude** scientific research equipment purchased under research project awards from current fund accounts that are reported under items 1, 2, and 3.

ITEM 4. CAPITAL EXPENDITURES FOR FACILITIES AND EQUIPMENT FOR RESEARCH, DEVELOPMENT, AND INSTRUCTION, BY FIELD OF SCIENCE/ENGINEERING AND SOURCE OF FUNDS: FY 1982

^{&#}x27;Also, see enclosed "Crosswalk" between NSF field of science/engineering codes and the NCES Classification of Instructional Programs (NCES 81-323).

*Institutions with schools of veterinary medicine should distribute R&D expenditures among the appropriate disciplines (agricultural, biological, and medical) rather than only in medical sciences.

science and technology inputs and outputs

science indicators literature data base

purpose and background

This data base includes complete coverage of over 2,100 of the world's most influential journals, spanning the physical and biological sciences. The data are derived from journals carried on the 1973 Science Citation Index (SCI) data base which was created by the Institute for Scientific Information. Machine-readable data for 13 specially constructed bibliometric indicators of international and domestic scientific activity are available, including national publication counts, national citation indicators, international co-authorships, etc. In most cases, these data are available for the years 1973 through 1980 in any one of the following fields as well as a total of all fields: Clinical medicine, biomedicine, biology, chemistry, physics, earth and space sciences, engineering and

technology, psychology (1973-77 only), and mathematics.

sample

These more than 2,100 journals are the largest, most cited journals in the world. Although they are a sample, they represent virtually all the significant research literature of the world. The data base does not include journals added to the SCI after 1973 in order that comparisons over time can be made.

references

The most recent biennial National Science Board (NSB) report based on the data above is

Science Indicators—1982 (NSB 83-1), available from NSF and GPO:

data access

A complete description of the data base is contained in the publication, Data User's Guide to the National Science Foundation's Science Literature Data Base (1980). This publication is available from the Science Indicators Unit (202) 634-4682.

Data tapes for one or a set of indicators may be ordered from:

Computer Horizons, Inc. 1050 Kings Highway North Cherry Hill, New Jersey 08034 (609) 779-0911

The cost is \$100.00 for the first indicator and \$50.00 for each additional indicator, plus shipping costs.

counts of patents applied for and granted in the united states

purpose and background

Data are provided by the Office of Technology Assessment and Forecasts, U.S. Patent and Trademark Office. Patent counts are classified by nationality of inventor and class of owner (individual, U.S. Government, U.S. corporation, foreign government, foreign corporation). They are also classified by field of technology (product field) by use of a computer concordance developed under National Science Foundation (NSF) sponsorship. Special tabulations have been made of patenting by small businesses and of energy-related patenting:

sample

All patents granted in the United States are covered. They are presented both by year of grant and year of application. Reports are updated biennially, and generally cover the period from 1963 to 1982.

references

The most recent report based on the data above is

Science Indicators—1982 (NSB 83-1), available from NSF and GPO.

data availability

Earlier Patent Office reports are unavailable, but the 1981 reports include the earlier data and are available in microfiche form. Copies can be obtained from the Science Indicators Unit, Division of Science Resources Studies, or from the Office of Technology Assessment and Forecast [OTAF]. OTAF is also prepared to make special computer runs with their patent data file for a fee. Inquiries should be directed to:
