 Force; \*Occupations; Participant Characteristics;  
 Racial Differences; Sex Differences

**IDENTIFIERS** Current Population Survey

**ABSTRACT**

As this report illustrates, nearly one in four adult workers today has completed college, while in 1970 just one in seven had as much formal schooling. This growth, together with the higher labor force participation rates of college graduates, has generated significant increases in the college-educated work force. Other factors include women's increased share of the college-graduate work force, the ongoing decline in the number of school leavers, and higher proportions of Blacks and Hispanics with college degrees. Data continue to confirm that educational attainment is one of the most important determinants of occupation. Following the four-page report is an explanatory note briefly describing the concepts, definitions, and estimating methods used in the Current Population Surveys 1983 and 1982 from which the data were taken, and indicators of data reliability. Appendixes contain 27 supplementary tables, including educational attainment of the civilian labor force by sex; employment status by years of school completed and other variables; labor force status by years of school completed and other variables; labor force status of women by marital status, age, and years of school completed; employed civilians by years of school completed and other variables; and unemployed persons by years of school completed and other variables. # Preface

This bulletin on educational attainment of the labor force is part of the Special Labor Force Reports series. It discusses changes since 1970 in the labor force activity of college graduates by sex, race, and Hispanic origin. The article was initially published in the *Monthly Labor Review*, March 1984, and is reprinted with additional tabular material and an explanatory note.

The data were compiled from supplementary questions to the March 1982 and 1983 Current Population Survey (CPS) conducted and tabulated by the Bureau of the Census for the Bureau of Labor Statistics.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

# More U.S. workers are college graduates

ANNE MCDUGALL YOUNG AND HOWARD HAYGHE

From now until about the end of the decade, the last of the enormous postwar birth cohort will pass through school and into the adult labor force. Millions more workers will have college degrees, as the anticipated number of bachelors' and higher degrees awarded will continue to exceed a million a year for the rest of the 1980's.<sup>1</sup> Thus, college graduates will continue to represent a growing proportion of the labor force.

Today, nearly 1 in 4 adult workers has completed college. A little more than a decade ago, in 1970, just 1 in 7 had as much formal schooling. During the 13-year interval, the baby-boom generation—now concentrated in the 25- to 34-years age group—went to college in record numbers, and, in most of these years, over a million bachelors' and advanced degrees were awarded annually.<sup>2</sup> This growth, together with the fact that labor force participation rates of college graduates are typically higher than the rates for persons with fewer years of school, generated significant increases in the college-educated work force.<sup>3</sup>

## More college graduates

Between 1970 and 1983, the number of 25- to 64-year-old workers with 4 years or more of college increased by 11.5 million. Almost half of this rise was among 25- to 34-year-olds, with 35- to 44-year-olds accounting for most of the rest. While the proportion of working men ages 25 to 64 with a college degree rose by more than two-thirds over the 1970-83 period, that of women almost doubled. (See table 1.) Along with the increase in the number of graduates, the sharp upward trend in women's labor force participation was a major factor contributing to this rise. From 1970 to 1983, the labor force participation rate increased for all but the oldest group of female college graduates, with that of 25- to 34-year-olds rising the most:

Age	Women		Men	
	1970	1983	1970	1983
25 to 64 years .....	61	77	96	95
25 to 34 years .....	58	82	95	95
35 to 44 years .....	58	76	99	98
45 to 54 years .....	67	73	97	96
55 to 64 years .....	64	56	90	83

In the past, household and child-care responsibilities were among the major reasons for women ages 25 to 34 to stay

at home. During the 1970's, inflation and economic need, among other factors, apparently became more compelling reasons for women in this age cohort to work outside the home. By 1983, not only did fewer married college graduates ages 25 to 34 have preschool children (53 percent versus 68 percent in 1970), but those who did have children under age 6 were far more likely to be in the labor force (61 percent compared with 34 percent in 1970).<sup>4</sup> The labor force participation rate of 55- to 64-year-old college graduates generally paralleled the downward trend for all women in this age group during most of the 1970-83 period.

In contrast to the situation among most women, there has been a decrease in the labor force participation rates of adult men in all educational attainment groups. For male college graduates, however, the rate has slipped by only a percentage point since 1970. This decline was considerably less than for men in other educational attainment categories, and, like that of the other men, it occurred primarily among those in the older age brackets. One result of these contrasting male-female labor force trends has been that women's share of the college-graduate work force increased, from 27 percent in 1970 to 38 percent in 1983.

The ongoing decline in the number of school leavers—workers who have not completed 12 years of formal schooling—is an additional factor behind the growth in college graduates' share of the adult work force. Between March 1970 and 1983, the total number of school leavers in the labor force declined by more than 7 million, mostly because of retirement or death among older workers who have typically completed fewer years of school than younger workers.

## Black and Hispanic workers

Blacks and Hispanics have joined in the general upgrading of the educational attainment of the population in recent years. However, their proportions with college degrees continue to be much lower than that of whites. In 1983, 13 percent of adult black workers and 10 percent of Hispanics were college graduates, compared with 25 percent of whites. Moreover, since 1970, the percentage-point increase for

Anne McDougall Young and Howard Hayghe are economists in the Division of Employment and Unemployment Analysis, Bureau of Labor Statistics.

<sup>1</sup>Data refer to black and other workers

<sup>2</sup>Data are derived from the 1970 census

Note: Detail for the above race and Hispanic-origin groups in 1983 will not sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups

blacks (5 points) and Hispanics (3 points) has been much smaller than for whites (10 points). For both whites and blacks, the proportions of adult workers who were school leavers dropped by about half, while the share for Hispanics declined by one-third. This difference in the size of the decline between Hispanics on the one hand, and whites and blacks on the other, may reflect recent immigration from countries where the propensity to stay in school is not as great as in the United States, and public educational opportunities are not as widely available.<sup>5</sup>

Greater educational attainment was linked with higher labor force participation rates for all race and ethnic groups. However, labor force rates differed significantly for some race and sex groups with the same general level of schooling. Age was sometimes an important factor. For instance, among dropouts in the adult labor force, almost 40 percent of the male Hispanics were 25 to 34 years old, compared with 25 percent of both whites and blacks. The preponderance of younger workers pushed the labor force participation for Hispanic male dropouts to 87 percent, compared with 79 percent for whites and 72 percent for blacks. (See table 2.)

Black women were much more likely to be in the labor force than white or Hispanic women at every level of schooling, with the difference rising from about 4 percentage points among dropouts to almost 15 percentage points among college graduates. The persistence of higher labor force rates

among black women reflects, in part, financial need in families where the men, on average, have lower earnings than white men at all levels of education.<sup>6</sup> Also, a larger proportion of black families were maintained by women, 42 percent in March 1983, compared with about 13 percent of white families and 23 percent of Hispanic families.<sup>7</sup>

As can be seen, the overall participation rate for Hispanic women was lower than that for either blacks or whites. This is partly because more than half of the Hispanic women in the population had not completed high school, compared

with only a fourth of the whites and a third of the blacks. Because labor force participation rates of high school dropouts are typically lower than for other education groups, the concentration of Hispanic women in that category had the effect of decreasing their overall labor force rate. Also, relatively more Hispanic than white or black women had children under age 6, whose presence tends to inhibit mothers' labor force participation.

### New occupational classification

The occupational classification system used since the 1970 decennial census has now been replaced by one that links occupational titles more closely to job function. Beginning in January 1983, the four traditional summary groups (white-collar, blue-collar, service, and farm) into which Current Population Survey (CPS) occupational data were divided, were replaced by the system of six major groups—identified in table 3—that was used for 1980 census data. Many of the new occupational categories are different from the old ones, and the introduction of the new system in 1983 breaks the continuity somewhat of CPS occupational data series.<sup>8</sup>

However, the data based on the new classification system continue to confirm the well-known fact that educational attainment is one of the most important determinants of occupation. In March 1983 the largest proportion of school

dropouts of all races were operators, fabricators, and laborers. High school graduates were concentrated in the technical, sales, and administrative support category, with a large proportion also working as operators, fabricators, and laborers. Among workers who had attended but not graduated from college, most were in occupations similar to those of high school graduates. But of those with 4 years of college or more, 3 out of 5 were in managerial and professional specialty occupations.

FROM A NATIONAL STANDPOINT, a better trained work force is highly desirable. However, with respect to the college educated, the growth in the number of adult workers with degrees carries with it the possibility of an uncertain future for many young college graduates. This is because the greatest increase in the number of jobs over the decade to come is projected for such occupations as janitors, sales clerks, secretaries, and so forth.<sup>9</sup> Thus, the potential exists for a growing mismatch between actual educational levels and those required for occupations with the greatest anticipated growth.<sup>10</sup> In other words, many college graduates—perhaps 20 percent—will not be able to get jobs requiring a college degree, continuing the situation that has prevailed in recent years. Such mismatches could seriously affect the lives of many young workers and their families for years to come.

<sup>2</sup> *Ibid.*

<sup>3</sup> Data in this report are based on tabulations from the March 1983 Current Population Survey (CPS), conducted for the Bureau of Labor Statistics by the Bureau of the Census. The data relate to persons 25 to 64 years old, unless otherwise specified. Because these estimates are based on a sample, they may differ from those obtained if a complete census were conducted. Sampling variability may be relatively large in cases where the estimates are small. Small estimates, or small differences between estimates, should be interpreted with caution. This report is the latest in a series on this subject. The most recent was Anne McDougall Young, "Recent trends in higher education and labor force activity," *Monthly Labor Review*, February 1983, pp. 39-41. A research summary, "Educational attainment of workers, March 1981," detailed tables for March 1981, and summary educational attainment tables for 1980 revised to the 1980 Census base are included in *Educational Attainment of Workers, March 1981*, Bulletin 2159 (Bureau of Labor Statistics, January 1983).

# Appendix A. Explanatory Note

Statistics on the labor force, employment, unemployment, and persons not in the labor force, classified by a variety of demographic, social, and economic characteristics are derived from the Current Population Survey (CPS), which is conducted by the Bureau of the Census for the Bureau of Labor Statistics. The information is collected by trained interviewers from a sample of about 60,000 households, representing 629 areas in 1,148 counties and independent cities, with coverage in 50 States and the District of Columbia.

The estimates in this bulletin are based on supplementary questions in the March 1982 and 1983 CPS. These estimates relate to persons 16 years and over in the civilian noninstitutional population in the calendar week which included March 12th of each year.

The concepts, definitions, and estimating methods used in the survey, as well as indicators of the reliability of the data are briefly described below. A more detailed description of the survey appears in *Concepts and Methods Used in Labor Force Statistics Derived From the Current Population Survey*, BLS Report 463, and in the Explanatory Notes of the BLS monthly publication, *Employment and Earnings*.

## Concepts and Definitions

*Educational attainment* applies to years of school completed in regular schools, which include graded public, private, and parochial elementary and high schools, colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which could be expected to advance a person to an elementary certificate; a high school diploma; or a college, university, or professional school degree. Schooling in other than regular schools is counted only if the credits obtained are regarded as transferable to a school in the regular school system.

The *civilian labor force* comprises all civilians classified as employed or unemployed in accordance with the criteria described below.

*Median years of school completed* indicate the value which divides the population group into two equal parts, one part having completed more schooling and one part having completed less schooling than the median. For purposes of computing these medians, the years of school completed are numbered consecutively; for example, the first year of high school is indicated by 9

and the first year of college by 13. The medians are expressed in continuous part-years, although the respondents' answers to the survey questions are in terms of complete, discrete years.

*Employed persons* are (a) all civilians who, during the survey week, did any work at all as paid employees, in their own business, profession, or on their own farm, or who worked 15 hours or more as unpaid workers in an enterprise operated by a member of the family; and (b) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, labor-management disputes, or personal reasons, whether they were paid for the time off or were seeking other jobs. Each employed person is counted only once. Those who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week.

*Unemployed persons* are all civilians who had no employment during the survey week, were available for work, except for temporary illness, and (a) had made specific efforts to find employment sometime during the prior 4 weeks, or (b) were waiting to be recalled to a job from which they had been laid off, or (c) were waiting to report to a new job within 30 days.

*Duration of unemployment* represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of seeking work. Measurements of mean and median duration are computed from a distribution of single weeks of unemployment.

The *unemployment rate for all civilian workers* represents the number unemployed as a percent of the civilian labor force. This measure can also be computed for groups within the labor force classified by sex, age, race, Hispanic origin, marital status, etc.

*Not in the labor force* includes all persons who are not classified as employed or unemployed. These persons are further classified as engaged in own home housework, in school, unable to work because of long-term physical or mental illness, retired, and other. The

"other" group includes individuals reported as too old or temporarily unable to work, the voluntarily idle, seasonal workers for whom the survey week fell in an off season and who were not reported as looking for work, and persons who did not look for work because they believed that no jobs were available in the area or that no jobs were available for which they could qualify—discouraged workers. Persons doing only incidental, unpaid family work (less than 15 hours in the specified week) are also classified as not in the labor force.

*Occupation, industry, and class of worker* for the employed apply to the job held in the survey week. Persons with two or more jobs are classified in the job at which they worked the greatest number of hours during the survey week. The unemployed are classified according to their last full-time job lasting 2 weeks or more. The classifications of occupations and industries used in data derived from the CPS through 1982 are defined as in the 1970 census. Beginning with 1983 data, they are defined as in the 1980 census. Information on the detailed categories included in these groups is available upon request.

*Hours of work* statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week but were off on the Columbus Day holiday would be reported as working 32 hours even though they were paid for the holiday. For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the week; all the hours are credited to the major job.

*Full-time workers* are persons who worked 35 hours or more during the survey week. Part-time workers are those who worked 1 to 34 hours during the survey week. *Part-time workers* are further classified by their usual status at their present job (either full or part time) and by their reasons for working part time during the survey week (economic or other reasons). "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of a job during the week, and inability to find full-time work. "Other reasons" include: Labor dispute, bad weather, own illness, vacation, demands of housework, school, no desire for full-time work, and full-time worker only during peak season. Persons with a job but not at work during the survey week are classified according to whether they usually work full or part time.

*Age* is based on the age of the respondent at his or her last birthday.

*White, black, and other* are terms used to describe the race of workers. Included in the "other" group are American Indians, Alaskan Natives, Asians, and Pacific Islanders, and any other race except white and black. All tables in this bulletin which contain racial data present data for the black population group. Be-

cause of their relatively small sample size, data for "other" races are not published. In the enumeration process, race is determined by the household respondent.

*Hispanic origin* refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican living on the mainland, Cuban, Central or South American, or of other Hispanic origin or descent. Persons of Hispanic origin may be of any race; thus they are included in both the white and black population groups.

*Single, never married; married, spouse present; and other marital status* are terms used to define the marital status of individuals at the time of interview. *Married, spouse present*, applies to husband and wife if both were reported as members of the same household even though one may be temporarily absent on business, vacation, on a visit, in a hospital, etc. *Other marital status* applies to persons who are married, spouse absent; widowed; or divorced. *Married, spouse absent*, includes persons who are separated because of marital discord, as well as persons who are living apart because either the husband or the wife was employed and living away from home, serving in the Armed Forces, or had a different place of residence for any reason.

## Estimating Methods

The estimating procedure used in this survey inflates weighted sample results to independent estimates of the civilian noninstitutional population by age, sex, race, and residence. These independent estimates are based on data from the 1980 census and other statistics on births, deaths, immigration, emigration, and the Armed Forces.

### Rounding of the estimates

The sums of individual items may not always equal the totals shown in the same tables because of independent rounding of the totals and components to the nearest thousand. Similarly, sums of percent distributions may not always equal 100 percent because of rounding. Differences, however, are insignificant.

### Reliability of the estimates

Since the estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules and procedures. As in any survey, the results are also subject to errors of response and reporting. These may be relatively large in the case of persons with irregular attachment to the labor force. Particular care should be exercised in the interpretation of figures based on relatively small estimates as well as small differences between estimates.

The standard error is primarily a measure of sampling variability, that is, of the variations that might occur

by chance because a sample rather than the entire population is surveyed. As calculated for this bulletin, the standard error also partially measures the effect of response and enumeration errors but does not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate differs from a complete census by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

Tables A-1 through A-4 show approximations of the standard errors of estimated numbers and percentages at the 68-percent confidence level, and should be interpreted as providing an indication of the order of magnitude of the standard error rather than a precise standard error for any specific item. Standard errors for intermediate values may be obtained by interpolation. The following examples illustrate the use of these tables.

Table B-2 of the supplementary tables shows that 7,646,000 men 16 years and over with 4 years of college, were in the labor force in March 1983. The population of all men 16 years and over was 82,260,000. Table A-1 shows the standard error on the labor force estimate to be approximately 116,800. Thus, the chances are about 68 out of 100 that the difference between the sample estimate and a complete census count would be less than 116,800. The chances are 95 out of 100 that the difference would be less than 233,600.

The 7,646,000 men represented 88.8 percent of all men 16 years and over in the civilian noninstitutional population with 4 years of college. Table A-3 shows the standard error of 88.8 percent with a base of 8,610,000 (population) to be about 0.5 percent. Consequently, the chances are 68 out of 100 that a complete census count would have disclosed the figure to be between 88.3 and 89.3 percent, and 95 out of 100 that the figure would have been between 87.8 and 89.8 percent.

For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately:

$$\sigma = \sqrt{(s_1)^2 + (s_2)^2}$$

As shown in the previous example, in March 1983,

the labor force participation rate of men with 4 years of college was 88.8 percent, while the rate for women with that amount of education was 67.8 percent, an apparent difference of 21.0 percentage points. Table A-3 shows the standard error for 67.8 percent on a base of 7,667,000 women with 4 years of college to be approximately 0.7 percentage point and the standard error for 88.8 on a base of 8,610,000 men with 4 years of college to be approximately 0.5 percentage point. Thus, the standard error of the estimated difference of 21.0 percentage points is:

$$0.86 = \sqrt{(0.7)^2 + (0.5)^2}$$

This means the chances are 68 out of 100 that the estimated difference derived using complete census figures would differ by less than 0.86 percentage points and 95 out of 100 that it would differ by less than 1.7 percentage points. Therefore, the conclusion is that at both levels of confidence, the labor force participation rate of men with 4 years of college is greater than that of women with that much education. Of course, should the standard error be equal to or greater than the estimated difference of percentages based on the sample, there would be no significant difference between the percentages.

The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerator of the percentages; this is particularly true for percentages of 50 percent or more. As a general rule, percentages are not published when the monthly base of the measure is less than 75,000. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

**Table A-1. Standard errors for estimated numbers of total or white persons**

(in thousands)

Estimated number of persons	Total persons in age groups									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000

1983	45,308	100.0	.7	4.0	10.5	45.8	20.6	18.4	12.8

<sup>1</sup> Includes persons reporting no school years completed.  
<sup>2</sup> 1940 census figures revised for comparability with labor force estimates from the Current Population Survey.

NOTE: Data for 1940 and 1952 were collected in April and October, respectively. Data for 1971-80 have been revised to reflect 1980 census population adjustments and thus differ from previously published data.

**Table B-2. Employment status of the population by years of school completed, sex, race, and Hispanic origin, March 1983**

<sup>1</sup> Includes persons reporting no school years completed.

NOTE: Detail for the above race and Hispanic-origin groups will not

sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

# Appendix C. Supplementary Tables for 1982

Table C-1. Employment status of the population by years of school completed, sex, race, and Hispanic origin, March 1982

Years of school completed, sex, race, and Hispanic origin	Civilian noninstitutional population	Civilian labor force									Not in labor force
		Total	Percent of population	Employed			Unemployed				
				Total	Agri-culture	Nonagri-cultural industries	Total	Percent of labor force	15 weeks or more		
									Total	Percent of unemployed

sum to totals because data for the "other races" group are not presented and Hispanics are included in both the white and black population groups.

# BLS Periodicals

**Monthly Labor Review**  
the oldest and most authoritative Government research journal in economics and social sciences. Regular features include current labor statistics and developments in industrial relations.

\$26 a year, 12 issues.

**Occupational Outlook Quarterly**

helps students and guidance counselors learn about new occupations, training opportunities, salary trends, and career counseling programs. Written in nontechnical language and illustrated in color.

\$9 a year, four issues.

**Employment and Earnings**

gives current employment and earnings statistics for the Nation as a whole, for individual States, and for more than 200 areas. Included are household and establishment data, seasonally and not seasonally adjusted.

\$39 a year, 12 issues and annual supplement.

**CPI Detailed Report**

is the most comprehensive report on monthly consumer price indexes and rates of change. Includes data on commodity and service groups for 28 cities.

\$28 a year, 12 issues.

**Producer Prices and Price Indexes**

includes price movements of both farm and industrial commodities, by industry and stage of processing. Tables and charts give greater detail than available in other published material.

\$34 a year, 12 issues and annual supplement.

**Current Wage Developments**

reports on specific wage and benefit changes from collective bargaining agreements. Includes data on strikes or lockouts, major agreements expiring, and compensation changes.

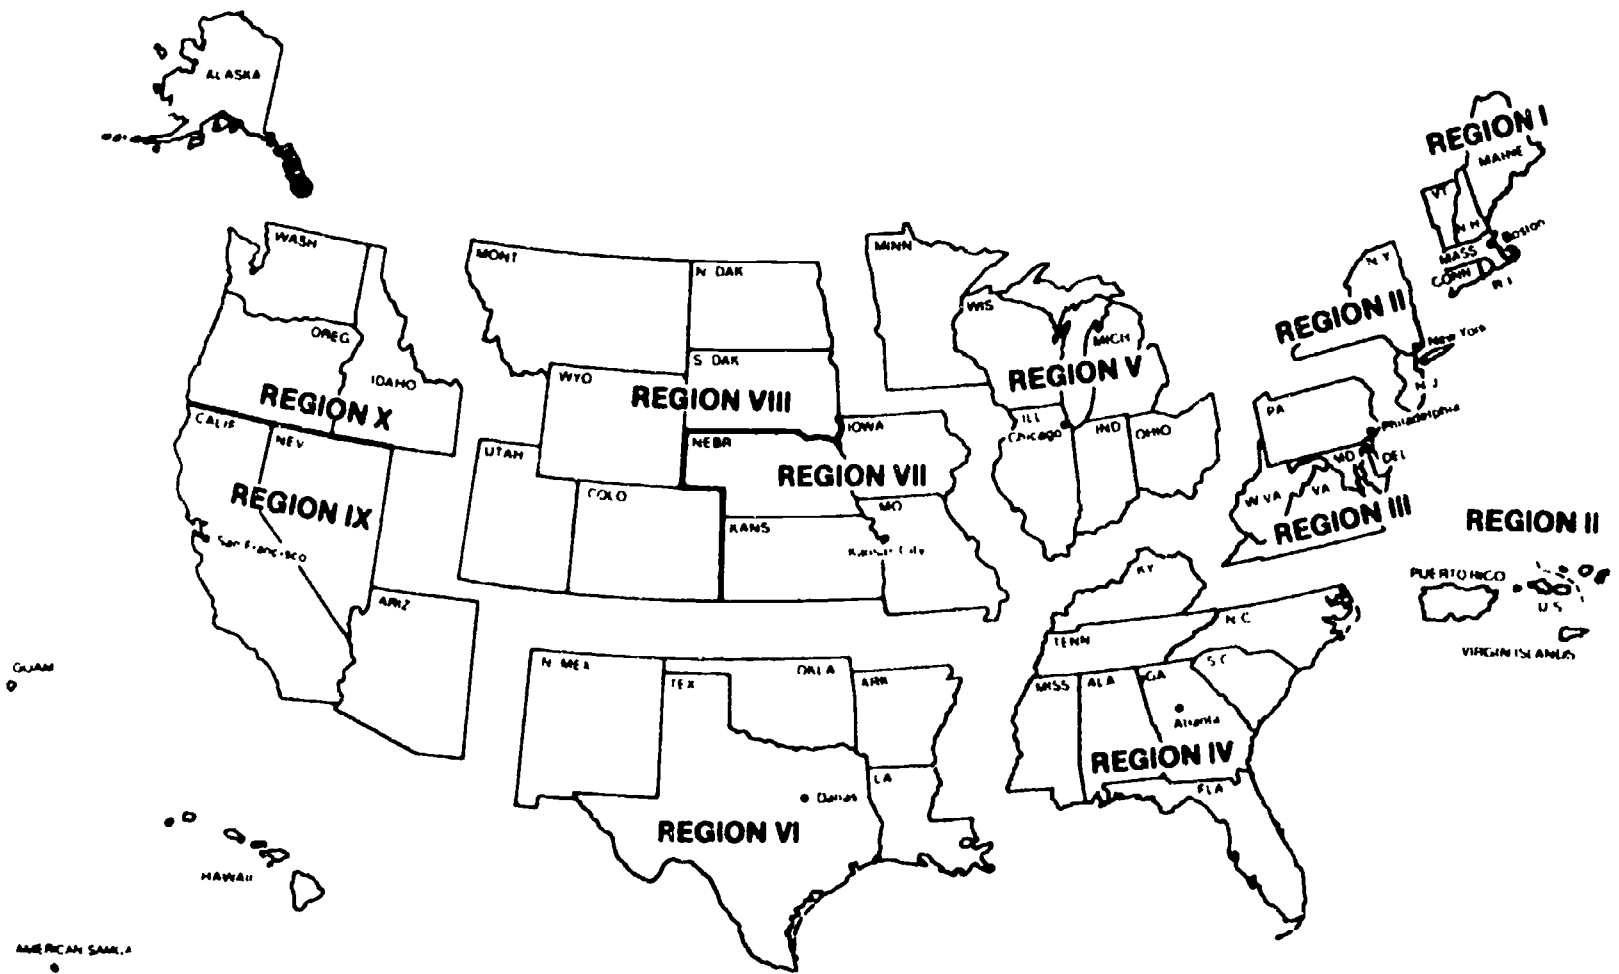

\$23 a year, 12 issues.

BLS periodicals provide timely information on employment, occupations, wages, and prices.

Subscriptions are available from:  
Superintendent of Documents,  
U.S. Government Printing Office,  
Washington, D.C. 20402.  
For subscriptions to foreign countries,  
add 25 percent to all prices.  
Make all checks payable to  
Superintendent of Documents.
